1561	421 - 5	Personal Information Withheld	Bowen Island, BC	I understand that a small population of elk have been re-established near McNab Creek and will be affected by a mine. Other indigenous animals will be cut off by the mine from the estuary.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
1562	421 - 6	Personal Information Withheld	Bowen Island, BC	Please, for all our sakes, turn down this application for a gravel mine on this important habitat. Why would the province bother doing all the costly remediation work of Britannia Mines and other industrial sites to turn around and undo it by approving this proposal? Thank you for your careful and attentive work protecting our home.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
1563	422 - 1	Personal Information Withheld	West Vancouver, BC	This Burnco Aggregate Project must not be approved. Howe Sound is finally cleaning up after decades of mills polluting the air and water. This would be a catastrophe! We must not continue to destroy the environment. Do not approve this project.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1564	423 - 1	Personal Information Withheld	Bowen Island, BC	It is completely inappropriate to allow the Burnco gravel mine to operate in this incredibly beautiful and environmentally sensitive area of Howe Sound. Given the slow, but important recovery finally occurring in this area, no project like this should ever be approved. I strongly oppose this project.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. 1565	424 - 1	Personal Information Withheld	Bowen Island, BC	Totally inappropriate location for this type of enterprise. Howe Sound is just starting to recover from previous industrial misuses - let's not take a giant step backwards.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1566	425 - 1	Jonathan Bennett	Bowen Island, BC	I implore you not to approve this mine project. Howe Sound is one of the planet's jewels - you can count on the fingers of one hand the deep ocean sounds close to major metropolitan areas - and it is gradually, visibly recovering from decades of industrial misuse. It would be not only wicked but stupid to let something happen that will slow or even reverse that recovery.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1567	426 - 1	Luisa Nitrato Izzo	Squamish, BC	This project presents a serious risk to salmon and salmon habitat. For this reason I STRONGLY urge you to reject the proposal. We must protect this valuable salmon habitat for generations to come through wide stewardship, not destroy it through projects such as this one that seriously threaten our environment. Thank you.	A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.  The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.  The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.
1568	427 - 1	Personal Information Withheld	BC	No. No and no....leave my BC alone. No	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1569	428 - 1	Martin Smith	North Vancouver, BC	I am writing to urge against the proposed gravel mine operation at McNabb Creek in Howe Sound.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1570	428 - 2	Martin Smith	North Vancouver, BC	There are not many wild areas left near Vancouver but those like McNabb creek estuary should be left to develop naturally. Thankyou for considering my views	A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.  An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.  The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.  The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.

1572	429 - 1	Dr. R. Bruce Bessie	Furry Creek, BC	My family has resided within the corridor for 48 years. Over this period of time , the Sound has slowly recovered from a devastatingly low point when the Biritianna mine and Woodfiber pulp mill were both seriously contributing to the decline of marine life within this Southern most fjord of the BC coast .	It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).  Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.
1573	429 - 2	Dr. R. Bruce Bessie	Furry Creek, BC	Over this time ,we have witnessed the huge tourism growth within the corridor and fully supported the goals of the previous BC government agencies in developing this corridor as the center piece of " Super Natural BC ". This Southern Fjord is a jewel and is the centrepiece of the tourism and recreation market .	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.

1576	429 - 5	Dr. R. Bruce Bessie	Furry Creek, BC	With my university educated background , I feel that approval of this application is VERY shortsighted and I truly hope you will recognize the potential danger that approval of this application may have on such a great BC tourism asset . I hope you will weigh the value of Howe Sound to the Super Natural BC image and will be good long range thinkers!	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1577	430 - 1	Susan Swift	Bowen Island, BC	Honourable Assessors, I am a relatively new resident (3 years) of Bowen Island in Howe Sound, a beautiful fjord that is home to Bowyer, Bowen, Gambier, Anvil, and the Pasley Islands. My husband owns a kayak business on Bowen Island and we depend on tourism and the health of our marine environment for our survival.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
1578	430 - 2	Susan Swift	Bowen Island, BC	We view the BURNCO mine application with horror, knowing that it threatens the Sound's recovery (as documented by David Suzuki and others.) We are just one family dependent on the sea, but there are many, many, many krill, plankton, herring and anchovy "families" who also call this home. The marine food chain depends upon these families thriving in order to support seals, sea lions, whales, dolphins, cod, and salmon -- the oceanic ambassadors of British Columbia. The BURNCO mine is a documented threat to the families that rely on a healthy Howe Sound for their survival. <a href="http://vancouver.sun.com/news/local-news/anchovy-schools-are-back-in-session-with-phenomenal-numbers-spawning-in-howe-sound">http://vancouver.sun.com/news/local-news/anchovy-schools-are-back-in-session-with-phenomenal-numbers-spawning-in-howe-sound</a> Thank you for your consideration.	A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.  The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.  The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.
1579	431 - 1	Personal Information Withheld	Salt Spring Island, BC	I lived in Squamish from 1980-84 then from 1988-2015. During that time I have witnessed the slow recovery of Howe Sound and its communities from resource industry activity. Britannia Mine, Woodfibre Pulp and Paper, Nexen Chemical plant, various woodsorts, the port facility, the railway and its expansion have all had an impact on the health of the environment and left a legacy of contamination to deal with. Knowing what we know now, from the history of the industry ...the toxins in the soil and water, the disruption of ecosystems on land and in water and the air quality issues I cannot believe that any further industrial activity is being considered. Clean energy is the path that we need to be taking.	It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).  Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.

1580	431 - 2	Personal Information Withheld	Salt Spring Island, BC	None of the proposals for Howe Sound can be justified to be clean industry and safe for the environment. Specifically, the Burnco project is on one the the last remaining estuaries on our south coast. This development should not be given any approval.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
1581	432 - 1	Steven Threndyle	North Vancouver, BC	As a freelance travel writer who specializes in writing about British Columbia, I have to go on record as saying that the head of Howe Sound is one of the wildest, yet oddly most accessible, places I've ever been. A short boat ride from West Vancouver or Squamish, and you are transported into a wonderful ecosystem of productive fishing habitat, Coast Range mountain peaks (the McNab Lions!) and a pristine stretch of beach.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
1582	432 - 2	Steven Threndyle	North Vancouver, BC	The tranquility of this special spot would be severely compromised by the Burnco Gravel operation; both from a scenic and - far worse - the sonic disturbance of gravel crushers.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

1583	432 - 3	Steven Threndyle	North Vancouver, BC	The tranquility of this special spot would be severely compromised by the Burnco Gravel operation; both from a scenic and - far worse - the sonic disturbance of gravel crushers.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p>
1584	432 - 4	Steven Threndyle	North Vancouver, BC	Please consider how special Howe Sound is and make this region part of a wilderness area or put it into the provincial park system. Save this precious land for our children... some of whom are photographed enjoying McNab Creek, here.	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
1585	433 - 1	Personal Information Withheld	Furry Creek, BC	Over the past 16 years living on Howe Sound I have watched the painfully slow but amazing recovery of sea life here. I am worried that without a holistic approach to regulate big industry on Howe Sound that we will again wipe out what lives in and around these waters. My degree is science, but I am well aware of the need for some industrial considerations but not for this project at McNab Creek.	<p>It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).</p> <p>Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.</p>
1586	433 - 2	Personal Information Withheld	Furry Creek, BC	The negatives here far outweigh the incorrectly perceived need for gravel at this location.	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>

1591	434 - 2	Sunshine Coast Conservation Association	Sunshine Coast, BC	Howe Sound was closed in 1963 to commercial fishing for the purposes of stock management and to preserve the sports fishery. In the 1970's McNab Creek was identified as one of three more gently sloping streams on the west side of Howe Sound with a significant estuary (there being none on the east side) and therefore had significant capabilities, along with the Squamish River, for supporting the fishery in Howe Sound. Escapement records for McNab Creek go back to 1950, with sport fishing for Cutthroat Trout and Steelhead recognized as early as 1935. In 1991, workers of Canadian Forest Products, Mainland Logging Division, were recognized for their ten years of Salmon Enhancement Program efforts at McNab Creek by the Head of the Public Involvement Program, Department of Fisheries & Oceans. In 1999, a provincial Fish and Fish Habitat Inventory noted that the creek still contained important spawning and rearing habitat for anadromous salmonids, Cutthroat and Steelhead. McNab Creek is considered a major Chum system within the Howe Sound/Sunshine Coast Area with a management escapement goal of 10,000 (2009).	Thank you for this information. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1592	434 - 3	Sunshine Coast Conservation Association	Sunshine Coast, BC	The above is only a partial account of the high, long-known, historical values of salmonids, Cutthroat Trout and Steelhead in the McNab Creek watershed. BURNCO, in their first two unsuccessful attempts to obtain authorizations from Fisheries & Oceans Canada (DFO), and in acknowledging in the Purpose of Application that the proposed project is subject to a comprehensive study review under the former Canadian Environmental Assessment Act as a result of a required approval under the Fisheries Act, should recognize the primary importance of these species.	BURNCO agrees that there is historical importance of salmonids in the McNab Creek watershed. BURNCO has endeavored to adjust the design and mitigation measures of the Proposed Project to avoid or limit the potential effects of the Proposed Project on salmonids and their habitats. Efforts were made to design the Proposed Project so that it would not reduce baseflows in McNab Creek. With the implementation of the Fish Habitat Offset Plan (Appendix 5.1-B of the EAC Application/EIS) it is expected that the amount of salmonid habitat than is currently present will be increased.
1593	434 - 4	Sunshine Coast Conservation Association	Sunshine Coast, BC	Yet, BURNCO's Project Description of the Summary does not refer to the expected impact of the Project on these specific valued components. It should include a statement of maintaining or improving salmonid, Cutthroat and Steelhead (Salmonidae) populations and habitats during construction, operation and effective closure.	The Fisheries and Freshwater Habitat assessment (Section 5.1 of the EAC Application/EIS) and the Fish Habitat Offset Plan (Appendix 5.1-A of the EAC Application/EIS) indicate that the amount of available habitat for salmonids will be increased.

1594	434 - 5	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>Vol. 2, 5.1.6 Conclusions notes that "All potential Project-related residual adverse effects (on fish and fish habitat valued components) were determined to be negligible – not significant and requiring no further consideration." This statement is based largely on a hydrological model that would set the hydrostatic pressure in the 30 ha, 30 m deep wetted pit during the 16 years of operation slightly above the baseline water conditions in McNab Creek. The proponent expects that there would then be no ground water loss in McNab Creek, as presently occurs to the upper reaches of the existing compensation channel; the slight net increase is evaluated as positive. This model also believes that the downslope impact on the estuarine waterways would increase and the net benefit is seen as positive.</p> <p>The SCCA disagrees with this assessment. The baseline studies on the Salmonidae utilizing the surrounding fresh and marine waterways are not comprehensive enough to judge the potential impact of a failure, in particular pit containment. Further, a suite of Spill &amp; Emergency Response Plans and Compensation Plans must be developed prior to construction for the variety of failures possible (e.g. sudden loss of water in McNab Creek, sudden overwhelming and or sediment contamination of estuarine waterways). In order to develop appropriate plans, baseline studies must be completed to determine which species, their age and their behaviour (e.g. transit, rearing, spawning) are expected to be in the water ways at any given time. Further studies and changes to fisheries habitat protection during construction and operations, and climate change</p>	<p>In order to ground-truth the expected result of the groundwater model, BURNCO will monitor the groundwater gradient and the water levels within the pit lake throughout the operational phase. These monitored groundwater and pit lake water levels will be used to refine the analysis of the closure groundwater gradient and pit lake water level. These analysis will be used to inform the progressive planning of the mine. After closure, if necessary, the groundwater gradient can be altered (varying the rate of loss from McNab Creek) by adjusting the height of the weir at the outlet of the pit lake.</p> <p>A consequence analysis regarding the Pit Lake Containment Berm as well as the McNab Creek Flood Protection Dyke are being conducted and will be submitted with the Mines Act Permit Application (MAPA). This analysis will consider the potential effects on fish and fish habitat in the downstream environment. In addition, an assessment of the loss of containment of the Pit Lake on fisheries and freshwater habitat was presented in the EAC Application/EIS in Section 5.1.5.4.2.2.</p> <p>A Spill Prevention and Emergency Response Plan as a well as a Emergency Response Plan will be developed and will include what to do in the event of loss of containment of the pit lake. An outline of these plans is presented in Section 17.0 of the EAC Application/EIS.</p> <p>Freshwater fish and fish habitat baseline studies completed are presented in Appendix 5.1-A. Baseline studies included electrofishing, fyke netting, minnow trapping, adult salmon spawner surveys, beach seining and benthic invertebrate community surveys. BURNCO has also committed to conducting fish habitat monitoring and fish community monitoring within the fish-bearing streams of the LSA to determine if there are any measurable changes to fish habitat utilization during the Proposed Project. This is described in Section 17.4 of the EAC Application/EIS.</p>

1595	434 - 6	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>Selection and rationale omits Steelhead Trout (<i>Oncorhynchus mykiss</i>). This species has suffered significant declines over that last 20 years and is susceptible to changes and loss of key habitats that include; degradation to rearing (most importantly parr rearing) and access to holding and spawning areas.</p> <p>It is assumed that the rationale for the omission of Steelhead is that the project footprint does not directly impact their habitat. While no direct impacts may occur, alteration of mainstem flow does have the potential to impact both Steelhead adult migration and alter accessible juvenile rearing habitats that are located adjacent to and above the project footprint area. It is known that Box Canyon Creek, found immediately upstream of the project area provides both Steelhead rearing and spawning. The McNab Creek mainstem immediately above and below Box Canyon Creek confluence also supports Steelhead rearing and spawning.</p> <p>Given the importance of this species regionally and the concern regarding potential effects of gravel mining on stream flows, Steelhead must be included as a VC.</p>	<p>Steelhead was not included as a Valued Component (VC) for the following reasons:</p> <ul style="list-style-type: none"> <li>-Observations of steelhead within the LSA were infrequent.</li> <li>-The consideration of stream flow and water quality in relation to other salmonids would also speak to potential effects on steelhead and their habitats.</li> </ul> <p>Rationale for the selection of VCs was provided in the Approved Application Information Requirements/EIS Guidelines and in Section 4.2 of the EAC Application/EIS.</p>
1596	434 - 7	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>Selection and rationale omits Chinook Salmon (<i>Oncorhynchus tshawytscha</i>). Chinook in the Strait of Georgia have shown many years of low returns and there is still uncertainty about their long term abundance. Given that Species-at-Risk designated Orcas depend on Chinook, populations of Chinook regardless of size need to be protected. Perhaps the project footprint will not directly impact their habitat but the alteration of mainstem flow in McNab Creek can impact adult and juvenile migration. Impacts to the foreshore caused by the flow from the pit could also impact the juveniles as they transit to the salt water. Chinook must also be included as a VC.</p>	<p>Chinook salmon was not included as a Valued Component (VC) for the following reasons:</p> <ul style="list-style-type: none"> <li>-Observations of chinook salmon within the LSA were infrequent.</li> <li>-The consideration of stream flow and water quality in relation to other salmonids would also speak to potential effects on chinook and their habitats.</li> </ul> <p>Rationale for the selection of VCs was provided in the Approved Application Information Requirements/EIS Guidelines and in Section 4.2 of the EAC Application/EIS.</p>
1597	434 - 8	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>Table 5.1-2 states Chinook have similar habitat needs to other species. The habitat requirements of Chinook salmon are not similar to that of other salmonids that are being considered in the assessment. Therefore the effects on anadromous Chinook salmon must be separately assessed of the other salmonid VC's.</p>	<p>The consideration of potential changes to broad habitat parameters including changes in stream flow and water quality are applicable to chinook salmon. During the freshwater component of their life history chinook salmon need adequate flows of clean well oxygenated water similar to other salmonid species .</p>

1598	434 - 9	Sunshine Coast Conservation Association	Sunshine Coast, BC	Table 5.1-2 states Steelhead have similar habitat needs to other species. Certainly they do coexist with both Coho and Cutthroat but Steelhead and in particular adults and parr have specific and limiting habitat preferences. On the South Coast Steelhead parr habitat is typically the limiting factor to their success. This habitat (boulder dominated riffles) is found along the project interface and should be included in any project risk analysis, and mitigation strategy.	Steelhead adults and parr are not commonly present within the LSA. The consideration of potential changes to broad habitat parameters including stream flow and water quality are applicable to steelhead. Consideration of stream flow and the avoidance of any baseflow reduction in McNab Creek is expected to address potential effects on steelhead in the McNab Creek mainstem.
1599	434 - 10	Sunshine Coast Conservation Association	Sunshine Coast, BC	The planned mining is within the historic alluvial fan and it should be assumed that alteration to the centre of this deposition will also have implication on the sections of this geomorphic feature surrounding the centre excavation. The upper boundary of this historic deposition should be the upper boundary of the LSA, thereby pushing the LSA closer to the confluence with Box Canyon Creek.	<p>The spatial boundaries for the Fisheries and Freshwater Habitat EA have been selected to take into account the physical extent of the Proposed Project and the physical extent of Project-related effects.</p> <p>The LSA was set to include the lower reach of the McNab Creek mainstream, which extends from its mouth upstream to the northern edge of the Project Area based on where the Project had the potential to affect stream flow.</p> <p>The RSA was set to include:</p> <ul style="list-style-type: none"> <li>-All mainstem reaches of McNab Creek and tributary catchments of the McNab Creek watershed; and</li> <li>- Marine intertidal and shallow subtidal habitat areas potential affected by Proposed Project activities.</li> </ul> <p>The RSA includes the confluence with Box Canyon Creek.</p>
1600	434 - 11	Sunshine Coast Conservation Association	Sunshine Coast, BC	"...the assessment of adverse Proposed Project effects on freshwater fish and fish habitat encompass three major Proposed Project phases, as defined in Volume 2, Part A - Section 2.0 of the EAC Application/EIS:" The SCCA was unable to locate Part A of Volume 2 on the BC Environmental Project Information Centre. (Sept. 23, 2016). A fourth "predevelopment" phase of assessment should be added to determine baseline populations of Salmonidae and their habitats (freshwater & marine).	<p>Volume 2 of the EAC Application/EIS (Sections 5.6 through 9.3) was posted to the BC EAO epic website on 2016/08/03 and is available at the link: <a href="http://a100.gov.bc.ca/appsdata/epic/html/deploy/epic_document_355_40820.html">http://a100.gov.bc.ca/appsdata/epic/html/deploy/epic_document_355_40820.html</a>.</p> <p>The pre-development phase of the Proposed Project was defined as the baseline for each discipline. The baseline for Marine Resources is presented in Section 5.2.4 of the EAC Application/EIS and is also provided in more detail in two appendices (Appendix 5.2-A and 5.2-B). The baseline for Fisheries and Freshwater Habitat is presented in Section 5.1.4 of the EAC Application/EIS and is also provided in more detail in one appendix (Appendix 5.1-A).</p>
1601	434 - 12	Sunshine Coast Conservation Association	Sunshine Coast, BC	Temporal boundaries are presumably timeframes for continued study. The idea that fish and fish habitat is examined only one-year post operations is unacceptable. A framework for documenting positive or negative change must be provided. This must be a meaningful, statistically robust, comparison that also provides options for additional compensation and/or restoration, resulting from unforeseen impacts. A detailed monitoring plan must be developed that uses predevelopment baseline, operations and post operations data to ascertain the impacts of effects of the project on the Salmonidae. This report must be publicly posted.	The temporal boundaries provided in the EAC Application/EIS for each discipline are not timeframes for contained studies, rather they are established for the assessment of adverse Proposed Project effects on Valued Components (VCs). A follow-up monitoring strategy for Fisheries and Freshwater habitat is outlined in Section 17.0 of the EAC Application/EIS. The timeframe and strategy for the monitoring of fish bearing watercourses potentially affected by the Proposed Project as well as the offsetting habitat will be established in consultation with Fisheries and Oceans Canada (DFO). This information will be provided in the Fisheries Act Authorization permit application. A draft of the monitoring plan for the offsetting habitat is provided in Appendix 5.1-B of the EAC Application/EIS and will be updated for the purposes of the Fisheries Act Authorization. Monitoring data will be compared to pre-development data collected for the purposes of the baseline program. Fisheries and Freshwater Habitat baseline data collected is outlined in Appendix 5.1-A of the EAC Application/EIS.

1602	434 - 13	Sunshine Coast Conservation Association	Sunshine Coast, BC	Base flows are reported as a net improvement over the life of the project. What appears to be missing is an instream flow assessment that looks at changes, positive or negative, on fish habitat, including migration and rearing. This assessment should present all possible scenarios and link clearly the surface water analysis to fish habitat (and impacts on amphibians) to the creation of the wetted pit. It is assumed that the net increase is an average over 12 months. How does this look monthly and during critical life history periods of each of the identified Salmonidae? A detailed instream flow assessment with appropriate surveys of channels cross sections and appropriate modelling should be provided.	Instream flow assessment (such as Physical Habitat Simulation (PHABSIM)) was not considered necessary for the assessment of Proposed Project effects on the McNab Creek mainstem and the majority of the foreshore groundwater-fed watercourses. This was because the groundwater and surface water modelling predicted small to moderate increases in baseflows that would lead to increases in wetted usable fish habitat areas. Predicted increases in baseflow would occur as groundwater influxes along the length of the watercourses. These influxes will follow the current seasonal flow regime.  The foreshore groundwater-fed watercourses are tidally influenced with daily fluctuations in both depth and velocity. The utility of habitat simulation modeling in these circumstances is questionable since the juvenile fish using the area tend to associate with pool habitat where wetted usable area is relatively unaffected by changes in flow. Consideration of spawning habitat is also questionable since spawning in groundwater-fed watercourses tends to be associated with zones of groundwater upwelling. Based on the predictions of the modelling, the amount of groundwater influx in the lower segment of WC 2 is predicted to increase by approximately 50% with creation of the pit lake.
1603	434 - 14	Sunshine Coast Conservation Association	Sunshine Coast, BC	Base flow conclusions are based on a model that assumes current area ground waters and the created off-channel WC2 draw base flow from the mainstem of McNab Creek. There are a lot of assumptions that hinge on the model being correct. Modelling of all possible outcomes and potential mitigative measures should be presented. What, for example, if the model is wrong and the base flows drop even for one season due to climate change? It would be expected that the operations of the mine cease until baseline conditions return and should be stated in the Spills & Emergency Response Plans.	A Water Management Plan is currently being prepared for inclusion in the Mines Act Permit Application (MAPA) and the Water Sustainability Act permit application. This plan will provide a long-term water management and monitoring strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. Throughout the operational phase of the Proposed Project the owner shall monitor the groundwater gradient and the water levels within the pit lake that were predicted through modelling. These monitored groundwater and pit lake water levels shall be used to refine the analysis of the closure groundwater gradient and pit lake water level. These analysis shall be used to inform the progressive planning of the mine. After closure, if necessary, the groundwater gradient can be altered (varying the rate of loss from McNab Creek) by adjusting the height of the weir at the outlet of the pit lake.
1604	434 - 15	Sunshine Coast Conservation Association	Sunshine Coast, BC	It was reported that few Steelhead were captured in McNab mainstem. Recent sampling for the upstream Box Canyon Hydro project has resulted in a significant number of juvenile Steelhead captured in the mainstem and habitats around Box Canyon Creek. In addition, spawning Steelhead were documented in Box Canyon in 2016. Potential effects on Steelhead (as noted earlier) should be included.	Steelhead adults and parr are not commonly present within the LSA. The consideration of potential changes to broad habitat parameters including stream flow and water quality are applicable to steelhead. Consideration of stream flow and the avoidance of any baseflow reduction in McNab Creek is expected to address potential effects on steelhead in the McNab Creek mainstem.
1605	434 - 16	Sunshine Coast Conservation Association	Sunshine Coast, BC	Section 5.1.4.2 downplays the population size and area importance of the remaining salmon and anadromous trout returning to McNab Creek. Rather than enumerating the average number of historic spawners, maximum historic numbers for each species given would be appropriate – e.g. 1,500 Chum and 3,500 Pinks were recorded in the escapement record for 1951.	Section 5.1.4.2 of the EAC Application/EIS considers accidents and malfunctions and may not be the correct section. Section 5.1.3.1 of the EAC Application/EIS speaks to historical salmon returns to McNab Creek. Reporting on average numbers of returning spawners is common practice as this provides more useful information about the productivity of the system. Reporting on maximum historical numbers is interesting, but without consideration of habitat availability and actual smolt production, may provide limited information regarding actual productivity of the system.

1606	434 - 17	Sunshine Coast Conservation Association	Sunshine Coast, BC	Recent numbers have been depressed (except Pink Salmon) and are likely the result of lower ocean survivals. The assessments and proposed design does not provide any assurance or mitigative suggestions to ensure that the quality and quantity of existing salmonid habitats remain in the Regional Study Area – McNab Creek.	The design of the Proposed Project avoids effects to the baseflows of McNab Creek. The Proposed Project design is predicted to result in increases to baseflow in all of the foreshore minor streams below the proposed pit lake except for WC 2. There will be direct and indirect losses of habitat in WC 2 associated with the Proposed Project. These losses will be addressed through the implementation of the Fish Habitat Offset Plan (Appendix 5.1-B of the EAC Application/EIS) that will create more salmonid habitat than will be affected by the Proposed Project. Approximately 500 m of groundwater-fed fish habitat will be lost as a result of the Proposed Project; the offset plan will create approximately 790 m of new groundwater-fed fish habitat. A multi-year monitoring program will be implemented to evaluate Proposed Project related effects predicted in the assessment and to evaluate the success of the Fish Habitat Offset Plan.
1607	434 - 18	Sunshine Coast Conservation Association	Sunshine Coast, BC	Indirect loss of salmonid habitat is actually reported. There seems to be some contradiction between sections. Earlier the document suggested there was a net increase and/or base flows will not change so habitat remains the same. There is no breakdown of how losses would occur and when. Clarification is needed.	Section 5.1.4.1.2.1.1 of the EAC Application/EIS provides a breakdown of direct (e.g., habitat loss) and indirect effects (e.g., baseflow) on fish habitat during construction. Similar breakdowns are provided for operations and closure. All of the direct losses of fish habitat will occur during construction. To address these effects BURNCO has committed to constructing the habitat offset extension prior to the loss of the upper section of WC 2 to reduce the potential for temporal loss in the potential productivity of the system.
1608	434 - 19	Sunshine Coast Conservation Association	Sunshine Coast, BC	Section 5.1.5.3.2 refers to the proposed approach during construction and follow-up. This is unclear. A monitoring program that includes typical construction and operations environmental parameters should be required. There should also be a robust monitoring program designed that compared VC's (Including Steelhead and Chinook) pre and post development in the expanded LSA and immediately outside the expanded LSA. In this case, expanded baseline data in McNab would be established before development, during operations (16 years), and then for a statistically appropriate period post operations.	<p>The proposed monitoring program for the Proposed Project will consist of two main components: compliance monitoring and effects monitoring. Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational EPPs as stated in Section 16.0 of the EAC Application/EIS. Compliance monitoring will include assessment of Proponent and contractors' environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program. Monitoring programs provide an opportunity for local community members and First Nations groups to be involved in the development and implementation of monitoring initiatives. This will be clearly defined within the final monitoring framework which will be developed for each of the areas described below. This is outlined as construction monitoring within Section 5.1.5.3.2 of the EAC Application/EIS. Additional details regarding compliance monitoring of Fisheries and Freshwater Habitat is provided in the Fisheries Habitat Protection and Mitigation Plan outlined in Section 16.2.2.6 of the EAC Application/EIS. This plan will be further developed for the Fisheries Act Authorization application.</p> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks. The effects monitoring strategy for Fisheries and Freshwater Habitat is outlined in Section 17.0 of the EAC Application/EIS as the follow-up monitoring strategy. The effects monitoring strategy will outline the requirements for the monitoring of fish bearing watercourses potentially affected by the Proposed Project as well as the offsetting habitat and will be established in consultation with Fisheries and Oceans Canada (DFO). This information will be provided in the Fisheries Act Authorization. A draft of the monitoring plan for the offset habitat is provided in Appendix 5.1-B and will be updated for the purposes of the Fisheries Act Authorization. Monitoring data will be compared to pre-development data collected for the purposes of the baseline program. Baseline data collected with respect to Fisheries and Freshwater Habitat is outlined in Appendix 5.1-A.</p>

1609	434 - 20	Sunshine Coast Conservation Association	Sunshine Coast, BC	In addition to the environmental monitor preparing and submitting to FLNRO and to DFO regular environmental monitoring reports documenting construction activities, effectiveness of mitigation measures, incidents, non-compliant events, corrective action taken and photograph documentation during construction, reports shall also be submitted during operation of the mine.	<p>An outline of the environmental management program for the Proposed Project, including information regarding environmental monitoring and reporting, is provided in Section 16.0 of the EAC Application/EIS.</p> <p>The purpose of the Environmental Management Program is to assist BURNCO and its contractors in adhering to applicable environmental legislations and Proposed Project Commitments and Assurances specified in the EAC Application by providing performance-based environmental requirements, standard protocols, and mitigation measures to avoid and reduce the potential for environmental effects throughout the Proposed Project. Effective planning and application of Construction and Operational Environmental Management Programs through the implementation of Construction and Operational Environmental Management Plans (CEMP and OEMP) will reduce the potential for adverse environmental effects.</p>
1610	434 - 21	Sunshine Coast Conservation Association	Sunshine Coast, BC	Further and in accordance with the recent revisions to the fisheries protection provisions of the Fisheries Act; in the event of a non-compliant incident during construction and/or operation the monitor must immediately contact DFO's Observe, Record and Report and then report the non-compliant incident to the BC Environmental Assessment Office.	The comment is in line with the mitigation strategy for Fisheries and Freshwater Habitat. As stated in Section 5.1.5.3.2.1 and 16.2.2.6 of the EAC Application/EIS "In accordance with the recent revisions to the fisheries protection provisions of the Fisheries Act; in the event of a non-compliant incident the monitor will contact DFO's Observe, Record and Report (ORR) line (1-800-465-4336) and report the incident."
1611	434 - 22	Sunshine Coast Conservation Association	Sunshine Coast, BC	We challenge the statements that 'Residual Effects' to fish habitats are low. The proponent states there is a potential to impact habitats through surface water change, coupled with only modelled data. The risk can not be low; at the very least it should be moderate.	<p>The conclusion that effects to fish and fish habitat will be low are based on the following:</p> <ul style="list-style-type: none"> <li>- the baseline data collected</li> <li>- the modelled predictions</li> <li>- commitment to monitor surface water levels</li> <li>- commitment to monitor the groundwater gradient</li> <li>- commitment to adaptively manage the extent of the excavation and design of the pit lake in response to monitoring information</li> </ul> <p>With the implementation of the Fish Habitat Offset Plan (Appendix 5.1-B of the EAC Application/EIS) it is expected that the amount of available salmonid habitat will be increased from existing conditions.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
1612	434 - 23	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>As stated on page 1, the SCCA challenges the statement that the net residual effects for anadromous and resident fish are negligible. The premise that there are negligible effects is based on the creation of new habitat and that the base flows remain unchanged. In the event the model is flawed, the potential to impact migrating adult and juvenile salmonids is high. In the event the base flows become lower/higher through piping, avulsions, dyke failure or dam failure, the impact to rearing and spawning habitats become high.</p> <p>It should be noted that the calculations and opinions are based on the proponents' LSA; it should be based on the extended LSA which would include the entire historic alluvial fan.</p>	<p>The conclusion that effects to fish and fish habitat will be low are based on the following:</p> <ul style="list-style-type: none"> <li>- the baseline data collected</li> <li>- the modelled predictions</li> <li>- commitment to monitor surface water levels</li> <li>- commitment to monitor the groundwater gradient</li> <li>- commitment to adaptively manage the extent of the excavation and design of the pit lake in response to monitoring information</li> </ul> <p>With the implementation of the Fish Habitat Offset Plan (Appendix 5.1-B of the EAC Application/EIS) it is expected that the amount of available salmonid habitat will be increased from existing conditions.</p> <p>The LSA was set to include the lower reach of the McNab Creek mainstream, which extends from its mouth upstream to the northern edge of the Project Area based on where the Project had the potential to affect stream flow.</p> <p>The RSA was set to include:</p> <ul style="list-style-type: none"> <li>-All mainstem reaches of McNab Creek and tributary catchments of the McNab Creek watershed; and</li> <li>- Marine intertidal and shallow subtidal habitat areas potential affected by Proposed Project activities.</li> </ul> <p>The RSA includes the confluence with Box Canyon Creek.</p>
1613	434 - 24	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>Appendix 5.1-A</p> <p>The lack of mainstem sampling (electrofishing in particular) is questioned. It is our understanding that the mainstem MC 1 through 5 were sampled only in 2010. There is a conclusion here and elsewhere that Steelhead impact is negligible because of the lack of fish in the system. If this conclusion is only based on one year of sampling, this is inadequate. Baseline should have been repeated along the LSA and into the Regional Study Area (RSA) over a longer time period.</p>	<p>Using potentially lethal techniques such as electrofishing to reconfirm fish presence when low numbers have already been identified was determined to be inappropriate. The risk to the resource outweighed the need for additional confirmation of presence. Proposed Project design and mitigation measures incorporated a conservative approach and included the potential for low numbers of steelhead to be present in the system. Mitigation measures included design elements (e.g., extent of pit) that avoided reductions in McNab Creek baseflows where steelhead are known to be present. The lack of potential residual effects as a result of the implementation of mitigation measures, rather than a lack of steelhead, is what supports a determination of negligible impact.</p>
1614	434 - 25	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>There was no sampling conducted in January or February of any year in the mainstem, for example. At the least this and instream flow assessments must be conducted to determine Salmonidae presence and requirements.</p>	<p>Please see above response. Winter sampling of salmonid populations tends to be unreliable and with the possibility of eggs being present in the gravel it was not considered appropriate. The movement of salmonids into overwintering habitat (deep pools or interstitial spaces within the substrate) is well documented. Lower temperatures and lower metabolic rates reduce movements and feeding. Lower temperatures also limit the effectiveness of electrofishing for population estimation.</p>
1615	434 - 26	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>Trap data show limited smolt catches in the mainstem. An alternative method would have made more sense and may have increased success, such as a Rotary Screw in the upper areas above the lower depositional area, or fixed channel traps in the lower reaches of the mainstem. Fyke nets, while effective in the right areas (intertidal) provide limited catch data for larger smolts (Steelhead and Cutthroat).</p>	<p>Smolt sampling in the McNab Creek mainstem was conducted to identify and compare smolt migration in relation to smoltification in WC 2. It was not attempting to provide a population estimate for McNab Creek. It is true that other methods could have been used but the methods used are considered adequate for the purpose intended.</p>

1616	434 - 27	Sunshine Coast Conservation Association	Sunshine Coast, BC	The baseline should provide a robust and statistically significant study of pre and post development. This requires multiple years' pre and post data.	That is true to a degree, however, salmonid populations tend to be highly variable and the freshwater portion of their lifecycle is not the only time when density dependent and/or density independent factors may impact their survival. In spite of this, BURNCO will implement a multi-year environmental effects monitoring program to evaluate the accuracy of predicted potential effects on fish and fish habitat.
1617	434 - 28	Sunshine Coast Conservation Association	Sunshine Coast, BC	There was no effort to enumerate adult migrating anadromous Cutthroat and Steelhead. Both species migrate past the LSA to the upper reaches. This data would provide evidence for determination of VC's.	It is known that both steelhead and cutthroat trout are present in the McNab Creek mainstem. Both anadromous and resident cutthroat were selected as Valued Components (VC) based on their presence in the LSA and potential for being affected by the Project. Steelhead were known to be infrequently present in the LSA as they migrate past the area to upstream reaches in the watershed. The potential for interaction between steelhead and Proposed Project activities was considered small therefore steelhead were not selected as a VC.
1618	434 - 29	Sunshine Coast Conservation Association	Sunshine Coast, BC	Instream flow assessment using potential changes in base flow to model habitat changes and channel connectivity must be incorporated.	Instream flow assessment (such as Physical Habitat Simulation (PHABSIM)) was not considered necessary for the assessment of Proposed Project effects on the McNab Creek mainstem and the majority of the foreshore groundwater-fed watercourses. This was because the groundwater and surface water modelling predicted small to moderate increases in baseflows that would lead to increases in wetted usable fish habitat areas. Predicted increases in baseflow would occur as groundwater influxes along the length of the watercourses. These influxes will follow the current seasonal flow regime.  It is true that the loss of the upper segment of WC 2 will lead to a reduction in surface water flow entering the lower segment of WC 2. The reduction in surface flow was predicted to lead to a 116 m2 reduction in average wetted area which was considered as habitat loss and will be addressed through the implementation of the habitat offset. The lower segment of WC 2 is tidally influenced with daily fluctuations in both depth and velocity. The utility of habitat simulation modeling in these circumstances is questionable since the juvenile fish using the area tend to associate with pool habitat where wetted usable area is relatively unaffected by changes in flow. Consideration of spawning habitat is also questionable since spawning in groundwater-fed watercourses tends to be associated with zones of groundwater upwelling. Based on the predictions of the modelling, the amount of groundwater influx in the lower segment of WC 2 is predicted to increase by approximately 50% with creation of the pit lake.
1619	434 - 30	Sunshine Coast Conservation Association	Sunshine Coast, BC	Appendix 5.1-B A plan was developed to address loss of WC2 (the DFO Channel) and the footprint of the loading facility. The approach adopted to address the loss of WC2 (the compensation channel) was to develop a new area of off channel and "hard" habitat located in the in marine near shore. The marine offset plan requires more supporting information and the very small areas proposed should be enlarged.	The Fish Habitat Offset Plan provided in Appendix 5.1-B of the EAC Application/EIS was developed to address the loss of the upper segment of WC 2 (and associated baseflow effects) as well as the loss of intertidal and subtidal habitats as a result of installation of the piles for the barge load-out jetty. To offset the loss of the upper segment of WC 2, a new extension of the lower segment of WC 2 has been proposed as outlined in Appendix 5.1-B of the EAC Application/EIS.  For the loss of habitat in the foreshore portion of the LSA, a total of 18 pilings, 42 cm in diameter will be installed (Figure 5.1-4) for the barge load-out jetty. The direct fish habitat loss associated with their installation is estimated to be less than 5 m2. The narrow width (< 2 m), height above the water (> 5m) and orientation (North/South) of the conveyer structure indicate that it is unlikely to cause any shading effects on intertidal or shallow subtidal habitats. To address the residual effects in the marine foreshore area, BURNCO is proposing to construct approximately 10 m2 of hard substrate intertidal habitat attached to the pilings supporting the conveyer system across the foreshore.  The Fish Habitat Offset Plan will be further refined in consultation with Fisheries and Oceans Canada (DFO) and other stakeholders for the purposes of the Fisheries Act Authorization.

1620	434 - 31	Sunshine Coast Conservation Association	Sunshine Coast, BC	The SCCA is concerned with the long-term viability of any constructed channel. In the event that the off channel is accepted, there should be a legal, long-term commitment to maintain the channel for numerous years post operations. The failure rate of created off-channels is high. In most cases, this is a result of proponents meeting their post construction commitments, and then ceasing to maintain the habitats, which leads to channel failure. This is a significant concern with the proposed offset proposal but can be rectified by a long-term legal commitment.	BURNCO expects that a multi-year monitoring program and letter of credit (to address monitoring and repair of the proposed habitat offset) will be a requirement of the Fisheries Act authorization. BURNCO will comply with these regulatory requirements.
1621	434 - 32	Sunshine Coast Conservation Association	Sunshine Coast, BC	Hydrostratigraphy (Sec 5.6.4.3) The consultants state that the hydrogeological properties of a possible fault structure within the bedrock that may parallel McNab Creek valley is not known. Further they note that "...the hydrogeological significance of this fault structure, if it exists, would only be high relative to the groundwater flow system in the valley fill aquifer if it is laterally continuous, highly permeable and of considerable width." The properties should be evaluated to determine the significance of this geological structure.	The closest fault structures mapped near the project are on Gambier Island and Anvil Island approximately 5 km towards the south and south east, and near Foulger Creek and Woodfibre Creek approximately 12 km towards northeast (iMapBC online database). The database does not contain any mapped fault structures in the McNab Creek valley. Although their existence cannot be ruled out, it is likely that if a laterally extensive and wide structure existed in this area, it would have been identified during previous mapping efforts. Potential contribution from minor fault structures or fractured rock zones have been included in the hydrogeological model, and the model sensitivity analyses showed that model predictions are much less sensitive to groundwater contribution from bedrock compared to groundwater fluxes in the shallow unconsolidated sediments. This is expected, as these shallow sediments are in the direct hydraulic connection to McNab Creek and are significantly more permeable than any structures that may exist at depth in bedrock.
1622	434 - 33	Sunshine Coast Conservation Association	Sunshine Coast, BC	Project – VC Interactions (Sec 5.6.5.1) Although project – VC Interactions are identified there is no recognition that probable climate changes have the ability to affect groundwater flows during the lifetime of the proposed project. Further studies prior to construction must be conducted to prepare for these effects.	Climate change would affect the flows in McNab Creek and the losses from McNab Creek under current conditions (i.e., no mining). As presented in Appendix 5.6-D of the EAC Application/EIS, seepage losses from McNab Creek are predicted to reduce during mining after blockage of the upper portion of the groundwater channel (WC2) and gradually become close to baseline conditions in the later years of the Project. Additional modelling has shown that, for example, under different climate conditions that might be associated as well with climate changes (extended periods of dry weather or intense precipitations) the current baseline conditions would still result in more losses from McNab creek than if mining were to occur during the same period.
1623	434 - 34	Sunshine Coast Conservation Association	Sunshine Coast, BC	Operations (Sec 5.6.5.2.1.2) The water removed from groundwater during operations to provide make-up water to the wash plant is identified as representing a reduction in groundwater flow. The effect of this water on surface water flow needs to be further accounted for.	As described in Section 5.6.5.2.1.2 of the EAC Application/EIS, during operations, the groundwater water well installed during construction will be pumped to provide make-up water to the wash plant at a rate of approximately 160 m3/day. This water will be removed from groundwater and represents a reduction in groundwater flow. Although groundwater flow will be affected near the well, which will be installed near the wash plant, it represents less than 0.3 % of the total groundwater flow through the valley deposits and as such will have negligible effect to overall groundwater and surface water flow. Table 5.6-6 of the EAC Application/EIS presents the predicted effects to groundwater flow as a result of the aggregate mining and the pumping of the water well. This reduction in groundwater flow was included in the assessment of surface water baseflows and is presented in the Appendix 5.6-A and 5.6-D of the EAC Application/EIS.
1624	434 - 35	Sunshine Coast Conservation Association	Sunshine Coast, BC	Mitigation (Sec 5.6.5.3) It is stated that "Monitoring of the groundwater flow rates, hydraulic heads and quality will be conducted during construction and reclamation and closure". Monitoring must also be conducted through the operations phase should this project be approved	A Water Management Plan, prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. Throughout the operational phase of the project the owner shall monitor the groundwater gradient and the water levels within the pit lake. These monitored groundwater and pit lake water levels shall be used to refine the analysis of the closure groundwater gradient and pit lake water level. These analysis shall be used to inform the progressive planning of the mine. After closure, if necessary, the groundwater gradient can be altered (varying the rate of loss from McNab Creek) by adjusting the height of the weir at the outlet of the pit lake.

1625	434 - 36	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>Conclusions (Sec 5.6.6)</p> <p>More details need to be provided in the assertion that the quality of the groundwater resulting from the wetted pit and entering the down slope waterways during operations will not be compromised and negatively affect the ecosystems.</p>	<p>As stated in section 5.6.6 of the EAC Application/EIS, the significance of potential effects to groundwater flow and groundwater quality through construction, operations, and reclamation and closure are considered negligible – not significant. The assessment of significance used an approach that was conservative in nature so that there is a high level of confidence that the Proposed Project-related effects have not been underestimated. Effects to groundwater quality are considered to be negligible – not significant; no water quality parameters are predicted to exceed BCWQG or CCME guidelines throughout operations and reclamation and closure. A Water Management Plan, was prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, and provides a more detailed plan for surface water quality monitoring than the conceptual plan proposed in the EA. Regular surface water quality monitoring in minor creeks and McNab Creek during the mine life is proposed in the Water Management Plan, consistent with the EA. These waterbodies represent the downstream receiving aquatic environment. A direct surface connection between the pit lake and the receiving environment is not expected during operations; it will only be established at closure when the constructed offset habitat is connected to the pit lake. At that time, pit lake water will be monitored to confirm the prediction made in the assessment that pit lake water does not represent a deleterious substance and would be unlikely to cause pollution in the downstream receiving environment.</p> <p>If mine-related changes in surface water quality during the mine life consistently exceed provincial and federal water quality guidelines and concentrations can be distinguished from the baseline conditions, then biological monitoring will be triggered to determine if these changes have impacted aquatic resources in the downstream receiving environment. Relevant groundwater data will be reviewed as part of the adaptive management process. Further details are provided in the Water Management Plan.</p>
1626	434 - 37	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>Technical Boundaries (Sec 5.5.3.2)</p> <p>It is noted that the assessment of the Proposed Project's potential effects and residual effects on base flow and extreme low flow were based on numerical modelling with limited calibration. It is also noted that the proponent plans to continue monitoring site conditions (presumably groundwater and surface water) and to recalibrate the model as the project progresses. This technical boundary must be dealt with before the project begins. If the project is approved before this is resolved, then re-calibration of the model as the project progresses must be made a mandatory condition of the environmental certificate. Changes to the water balance model and water management practices resulting from the re-calibration must be communicated immediately to the BC Assessment Office and DFO.</p>	<p>BURNCO defers to the BCEAO on potential conditions of environmental assessment certification.</p> <p>During the operational phase of the Project the water level in the pit will be monitored but not be actively managed. Mining operational activities will need to accommodate fluctuations in the Pit Lake water levels. The owner shall monitor the groundwater gradient and the water levels within the pit lake. These monitored groundwater and pit lake water levels shall be used to refine the water balance model and analysis of the closure groundwater gradient and pit lake water level. These analysis shall be used to inform the progressive planning of the mine. Changes to the hydrogeologic water balance model results and any resulting recommended changes to the mine plan shall be communicated to the regulatory authority. After closure, if necessary, the groundwater gradient can be altered (varying the rate of loss from McNab Creek) by adjusting the height of the weir at the outlet of the pit lake.</p>

1627	434 - 38	Sunshine Coast Conservation Association	Sunshine Coast, BC	The consultants correctly recognize the limitations of the climate and hydrological baselines conditions used because they were largely based on available long term regional data as there was limited local data. The use of the Water Survey Canada (WSC) hydrometric station located at Chapman Creek above Sechelt is troubling as it does not provide current data and that watershed has a distinctively different climate regime; therefore the water flows are expected to be different. Further hydrological studies should be conducted on McNab Creek directly to determine baseline conditions throughout the year which then need to be entered into the model.	It is recommended that flow monitoring on McNab Creek be carried out throughout the operational phase of the project. This will be detailed in the Water Management Plan that will be provided during the Water Sustainability Act permitting process.
1628	434 - 39	Sunshine Coast Conservation Association	Sunshine Coast, BC	Changes in Surface Flows (Sec 5.5.5.2.1.) The statement that "The extent of the proposed pit will be re-evaluated if the calibrated and refined results suggest that a negative impact to aquatic habitat in McNab Creek is anticipated" must be a condition of the environmental certificate should the project be approved.	BURNCO defers to the BCEAO on potential conditions of environmental assessment certification.
1629	434 - 40	Sunshine Coast Conservation Association	Sunshine Coast, BC	Although increased baseline flows in McNab Creek as a result of operations and reclamation/closure can be viewed as a positive as it would resume creek flow during current summer "droughts", the same can not be concluded for the lower segments of WC2 and the Minor Foreshore Streams. The benefit/harm needs to be evaluated against the individual fish species requirements of each waterway. Increased flow and wetted area are not suitable evaluations. It is not understood, for example, how a predicted increase of 53% in the closure phase of base flow in the Minor Foreshore Streams can be evaluated as positive to the fish and fish habitats.	The predicted changes to baseflows in each of the foreshore minor streams are provided in Table 5.5-15 of the Surface Water Resources Section of the EAC Application/EIS. The estimates are provided as m3/day. When these values are converted into m3/second the changes to baseflow are minor. Increases in average depth are predicted to be < 2.8 cm and are presented in Table 5.5-17 of the EAC Application/EIS. These watercourses are low gradient (<1%) and influenced by tidal backwatering. The additional baseflow will be provided as increased groundwater upwelling that will enter the watercourses along their length rather than at one location. The additional baseflow will cause minor increases to average water depth or water velocity. Fish species using these habitats are adapted to a range of changing depths and velocities associated with the tidal fluctuation (e.g., backwatering). The additional baseflow is also not expected to cause additional scouring or erosion as the watercourses are currently influenced by daily changes in depth and velocities associated with the tidal fluctuations. The small amounts of additional wetted area that will be provided by the increased baseflow are considered positive as it will lead to a minor increase in the amount of available fish habitat. The additional upwelling of groundwater will also increase water movement and exchange through the gravels present in the substrate of these channels.
1630	434 - 41	Sunshine Coast Conservation Association	Sunshine Coast, BC	Climate change modeling elsewhere in the document has indicated an increase in extreme events, increased intensity of rainfall and increased periods of drought. Such events and conditions must be evaluated in the model and appropriate plans created before the Project were to begin.	It is not anticipated that climate change will have a significant effect on the findings of the study during the operation phase of the Project. Provision for climate change will be included in the design of Project components which will remain after the closure such as the McNab Creek Flood Control Dike, the Pit Lake Containment Berm and the Pit Lake Spillway.
1631	434 - 42	Sunshine Coast Conservation Association	Sunshine Coast, BC	Not stated in this Section is how the evaporation loss from a 30 ha wetted pit versus the evapotranspiration of the initial vegetation cover is considered in the water model.	The hydrogeological modelling and analysis conducted for the Project is presented in Part G, Section 22, Appendix 5.6-D of the EAC Application/EIS.  Confirming that increased evaporation resulting from the change in pit lake surface area was incorporated into the model. Specified flux boundary that represents recharge to groundwater from precipitation was automatically adjusted during model simulation in the area of the pit lake for increased evaporation at each phase of mine development.

1632	434 - 43	Sunshine Coast Conservation Association	Sunshine Coast, BC	With respect to the reduced base flow in WC2 during the proposed project operations it should be stated that they are projected to have negative potential effects. Further, it needs to be stated how the proponent will deal with this expected impact on the Salmonidae and their habitats	The potential effects of a reduction in baseflow in the lower segment of WC 2 on fish species is assessed in Fisheries and Freshwater Habitat Section 5.2 of the EAC Application/EIS. The predicted change in wetted area is identified as a reduction in available habitat that is documented in the habitat balance provided. This reduction is also identified in the habitat offset plan (Appendix 5.1-B of the EAC Application/EIS). The habitat offset plan is designed to address both the direct physical loss of habitat in the upper section of WC 2 and the indirect reduction in habitat associated with a reduction in baseflow entering the lower section of WC 2.
1633	434 - 44	Sunshine Coast Conservation Association	Sunshine Coast, BC	If the proposed project is accepted there must be a legal long-term commitment to monitoring and maintenance of the relocated compensation channel for numerous years post operations. Monitoring for more than 1-year post closure and reclamation of the McNab Creek and the Minor Foreshore Streams must also be committed to.	Habitat offset monitoring will be conducted for the offset habitat to confirm that habitat offset measures outlined in the Habitat Offset Plan are followed and to assess the functionality of the offset habitat over the long-term. The habitat will be monitored upon completion of construction and an initial monitoring report with as-built drawings will be provided to regulatory agencies. The initial monitoring report will confirm whether the construction of the offset habitat meets the performance criteria outlined in the Habitat Offset Plan. The offset habitat will then be monitored during years 1, 2, 3 and 5 (if necessary) and monitoring reports will be provided to regulatory agencies. If the long-term performance objectives of the offset habitat are not being met, regulators will be consulted to identify appropriate remediation measures. The Fish Habitat Offset Plan is provided in Volume 4, Part G - Section 22: Appendix 5.1-B. Additional details of the habitat offset monitoring will be provided in the Fisheries Authorization permit application.  In addition, fish habitat and fish community within the fish-bearing streams of the LSA will be monitored to determine if there are any measurable changes to fish habitat structure and function. This is described in Section 17.4 of the EAC Application/EIS.

1634	434 - 45	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>In order to comply with Sec 38(4) of the Fisheries Act R.S.C 1985, a survey specific to intertidal spawning forage fish (winter and summer Surf Smelt and Pacific Sand Lance) needs to be conducted across the entire intertidal area. The habitat survey must be conducted according to current forage fish sampling protocols. It is recognized that forage fish are a cornerstone of the marine food web.</p> <p>Forage fish make up a minimum of 50% of the diet of adult Coho salmon and Pacific Sand Lance &amp; Herring comprise 72% of an adult Chinook salmon's diet. Larval and juvenile Sand Lance form a major portion of a juvenile Chinook's diet. Chinook salmon, in turn, are a major food source for the SARA identified South Coast population of Orcas.</p>	<p>Surf smelt (<i>Hypomesus pretiosus</i>) tend to spawn on gravel and sand beaches near the high tide line, where overhanging vegetation is present ((Schaefer 1936, Penttila 1995). The timing of spawning is variable with different stocks spawning during summer, winter or year-round. Summer spawning of surf smelt requires overhanging canopies of trees growing in the backshore to shade eggs during the summer incubation period (Penttila 2002; Rice 2006). Overhanging riparian vegetation in the intertidal zone of the LSA is limited. Pacific sand lance (<i>Ammodytes hexapterus</i>) live near the shore year-round and spawn on sand or pebbled beaches in the mid to upper intertidal zone during the winter (November–February), often using the same beaches as the surf smelt (Schaefer 1936, Penttila 1995).</p> <p>Both surf smelt and pacific sand lance tend to spawn on beaches dominated by fine gravel and course sand. They do not tend to spawn on beaches with abundant fine sediment. The shoreline of the LSA has fairly extensive and productive salt marsh cover. The fine sediments associated with this salt marsh habitat is unlikely to support surf smelt or Pacific sand lance spawning in these areas.</p> <p>Given the unfavorable habitat conditions presently available in the subtidal areas of the marine Proposed Project footprint due to wood debris and the lack of suitable herring spawning habitat (e.g., eelgrass, understory malcroalgae, and canopy kelp) the potential for herring spawning to be affected by the Proposed Project was considered unlikely.</p> <p>If required by regulatory agencies, an intertidal forage fish spawn survey could be conducted in accordance with standard forage fish egg sampling procedures (Moulton and Penttila 2001) prior to the start of the piling program. Additional mitigation that might be implemented during construction to manage adverse impacts on spawning areas includes limiting machine access and avoiding grounding within the mid and upper intertidal zone.</p> <p>Moulton, L.L. and D. Penttila. 2001. Field manual for sampling forage fish spawn in intertidal shore regions. San Juan County Forage Fish Assessment Project. 23 p.</p> <p>Penttila, D. 1995. 1641	434 - 52	Sunshine Coast Conservation Association	Sunshine Coast, BC	The other drawback to the protocol is in examining data only to 2010, 2015 was the warmest year on record in the world and 2016 is expected to surpass that record. Including data from 2010-2015 in the Gower Pt records would undoubtedly show an increased trend for a warmer and drier climate. It would indicate that climate change is already occurring and that should be noted in the report.	Meteorological conditions such as rainfall and temperature are expected to vary from year to year. This year to year variation is expected to be much greater than the longer term trends. The statistical analysis of the climate normal data (30 year dataset) from the Gibsons Gower Point station indicated that there were statistically significant changes (increases) in temperature and a decrease in precipitation in summer.
1642	434 - 53	Sunshine Coast Conservation Association	Sunshine Coast, BC	Project Considerations due to a Changing Climate (Sec 5.8.5.4) Given that the National Oceanic & Atmospheric Administration has confirmed that 2015 had the warmest average surface temperatures on the planet and that the consultants' own modeling predicts a warmer but wetter future at the projected project site, and has produced a Table (5.8-7) with specific climate factors, the SCCA disagrees with the statement that "Only Proposed Project components during the reclamation and closure phase could be affected as climate change will take many years to occur." The likelihood of climate infrastructure interactions occurring as early as the construction phase is high and the project should be designed to meet these changing conditions.	Meteorological conditions such as rainfall and temperature are expected to vary from year to year. Furthermore, the seasonal variability (e.g. differences between summer and winter for example) likely to be experienced at the Proposed Project site are greater than the projected change in climate in the near-term. Infrastructure will be designed to the current best practices and codes, which include allowances for the range of seasonal conditions. The inter-annual variability is important, however, in the short-term (e.g., during construction) changes due to seasonal variability will be more dominant. The range of temperatures between summer and winter is much greater than the increase in temperature from projected climate change in the near-term. Since construction activities will occur in the next few year, considerable climate-infrastructure interaction impacts from climate change are not expected.
1643	434 - 54	Sunshine Coast Conservation Association	Sunshine Coast, BC	Climate Risk Matrix (Table 5.8-8) As per arguments above that a base climate station was chosen with much reduced precipitation records, and did not include the last 5-6 years of climate data, this skews not only the arrival of climate change but also the extent of potential interactions with the project. The description of potential interactions with climate change across all phases of the proposed project is challenged with the exception of reclamation and closure. It is agreed that "For example, future changes in temperature, rainfall and storm events may impact the rate at which the aggregate pit refills with water" and that "Changes to climate may impact species found in the area." Revised modelling would likely prove that these changes would arrive much earlier in the life of the proposed project.	According to Environment Canada "Climate Normals and Averages are used to summarize or describe the average climatic conditions of a particular location. At the completion of each decade, Environment Canada updates its Climate Normals for as many locations and as many climatic characteristics as possible." (Government of Canada. 2014. Canadian Climate Normals. Electronic resources. <a href="http://climate.weather.gc.ca/climate_normals/index_e.html">http://climate.weather.gc.ca/climate_normals/index_e.html</a> ). At the time of the assessment the most up-to-date climate normal datasets generated by Environment and Climate Change Canada were for the 1981 to 2010 period. These datasets were used in the assessment.

1644	434 - 55	Sunshine Coast Conservation Association	Sunshine Coast, BC	Project Considerations due to Changing Climate (Sec. 5.8.5.4) Although it is stated that the "Proposed Project will consider the potential for climate factors such as extreme weather events, increased precipitation and temperatures, while designing Proposed Project infrastructure to minimize potential impacts of a changing climate on the Proposed Project", there is no reference to specifics, which should be included.	Infrastructure will be designed to the current best practices and codes, which include allowances for the range of seasonal conditions.
1645	434 - 56	Sunshine Coast Conservation Association	Sunshine Coast, BC	The effects of increased drought, changes in rainfall patterns and extreme weather events must be considered not only in the context of infrastructure interactions but also on impacts of Salmonidae (and other wildlife). Mitigation plans and Spill Response & Emergency Plans must be specifically developed prior to the construction of any kind to deal with the possibility of failure in the models caused by weather events thereby ensuring that there is no harm to fish and fish habitat caused directly or indirectly by the proposed project.	<p>In order to groundtruth the expected result of the groundwater model, BURNCO will monitor the groundwater gradient and the water levels within the pit lake throughout the operational phase. These monitored groundwater and pit lake water levels will be used to to inform the progressive planning of the mine and to refine the analysis of the closure groundwater gradient and pit lake water level. After closure, if necessary, the groundwater gradient can be altered (varying the rate of loss from McNab Creek) by adjusting the height of the weir at the outlet of the pit lake.</p> <p>A consequence analysis regarding the Pit Lake Containment Berm as well as the McNab Creek Flood Protection Dyke are currently being conducted and will be submitted with the Mines Act Permit Application (MAPA). This analysis will consider the potential effects on fish and fish habitat in the downstream environment. In addition, an assessment of the loss of containment of the Pit Lake on fisheries and freshwater habitat was presented in the EAC Application/EIS in Section 5.1.5.4.2.2.</p> <p>A Spill Prevention and Emergency Response Plan as a well as a Emergency Response Plan will be developed for the Proposed Project. An outline of these plans is presented in Section 17.0 of the EAC Application/EIS.</p>
1646	434 - 57	Sunshine Coast Conservation Association	Sunshine Coast, BC	In addition to the SCCA's concerns regarding fish and fish habitat, Glass Sponge Reefs have recently been discovered in Georgia Strait and Howe Sound. The unique, rare and "at risk" animals have been recognized by DFO with mandatory fishing closures around some of the reefs. The provincial government also recognized their global importance with the expansion of Halkett Marine Park (2016) at the southern tip of Gambier Island to protect the animals discovered there. Thorough surveys must be completed to determine their presence within 200m of the land-based project area and proposed barging route.	Comprehensive surveys for glass sponges were conducted within the subtidal footprint of the Proposed Project, including within 200 m of all marine infrastructure. This included systematic dive and towed video surveys in the depth ranges corresponding with known sponge reef occurrences in Howe Sound. No glass sponges were recorded during these surveys. The closest known individual glass sponges to the Proposed Project site are located on a subtidal rock wall (49.33.55 N, 123.22.66 W) approximately 1 km to the east of the barge load-out jetty, or approximately 100 to 150 m east of the outlet of McNab Creek (on the east side of the estuary), in water depths around -25 m depth chart datum (CD). This site is located within the Marine Resources LSA and RSA. The closest known sponge reefs (i.e., bioherms) to the BURNCO site are on the north side of the eastern Defence Island (49.34.67 N, 123.16.26 W - west side of Porteau sill, ) in water depths between -28 m and -35 m (CD). This site is approximately 9 km east of the proposed barge load-out jetty, and is located outside the Marine Resources LSA but within the RSA. The closest known sponge reefs to the proposed barging route occur at the entrance to Howe Sound (west of Passage Island in Queen Charlotte Channel), where two known sponge reef sites directly overlap with the proposed barging route in water depths ranging from -40 m to -120 m depth (CD). Both of these sites are located in the Marine Resources LSA and the RSA. Within Howe Sound, the proposed barging route also passes within 990 m of a known sponge reef in Ramillies Channel (in water depths of -20 to -30 m CD); as well as within 574 m of a known sponge reef in Thornbrough Channel (in-water depths of -150 to 160 m CD). Both sites are located outside the Marine Resources LSA but within the RSA.

1647	434 - 58	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>In conclusion, the SCCA disagrees with the current environmental impact assessment that the proposed Project will have negligible effects on Salmonidae and their habitats. It is our belief that the proponent's assessment is premature. At the least the following actions should be taken to create a more robust assessment:</p> <p>The baseline surveys of specific habitat requirements for of each of the salmon species (including Cutthroat and Steelhead Trout) need to be determined for each species' life cycle and across runs of different years in both freshwater and nearshore marine habitats. In addition, the water balance model based in part on the historic water flows of Chapman Creek (which had a different climate regime than McNab Creek is currently experiencing) should be calibrated with direct water flow measurements recorded over a number of years from McNab Creek itself to determine baseline conditions. Thirdly, it must be recognised that the meteorological effects of climate change are occurring now and must be factored into the water balance model and the climate infrastructure interactions with respect to fish and fish habitat.</p>	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities. Specific issues have been responded to above.
1648	435 - 1	Valori McKay	Lions Bay, BC	I live on Howe Sound and recreate in and on the waters.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1649	435 - 2	Valori McKay	Lions Bay, BC	I oppose the loss of environment the gravel mine will create and the danger that increased shipping will cause to wildlife and humans both.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

1655	437 - 1	Lisa Turpin	Lions Bay, BC	I am absolutely shocked that the province would again be entertaining the reindustrialization of the Howe Sound when we have finally cleaned it up from the last man made environmental impacts. I quote the following from Common Sense Canadian advise you to seriously reconsider issuing any permission for this disastrous impact on the whole environment of the Howe Sound area. The area is not an industrial area and industry does not belong here for many more than the 10 reasons below, however I am just so applaud that we even need to remind the government again that this area is one of the biggest nature tourist generators for the province and KEEP INDUSTRY OUT as the impacts of this decision will be devastating on so many levels. Why should we care? Here, from the Future of Howe Sound Society fighting to protect the McNab Creek Valley, are ten very good reasons:	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1656	437 - 2	Lisa Turpin	Lions Bay, BC	1. Why would anyone develop a gravel mine in Vancouver's ocean playground, an area of outstanding natural beauty? This is where an ever growing city comes to sail, dive, kayak, fish, camp and hike. Tourists flock from all over the world to see "SuperNatural, British Columbia", how would a gravel pit look in the tourism advertising?	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
1657	437 - 3	Lisa Turpin	Lions Bay, BC	2. Howe Sound is only now showing encouraging signs of environmental recovery after decades of industrial misuse. Should we now allow a reindustrialization of the area?	It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).  Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.
1658	437 - 4	Lisa Turpin	Lions Bay, BC	2. Howe Sound is only now showing encouraging signs of environmental recovery after decades of industrial misuse. Should we now allow a reindustrialization of the area?	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.

1659	437 - 5	Lisa Turpin	Lions Bay, BC	3. How can we consider developing a massive 77 hectare pit which will excavate the entire McNab estuary from one side of the valley to the other, completely eliminating one of only three river estuaries in Howe Sound, without developing an integrated, long term land and water use plan for the whole of Howe Sound?	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
1660	437 - 6	Lisa Turpin	Lions Bay, BC	3. How can we consider developing a massive 77 hectare pit which will excavate the entire McNab estuary from one side of the valley to the other, completely eliminating one of only three river estuaries in Howe Sound, without developing an integrated, long term land and water use plan for the whole of Howe Sound?	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
1661	437 - 7	Lisa Turpin	Lions Bay, BC	4. The size of the gravel pit will limit access to the foreshore for wildlife such as elk, deer and bears who currently frequent the area to forage for food.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

	Ref #	Commenter (Name)	Location		
1662	437 - 8	Lisa Turpin	Lions Bay, BC	5. The excavation of the river estuary will dramatically change the movement of water through the valley and have a significant negative impact on the freshwater habitat.	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>
1663	437 - 9	Lisa Turpin	Lions Bay, BC	6. The proposed mine developer, Burnco, filed a judicial review application against DFO in BC Supreme Court to ‘strong arm’ the DFO to allow them to proceed to an environmental review. The DFO have since agreed to that review with serious concerns as “the project presents a high risk to Salmon and Salmon habitat”.	<p>Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO’s involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.</p> <p>Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.</p>
1664	437 - 10	Lisa Turpin	Lions Bay, BC	7. In addition to the destruction to fish habitat, Burnco’s own consultants believe the mine site could be home to 21 species at risk including a population of Roosevelt Elk re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
1665	437 - 11	Lisa Turpin	Lions Bay, BC	8. The noise from the gravel crushing facility and loading of barges will be significant. It will have a negative impact on the enjoyment of the area by boaters, kayakers, fishermen, tourists and other in Howe Sound. The mine developer has stated at meetings that if the demand is there, they want to run the mining and crushing facilities 24/7, 365 days a year.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response

1666	437 - 12	Lisa Turpin	Lions Bay, BC	8. The noise from the gravel crushing facility and loading of barges will be significant. It will have a negative impact on the enjoyment of the area by boaters, kayakers, fishermen, tourists and other in Howe Sound. The mine developer has stated at meetings that if the demand is there, they want to run the mining and crushing facilities 24/7, 365 days a year.	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRDP noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>
1667	437 - 13	Lisa Turpin	Lions Bay, BC	9. Noise and light pollution will have significant negative impacts on the land and aquatic animals in the area. Noise and vibration pollution have been found to negatively impact the ability of marine mammals to communicate, navigate, find food and it is believed increasingly to impact their fertility.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

1668	437 - 14	Lisa Turpin	Lions Bay, BC	<p>9. Noise and light pollution will have significant negative impacts on the land and aquatic animals in the area. Noise and vibration pollution have been found to negatively impact the ability of marine mammals to communicate, navigate, find food and it is believed increasingly to impact their fertility.</p>	<p>A predictive noise model was developed for the Proposed Project as described in Volume 2, Section 9.2. The Type 7810 Predictor® (Predictor®) software was used to assess the potential noise effects associated with the Proposed Project as well as the effectiveness of potential noise controls.</p> <p>Effects to wildlife related to noise were estimated by overlaying the output of noise models with species-specific habitat suitability mapping and summarizing the change in habitat for VCs for which noise thresholds were defined in literature (i.e., amphibian species at risk, northern goshawk, western screech-owl, marbled murrelet, and common nighthawk). Noise thresholds beyond which habitat loss is expected are defined for each VC in Section 5.3.1.5.2 of Vol 2, Section 5.3.</p> <p>Due to the paucity of literature regarding noise thresholds for Roosevelt elk and grizzly bear, effects of noise and other sensory disturbance were measured using published zones of influence (ZOI). A ZOI represents the distance at which avoidance of certain anthropogenic disturbances has been observed.</p> <p>Noise will be managed during the construction and operational phases according to the Environmental Objectives and Best Management Practices for Aggregate Extraction in BC (BC MWLAP 2002). Noise mitigation measures are detailed in Volume 2, Part B - Section 9.2 and include:</p> <ul style="list-style-type: none"> <li>- Maintaining vegetation and trees around the active work areas to act as a noise buffer;</li> <li>- Reducing the height aggregate falls along conveyors and within the crushing facility;</li> <li>- Enclosing conveyors which will assist in reducing noise emissions;</li> <li>- Minimizing speed on roadways;</li> <li>- Operating equipment within specifications and maintaining level roads; and</li> <li>- Reducing idling time.</li> </ul>
1669	437 - 15	Lisa Turpin	Lions Bay, BC	<p>9. Noise and light pollution will have significant negative impacts on the land and aquatic animals in the area. Noise and vibration pollution have been found to negatively impact the ability of marine mammals to communicate, navigate, find food and it is believed increasingly to impact their fertility.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

1670	437 - 16	Lisa Turpin	Lions Bay, BC	10. The mine will have an impact on the economic potential of the Howe Sound area. There is considerable potential in Howe Sound to continue to grow the tourism industry with significant economic multipliers that would accrue to the local economy. A mine is not going to add to the beauty of the area.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
1671	438 - 1	B. P. Hanby	West Vancouver, BC	I tried forwarding the criticisms detailed by Eoin Finn with which I fully agree but the Email address used was rejected. Why do Governments make communicating with them so difficult particularly for those not brought up in the computer age?	Eoin Finn's submissions are included and addressed in this tracking table (See Ref 608 and 632).
1672	438 - 2	B. P. Hanby	West Vancouver, BC	The proposal to mine Mcnab Creek is a travesty.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1673	438 - 3	B. P. Hanby	West Vancouver, BC	Howe Sound is gradually recovering from assaults inflicted over the last 100 years, particularly the mining of copper and other metals at the Britannia mine site, serious mercury pollution in the Squamish area and the deposits of furans and dioxins generated by the Woodfibre Mill. Rehabilitation of Britannia Creek including an effective water treatment facility has resulted in returns of salmon and trout. The cost including ongoing maintenance, I understand, is in the order of 100 million dollars paid by the tax payers of this Province. And now we propose further assaults or death by a thousand cuts or maybe three. The first would be the Burnco proposal.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
1674	438 - 4	B. P. Hanby	West Vancouver, BC	This will involve noise and light pollution, damage to marine species and a significant increase in tug and barge traffic.	A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.  Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.

1675	438 - 5	B. P. Hanby	West Vancouver, BC	This will involve noise and light pollution, damage to marine species and a significant increase in tug and barge traffic.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
1676	438 - 6	B. P. Hanby	West Vancouver, BC	This will involve noise and light pollution, damage to marine species and a significant increase in tug and barge traffic.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

1687	439 - 3	Personal Information Withheld	Gibsons, BC	There has been a concerted effort of communities and citizens around Howe Sound to recover from previous industrialization. This region is a supernatural playground for Lower Mainlanders and visitors, right outside of the urban area. There have been developments in eco-tourism, with cycling routes and marine trails and campsites dotting Howe Sound.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
1688	439 - 4	Personal Information Withheld	Gibsons, BC	The proposed activity would affect air quality in the region.	A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.  Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.  Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.  Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.
1689	439 - 5	Personal Information Withheld	Gibsons, BC	The activity would create noise from 7am to 9 or 10 pm at least five days a week for twenty years.	The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.  Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.

1690	439 - 6	Personal Information Withheld	Gibsons, BC	People have bought property or moved to this area for its recreational and wilderness environmental values. The proposal would take away those things to various degrees from impacted communities around the work site and along the path of the gravel barges as they move towards the Vancouver area.	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
1691	439 - 7	Personal Information Withheld	Gibsons, BC	The proposal would take away those things to various degrees from impacted communities around the work site and along the path of the gravel barges as they move towards the Vancouver area. The proponent must make clear how the affected communities would benefit from this project, especially in light of what would be lost by the presence of the project in this beautiful fjord.	BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.
1692	439 - 8	Personal Information Withheld	Gibsons, BC	The project should be required to submit the the Sunshine Coast Regional District noise bylaw.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p>
1693	439 - 9	Personal Information Withheld	Gibsons, BC	The project should be required to use the most direct route to Vancouver, and not travel through Thornborough Channel.	Ramillies Channel is the preferred route. Thornbrough Channel is proposed only as an alternate, poor weather route.
1694	439 - 10	Personal Information Withheld	Gibsons, BC	The proponent should be required to take a serious look at the potential impacts of climate change upon the proposed lake and operations site.	<p>A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS. Potential effects considered were changes in GHG emissions as a result of the Project, the Project's contribution to climate change through the emission of GHG's, and how potential changes in climate will affect project-related infrastructure.</p> <p>Proposed mitigation includes the use of electricity instead of fossil fuels, routine maintenance of vehicles, and minimizing idling of vehicles and tugs. Mitigation measures that will reduce GHG emissions are consistent with specific actions within the Seas-to-Sky Air Quality Management Plan.</p> <p>Following the application of proposed mitigation, the contribution of the proposed Project GHG emissions to provincial, federal and global totals were determined to be negligible.</p>

1702	441 - 1	Mona Helcermanas-Benge	West Vancouver, BC	I am a life-long resident of Horseshoe Bay and have witnessed the pollution, degradation of the marine environment and thankfully the difficult clean up of Howe Sound.	<p>It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).</p> <p>Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.</p>
1703	441 - 2	Mona Helcermanas-Benge	West Vancouver, BC	Now as you are no doubt aware, the Orcas, Grey Whales, Dolphins, rock fish, salmon, herring and anchovies have returned.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
1704	441 - 3	Mona Helcermanas-Benge	West Vancouver, BC	The tourism industry grows with every year and the demographics all around the sound have changed to young families, academics and small business people.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
1705	441 - 4	Mona Helcermanas-Benge	West Vancouver, BC	Now it seems that both the provincial and federal levels of government have decided to re-industrialize the sound in direct conflict to what the local residents, municipal governments and 10K signatures on a Declaration to protect Howe Sound have informed the politicians.	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
1706	441 - 5	Mona Helcermanas-Benge	West Vancouver, BC	I am absolutely opposed to the Burnco project.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

1707	441 - 6	Mona Helcermanas-Benge	West Vancouver, BC	It is not for the BC or Canadian Government to destroy the estuary of McNab Creek in order to add to Burnco's profit picture.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
1708	441 - 7	Mona Helcermanas-Benge	West Vancouver, BC	This project has twice been rejected by Fisheries and Oceans Canada due to the likely loss of salmon habitat in McNab Creek.	<p>Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO's involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.</p> <p>Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.</p>
1709	441 - 8	Mona Helcermanas-Benge	West Vancouver, BC	Even Burnco's consultants documented that the gravel quarry could be home to 21 species officially at risk. This includes Roosevelt elk, re-introduced to McNab Creek in 2001 by the BC Ministry of Environment.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

1710	441 - 9	Mona Helcermanas-Benge	West Vancouver, BC	Since politicians no longer appear to care about our wildlife other than to use pictures of them to attract tourism and hunters, allow me to mention the fact that a very noisy, dusty gravel and crush mill is proposed to be sited next to an existing multi-residential area.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>
1711	441 - 10	Mona Helcermanas-Benge	West Vancouver, BC	Since politicians no longer appear to care about our wildlife other than to use pictures of them to attract tourism and hunters, allow me to mention the fact that a very noisy, dusty gravel and crush mill is proposed to be sited next to an existing multi-residential area.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
1712	441 - 11	Mona Helcermanas-Benge	West Vancouver, BC	The SCR D already said NO to this project in 2009. How many times will it come back. Until we are all too old to stand up to the politicians who practice corporate socialism?	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>

1713	441 - 12	Mona Helcermanas-Benge	West Vancouver, BC	Should full compensation for loss not be acceptable to local homeowners, this mine should not be approved.	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
1714	441 - 13	Mona Helcermanas-Benge	West Vancouver, BC	Why BC should help this company by allowing the McNab Creek strata title properties to be well within 500' of the proposed mining operations when generally gravel operations are not allowed within 1000' of any residential property.	The McNab Creek strata title properties are located more than 1000' from any component of the proposed Project.
1715	441 - 14	Mona Helcermanas-Benge	West Vancouver, BC	Apparently there are no plans for air quality monitoring stations in the vicinity.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. 1716	441 - 15	Mona Helcermanas-Benge	West Vancouver, BC	And what about the noise? Marine noise transmits 5-10 times farther and faster through water than through air and it will be terrible enough for the people living nearby.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>
1717	441 - 16	Mona Helcermanas-Benge	West Vancouver, BC	McNab Creek is in Sechelt traditional territory. Why were they not consulted.	<p>First Nation consultation requirements are delegated to Proponents by the Crown. For the Proposed Project, only Squamish Nation and the Tsleil-Waututh Nation were identified as potentially affected first Nations by the BCEAO. The CEA Agency identified additional Aboriginal Group, however, the Sechelt First Nation was not among these, presumably because of the proximity of the proposed Project to their Traditional Territory.</p>
1718	441 - 17	Mona Helcermanas-Benge	West Vancouver, BC	The lobbyists always promote these projects as big job industries but apparently there will very few in this case. Why would you approve something that will cause so much negative impact merely to provide a profit for Burnco?	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>

1719	441 - 18	Mona Helcermanas-Benge	West Vancouver, BC	I ask that you re-do the employment estimates and repost/all additional time for public scrutiny and comments.	<p>The estimated number of jobs created by the proposed Project during construction and operations phases are presented in Section 2.5.4 of the EAC Application/EIS.</p> <p>Employment numbers were presented on three Open House display panels, as follows:</p> <ul style="list-style-type: none"> <li>- Project Specifications: 80 person years during construction and 360 person years during operations (direct, indirect and induced);</li> <li>- Project Benefits: 12 full-time jobs at the site (i.e. direct only);</li> <li>- Sustainable Economy: 119 jobs during construction and 99 jobs during operations (direct, indirect and induced); 33 long-term jobs during operations are expected to be filled by Sunshine Coast residents.</li> </ul>
1720	441 - 19	Mona Helcermanas-Benge	West Vancouver, BC	I urge that you reject the project and suggest that Burnco find another less damaging location away from Howe Sound.	<p>Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>
1721	442 - 1	Rosemary Knight	Bowen Island, BC	My name is Dr. Rosemary Knight. I am a Professor in the School of Earth, Energy and Environmental Sciences at Stanford University, California, and a home-owner on Bowen Island. My address on Bowen Island is [redacted].	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>
1722	442 - 2	Rosemary Knight	Bowen Island, BC	I am writing to express my strong opposition to the proposed Burnco Aggregate Project McNab Creek.	<p>Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>
1723	442 - 3	Rosemary Knight	Bowen Island, BC	I am both a research scientist and an educator in the field of environmental sciences. After reviewing the proposal I have to conclude that it makes little sense to locate a gravel mine in this location. The impact on the estuary will be significant.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

1724	442 - 4	Rosemary Knight	Bowen Island, BC	As an educator I find myself continually trying to explain to young people why we made the mistakes we did, and caused the environmental damage we did, over the past decades in our rush for economic development. My excuse/explanation is that we did not really understand the complexities of coupled water/vegetation/animal ecosystems. There is no longer this excuse. This project is something that might have been considered 20 years ago, before we came to understand the functioning of estuarine ecosystems. We now have the knowledge base, and as such, the responsibility to NOT allow such projects in environmentally sensitive areas like the McNab Creek estuary, that supports not only the species in the estuary, but also in the adjacent Howe Sound.	<p>Potential effects of the Proposed Project have been assessed for selected valued environmental components to address key issues related to fish and fish habitat, marine resources, terrestrial wildlife and vegetation, geotechnical and natural hazards, water resources, air quality and climate change.</p> <p>The assessment concludes that, with the application of design considerations and identified mitigation, no significant adverse environmental effects will result from the Proposed Project.</p> <p>A detailed assessment of potential environmental effects of the Proposed Project is presented in Volume 2, Part B of the EAC Application/EIS.</p>
1725	442 - 5	Rosemary Knight	Bowen Island, BC	After the industrial mistakes of the past, Howe Sound is in recovery. The marine mammals have returned and we are all celebrating this recovery. Are you sure that this project will not have impacts on Howe Sound that will reverse this environmental success story? Are you sure that this is truly the best use of this land? Are you sure that you have good answers for the young people who will, if this project is approved, look at the destruction and ask – How could you – our provincial government – have allowed this to happen?	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
1726	443 - 1	Personal Information Withheld	Squamish, BC	I am deeply concerned about Burnco's proposed aggregate mine at McNab creek. The McNab Creek estuary is a fragile and important ecological area, home to salmon and at risk species such as Roosevelt Elk and 22 others identified by Burnco's own consultants. A mine in this location would destroy the local ecology and have impacts for the larger ecological area of Howe Sound, which is itself slowly recovering from past industrial pollution.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. 1727	443 - 2	Personal Information Withheld	Squamish, BC	Herring populations are rising and bringing in whales that feed on the herring. A gravel mine would reverse these hard won advances to restore health to Howe Sound.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
1728	443 - 3	Personal Information Withheld	Squamish, BC	No economic argument for the mine is worth destroying this important habitat, especially when the only winner would be Burnco, and not the people of BC.	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. 1729	443 - 4	Personal Information Withheld	Squamish, BC	The very few jobs the mine would create do not justify the irreversible destruction of this land and they would be offset by a likely loss of jobs in other sectors such as ecotourism and recreation that depend on a healthy Howe Sound for their economic survival.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
1730	443 - 5	Personal Information Withheld	Squamish, BC	While my primary concern is for the ecological integrity of this area, I understand there are also some residential lots near the proposed site and I am also concerned about the significant impacts the mine site would have on these people in terms of noise pollution, water pollution, decline in property values, and eyesores on the land.	A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.  Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.
1731	443 - 6	Personal Information Withheld	Squamish, BC	While my primary concern is for the ecological integrity of this area, I understand there are also some residential lots near the proposed site and I am also concerned about the significant impacts the mine site would have on these people in terms of noise pollution, water pollution, decline in property values, and eyesores on the land.	A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 (Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.  Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.  Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.
1732	443 - 7	Personal Information Withheld	Squamish, BC	While my primary concern is for the ecological integrity of this area, I understand there are also some residential lots near the proposed site and I am also concerned about the significant impacts the mine site would have on these people in terms of noise pollution, water pollution, decline in property values, and eyesores on the land.	Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.  The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.  Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).  BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.

1733	443 - 8	Personal Information Withheld	Squamish, BC	While my primary concern is for the ecological integrity of this area, I understand there are also some residential lots near the proposed site and I am also concerned about the significant impacts the mine site would have on these people in terms of noise pollution, water pollution, decline in property values, and eyesores on the land.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The assessment acknowledges that the residents of the McNab Estates Strata would be most affected by the potential visual impacts due to their close proximity to the Proposed Project. The McNab Strata viewpoint was taken from the end of the breakwater were the view would be unobstructed; this publically accessible location would be experienced by residents accessing the dock at the McNab Estates Strata.</p> <p>The lighting assessment indicated residential receptors at the Strata are located in a dark setting with existing lighting visible from adjacent industrial land use. The assessment of viewing locations and/or viewing conditions is limited to those locations that represent viewing opportunities that currently exists are may be certain or reasonably foreseeable.</p> <p>BURNCO has committed to establishing a mutually agreeable mechanism for engaging with the McNab Creek Strata owners regarding issues of benefit and concern.</p>
1734	443 - 9	Personal Information Withheld	Squamish, BC	I am asking you to not approve this mine in this location. I am asking you to please think of the long term health of the land, of Howe Sound and of the wider net of economic activity in the area that depends upon a clean Howe Sound. Thank you for your consideration and, what I hope will be a thoughtful, wise decision to not grant approval to this development	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1735	444 - 1	Len Gilday	Bowen Island, BC	I live in Howe Sound, on Bowen Island, and have rejoiced as orcas, herrings, salmon and other species have made a slow recovery in their former homelands. The proposed McNab Creek gravel mine will put too all this at risk. Please do not approve this project. It is the wrong plan in the wrong place at the wrong time. It's wrong.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

1736	445 - 1	Personal Information Withheld	North Vancouver, BC	<p>While looking at the Burnco references and personal communications cited in the EAC Application/EIS, I notice a reference to myself [redacted]: Dietrich, S. 2014. 4.5 Acres Zoned for 2 Waterfront cabins on Gambier Island. Available at: <a href="http://www.gambierislandlotforsale.com/">http://www.gambierislandlotforsale.com/</a>. Accessed 24 Jul 2014. 21-48</p> <p>I have no idea what they are referencing in the sustainable economy section! All I know is that I have been trying to sell a 4.5 acre waterfront lot within the Douglas Bay community for a few years now. The lot has a direct view of McNab Valley and the local realtor is suggesting that the reason it is not selling is because of the proposed Burnco project. In one of the most heated real estate markets that Vancouver and the surrounding areas has ever seen, I can't seem to attract more than \$200,000 for this prime property oceanfront lot. The value seems to be less than I paid for it in 2007. If it were located anywhere else the piece would have easily doubled by now.</p> <p>The real issue here is that there are so many references in the document that most of them will never be reviewed and they likely have no bearing on anything substantially related to the the Burnco project.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
1737	446 - 1	Cathryn Robertson	Bowen Island, BC	<p>Estuaries are needed for the salmon and the bears.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. 1738	446 - 2	Cathryn Robertson	Bowen Island, BC	Estuaries are needed for the salmon and the bears.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
1739	446 - 3	Cathryn Robertson	Bowen Island, BC	<p>The reindustrializaion of Howe Sound, a marine treasure is not forward thinking. The future of this site will be destroyed for generations, never to be an estuary in a fiord again, ever.</p> <p>Howe sound has the return of anchovies, humpback whales, orcas, mackeral and bears. Please do not destroy for a gravel mine with the resulting pit.</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
1740	446 - 4	Cathryn Robertson	Bowen Island, BC	<p>The future of this site will be destroyed for generations, never to be an estuary in a fiord again, ever. Howe sound has the return of anchovies, humpback whales, orcas, mackeral and bears. Please do not destroy for a gravel mine with the resulting pit.</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

	Ref #	Commenter (Name)	Location		
1741	446 - 5	Cathryn Robertson	Bowen Island, BC	Please do not destroy for a gravel mine with the resulting pit.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1742	447 - 1	Brenda Broughton	Lions Bay, BC	The Proposed Burnco Proposed Aggregate Project at McNab Creek in Howe Sound will lead to Land and Marine Environmental, Health, Economic, Social and Heritage degradation :	The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway. Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.
1743	447 - 2	Brenda Broughton	Lions Bay, BC	1.Environmental: Acid drainage, which is a bi-product of rock crushing will harm the prawn and scallop beds in front of the McNab Creek estuary and harm the salmon species within the estuary, from spawning successfully. Rock crushing releases sulphites that immediately mix with oxygen to become toxic acid drainage, which creates an unconscionable risk to sealife and is a retrograde step in the decades long recovery process.	Information regarding geochemical testing for ML-ARD potential is presented in Section 5.5.5.2.4 of the EAC Application/EIS. The results of geochemical testing are presenting in Appendix 5.6-C.  Yes, geochemical testing was conducted on 3 composite samples collected from two test pits at the Project site. The geochemical testing program included acid base accounting, whole rock and trace metal analysis, and sequential leach tests. The objective of acid base accounting was to determine the material's potential to generate acidity. The acid base accounting results confirmed that the materials contained no sulphide minerals; oxidation of sulphide minerals is the primary source of long-term acid generation potential. Therefore, the materials are considered to have a low potential for long-term acid generation.  The results of whole rock and trace metal analysis were used to identify parameters that may require further consideration in the context of metal leaching potential. Sequential leach testing was used to evaluate the metal leaching potential of the materials. Sequential leach testing is appropriate for evaluating the potential for metal leaching in the absence of reactive sulphide minerals, therefore this test method was used in place of the humidity cell test method (HCT). The results of the sequential leach tests were screened in the context of the BCWQ and CCME Guidelines for the protection of Freshwater Aquatic Life to identify parameters of potential environmental concern. The results of the sequential leach tests were used to develop inputs to the water quality predictions for the Proposed Project.
1744	447 - 3	Brenda Broughton	Lions Bay, BC	2.Health Effects: Rock Crushing Dust creates fine particulate airborne waste that will enter and line the human lung. This poses a significant harm to human health and one assumes a risk to the health of both animal and sea life. The Vancouver Aquarium is actively charting the recovery of Howe Sound.	A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.  Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.  Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.  Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.

	Ref #	Commenter (Name)	Location		
1745	447 - 4	Brenda Broughton	Lions Bay, BC	2.Health Effects: Rock Crushing Dust creates fine particulate airborne waste that will enter and line the human lung. This poses a significant harm to human health and one assumes a risk to the health of both animal and sea life. The Vancouver Aquarium is actively charting the recovery of Howe Sound.	<p>A detailed assessment of potential public health effects of the Proposed Project is presented in Volume 2, Part B – Section 9.1 of the EAC Application/EIS.</p> <p>Potential effects of the Proposed Project on human health assessed considered activities contributing to air emissions, deposition of particulate matter to terrestrial environments, and emission of substances to aquatic environments.</p> <p>Following the application of proposed mitigation, all potential health effects were determined to be negligible or not significant.</p>
1746	447 - 5	Brenda Broughton	Lions Bay, BC	3.Economic, Mammal and Human Health, along with Social Effects: Noise will echo through the Howe Sound similar to the fog horns. The difference is that it will invade the serenity and harm the economy as a result.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p>
1747	447 - 6	Brenda Broughton	Lions Bay, BC	In addition, this noise level will likely be a deterrent to marine mammals who have returned following several decades of recovery efforts in Howe Sound.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

1748	447 - 7	Brenda Broughton	Lions Bay, BC	<p>Hundreds of millions of dollars have been spent cleaning up Howe Sound from the Federal and Provincial Government and business such as Howe Sound Pulp and Paper. Those businesses who did not clean up, did not survive the world's scrutiny that demands responsible business stewardship.</p> <p>This project represents IRRESPONSIBLE environmental, social, heritage, health and economic stewardship. It is a very poor business decision for the Province of BC.</p>	<p>It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).</p> <p>Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.</p>
1749	447 - 8	Brenda Broughton	Lions Bay, BC	<p>4.Economic Effects: The visual vistas that Howe Sound presents is our Canadian and British Columbian right. Stanley Park would also have gravel and we would not consider mining Stanley Park. Howe Sound is a world renowned spectacular tourist attractant to Canada, British Columbia, and the Lower Mainland. Even if there was gold in Stanley Park, we would not mine it, as Stanley Park, like Howe Sound is the gold.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

1753	447 - 12	Brenda Broughton	Lions Bay, BC	<p>8. Environmental and Social: McNab Creek estuary is a tourism mecca...of paddle boards, cruise ships pass McNab Creek estuary, 3 yacht clubs, many children and family summer camps [many for the underprivileged]; iconic of 'Spectacular British Columbia'. McNab Creek is the 'Mother's Lap' of Howe Sound. McNab Creek is iconic for British Columbians...at the lap of the snow capped mountains...where your eye naturally falls, always when taking in the breathtaking vistas, you are looking at McNab Creek.</p> <p>As Howe Sound is a 'coliseum' you cannot say that if you were swimming at water level you would not see this mine, as it will be seen by every passerby, whether by boat, ferry, on the Sea to Sky Corridor or by the frequently seen paddle boards at McNab Creek ~ the mine will be seen due to the 'coliseum' natural geography from the surrounding mountain terrain.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
1754	447 - 13	Brenda Broughton	Lions Bay, BC	<p>9. Economy and Social: Gravel comes from Mountains and can be found anywhere in BC, thus this project is very unneeded and unnecessary. In the 1980's there was a serious proposal to Open Pit Mine Gambier Island. Had this gone forward Gambier Island would appear to be a volcano and with European opposition, it is very unlikely that BC would have had the opportunity to host the 2010 Olympics.</p>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>

1758	448 - 3	Personal Information Withheld	Lions Bay, BC	WE DO NOT NEED MORE NOISE, POLLUTION, EXTINCTION OF FISH HABITAT, HAVING TO WEAR DUST MASKS TO STOP EXTREMELY DANGEROUS CHRYSTALLINE SILICA MATERIALS ENTERING OUR LUNGS IN ORDER TO LIVE HERE DAY BY DAY. WILL FREE RESPIRATORS BE PROVIDED BY THIS COMPANY OR GOVERNMENT IF THIS PROJECT GOES AHEAD??	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>
1759	448 - 4	Personal Information Withheld	Lions Bay, BC	WE DO NOT NEED MORE NOISE, POLLUTION, EXTINCTION OF FISH HABITAT, HAVING TO WEAR DUST MASKS TO STOP EXTREMELY DANGEROUS CHRYSTALLINE SILICA MATERIALS ENTERING OUR LUNGS IN ORDER TO LIVE HERE DAY BY DAY. WILL FREE RESPIRATORS BE PROVIDED BY THIS COMPANY OR GOVERNMENT IF THIS PROJECT GOES AHEAD??	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
1760	448 - 5	Personal Information Withheld	Lions Bay, BC	WE DO NOT NEED MORE NOISE, POLLUTION, EXTINCTION OF FISH HABITAT, HAVING TO WEAR DUST MASKS TO STOP EXTREMELY DANGEROUS CHRYSTALLINE SILICA MATERIALS ENTERING OUR LUNGS IN ORDER TO LIVE HERE DAY BY DAY. WILL FREE RESPIRATORS BE PROVIDED BY THIS COMPANY OR GOVERNMENT IF THIS PROJECT GOES AHEAD??	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>

1761	448 - 6	Personal Information Withheld	Lions Bay, BC	WE DO NOT NEED MORE NOISE, POLLUTION, EXTINCTION OF FISH HABITAT, HAVING TO WEAR DUST MASKS TO STOP EXTREMELY DANGEROUS CHRYSTALLINE SILICA MATERIALS ENTERING OUR LUNGS IN ORDER TO LIVE HERE DAY BY DAY. WILL FREE RESPIRATORS BE PROVIDED BY THIS COMPANY OR GOVERNMENT IF THIS PROJECT GOES AHEAD??	<p>A detailed assessment of potential public health effects of the Proposed Project is presented in Volume 2, Part B – Section 9.1 of the EAC Application/EIS.</p> <p>Potential effects of the Proposed Project on human health assessed considered activities contributing to air emissions, deposition of particulate matter to terrestrial environments, and emission of substances to aquatic environments.</p> <p>Following the application of proposed mitigation, all potential health effects were determined to be negligible or not significant.</p>
1762	449 - 1	Star Morris	Squamish, BC	<p>I have attended open houses, presentations and reviewed the application on this Project.</p> <p>I appreciate that Burnco has done their utmost to mitigate risks towards a sustainable project. However, I believe that, cummulatively, the risks outweigh the benefits and cannot support the Project.</p> <p>I submit and concur with the specifics and attached comments.</p>	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1763	449 - 2	Star Morris	Squamish, BC	<p>Issue 1: Regional demand for additional aggregate is not demonstrated</p> <p>The Vancouver market requirement for an additional gravel /aggregate source is not supported by the proponent's documentation. A greater profit margin for the Proponent should not be grounds for destroying the estuary of McNab Creek.</p> <p>Recommendation: A supply/demand report showing strong evidence of the need for supply from this location (and the unavailability of supply from established locations), such as has been done for the Okanagan region, should be prepared before considering a permit for this project. See <a href="https://www.regionaldistrict.com/media/112368/2013_11_08__Full_Report__Aggregate_Supply_and_Demand_Update_and_Analysis.pdf">https://www.regionaldistrict.com/media/112368/2013_11_08__Full_Report__Aggregate_Supply_and_Demand_Update_and_Analysis.pdf</a></p>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>

1764	449 - 3	Star Morris	Squamish, BC	<p>Issue 2: Loss of productive salmon habitat</p> <p>The project has (twice) been rejected by Fisheries &amp; Oceans Canada because of the likely loss of salmon habitat in McNab Creek. In a year of disastrous returns to the Fraser and other runs, this proposal is ill-timed and ill-advised.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
1765	449 - 4	Star Morris	Squamish, BC	<p>Issue 3: Insufficient data for at-risk species baselines.</p> <p>For several key aquatic and land-based species (such as anadromous salmon, resident cutthroat trout and Roosevelt elk), population data was collected over far too narrow a timespan to be useful for establishing accurate baselines. Without accurate baselines, quantitative monitoring of the effects of this project will not be possible.</p> <p>Recommendation: Part-year data is utterly insufficient to establishing accurate baselines. At least five years of data should be collected to afford accurate baselines usable for ongoing monitoring of effects on species populations and habitat. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where habitat damage exceeds pre-agreed norms.</p>	<p>The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada. The baseline studies conducted are sufficient for the purpose of assessing potential effects of the Proposed Project on selected Valued Components. Additional years of supplemental field studies are not required or proposed for the assessment.</p> <p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS. Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>

1766	449 - 5	Star Morris	Squamish, BC	<p>Issue 4: 21 species officially at risk from Burnco.</p> <p>Burnco's consultants documented that the gravel quarry could be home to 21 species officially at risk. This includes Roosevelt elk , re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
1767	449 - 6	Star Morris	Squamish, BC	<p>Issue 5: Will McNab Creek and the estuary become salty?</p> <p>As rock is removed from the mine, fresh water from the estuary will creep into the resultant 25m pit. This will lead to salt water seeping into the estuary, and into McNab Creek. This will kill a variety of salmon and plants.</p> <p>Recommendation: Have thorough hydrological studies done over several years. Use the precautionary principle. Local authorities (eg. SCR D) should have the power to compel a reduction, suspension or cessation of mine activities where salination exceeds preagreed norms.</p>	<p>The hydraulic conductivity of the valley sediments is much higher than hydraulic conductivity of any bedrock structures, if they exist. Therefore, the groundwater flow in the valley sediments will dominate and it will provide key control on the position of the salt water-freshwater interface. Furthermore, because of topographic highs that surround the valley, the hydraulic heads are expected to be higher than in the valley sediments, inhibiting saltwater ingress. As presented in Section 3.3 in Appendix 5.6-A of the EAC Application/EIS, based on monitoring data (2010-2014), tidal elevations exceeded groundwater elevation only in rare occasions between July and September of each monitoring year. During these high tide intervals, there is an inferred landward gradient in the immediate vicinity of the shoreline; however, its duration is inherently less than the corresponding periods of southwards gradient associated with lower tidal position. Accordingly, the net groundwater flow direction during the entire monitoring period is confirmed to be southwards toward the marine foreshore. Moreover, monitoring data indicate that the saltwater wedge could be located at greater depths than approximately -30 m elevation; analytical calculations based on methodology presented in Domenico and Schwartz (1990) showed that, due to relatively high groundwater flow in the alluvial sediments, the saltwater edge could be depressed to the depth of the overburden/bedrock contact within 50 m to 150 m of the ocean shore. Based on these observations, the potential presence of a fault structure in bedrock in the vicinity of the project area is not considered to influence groundwater flow direction in the valley sediments or increase the risk of saltwater intrusion.</p>

1768	449 - 7	Star Morris	Squamish, BC	<p>Issue 6: Unsuitable location</p> <p>This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area. In 2009 SCRD said no to a permit for an aggregate operation at McNab Creek. There was concern re noise and dust from onsite crushing, sorting, weighing, and stockpiling, all of which Burnco plans to do. Why allow these activities now?</p> <p>Recommendation: To do so would represent atrocious planning, with little/no obvious compensating factors. It should not be permitted.</p>	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>

1769	449 - 8	Star Morris	Squamish, BC	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). The proposed “compensation channel” is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Recommendation: Any approval of this proposal should include a contingency bond to fund maintenance of the new streamway, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project.</p>	<p>The proposed Project will lead to the loss of approximately 200 m<sup>2</sup> of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. The proposed design for the channel extension uses the existing lower channel as a template and it will meet the factors and criteria that are generally accepted for the construction of a functional groundwater-fed spawning channel. It should provide conditions similar to the existing run habitat in the lower section of WC2 that was designed as chum spawning habitat by DFO and where spawning activity was observed during the November 2016 survey.</p> <p>The creation of the pit lake is predicted to cause a doubling of groundwater influx into the lower section of WC2. The increase in ground water influx will lead to additional groundwater upwelling and the increased upwelling is expected to provide increased levels of intergravel flow that will be suitable for eggs and alevins. The average depth in the proposed offset habitat extension and the remaining section of WC2 is predicted to be above 0.3 m making it suitable for salmon spawning. As described in the Aquatic Health assessment provided in Surface Water Resources (Section 5.5.7.2), the water quality and temperature of ground and surface water entering the offset habitat and existing lower section of WC2 will be suitable for salmonids to complete all stages of their life history including spawning.</p> <p>In response to comments from the Technical Working Group, the design of the habitat offset plan was revised to allow approximately 20 m of pool habitat upstream of the culvert and approximately 20 m of gravel bed run habitat downstream of the culvert to be retained which will avoid approximately 232 m<sup>2</sup> of habitat loss. The design of the channel extension incorporates run and pool habitat in approximately a 1 : 1 ratio, based on this design and the use of run habitat for spawning in the existing lower channel it is expected that more than 2, 000 m<sup>2</sup> of the offset channel habitat will provide conditions suitable for salmonid spawning.</p>
1770	449 - 9	Star Morris	Squamish, BC	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). The proposed “compensation channel” is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Recommendation: Any approval of this proposal should include a contingency bond to fund maintenance of the new streamway, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project.</p>	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>

Should full compensation for loss not be acceptable to local homeowners, this mine should not be approved.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

1777	449 - 16	Star Morris	Squamish, BC	<p>Issue 11: Plant lighting</p> <p>The McNab area (and much of Howe Sound) is currently a dark zone, allowing residents visibility of the wonders of the night sky. Plant lighting will destroy this local value for much of the year.</p> <p>Recommendation: Any approval must come with strict (and measurable) restrictions on lighting intensity and local dispersion. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where light intensities exceed pre-agreed norms.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
1778	449 - 17	Star Morris	Squamish, BC	<p>Issue 12: Water Quality is insufficiently characterized in the application</p> <p>Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs.</p> <p>Recommendation: Siltation monitoring (both in the original and compensation channels and in the nearby ocean), with periodic reporting of results that are auditable and accessible to the public, should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.</p>	<p>Wash water will be processed for removal of fines and silt in a 95% efficient wash plant to be fed using recycled water from two large storage tanks. Fines will not be discharged to the estuary; they will be deposited in a designated inland fines area and covered in accordance with an approved Reclamation and Effective Closure Plan.</p>

1779	449 - 18	Star Morris	Squamish, BC	<p>Issue 12: Water Quality is insufficiently characterized in the application</p> <p>Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs.</p> <p>Recommendation: Siltation monitoring (both in the original and compensation channels and in the nearby ocean), with periodic reporting of results that are auditable and accessible to the public, should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.</p>	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>
1780	449 - 19	Star Morris	Squamish, BC	<p>Issue 12: Water Quality is insufficiently characterized in the application</p> <p>Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs.</p> <p>Recommendation: Siltation monitoring (both in the original and compensation channels and in the nearby ocean), with periodic reporting of results that are auditable and accessible to the public, should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.</p>	<p>A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken. Adaptive management techniques to be implemented as required include:</p> <ul style="list-style-type: none"> <li>- Continue to evaluate the extent of the pit during operations.</li> <li>- During the wet season, if water levels in the pit lake become higher than has been designed for the Pit Lake Containment Berm then the valves in the culverts will be closed to reduce the amount of water reporting to the pit from the surface water on the western slope.</li> <li>- The height of the pit lake at the outlet structure can be adjusted to increase or decrease the level of the pit lake (e.g., adding or lowering stop logs) at closure to maintain the hydraulic gradient between McNab Creek and the Project Area following closure.</li> </ul>
1781	449 - 20	Star Morris	Squamish, BC	<p>Issue 13: "Daytime Hours" definition</p> <p>The Proponent advertises that the plant will operate only on weekdays and during "daytime hours". Daylight hours vary seasonally, but the definition of "daytime hours" is unclear.</p> <p>Recommendation: Clearly define "daytime hours" in the proposal.</p>	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
1782	449 - 21	Star Morris	Squamish, BC	<p>Issue 14: The nearshore strip of forest cover is too narrow</p> <p>The strip of forest cover between the pit and the ocean is too narrow to be sustainable. Blowdown and saltwater invasion will threaten its existence</p> <p>Recommendation: For reasons of sustainability and visual camouflage, increase the width of the ocean-pit separation strip, and lessen the size of the proposed pit and crushing area.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. Maintaining a treed buffer along the foreshore (approx. 25-50 m wide adjacent to the processing area) will also limit dust and noise emissions to the marine environment. Additional screening of lan-based structures may be possible around project components not currently screened by existing vegetation. The nature and extent of vegetation screening incorporated into the site design will be described in the Vegetation Management Plan (Volume 3, Part E, Section 16 of the EAC Application/EIS).</p> <p>A detailed assessment of potential vegetation effects (including windthrow effects) of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS. The significance of windthrow effects were determined to be negligible; few new windward edges will be created. Monitoring of treeline edges will be conducted to evaluate potential windthrow effects and adaptive management will be employed, if necessary.</p>
1783	449 - 22	Star Morris	Squamish, BC	<p>Issue 15: Loss of property values in the nearby strata units</p> <p>The proponent claims little or no loss of value for nearby properties. This assertion is contradicted by many studies that have highlighted the loss of value (including the value associated with quiet enjoyment) at or near industrial sites adjacent to established residential areas. Recent jurisprudence in BC has borne out the right of homeowners to receive compensation for that loss. See <a href="http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882">http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882</a></p> <p>Recommendation: Fair market value compensation for loss of property value must form part of the economic analysis of any approval for this mine.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
1784	449 - 23	Star Morris	Squamish, BC	<p>Issue 16: First Nation consultation – Sechelt FN was omitted this time</p> <p>Squamish and Tseil-Waututh First Nations have been consulted re Burnco, but not the Sechelt FN. The Sechelt First Nations weren't consulted about the gravel quarry at McNab Creek in 2009 either. McNab Creek is in Sechelt traditional territory.</p> <p>Recommendation: Respect/consult with Sechelt First Nations re Burnco.</p>	<p>First Nation consultation requirements are delegated to Proponents by the Crown. For the Proposed Project, only Squamish Nation and the Tseil-Waututh Nation were identified as potentially affected first Nations by the BCEAO. The CEA Agency identified additional Aboriginal Group, however, the Sechelt First Nation was not among these, presumably because of the proximity of the proposed Project to their Traditional Territory.</p>

1785	449 - 24	Star Morris	Squamish, BC	<p>Issue 17: Advisory Committee of voluntary citizens</p> <p>In 2009 when a gravel quarry at McNab Creek was turned down by SCRD, one requirement was an Advisory Committee of volunteer citizens to provide ongoing input with the goal of community acceptance of the project.</p> <p>Recommendation: Require the formation of an Advisory Committee of volunteer citizens.</p>	<p>BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.</p>
1786	449 - 25	Star Morris	Squamish, BC	<p>Issue 18: The job benefits were analyzed on the basis of too narrow an RAA.</p> <p>BURNCO currently sources its aggregate from Jervis Inlet, Port McNeil and Coquitlam. To gauge the benefits to the BC economy, the net job creation figures (i.e. McNab's 12 jobs less the job losses at the above aggregate sources) as a consequence of allowing the McNab Creek operation must be considered.</p> <p>Recommendation: If there is little or no net job gain to BC as a result of this proposal, it should be firmly rejected. Jobs in areas like Port McNeil are much harder to come by than in the Lower Mainland/ Howe Sound.</p>	<p>The local spatial study area for the operations phase labour market effects (including employment) of the Proposed project was described in the Application Information Requirements/EIS Guidelines, which was approved by the BCEAO and the CEA Agency on December 16, 2014 after review by the Technical Working Group established to guide this assessment. This local spatial study area is Sunshine Coast Regional District.</p> <p>The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.</p>

1787	449 - 26	Star Morris	Squamish, BC	<p>Issue 19: Barge traffic will diminish Howe Sound's recreational and tourism potential and add to the cumulative traffic hazard in Howe Sound</p> <p>Shipping 1-4 million tonnes of aggregate annually from this location will make for 2-6 tug/barge movements daily through Southern Howe Sound,. Routes would cross very busy sailing and small-boat recreational areas, the Howe Sound Marine Trail and ferry routes, the path of LNG tankers exiting from the Woodfibre LNG plant and freighters from Squamish Terminals. This exponentially increases the risk of collisions and loss of life in a narrow waterway and diminishes the amenity and tourism use of the Sound. The cumulative effects and worst-case hazard analysis of this project have been underestimated by the Proponent.</p> <p>Recommendation: A cumulative impact assessment, including loss of amenity and tourism value of the Sound, should be completed prior to deciding on this application. So too should a study of the increased hazards associated with increasing the large-vessel traffic in Howe Sound. Improvements to vessel tracking, buoys and channel markers in the area will be necessary.</p>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
1788	449 - 27	Star Morris	Squamish, BC	<p>Issue 20: The job benefits analysis used the questionable input-output econometric model.</p> <p>BURNCO has used input-output econometric analysis to predict the job creation benefits accruing to the project For resource projects, this is a highly questionable analysis technique. The Australian Institute has written a convincing argument highlighting the inadequacies of input-output analysis. See <a href="http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf">http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf</a> (Input-output was used by the BC Government in arriving at its inflated job estimates for BC's LNG industry.)</p> <p>Recommendation: Red-do the employment estimates and repost/ allow additional time for public scrutiny and comments</p>	<p>The environmental assessment of the Proposed Project used an input-output (I-O) impact modelling methodology to estimate the Project's potential effect on employment (as well as other economic parameters). The B.C. Input-Output Model (BCIOM) was used. The BCIOM is maintained by BC Stats, which is the central statistics agency of the B.C. government. The BCIOM is a version of Statistics Canada's Inter-Provincial Input-Output Model (IPIOM) which BC Stats calibrated for undertaking economic analyses of B.C.-based projects. The BCIOM is a robust, calibrated, third party provided input-output model, and has been previously accepted for use by by the BCEAO and the CEA Agency to assist with estimating the economic impact of proposed projects.</p>

1789	449 - 28	Star Morris	Squamish, BC	<p>Issue 21: There was an inconsistency between the job creation figures shown in 2 different slides in the Open Houses</p> <p>One showed about 300 person-years of employment (over 25years). The other (derived from input-output analysis) showed person-year employment benefits several times that amount.</p> <p>Recommendation: This misleading discrepancy should be resolved by further analysis, and that section of the application re-submitted, with additional time allowed for public scrutiny and comment</p>	<p>The estimated number of jobs created by the proposed Project during construction and operations phases are presented in Section 2.5.4 of the EAC Application/EIS.</p> <p>Employment numbers were presented on three Open House display panels, as follows:</p> <ul style="list-style-type: none"> <li>- Project Specifications: 80 person years during construction and 360 person years during operations (direct, indirect and induced);</li> <li>- Project Benefits: 12 full-time jobs at the site (i.e. direct only);</li> <li>- Sustainable Economy: 119 jobs during construction and 99 jobs during operations (direct, indirect and induced); 33 long-term jobs during operations are expected to be filled by Sunshine Coast residents.</li> </ul>
1790	449 - 29	Star Morris	Squamish, BC	<p>Issue 22: Preservation of marine tourism, hiking access to the vicinity of McNab</p> <p>Moorages, anchorages, swimming facilities and back-country access have long been part of the McNab Creek area's attractions for Howe Sound visitors and local boating clubs</p> <p>Recommendation: The application fails to properly address how these local amenities will be protected. Neither does it propose how loss of these amenities will be compensated for. The Management Plan should address this issue.</p>	<p>Harvesting fish and wildlife' and 'Outdoor recreation and tourism' are valued components in the environmental assessment of the Proposed Project (see Table 7.3-1). No displacement effects on recreational hunting or other recreational activities is anticipated due to the Proposed Project because the primary access to the local study area is through the Proposed Property, and public access and use of the Proposed Property has never been permitted. During the construction and operation phases, recreationists and tourists would continue to have access to the foreshore area below the high water mark and to the anchorage area in the vicinity of where McNab Creek enters Howe Sound.</p> <p>Proposed Project construction and operations would prevent marine-based recreational and tourism activities occurring around the Project jetty. As the jetty is located within an existing log boom tenure and recreational and tourism activities are concentrated on the eastern side of the local study area (where McNab Creek enters Howe Sound), this effect is considered to be negligible.</p> <p>Displacement on the water would occur on an intermittent basis as a result of Proposed Project-related vessel traffic, which would require smaller vessels to alter direction and/or speed when navigating at the same time as water taxis or barges (Volume 2, Part B - Section 7.2). These navigational challenges are present in the LSA due to forestry activity, and are subject to the Collision Regulations of the Canada Shipping Act. Any resulting effects on recreational boating recreational activities due to potential interactions of recreational vessels and equipment and Project-associated vessels are not detectable or not measureable, so potential effects of the Proposed Project on water-based recreation and tourism access matters in the construction and operation phases are determined to be negligible.</p> <p>As part of the Marine Transport Management Plan outlined in Marine Transport (Volume 2, Part B - Section 7.2), BURNCO would also develop and implement strategies, best management practices and guidelines to avoid and minimise Proposed Project - related disruption of marine-based recreational activities during construction and operations. As part of the development of this plan, BURNCO would consult with key marine user groups (e.g., McNab Strata, yacht clubs, camps, and kayaking operators) to discuss strategies (including but not limited to routing options) to manage the interaction of Proposed Project vessel traffic with recreational and tourism areas during the high season months.</p>

1791	449 - 30	Star Morris	Squamish, BC	<p>Issue 23: End-of-project remediation</p> <p>The compensation channel is an artificial structure which will likely not survive long after project's end.</p> <p>Recommendation: Restoring the natural streamway should be a firm end-state requirement.</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>
1792	450 - 1	Personal Information Withheld	Bowen Island, BC	I am writing to you in opposition to the wet gravel mine proposed for McNab Creek by Burnco.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1793	450 - 2	Personal Information Withheld	Bowen Island, BC	Why would anyone mine an estuary in an area (Howe Sound) that is still recovering from earlier industrialization?	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
1794	450 - 3	Personal Information Withheld	Bowen Island, BC	This entire area, is the recreational area for Vancouver and the Lower Mainland, as such, has high tourism and ecological value.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

1798	451 - 1	Personal Information Withheld	Lions Bay, BC	FROM THE PEOPLE IN LIONS BAY AND HOWE SOUND, WHO LIVE , WORK, AND BREATHE IN THE FRESH AIR HERE, WHO HAVE CHILDREN AND GRAND-CHILDREN HERE, WE WILL NOT ALLOW OUT BEAUTIFUL HOWE SOUND TO BE POLLUTED BY A GRAVEL MINING OPERATION WHICH HAS NO USE HERE.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
1799	452 - 1	Michael Broughton	Lions Bay, BC	The people of Howe Sound and the Sea to Sky region are values driven and have devoted time, money and energy to the clean up and remediation of Howe Sound, polluted and denigrated by poor industrial practice. To consider re-industrializing an area which has established itself as a destination for eco-tourism is unconscionable ....	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
1800	452 - 2	Michael Broughton	Lions Bay, BC	12 jobs and ultimately a 76 acre gravel extraction lake makes no sense... The Sea to Sky Gondola employees dozens of employees, there are 12 employees at the Lions Bay General Store and Café, dozens more in Sewell's adventure boats bring excited, inspired and awestruck tourists to the beauty of Howe Sound, offering a complete ecosystem from healthy water for salmon to return to all the way to the spectacle of Orca's and larger whales breaching, fishing, and frolicking in Howe Sound.	Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.
1801	452 - 3	Michael Broughton	Lions Bay, BC	Howe Sound and the Sea to Sky corridor is the playground and the oxygen of the lower mainland. To have an outdoor wonderland within minutes of a major metropolitan area is the envy of the world, and this must be protected. Major, predominantly high-tech and future leaning firms that can establish virtually anywhere are coming to Greater Vancouver because their employees are values driven, they seek clean air, a healthy lifestyle, and quality life experiences for themselves and for their children. These are provided and supported by the Sea to Sky corridor.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.

1802	452 - 4	Michael Broughton	Lions Bay, BC	This project is not needed to support our local or provincial economy, is destructive to other initiatives that support the reality that "the environment is the economy" and flies in the face of all the incredible work done by so many to restore the health and beauty of the region.	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
1803	452 - 5	Michael Broughton	Lions Bay, BC	Sustainability has been described as a three legged stool, with economic, environmental and social augmented by cultural as a fourth component. This project is not sustainable, it fails on all four elements. The project takes more from than it gives the economy of the region, is environmentally irresponsible, and provides nothing and is destructive to the social and cultural fabric of our region.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
1804	452 - 6	Michael Broughton	Lions Bay, BC	When the Village of Lions Bay gravel pit was in operation during the building of the Sea to Sky Highway Upgrade prior to 2010, the mining of the Lions Bay 'Brunswick' gravel pit could be heard across long distances within the community regularly. This noise created a regular disruption for many residents, both above and below and surrounding spanning distances well in excess of 500'.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>

	Ref #	Commenter (Name)	Location		
1805	452 - 7	Michael Broughton	Lions Bay, BC	There is gravel all over BC. It is egregious to consider mining in one of 3 estuaries in the most southerly fjord in North America. This is simply irresponsible. It takes away much needed jobs from its current gravel mining location in Port McNeill, and will take away jobs in the boating and eco-tourism industry in Howe Sound. This would be economically irresponsible.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
1806	452 - 8	Michael Broughton	Lions Bay, BC	As owner/operator of the Lions Bay General Store & Café, visitors from all over the world, comment daily on the beauty and pristine nature of Howe Sound, Howe Sound has been the 'driveway entrance' to Whistler but in recent years Squamish and the Squamish region has become the destination for outdoor adventure and tourism. The Sea to Sky Gondola has been an incredible draw and success in highlighting the beauty of Howe Sound. Tourists and locals alike no longer see the Sea to Sky Highway as a roadway to someplace else but as a destination and experience itself. This is Howe Sound.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
1807	452 - 9	Michael Broughton	Lions Bay, BC	The Vancouver market requirement for an additional gravel /aggregate source is not supported by the proponent's documentation. A greater profit margin for the Proponent should not be grounds for destroying the estuary of McNab Creek.	<p>The Proposed Project will provide sand and gravel that will be used to meet the growing demands of the BC marketplace.</p> <p>Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>

1808	452 - 10	Michael Broughton	Lions Bay, BC	The project has (twice) been rejected by Fisheries & Oceans Canada because of the likely loss of salmon habitat in McNab Creek. In a year of disastrous returns to the Fraser and other runs, this proposal is ill-timed and ill-advised. For several key aquatic and land-based species (such as anadromous salmon, resident cutthroat trout and Roosevelt elk), population data was collected over far too narrow a time span to be useful for establishing accurate baselines. Without accurate baselines, quantitative monitoring of the effects of this project will not be possible.	Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO's involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.  Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.
1809	452 - 11	Michael Broughton	Lions Bay, BC	This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area. The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as "marine").	A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.  Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.
1810	452 - 12	Michael Broughton	Lions Bay, BC	This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area. The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as "marine").	A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.  Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.  Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.  Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.
1811	452 - 13	Michael Broughton	Lions Bay, BC	The proposed "compensation channel" is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for loss should be automatic.	Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.  Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.  Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.

1812	452 - 14	Michael Broughton	Lions Bay, BC	The McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of unsightliness, the adverse effects on property values, noise and dust issues, gravel mining operations are generally not allowed within 1000' of any residential property. Other BURNCO properties have had 1,000' separation zones stipulated as conditions of their licenses to operate. Example: BURNCO property in Parkland County, Alberta.	The McNab Creek strata title properties are located more than 1000' from any component of the proposed Project.
1813	452 - 15	Michael Broughton	Lions Bay, BC	The McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of unsightliness, the adverse effects on property values, noise and dust issues, gravel mining operations are generally not allowed within 1000' of any residential property. Other BURNCO properties have had 1,000' separation zones stipulated as conditions of their licenses to operate. Example: BURNCO property in Parkland County, Alberta.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
1814	452 - 16	Michael Broughton	Lions Bay, BC	The McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of unsightliness, the adverse effects on property values, noise and dust issues, gravel mining operations are generally not allowed within 1000' of any residential property. Other BURNCO properties have had 1,000' separation zones stipulated as conditions of their licenses to operate. Example: BURNCO property in Parkland County, Alberta.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCR noise bylaw was considered as part of the assessment.</p>

1817	452 - 19	Michael Broughton	Lions Bay, BC	<p>Moorages, anchorages, swimming facilities and back-country access have long been part of the McNab Creek area's attractions for Howe Sound visitors and local boating clubs. BURNCO currently sources its aggregate from Jervis Inlet, Port McNeil and Coquitlam. To gauge the benefits to the BC economy, the net job creation figures (i.e. McNab's 12 jobs less the job losses in those areas) as a consequence of allowing the McNab Creek operation must be considered.</p>	<p>Harvesting fish and wildlife' and 'Outdoor recreation and tourism' are valued components in the environmental assessment of the Proposed Project (see Table 7.3-1). No displacement effects on recreational hunting or other recreational activities is anticipated due to the Proposed Project because the primary access to the local study area is through the Proposed Property, and public access and use of the Proposed Property has never been permitted. During the construction and operation phases, recreationists and tourists would continue to have access to the foreshore area below the high water mark and to the anchorage area in the vicinity of where McNab Creek enters Howe Sound.</p> <p>Proposed Project construction and operations would prevent marine-based recreational and tourism activities occurring around the Project jetty. As the jetty is located within an existing log boom tenure and recreational and tourism activities are concentrated on the eastern side of the local study area (where McNab Creek enters Howe Sound), this effect is considered to be negligible.</p> <p>Displacement on the water would occur on an intermittent basis as a result of Proposed Project-related vessel traffic, which would require smaller vessels to alter direction and/or speed when navigating at the same time as water taxis or barges (Volume 2, Part B - Section 7.2). These navigational challenges are present in the LSA due to forestry activity, and are subject to the Collision Regulations of the Canada Shipping Act. Any resulting effects on recreational boating recreational activities due to potential interactions of recreational vessels and equipment and Project-associated vessels are not detectable or not measureable, so potential effects of the Proposed Project on water-based recreation and tourism access matters in the construction and operation phases are determined to be negligible.</p> <p>As part of the Marine Transport Management Plan outlined in Marine Transport (Volume 2, Part B - Section 7.2), BURNCO would also develop and implement strategies, best management practices and guidelines to avoid and minimise Proposed Project - related disruption of marine-based recreational activities during construction and operations. As part of the development of this plan, BURNCO would consult with key marine user groups (e.g., McNab Strata, yacht clubs, camps, and kayaking operators) to discuss strategies (including but not limited to routing options) to manage the interaction of Proposed Project vessel traffic with recreational and tourism areas during the high season months.</p>
1818	452 - 20	Michael Broughton	Lions Bay, BC	<p>The EAO process provides the proponent the opportunity to address the concerns identified by the public in October 2013. This is unfortunate. They are saying less fish will die, they will screen more of the visual devastation, they will try to fix what they damage..... all of these responses are unacceptable in that the project is in the wrong place and is unacceptable as a concept for the region. The premise is wrong, it is unacceptable, in the wrong place, and no amount of mitigation will make it acceptable.</p>	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A -Section 3.1.2. of the EAC Application/EIS.</p>

1819	453 - 1	Personal Information Withheld	Bowen Island, BC	The Burnco Aggregate Project proposed for McNab Creek area will seriously conflict with all the efforts of the past decades to nurse Howe Sound back to health. As a resident of Howe Sound I enjoy all the wildlife and the physical beauty of the sound and am dead against this project.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
1820	454 - 1	Carolyn Philip	New Westminster, BC	Whenever we have visitors from out of town, we take them to Howe Sound to enjoy the spectacular beauty of the area. All of them are amazed that such a pristine and beautiful area exists so close to a major city. We have seen dramatic improvements in the marine ecosystem in the past ten years, can't believe this and the unspoiled scenery would be put at risk by a gravel pit.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
1821	454 - 2	Carolyn Philip	New Westminster, BC	It's time we protected and promoted our beautiful environment rather than despoiling it.	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
1822	454 - 3	Carolyn Philip	New Westminster, BC	Protect the McNabb Creek Fish run, the Elk habitat, and the future supernatural tourism potential of Howe Sound.	A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.  The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.  The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.

This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
1828	456 - 2	Personal Information Withheld	Howe Sound, BC	In fact, all of Howe Sound is a naturally spectacular place that should be preserved as a International Heritage Site.	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
1829	456 - 3	Personal Information Withheld	Howe Sound, BC	This is no place for a gravel pit. The long term economic benefits derived from eco tourism would far surpass any benefit from the gravel pit.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
1830	456 - 4	Personal Information Withheld	Howe Sound, BC	I have serious concerns that the environment assessment was not completed correctly and I urge you to not allow this proposed gravel pit to proceed.	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>

1831	457 - 1	Personal Information Withheld	Lions Bay, BC	THIS PROJECT HAS BEEN DENIED TWICE BEFORE. HAVING SPENT BILLIONS OF TAX PAYERS DOLLARS TO CLEAN UP OUR SOUND AFTER COPPER MINE AND WOODFIBRE DISASTERS WHY WOULD YOU EVEN THINK, OR ALLOW A GRAVEL PIT TO BE ALLOWED HERE...YOU WOULD BE COMPLETE IDIOTS TO DO SO AND WILL HAVE A LOT OF QUESTIONS AS TO WHY YOU ARE NOT PROTECTING OUR SALMON, HERRING, SPOT PRAWNS ETC.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
1832	458 - 1	Personal Information Withheld	North Vancouver, BC	This letter is being submitted regarding your request for public comment on the Environmental Impact Statement submitted by Burnco Rock Products's proposed open pit mine at the McNab Creek estuary.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1833	458 - 2	Personal Information Withheld	North Vancouver, BC	This letter is being submitted as a result of your request for public comment on the Environmental Impact Statement submitted by Burnco Rock Products regarding its proposal for an open pit mine at McNabb Creek. While we have significant concerns that this is a highly flawed and biased process, we have no option but to “play the game” and “trust in the process”.	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>
1834	458 - 3	Personal Information Withheld	North Vancouver, BC	Burnco Rock Product's (Burnco's) proposed, large, open-pit aggregate mine and crushing facility is clearly contrary to regional commitments and development efforts in the area, and more importantly it is completely inconsistent with the established use of the area for primarily leisure purposes.	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>

1835	458 - 4	Personal Information Withheld	North Vancouver, BC	Howe Sound is a unique wilderness area and McNab sits in the middle of it. Located only 45min from urban Vancouver, Howe Sound is a world away from city life. Most global cities have lost their access to nature close to the urban core, but here, in Vancouver, we are privileged to have the wilderness on our doorstep, we should not take it for granted. We cannot ignore the physical and mental health benefits derived to the urban population from easy access to wilderness areas like Howe Sound. These benefits do not appear represented in any assessment of the proposed mine, but they should, human physical and mental health is key to a healthy and sustainable city.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
1836	458 - 5	Personal Information Withheld	North Vancouver, BC	Howe Sound is a unique wilderness area and McNab sits in the middle of it. Located only 45min from urban Vancouver, Howe Sound is a world away from city life. Most global cities have lost their access to nature close to the urban core, but here, in Vancouver, we are privileged to have the wilderness on our doorstep, we should not take it for granted. We cannot ignore the physical and mental health benefits derived to the urban population from easy access to wilderness areas like Howe Sound. These benefits do not appear represented in any assessment of the proposed mine, but they should, human physical and mental health is key to a healthy and sustainable city.	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>

1837	458 - 6	Personal Information Withheld	North Vancouver, BC	<p>The proposed open pit mine should not be considered in isolation. The cumulative impact of other projects in the area need to form part of this assessment. In May 2015 the Auditor General of BC issued a report with nine recommendations and stated "it's in the interest of British Columbians to address cumulative effects management without delay" Howe Sound was selected as one of the Province's first regions for Cumulative Effects Assessment under the new framework.</p>	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for the following:</p> <ul style="list-style-type: none"> <li>- Marine mammals – behavioural disturbance</li> <li>- Amphibian species at risk – barriers to movement, change in mortality, habitat loss</li> <li>- Roosevelt elk – barriers to movement, change in mortality, habitat loss</li> <li>- Grizzly bear – change in mortality, habitat loss</li> <li>- Environmentally sensitive ecosystems – loss of extent</li> <li>- Ecosystems at risk – loss of extent</li> <li>- Air quality indicators – increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual)</li> <li>- Real estate – change in real estate value</li> <li>- Marine navigation – interference with navigation use and navigability due to Project-related vessel traffic</li> <li>- Harvesting fish and wildlife – change in environmental setting</li> <li>- Recreation and tourism – change in environmental setting</li> <li>- Visual quality – change in visual quality</li> <li>- Heritage resources – changes to heritage resource integrity, context and accessibility</li> <li>- People – Human health (air quality and particulate matter).</li> </ul> <p>All potential cumulative residual effects were determined to be negligible or not significant except net effects to grizzly bear; cumulative residual effects to the threatened Squamish-Lillooet Grizzly Bear Population Unit were determined to be significant due in large part to vehicle collisions that might result from the development of new logging roads. Grizzly bear have not been observed within the Proposed Project area and the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
1838	458 - 7	Personal Information Withheld	North Vancouver, BC	<p>While the economic return will accrue to Burnco and a small number of local businesses, significant socio-economic costs and environmental damage to Howe Sound will be borne by the communities and residents of the area and the taxpayers of British Columbia who will derive little benefit from the project. The mine will generate only 12 full time jobs at around \$25/hr, similar to a less experienced construction worker. The aggregate itself may well replace aggregate from other parts of BC and thus the jobs may not be "net new" employment but rather "replacement employment", there is no benefit in this.</p>	<p>The local spatial study area for the operations phase labour market effects (including employment) of the Proposed project was described in the Application Information Requirements/EIS Guidelines, which was approved by the BCEAO and the CEA Agency on December 16, 2014 after review by the Technical Working Group established to guide this assessment. This local spatial study area is Sunshine Coast Regional District.</p> <p>The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.</p>
1839	458 - 8	Personal Information Withheld	North Vancouver, BC	<p>Environmental Impacts</p>	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>

1840	458 - 9	Personal Information Withheld	North Vancouver, BC	Howe Sound has a history of industrial abuse and is only now seeing return of marine mammal and fish life. In the past six years, whales and dolphins have been observed in the Sound for the first time in over a decade and herring and salmon have become increasingly abundant. This proposed project could clearly have a significant negative impact on marine wildlife and their habitat and freshwater fish and their habitat. There are only 3 estuaries in all of Howe Sound. They act as a nursery for prawns, scallops, oysters, rock-fish, salmon and countless other types of marine life. The harm from this proposed project to McNab's valley and alluvial fan and the habitat that rely on it cannot be overstated.	<p>It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).</p> <p>Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.</p>
1841	458 - 10	Personal Information Withheld	North Vancouver, BC	Howe Sound has a history of industrial abuse and is only now seeing return of marine mammal and fish life. In the past six years, whales and dolphins have been observed in the Sound for the first time in over a decade and herring and salmon have become increasingly abundant. This proposed project could clearly have a significant negative impact on marine wildlife and their habitat and freshwater fish and their habitat. There are only 3 estuaries in all of Howe Sound. They act as a nursery for prawns, scallops, oysters, rock-fish, salmon and countless other types of marine life. The harm from this proposed project to McNab's valley and alluvial fan and the habitat that rely on it cannot be overstated.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. 1843	458 - 12	Personal Information Withheld	North Vancouver, BC	<p>In fact, Oceans and Fisheries Canada (aka DFO) has already rejected such proposals in the past. With respect to the Burnco project, In June of 2010, DFO determined that the project would result in harmful alteration, disruption or destruction (“HADD”) of fish habitat that cannot be compensated elsewhere in the Sound. As such DFO advised Burnco that DFO was not prepared to issue a HADD authorization.</p> <p>In response, I understand Burnco filed a judicial review application against DFO in Supreme Court. Subsequently, DFO agreed to participate in a full environmental review. However, in June, 2011, DFO issued a letter in which they stated that they “continue to have serious concerns about the extent of the impacts to fish and fish habitat that may result from this project” and that “The project presents a high risk to Salmon and Salmon habitat.”</p>	<p>Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO’s involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.</p> <p>Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.</p>
1844	458 - 13	Personal Information Withheld	North Vancouver, BC	<p>There are major concerns from stakeholders throughout Howe Sound about the crushing and loading facilities and associated noise, glare from industrial lighting, vibrations, dust, emissions and destruction or damage to wildlife habitat both terrestrial and aquatic.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCR noise bylaw was considered as part of the assessment.</p>

1845	458 - 14	Personal Information Withheld	North Vancouver, BC	There are major concerns from stakeholders throughout Howe Sound about the crushing and loading facilities and associated noise, glare from industrial lighting, vibrations, dust, emissions and destruction or damage to wildlife habitat both terrestrial and aquatic.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>
1846	458 - 15	Personal Information Withheld	North Vancouver, BC	There are major concerns from stakeholders throughout Howe Sound about the crushing and loading facilities and associated noise, glare from industrial lighting, vibrations, dust, emissions and destruction or damage to wildlife habitat both terrestrial and aquatic.	<p>A predictive noise model was developed for the Proposed Project as described in Volume 2, Section 9.2. The Type 7810 Predictor® (Predictor®) software was used to assess the potential noise effects associated with the Proposed Project as well as the effectiveness of potential noise controls.</p> <p>Effects to wildlife related to noise were estimated by overlaying the output of noise models with species-specific habitat suitability mapping and summarizing the change in habitat for VCs for which noise thresholds were defined in literature (i.e., amphibian species at risk, northern goshawk, western screech-owl, marbled murrelet, and common nighthawk). Noise thresholds beyond which habitat loss is expected are defined for each VC in Section 5.3.1.5.2 of Vol 2, Section 5.3.</p> <p>Due to the paucity of literature regarding noise thresholds for Roosevelt elk and grizzly bear, effects of noise and other sensory disturbance were measured using published zones of influence (ZOI). A ZOI represents the distance at which avoidance of certain anthropogenic disturbances has been observed.</p> <p>Noise will be managed during the construction and operational phases according to the Environmental Objectives and Best Management Practices for Aggregate Extraction in BC (BC MWLAP 2002). Noise mitigation measures are detailed in Volume 2, Part B - Section 9.2 and include:</p> <ul style="list-style-type: none"> <li>- Maintaining vegetation and trees around the active work areas to act as a noise buffer;</li> <li>- Reducing the height aggregate falls along conveyors and within the crushing facility;</li> <li>- Enclosing conveyors which will assist in reducing noise emissions;</li> <li>- Minimizing speed on roadways;</li> <li>- Operating equipment within specifications and maintaining level roads; and</li> <li>- Reducing idling time.</li> </ul>

1847	458 - 16	Personal Information Withheld	North Vancouver, BC	There are major concerns from stakeholders throughout Howe Sound about the crushing and loading facilities and associated noise, glare from industrial lighting, vibrations, dust, emissions and destruction or damage to wildlife habitat both terrestrial and aquatic.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
1848	458 - 17	Personal Information Withheld	North Vancouver, BC	There are major concerns from stakeholders throughout Howe Sound about the crushing and loading facilities and associated noise, glare from industrial lighting, vibrations, dust, emissions and destruction or damage to wildlife habitat both terrestrial and aquatic.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>

	Ref #	Commenter (Name)	Location		
1849	458 - 18	Personal Information Withheld	North Vancouver, BC	<p>A 2012 research project by Vancouver Aquarium found that the foreshore area directly in front of the proposed project is a marine rich habitat and an important and rare nursery area for various aquatic habitat.</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
1850	458 - 19	Personal Information Withheld	North Vancouver, BC	<p>Burnco's Consultant's, Golder and Associates, clearly show in their assessments dust blooms extending far out to sea which over the 16 years of this projects lifetime will cause harmful silt and sediment build up across the foreshore area. The extent of these dust blooms directly contradict other Golder assurances that spraying mitigations will eliminate such dust blooms in the first place. Clearly Golder needs to do further work to get reconcile their opinions.</p> <p>The area can be very exposed to extreme wind conditions which are difficult to predict and monitor. The proponents air quality report shows particulate matter over the marine environment but the marine assessment contradicts this by saying there will be no sediment seems a little incongruous. We need to ensure that should the project go ahead this particulate matter is evaluated on a continuous basis both through air quality monitoring and monitoring of the marine ecosystems around the project. A build-up of silt in the marine environment cannot be allowed, over the course of the project it would destroy local marine life.</p>	<p>The air quality dispersion model predictions presented in Figures 5.7-2, 5.7-3, 5.7-4 and 5.7-5 represent in-air concentrations of particulate matter fractions and not predictions of dust deposition; the concentrations presented do not represent dust plumes. In addition, the dispersion modelling methods and associated assumptions - approved by the Ministry of Environment (MOE) - incorporated a high degree of conservatism. The air dispersion model was based on worst case daily emission rates and assumed worst case daily emissions every day of the year. These assumptions contributed to the high level of confidence in the air quality assessment predictions that there will no significant adverse effects.</p> <p>The same Ministry-approved CALPUFF model that was used to predict air quality concentrations (i.e., run in dynamic [3D] mode with a fine resolution meteorological data set) was used to predict deposition rates which were incorporated into the surface water quality model and the assessment of potential effects on water quality and aquatic health. With the effective implementation of the proposed erosion and sediment control measures and BMPs, the potential residual effects on water quality and aquatic health were determined to be negligible and not significant. Proposed mitigation for controlling the release of dust to the aquatic environment including the following:</p> <ul style="list-style-type: none"> <li>- Developing and implementing an Air Quality and Dust Control Management Plan that will detail measures to control fugitive particulates.</li> <li>- Developing and implementing an Erosion and Sediment Control Plan.</li> <li>- Establishing an on-site Air Quality and Meteorology Monitoring Program.</li> <li>- Fines/silt cakes berm should be vegetated as soon as possible and where possible by planting and seeding with native trees, shrubs, and grasses.</li> <li>- Placement of erosion control blankets on the berm to prevent dust.</li> <li>- Sediment and erosion control measures should be maintained at all times around the crushing areas and until vegetation is achieved on the berm.</li> <li>- Processing plant crushing and dry screening units will be partially enclosed.</li> <li>- Watering of 10 mm crushed gravel and 20 mm crush gravel stockpiles.</li> <li>- Watering of unpaved roads and restricting speed limits</li> </ul>

1851	458 - 20	Personal Information Withheld	North Vancouver, BC	Golder Associates also indicate the site could be home to up to 21 Species at Risk including a population of Roosevelt Elk that were transplanted to McNab Creek by the BC Ministry of Environment in 2001 in an effort to re-introduce the species to the area.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
1852	458 - 21	Personal Information Withheld	North Vancouver, BC	The current value of the McNabb area as salmon bearing habitat is downplayed in the proponent's report. Our own experience has been of a rejuvenation in fish stocks at McNab, reflecting the fish recovery seen elsewhere in Howe Sound. Greater scrutiny around this part of the report is necessary to reflect the true value of the creek as a salmon habitat.	<p>A description and quantification of potential spawning habitat in the upper section of WC2 is provided in section 3.1.3.1 of Appendix 5.1-A and in Table 6 of the same appendix. A spawner survey conducted on 13 November 2016 re-affirmed the baseline description and observed less than 200 m2 of suitable salmonid spawning habitat based on the presence of exposed gravels and adequate depth (&gt; 18cm).</p> <p>As described in section 3.1.3.2 of Appendix 5.1-A the lower section of WC2 consists of low gradient run and pool habitat with exposed gravels present in the runs and fines occurring in the pool areas. The distribution of pool to run habitat is approximately 1/1 along the length of the lower section. There is approximately 3,920 m2 of wetted area in the lower section of WC2 suggesting that there is approximately 1960 m2 of run habitat that may be suitable for spawning, based on the presence of exposed gravels and adequate depth. During the 13 November 2016 spawner survey chum salmon were observed to be spawning in the available run habitat present in the lower section of the channel (Figure 1, 30-Dec-2016 Technical Memo entitled BURNCO Aggregate Project: Additional Information Regarding Watercourse Two (WC2), Fish and Fish Habitat).</p> <p>The Fish Habitat Offset Plan proposes to create more than 5,000 m2 of additional groundwater-fed channel habitat with approximately a 1/1 ration of pool to run habitat. The offset channel extension uses the design of the existing lower channel as a template so it is reasonable to expected that approximately 2,500 m2 of the new habitat will have conditions similar to the run habitat present in the existing channel where chum salmon were observed to be spawning.</p> <p>A 30-Dec-2016 Technical Memo entitled BURNCO Aggregate Project: Additional Information Regarding Watercourse Two (WC2), Fish and Fish Habitat provides the results of 2016 spawner surveys for WC2 and a description of salmonid species utilization of habitat provided by groundwater-fed channels.</p>

1853	458 - 22	Personal Information Withheld	North Vancouver, BC	<p>Even if Burnco make the best possible effort, there is no way they will be able to significantly mitigate the noise from loading millions of tonnes of aggregate into steel hulled barges. Noise and vibrations have been found to disturb large marine mammals' communication, navigation and food-finding abilities, and are increasingly believed to impact their fertility. Sadly, if Burnco is allowed to proceed with this mine, we can expect the dolphins, orcas, and grey whales to vacate the area.</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

1854	458 - 23	Personal Information Withheld	North Vancouver, BC	An artificial lake is not a reasonable remediation to replace the habitat for the displaced wildlife.	<p>The pit lake is not proposed as mitigation for habitat loss. Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>
1855	458 - 24	Personal Information Withheld	North Vancouver, BC	We find it difficult to believe that there will be no audible impact from the project on the north end of Gambier Island. Given the natural topography of the area and the fact that noise travels very clearly across water we have significant concerns about the noise of the barge loading in particular which we believe will have a significant negative impact of the peaceful nature of the area for humans as well as for marine and terrestrial life. While talking to representatives from Golder at the Open House in West Vancouver in September 2016 it became clear that the noise impact had been modelled with little firsthand knowledge of the area impacted; the lead representative on noise impact admitted he had never been onsite.	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Considering these factors, the modelled Project contributions to noise levels at NR4 (Eakins Point, inside the LSA and across the water from the Project) were below baseline and resulted in Negligible-Not Significant effects.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners, including receptors across the water such as Eakins Point.</p>

1856	458 - 25	Personal Information Withheld	North Vancouver, BC	The noise values expected from the Golder models were considered to be acceptable to urban and industrial settings; the study area is neither as it is primarily recreational.	The Commission Guideline defines a pristine area as: "A pure, natural area that might have a dwelling but no industrial presence, including energy, agricultural, forestry, manufacturing, recreational, or other industries that already impact the noise environment."  McNab Creek is not considered to be a pristine because there is a known industrial presence activity (i.e. logging), as well as known recreation use of the area (e.g., boating, hunting). There is also a run-of-river power project in close proximity.
1857	458 - 26	Personal Information Withheld	North Vancouver, BC	Golder has much work to do to assist Burnco in measuring and evaluating the impact of their project on the marine and terrestrial mammals resident and using the area!	A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.  The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.  The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.
1858	458 - 27	Personal Information Withheld	North Vancouver, BC	Golder has much work to do to assist Burnco in measuring and evaluating the impact of their project on the marine and terrestrial mammals resident and using the area!	A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.  Potential effects were assessed for the following selected valued components: - Amphibian species at risk - Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet; - Roosevelt elk and grizzly bear; - Environmentally sensitive ecosystems; - Ecosystems at risk; and - Plant species a risk.  Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.  Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.

1859	458 - 28	Personal Information Withheld	North Vancouver, BC	<p>A number of areas of the EIS identify possible environmental impacts of the project but allude to these being addressed by “best management practices”. There are significant concerns around approving a development with clear environmental risks based on the “hope” that best environmental practices will be adhered to. The resources available at the BCEAO for oversight of such projects seem fairly limited from a resource perspective (5-6 people cover the province). What is to stop the proponent from ignoring “best practise” and declining to follow mitigation strategies? The experience of residents adjacent to the Cougar Ridge Mine in Calgary, Alberta owned and operated by Burnco does not suggest that Burnco can be guaranteed to be a “good neighbour”.</p>	<p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 and are summarized below. BURNCO commits to funding for these monitoring initiatives.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring.</p> <p>Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational Environmental Protection Plans (EPPS). Compliance monitoring will include assessment of Proponent and contractors’ environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program.</p> <p>BURNCO will submit a report to the BCEAO on the status of compliance with the Certificate Conditions, at the following times:</p> <ul style="list-style-type: none"> <li>- At least 30 days prior to the start of Construction;</li> <li>- On or before January 31 in each year after the start of Construction;</li> <li>- At least 30 days prior to the start of Operations;</li> <li>- On or before January 31 in each year after the start of Operations;</li> <li>- At least 30 days prior to the start of Closure and Reclamation;</li> <li>- On or before January 31 in each year after the start of Closure and Reclamation; and</li> <li>- Within 30 days of completing Closure and Reclamation.</li> </ul> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>

1860	458 - 29	Personal Information Withheld	North Vancouver, BC	<p>Economic Impacts</p> <p>While the project will create 12 full time jobs, it will jeopardize far more jobs than that by impacting the tourism and film industries irreparably.</p> <p>BC FILM INDUSTRY</p> <p>The BC Film industry contributes \$1.3 billion annually to the BC economy. Crews regularly use Howe Sound to represent many world locales, as it provides the key ingredients of wilderness, breathtaking scenery, and easy access from Vancouver, and silence. The introduction of an open pit mine, gravel barge and crusher will dramatically diminish this appeal—making Vancouver itself a less convenient place to film a movie, since its nearby wilderness will no longer be viable for filming.</p> <p>In a 2012 letter to the Future of Howe Sound Society (FHSS) from Thierry Tanguy, a Unit and Location Manager, in Greater Vancouver's Film Industry, Thierry had this to say: "In the last few years, a number of projects have been filmed in the Squamish corridor, as opposed to the other regions we typically compete with, such as California and Louisiana, precisely because of the pristine beauty of its coastline. To name a specific example, I just finished working on a project entitled 'Horns' for Mandalay Pictures. ... originally slated to be filmed in Savannah, Georgia. The one element that shifted the interest in favour of British Columbia is the beauty of the Squamish corridor and Howe Sound where we ended up filming Two-Thirds of the project. This is Twenty-Million</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
1861	458 - 30	Personal Information Withheld	North Vancouver, BC	<p>The mine will be visible from the Cypress ski area and Lions Bay, a popular hiking and rock-climbing destination. Every visitor headed to Squamish or Whistler on the Sea-to-Sky Highway and Sea-to-Sky Gondola, as well as daily sightseeing flights from downtown on Harbour Air and others, will see this once-stunning valley being rendered into a gravel mine.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

	Ref #	Commenter (Name)	Location		
1862	458 - 31	Personal Information Withheld	North Vancouver, BC	<p><b>Property Values</b> Property values along the Howe Sound have already been negatively impacted. The 16 vacation homes at McNab Creek and 53 recreational properties directly across the channel at Douglas Bay on Gambier Island will be the hardest hit due to the obvious eyesore, increased barge traffic, noise and loss of natural beauty. The reduction in property values which has already occurred since the mine was first proposed 6 years ago, harms not only residents, but municipal governments' tax base. Given the considerable increases in property values in the Lower Mainland in the last 6 years it is quite staggering that properties anywhere close to this proposed mine have seen a decline in both assessed value and potential resale value, as evidenced by recent land sales in the area.</p> <p>Vancouver-based Burrard and West Vancouver-based Thunderbird Yacht Clubs have outstations directly opposite the mine site. The 600 members will suffer loss of land value, and outstations will suffer from significantly diminished use.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
1863	458 - 32	Personal Information Withheld	North Vancouver, BC	<p><b>Social Impacts</b> Easy accessibility from Vancouver allows people across the lower mainland to enjoy wilderness on their doorstep. The impact of the mine will diminish Howe Sound for present and future generations, reducing Vancouver's much-vaunted "liveability."</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
1864	458 - 33	Personal Information Withheld	North Vancouver, BC	<p>The immediate visual impact of the mine and crushing facilities has only been shown by the proponent at sea level. To understand the full visual impact an assessment from a higher elevation is needed. We believe that from a higher elevation the open pit mine and crushing facilities will be fully visible and have a further negative social and economic impact on the properties from which they are visible.</p>	<p>The visual resources assessment (Section 7.4 of the EAC Application/EIS) acknowledges that the residents of the McNab Strata would be most affected by the potential visual impacts due to their close proximity to the Proposed Project. The viewpoint was taken from the end of the breakwater where the view would be unobstructed, and it is a publically accessible location that would be experienced by residents accessing the dock at the McNab Estates Strata. The lighting assessment indicated residential receptors at the Strata are located in a dark setting with existing lighting visible from adjacent industrial land use.</p> <p>Assessment of viewing locations and/or viewing conditions are limited to those locations that represent viewing opportunities that currently exist or that are certain or reasonably foreseeable.</p>

1865	458 - 34	Personal Information Withheld	North Vancouver, BC	In the immediate vicinity of this proposed mine there are existing communities including McNab Creek Strata, Douglas Bay Strata, Brigade Bay, Burrard Yacht Club and Thunderbird Yacht Club. All of these communities enjoy the peace and tranquillity and abundant wildlife in this amazing section of Howe Sound. Families engage in all manner of sport and recreation including hiking, swimming, water sports, sailing, wind surfing, paddle boarding and kayaking. In addition numerous kids camps such as Potlach, Day Break, Artaban, Boys and Girls Club use this area for recreation and there are frequent excursions of kayakers in procession from these camps paddling by or visiting McNab Creek area.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
1866	458 - 35	Personal Information Withheld	North Vancouver, BC	In its draft AIR Burnco committed to reporting on the status of consultations with private local land owners and tenure holders who will be affected by the project. However Volume 4, section 21 of the report shows little evidence that Burnco fulfilled these commitments. At section 21.2.4.1 – Social Communications the list of Personal Communications lacks engagement with the local stakeholders who will be impacted by the project. For instance, although Douglas Bay is the largest private land holding in the area and will be directly impacted if the project goes ahead no one from Burnco has attempted to contact the members of the Douglas Bay Strata.	The sample of key informants described in Section 7.3 of the EAC Application/EIS (Non-traditional Land and Resource Use) was not intended to be exhaustive of all stakeholders potentially affected by the Proposed Project, but rather was intended to be wide ranging enough to confirm and expand on non-traditional land and resource use information available from the referenced secondary sources. Key informants interviewed or provided data for this report included representatives from recreational groups and tourism operators, as well as DFO and MFLNRO. Specifically key informants included:  <ul style="list-style-type: none"> <li>- Burrard Yacht Club</li> <li>- Coastal Inlet Adventures</li> <li>- DFO</li> <li>- Don's Water Taxi</li> <li>- Gambier Island Local Trust</li> <li>- Gibson Chamber of Commerce</li> <li>- Islands Trust</li> <li>- MFLNRO</li> <li>- Recreation Sites and Trails BC</li> <li>- Sewell's Marina</li> <li>- Squamish Yacht Club</li> <li>- Sunshine Kayaks</li> <li>- Thunderbird Yacht Club</li> </ul> Conditions C-5.1 through C-5.3 (Table 19.1) outlines the Proponent commitment to ongoing engagement with the McNab Creek Strata. BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. BURNCO has also proposed a McNab Community Enhancement Fund (CEF) that would consist of money set aside each year of operation, based on output, to enhance the McNab community through targeted funding on projects throughout the region. Funding of projects would be given priority by BURNCO's Management Committee based on a number of criteria that would include: <ul style="list-style-type: none"> <li>- Mitigation of project effects</li> </ul>

1867	458 - 36	Personal Information Withheld	North Vancouver, BC	In conclusion we cannot see how the joint goals of environmental, social and economic sustainability for Howe Sound can be achieved if this project is allowed to go ahead. We can only trust in the process and believe that our public servants and government will recognize that the value of McNab Creek and the whole Howe Sound region outweighs the business needs of one Alberta based company.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
1868	458 - 37	Personal Information Withheld	North Vancouver, BC	If the project should go ahead we need to ensure that there are stringent conditions (including multi-million dollar environmental bonds) attached to its approval which are closely monitored on an ongoing basis by an independent third party and to ensure that the scope of the operation does not extend beyond that described in the EIS. A robust monitoring and safeguard system needs to be in place to ensure the commitments in this application are followed through and that Burnco is held accountable should the need arise.	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>

1871	459 - 2	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>Review of the Environmental Impact Statement for Burnco Aggregate Project: threats to fish and fish habitat in McNab Creek watershed.</p> <p>Stamford Environmental Mike Stamford, MSc. For Sunshine Coast Conservation Association 30 September 2016</p> <p>This letter provides comments on the Environmental Impact Statement prepared by Golder Associates for Burnco Aggregates (cited as Burnco 2016), which describes the potential impacts and compensation plans for fish and fish habitat around proposed a gravel mining operation in the McNab Creek watershed.</p>	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>
1872	459 - 3	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>Four value components (VC's) have been chosen by the proponent to evaluate impacts from mining gravel in the McNab Creek flood plain. These include: cutthroat trout (<i>Oncorhynchus clarki</i>; anadromous and freshwater forms), chum salmon (<i>O. keta</i>), pink salmon (<i>O. gorbuscha</i>), and coho salmon (<i>O. kisutch</i>). Baseline sampling (Golder 2016) examined the distribution of summer rearing juvenile fish spanning three years (2009, 2010, 2011), and overwintering juveniles during one year (2012), all in the local study area (LSA). Juvenile densities appear to have been evaluated during only one summer rearing season (i.e. a sample size of one during 2010). Adult abundance estimates (termed escapement) were collected using foot surveys of McNab Creek and WC2 (a constructed ground water channel) during late summer and early winter of years 2009, 2010, 2011, 2012, and 2013. Each survey crew of two visually assessed species and numbers (counts) of migrating adult salmon from the stream banks.</p>	<p>The introduction to the Fisheries and Freshwater Habitat Baseline (Appendix 5.1-A of the EAC Application/EIS) provides a set of objectives for the habitat assessments and fish sampling that was conducted. This is summarized below:</p> <p>"The objectives of the habitat assessments were to collect information regarding the location and extent of available fish habitats and to assess the characteristics of these habitats. The objective of the fish sampling program was to collect information regarding the fish community present, and the distribution and habitat use of fish species potentially affected by the Proposed Project. This report provides a baseline description of the watercourses (both constructed and natural), habitat characteristics, habitat quality, fish distribution and fish use within the watercourses present near the Proposed Project."</p> <p>BURNCO agrees that attempting to collect representative density and abundance information for highly variable salmonid populations is not particularly useful. We recognize that anadromous salmonid populations are influenced by a wide range of density dependent and density independent factors in both freshwater and marine phases of their life history. That is why fish sampling was done to provide information regarding fish distribution, habitat utilization and relative abundance among the various watercourses within the LSA. A variety of methods including electrofishing, minnow trapping, visual observation and fyke netting were used to gather this information. Collecting data on fish species and age class provides useful information for the evaluation of potential Project related effects.</p> <p>Assessing the accuracy of the assessment predictions and the effectiveness of mitigation measures will be done through an Environmental Effects Monitoring Program (EEMP) that will cover monitoring before, during and after activities that have the potential to affect fish and fish habitat. Where practical the design of the EEMP will include the use of reference sites unlikely to be impacted by the Proposed Project as a means of distinguishing natural variation from Proposed Project effects.</p>

1873	459 - 4	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>It remains unclear what these data will be used for. For instance, juvenile fish densities and even their distribution in nature often fluctuate enormously among years so knowing these parameters from a single year of sampling (i.e. 2010) have limited use. Similarly, understanding the distribution of rearing juveniles is limited since sampling appears to have been restricted to small enclosed areas, excluding long stretches of other rearing areas. These data do not provide sufficient resolution to evaluate threats to fish populations from any anthropogenic disturbances to their home stream (i.e. McNab Creek and associated groundwater fed channels). More appropriate data would include a temporal series of abundance estimates (e.g. densities collected over a minimum of five years prior to development) to provide base line population abundance estimates. Distribution data would better be examined with open site electrofishing spanning larger genera areas and include a wider range of habitat types. Focusing sampling effort in small areas appropriate for installing enclosure nets biases the sample, especially if the data are used to evaluate species presence in the watershed and identifying value components.</p>	<p>The introduction to the Fisheries and Freshwater Habitat Baseline (Appendix 5.1-A of the EAC Application/EIS) provides a set of objectives for the habitat assessments and fish sampling that was conducted. 1874	459 - 5	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>Perhaps more importantly, the fish data should also include adult abundance estimates to gain perspective on natural (pre impact escapement) population trends and distribution. The baseline data collected for this project provide a brief snap shot of migrating adult salmon visually observed from the stream bank during spawning surveys. Walking along the stream bank observing migrating fish have limited accuracy of counts (i.e. low capture probabilities) and even provides questionable species identifications. These data do not have sufficient resolution (e.g. no capture probabilities provided) to evaluate: a) changes in population productivity for any species that might result from anthropogenic disturbances in their watershed (e.g. gravel mining); b) changes in population productivity or distribution of any species resulting from actions designed to compensate for disturbances (e.g. WC2 extension). Without rigorous prior information that accurately estimates fish population abundance and distribution in McNab watershed how will these fish data be useful?</p>	<p>The introduction to the Fisheries and Freshwater Habitat Baseline (Appendix 5.1-A of the EAC Application/EIS) provides a set of objectives for the habitat assessments and fish sampling that was conducted. 1875	459 - 6	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>The environmental impact statement cites DFO and MOE data that suggest fewer than 500 adult salmon historically return to McNab Creek each year. How were these numbers determined? If these estimates of adult abundance are close to being accurate then these small populations are especially vulnerable to threats from disturbances in their home stream (including the estuary) and highlights the urgency for conservation assessments for these species. The Government of BC is currently working to assess the conservation status of our native species (e.g. Hagen and Decker 2011; Stamford et al. 2015) because the public values increasingly recognize the importance of conserving our living resources (i.e. the unique diversity of the native species in B.C.). Conservation assessments often identify areas where past behaviours during resource extraction have pushed fish populations into situations of high extinction risk or areas where extirpations have occurred in watersheds and these impacts are no longer acceptable in B.C. Resource extraction practices are increasingly required to be precautionary in their development plans to avoid causing unforeseen (miscalculated) impacts and threats to native species. For instance, with evidence suggesting small populations of salmon exist in McNab watershed should trigger a sampling regime designed to accurately identify all species present, evaluate their distribution and habitat use, population abundance. These data are needed to evaluate conservation status and identify behaviours that avoid threats to these populations. Instead, Burnco (2016) appears to suggest that evidence for small salmon populations should facilitate freedom for any industrial development behaviour. This</p>	<p>The numbers provided were obtained from federal and provincial fisheries databases.</p> <p>DFO. 2012. Mapster. Available at: <a href="http://www.pac.dfo-mpo.gc.ca/gis-sig/maps-cartes-eng.htm">http://www.pac.dfo-mpo.gc.ca/gis-sig/maps-cartes-eng.htm</a> Accessed January 2013</p> <p>MoE (BC Ministry of Environment). 2012. Habitat Wizard. Available at: <a href="http://www.env.gov.bc.ca/habwiz/">http://www.env.gov.bc.ca/habwiz/</a>. Accessed January 2013</p> <p>These databases include the results of annual salmon escapement surveys that were historically conducted as far back as the 1940s. These escapement surveys used visual observation methods similar to the spawner surveys conducted more recently at the Proposed Project site. It is true that an annual surveys only provide a snapshot each year. A review of several decades of such information does indicate that the timing and size of the salmon runs in the McNab system are highly variable. That is why the assessment provided a range as well as an average return. Salmon returns to smaller coastal stream systems tend to be highly variable due to the wide variety of freshwater and marine factors that may influence their survival.</p> <p>Please see the response to the comment above regarding the objectives for fish sampling.</p> <p>The assessment did not intend to suggest that smaller populations warrant a less conservative approach. The assessment conclusions are based on the expectation that Proposed Project design and mitigation measures, including habitat offsetting for direct and indirect effects to fish habitat, are expected to avoid/reduce the potential for fish habitat quantity and quality to be affected.</p>

1876	459 - 7	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>Other salmonid species present in the watershed were excluded from the VC list due to “infrequent sightings or observations in the baseline sampling” (Golder Associates 2016). Steelhead/rainbow trout (<i>O. mykiss</i>) and chinook salmon (<i>O. tshawytschaw</i>) are both known to inhabit McNab watershed but baseline sampling has been insufficient to evaluate fish abundance, or even distribution.</p> <p>Low abundance in baseline sampling is the stated reason for their exclusion, yet capturing eight adult steelhead was mentioned briefly in the document. Also excluded from the VC list is the Dolly Varden (<i>Salvelinus malma</i>), which is present in the regional study area (e.g. adjacent watersheds and further upstream; Hatfield Consultants Ltd. 1997; Whelan and Associates Ltd. 1999). All of these species have both resident and anadromous life histories, which means they use McNab Creek and the estuary to complete their life history. The McNab Creek estuary is the second largest estuary (highly productive area) in Howe Sound and provides critical habitat for numerous species (including anadromous fish). McNab estuary probably provides critical rearing and overwintering habitat for populations derived from surrounding areas (e.g. those that spawn in adjacent streams); many small populations especially vulnerable to disturbances. Given the increasing conservation and economic values that biodiversity provides both to First Nations and British Columbians in general the disturbances to the estuary during 16 years of resource extraction should not be minimized.</p>	<p>Low numbers of steelhead and chinook were captured during a comprehensive fish sampling program that extended over a number of years and used a variety of fish sampling techniques including electrofishing, minnow trapping and fyke netting. These results suggest that steelhead and chinook are not abundant within the LSA. The assessment documents that five steelhead were captured during sampling.</p> <p>Species such as steelhead, chinook and Dolly Varden may not be common in the LSA and thus they were not identified as VCs. This does not mean that potential effects on them were ignored. Consideration of issues such as adequate stream flow and water quality for VC species also serves to protect these less common species.</p> <p>BURNCO agrees that disturbance to McNab Creek and the McNab Creek estuary should be avoided as much as is practical. Proposed Project design and mitigation measures presented in the EAC Application/EIS are expected to avoid/reduce potential Project related effects to fish and fish habitat in these areas.</p>
1877	459 - 8	Sunshine Coast Conservation Association	Sunshine Coast, BC	<p>Burnco (2016) list numerous possible accidents but each is classified as negligible in their likelihood of occurrence. There is no way of evaluating these predictions or the cumulative effects that could cause a general erosion of habitat quality in this important ecosystem.</p>	<p>Potential effects associated with accidents and malfunctions were characterized as negligible based on the low likelihood of occurrence and the implementation of existing best management practices and standards that are regularly used and have a high degree of reliability.</p>

1878	459 - 9	Sunshine Coast Conservation Association	Sunshine Coast, BC	The gravel mining operation in McNab watershed will remove vast quantities of gravel that will permanently impact the watershed. Burnco (2016) has seriously downplayed the potential impacts on the surrounding ecology in Howe Sound. Yet any miscalculations in their perceived operations cannot be evaluated because prior biological data has not been collected. The potential cost to our living resources and recovering biodiversity that depends on McNab watershed and estuary are high and there are other local sources of gravel available. We urge the regulators of our public resources to consider the potential impacts on our living resources and not allow this development to occur. To permanently disfigure an estuary and potentially deplete biological functioning in one of the most productive areas in Howe Sound carry serious consequences to long-term economics and general well being to future generations of British Columbians.	The biological function of the estuary is influenced by the sediment supply currently entering the estuary from McNab Creek which is derived from actively eroding locations within the watershed. The extraction of terrestrial gravel deposits from the pit is not expected to impact or change the function of the estuary because the alluvial fan is not a contributor to the sediment/gravel budget.  Assessing the accuracy of the assessment predictions and the effectiveness of mitigation measures will be done through an Environmental Effects Monitoring Program (EEMP) that will include consistent monitoring before, during and after activities that have the potential to affect fish and fish habitat. Where practical the design of the EEMP will include the use of reference sites unlikely to be impacted by the Project as a means of distinguishing natural variation from Project caused effects.
1879	460 - 1	John Adams	North Vancouver, BC	We all cherish and celebrate the recovery of Howe Sound after decades of toxic pollution from heavy industry. BC taxpayers paid millions to clean up the Britannia mine in Howe Sound and now finally those actions, along with other conservation efforts, are paying off with the return of fish stocks, dolphins, orcas, whales and a proliferation of bald eagles and other wildlife.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
1880	460 - 2	John Adams	North Vancouver, BC	Please bring to an end the proposed Burnco open pit mine before massive economic harm is caused to thousands of local residents and businesses including our film and tourism industries as well as countless dollars have been spent by both BC and Federal regulators evaluating whether the environmental destruction of a portion of this sensitive ecosystem can be "mitigated".	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B - Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.

1884	461 - 2	Sam Wainwright	Gambier Island, BC	I am completely against the development of the Burnco Mine Project and have been since it was first preposed. Over the past 10 years I have watched the growth and return of our natural wildlife come back into the region. This includes fish, birds, crabs, dolphins & whales! This area is treasure of the BC Coast line and needs to be treated as such.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
1885	461 - 3	Sam Wainwright	Gambier Island, BC	My family and 100's & thousands of others treat and respect these marine parks as the jewel and where they spend their most precious time with their family & friends to enjoy and admire its beauty.	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
1886	461 - 4	Sam Wainwright	Gambier Island, BC	To allow Bunco to roll out their mining project would be devastating to the area, it neighbours and most importantly the wild life! We can lot let this happen!	A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.  Potential effects were assessed for the following selected valued components: - Amphibian species at risk - Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet; - Roosevelt elk and grizzly bear; - Environmentally sensitive ecosystems; - Ecosystems at risk; and - Plant species a risk.  Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.  Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.

1893	463 - 5	Peter Williamson	Bowen Island, BC	I am deeply concerned about the impact of the mining operations on terrestrial wildlife in the MacNab Creek area, and the marine life at the mouth of MacNab Creek and in the wider Howe Sound.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
1894	463 - 6	Peter Williamson	Bowen Island, BC	I am deeply concerned about the impact of the mining operations on terrestrial wildlife in the MacNab Creek area, and the marine life at the mouth of MacNab Creek and in the wider Howe Sound.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

1895	463 - 7	Peter Williamson	Bowen Island, BC	The mining operations themselves will create light pollution, noise, sediment in the waters, destruction of the estuary, and will increase marine traffic in Howe Sound to an unacceptable level. There is likely to be a negative impact on commercial and recreational fisheries, as well as marine mammals which are now returning to Howe Sound.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
1896	463 - 8	Peter Williamson	Bowen Island, BC	The mining operations themselves will create light pollution, noise, sediment in the waters, destruction of the estuary, and will increase marine traffic in Howe Sound to an unacceptable level. There is likely to be a negative impact on commercial and recreational fisheries, as well as marine mammals which are now returning to Howe Sound.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p>
1897	463 - 9	Peter Williamson	Bowen Island, BC	The mining operations themselves will create light pollution, noise, sediment in the waters, destruction of the estuary, and will increase marine traffic in Howe Sound to an unacceptable level. There is likely to be a negative impact on commercial and recreational fisheries, as well as marine mammals which are now returning to Howe Sound.	<p>A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken. Adaptive management techniques to be implemented as required include:</p> <ul style="list-style-type: none"> <li>- Continue to evaluate the extent of the pit during operations.</li> <li>- During the wet season, if water levels in the pit lake become higher than has been designed for the Pit Lake Containment Berm then the valves in the culverts will be closed to reduce the amount of water reporting to the pit from the surface water on the western slope.</li> <li>- The height of the pit lake at the outlet structure can be adjusted to increase or decrease the level of the pit lake (e.g., adding or lowering stop logs) at closure to maintain the hydraulic gradient between McNab Creek and the Project Area following closure.</li> </ul>

1898	463 - 10	Peter Williamson	Bowen Island, BC	The mining operations themselves will create light pollution, noise, sediment in the waters, destruction of the estuary, and will increase marine traffic in Howe Sound to an unacceptable level. There is likely to be a negative impact on commercial and recreational fisheries, as well as marine mammals which are now returning to Howe Sound.	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
1899	463 - 11	Peter Williamson	Bowen Island, BC	The mining operations themselves will create light pollution, noise, sediment in the waters, destruction of the estuary, and will increase marine traffic in Howe Sound to an unacceptable level. There is likely to be a negative impact on commercial and recreational fisheries, as well as marine mammals which are now returning to Howe Sound.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
1900	463 - 12	Peter Williamson	Bowen Island, BC	There are many alternative sources of gravel and there is no justification proceeding with this project.	<p>Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>

1901	463 - 13	Peter Williamson	Bowen Island, BC	There is minimal economic benefit to British Columbia, as a whole, and Howe Sound region, in particular.	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>
1902	463 - 14	Peter Williamson	Bowen Island, BC	I implore you not to allow this project to proceed.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

1906	465 - 1	Personal Information Withheld	Vancouver, BC	<p>The Howe Sound is an incredibly sensitive environment. We have already made this mistake once in the past with the old Britannia Mine, and waste materials from the mine which were not properly dealt with leaked into the ocean and caused environmental devastation for years. It has only been recently that we have seen changes in the Howe Sound that mark it returning to a healthy state- whales such as orcas and dolphins are becoming more plentiful and venturing further in like they used too before the first mine. The reason we teach history in our schools is not only to give children perspective to the world around them, but to discourage the mistakes we made in the past. Please let the failures of the past warn and guide your actions of the future.</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

1909	467 - 2	Steve Dietrich	Gambier Island, BC	<p>This is a place where silence and beauty is so spectacular that you can read a book while hearing only the occasional splash of a seal, the flapping of wings from a blue heron, and the crunching teeth of a sea otter while eating his morning fish. Mountains tower straight out of the ocean 3,000 - 5,000 feet in a 360 degree view. Kids paddle board in notoriously calm waters. There is recreational crabbing, prawning, fishing, and natural oysters beds, among many other forms of wildlife. You may think you are in Alaska but you are only 45 minutes from downtown Vancouver.</p> <p>It seems so long ago that the Howe Sound was so polluted that no one was even interested in enjoying the many wonders of this area. This is not the only area that has had a eye opener. Consider, the dump within the Whistler town center 40 years ago before it was really discovered. The logging dumps in Tofino and clear cutting in Clayoquot Sound, prior to it becoming a UNESCO biosphere or the recent success of the Sea to Sky Gondola in a town that has emerged from a rough industrial history. Even the shores of Vancouver were once filled with heavy industry and is now one of the most livable metropolitan areas in Canada. The beauty of McNab Valley is that it is not overcome by tourists, it is actually slightly hard to get to without a boat. However, there are many areas in BC (such as the ones above) that were also once hard to get to. Access to Howe Sounds is slowly changing with the growth in water taxi's more and more personal water craft, kayaks and paddle boards etc. Please be cognizant of the monetary value in increased marine resources and potential tourism dollars that will greatly</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. 1911	467 - 4	Steve Dietrich	Gambier Island, BC	The immense benefits that this area offers with respect to both natural marine and terrestrial ecosystems is truly spectacular. The industrial applications that are being considered for this region are truly disappointing. I understand that gravel is an important part of our lives but a mine of this nature would surely be better suited in other locations with a lower impact to both the ecosystem and tourism economy.	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
1912	467 - 5	Steve Dietrich	Gambier Island, BC	<p>More Concerns:</p> <ul style="list-style-type: none"> <li>• Noise from rock crushers reverberating off the mountains surrounding the site and the ocean. This area is valued for its peace and quiet and majestic beauty. Apparently, there is no plan to have any monitoring mechanism in place and no repercussions should the noise be disturbing.</li> </ul>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>
1913	467 - 6	Steve Dietrich	Gambier Island, BC	<p>More Concerns:</p> <ul style="list-style-type: none"> <li>• Noise from rock crushers reverberating off the mountains surrounding the site and the ocean. This area is valued for its peace and quiet and majestic beauty. Apparently, there is no plan to have any monitoring mechanism in place and no repercussions should the noise be disturbing.</li> </ul>	<p>Noise monitoring locations will be included as part of the Noise Management Plan. Stations will be located to monitor noise levels at the McNab Strata and at Ekins Point on Gambier Island.</p>

This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

1927	468 - 1	Michele Hall-McCaffrey	Gambier Island, BC	I attended the Burnco Public Open House in West Vancouver and commend Burnco for the effort put into the materials and information and presentation. I am however, opposed to industrialization that impacts the foreshore and water resources of Howe Sound. I have been travelling Howe Sound by boat and water taxi for 24 years and have seen first hand the issues with development that impacts watersheds and streams and the very lengthy period of recovery time needed when these resources are impacted. I have also seen first hand what many other commenters have noted, an apparent but slow recovery of Howe Sound and the return of sea life that is notable and significant - whales and dolphins on a regular basis and primarily just the last 2-3 years.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
1928	468 - 2	Michele Hall-McCaffrey	Gambier Island, BC	In my area, we have a salmon spawning creek that sees wildly varying returns of salmon annually. Howe Sound supports salmon and we need to be conscientious about how we manage the area.	A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.  The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.  The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.
1929	468 - 3	Michele Hall-McCaffrey	Gambier Island, BC	While Burnco's plans for fish habitat between the future mine lake and the ocean seem adequate at first look, the protection of this habitat from mine lake overflow appears to depend on a dam gate and Golder consultants were unable to answer who would monitor and control this once the project was closed down. I suspect it would be the local government and paid for by us, the tax payers. This needs to be a factor that is determined up front. Too often we see the taxpayer on the hook after private industry has finished a project. The examples are numerous.	A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit. Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until installed works are determined to be functioning as intended.  Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.  Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.

1930	468 - 4	Michele Hall-McCaffrey	Gambier Island, BC	This area of Howe Sound is also subject extreme winter rains and heavy storms. Given this, I question whether the mine lake can be contained in such a way as to have no impact on McNab Creek.	<p>During the operational phase of the Project the water level in the pit will be monitored but not be actively managed. Mining operational activities will need to accommodate fluctuations in the Pit Lake water levels. The owner shall monitor the groundwater gradient and the water levels within the pit lake. These monitored groundwater and pit lake water levels shall be used to refine the analysis of the closure groundwater gradient and pit lake water level. These analysis shall be used to inform the progressive planning of the mine. After closure, if necessary, the groundwater gradient can be altered (varying the rate of loss from McNab Creek) by adjusting the height of the weir at the outlet of the pit lake.</p> <p>The Pit Lake water levels provided in Table 5.5-7 (Volume 2 Section 5.5), include consideration of surface water and groundwater inflows and groundwater outflows from the Pit Lake on an average annual basis. Additional analysis indicated that during extreme wet periods ranging in duration from days to months, the increased rates of surface water and groundwater inflow would result in Pit Lake water levels in excess of the values presented in Table 5.5-7. Under these conditions the rate of groundwater outflow would also increase above those predicted under annual average conditions. The height of the Pit Lake Containment Berm was designed in order to contain the elevated Pit Lake water levels that would result from extreme prolonged wet periods. Details of the analysis and design of the Pit Lake Containment Berm will be provided in the Mines Act Application.</p>
1931	468 - 5	Michele Hall-McCaffrey	Gambier Island, BC	The watersheds and major freshwater sources into Howe Sound have had enough industrialization what with Howe Sound Pulp and Paper, Woodfibre (now closed but under consideration for another major industrial project), water log booming (now discontinued but having long term impacts on ocean floor health), commercial activity at Squamish, and the severe problems caused by Britannia Mine that have cost taxpayers millions in cleanup.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
1932	468 - 6	Michele Hall-McCaffrey	Gambier Island, BC	Obviously aggregate is needed for the lower mainland however Howe Sound watersheds are not an appropriate source. Howe Sound has much more economic and social value by being able to support and improve marine life and stocks and as a world class recreational area within minutes of the city of Vancouver,	<p>Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>
1933	468 - 7	Michele Hall-McCaffrey	Gambier Island, BC	Obviously aggregate is needed for the lower mainland however Howe Sound watersheds are not an appropriate source. Howe Sound has much more economic and social value by being able to support and improve marine life and stocks and as a world class recreational area within minutes of the city of Vancouver,	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. 1934	468 - 8	Michele Hall-McCaffrey	Gambier Island, BC	Obviously aggregate is needed for the lower mainland however Howe Sound watersheds are not an appropriate source. Howe Sound has much more economic and social value by being able to support and improve marine life and stocks and as a world class recreational area within minutes of the city of Vancouver,	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
1935	468 - 9	Michele Hall-McCaffrey	Gambier Island, BC	If for some reason, the government approves this project, I hope my concerns about the mine lake are closely and thoroughly examined and a future management plan is in place that will not land in the taxpayers lap.	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>
1936	468 - 10	Michele Hall-McCaffrey	Gambier Island, BC	I also believe that if it is approved, it should only be permitted as a seasonal operation, that excludes the summer months and additionally should only operate at any time from Monday to Friday limited to 8 hours a day.	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>
1937	468 - 11	Michele Hall-McCaffrey	Gambier Island, BC	The noise concerns mentioned by other commenters are very important and this application should not take precedence over, or compromise, existing users and landowners and campers (Camp Latona children's camp) and the enjoyment of their facilities and properties. I do want to reiterate however, that overall, I do not support further industrialization of Howe Sound.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p>

1938	468 - 12	Michele Hall-McCaffrey	Gambier Island, BC	I was driving through Princeton recently, an easy drive from Vancouver, and they are building mountains out of mining waste aggregate. Perhaps the focus should be on lowering the cost of transporting this to the lower mainland.	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
1939	469 - 1	Personal Information Withheld	Bowen Island, BC	<p>I am concerned with the approval process for this project for two reasons.</p> <p>1. The proponent delivers all the evidence. However there is a wealth of educated and intelligent information material in the public domain that disputes many of the findings presented by the proponent. The proponent's representation of what will be destroyed and what will be remedied is in stark contrast to the public domain materials.</p>	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>
1940	469 - 2	Personal Information Withheld	Bowen Island, BC	Only a truly independent review - paid by the proponent but carried out by government appointed and independent experts - can truly determine impact, cost and benefit of the proposed wet mine.	<p>The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada in accordance with:</p> <ul style="list-style-type: none"> <li>- BCEAO Guideline for the Selection of Valued Components and Assessment of Potential Effects (BCEAO 2013),</li> <li>- Operational Policy Statement: Addressing Cumulative Environmental Effects under the Canadian Environmental Assessment Act (CEA Agency 2007),</li> <li>- Addressing Cumulative Environmental Effects. A Reference Guide for the Canadian Environmental Assessment Act (CEA Agency 1994),</li> <li>- Cumulative Effects Practitioners Guide (CEA Agency 1999), and</li> <li>- A Reference Guide for the Canadian Environmental Assessment Act: Determining Whether a project is Likely to Cause Significant Environmental Effects (FEARO 1994a).</li> </ul> <p>A detailed methods framework is provided in Volume 2, Part B – Section 4 of the EAC Application/EIS.</p>

1941	469 - 3	Personal Information Withheld	Bowen Island, BC	Only a truly independent review - paid by the proponent but carried out by government appointed and independent experts - can truly determine impact, cost and benefit of the proposed wet mine.	<p>BURNCO engaged an independent and reputable team of qualified scientists and EA practitioners from Golder Associates Ltd. to conduct the required studies and prepare an environmental assessment for the Proposed Project. Golder is a global, employee-owned company with over 50 years of experience. They have over 400 BC-based staff involved in environmental assessment and related activities. All of Golder's work undergoes a high level of quality control and technical review. In addition, some of Golder's work for this project – specifically the groundwater modelling of the proposed mine plan – was subject to third-party technical review prior to being relied upon for the assessment.</p> <p>The qualifications and experience of the EA Project Team is presented in Section 2.1.1. of the EAC Application/EIS. Their work will be subject to further technical review through the ongoing EA review process.</p> <p>Many of the studies undertaken and changes made to the Proposed Project were a direct result of our consultants findings and recommendations.</p> <p>BURNCO is a 104-year old company that has built a reputation as a responsible resource developer. We depend upon independent assessments such as those conducted for the EA to help ensure we protect our reputation and don't put our business at risk.</p>
1942	469 - 4	Personal Information Withheld	Bowen Island, BC	2. A wet gravel mine is unusual for aggregate mining in British Columbia. It is a highly disruptive process and will negatively impact water quality, flora and fauna considerably.	<p>Wet mining is the selected mining method because of the proximity of the aggregate deposit relative to the existing water table. Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p> <p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>

All potential residual effects were determined to be negligible or not significant.</p>
1944	469 - 6	Personal Information Withheld	Bowen Island, BC	2. A wet gravel mine is unusual for aggregate mining in British Columbia. It is a highly disruptive process and will negatively impact water quality, flora and fauna considerably.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
1945	469 - 7	Personal Information Withheld	Bowen Island, BC	Burnco is an American company with little knowledge or interest in the sensitive environment of Howe Sound in general and the MacNabe Creek in particular.	<p>BURNCO is a 104-year old family-owned Canadian company with operations in British Columbia, Alberta, Saskatchewan and Texas.</p> <p>BURNCO has over 1,150 employees (180 in BC) and is Canada's largest independent ready mix concrete and aggregate company.</p> <p>BURNCO's BC operations currently transport sand and gravel by barge from Treat Creek (east of Powell River) and as far away as Port McNeil on northern Vancouver Island, to existing facilities along the Fraser River in Burnaby and Langley.</p>

1948	470 - 1	Personal Information Withheld	Gambier Island, BC	Why is it that after years of comments that we still are at this stage. This Burnco open pit mine doesn't belong in the Howe Sound. It has taken decades to get this area cleaned up for all of us in the Howe Sound using tax payer's funds.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
1949	470 - 2	Personal Information Withheld	Gambier Island, BC	The many replies that get send to the EAO asking to not have this developed. I wonder if anyone even reads these as there hasn't been a single project that hasn't been approved.	The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.  Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.
1950	470 - 3	Personal Information Withheld	Gambier Island, BC	This gravel mine benefits only Burnco and maybe 10 employees once finished.	Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.  Benefits of the Proposed Project include: - capital expenditures (\$21.5 million), - operational expenditures (\$13 million/year), - direct, indirect and induced employment, and - taxation revenue.  Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.  BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.  Other benefits or positive effects of the Proposed Project are: - Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses; - Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel; - New amphibian breeding habitat ; - Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.

1951	470 - 4	Personal Information Withheld	Gambier Island, BC	Tourism last year created more income to BC than any other industry.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
1952	470 - 5	Personal Information Withheld	Gambier Island, BC	Let's think about what we are doing long term. No No No Burnco in the Howe Sound.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
1953	471 - 1	Linda Ruiz	Gibsons, BC	Howe Sound has recently undergone restoration from many years of industry. It is just coming back.	<p>It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).</p> <p>Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.</p>
1954	471 - 2	Linda Ruiz	Gibsons, BC	This area is more valuable to tourism and fisheries than this proposed mine.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
1955	471 - 3	Linda Ruiz	Gibsons, BC	This area is more valuable to tourism and fisheries than this proposed mine.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
1956	471 - 4	Linda Ruiz	Gibsons, BC	This is not the place for a mine. There are too many irreparable hazards to the surrounding marine environment.	<p>The Proposed Project will provide sand and gravel that will be used to meet the growing demands of the BC marketplace.</p> <p>Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>

1957	471 - 5	Linda Ruiz	Gibsons, BC	This is not the place for a mine. There are too many irreparable hazards to the surrounding marine environment.	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
1958	472 - 1	Brian Gaffney	North Vancouver, BC	Stop the proposed gravel mine in Howe Sound	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1959	473 - 1	Personal Information Withheld	Garibaldi Highlands, BC	Howe Sound is a beautiful place where people from around the world admire while travelling to Whistler or touring BC. A place of spectacular beauty and life. It needs to be protected.	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
1960	473 - 2	Personal Information Withheld	Garibaldi Highlands, BC	What if the city fathers so long ago decided to sell the now world famous Stanley Park to industry citing the need to keep the economy healthy? We would not have a world class city with the jewel of Stanley Park in it's crown. It would be just another waterfront city, not a spectacular place where the people are proud of their inheritance, a gift from the wise city fathers Please do not destroy Howe Sound with another scar on the landscape.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

1961	473 - 3	Personal Information Withheld	Garibaldi Highlands, BC	Please do not destroy Howe Sound with another scar on the landscape.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
1962	473 - 4	Personal Information Withheld	Garibaldi Highlands, BC	The Liberal legacy is already greatly tarnished. Don't make it worse.	Thank you for this information. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1963	474 - 1	Personal Information Withheld	Bowen Island, BC	Please do NOT approve the aggregate project at the McNab Creek location. If such a mine is deemed necessary, please make sure it is sited in a less sensitive area. Too much GOOD environmental remedial WORK has been done in the Howe Sound area to allow for something that will almost certainly reverse previous damage. Thank you.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
1964	475 - 1	Personal Information Withheld	Lions Bay, BC	I believe the Burnco Aggregate Mine Project should not be allowed to proceed based on a long list of items. They include the following:	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

Issue No.	Source			Public Comment/Issue	Proponent Response

1965	475 - 2	Personal Information Withheld	Lions Bay, BC	<p>Health</p> <p>Noise - The amount of noise generated by the crushing facility and mining operation on a consistent basis, will create Noise health effects. Health consequences of regular exposure, to consistent elevated sound levels, from the new noise generated by this facility, is known to cause hearing impairment, hypertension, ischemic heart disease, annoyance, and sleep disturbance.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>
1966	475 - 3	Personal Information Withheld	Lions Bay, BC	<p>Air Quality including dust - Dust and particulate matter generated from the crushing facility and mining operation will impact the health of residents of the Howe Sound region. These harmful allergens can trigger allergic reactions and asthma in many people.</p>	<p>A detailed assessment of potential public health effects of the Proposed Project is presented in Volume 2, Part B – Section 9.1 of the EAC Application/EIS.</p> <p>Potential effects of the Proposed Project on human health assessed considered activities contributing to air emissions, deposition of particulate matter to terrestrial environments, and emission of substances to aquatic environments.</p> <p>Following the application of proposed mitigation, all potential health effects were determined to be negligible or not significant.</p>
1967	475 - 4	Personal Information Withheld	Lions Bay, BC	<p>Economy</p> <p>Howe Sound directly contributes hundreds of millions of dollars of revenue from tourism, entertainment and commercial fishing industries. The Burnco Aggregate Mine Project will reduce this revenue significantly and not provide corresponding off setting revenue for the losses incurred.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
1968	475 - 5	Personal Information Withheld	Lions Bay, BC	<p>The amount of noise generated by the crushing facility and mining operation on a consistent basis will lower the property value of homes located in the area including Lions Bay, Furry Creek, the proposed Porteau Cove housing development, Gambier Island, Anvil Island, Britania Mines and of course McNab Creek.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>

	Ref #	Commenter (Name)	Location		
1969	475 - 6	Personal Information Withheld	Lions Bay, BC	Dust and particulate matter generated by the crushing facility and mining operation will increase health costs to BC Taxpayers.	<p>A detailed assessment of potential public health effects of the Proposed Project is presented in Volume 2, Part B – Section 9.1 of the EAC Application/EIS.</p> <p>Potential effects of the Proposed Project on human health assessed considered activities contributing to air emissions, deposition of particulate matter to terrestrial environments, and emission of substances to aquatic environments.</p> <p>Following the application of proposed mitigation, all potential health effects were determined to be negligible or not significant.</p>
1970	475 - 7	Personal Information Withheld	Lions Bay, BC	The Wave wakes from commercial barge traffic will create damage to properties along the shore as well as crown beaches/streams/shore lines which will increase insurance claims and premiums in BC.	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
1971	475 - 8	Personal Information Withheld	Lions Bay, BC	Environment Ground water pollution from the mine will have a negative environmental impact on the region and in Howe Sound.	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 (Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>

1972	475 - 9	Personal Information Withheld	Lions Bay, BC	The mine will create risks to Wildlife Safety including impacting of rare birds and protected species and disturbance of terrestrial vegetation unique to the area.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
1973	475 - 10	Personal Information Withheld	Lions Bay, BC	Marine resources such as killer whales, dolphins, crabs, and trout will all be negatively impacted from the noise and disturbance of the estuary.	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

1974	475 - 11	Personal Information Withheld	Lions Bay, BC	Burnco's consultants documenting that the gravel quarry could be home to 21 species officially at risk. This includes Roosevelt elk, re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
1975	475 - 12	Personal Information Withheld	Lions Bay, BC	<p>Social</p> <p>The McNab creek region is a known as a tourism and recreation area. Introducing a mining operation will severely impact and change the use of the region. The mine will:</p> <ul style="list-style-type: none"> <li>- limit the recreational activities enjoyed on the water in front of the estuary</li> <li>- limit if not stop the fishing and crabbing opportunities on the water in front of the area</li> <li>- severely impact the recreational opportunities on Gambier Island directly across from the area</li> <li>- new commercial barge traffic will create a hazardous situation for boaters, recreational kayakers and children on the water from the surrounding commercial kids camps</li> </ul>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
1976	475 - 13	Personal Information Withheld	Lions Bay, BC	Also, the proposed mine is far too close to existing residential properties and the McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of the confined topography of the area, mitigation of these damaging effects is impractical. Because of unsightliness, the adverse effects on property values, noise and dust issues, gravel mining operations are generally not allowed within 1000' of any residential property.	The McNab Creek strata title properties are located more than 1000' from any component of the proposed Project.

1977	475 - 14	Personal Information Withheld	Lions Bay, BC	<p>Cultural</p> <p>There are several instances where historical first nations artifacts have been found in the region. Disturbing the estuary will limit, if not remove opportunities for archeological study.</p>	<p>A detailed assessment of potential effects of the Proposed Project to heritage resources is presented in Volume 2, Part B – Section 8.1 of the EAC Application/EIS.</p> <p>While archaeological field studies have been completed and no archaeological sites were recorded within the local study area (LSA), the area does retain potential to contain buried archaeological materials. If heritage resources are encountered, adverse effects mitigation would be facilitated through the implementation of a Heritage Resource Chance Find Management Plan (Volume 3, Part E - Section 16.0) to determine appropriate actions which would include:</p> <ul style="list-style-type: none"> <li>- modify or stop any land-altering activities in the immediate vicinity;</li> <li>- notify the Archaeology Branch, the Skwxwwu7mesh (Squamish) First Nation and the Tsleil-Waututh Nation; and</li> <li>- determine an acceptable management strategy in consultation with the Archaeology Branch, the Skwxwwu7mesh (Squamish) First Nation and the Tsleil-Waututh Nation.</li> </ul>
1978	475 - 15	Personal Information Withheld	Lions Bay, BC	<p>Howe Sound is a centre piece jewel for Sea to Sky and BC tourism, including the growing number of visitors to the Whistler area. Culturally BC has positioned tourism around nature and the unparalleled spectacular environment. The mine, which is visible from the highway and which will be heard from the eastern shores of Howe Sound limits the cultural tourism opportunities already established in the region.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
1979	475 - 16	Personal Information Withheld	Lions Bay, BC	<p>Howe Sound is a centre piece jewel for Sea to Sky and BC tourism, including the growing number of visitors to the Whistler area. Culturally BC has positioned tourism around nature and the unparalleled spectacular environment. The mine, which is visible from the highway and which will be heard from the eastern shores of Howe Sound limits the cultural tourism opportunities already established in the region.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
1980	475 - 17	Personal Information Withheld	Lions Bay, BC	<p>Howe Sound is a centre piece jewel for Sea to Sky and BC tourism, including the growing number of visitors to the Whistler area. Culturally BC has positioned tourism around nature and the unparalleled spectacular environment. The mine, which is visible from the highway and which will be heard from the eastern shores of Howe Sound limits the cultural tourism opportunities already established in the region.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCR noise bylaw was considered as part of the assessment.</p>

1982	475 - 19	Personal Information Withheld	Lions Bay, BC	<p>A Telling Tale</p> <p>Sometimes speaking with the applicant and their consultants reveals the type of neighbour the applicant will be. The following quotes were received at the Burnco Open House held in Horsehoe Bay, in September 2016, from Burnco and Burnco representatives:</p> <p>"It's my land and I'll do what I want with it." from Mr Burns, CEO of Burnco when he interrupted a private conversation about how the Burnco proposed gravel mine appears to be taking up the whole McNab Creek foreshore and encroaching on McNab Creek.</p> <p>"Royalties from the project will be paid to another Burnco company" from Mr Burns, CEO of Bunco when asked about the revenue BC taxpayers should expect to receive from the Bunco proposed gravel mine at McNab Creek.</p> <p>"I've never been to the Burnco proposed gravel mine site" Environmental consultant who was responsible for the Sound assessment and mitigation plan.</p> <p>We ask you, Is this the type of company BC Taxpayers, the BC Government, Governments surrounding Howe Sound, First Nations and Sea to Sky residents/property owners want to be doing business with?</p>	<p>BURNCO is a 104-year old family-owned Canadian company with operations in British Columbia, Alberta, Saskatchewan and Texas.</p> <p>BURNCO has over 1,150 employees (180 in BC) and is Canada's largest independent ready mix concrete and aggregate company.</p> <p>BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.</p>
1983	476 - 1	Personal Information Withheld	Howe Sound, BC	<p>How can Burnco remove 20 million tonnes of sand and gravel from the McNab River estuary and not damage the ecosystem?</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

1984	476 - 2	Personal Information Withheld	Howe Sound, BC	In my opinion, there is no way to remediate.	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>
1985	476 - 3	Personal Information Withheld	Howe Sound, BC	This project will damage the salmon spawning channel and will leave a big mess behind.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
1986	476 - 4	Personal Information Withheld	Howe Sound, BC	This is a relatively small gravel deposit and Burnco has other sources to mine.	<p>Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>

1987	476 - 5	Personal Information Withheld	Howe Sound, BC	Also, with rising sea levels, I question how long the berm between the gravel mine and the foreshore will last.	<p>A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS. Potential effects considered were changes in GHG emissions as a result of the Project, the Project's contribution to climate change through the emission of GHG's, and how potential changes in climate will affect project-related infrastructure.</p> <p>Potential effects of future sea-level rise are addressed in Section 5.8.5.2 of the EAC Application/EIS. The predicted RSP2100 (sea-level height by 2100 relative to 2007 levels) using the mean sea-level rise was 18 cm, with a possible range of 6 to 30 cm. The predicted RSL2100 using the high predicted sea-level rise was 88 cm, with a possible range of 57 to 118 cm.</p> <p>Since the Proposed Project is expected to be completed by 2035 it is expected that rising sea levels of this amount will have little direct impact on the Proposed Project operation phase. The Proposed Project closure plan consists of removing surface infrastructure and site reclamation including a ground and surface water-fed lake (the pit lake), and therefore it is expected that the predicted rising sea level will have little impact on Proposed Project closure. The height of the Pit Lake Containment Berm was designed in order to contain the elevated Pit Lake water levels that would result from extreme prolonged wet periods. Details of the analysis and design of the Pit Lake Containment Berm will be provided in the Mines Act Application.</p>
1988	476 - 6	Personal Information Withheld	Howe Sound, BC	The value of this river estuary is in the salmon habitat it provides. Howe Sound is finally recovering after years of industrial activity. We are seeing the herring, salmon, dolphins and Orcas return.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
1989	476 - 7	Personal Information Withheld	Howe Sound, BC	This gravel mine is a regressive step backwards. I'm strongly opposed to this project.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
1990	477 - 1	Personal Information Withheld	North Vancouver, BC	Approval of the Burnco proposal to place a gravel mine in the estuary at McNab Creek is a very bad idea for the marine environment, the residents in the area and the growing tourism industry.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. 2000	478 - 8	Mark Robichaud	Squamish, BC	4. The size of the gravel pit will limit access to the foreshore for wildlife such as elk, deer and bears who currently frequent the area to forage for food.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2001	478 - 9	Mark Robichaud	Squamish, BC	5. The excavation of the river estuary will dramatically change the movement of water through the valley and have a significant negative impact on the freshwater habitat.	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>
2002	478 - 10	Mark Robichaud	Squamish, BC	6. The proposed mine developer, Burnco, filed a judicial review application against DFO in BC Supreme Court to ‘strong arm’ the DFO to allow them to proceed to an environmental review. The DFO have since agreed to that review with serious concerns as “the project presents a high risk to Salmon and Salmon habitat”.	<p>Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO’s involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.</p> <p>Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.</p>

2003	478 - 11	Mark Robichaud	Squamish, BC	7. In addition to the destruction to fish habitat, Burnco's own consultants believe the mine site could be home to 21 species at risk including a population of Roosevelt Elk re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2004	478 - 12	Mark Robichaud	Squamish, BC	8. The noise from the gravel crushing facility and loading of barges will be significant. It will have a negative impact on the enjoyment of the area by boaters, kayakers, fishermen, tourists and other in Howe Sound. The mine developer has stated at meetings that if the demand is there, they want to run the mining and crushing facilities 24/7, 365 days a year.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p>
2005	478 - 13	Mark Robichaud	Squamish, BC	8. The noise from the gravel crushing facility and loading of barges will be significant. It will have a negative impact on the enjoyment of the area by boaters, kayakers, fishermen, tourists and other in Howe Sound. The mine developer has stated at meetings that if the demand is there, they want to run the mining and crushing facilities 24/7, 365 days a year.	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>

2006	478 - 14	Mark Robichaud	Squamish, BC	<p>9. Noise and light pollution will have significant negative impacts on the land and aquatic animals in the area. Noise and vibration pollution have been found to negatively impact the ability of marine mammals to communicate, navigate, find food and it is believed increasingly to impact their fertility.</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>
2007	478 - 15	Mark Robichaud	Squamish, BC	<p>9. Noise and light pollution will have significant negative impacts on the land and aquatic animals in the area. Noise and vibration pollution have been found to negatively impact the ability of marine mammals to communicate, navigate, find food and it is believed increasingly to impact their fertility.</p>	<p>A predictive noise model was developed for the Proposed Project as described in Volume 2, Section 9.2. The Type 7810 Predictor® (Predictor®) software was used to assess the potential noise effects associated with the Proposed Project as well as the effectiveness of potential noise controls.</p> <p>Effects to wildlife related to noise were estimated by overlaying the output of noise models with species-specific habitat suitability mapping and summarizing the change in habitat for VCs for which noise thresholds were defined in literature (i.e., amphibian species at risk, northern goshawk, western screech-owl, marbled murrelet, and common nighthawk). Noise thresholds beyond which habitat loss is expected are defined for each VC in Section 5.3.1.5.2 of Vol 2, Section 5.3.</p> <p>Due to the paucity of literature regarding noise thresholds for Roosevelt elk and grizzly bear, effects of noise and other sensory disturbance were measured using published zones of influence (ZOI). A ZOI represents the distance at which avoidance of certain anthropogenic disturbances has been observed.</p> <p>Noise will be managed during the construction and operational phases according to the Environmental Objectives and Best Management Practices for Aggregate Extraction in BC (BC MWLAP 2002). Noise mitigation measures are detailed in Volume 2, Part B - Section 9.2 and include:</p> <ul style="list-style-type: none"> <li>- Maintaining vegetation and trees around the active work areas to act as a noise buffer;</li> <li>- Reducing the height aggregate falls along conveyors and within the crushing facility;</li> <li>- Enclosing conveyors which will assist in reducing noise emissions;</li> <li>- Minimizing speed on roadways;</li> <li>- Operating equipment within specifications and maintaining level roads; and</li> <li>- Reducing idling time.</li> </ul>

2008	478 - 16	Mark Robichaud	Squamish, BC	9. Noise and light pollution will have significant negative impacts on the land and aquatic animals in the area. Noise and vibration pollution have been found to negatively impact the ability of marine mammals to communicate, navigate, find food and it is believed increasingly to impact their fertility.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
2009	478 - 17	Mark Robichaud	Squamish, BC	10. The mine will have an impact on the economic potential of the Howe Sound area. There is considerable potential in Howe Sound to continue to grow the tourism industry with significant economic multipliers that would accrue to the local economy. A mine is not going to add to the beauty of the area.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2010	479 - 1	Dave Hess	West Vancouver, BC	Please do not approve the application for the Burnco Aggregate Project proposed for the Howe Sound estuary of McNab Creek. Mining gravel in McNab Creek would destroy the estuary and natural beauty of the area.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

2011	479 - 2	Dave Hess	West Vancouver, BC	This project would have devastating effects on fish habitat in the McNab estuary, as well as putting tonnes of effluent into the Howe Sound ocean currents.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2012	479 - 3	Dave Hess	West Vancouver, BC	Mining activity would also cause disruption or destruction of the successful elk repatriation project being carried out in the area.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2013	479 - 4	Dave Hess	West Vancouver, BC	Environmental degradation should not be allowed for the benefit of mining gravel from the McNab Creek estuary. Further destruction of wildlife habitat and the environment of Howe Sound is unacceptable. Please protect our natural wildlife and resources.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
2014	479 - 5	Dave Hess	West Vancouver, BC	Please do NOT approve the Burnco Aggregate Project, either now or in the future. Thank you for considering these comments.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

2015	480 - 1	Dr. Hugh Freeman	Bowen Island, BC	Pure and simple. This is a proposal that will have a negative environmental impact on Howe Sound.	<p>Potential effects of the Proposed Project have been assessed for selected valued environmental components to address key issues related to fish and fish habitat, marine resources, terrestrial wildlife and vegetation, geotechnical and natural hazards, water resources, air quality and climate change.</p> <p>The assessment concludes that, with the application of design considerations and identified mitigation, no significant adverse environmental effects will result from the Proposed Project.</p> <p>A detailed assessment of potential environmental effects of the Proposed Project is presented in Volume 2, Part B of the EAC Application/EIS.</p>
2016	480 - 2	Dr. Hugh Freeman	Bowen Island, BC	Howe Sound has the potential for a world class marine conservation area that would produce lots of tourist-related income for a multitude of local companies and a beautiful educational resource for millions, so close to a world class city.	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
2017	480 - 3	Dr. Hugh Freeman	Bowen Island, BC	Howe Sound has the potential for a world class marine conservation area that would produce lots of tourist-related income for a multitude of local companies and a beautiful educational resource for millions, so close to a world class city.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2018	480 - 4	Dr. Hugh Freeman	Bowen Island, BC	Why waste this wonderful place on a gravel pit?	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>

2019	480 - 5	Dr. Hugh Freeman	Bowen Island, BC	It is time for the BC and federal governments to become serious about preserving this wonderful place. It makes no sense.	The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.  Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.
2020	481 - 1	Personal Information Withheld	North Vancouver, BC	Howe Sound needs to stay beautiful.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2021	481 - 2	Personal Information Withheld	North Vancouver, BC	This is where we live, play, and rely on the TOURISM for the economy. I say no to this project.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
2022	482 - 1	Pamela Fitzpatrick	Vancouver, BC	Please think of the big picture involved in this proposed mine decision.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
2023	482 - 2	Pamela Fitzpatrick	Vancouver, BC	Now that Howe Sound is finally recovering from the toxic pollution caused by decades of heavy industry, it is time for a comprehensive plan for the area: one which respects and honours the major and sensitive ecosystems now coming back to life, as well as the needs of residents and tourists. Not just the mining wants.	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
2024	482 - 3	Pamela Fitzpatrick	Vancouver, BC	Please do not allow this project to proceed; you will destroy an amazing natural resource.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

2025	483 - 1	My Sea to Sky	Howe Sound, BC	<p>Please post the attached file as the submission from My Sea to Sky. We are an organization of thousands of local citizens dedicated to the protection of Howe Sound for this and future generations of British Columbians. We see no benefit to local communities in the Burnco application. Rather, this project will significantly damage the local environment, degrade the tourism and recreational economy of Howe Sound, and destroy irreplaceable salmon habitat restored at public expense in the wake of a past era of careless destruction. We are firmly opposed to granting this application</p>	<p>Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>
2026	483 - 2	My Sea to Sky	Howe Sound, BC	<p>Issue 1: Regional demand for additional aggregate is not demonstrated</p> <p>The Vancouver market requirement for an additional gravel /aggregate source is not supported by the proponent's documentation. A greater profit margin for the Proponent should not be grounds for destroying the estuary of McNab Creek.</p> <p>Recommendation: A supply/demand report showing strong evidence of the need for supply from this location (and the unavailability of supply from established locations), such as has been done for the Okanagan region, should be prepared before considering a permit for this project. See <a href="https://www.regionaldistrict.com/media/112368/2013_11_08__Full_Report__Aggregate_Supply_and_Demand_Update_and_Analysis.pdf">https://www.regionaldistrict.com/media/112368/2013_11_08__Full_Report__Aggregate_Supply_and_Demand_Update_and_Analysis.pdf</a></p>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
2027	483 - 3	My Sea to Sky	Howe Sound, BC	<p>Issue 2: Loss of productive salmon habitat</p> <p>The project has (twice) been rejected by Fisheries &amp; Oceans Canada because of the likely loss of salmon habitat in McNab Creek. In a year of disastrous returns to the Fraser and other runs, this proposal is ill-timed and ill-advised.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. 2028	483 - 4	My Sea to Sky	Howe Sound, BC	<p>Issue 3: Insufficient data for at-risk species baselines.</p> <p>For several key aquatic and land-based species (such as anadromous salmon, resident cutthroat trout and Roosevelt elk), population data was collected over far too narrow a timespan to be useful for establishing accurate baselines. Without accurate baselines, quantitative monitoring of the effects of this project will not be possible.</p> <p>Recommendation: Part-year data is utterly insufficient to establishing accurate baselines. At least five years of data should be collected to afford accurate baselines usable for ongoing monitoring of effects on species populations and habitat. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where habitat damage exceeds pre-agreed norms.</p>	<p>The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada. The baseline studies conducted are sufficient for the purpose of assessing potential effects of the Proposed Project on selected Valued Components. Additional years of supplemental field studies are not required or proposed for the assessment.</p> <p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS. Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>
2029	483 - 5	My Sea to Sky	Howe Sound, BC	<p>Issue 4: 21 species officially at risk from Burnco.</p> <p>Burnco's consultants documented that the gravel quarry could be home to 21 species officially at risk. This includes Roosevelt elk , re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2030	483 - 6	My Sea to Sky	Howe Sound, BC	<p>Issue 5: Will McNab Creek and the estuary become salty?</p> <p>As rock is removed from the mine, fresh water from the estuary will creep into the resultant 25m pit. This will lead to salt water seeping into the estuary, and into McNab Creek. This will kill a variety of salmon and plants.</p> <p>Recommendation: Have thorough hydrological studies done over several years. Use the precautionary principle. Local authorities (eg. SCR D) should have the power to compel a reduction, suspension or cessation of mine activities where salination exceeds preagreed norms.</p>	<p>The hydraulic conductivity of the valley sediments is much higher than hydraulic conductivity of any bedrock structures, if they exist. Therefore, the groundwater flow in the valley sediments will dominate and it will provide key control on the position of the salt water-freshwater interface. Furthermore, because of topographic highs that surround the valley, the hydraulic heads are expected to be higher than in the valley sediments, inhibiting saltwater ingress. As presented in Section 3.3 in Appendix 5.6-A of the EAC Application/EIS, based on monitoring data (2010-2014), tidal elevations exceeded groundwater elevation only in rare occasions between July and September of each monitoring year. During these high tide intervals, there is an inferred landward gradient in the immediate vicinity of the shoreline; however, its duration is inherently less than the corresponding periods of southwards gradient associated with lower tidal position. Accordingly, the net groundwater flow direction during the entire monitoring period is confirmed to be southwards toward the marine foreshore. Moreover, monitoring data indicate that the saltwater wedge could be located at greater depths than approximately -30 m elevation; analytical calculations based on methodology presented in Domenico and Schwartz (1990) showed that, due to relatively high groundwater flow in the alluvial sediments, the saltwater edge could be depressed to the depth of the overburden/bedrock contact within 50 m to 150 m of the ocean shore. Based on these observations, the potential presence of a fault structure in bedrock in the vicinity of the project area is not considered to influence groundwater flow direction in the valley sediments or increase the risk of saltwater intrusion.</p>
2031	483 - 7	My Sea to Sky	Howe Sound, BC	<p>Issue 6: Unsuitable location</p> <p>This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area. In 2009 SCR D said no to a permit for an aggregate operation at McNab Creek. There was concern re noise and dust from onsite crushing, sorting, weighing, and stockpiling, all of which Burnco plans to do. Why allow these activities now?</p> <p>Recommendation: To do so would represent atrocious planning, with little/no obvious compensating factors. It should not be permitted.</p>	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>

2032	483 - 8	My Sea to Sky	Howe Sound, BC	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). The proposed “compensation channel” is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Recommendation: Any approval of this proposal should include a contingency bond to fund maintenance of the new streamway, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project.</p>	<p>The proposed Project will lead to the loss of approximately 200 m2 of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. The proposed design for the channel extension uses the existing lower channel as a template and it will meet the factors and criteria that are generally accepted for the construction of a functional groundwater-fed spawning channel. It should provide conditions similar to the existing run habitat in the lower section of WC2 that was designed as chum spawning habitat by DFO and where spawning activity was observed during the November 2016 survey.</p> <p>The creation of the pit lake is predicted to cause a doubling of groundwater influx into the lower section of WC2. The increase in ground water influx will lead to additional groundwater upwelling and the increased upwelling is expected to provide increased levels of intergravel flow that will be suitable for eggs and alevins. The average depth in the proposed offset habitat extension and the remaining section of WC2 is predicted to be above 0.3 m making it suitable for salmon spawning. As described in the Aquatic Health assessment provided in Surface Water Resources (Section 5.5.7.2), the water quality and temperature of ground and surface water entering the offset habitat and existing lower section of WC2 will be suitable for salmonids to complete all stages of their life history including spawning.</p> <p>In response to comments from the Technical Working Group, the design of the habitat offset plan was revised to allow approximately 20 m of pool habitat upstream of the culvert and approximately 20 m of gravel bed run habitat downstream of the culvert to be retained which will avoid approximately 232 m2 of habitat loss. The design of the channel extension incorporates run and pool habitat in approximately a 1 : 1 ratio, based on this design and the use of run habitat for spawning in the existing lower channel it is expected that more than 2, 000 m2 of the offset channel habitat will provide conditions suitable for salmonid spawning.</p>
2033	483 - 9	My Sea to Sky	Howe Sound, BC	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). The proposed “compensation channel” is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Recommendation: Any approval of this proposal should include a contingency bond to fund maintenance of the new streamway, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project.</p>	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>

2039	483 - 15	My Sea to Sky	Howe Sound, BC	<p>Issue 10: The impact of marine noise is insufficiently studied in the application</p> <p>The impact of marine noise (from the conveyor belts –tugs, barge loading and water taxis) on cetaceans, herring, salmon (spawning adult and habituating juveniles) and other at-risk species (including waterfowl) is underestimated in the “science” work done by the Proponent</p> <p>Recommendation: Marine noise transmits 5-10 times farther &amp; faster through water than through air. Marine noise should be carefully baselined and monitored in wide spatial and temporal dimensions around the site Periodic reporting of results that are auditable and accessible to the public should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where marine noise exceeds pre-agreed norms.</p>	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

2042	483 - 18	My Sea to Sky	Howe Sound, BC	<p>Issue 12: Water Quality is insufficiently characterized in the application</p> <p>Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs.</p> <p>Recommendation: Siltation monitoring (both in the original and compensation channels and in the nearby ocean), with periodic reporting of results that are auditable and accessible to the public, should be part of any approval of the project. Local authorities (eg. SCR D) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.</p>	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>
2043	483 - 19	My Sea to Sky	Howe Sound, BC	<p>Issue 12: Water Quality is insufficiently characterized in the application</p> <p>Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs.</p> <p>Recommendation: Siltation monitoring (both in the original and compensation channels and in the nearby ocean), with periodic reporting of results that are auditable and accessible to the public, should be part of any approval of the project. Local authorities (eg. SCR D) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.</p>	<p>A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken. Adaptive management techniques to be implemented as required include:</p> <ul style="list-style-type: none"> <li>- Continue to evaluate the extent of the pit during operations.</li> <li>- During the wet season, if water levels in the pit lake become higher than has been designed for the Pit Lake Containment Berm then the valves in the culverts will be closed to reduce the amount of water reporting to the pit from the surface water on the western slope.</li> <li>- The height of the pit lake at the outlet structure can be adjusted to increase or decrease the level of the pit lake (e.g., adding or lowering stop logs) at closure to maintain the hydraulic gradient between McNab Creek and the Project Area following closure.</li> </ul>
2044	483 - 20	My Sea to Sky	Howe Sound, BC	<p>Issue 13: "Daytime Hours" definition</p> <p>The Proponent advertises that the plant will operate only on weekdays and during "daytime hours". Daylight hours vary seasonally, but the definition of "daytime hours" is unclear.</p> <p>Recommendation: Clearly define "daytime hours" in the proposal.</p>	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCR D noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2045	483 - 21	My Sea to Sky	Howe Sound, BC	<p>Issue 14: The nearshore strip of forest cover is too narrow</p> <p>The strip of forest cover between the pit and the ocean is too narrow to be sustainable. Blowdown and saltwater invasion will threaten its existence</p> <p>Recommendation: For reasons of sustainability and visual camouflage, increase the width of the ocean-pit separation strip, and lessen the size of the proposed pit and crushing area.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. Maintaining a treed buffer along the foreshore (approx. 25-50 m wide adjacent to the processing area) will also limit dust and noise emissions to the marine environment. Additional screening of lan-based structures may be possible around project components not currently screened by existing vegetation. The nature and extent of vegetation screening incorporated into the site design will be described in the Vegetation Management Plan (Volume 3, Part E, Section 16 of the EAC Application/EIS).</p> <p>A detailed assessment of potential vegetation effects (including windthrow effects) of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS. The significance of windthrow effects were determined to be negligible; few new windward edges will be created. Monitoring of treeline edges will be conducted to evaluate potential windthrow effects and adaptive management will be employed, if necessary.</p>
2046	483 - 22	My Sea to Sky	Howe Sound, BC	<p>Issue 15: Loss of property values in the nearby strata units</p> <p>The proponent claims little or no loss of value for nearby properties. This assertion is contradicted by many studies that have highlighted the loss of value (including the value associated with quiet enjoyment) at or near industrial sites adjacent to established residential areas. Recent jurisprudence in BC has borne out the right of homeowners to receive compensation for that loss. See <a href="http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882">http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882</a></p> <p>Recommendation: Fair market value compensation for loss of property value must form part of the economic analysis of any approval for this mine.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
2047	483 - 23	My Sea to Sky	Howe Sound, BC	<p>Issue 16: First Nation consultation – Sechelt FN was omitted this time</p> <p>Squamish and Tseil-Waututh First Nations have been consulted re Burnco, but not the Sechelt FN. The Sechelt First Nations weren't consulted about the gravel quarry at McNab Creek in 2009 either. McNab Creek is in Sechelt traditional territory.</p> <p>Recommendation: Respect/consult with Sechelt First Nations re Burnco.</p>	<p>First Nation consultation requirements are delegated to Proponents by the Crown. For the Proposed Project, only Squamish Nation and the Tseil-Waututh Nation were identified as potentially affected first Nations by the BCEAO. The CEA Agency identified additional Aboriginal Group, however, the Sechelt First Nation was not among these, presumably because of the proximity of the proposed Project to their Traditional Territory.</p>

2048	483 - 24	My Sea to Sky	Howe Sound, BC	<p>Issue 17: Advisory Committee of voluntary citizens</p> <p>In 2009 when a gravel quarry at McNab Creek was turned down by SCRD, one requirement was an Advisory Committee of volunteer citizens to provide ongoing input with the goal of community acceptance of the project.</p> <p>Recommendation: Require the formation of an Advisory Committee of volunteer citizens.</p>	<p>BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.</p>
2049	483 - 25	My Sea to Sky	Howe Sound, BC	<p>Issue 18: The job benefits were analyzed on the basis of too narrow an RAA.</p> <p>BURNCO currently sources its aggregate from Jervis Inlet, Port McNeil and Coquitlam. To gauge the benefits to the BC economy, the net job creation figures (i.e. McNab's 12 jobs less the job losses at the above aggregate sources) as a consequence of allowing the McNab Creek operation must be considered.</p> <p>Recommendation: If there is little or no net job gain to BC as a result of this proposal, it should be firmly rejected. Jobs in areas like Port McNeil are much harder to come by than in the Lower Mainland/ Howe Sound.</p>	<p>The local spatial study area for the operations phase labour market effects (including employment) of the Proposed project was described in the Application Information Requirements/EIS Guidelines, which was approved by the BCEAO and the CEA Agency on December 16, 2014 after review by the Technical Working Group established to guide this assessment. This local spatial study area is Sunshine Coast Regional District.</p> <p>The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.</p>

2050	483 - 26	My Sea to Sky	Howe Sound, BC	<p>Issue 19: Barge traffic will diminish Howe Sound's recreational and tourism potential and add to the cumulative traffic hazard in Howe Sound</p> <p>Shipping 1-4 million tonnes of aggregate annually from this location will make for 2-6 tug/barge movements daily through Southern Howe Sound,. Routes would cross very busy sailing and small-boat recreational areas, the Howe Sound Marine Trail and ferry routes, the path of LNG tankers exiting from the Woodfibre LNG plant and freighters from Squamish Terminals. This exponentially increases the risk of collisions and loss of life in a narrow waterway and diminishes the amenity and tourism use of the Sound. The cumulative effects and worst-case hazard analysis of this project have been underestimated by the Proponent.</p> <p>Recommendation: A cumulative impact assessment, including loss of amenity and tourism value of the Sound, should be completed prior to deciding on this application. So too should a study of the increased hazards associated with increasing the large-vessel traffic in Howe Sound. Improvements to vessel tracking, buoys and channel markers in the area will be necessary.</p>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
2051	483 - 27	My Sea to Sky	Howe Sound, BC	<p>Issue 20: The job benefits analysis used the questionable input-output econometric model.</p> <p>BURNCO has used input-output econometric analysis to predict the job creation benefits accruing to the project For resource projects, this is a highly questionable analysis technique. The Australian Institute has written a convincing argument highlighting the inadequacies of input-output analysis. See <a href="http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf">http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf</a> (Input-output was used by the BC Government in arriving at its inflated job estimates for BC's LNG industry.)</p> <p>Recommendation: Red-do the employment estimates and repost/ allow additional time for public scrutiny and comments</p>	<p>The environmental assessment of the Proposed Project used an input-output (I-O) impact modelling methodology to estimate the Project's potential effect on employment (as well as other economic parameters). The B.C. Input-Output Model (BCIOM) was used. The BCIOM is maintained by BC Stats, which is the central statistics agency of the B.C. government. The BCIOM is a version of Statistics Canada's Inter-Provincial Input-Output Model (IPIOM) which BC Stats calibrated for undertaking economic analyses of B.C.-based projects. The BCIOM is a robust, calibrated, third party provided input-output model, and has been previously accepted for use by by the BCEAO and the CEA Agency to assist with estimating the economic impact of proposed projects.</p>

2052	483 - 28	My Sea to Sky	Howe Sound, BC	<p>Issue 21: There was an inconsistency between the job creation figures shown in 2 different slides in the Open Houses</p> <p>One showed about 300 person-years of employment (over 25years). The other (derived from input-output analysis) showed person-year employment benefits several times that amount.</p> <p>Recommendation: This misleading discrepancy should be resolved by further analysis, and that section of the application re-submitted, with additional time allowed for public scrutiny and comment</p>	<p>The estimated number of jobs created by the proposed Project during construction and operations phases are presented in Section 2.5.4 of the EAC Application/EIS.</p> <p>Employment numbers were presented on three Open House display panels, as follows:</p> <ul style="list-style-type: none"> <li>- Project Specifications: 80 person years during construction and 360 person years during operations (direct, indirect and induced);</li> <li>- Project Benefits: 12 full-time jobs at the site (i.e. direct only);</li> <li>- Sustainable Economy: 119 jobs during construction and 99 jobs during operations (direct, indirect and induced); 33 long-term jobs during operations are expected to be filled by Sunshine Coast residents.</li> </ul>
2053	483 - 29	My Sea to Sky	Howe Sound, BC	<p>Issue 22: Preservation of marine tourism, hiking access to the vicinity of McNab</p> <p>Moorages, anchorages, swimming facilities and back-country access have long been part of the McNab Creek area's attractions for Howe Sound visitors and local boating clubs</p> <p>Recommendation: The application fails to properly address how these local amenities will be protected. Neither does it propose how loss of these amenities will be compensated for. The Management Plan should address this issue.</p>	<p>Harvesting fish and wildlife' and 'Outdoor recreation and tourism' are valued components in the environmental assessment of the Proposed Project (see Table 7.3-1). No displacement effects on recreational hunting or other recreational activities is anticipated due to the Proposed Project because the primary access to the local study area is through the Proposed Property, and public access and use of the Proposed Property has never been permitted. During the construction and operation phases, recreationists and tourists would continue to have access to the foreshore area below the high water mark and to the anchorage area in the vicinity of where McNab Creek enters Howe Sound.</p> <p>Proposed Project construction and operations would prevent marine-based recreational and tourism activities occurring around the Project jetty. As the jetty is located within an existing log boom tenure and recreational and tourism activities are concentrated on the eastern side of the local study area (where McNab Creek enters Howe Sound), this effect is considered to be negligible.</p> <p>Displacement on the water would occur on an intermittent basis as a result of Proposed Project-related vessel traffic, which would require smaller vessels to alter direction and/or speed when navigating at the same time as water taxis or barges (Volume 2, Part B - Section 7.2). These navigational challenges are present in the LSA due to forestry activity, and are subject to the Collision Regulations of the Canada Shipping Act. Any resulting effects on recreational boating recreational activities due to potential interactions of recreational vessels and equipment and Project-associated vessels are not detectable or not measureable, so potential effects of the Proposed Project on water-based recreation and tourism access matters in the construction and operation phases are determined to be negligible.</p> <p>As part of the Marine Transport Management Plan outlined in Marine Transport (Volume 2, Part B - Section 7.2), BURNCO would also develop and implement strategies, best management practices and guidelines to avoid and minimise Proposed Project - related disruption of marine-based recreational activities during construction and operations. As part of the development of this plan, BURNCO would consult with key marine user groups (e.g., McNab Strata, yacht clubs, camps, and kayaking operators) to discuss strategies (including but not limited to routing options) to manage the interaction of Proposed Project vessel traffic with recreational and tourism areas during the high season months.</p>

2054	483 - 30	My Sea to Sky	Howe Sound, BC	<p>Issue 23: End-of-project remediation</p> <p>The compensation channel is an artificial structure which will likely not survive long after project's end.</p> <p>Recommendation: Restoring the natural streamway should be a firm end-state requirement.</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>
2055	484 - 1	Cheryl Wozny	Lions Bay, BC	I believe the Burnco Aggregate Mine Project should not be allowed to proceed based on a long list of items. They include the following:	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2056	484 - 2	Cheryl Wozny	Lions Bay, BC	<p>Health</p> <p>Sightline, noise and dust: The proposed mine is far too close to existing residential properties and the McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of the confined topography of the area, mitigation of these damaging effects is impractical.</p>	The McNab Creek strata title properties are located more than 1000' from any component of the proposed Project.
2057	484 - 3	Cheryl Wozny	Lions Bay, BC	<p>Health</p> <p>Sightline, noise and dust: The proposed mine is far too close to existing residential properties and the McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of the confined topography of the area, mitigation of these damaging effects is impractical.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

2058	484 - 4	Cheryl Wozny	Lions Bay, BC	<p>Health Sightline, noise and dust: The proposed mine is far too close to existing residential properties and the McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of the confined topography of the area, mitigation of these damaging effects is impractical.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>
2059	484 - 5	Cheryl Wozny	Lions Bay, BC	<p>Health Sightline, noise and dust: The proposed mine is far too close to existing residential properties and the McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of the confined topography of the area, mitigation of these damaging effects is impractical.</p>	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
2060	484 - 6	Cheryl Wozny	Lions Bay, BC	<p>Noise - The impact of marine noise is insufficiently studied in the application. The amount of noise generated by the crushing facility and mining operation on a consistent basis, will create Noise health effects. Marine noise transmits 5-10 times farther &amp; faster through water than through air. Health consequences of regular exposure, to consistent elevated sound levels, from the new noise generated by this facility, is known to cause hearing impairment, hypertension, ischemic heart disease, annoyance, and sleep disturbance.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. 2061	484 - 7	Cheryl Wozny	Lions Bay, BC	Air Quality including dust - Dust and particulate matter generated from the crushing facility and mining operation will impact the health of residents of the Howe Sound region. These harmful allergens can trigger allergic reactions and asthma in many people. Air quality, which will inevitably deteriorate in the vicinity of the mine, is insufficiently characterized in the application.	<p>A detailed assessment of potential public health effects of the Proposed Project is presented in Volume 2, Part B – Section 9.1 of the EAC Application/EIS.</p> <p>Potential effects of the Proposed Project on human health assessed considered activities contributing to air emissions, deposition of particulate matter to terrestrial environments, and emission of substances to aquatic environments.</p> <p>Following the application of proposed mitigation, all potential health effects were determined to be negligible or not significant.</p>
2062	484 - 8	Cheryl Wozny	Lions Bay, BC	Water Quality is insufficiently characterized in the application. Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs. Siltation monitoring should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.	<p>Wash water will be processed for removal of fines and silt in a 95% efficient wash plant to be fed using recycled water from two large storage tanks. Fines will not be discharged to the estuary; they will be deposited in a designated inland fines area and covered in accordance with an approved Reclamation and Effective Closure Plan.</p>
2063	484 - 9	Cheryl Wozny	Lions Bay, BC	Water Quality is insufficiently characterized in the application. Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs. Siltation monitoring should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>

2064	484 - 10	Cheryl Wozny	Lions Bay, BC	Water Quality is insufficiently characterized in the application. Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs. Siltation monitoring should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.	A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken. Adaptive management techniques to be implemented as required include: - Continue to evaluate the extent of the pit during operations. - During the wet season, if water levels in the pit lake become higher than has been designed for the Pit Lake Containment Berm then the valves in the culverts will be closed to reduce the amount of water reporting to the pit from the surface water on the western slope. - The height of the pit lake at the outlet structure can be adjusted to increase or decrease the level of the pit lake (e.g., adding or lowering stop logs) at closure to maintain the hydraulic gradient between McNab Creek and the Project Area following closure.
2065	484 - 11	Cheryl Wozny	Lions Bay, BC	Economy Howe Sound directly contributes hundreds of millions of dollars of revenue from tourism, entertainment and commercial fishing industries. The Burnco Aggregate Mine Project will reduce this revenue significantly and not provide corresponding off setting revenue for the losses incurred.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
2066	484 - 12	Cheryl Wozny	Lions Bay, BC	Also, Regional demand for additional aggregate is not demonstrated. A greater profit margin for the Proponent should not be grounds for destroying the estuary of McNab Creek.	The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.  Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by: - Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC; - Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and - Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.  The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.

2075	484 - 21	Cheryl Wozny	Lions Bay, BC	Loss of productive salmon habitat, that will be impacted negatively from mining a pristine estuary. The project has (twice) been rejected by Fisheries & Oceans Canada because of the likely loss of salmon habitat in McNab Creek. In a year of disastrous returns to the Fraser and other runs, this proposal is ill-timed and ill-advised.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
2076	484 - 22	Cheryl Wozny	Lions Bay, BC	Marine resources such as killer whales, dolphins, crabs, and trout will all be negatively impacted from the noise and disturbance of the estuary.	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

2077	484 - 23	Cheryl Wozny	Lions Bay, BC	Burnco's consultants documenting that the gravel quarry could be home to 21 species officially at risk. This includes Roosevelt elk, re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2078	484 - 24	Cheryl Wozny	Lions Bay, BC	<p>Social</p> <p>The McNab creek region is a known as a tourism and recreation area. Introducing a mining operation will severely impact and change the use of the region. The mine will:</p> <p>limit the recreational activities enjoyed on the water in front of the estuary limit if not stop the fishing and crabbing opportunities on the water in front of the area severely impact the recreational opportunities on Gambier Island directly across from the area the increase commercial barge traffic will create a hazardous situation for boaters, recreational kayakers and children on the water from the surrounding commercial kids camps.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2079	484 - 25	Cheryl Wozny	Lions Bay, BC	Also, the proposed mine is far too close to existing residential properties and the McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of the confined topography of the area, mitigation of these damaging effects is impractical. Because of unsightliness, the adverse effects on property values, noise and dust issues, gravel mining operations are generally not allowed within 1000' of any residential property.	The McNab Creek strata title properties are located more than 1000' from any component of the proposed Project.

2090	485 - 2	Delena Angrignon	Squamish, BC	Environmentally this project would be a disaster for one of the 3 only Estuaries in Howe Sound.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
2091	485 - 3	Delena Angrignon	Squamish, BC	<p>This project has been refused in the past due to concerns about the fish and fish habitat in McNab Creek, in particular the Chum and Coho Salmon.</p> <p>It's only because of gutted environmental laws by the Harper Government that Bunco is back trying to get approval. The proposed mine developer, Burnco, filed a judicial review application against DFO in BC Supreme Court to 'strong arm' the DFO to allow them to proceed to an environmental review. The DFO have since agreed to that review with serious concerns as "the project presents a high risk to Salmon and Salmon habitat".</p>	<p>Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO's involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.</p> <p>Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.</p>
2092	485 - 4	Delena Angrignon	Squamish, BC	In addition to the destruction to fish habitat, Burnco's own consultants believe the mine site could be home to 21 species at risk including a population of Roosevelt Elk re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

2093	485 - 5	Delena Angrignon	Squamish, BC	<p>The concerns for Fish/fish habitat:</p> <p>a) The project's potential to cause serious harm to fish and fish habitat, due to changing hydrological patterns that would:</p> <ul style="list-style-type: none"> <li>-Affect the water and salinity levels in McNab Creek, As they dig down to remove gravel, the fresh water from the estuary will be siphoned into the pit, which will change the salinity of McNab Creek and impact the salmon runs.</li> <li>-Lead to salt water seeping into the estuary ground water – which would kill the plants there.</li> </ul>	<p>The hydraulic conductivity of the valley sediments is much higher than hydraulic conductivity of any bedrock structures, if they exist. Therefore, the groundwater flow in the valley sediments will dominate and it will provide key control on the position of the salt water-freshwater interface. Furthermore, because of topographic highs that surround the valley, the hydraulic heads are expected to be higher than in the valley sediments, inhibiting saltwater ingress. As presented in Section 3.3 in Appendix 5.6-A of the EAC Application/EIS, based on monitoring data (2010-2014), tidal elevations exceeded groundwater elevation only in rare occasions between July and September of each monitoring year. During these high tide intervals, there is an inferred landward gradient in the immediate vicinity of the shoreline; however, its duration is inherently less than the corresponding periods of southwards gradient associated with lower tidal position. Accordingly, the net groundwater flow direction during the entire monitoring period is confirmed to be southwards toward the marine foreshore. Moreover, monitoring data indicate that the saltwater wedge could be located at greater depths than approximately -30 m elevation; analytical calculations based on methodology presented in Domenico and Schwartz (1990) showed that, due to relatively high groundwater flow in the alluvial sediments, the saltwater edge could be depressed to the depth of the overburden/bedrock contact within 50 m to 150 m of the ocean shore. Based on these observations, the potential presence of a fault structure in bedrock in the vicinity of the project area is not considered to influence groundwater flow direction in the valley sediments or increase the risk of saltwater intrusion.</p>
2094	485 - 6	Delena Angrignon	Squamish, BC	<p>b) DFO is very worried about the fish and fish habitat in McNab Creek, particularly chum and coho salmon. The Vancouver Aquarium is concerned re the salmon, and re rockfish at the estuary mouth.</p> <p>c) The planned artificial salmon spawning channel would do nothing to compensate for the damage to fish and fish habitat in the McNab estuary.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2095	485 - 7	Delena Angrignon	Squamish, BC	<p>3. The effects of wet mining (digging the gravel out of water, where the estuary forest used to be):</p> <p>Burnco's argument that there won't be dust because they're mining "wet" is also misleading because the dust just becomes silt. The silt will kill the plant and animal life in the estuary.</p>	<p>Wash water will be processed for removal of fines and silt in a 95% efficient wash plant to be fed using recycled water from two large storage tanks. Fines will not be discharged to the estuary; they will be deposited in a designated inland fines area and covered in accordance with an approved Reclamation and Effective Closure Plan.</p>

2098	485 - 10	Delena Angrignon	Squamish, BC	4. The project will cause dust, noise and light pollution (both on land and at sea – on the dock) for wildlife, local residents and also for recreational users of the area.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

2099	485 - 11	Delena Angrignon	Squamish, BC	4. The project will cause dust, noise and light pollution (both on land and at sea – on the dock) for wildlife, local residents and also for recreational users of the area.	<p>A predictive noise model was developed for the Proposed Project as described in Volume 2, Section 9.2. The Type 7810 Predictor® (Predictor®) software was used to assess the potential noise effects associated with the Proposed Project as well as the effectiveness of potential noise controls.</p> <p>Effects to wildlife related to noise were estimated by overlaying the output of noise models with species-specific habitat suitability mapping and summarizing the change in habitat for VCs for which noise thresholds were defined in literature (i.e., amphibian species at risk, northern goshawk, western screech-owl, marbled murrelet, and common nighthawk). Noise thresholds beyond which habitat loss is expected are defined for each VC in Section 5.3.1.5.2 of Vol 2, Section 5.3.</p> <p>Due to the paucity of literature regarding noise thresholds for Roosevelt elk and grizzly bear, effects of noise and other sensory disturbance were measured using published zones of influence (ZOI). A ZOI represents the distance at which avoidance of certain anthropogenic disturbances has been observed.</p> <p>Noise will be managed during the construction and operational phases according to the Environmental Objectives and Best Management Practices for Aggregate Extraction in BC (BC MWLAP 2002). Noise mitigation measures are detailed in Volume 2, Part B - Section 9.2 and include:</p> <ul style="list-style-type: none"> <li>- Maintaining vegetation and trees around the active work areas to act as a noise buffer;</li> <li>- Reducing the height aggregate falls along conveyors and within the crushing facility;</li> <li>- Enclosing conveyors which will assist in reducing noise emissions;</li> <li>- Minimizing speed on roadways;</li> <li>- Operating equipment within specifications and maintaining level roads; and</li> <li>- Reducing idling time.</li> </ul>
2100	485 - 12	Delena Angrignon	Squamish, BC	4. The project will cause dust, noise and light pollution (both on land and at sea – on the dock) for wildlife, local residents and also for recreational users of the area.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

2101	485 - 13	Delena Angrignon	Squamish, BC	5. Would require SLRD to rezone this land, moving this land into industrial zoning forever.	<p>The proposed Project lies within Electoral Area F of the Sunshine Coast Regional District. While there are three OCPs in Electoral Area F, none of them overlap with the local study area (LSA). Regional zoning for the LSA is discussed in Volume 2, Part B, Section 6 of the EAC Application/EIS.</p> <p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
2102	485 - 14	Delena Angrignon	Squamish, BC	<p>Economically: Burnco has not proven that their is a huge demand that cannot be met by existing quarries. In fact, my concern is that they are taking away work from BC Corporations and only looking to gain a foot into Howe Sound for the potential of bidding on work for Woodfibre LNG that would compete with existing businesses that employee people. Burnco's 12 full time jobs aren't worth it as they are not adding to the pool of jobs but just taking away existing jobs. So that nets zero employment benefit.</p>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
2103	485 - 15	Delena Angrignon	Squamish, BC	<p>Economically: Burnco has not proven that their is a huge demand that cannot be met by existing quarries. In fact, my concern is that they are taking away work from BC Corporations and only looking to gain a foot into Howe Sound for the potential of bidding on work for Woodfibre LNG that would compete with existing businesses that employee people. Burnco's 12 full time jobs aren't worth it as they are not adding to the pool of jobs but just taking away existing jobs. So that nets zero employment benefit.</p>	<p>Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>

2106	485 - 18	Delena Angrignon	Squamish, BC	Burnco is not adding to the value of this area by their project. Howe Sound is a recreational playground that attracts tourism dollars because of the pristine nature it is in.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2107	485 - 19	Delena Angrignon	Squamish, BC	This Calgary based company is the only recipient of gain. Their websites boast areas that they have remediated successfully. However, it must be noted that they have never remediated a pristine environment. Who would hold them accountable?	<p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 and are summarized below. BURNCO commits to funding for these monitoring initiatives.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring.</p> <p>Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational Environmental Protection Plans (EPPS). Compliance monitoring will include assessment of Proponent and contractors' environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program.</p> <p>BURNCO will submit a report to the BCEAO on the status of compliance with the Certificate Conditions, at the following times:</p> <ul style="list-style-type: none"> <li>- At least 30 days prior to the start of Construction;</li> <li>- On or before January 31 in each year after the start of Construction;</li> <li>- At least 30 days prior to the start of Operations;</li> <li>- On or before January 31 in each year after the start of Operations;</li> <li>- At least 30 days prior to the start of Closure and Reclamation;</li> <li>- On or before January 31 in each year after the start of Closure and Reclamation; and</li> <li>- Within 30 days of completing Closure and Reclamation.</li> </ul> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>

2108	485 - 20	Delena Angrignon	Squamish, BC	The idea that they will build a berm of soil along the part of the creek closest to the gravel extraction, sounds good until you think about the dust and runoff from the berm will wash into the creek, and damage fish and insect life there.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
2109	485 - 21	Delena Angrignon	Squamish, BC	It will probably also silt up/kill fragile ancient glass sponges nearby in the ocean.	<p>A detailed assessment of potential effects on marine resources, including marine benthic communities, is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>Glass sponges are a group of filter feeding organisms which can form large sponge reefs that provide habitat for other marine invertebrate and fish species. Glass sponges in Howe Sound live at depths as shallow as -20 m (chart datum). BURNCO has included glass sponges in the assessment of potential effects on marine resources.</p> <p>Although no glass sponges were observed during the dive and towed video surveys of the Proposed Project area, foreshore and sub-tidal nearshore conducted for the assessment, their known occurrences throughout Howe Sound have been documented. The marine footprint of the Proposed Project does not overlap with any known or mapped locations of glass sponges or glass sponge reefs occurrences.</p> <p>Potential residual effects of propeller scour and aggregate spills on glass sponges were assessed. Propeller wash velocities at the depths at which glass sponges occur are predicted to be within the same magnitude as tidal currents present at this depth. With the application of proposed mitigation, the likelihood of an aggregate spill adversely affecting glass sponge colonies is low. The significance of potential residual effects on marine benthic communities, including glass sponges, were determined to be negligible or not significant.</p>
2110	485 - 22	Delena Angrignon	Squamish, BC	With what we know about the assets in Howe Sound from the David Suzuki project and the value of estuaries to the whole of Howe Sound, this project should not be provided with an EA certificate. We ask the BCEAO to reject this project.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

2111	486 - 1	Glen Allan Stein	Squamish, BC	It's a destructive industry, no matter where the companies want to locate their mine. I'm totally against any and all mining operations allocated for here in the Howe Sound. I am a full time Squamish resident. We don't want any LNG facilities here either, so don't feel we're pinpointing your mining operation.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2112	487 - 1	Amanda	Bowen Island, BC	DO NOT destroy McNabb creek!!! This is so short sighted. The marine life that has finally had a chance to return to Howe Sound, should never be threatened again. Money won't buy the planet back once we destroy it!!!	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2113	488 - 1	Rob	Squamish, BC	No!!!	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2114	489 - 1	Personal Information Withheld	Squamish, BC	Estuaries are fragile and provide vital habitat for flora and fauna, including salmon and many other species at risk. The return of cetaceans to Howe Sound in recent years is dependent on the health of Howe Sound waters, and estuaries such as McNab Creek contribute to Howe Sound's overall health. A gravel mine in such an delicate ecosystem will affect not only flora and fauna in the estuary itself, but also others dependent on these species, as well as the experience of those who recreate in these areas.	A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.  The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.  The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.

2115	489 - 2	Personal Information Withheld	Squamish, BC	Estuaries are fragile and provide vital habitat for flora and fauna, including salmon and many other species at risk. The return of cetaceans to Howe Sound in recent years is dependent on the health of Howe Sound waters, and estuaries such as McNab Creek contribute to Howe Sound's overall health. A gravel mine in such an delicate ecosystem will affect not only flora and fauna in the estuary itself, but also others dependent on these species, as well as the experience of those who recreate in these areas.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
2116	489 - 3	Personal Information Withheld	Squamish, BC	Please don't risk the improved health of species in this area with the Burnco Aggregate Project. As someone who lives in this area because of its beautiful and healthy landscape, and has seen the Sound's return to health in recent years, I understand the importance of healthy surrounding land and waters as vital to the health, growth, and popularity of the Sunshine Coast, Squamish and the Lower Mainland as well.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
2117	490 - 1	John Preissl	Burnaby, BC	I am a stream keeper and Environmental photographer from Burnaby who has spent a lifetime hiking, fishing, photographing and exploring the Squamish area and Sound. I am also of Squamish and Leq a mel Nation ancestry. As a stream keeper for many years I have serious concerns with Burnco and a proposed large gravel mine just above the McNab Creek Estuary and literally in the direct watershed of this almost pristine watershed.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. 2118	490 - 2	John Preissl	Burnaby, BC	The one issue that I am very educated and familiar with is sediment/silt issues in rivers, creeks and streams and how that can seriously harm and or kill juvenile and adult Salmon. You may have seen much of the media I have done lately and over the years with these serious issues in our Salmon creeks in Burnaby and my oil spill photos the past few years in the Vancouver Sun and other media outlets. I am working with some of the larger environmental groups and Salmon groups to help with these sediment/silt issues and large developments in and around Vancouver. Sediment and silt is a huge problem for Salmon, Cutthroat Trout and all other fish species year round and not just in the spawning season. It is also devastating for the sea life in the general area.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2119	490 - 3	John Preissl	Burnaby, BC	The one issue that I am very educated and familiar with is sediment/silt issues in rivers, creeks and streams and how that can seriously harm and or kill juvenile and adult Salmon. You may have seen much of the media I have done lately and over the years with these serious issues in our Salmon creeks in Burnaby and my oil spill photos the past few years in the Vancouver Sun and other media outlets. I am working with some of the larger environmental groups and Salmon groups to help with these sediment/silt issues and large developments in and around Vancouver. Sediment and silt is a huge problem for Salmon, Cutthroat Trout and all other fish species year round and not just in the spawning season. It is also devastating for the sea life in the general area.	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>
2120	490 - 4	John Preissl	Burnaby, BC	The one issue that I am very educated and familiar with is sediment/silt issues in rivers, creeks and streams and how that can seriously harm and or kill juvenile and adult Salmon. You may have seen much of the media I have done lately and over the years with these serious issues in our Salmon creeks in Burnaby and my oil spill photos the past few years in the Vancouver Sun and other media outlets. 2122	490 - 6	John Preissl	Burnaby, BC	We only recently have the orcas, humpbacks, Dal's porpoise and pacific whited sided dolphins returning due to the herring and anchovies returning in this fragile sound. Let us keep it that way.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2123	490 - 7	John Preissl	Burnaby, BC	I will be doing a full photo tour of the entire area of the creek and estuary in the coming weeks to photo document this amazing salmon watershed area.	Thank you for this information. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2124	491 - 1	Personal Information Withheld	Lestock, SK	Please review application for EPA.we want to preserve all natural space this place provides.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2125	492 - 1	Personal Information Withheld	Gibsons, BC	I am against the gravel mine because it poses risks to wile salmon.	A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.  The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.  The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.

2126	493 - 1	Personal Information Withheld	Vancouver, BC	I am strongly against the Burnco gravel mine. It will threaten the McNab estuary and create a lot of pollution in Howe Sound. Please prevent this terrible project from going ahead.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
2127	494 - 1	Personal Information Withheld	North Vancouver, BC	I am opposed to the proposed Burnco project at McNab Creek.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2128	494 - 2	Personal Information Withheld	North Vancouver, BC	Howe Sound is only now recovering from decades of heavy industrial use. Let's not go backward on this recovery. The environmental impacts of the proposed project are simply too great to be justified for the use proposed.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
2129	494 - 3	Personal Information Withheld	North Vancouver, BC	Howe Sound is not an appropriate location for this type of industrial activity.	Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.

2130	494 - 4	Personal Information Withheld	North Vancouver, BC	I support the creation of a long term comprehensive land and water use plan for economic and social activities in the region that are compatible with sustainable uses of Howe Sound.	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
2131	495 - 1	Personal Information Withheld	Bowen Island, BC	Howe Sound has been through tough times and is finally living some of its former glory. With the closure of Woodfibre and Britannia Mine clean up efforts, species are returning to live, love, give birth, and play here. I worked in this are in the 80s and the beaches and intertidal and subtidal zones were a wasteland. Today I seen the return of rockfish, pipefish, greenlings, seaperch,salmon, steelhead and marine mammals such as seals, porpoises, dophins, and Orcas. Let us now continue our caring, connection, and stewardship of Howe Sound. Let's speak up for those beings who cannot. No gravel pit should be a part of the Sound. If you could ask the more than humans who make this place their home, they would agree. Thank you.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2132	496 - 1	Kevin Mizuno	Vancouver, BC	This needs to STOP!! We need to think more about the beauty of BC and the Environmental impact, then a gravel mine!!	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2133	497 - 1	Personal Information Withheld	Vancouver, BC	The Howe Sound which is on the southeast of the Strait of Georgia, and extends 42 kilometres to its head at Squamish with its beautiful network of fjords, is an amazing wilderness enjoyed by all locals and visitors alike, with unspoilt marine wildlife.  At McNab Creek valley which is located in the middle of the Howe Sound, is where Burnco is proposing to develop a 74+ acre pit, build an onsite crushing and processing plant, and produce 20+ million tonnes of aggregate per year over 16 + years. The project will create only 12 direct jobs.  To whose benefit is this proposed mine? To the:	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

2138	497 - 6	Personal Information Withheld	Vancouver, BC	As you can see the benefit is clearly to Burnco. We need to speak for the future of all related to the Howe Sound Ecosystem and for those who cannot speak and act and ensure they protected and put a stop to the Burnco proposed aggregate mine at McNab Creek.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2139	498 - 1	Martin Kukla	Vancouver, BC	I am strongly opposing Burnco Aggregate Mine project. I think that we all live in 21st century where we all realize how important is to protect the environment we live in. Such a beautiful place is a gift to us and we should look after it. No more digging, logging and mining is needed. We don't have to develop every single place on earth.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2140	499 - 1	Theodora Carroll	Howe Sound, BC	I am against the Burnco Aggregate Project. It is the wrong type of project for Howe Sound in terms of its environmental impacts on land, sea/water, and air, and on both marine and terrestrial biodiversity.	Potential effects of the Proposed Project have been assessed for selected valued environmental components to address key issues related to fish and fish habitat, marine resources, terrestrial wildlife and vegetation, geotechnical and natural hazards, water resources, air quality and climate change.  The assessment concludes that, with the application of design considerations and identified mitigation, no significant adverse environmental effects will result from the Proposed Project.  A detailed assessment of potential environmental effects of the Proposed Project is presented in Volume 2, Part B of the EAC Application/EIS.

	Ref #	Commenter (Name)	Location		
2143	499 - 4	Theodora Carroll	Howe Sound, BC	Finally it contributes to climate change and is not warranted.	<p>A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS. Potential effects considered were changes in GHG emissions as a result of the Project, the Project's contribution to climate change through the emission of GHG's, and how potential changes in climate will affect project-related infrastructure.</p> <p>Proposed mitigation includes the use of electricity instead of fossil fuels, routine maintenance of vehicles, and minimizing idling of vehicles and tugs. Mitigation measures that will reduce GHG emissions are consistent with specific actions within the Seas-to-Sky Air Quality Management Plan.</p> <p>Following the application of proposed mitigation, the contribution of the proposed Project GHG emissions to provincial, federal and global totals were determined to be negligible.</p>
2144	499 - 5	Theodora Carroll	Howe Sound, BC	Given the magnificence and uniqueness of Howe Sound, and that it is being proposed as a UNESCO Heritage area, it is a pity that the BC Government and the Federal Government are being so short-sighted in likely approving this project - on the basis of very limited short-term (dollar) gain for very long (environmental, biodiversity, health, and tourism) gain.	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
2145	499 - 6	Theodora Carroll	Howe Sound, BC	The majority of Howe Sound residents/citizens and municipalities have demonstrated clearly that they are against this project and it is hoped that for once the BC and Federal governments will listen to the majority rather than a very limited minority. Do NOT approve BurnCo Aggregate Project.	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>
2146	500 - 1	Trevor Boudreau	Vancouver, BC	Burnco has done a good job responding to initial concerns and making changes to its plans in this revised application. I support moving forward with this project - as long as its operations can be done in a sustainable manner and environmental impacts can be mitigated. I also trust in the guidance of the Squamish First Nation upon whose traditional lands this project would be built.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
2147	500 - 2	Trevor Boudreau	Vancouver, BC	Burnco has done a good job responding to initial concerns and making changes to its plans in this revised application. I support moving forward with this project - as long as its operations can be done in a sustainable manner and environmental impacts can be mitigated. I also trust in the guidance of the Squamish First Nation upon whose traditional lands this project would be built.	Thank you for your submission. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2148	501 - 1	Laurie Parkinson	Bowyer Island, BC	<p>McNab Creek is an unsuitable location for a gravel quarry.</p> <p>This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area.</p> <p>In 2009 SCRD said no to a permit for an aggregate operation at MdNab Creek. There was concern re noise and dust from onsite crushing, sorting, weighing, and stockpiling, all of which Burnco plans to do.</p> <p>Why allow these activities now?</p> <p>To do so would represent atrocious planning, with little/no obvious compensating factors. It should not be permitted.</p>	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2149	502 - 1	Laurie Parkinson	Bowyer Island, BC	<p>The fish habitat offset plan may not work.</p> <p>The proponent has no experience operating an aggregate mine in a marine environment. Contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as "marine". The proposed "compensation channel" is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Any approval of this proposal should include a contingency bond to fund maintenance of the new stream-way, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project.</p>	<p>The proposed Project will lead to the loss of approximately 200 m<sup>2</sup> of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. The proposed design for the channel extension uses the existing lower channel as a template and it will meet the factors and criteria that are generally accepted for the construction of a functional groundwater-fed spawning channel. It should provide conditions similar to the existing run habitat in the lower section of WC2 that was designed as chum spawning habitat by DFO and where spawning activity was observed during the November 2016 survey.</p> <p>The creation of the pit lake is predicted to cause a doubling of groundwater influx into the lower section of WC2. The increase in ground water influx will lead to additional groundwater upwelling and the increased upwelling is expected to provide increased levels of intergravel flow that will be suitable for eggs and alevins. The average depth in the proposed offset habitat extension and the remaining section of WC2 is predicted to be above 0.3 m making it suitable for salmon spawning. As described in the Aquatic Health assessment provided in Surface Water Resources (Section 5.5.7.2), the water quality and temperature of ground and surface water entering the offset habitat and existing lower section of WC2 will be suitable for salmonids to complete all stages of their life history including spawning.</p> <p>In response to comments from the Technical Working Group, the design of the habitat offset plan was revised to allow approximately 20 m of pool habitat upstream of the culvert and approximately 20 m of gravel bed run habitat downstream of the culvert to be retained which will avoid approximately 232 m<sup>2</sup> of habitat loss. The design of the channel extension incorporates run and pool habitat in approximately a 1 : 1 ratio, based on this design and the use of run habitat for spawning in the existing lower channel it is expected that more than 2, 000 m<sup>2</sup> of the offset channel habitat will provide conditions suitable for salmonid spawning.</p>
2150	502 - 2	Laurie Parkinson	Bowyer Island, BC	<p>The fish habitat offset plan may not work.</p> <p>The proponent has no experience operating an aggregate mine in a marine environment. Contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as "marine". The proposed "compensation channel" is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Any approval of this proposal should include a contingency bond to fund maintenance of the new stream-way, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project.</p>	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>

2151	503 - 1	Personal Information Withheld	Grantham's Landing, BC	I am totally opposed to this gravel mine in a key salmon estuary in biologically sensitive Howe Sound.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
2152	503 - 2	Personal Information Withheld	Grantham's Landing, BC	For God's sake, the whales and dolphins are just coming back! Give nature a chance!	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2153	503 - 3	Personal Information Withheld	Grantham's Landing, BC	For God's sake, the whales and dolphins are just coming back! Give nature a chance!	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

Should full compensation for loss not be acceptable to local homeowners, this mine should not be approved.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

2160	506 - 2	Personal Information Withheld	Gibsons, BC	I do not want to see this region become re-industrialised as it has taken 25 years for Howe Sound to return to being a viable ecosystem with the food chain returning from plankton on up to whales. That is the result of the closure of the Britannia Mine and its toxic consequence on Howe Sound. Why on earth would we want to jeopardize that return?	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
2161	506 - 3	Personal Information Withheld	Gibsons, BC	I believe this mine would contribute to the decline of the region's waterways.	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>

2162	506 - 4	Personal Information Withheld	Gibsons, BC	I believe that tourism and its spinoffs benefit a far broader chunk of the population and is preferable than 12 supposed jobs created by the proposed project with all of the money going to Burnco. I am not against mining. I am against this particular project as I believe it is a poor fit for the region and the small community near the mine at McNab Creek.	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>
2163	506 - 5	Personal Information Withheld	Gibsons, BC	I believe that tourism and its spinoffs benefit a far broader chunk of the population and is preferable than 12 supposed jobs created by the proposed project with all of the money going to Burnco. I am not against mining. I am against this particular project as I believe it is a poor fit for the region and the small community near the mine at McNab Creek.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2164	507 - 1	Peter Kowalczyk	Bowyer Island, BC	<p>Regional demand for additional aggregate is not demonstrated</p> <p>The Vancouver market requirement for an additional gravel aggregate source is not supported by the proponent's documentation. A greater profit margin for the Proponent should not be grounds for destroying the estuary of McNab Creek.</p> <p>A supply/demand report showing strong evidence of the need for supply from this location (and the unavailability of supply from established locations), such as has been done for the Okanagan region, should be prepared before considering a permit for this project. See <a href="https://www.regionaldistrict.com/media/112368/2013_11_08__Full_Report__Aggregate_Supply_and_Demand_Update_and_Analysis.pdf">https://www.regionaldistrict.com/media/112368/2013_11_08__Full_Report__Aggregate_Supply_and_Demand_Update_and_Analysis.pdf</a></p>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
2165	508 - 1	Harriet Hunter	Gibsons, BC	I definitely oppose the Burnco Aggregate Project.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2166	508 - 2	Harriet Hunter	Gibsons, BC	The fragile recovery of Howe Sound should not be a site of re-industrialization but should be a protected environment for marine life and human habitation.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. 2167	508 - 3	Harriet Hunter	Gibsons, BC	<p>The company's application does not show us that it is committed to careful management of its mining and processing operations in order to protect the surrounding marine and human environments.</p>	<p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 and are summarized below. BURNCO commits to funding for these monitoring initiatives.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring.</p> <p>Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational Environmental Protection Plans (EPPS). Compliance monitoring will include assessment of Proponent and contractors' environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program.</p> <p>BURNCO will submit a report to the BCEAO on the status of compliance with the Certificate Conditions, at the following times:</p> <ul style="list-style-type: none"> <li>- At least 30 days prior to the start of Construction;</li> <li>- On or before January 31 in each year after the start of Construction;</li> <li>- At least 30 days prior to the start of Operations;</li> <li>- On or before January 31 in each year after the start of Operations;</li> <li>- At least 30 days prior to the start of Closure and Reclamation;</li> <li>- On or before January 31 in each year after the start of Closure and Reclamation; and</li> <li>- Within 30 days of completing Closure and Reclamation.</li> </ul> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2168	509 - 1	Laurie Parkinson	Bowyer Island, BC	<p>The impact of marine noise is insufficiently studied in the application.</p> <p>The impact of marine noise (from the conveyor belts - tugs, barge loading and water taxis) on cetaceans, herring, salmon (spawning adult and habituating juveniles) and other at-risk species (including waterfowl) is underestimated in the "science" work done by the Proponent.</p> <p>Marine noise transmits 5-10 times farther &amp; faster through water than through air. Marine noise should be carefully baselined and monitored in wide spatial and temporal dimensions around the site. Periodic reporting of results that are auditable and accessible to the public should be part of any approval of the project. Local authorities (eg SCRD) should have the power to compel a reduction, suspension, or cessation of mine activities where marine noise exceeds pre-arranged norms.</p>	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>
2169	510 - 1	Peter Kowalczyk	Bowyer Island, BC	<p>Loss of productive salmon habitat</p> <p>The project has (twice) been rejected by Fisheries &amp; Oceans Canada because of the likely loss of salmon habitat in McNab Creek. In a year of disastrous returns to the Fraser and other runs, this proposal is ill-timed and ill-advised</p> <p>The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

2170	511 - 1	Peter Kowalczyk	Bowyer Island, BC	<p>Insufficient data for at-risk species baselines.</p> <p>For several key aquatic and land-based species (such as anadromous salmon, resident cutthroat trout and Roosevelt elk), population data was collected over far too narrow a timespan to be useful for establishing accurate baselines. Without accurate baselines, quantitative monitoring of the effects of this project will not be possible.</p> <p>Part-year data is utterly insufficient to establishing accurate baselines. At least five years of data should be collected to afford accurate baselines usable for ongoing monitoring of effects on species populations and habitat. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where habitat damage exceeds pre-agreed norms</p>	<p>The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada. The baseline studies conducted are sufficient for the purpose of assessing potential effects of the Proposed Project on selected Valued Components. Additional years of supplemental field studies are not required or proposed for the assessment.</p> <p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS. Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>
2171	512 - 1	Peter Kowalczyk	Bowyer Island, BC	<p>21 species officially at risk from Burnco.</p> <p>Burnco's consultants documented that the gravel quarry could be home to 21 species officially at risk. This includes Roosevelt elk , re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.</p> <p>The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2172	513 - 1	Peter Kowalczyk	Bowyer Island, BC	<p>Unsuitable location.</p> <p>This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area</p> <p>In 2009 SCRD said no to a permit for an aggregate operation at McNab Creek. There was concern re noise and dust from onsite crushing, sorting, weighing, and stockpiling, all of which Burnco plans to do. Why allow these activities now? To do so would represent atrocious planning, with little/no obvious compensating factors. It should not be permitted.</p>	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>
2173	514 - 1	Laurie Parkinson	Bowyer Island, BC	<p>Plant and dock lighting</p> <p>The McNab Creek area (and much of Howe Sound) is currently a dark zone, allowing residents visibility of the wonders of the night sky. Plant and dock lighting will destroy this local value for much of the year.</p> <p>Any approval must come with strict (and measurable) restrictions on lighting intensity and local dispersion. Local authorities (eg SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where light intensities exceed pre-arranged norms.</p>	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects, including visual quality. Changes in visual quality considered the potential for cumulative effects related to vegetation clearing and the installation and operation of land-based and marine-based infrastructure and night-time security lighting to the landscape visible from selected receptor sites. The Visual Quality CEA is presented in Section 7.4.5.7 of the EAC Application/EIS. All potential cumulative residual effects were determined to be negligible or not significant.</p>

2174	515 - 1	Peter Kowalczyk	Bowyer Island, BC	<p>The Fish Habitat offset plan may not work.</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as "marine"). The proposed "compensation channel" is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Any approval of this proposal should include a contingency bond to fund maintenance of the new streamway, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project</p>	<p>The proposed Project will lead to the loss of approximately 200 m2 of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. The proposed design for the channel extension uses the existing lower channel as a template and it will meet the factors and criteria that are generally accepted for the construction of a functional groundwater-fed spawning channel. It should provide conditions similar to the existing run habitat in the lower section of WC2 that was designed as chum spawning habitat by DFO and where spawning activity was observed during the November 2016 survey.</p> <p>The creation of the pit lake is predicted to cause a doubling of groundwater influx into the lower section of WC2. The increase in ground water influx will lead to additional groundwater upwelling and the increased upwelling is expected to provide increased levels of intergravel flow that will be suitable for eggs and alevins. The average depth in the proposed offset habitat extension and the remaining section of WC2 is predicted to be above 0.3 m making it suitable for salmon spawning. As described in the Aquatic Health assessment provided in Surface Water Resources (Section 5.5.7.2), the water quality and temperature of ground and surface water entering the offset habitat and existing lower section of WC2 will be suitable for salmonids to complete all stages of their life history including spawning.</p> <p>In response to comments from the Technical Working Group, the design of the habitat offset plan was revised to allow approximately 20 m of pool habitat upstream of the culvert and approximately 20 m of gravel bed run habitat downstream of the culvert to be retained which will avoid approximately 232 m2 of habitat loss. The design of the channel extension incorporates run and pool habitat in approximately a 1 : 1 ratio, based on this design and the use of run habitat for spawning in the existing lower channel it is expected that more than 2, 000 m2 of the offset channel habitat will provide conditions suitable for salmonid spawning.</p>
2175	515 - 2	Peter Kowalczyk	Bowyer Island, BC	<p>The Fish Habitat offset plan may not work.</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as "marine"). The proposed "compensation channel" is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Any approval of this proposal should include a contingency bond to fund maintenance of the new streamway, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project</p>	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>
2176	516 - 1	Personal Information Withheld	Keats Island, BC	I am opposed to Burnco's McNab Creek mine proposal. I find their presentation unconvincing.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

2177	516 - 2	Personal Information Withheld	Keats Island, BC	The mine would be the last blow to a habitat already degraded by long term logging.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2178	516 - 3	Personal Information Withheld	Keats Island, BC	This estuary is the last large undeveloped one on the Sound. It should be preserved and allowed to heal for the good of the marine and terrestrial wildlife as well as our ignorant human selves.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

2185	520 - 1	Peter Kowalczyk	Bowyer Island, BC	<p>The impact of marine noise is insufficiently studied in the application.</p> <p>The impact of marine noise (from the conveyor belts –tugs, barge loading and water taxis) on cetaceans, herring, salmon (spawning adult and habituating juveniles) and other at-risk species (including waterfowl) is underestimated in the “science” work done by the Proponent.</p> <p>Marine noise transmits 5-10 times farther &amp; faster through water than through air. Marine noise should be carefully baselined and monitored in wide spatial and temporal dimensions around the site. Periodic reporting of results that are auditable and accessible to the public should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where marine noise exceeds pre-agreed norms</p>	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>
2186	521 - 1	Kevin	Manning, AB	<p>Howe Sound is still in recovery from major industry in the last century. This gravel mine is not needed or vital to our province or city region in any way but having a natural jewel so close to the urban centre is for our tourism industry. Please give the sound more time to recover and decline Burnco's application.</p>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>

2187	521 - 2	Kevin	Manning, AB	Howe Sound is still in recovery from major industry in the last century. This gravel mine is not needed or vital to our province or city region in any way but having a natural jewel so close to the urban centre is for our tourism industry. Please give the sound more time to recover and decline Burnco's application.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2188	522 - 1	Laurie Parkinson	Bowyer Island, BC	Water quality is insufficiently characterized in the application.  Removing sediment from the water discharged into the ocean is critical to habitat protection, especially for the nearby eel grass beds and glass sponge reefs.  Siltation monitoring (in the original channel, compensation channels, and in the nearby ocean), with periodic reporting of results that are auditable and accessible to the public, should be part of any approval of the project. Local authorities (eg SCRD) should have the power to compel a reduction, suspension, or cessation of mine activities where sediments/siltation exceeds pre-arranged norms.	Wash water will be processed for removal of fines and silt in a 95% efficient wash plant to be fed using recycled water from two large storage tanks. Fines will not be discharged to the estuary; they will be deposited in a designated inland fines area and covered in accordance with an approved Reclamation and Effective Closure Plan.
2189	522 - 2	Laurie Parkinson	Bowyer Island, BC	Water quality is insufficiently characterized in the application.  Removing sediment from the water discharged into the ocean is critical to habitat protection, especially for the nearby eel grass beds and glass sponge reefs.  Siltation monitoring (in the original channel, compensation channels, and in the nearby ocean), with periodic reporting of results that are auditable and accessible to the public, should be part of any approval of the project. Local authorities (eg SCRD) should have the power to compel a reduction, suspension, or cessation of mine activities where sediments/siltation exceeds pre-arranged norms.	A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.  Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.  Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.

2194	524 - 3	Peter Kowalczyk	Bowyer Island, BC	<p>Water quality is insufficiently characterized in the application.</p> <p>Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs.</p> <p>Siltation monitoring (both in the original and compensation channels and in the nearby ocean) , with periodic reporting of results that are auditable and accessible to the public , should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms</p>	<p>A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken. Adaptive management techniques to be implemented as required include:</p> <ul style="list-style-type: none"> <li>- Continue to evaluate the extent of the pit during operations.</li> <li>- During the wet season, if water levels in the pit lake become higher than has been designed for the Pit Lake Containment Berm then the valves in the culverts will be closed to reduce the amount of water reporting to the pit from the surface water on the western slope.</li> <li>- The height of the pit lake at the outlet structure can be adjusted to increase or decrease the level of the pit lake (e.g., adding or lowering stop logs) at closure to maintain the hydraulic gradient between McNab Creek and the Project Area following closure.</li> </ul>
2195	525 - 1	Peter Kowalczyk	Bowyer Island, BC	<p>“Daytime Hours” definition.</p> <p>The Proponent advertises that the plant will operate only on weekdays and during “daytime hours”. Daylight hours vary seasonally, but the definition of “daytime hours” is unclear</p> <p>Clearly define “daytime hours” in the proposal</p>	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>
2196	526 - 1	Peter Kowalczyk	Bowyer Island, BC	<p>The nearshore strip of forest cover is too narrow The strip of forest cover between the pit and the ocean is too narrow to be sustainable.</p> <p>Blowdown and saltwater invasion will threaten its existence</p> <p>For reasons of sustainability and visual camouflage, Increase the width of the ocean-pit separation strip, and lessen the size of the proposed pit and crushing area</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. Maintaining a treed buffer along the foreshore (approx. 25-50 m wide adjacent to the processing area) will also limit dust and noise emissions to the marine environment. Additional screening of lan-based structures may be possible around project components not currently screened by existing vegetation. The nature and extent of vegetation screening incorporated into the site design will be described in the Vegetation Management Plan (Volume 3, Part E, Section 16 of the EAC Application/EIS).</p> <p>A detailed assessment of potential vegetation effects (including windthrow effects) of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS. The significance of windthrow effects were determined to be negligible; few new windward edges will be created. Monitoring of treeline edges will be conducted to evaluate potential windthrow effects and adaptive management will be employed, if necessary.</p>

2197	527 - 1	Peter Kowalczyk	Bowyer Island, BC	<p>Loss of property values in the nearby strata units.</p> <p>The proponent claims little or no loss of value for nearby properties. This assertion is contradicted by many studies that have highlighted the loss of value (including the value associated with quiet enjoyment) at or near industrial sites adjacent to established residential areas. Recent jurisprudence in BC has borne out the right of homeowners to receive compensation for that loss. See <a href="http://www.cbc.ca/news/canada/british-columbia/grace-islet-controversy-ends-as-b-c-steps-in-to-buy-land-1.2906882">http://www.cbc.ca/news/canada/british-columbia/grace-islet-controversy-ends-as-b-c-steps-in-to-buy-land-1.2906882</a></p> <p>Fair market value compensation for loss of property value must form part of the economic analysis of any approval for this mine</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
2198	528 - 1	Personal Information Withheld	Gibsons, BC	<p>I aks you to reject the application as this proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>
2199	528 - 2	Personal Information Withheld	Gibsons, BC	<p>I aks you to reject the application as this proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area.</p>	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>

2200	528 - 3	Personal Information Withheld	Gibsons, BC	Furthermore the project has (twice) been rejected by Fisheries & Oceans Canada because of the likely loss of salmon habitat in McNab Creek, and would endanger marine species.	<p>Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO's involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.</p> <p>Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.</p>
2201	528 - 4	Personal Information Withheld	Gibsons, BC	Furthermore the project has (twice) been rejected by Fisheries & Oceans Canada because of the likely loss of salmon habitat in McNab Creek, and would endanger marine species.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2202	528 - 5	Personal Information Withheld	Gibsons, BC	Furthermore the project has (twice) been rejected by Fisheries & Oceans Canada because of the likely loss of salmon habitat in McNab Creek, and would endanger marine species.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

2207	533 - 1	Peter Kowalczyk	Bowyer Island, BC	<p>Barge traffic will diminish Howe Sound's recreational and tourism potential and add to the cumulative traffic hazard in Howe Sound.</p> <p>Shipping 1-4 million tonnes of aggregate annually from this location will make for 2-6 tug/barge movements daily through Southern Howe Sound,. Routes would cross very busy sailing and small-boat recreational areas, the Howe Sound Marine Trail and ferry routes, the path of LNG tankers exiting from the Woodfibre LNG plant and freighters from Squamish Terminals. This exponentially increases the risk of collisions and loss of life in a narrow waterway and diminishes the amenity and tourism use of the Sound. The cumulative effects and worst-case hazard analysis of this project have been underestimated by the Proponent. The Howe Sound airshed is restricted, pollution from this increased heavy tugboat traffic will impact everyone along the route.</p> <p>A cumulative impact assessment, including loss of amenity and tourism value of the Sound, should be completed prior to deciding on this application. So too should a study of the increased hazards associated with increasing the large-vessel traffic in Howe Sound. Improvements to vessel tracking, buoys and channel markers in the area will be necessary.</p>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>

2209	534 - 2	Laurie Parkinson	Bowyer Island, BC	<p>The job benefits were analyzed on the basis of too narrow an RAA.</p> <p>BURNCO currently sources its aggregate from Jervis Inlet, Port McNeil and Coquitlam. To gauge the benefits to the BC economy, the net job creation figures (i.e. McNab's 12 jobs less the job losses at the above aggregate sources) as a consequence of allowing the McNab Creek operation must be considered.</p> <p>If there is little or no net job gain to BC as a result of this proposal, it should be firmly rejected. Jobs in areas like Port McNeil are much harder to come by than in the Lower Mainland/ Howe Sound</p>	<p>The local spatial study area for the operations phase labour market effects (including employment) of the Proposed project was described in the Application Information Requirements/EIS Guidelines, which was approved by the BCEAO and the CEA Agency on December 16, 2014 after review by the Technical Working Group established to guide this assessment. This local spatial study area is Sunshine Coast Regional District.</p> <p>The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.</p>
2210	536 - 1	Murray Skeels	Bowen Island, BC	<p>This project would provide gravel, a commodity readily available for extraction in a cost effective manner from many areas with quite low ecological values. This particular location is an extremely rich ecological area that will be destroyed by the project.</p>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resource is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
2211	536 - 2	Murray Skeels	Bowen Island, BC	<p>This project would provide gravel, a commodity readily available for extraction in a cost effective manner from many areas with quite low ecological values. This particular location is an extremely rich ecological area that will be destroyed by the project.</p>	<p>Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>

2212	536 - 3	Murray Skeels	Bowen Island, BC	This project would provide gravel, a commodity readily available for extraction in a cost effective manner from many areas with quite low ecological values. This particular location is an extremely rich ecological area that will be destroyed by the project.	<p>Potential effects of the Proposed Project have been assessed for selected valued environmental components to address key issues related to fish and fish habitat, marine resources, terrestrial wildlife and vegetation, geotechnical and natural hazards, water resources, air quality and climate change.</p> <p>The assessment concludes that, with the application of design considerations and identified mitigation, no significant adverse environmental effects will result from the Proposed Project.</p> <p>A detailed assessment of potential environmental effects of the Proposed Project is presented in Volume 2, Part B of the EAC Application/EIS.</p>
2213	536 - 4	Murray Skeels	Bowen Island, BC	Only those who place very, very little value on the natural world would even contemplate the possibility that the benefit to be obtained from this giant gravel pit would outweigh the cost to our environment. Please reject this application. Murray Skeels Mayor, Bowen Island Municipality	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2214	537 - 1	Peter Kowalczyk	Bowyer Island, BC	<p>Preservation of marine tourism , hiking access to the vicinity of McNab.</p> <p>Moorages, anchorages , swimming facilities and back-country access have long been part of the McNab Creek area's attractions for Howe Sound visitors and local boating clubs.</p> <p>The application fails to properly address how these local amenities will be protected.</p> <p>These amenities have a real and calculable economic value and their loss will impact the local economy. The proposal does not identify how loss of these amenities will be compensated for. The Management Plan should address this issue.</p>	<p>Harvesting fish and wildlife' and 'Outdoor recreation and tourism' are valued components in the environmental assessment of the Proposed Project (see Table 7.3-1). No displacement effects on recreational hunting or other recreational activities is anticipated due to the Proposed Project because the primary access to the local study area is through the Proposed Property, and public access and use of the Proposed Property has never been permitted. During the construction and operation phases, recreationists and tourists would continue to have access to the foreshore area below the high water mark and to the anchorage area in the vicinity of where McNab Creek enters Howe Sound.</p> <p>Proposed Project construction and operations would prevent marine-based recreational and tourism activities occurring around the Project jetty. As the jetty is located within an existing log boom tenure and recreational and tourism activities are concentrated on the eastern side of the local study area (where McNab Creek enters Howe Sound), this effect is considered to be negligible.</p> <p>Displacement on the water would occur on an intermittent basis as a result of Proposed Project-related vessel traffic, which would require smaller vessels to alter direction and/or speed when navigating at the same time as water taxis or barges (Volume 2, Part B - Section 7.2). These navigational challenges are present in the LSA due to forestry activity, and are subject to the Collision Regulations of the Canada Shipping Act. Any resulting effects on recreational boating recreational activities due to potential interactions of recreational vessels and equipment and Project-associated vessels are not detectable or not measureable, so potential effects of the Proposed Project on water-based recreation and tourism access matters in the construction and operation phases are determined to be negligible.</p> <p>As part of the Marine Transport Management Plan outlined in Marine Transport (Volume 2, Part B - Section 7.2), BURNCO would also develop and implement strategies, best management practices and guidelines to avoid and minimise Proposed Project - related disruption of marine-based recreational activities during construction and operations. As part of the development of this plan, BURNCO would consult with key marine user groups (e.g., McNab Strata, yacht clubs, camps, and kayaking operators) to discuss strategies (including but not limited to routing options) to manage the interaction of Proposed Project vessel traffic with recreational and tourism areas during the high season months.</p>
2215	538 - 1	Laurie Parkinson	Bowyer Island, BC	<p>First Nation consultation – Sechelt First Nation was omitted. McNab Creek is in Sechelt traditional territory.</p> <p>Squamish and Tseil-Waututh First Nations have been consulted re Burnco, but not the Sechelt First Nation.</p> <p>The Sechelt First Nation wasn't consulted about the gravel quarry at McNab Creek in 2009 either, and this was part of SCR D saying no re a gravel quarry there in 2009.</p> <p>Respect/consult with Sechelt First Nations re Burnco.</p>	<p>First Nation consultation requirements are delegated to Proponents by the Crown. For the Proposed Project, only Squamish Nation and the Tseil-Waututh Nation were identified as potentially affected first Nations by the BCEAO. The CEA Agency identified additional Aboriginal Group, however, the Sechelt First Nation was not among these, presumably because of the proximity of the proposed Project to their Traditional Territory.</p>

2216	539 - 1	Peter Kowalczyk	Bowyer Island, BC	<p>End-of-project remediation</p> <p>Experience in the BC mining industry has shown escalating costs of end of project remediation.</p> <p>The compensation channel is an artificial structure which will likely not survive long after project's end. Restoring the natural streamway should be a firm end-state requirement. This should be funded by an environmental bond established at the start of project, and assessed an increased during the project to ensure sufficient funds for proper remediation when the project ends.</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>
2217	540 - 1	Laurie Parkinson	Bowyer Island, BC	<p>Loss of property values in the nearby strata units.</p> <p>The proponent claims little or no loss of value for nearby properties. This assertion is contradicted by many studies that have highlighted the loss of value (including the value associated with quiet enjoyment) at or near industrial sites adjacent to established residential areas.</p> <p>Recent jurisprudence in BC has borne out the right of homeowners to receive compensation for that loss. See <a href="http://www.cbc.ca/news/canada/british-columbia/grace-islet-controversy-ends-as-b-c-steps-in-to-buy-land-1.2906882">http://www.cbc.ca/news/canada/british-columbia/grace-islet-controversy-ends-as-b-c-steps-in-to-buy-land-1.2906882</a></p> <p>Fair market value compensation for loss of property value must form part of the economic analysis of any approval for this mine.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>

2218	541 - 1	Steve Dietrich	North Vancouver, BC	<p>Here is a great example of where the Howe Sound could be headed if looking at more positive industries down the road.  <a href="http://www.squamishchief.com/news/local-news/400-million-all-season-resort-in-works-1.2220168">http://www.squamishchief.com/news/local-news/400-million-all-season-resort-in-works-1.2220168</a>                      This type of resort/investment (\$400 Million) proposal does not come to many rural communities in Canada but is being proposed for Howe Sound! People are starting to recognize it's amazing beauty. Since the long process of cleaning-up after Britannia, there are finally more sustainable recreation and resort proposals coming to the Howe Sound which will have so many more economic, sociological and environmental benefits to the region than a gravel mine!                      Please consider a more positive future!!</p>	<p>BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.</p>
2219	542 - 1	Laurie Parkinson	Bowyer Island, BC	<p>Advisory Committee of voluntary citizens.</p> <p>In 2009 when a gravel quarry at McNab Creek was turned down by SCRD, one requirement by SCRD was an Advisory Committee of volunteer citizens to provide ongoing input with the goal of community acceptance of the project.</p> <p>Require the formation of an Advisory Committee of volunteer citizens - as part of the proposal for this project.</p>	<p>BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.</p>
2220	543 - 1	Peter Kowalczyk	Bowyer Island, BC	<p>End-of-project remediation</p> <p>Experience in the BC mining industry has shown escalating costs of end of project remediation.</p> <p>The compensation channel is an artificial structure which will likely not survive long after project's end. Restoring the natural streamway should be a firm end-state requirement. This should be funded by an environmental bond established at the start of project, and assessed an increased during the project to ensure sufficient funds for proper remediation when the project ends.</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>

2221	544 - 1	Laurie Parkinson	Bowyer Island, BC	<p>The job benefits were analyzed on the basis of too narrow an RAA .</p> <p>BURNCO currently sources its aggregate from Jervis Inlet, Port McNeil and Coquitlam. To gauge the benefits to the BC economy, the NET job creation figures (i.e. McNab's 12 jobs minus job losses at the above aggregate sources) as a consequence of allowing the McNab Creek operation must be considered.</p> <p>If there is little or no net job gain to BC as a result of this proposal, it should be firmly rejected. Jobs in areas like Port McNeil are much harder to come by than in the Lower Mainland/ Howe Sound.</p>	<p>The local spatial study area for the operations phase labour market effects (including employment) of the Proposed project was described in the Application Information Requirements/EIS Guidelines, which was approved by the BCEAO and the CEA Agency on December 16, 2014 after review by the Technical Working Group established to guide this assessment. This local spatial study area is Sunshine Coast Regional District.</p> <p>The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.</p>
2222	545 - 1	Personal Information Withheld	Gibsons, BC	Just don't do it!	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2223	546 - 1	Laurie Parkinson	Bowyer Island, BC	<p>Barge traffic will diminish Howe Sound's recreational and tourism potential, and add to the cumulative traffic hazard in Howe Sound.</p> <p>Shipping 1-4 million tonnes of aggregate annually from this location will make for 2-6 tug/barge movements daily through Southern Howe Sound. Routes would cross very busy sailing and small-boat recreational areas: significant recreational and small business boat traffic (that will only grow over time), the Howe Sound Marine Trail, ferry routes, the path of LNG tankers exiting from the Woodfibre LNG plant, and freighters from Squamish Terminals. This exponentially increases the risk of collisions and loss of life in a narrow waterway and diminishes the amenity and tourism use of the Sound. The cumulative effects and worst-case hazard analysis of this project have been underestimated by the Proponent.</p> <p>A cumulative impact assessment, including loss of amenity and tourism value of the Sound, should be completed prior to deciding on this application. So too should a study of the increased hazards associated with increasing the large-vessel traffic in Howe Sound. Improvements to vessel tracking, buoys and channel markers in the area will be necessary.</p>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>

2224	547 - 1	Laurie Parkinson	Bowyer Island, BC	<p>The job benefits analysis for BURNCO used the questionable input-output econometric model.</p> <p>BURNCO has used input-output econometric analysis to predict the job creation benefits accruing to the project.</p> <p>For resource projects, this is a highly questionable analysis technique. The Australian Institute has written a convincing argument highlighting the inadequacies of input-output analysis. See <a href="http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf">http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf</a> (Input-output was used by the BC Government in arriving at its inflated job estimates for BC's LNG industry.)</p> <p>Re-do the employment estimates and repost/allow additional time for public scrutiny and comments.</p>	<p>The environmental assessment of the Proposed Project used an input-output (I-O) impact modelling methodology to estimate the Project's potential effect on employment (as well as other economic parameters). The B.C. Input-Output Model (BCIOM) was used. The BCIOM is maintained by BC Stats, which is the central statistics agency of the B.C. government. The BCIOM is a version of Statistics Canada's Inter-Provincial Input-Output Model (IPIOM) which BC Stats calibrated for undertaking economic analyses of B.C.-based projects. The BCIOM is a robust, calibrated, third party provided input-output model, and has been previously accepted for use by the BCEAO and the CEA Agency to assist with estimating the economic impact of proposed projects.</p>
2225	548 - 1	Laurie Parkinson	Bowyer Island, BC	<p>There was an inconsistency between the job creation figures shown in 2 different slides in the Open Houses for BURNCO.</p> <p>One showed about 300 person-years of employment (over 25 years). The other (derived from input-output analysis) showed person-year employment benefits several TIMES that amount.</p> <p>This misleading discrepancy should be resolved by further analysis, and that section of the application re-submitted, with additional time allowed for public scrutiny and comment.</p>	<p>The estimated number of jobs created by the proposed Project during construction and operations phases are presented in Section 2.5.4 of the EAC Application/EIS.</p> <p>Employment numbers were presented on three Open House display panels, as follows:</p> <ul style="list-style-type: none"> <li>- Project Specifications: 80 person years during construction and 360 person years during operations (direct, indirect and induced);</li> <li>- Project Benefits: 12 full-time jobs at the site (i.e. direct only);</li> <li>- Sustainable Economy: 119 jobs during construction and 99 jobs during operations (direct, indirect and induced); 33 long-term jobs during operations are expected to be filled by Sunshine Coast residents.</li> </ul>

2226	549 - 1	Laurie Parkinson	Bowyer Island, BC	<p>Preservation of marine tourism and hiking access to the vicinity of McNab.</p> <p>Moorages, anchorages, swimming facilities and back-country access have long been part of the McNab Creek area's attractions for Howe Sound visitors and local boating clubs.</p> <p>The application fails to properly address how these local amenities will be protected. Neither does it propose how loss of these amenities will be compensated for. The Management Plan should address this issue.</p>	<p>Harvesting fish and wildlife' and 'Outdoor recreation and tourism' are valued components in the environmental assessment of the Proposed Project (see Table 7.3-1). No displacement effects on recreational hunting or other recreational activities is anticipated due to the Proposed Project because the primary access to the local study area is through the Proposed Property, and public access and use of the Proposed Property has never been permitted. During the construction and operation phases, recreationists and tourists would continue to have access to the foreshore area below the high water mark and to the anchorage area in the vicinity of where McNab Creek enters Howe Sound.</p> <p>Proposed Project construction and operations would prevent marine-based recreational and tourism activities occurring around the Project jetty. As the jetty is located within an existing log boom tenure and recreational and tourism activities are concentrated on the eastern side of the local study area (where McNab Creek enters Howe Sound), this effect is considered to be negligible.</p> <p>Displacement on the water would occur on an intermittent basis as a result of Proposed Project-related vessel traffic, which would require smaller vessels to alter direction and/or speed when navigating at the same time as water taxis or barges (Volume 2, Part B - Section 7.2). These navigational challenges are present in the LSA due to forestry activity, and are subject to the Collision Regulations of the Canada Shipping Act. Any resulting effects on recreational boating recreational activities due to potential interactions of recreational vessels and equipment and Project-associated vessels are not detectable or not measureable, so potential effects of the Proposed Project on water-based recreation and tourism access matters in the construction and operation phases are determined to be negligible.</p> <p>As part of the Marine Transport Management Plan outlined in Marine Transport (Volume 2, Part B - Section 7.2), BURNCO would also develop and implement strategies, best management practices and guidelines to avoid and minimise Proposed Project - related disruption of marine-based recreational activities during construction and operations. As part of the development of this plan, BURNCO would consult with key marine user groups (e.g., McNab Strata, yacht clubs, camps, and kayaking operators) to discuss strategies (including but not limited to routing options) to manage the interaction of Proposed Project vessel traffic with recreational and tourism areas during the high season months.</p>
2227	550 - 1	Anne	Sunshine Coast, BC	I am 100% against the Burnco Mine. The McNab Valley it too important to spoil with a gravel pit. Our family has been enjoying this incredible & unique area of Howe Sound since the 90's. Some of my most favorite memories were created at McNab Creek.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2228	550 - 2	Anne	Sunshine Coast, BC	Crabbing, fishing, wakeboarding, tubing, the list goes on and on.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2229	550 - 3	Anne	Sunshine Coast, BC	Future generations would miss out on so much if they allow an industry like a gravel pit to operate here; especially the wildlife!	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.

2230	550 - 4	Anne	Sunshine Coast, BC	Future generations would miss out on so much if they allow an industry like a gravel pit to operate here; especially the wildlife!	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2231	550 - 5	Anne	Sunshine Coast, BC	It's certainly not worth 12 jobs. No to Burnco!	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>

2233	552 - 1	Laurie Parkinson	Bowyer Island, BC	<p>The application seems to think that in terms of socio-economic impacts, BURNCO is too far from Woodfibre LNG to have any interaction. However, both facilities are in the Sea-to-Sky Corridor, and are all part of Howe Sound.</p> <p>The many tourists travelling to Whistler experience the Sound as a contiguous area that has a positive transition from over-industrialization in Vancouver - back to natural beauty in Howe Sound. Many new business and residents have arrived precisely because of this natural beauty.</p> <p>A return of multiple significant industrial projects on Howe Sound should be evaluated for cumulative impacts, especially on tourism, and the region's natural brand.</p> <p>An assessment that fails to recognize that all development in the Sound impacts the whole Sound is seriously flawed.</p> <p>The assessment also makes absolutely no mention of the new compressor station planned for Mt. Mulligan which is again further re-industrialization of the area. Any significant shift in economic basis will have impacts, but these have not been addressed by the Environmental Impact Statement.</p>	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for the following:</p> <ul style="list-style-type: none"> <li>- Marine mammals – behavioural disturbance</li> <li>- Amphibian species at risk – barriers to movement, change in mortality, habitat loss</li> <li>- Roosevelt elk – barriers to movement, change in mortality, habitat loss</li> <li>- Grizzly bear – change in mortality, habitat loss</li> <li>- Environmentally sensitive ecosystems – loss of extent</li> <li>- Ecosystems at risk – loss of extent</li> <li>- Air quality indicators – increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual)</li> <li>- Real estate – change in real estate value</li> <li>- Marine navigation – interference with navigation use and navigability due to Project-related vessel traffic</li> <li>- Harvesting fish and wildlife – change in environmental setting</li> <li>- Recreation and tourism – change in environmental setting</li> <li>- Visual quality – change in visual quality</li> <li>- Heritage resources – changes to heritage resource integrity, context and accessibility</li> <li>- People – Human health (air quality and particulate matter).</li> </ul> <p>All potential cumulative residual effects were determined to be negligible or not significant except net effects to grizzly bear; cumulative residual effects to the threatened Squamish-Lillooet Grizzly Bear Population Unit were determined to be significant due in large part to vehicle collisions that might result from the development of new logging roads. Grizzly bear have not been observed within the Proposed Project area and the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

2238	555 - 2	Allison Redding	Squamish, BC	Please do allow Burnco to move forward with there development plans. You must consider the estuary at McNab Creek, including the Salmon, and other at danger species.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
2239	555 - 3	Allison Redding	Squamish, BC	Please do allow Burnco to move forward with there development plans. You must consider the estuary at McNab Creek, including the Salmon, and other at danger species.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

	Ref #	Commenter (Name)	Location		
2240	555 - 4	Allison Redding	Squamish, BC	As well as the need for more aggregate in this region.	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
2241	555 - 5	Allison Redding	Squamish, BC	Please consider that there is not enough data to do this environment assessment.	<p>The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada. The baseline studies conducted are sufficient for the purpose of assessing potential effects of the Proposed Project on selected Valued Components. Additional years of supplemental field studies are not required or proposed for the assessment.</p> <p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS. Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>
2242	555 - 6	Allison Redding	Squamish, BC	Howe Sound is now a diverse and thriving ecosystem after surviving Britannia Mines decades ago, as well as the other industry on the Sound. As a local resident please take all these really important issues into consideration.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

2245	557 - 1	Albert Roos	North Vancouver, BC	As a frequent boater on Howe Sound for the past 20 years, I have seen enormous improvements in the Sound's marine wildlife population. Where once it appeared nearly "dead", whales are now frequently seen, as are Pacific White Sided Dolphins. Recreational fishing has rebounded. The McNab Creek estuary is a vital part of the marine ecosystem in this area. Burnco's proposed gravel pit site is ludicrous. on a simple cost vs. benefit analysis, we have a gravel operation employing a few people on the one hand vs. the health of a major recreational area and tourist attraction located minutes from a metropolitan area of almost 3 million people (and growing). We have one chance to make the correct decision. Burnco's application should be denied.	<p>It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).</p> <p>Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.</p>

2253	558 - 3	Kevin Davie	Sechelt, BC	This location will result in less GHGs released than trying to bring in other gravel from sources farther away.	<p>A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS. Potential effects considered were changes in GHG emissions as a result of the Project, the Project's contribution to climate change through the emission of GHG's, and how potential changes in climate will affect project-related infrastructure.</p> <p>Proposed mitigation includes the use of electricity instead of fossil fuels, routine maintenance of vehicles, and minimizing idling of vehicles and tugs. Mitigation measures that will reduce GHG emissions are consistent with specific actions within the Seas-to-Sky Air Quality Management Plan.</p> <p>Following the application of proposed mitigation, the contribution of the proposed Project GHG emissions to provincial, federal and global totals were determined to be negligible.</p>
2254	559 - 1	Personal Information Withheld	Vancouver, BC	No Gravel mine on Howe Sound! Protect supernatural BC. Protect species living in Howe Sound!	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2255	560 - 1	Sam Wainwright	Gambier Island, BC	My name is Sam Wainwright and I am the owner of Lot #30 on Gambier Island. This lot is directly across from the proposed Bunco Site. I have owned this site for over 10 years.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2256	560 - 2	Sam Wainwright	Gambier Island, BC	I am completely against the development of the Burnco Mine Project and have been since it was first preposed. Over the past 10 years I have watched the growth and return of our natural wildlife come back into the region. This includes fish, birds, crabs, dolphins & whales! This area is treasure of the BC Coast line and needs to be treated as such.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

2257	560 - 3	Sam Wainwright	Gambier Island, BC	My family and 100's & thousands of others treat and respect these marine parks as the jewel and where they spend their most precious time with their family & friends to enjoy and admire its beauty.	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
2258	560 - 4	Sam Wainwright	Gambier Island, BC	To allow Bunco to roll out their mining project would be devastating to the area, it neighbours and most importantly the wild life! We can lot let this happen!	A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.  Potential effects were assessed for the following selected valued components: - Amphibian species at risk - Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet; - Roosevelt elk and grizzly bear; - Environmentally sensitive ecosystems; - Ecosystems at risk; and - Plant species a risk.  Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.  Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.
2259	560 - 5	Sam Wainwright	Gambier Island, BC	The BC government must lead the way and put a stop to project such as these. They must be part of leading the world towards a more beautiful, green environment where people, nature, and wildlife can all live together and enjoy its beauty. I Sam Wainwright of LOT #30 on Gambier Island which is located directly across from Burnco preposed site STRONGLY DISAGREE WITH ALLOWING THE BURNCO MINE TO OPERATE.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

2260	561 - 1	Douglas Bay Strata Corp.	Gambier Island, BC	<p>This letter is being submitted in connection with your request for public comment on the Environmental Impact Statement submitted by Burnco Rock Products regarding its proposal to create an open pit mine at the McNab Creek estuary.</p> <p>Douglas Bay Strata Corp. is comprised of the owners of a 53 lot recreational property strata development situated at the north end of Gambier Island. We are situated directly across Thornbrough Channel from McNab Creek and many of our owners' lots face directly out to McNab Creek and the proposed aggregate mine. Our community is a family based development whose owners have been drawn to the location due to its natural beauty and the ability to escape urban distractions while enjoying the recreational opportunities that this area offers to the residents of Howe Sound and all of Metro Vancouver.</p> <p>Next to the McNab Creek Estates Strata, we are the community that will be most directly affected by this proposed mine and we are very concerned about this proposal.</p>	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2261	561 - 2	Douglas Bay Strata Corp.	Gambier Island, BC	<p>We believe that it is completely inconsistent with the established use of this area and the values and objectives of local communities. It will significantly degrade the social and cultural values of both the local area and Howe Sound as a whole. The establishment of a pit mine in an environmentally sensitive area just when Howe Sound is recovering from years of industrial abuse will have immeasurable social costs not only for residents of Howe Sound but also for the whole of the Lower Mainland.</p> <p>Howe Sound is a remarkable and unique region and the McNab Creek area is the heart of Howe Sound. Although it is only 45 minutes from Vancouver, it is worlds away from a metropolitan city. The ability to readily experience the great outdoors at its best is one of the things that makes Vancouver one of the world's most livable cities. The social value of allowing residents and visitors to enjoy outdoor recreational activities so easily cannot be readily measured, but it cannot be ignored in assessing the true cost of a project of this nature.</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

2262	561 - 3	Douglas Bay Strata Corp.	Gambier Island, BC	In addition to the established communities who will suffer if this project is approved, there are also two yacht club out-stations that will be directly impacted. In addition, there are three youth camps in the immediate vicinity and numerous other youth camps in and around Howe Sound who travel to the McNab creek area for day and overnight trips. These camps have been attracting young people to the region for more than fifty years. They provide the youth of the Lower Mainland with an opportunity to get away from urban areas and experience the great outdoors. Many Lower Mainland children get their first wilderness experience at these camps. To allow an open pit mine to operate in the epicentre of this natural experience would destroy the very reason that people are attracted to the area. People come here to experience the outdoors without the noise and visual pollution that we all have to deal with in our everyday lives. The social cost of allowing this project to proceed will be immense.	A detailed assessment of potential recreation effects - including youth camps - are considered in Volume 2, Part B – Section 7.3 of the EAC Application/EIS. Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.

2263	561 - 4	Douglas Bay Strata Corp.	Gambier Island, BC	<p>Federal, provincial and local governments have spent millions of dollars promoting the Sea to Sky Corridor internationally as an outdoor tourism destination. Hundreds of millions of dollars have been spent on developing infrastructure to support the growing tourism activities in the region. This taxpayer money has been spent for the purpose of attracting tourists and outdoor enthusiasts from around the world to come to this region. These efforts have met with considerable success and Howe Sound and the Sea to Sky corridor are now ranked as one of the premier outdoor tourist destinations in the world. Approving a pit mine in an environmentally sensitive area in the centre of this region will undermine these efforts at significant cost to the public.</p> <p>As property owners in the area, we understand what McNab Creek and Howe Sound offer to all residents of the Lower Mainland. In the future, in order to maintain its position as one of the most livable cities in the world, Metro Vancouver's growing population will need to have continued access to the outdoor experiences that many of us have grown up with and have taken for granted. Howe Sound provides unique opportunities not found elsewhere in the world. In Howe Sound, both residents and visitors can experience the great outdoors in a manner that is affordable, with incredible ease of access. Preservation of this natural advantage will allow Metro Vancouver to retain its reputation as one of the most livable cities in the world. A failure to retain this unique advantage will result in a huge social cost that has not been taken into account in Burnco's Environmental Impact Study. Not only will there be a direct cost</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2264	561 - 5	Douglas Bay Strata Corp.	Gambier Island, BC	<p>For years, Howe Sound suffered through environmental abuse. Over the past few decades, hundreds of millions of dollars have been expended in remediating Howe Sound. These expenditures have led to recovering herring and salmon populations and, for the first time in decades, orcas, white-sided dolphins and humpback whales have returned to the Sound.</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

2268	561 - 9	Douglas Bay Strata Corp.	Gambier Island, BC	To jeopardize the environmental recovery that is occurring in the Sound with a project that involves high risks to salmon, freshwater and marine habitat cannot be justified.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2269	561 - 10	Douglas Bay Strata Corp.	Gambier Island, BC	Clearly, allowing the development of an open pit mine in the heart of this region will be counter-productive to both the ongoing environmental remediation efforts as well as the region's reputation as an eco-tourism and outdoor recreational destination of choice. The cost to the region and taxpayers will be enormous while the benefits will be marginal. This project will result in little or no infrastructure to benefit the region and is only projected to create twelve jobs, which may well come with the loss of jobs in other areas including at the aggregate supply sites and shipping facilities currently used by Burnco.	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resource is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. 2270	561 - 11	Douglas Bay Strata Corp.	Gambier Island, BC	Clearly, allowing the development of an open pit mine in the heart of this region will be counter-productive to both the ongoing environmental remediation efforts as well as the region's reputation as an eco-tourism and outdoor recreational destination of choice. The cost to the region and taxpayers will be enormous while the benefits will be marginal. This project will result in little or no infrastructure to benefit the region and is only projected to create twelve jobs, which may well come with the loss of jobs in other areas including at the aggregate supply sites and shipping facilities currently used by Burnco.	BURNCO has proposed a McNab Community Enhancement Fund (CEF) that would consist of money set aside each year of operation, based on output, to enhance the McNab community through targeted funding on projects throughout the region. Funding of projects would be given priority by BURNCO's Management Committee based on a number of criteria that would include: <ul style="list-style-type: none"> <li>- Mitigation of project effects</li> <li>- Bringing amenities to our nearest neighbours</li> <li>- Supporting non-political groups actively improving Howe Sound through cleanup efforts, habitat improvements, etc.</li> <li>- Children's camps</li> <li>- Local united Way or similar organizations providing funding to community programs</li> <li>- Public amenities</li> </ul> <p>The CEF is a funding mechanism which may be replaced by a Sunshine Coast Regional District fee at some future date. If such a fee were introduced, then the CEF would cease.</p>
2271	561 - 12	Douglas Bay Strata Corp.	Gambier Island, BC	Although we cannot see how this project can be justified at any level, we also have specific concerns about the Environmental Impact Study that has been submitted. As a general comment, in reviewing the report that has been submitted, it seems that many of the concerns raised in the initial public comment period for the AIR have been discounted or dismissed without adequate analysis to substantiate the conclusions reached or, in some cases, ignored completely.	Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO's involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.  Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.
2272	561 - 13	Douglas Bay Strata Corp.	Gambier Island, BC	1. Burnco attempts to justify this project on the basis that the mine will help meet the Lower Mainland's demand for gravel. However there is no analysis of the available supply from existing locations or from other less environmentally sensitive sites. Burnco's own demands can easily be met from its existing suppliers and industry reports indicate that the currently identified supply sources in the Lower Mainland are sufficient to meet Metro Vancouver's demand requirements for in excess of 100 years.. Burnco is only choosing to proceed with this project based on its own cost structure while ignoring the environmental, social and economic costs of this project that will be borne by the public.	The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.  Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by: <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>

2273	561 - 14	Douglas Bay Strata Corp.	Gambier Island, BC	<p>2. The various components of the study have almost invariably been based on assumptions as to the scope and operating hours for the project. However we are very concerned about relying on studies which are based on these assumptions. Burnco's original proposal was based on a much larger pit mine which it intended to operate on a 24/7 basis.</p>	<p>The Proposed Project was thoughtfully designed to be environmentally responsible, sensitive to the environment of the proposed site while making use of existing conditions. Since the initial design, the project has changed considerably. Revisions and refinements have been made in response to our Project Team's feedback and to comments and concerns raised by regulatory agencies, Aboriginal Groups and the public.</p> <p>A few examples of project considerations, and subsequent changes and components designed to address feedback received to date include:</p> <ul style="list-style-type: none"> <li>- The project life has been reduced from 20-30 years to 16 years, and the maximum depth of excavation has been reduced from 55 metres to 35 metres;</li> <li>- There are no proposed discharges to, or withdrawals from, McNab Creek;</li> <li>- Using existing BC Hydro lines to electrically powered equipment to extract, process and load the aggregate resource to limit exhaust emissions from the burning of fossil fuels;</li> <li>- Reduced the size of the pit lake as the northern edge has been moved away from the McNab Creek Flood Protection Dyke.</li> <li>- Pit lake designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. The elevation of the pit lake will also be used to manage base flows in the natural groundwater watercourses below the pit lake.</li> <li>- Revised the size and location of the processing area to avoid identified fish habitat and to mitigate potential noise effects.</li> <li>- Revised stockpile location and design to limit potential operational noise effects.</li> <li>- Refined berm design and location to limit potential noise and air quality effects.</li> <li>- Areas progressively reclaimed during the operational phase will be re-vegetated to control erosion.</li> <li>- Maintained tree buffer on foreshore to limit noise effects, dust emissions, and visual effects.</li> <li>- Replaced wash water sedimentation ponds and associated discharges with a 95% efficient wash plant that uses recycled water from two large storage tanks. The 5% loss (via retention, evaporation and absorption) will be supplemented with make-up water from a ground water well. No wash water will be discharged.</li> <li>- Fines generated from the crushing, screening, washing of material will be extracted from the wash water and mechanically dried and compressed into sediment cakes which will be used in progressive reclamation of the onsite fines disposal area.</li> <li>- Covered or enclosed Project components and/or operating under wet conditions (e.g., fine water spray) to reduced potential</li> </ul>
2274	561 - 15	Douglas Bay Strata Corp.	Gambier Island, BC	<p>At the 2013 open house, a senior Burnco representative openly stated that the company's long-term intentions were to expand the mine operations even beyond what they were presenting at that time. We are very concerned that the project scope as set out in the EIS has been designed to facilitate obtaining initial approval for the project knowing that any application for future expansion will not be subject to the same level of assessment or review. The underlying reports contained in the EIS do not properly assess the potential environmental, social or economic impact that the project will ultimately have since the reports are predicated on assumptions regarding the scope of the project which may well severely understate the ultimate size of the project.</p>	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>

2275	561 - 16	Douglas Bay Strata Corp.	Gambier Island, BC	At the 2013 open house, a senior Burnco representative openly stated that the company's long-term intentions were to expand the mine operations even beyond what they were presenting at that time. We are very concerned that the project scope as set out in the EIS has been designed to facilitate obtaining initial approval for the project knowing that any application for future expansion will not be subject to the same level of assessment or review. The underlying reports contained in the EIS do not properly assess the potential environmental, social or economic impact that the project will ultimately have since the reports are predicated on assumptions regarding the scope of the project which may well severely understate the ultimate size of the project.	The Proposed Project is to extract approximately 20 million tonnes of sand and gravel over the 16 year life of the Proposed Project. This will be reflected in an approved EA certificate and mine plan.
2276	561 - 17	Douglas Bay Strata Corp.	Gambier Island, BC	3. The analysis of the potential noise impacts is based on assessment parameters regarding acceptable levels of noise in industrial or urban environments. Those measurements are clearly inappropriate for an area which is home to outdoor youth camps and residential communities and whose fundamental nature and attraction is dependent on retaining the characteristics of a wilderness location. The impact of noise on this unique, outdoor recreational area should not be measured by what is considered acceptable levels of noise in industrial or urban areas.	The Commission Guideline defines a pristine area as: "A pure, natural area that might have a dwelling but no industrial presence, including energy, agricultural, forestry, manufacturing, recreational, or other industries that already impact the noise environment."  McNab Creek is not considered to be a pristine because there is a known industrial presence activity (i.e. logging), as well as known recreation use of the area (e.g., boating, hunting). There is also a run-of-river power project in close proximity.
2277	561 - 18	Douglas Bay Strata Corp.	Gambier Island, BC	4. We also have great difficulty with the assertion that the noise levels will not be audible on Gambier Island and have to question the validity of a report that arrives at that conclusion. Our on the ground experience is that machinery operating at McNab is clearly audible in our community. The McNab Valley operates as a natural amphitheatre and sound carries across the water unimpeded. The noise that will be generated from the barge loading activity is of particular concern. There will be no sound buffer areas to limit the impact of the noise from the barge loading area and the noise will carry directly across the channel. From direct first-hand experience, we know that the noise level from barges loading and unloading at McNab Creek is enough to wake up our residents during the night.	A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.  Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.  A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.

2278	561 - 19	Douglas Bay Strata Corp.	Gambier Island, BC	<p>5. We also question the validity of the conclusion that there will be no cumulative impact from noise when the consultants at the recent open house presentations on the EIS were not even aware of the Box Canyon power project which is now operating in the valley. The noise studies were completed before the power project came on-line and the consultants indicated that the noise created by the Box Creek operations was not even taken into account in the cumulative impact study. Clearly, this brings into question the validity of any conclusions as to cumulative noise impacts that are contained in the report.</p>	<p>Cumulative effects due to noise were not assessed because the significance of the noise VC was Negligible, Not Significant. This approach to cumulative effects assessment is consistent with accepted EA practice in BC and Canada.</p> <p>The cumulative contribution of noise from the Box Canyon project is expected to be minimal, based on previous assessments of run-of-river projects (e.g. Narrows Inlet Hydro Project, 2012).</p>
2279	561 - 20	Douglas Bay Strata Corp.	Gambier Island, BC	<p>6. In its draft AIR, Burnco committed to reporting on the status of consultations with private land owners and tenure holders. However, in Volume 4, Section 21 of the report, there is little evidence that Burnco fulfilled its commitments in this regard. At section 21.2.4.1 - Social Conditions, the listing of Personal Communications shows a dearth of communications with any of the local constituents who will be affected by the proposed project. To our knowledge no-one from Burnco attempted to contact anyone at Douglas Bay even though we comprise the largest private land-holding in the area and will be directly impacted if the project proceeds. It seems clear that the background research undertaken in with respect to the potential social impacts of the project was deficient and so the conclusions reached in the reports must be viewed with great scepticism. From the comments published on the BC EAO website the vast majority of the public has significant concerns about the social impacts of this project but there has been little effort made by Burnco to communicate with communities or stakeholders who will be affected to properly assess the true social costs of the project or its impact on the surrounding communities.</p>	<p>During Pre-Application, BURNCO provided responses to issues identified in a written submission on the EAC Application Information Requirements/EIS Guidements provided by the Douglas Bay Strata Corp. on October 19, 2013. In addition, BURNCO responded to pre-application issues identified in seven (7) submissions on the EAC Application Information Requirements/EIS Guidements from individuals who self-identified as being from Douglas Bay, BC. Documentation of consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-C (Public) of the EAC Application/EIS.</p> <p>The Douglas Bay Strata Corp. is included in BURNCO's list of identified public stakeholders. In August 2016, upon filing the EAC Application/EIS, a letter was sent to all identified public stakeholders - including the President of the Douglas Bay Strata Council - to provide notification about the upcoming stages of the EA review and opportunities for public comment. The letter also provided information about upcoming Public Information Sessions and opportunities to meet with members of BURNCO's team to answer questions about the proposed Project. The EAC Application/EIS was available to public review from August 4 to the closure of the Public Comment Period on October 3, 2016.</p> <p>During Application Review, BURNCO has provided responses to issues identified in a written submission on the EAC Application/EIS provided by the Douglas Bay Strata Corp. on October 3, 2016. No additional comments on the EAC Application/EIS were received from individuals who self-identified as being from Douglas Bay, BC.</p> <p>BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.</p>

2280	561 - 21	Douglas Bay Strata Corp.	Gambier Island, BC	<p>6. In its draft AIR, Burnco committed to reporting on the status of consultations with private land owners and tenure holders. However, in Volume 4, Section 21 of the report, there is little evidence that Burnco fulfilled its commitments in this regard. At section 21.2.4.1 - Social Conditions, the listing of Personal Communications shows a dearth of communications with any of the local constituents who will be affected by the proposed project. To our knowledge no-one from Burnco attempted to contact anyone at Douglas Bay even though we comprise the largest private land-holding in the area and will be directly impacted if the project proceeds. It seems clear that the background research undertaken in with respect to the potential social impacts of the project was deficient and so the conclusions reached in the reports must be viewed with great scepticism. From the comments published on the BC EAO website the vast majority of the public has significant concerns about the social impacts of this project but there has been little effort made by Burnco to communicate with communities or stakeholders who will be affected to properly assess the true social costs of the project or its impact on the surrounding communities.</p>	<p>Phone based interviews are cited as personal communications (pers.comm.) within the text of the EAC Application/EIS and details included in the references (Part G, Section 21). The sample of key informants was not intended to be exhaustive of all stakeholders potentially affected by the Proposed Project, but rather was intended to be wide ranging enough to confirm and expand information available from the referenced secondary sources. Key informants interviewed or provided data for this report included representatives from recreational groups and tourism operators, as well as DFO and MFLNRO. The list of key informants included the following: Burrard Yacht Club, Coastal Inlet Adventures, District of Squamish, Don's Water Taxi, Gambier Island Local Trust, Gibsons and District Chamber of Commerce, Gibsons Landing Inn, Irwin Motel, Islands Trust, McNab Creek Strata, Sewell's Marina, Squamish Yacht Club, Sunshine Kayaking, Thunderbird Yacht Club, Recreation Sites and Trails BC and West Vancouver Fire &amp; Rescue Services.</p>
2281	561 - 22	Douglas Bay Strata Corp.	Gambier Island, BC	<p>7. Although we expressed concern during the comment period on the AIR that the proponent's visual and aesthetic viewpoints were inadequate as they were almost entirely based on sea level assessment locations, the assessments that were conducted did not include any height of land assessment sites in the neighbouring communities. We are very concerned that the results do not properly assess the impact on our owners, a number of whose lots or building sites are at heights above sea level and look directly at the project location. This is another example of where the concerns of neighbouring communities have not been properly reviewed or assessed in the studies undertaken by Burnco.</p>	<p>The visual resources assessment (Section 7.4 of the EAC Application/EIS) acknowledges that the local residents, particularly residents of the McNab Strata would be most affected by the potential visual impacts due to their close proximity to the Proposed Project. Viewing locations and/or viewing conditions assessed are limited to publicly accessible sites that represent key viewing opportunities that would be experienced by the greatest number of people within the Local Study Area. In many cases, these viewpoints are from sea level, considering recreation marine use, facilities and shorefront residents. However there are also some upland locations included in the assessment (e.g. Lions Bay) which provide a sense of how higher view angles would affect the visual impacts. Generally, increasing the view angle at certain or reasonably foreseeable mid-ground viewing opportunities would likely have a minor effect on increased visibility of the Project site considering the screening effect of vegetation surrounding the Project.</p> <p>Viewpoints 2, 3, and 5 reflect a range of viewing distances which might be experienced near the northern portion of Gambier Island and viewing conditions which might be experienced by most residents of the Strata. For each of these viewpoints, the level of visual impact is characterized as low. While portions of the marine facilities are likely to be discernable, proposed mitigation (e.g. retaining foreshore vegetation) will reduce potential effects by providing screening and reducing the level of visual contrast with the existing landscape.</p> <p>BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.</p>

	Ref #	Commenter (Name)	Location		
2282	561 - 23	Douglas Bay Strata Corp.	Gambier Island, BC	<p>8. In a number of areas, the EIS identifies potential environmental impacts of the project but suggests that these can be managed by “best management practices” and the adoption of “Best Management Plans”. We have significant concerns about approving a development with identified environmental risks based on an assumption that best management practices will be followed. There is little or no ability to ensure compliance with this commitment and so the risks associated with the project that have been discounted by the assumption that best practices will be followed are in fact very real risks that should be fully evaluated. At the recent Open House, Scott Burns responded to concerns about impacts on wildlife corridors and the neighbouring community by saying “it’s our land, we’ll do what we want.” If this is the attitude of Burnco’s senior management, it hardly gives confidence that Burnco is committed to best practices. Our concern in this regard is heightened by the experience of residents in the housing community adjacent to Burnco’s aggregate mine at Cougar Ridge near Calgary, Alberta, where Burnco has declined to follow best practices or adopt mitigation strategies that would reduce the impact of its operations on neighbouring land owners. To simply dismiss potential risks by assuming that best management practises will be followed is unacceptable particularly when there is little or no ability to enforce the use of best practices once the project has been approved.</p>	<p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 and are summarized below. BURNCO commits to funding for these monitoring initiatives.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring.</p> <p>Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational Environmental Protection Plans (EPPS). Compliance monitoring will include assessment of Proponent and contractors’ environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program.</p> <p>BURNCO will submit a report to the BCEAO on the status of compliance with the Certificate Conditions, at the following times:</p> <ul style="list-style-type: none"> <li>- At least 30 days prior to the start of Construction;</li> <li>- On or before January 31 in each year after the start of Construction;</li> <li>- At least 30 days prior to the start of Operations;</li> <li>- On or before January 31 in each year after the start of Operations;</li> <li>- At least 30 days prior to the start of Closure and Reclamation;</li> <li>- On or before January 31 in each year after the start of Closure and Reclamation; and</li> <li>- Within 30 days of completing Closure and Reclamation.</li> </ul> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>

2283	561 - 24	Douglas Bay Strata Corp.	Gambier Island, BC	<p>9. The EIS contains little evaluative data on what the impact of the project will have on adjoining land values. The residents of the McNab strata development immediately adjacent to the project site will be the most directly impacted. Anecdotal evidence is that since Burnco announced its development plans, property values for McNab Valley residents have plummeted. One realtor who is knowledgeable in the market has commented that if the project proceeds the McNab properties will likely be worth a fraction of their former value, if they will even be saleable at all. Since Burnco's development plans were announced, the spectre of a gravel mine being built has dampened the market considerably and our development has experienced a similar, though less pronounced, decline in value of the lots in our community. Burnco has not undertaken any proper evaluation or quantification of the cost impact that the project would have on neighbouring properties or the loss of property tax revenues that will result from the decreased land values.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
2284	561 - 25	Douglas Bay Strata Corp.	Gambier Island, BC	<p>10. The proponent downplays the current value of the McNab Creek area as salmon bearing habitat. However our experience in the last few years is that there has been a marked recovery in the salmon stocks. The analysis of the area from a fisheries perspective that has been provided by the proponent should be examined with great scrutiny. It certainly appears to us, and to others with historical knowledge of the area, that the McNab Creek environment is experiencing the same recovery that is being seen in the rest of Howe Sound and this project can only result in a severe set-back.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2285	561 - 26	Douglas Bay Strata Corp.	Gambier Island, BC	<p>11. It is our understanding from speaking with the consultants at the recent open house, that the models used for noise and dust assessment are based on averaging the anticipated impact. This would seem to us to be inappropriate and would mask the true impact of the project. Any modelling should be based on the peak level operating conditions in order to properly assess what impact the project will have.</p>	<p>In the absence of formal guidance, the environmental noise from the Project was assessed in accordance with noise regulations specified by the BC Oil and Gas Commission in the document British Columbia Noise Control Best Practices Guideline, by Health Canada in Useful Information for Environmental Assessments, and in the SCRD's Noise Control Bylaw. These guidelines do not provide noise limits for peak sound levels. Energy equivalent noise level (Leq) measurements and noise limits include all of the acoustic energy including any noise peaks.</p>

2286	561 - 27	Douglas Bay Strata Corp.	Gambier Island, BC	<p>12. We are concerned about the impact of dust on the area. Burnco downplays this issue by claiming that the pit dredging will not create dust and that it will use covered conveyors. However the Air Quality analysis does show particulates spreading out into Thornbrough Channel. The area can be exposed to extreme winds and there often are in-flow or out-flow wind conditions that can be highly variable and undoubtedly will spread the particulates over an area that is larger than the average areas depicted in the presentations. These particulates will necessarily fall in the surrounding marine areas and settle as sediment. It is incongruous to us that the Air Quality report shows particulate impact over the marine areas yet the marine assessment blithely asserts that there will be no sediment created by the operations and discounts any impact to the marine environment based on this assumption of no sediment being created. It seems that the proponent has not even considered its own assessment results developed in one context when reporting on another area of impact.</p>	<p>The air quality dispersion model predictions presented in Figures 5.7-2, 5.7-3, 5.7-4 and 5.7-5 represent in-air concentrations of particulate matter fractions and not predictions of dust deposition; the concentrations presented do not represent dust plumes. In addition, the dispersion modelling methods and associated assumptions - approved by the Ministry of Environment (MOE) - incorporated a high degree of conservatism. The air dispersion model was based on worst case daily emission rates and assumed worst case daily emissions every day of the year. These assumptions contributed to the high level of confidence in the air quality assessment predictions that there will no significant adverse effects.</p> <p>The same Ministry-approved CALPUFF model that was used to predict air quality concentrations (i.e., run in dynamic [3D] mode with a fine resolution meteorological data set) was used to predict deposition rates which were incorporated into the surface water quality model and the assessment of potential effects on water quality and aquatic health. With the effective implementation of the proposed erosion and sediment control measures and BMPs, the potential residual effects on water quality and aquatic health were determined to be negligible and not significant. Proposed mitigation for controlling the release of dust to the aquatic environment including the following:</p> <ul style="list-style-type: none"> <li>- Developing and implementing an Air Quality and Dust Control Management Plan that will detail measures to control fugitive particulates.</li> <li>- Developing and implementing an Erosion and Sediment Control Plan.</li> <li>- Establishing an on-site Air Quality and Meteorology Monitoring Program.</li> <li>- Fines/silt cakes berm should be vegetated as soon as possible and where possible by planting and seeding with native trees, shrubs, and grasses.</li> <li>- Placement of erosion control blankets on the berm to prevent dust.</li> <li>- Sediment and erosion control measures should be maintained at all times around the crushing areas and until vegetation is achieved on the berm.</li> <li>- Processing plant crushing and dry screening units will be partially enclosed.</li> <li>- Watering of 10 mm crushed gravel and 20 mm crush gravel stockpiles.</li> <li>- Watering of unpaved roads and restricting speed limits</li> </ul>

2287	561 - 28	Douglas Bay Strata Corp.	Gambier Island, BC	<p>13. It is very surprising to us that Burnco views the risk of flooding or debris flow as negligible. The McNab Valley is known for its heavy rainfalls and McNab Creek is rated as a high velocity creek. Log and debris dams and resultant debris floods are common in the Howe Sound region with Environment Canada's website recognizing Howe Sound as a hazard area for debris floods. A paper by Andree Blais-Stevens (Geological Survey of Canada) and Oldrich Hungr (Earth and Ocean Sciences, University of BC) states that over the last 150 years, hundreds of landslide events have been reported in the Sea to Sky Corridor with landslide activity peaking at approximately 40 events per decade in the 1980's and 1990's. They also note that almost 18% of all of Canada's landslide deaths have occurred in the Sea to Sky Corridor. Based on this type of readily available information regarding the risks of debris flows or flooding and our own experience from living in the region, it is baffling to us to see that Burnco's assessment concludes that any risk in this regard is negligible without any explanation as to how the conclusion has been reached or substantiated.</p>	<p>A detailed assessment of potential geotechnical and natural hazard effects of the Proposed Project is presented in Volume 2, Part B – Section 5.4 of the EAC Application/EIS. The objectives of this assessment were to identify and evaluate static and seismic ground conditions, and potential landslide, debris flow/flood and avalanche hazards that could be impacted by the Proposed Project, or that could impact the Proposed Project.</p> <p>A terrain stability field assessment was completed on November 2-3, 2016. The results of the field assessment, together with the data in our existing hydrologic and geotechnical assessment reports (Hydrological and Hydraulic Characterization McNab Valley Aggregate Project Howe Sound BC, Concrete Aggregate Summary, Assessment of Avulsion Risk of McNab Creek (located in EA Vol. 4 Appendix 5.4 – C, F, A respectively) indicate that there is no evidence for historic debris flows or debris floods. Therefore, further investigations are not considered to be required.</p>
2288	561 - 29	Douglas Bay Strata Corp.	Gambier Island, BC	<p>14. This project will result in increased barge traffic in the area based on average levels of vessel traffic in Howe Sound. The report concludes that the impact will not be significant based on overall vessel traffic in the region. However this area is home to two recreational boaters' outstations and is extensively used by recreational boaters, kayakers and others. This small vessel activity includes frequent travel in canoes or kayaks by children from the neighbouring camps. The barge routes also directly transect the new marine trail which runs along the east side of Gambier Island and through the McNab Creek vicinity. This route is expected to attract a large number of canoeists, kayakers and other boaters. The small vessel traffic in this area will continue to increase, perhaps dramatically, on an ongoing basis. The study does not properly address the nature and volume of the vessel traffic in the localized area and the potential safety impact that increased barge traffic could have, particularly in the summer months.</p>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>

2289	561 - 30	Douglas Bay Strata Corp.	Gambier Island, BC	We are very concerned about the significant negative impacts that this project will have on the communities in Howe Sound, residents of Metro Vancouver and on tourism and recreation in the region. The project poses clear environmental risks as well as significant economic, social, heritage and health effects while providing little benefit to the economy or communities of the region. There will be significant social and economic costs borne by neighbouring communities and the general public that have not been factored into the impact assessment that has been submitted by Burnco.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
2290	561 - 31	Douglas Bay Strata Corp.	Gambier Island, BC	We fail to see how the goals of environmental, economic and social sustainability for Howe Sound can be achieved if this project receives approval. We can only hope that the responsible authorities will recognize the true value of McNab Creek and the Howe Sound region and will not let the bottom line priority of one Alberta company outweigh the interests of the citizens of British Columbia.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
2291	561 - 32	Douglas Bay Strata Corp.	Gambier Island, BC	We fail to see how the goals of environmental, economic and social sustainability for Howe Sound can be achieved if this project receives approval. We can only hope that the responsible authorities will recognize the true value of McNab Creek and the Howe Sound region and will not let the bottom line priority of one Alberta company outweigh the interests of the citizens of British Columbia.	BURNCO is a 104-year old family-owned Canadian company with operations in British Columbia, Alberta, Saskatchewan and Texas.  BURNCO has over 1,150 employees (180 in BC) and is Canada's largest independent ready mix concrete and aggregate company.  BURNCO's BC operations currently transport sand and gravel by barge from Treat Creek (east of Powell River) and as far away as Port McNeil on northern Vancouver Island, to existing facilities along the Fraser River in Burnaby and Langley.
2292	561 - 33	Douglas Bay Strata Corp.	Gambier Island, BC	If this project is approved, which would be a travesty, then there must be enforceable conditions imposed which ensure that the scope of the operation is not extended beyond what has been represented in the EIS. To fail to strictly enforce the representations and commitments made in Burnco's proposal or to allow any subsequent amendments which could result in an expanded scope or extended operating hours would make a mockery of the process.	The Proposed Project is to extract approximately 20 million tonnes of sand and gravel over the 16 year life of the Proposed Project. This will be reflected in an approved EA certificate and mine plan.

2293	561 - 34	Douglas Bay Strata Corp.	Gambier Island, BC	<p>Proper safeguards need to be imposed to ensure that the characterizations used for the purposes of this application are honoured in practice. The proponent should be required to grant restrictive covenants in favour of McNab Creek Estates, our Strata Corporation and the yacht clubs (all of whom will be dramatically impacted by this proposal) which include operating restrictions consistent with the representations made in this application. It is only through registered covenants in favour of the adjoining land owners that the representations and commitments given in the approval process can be properly monitored and enforced.</p> <p>Yours truly,</p> <p>DOUGLAS BAY STRATA CORP, BSC 1539</p>	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>
2294	562 - 1	Personal Information Withheld	Lions Bay, BC	<p>Abstract: Taking into consideration the volume of concerns expressed by residents, together with the uncertainties and ambiguities associated with the proposed Burnco Aggregate Project, the sensible conclusion is such that the Project should either not be approved, or in the alternative, it should be placed under a moratorium at this stage. The far reaching "Howe Sound UNESCO Biosphere Region Initiative " is worthy of careful and serious consideration prior to any action likely to compromise its national and international value.</p>	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
2295	562 - 2	Personal Information Withheld	Lions Bay, BC	<p>Having substantial concerns regarding various proposals to increase the industrialization of Howe Sound, I have attended meetings held locally by Burnco, a proponent for a gravel and sand quarry/mine at McNabb Creek, as well as presentations by other proponents of industrialization. I have read most of the submissions made to the B.C. Environmental Assessment Office concerning the Burnco Project. Based on the material that I have studied, my initial concerns regarding the Burnco Project are well founded, and are in agreement with the sentiments expressed by many other authors. I wish to support the opinions of many of these authors, quoting or paraphrasing what they have written:</p> <ul style="list-style-type: none"> <li>- Howe Sound has many attributes threatened by industrialization;</li> </ul>	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>

2305	562 - 12	Personal Information Withheld	Lions Bay, BC	* damages to water and soil quality due to leachate from acid rock;	<p>Information regarding geochemical testing for ML-ARD potential is presented in Section 5.5.5.2.4 of the EAC Application/EIS. The results of geochemical testing are presenting in Appendix 5.6-C.</p> <p>Yes, geochemical testing was conducted on 3 composite samples collected from two test pits at the Project site. The geochemical testing program included acid base accounting, whole rock and trace metal analysis, and sequential leach tests. The objective of acid base accounting was to determine the material's potential to generate acidity. The acid base accounting results confirmed that the materials contained no sulphide minerals; oxidation of sulphide minerals is the primary source of long-term acid generation potential. Therefore, the materials are considered to have a low potential for long-term acid generation.</p> <p>The results of whole rock and trace metal analysis were used to identify parameters that may require further consideration in the context of metal leaching potential. Sequential leach testing was used to evaluate the metal leaching potential of the materials. Sequential leach testing is appropriate for evaluating the potential for metal leaching in the absence of reactive sulphide minerals, therefore this test method was used in place of the humidity cell test method (HCT). The results of the sequential leach tests were screened in the context of the BCWQ and CCME Guidelines for the protection of Freshwater Aquatic Life to identify parameters of potential environmental concern. The results of the sequential leach tests were used to develop inputs to the water quality predictions for the Proposed Project.</p>
2306	562 - 13	Personal Information Withheld	Lions Bay, BC	* damages due to noise, dust, light, and increased marine and other traffic;	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p>
2307	562 - 14	Personal Information Withheld	Lions Bay, BC	* damages due to noise, dust, light, and increased marine and other traffic;	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. 2310	562 - 17	Personal Information Withheld	Lions Bay, BC	* damage to the peace & quiet quality of life of the immediate and nearby residential areas;	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>
2311	562 - 18	Personal Information Withheld	Lions Bay, BC	* damage to the pristine and majestic beauty of Howe Sound and environs, so valuable both intrinsically and extrinsically to tourism and the tourist industry;	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2312	562 - 19	Personal Information Withheld	Lions Bay, BC	- Economic concerns and considerations relate to: * negative impacts on tourism and recreational uses; * negative effects on fishing;	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2313	562 - 20	Personal Information Withheld	Lions Bay, BC	* negative effects on the rare marine sponge biotherm;	<p>A detailed assessment of potential effects on marine resources, including marine benthic communities, is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>Glass sponges are a group of filter feeding organisms which can form large sponge reefs that provide habitat for other marine invertebrate and fish species. Glass sponges in Howe Sound live at depths as shallow as -20 m (chart datum). BURNCO has included glass sponges in the assessment of potential effects on marine resources.</p> <p>Although no glass sponges were observed during the dive and towed video surveys of the Proposed Project area, foreshore and sub-tidal nearshore conducted for the assessment, their known occurrences throughout Howe Sound have been documented. The marine footprint of the Proposed Project does not overlap with any known or mapped locations of glass sponges or glass sponge reefs occurrences.</p> <p>Potential residual effects of propeller scour and aggregate spills on glass sponges were assessed. Propeller wash velocities at the depths at which glass sponges occur are predicted to be within the same magnitude as tidal currents present at this depth. With the application of proposed mitigation, the likelihood of an aggregate spill adversely affecting glass sponge colonies is low. The significance of potential residual effects on marine benthic communities, including glass sponges, were determined to be negligible or not significant.</p>

2314	562 - 21	Personal Information Withheld	Lions Bay, BC	* negative effects on the health and well-being of residents of McNabb Creek and other Howe Sound communities;	<p>A detailed assessment of potential public health effects of the Proposed Project is presented in Volume 2, Part B – Section 9.1 of the EAC Application/EIS.</p> <p>Potential effects of the Proposed Project on human health assessed considered activities contributing to air emissions, deposition of particulate matter to terrestrial environments, and emission of substances to aquatic environments.</p> <p>Following the application of proposed mitigation, all potential health effects were determined to be negligible or not significant.</p>
2315	562 - 22	Personal Information Withheld	Lions Bay, BC	*negative effects on the economies of other existing gravel pits;	<p>The local spatial study area for the operations phase labour market effects (including employment) of the Proposed project was described in the Application Information Requirements/EIS Guidelines, which was approved by the BCEAO and the CEA Agency on December 16, 2014 after review by the Technical Working Group established to guide this assessment. This local spatial study area is Sunshine Coast Regional District.</p> <p>The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.</p>
2316	562 - 23	Personal Information Withheld	Lions Bay, BC	* negative effects on local and other Howe Sound property values;	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussions are ongoing.</p>

	Ref #	Commenter (Name)	Location		
2317	562 - 24	Personal Information Withheld	Lions Bay, BC	* McNabb Creek is not an Industrial Zone area, but is currently a Rural Zone Area;	<p>The proposed Project lies within Electoral Area F of the Sunshine Coast Regional District. While there are three OCPs in Electoral Area F, none of them overlap with the local study area (LSA). Regional zoning for the LSA is discussed in Volume 2, Part B, Section 6 of the EAC Application/EIS.</p> <p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
2318	562 - 25	Personal Information Withheld	Lions Bay, BC	* The loss of the future economic advantage of a forest that is in a state of regeneration;	<p>The loss of wildlife habitat was described using wildlife habitat suitability index models and habitat associations as described in Section 5.3.1.5 of Volume 2, Section 5.3. A detailed vegetation assessment and discussion on proposed Project effects to vegetation is described in Section 5.3.2, Volume 2, Section 5.3.</p> <p>The terrestrial LSA is 569 ha in size and does not contain any old growth forest. Approximately 20.0% (113.8 ha) of the Terrestrial LSA is considered mature forest, occurring mainly on the east side of McNab Creek, and as elevation increases from the valley bottom on either side of the LSA. These areas could be considered merchantable timber. Merchantable timber will be salvaged on site.</p> <p>The trees and vegetation where the pit lake is planned will be permanently lost (28.2 ha). However, reclamation activities post-closure will re-establish mature forest on site. Roosevelt elk winter habitat will be restored through the creation of 24.3 ha of mature forest over approximately 25 years. In addition, a total of 31 ha of moderate to high suitability Roosevelt elk habitat (based on habitat suitability index modelling) to the north, east and south of the Project area will be protected and left unaffected by the Project. Establishing mature forest will also provide suitable habitat for other mature forest species such as northern goshawk and marbled murrelet. Therefore, the removal of trees to establish the pit lake will be compensated for.</p>
2319	562 - 26	Personal Information Withheld	Lions Bay, BC	* There appears to be conflicting information pertaining to the construction period, the estimated supply of aggregate, and the longevity of the project;	The estimated duration of project construction will be up to two years. Some components will be constructed relatively quickly, while others will take longer depending on manufacturing times, construction windows and other limitations associated with the location of the Project site.
2320	562 - 27	Personal Information Withheld	Lions Bay, BC	* There appears to be conflicting information pertaining to the construction period, the estimated supply of aggregate, and the longevity of the project;	The Proposed Project is to extract approximately 20 million tonnes of sand and gravel over the 16 year life of the Proposed Project. This will be reflected in an approved EA certificate and mine plan.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2321	562 - 28	Personal Information Withheld	Lions Bay, BC	* There is a concern that claims of increased jobs are not valid, in that a redistribution of labour among the suppliers of gravel will minimise any new expansion of labour requirements;	<p>The estimated number of jobs created by the proposed Project during construction and operations phases are presented in Section 2.5.4 of the EAC Application/EIS.</p> <p>Employment numbers presented at the Public Open Houses were:</p> <ul style="list-style-type: none"> <li>- 80 person years during construction and 360 person years during operations (direct, indirect and induced);</li> <li>- 12 full-time jobs at the site (i.e. direct only);</li> <li>- 119 jobs during construction and 99 jobs during operations (direct, indirect and induced); 33 long-term jobs during operations are expected to be filled by Sunshine Coast residents.</li> </ul> <p>The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.</p>
2322	562 - 29	Personal Information Withheld	Lions Bay, BC	* There is concern that taxpayers, not Burnco, will shoulder the ultimate burdens of site cleanup and restoration;	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>
2323	562 - 30	Personal Information Withheld	Lions Bay, BC	- Alternatives: * A proposal for the designation of Howe Sound as a UNESCO Biosphere Region offers an attractive, long term and sustainable option requiring serious consideration.	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
2324	563 - 1	Personal Information Withheld	Squamish, BC	Howe sound is still on recovery from the Britannia mine, woodfibre past and in threat from woodfibre LNG.	<p>It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).</p> <p>Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.</p>

2325	563 - 2	Personal Information Withheld	Squamish, BC	Wildlife is returning and increasing howe sounds value as an eco-tourism destination. Eco-tourism is a low-impact low carbon emission industry that is being threatened by carbon intense development and pollution. Whale tours, guided eco-tours watersports are current growing employers.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2326	563 - 3	Personal Information Withheld	Squamish, BC	Wildlife is returning and increasing howe sounds value as an eco-tourism destination. Eco-tourism is a low-impact low carbon emission industry that is being threatened by carbon intense development and pollution. Whale tours, guided eco-tours watersports are current growing employers.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2327	563 - 4	Personal Information Withheld	Squamish, BC	Wildlife is returning and increasing howe sounds value as an eco-tourism destination. 2328	564 - 1	Alison Scully	McNab Creek, BC	I don't understand how digging up an estuary to get at the material that provides natural filters for the very life in the estuary can ever be considered.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
2329	564 - 2	Alison Scully	McNab Creek, BC	I am concerned about how the wildlife will get to the grasses and shoreline once their routes are blocked? From the model presented at the public meeting, the corridor that is left at the end of the project is very narrow. During the project, access will be cut off with a fence.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

2330	564 - 3	Alison Scully	McNab Creek, BC	Peace and quiet are of the highest value to the residents of McNab Creek. Contrary to Burnco's statements, we are not seasonal visitors. We are there year round, every chance we get, and some residents are spending the majority of their retirement there. In their report, Burnco has used the fact that there is an occasional logging truck and dumping of logs into the ocean as the same as machinery constantly dredging and crushing. They've used terms like 'negligible' and 'not significant' when it comes to the noise they will generate. This is just not true and the noise will greatly affect our community.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>
2331	564 - 4	Alison Scully	McNab Creek, BC	I'm also concerned about the dead lake they are leaving behind. The model they showed was about as un-natural as it gets. The perfectly straight shore lines were so unattractive and completely at odds with the natural beauty of the area. What happens if there is leakage from the lake into McNab Creek due to the significant rainstorms we receive, or rising tides due to climate change? It's been noted that the lake will not support any life, so leakage won't be acceptable for the environment.	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>
2332	564 - 5	Alison Scully	McNab Creek, BC	In the application is states the work hours are up to 14 hours per day and they will commit to the SCRD's noise bylaw 7am to 9pm. Working during 'daylight hours' was also a term used (quite a long time during summer - high use months). The operations manager said they are basing operations on 4, 10-hour shifts per week. There is clearly some inconsistency here.	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>
2333	565 - 1	Personal Information Withheld	Lions Bay, BC	I wish to voice my concerns regarding the proposed gravel extraction project by Burnco at the McNab Creek area. My concerns are as follows the claim by Burnco representatives that this project is sustainable, the impact that this project could have on the tourist industry in the Howe Sound area, the effects that this project could have on the newly recovered marine life of the sound and the impact of this project on the people who live in the Howe Sound region.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2334	565 - 2	Personal Information Withheld	Lions Bay, BC	At a meeting I attended a Burnco representative claimed that this project would be sustainable. I question how such a project could be sustainable when there is only a finite amount of gravel at this site so how can the extraction be sustainable. Once there is a hole in the ground what will replace the hole?	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
2335	565 - 3	Personal Information Withheld	Lions Bay, BC	At a meeting I attended a Burnco representative claimed that this project would be sustainable. I question how such a project could be sustainable when there is only a finite amount of gravel at this site so how can the extraction be sustainable. Once there is a hole in the ground what will replace the hole?	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
2336	565 - 4	Personal Information Withheld	Lions Bay, BC	The Howe Sound area relies heavily on the tourist industry bringing in millions of dollars annually to this area. I see the scars from this project being detrimental to the tourist industry. People do not want to see scarred areas.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
2337	565 - 5	Personal Information Withheld	Lions Bay, BC	The Howe Sound area relies heavily on the tourist industry bringing in millions of dollars annually to this area. I see the scars from this project being detrimental to the tourist industry. People do not want to see scarred areas.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

2338	565 - 6	Personal Information Withheld	Lions Bay, BC	I am also concerned about the impact this project would have on the marine life in the Sound due the noise and the vibrations that would be generated by this project. The marine life in the Sound is only now recovering and the ocean is coming back to health after millions of dollars have been spent on clean up. Why throw all this improvement away?	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>
2339	565 - 7	Personal Information Withheld	Lions Bay, BC	The impact of this project will also effect the people who live on the shores of Howe sound with the threat of noise, light visual pollution plus the more marine traffic in the Sound increases the quality of the air in the Sound.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>

2340	565 - 8	Personal Information Withheld	Lions Bay, BC	The impact of this project will also effect the people who live on the shores of Howe sound with the threat of noise, light visual pollution plus the more marine traffic in the Sound increases the quality of the air in the Sound.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
2341	565 - 9	Personal Information Withheld	Lions Bay, BC	The impact of this project will also effect the people who live on the shores of Howe sound with the threat of noise, light visual pollution plus the more marine traffic in the Sound increases the quality of the air in the Sound.	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>

2342	565 - 10	Personal Information Withheld	Lions Bay, BC	The impact of this project will also effect the people who live on the shores of Howe sound with the threat of noise, light visual pollution plus the more marine traffic in the Sound increases the quality of the air in the Sound.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
2343	565 - 11	Personal Information Withheld	Lions Bay, BC	Howe Sound is a beautiful place that should be protected from industrial development, not a place where some company like Burnco can come for a short period of time and take away part of the Sound leaving the scars behind for a minimum number of people who may not be hired locally for the duration of the project. The approval of this project could be the thin edge of the wedge for more industrial development on the shores of Howe Sound.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
2344	565 - 12	Personal Information Withheld	Lions Bay, BC	The location for this mine was according to a representative of Burnco was chosen over other alternative sites because they believed there would be less opposition from local people. This seems to me to be sheer arrogance and total disregard for a nation treasure driven by greed on the part of Burnco.	<p>Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>
2345	566 - 1	Personal Information Withheld	Squamish, BC	I would like to add my voice to those that would like to see Howe Sound continue on it's path to recovery. Like many others I live on the Sea to Sky Corridor. Like many others too I have cancer. Fortunately I am in now in remission. Currently I am relatively healthy and very happy spending time doing what I love - being outdoors on the water, on the shore or in the mountains above the Sound. Every day I am so grateful to be alive. To live in such a wonderful place and be so connected to nature and the land. I draw strength from our place of land, sea and sky. On my trips to and from the Cancer Agency and hospital I drink in Howe Sound. It fills me up and settles me.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

2346	566 - 2	Personal Information Withheld	Squamish, BC	I take delight in the whale sightings, the news of the recovering Elk population, the annual migration of both sea and songbirds.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2347	566 - 3	Personal Information Withheld	Squamish, BC	I take delight in the whale sightings, the news of the recovering Elk population, the annual migration of both sea and songbirds.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2348	566 - 4	Personal Information Withheld	Squamish, BC	The Burnco Gravel mine is one more industry that will irrevocably alter Howe Sound and undo much good that has taken place in recent years. Twelve full time jobs are not worth the effect it will have on the McNabb estuary. It is with great sadness I have seen the redwing blackbird nesting grounds at Nexen Beach be bulldozed under for the new oceanfront development. To hear their song at twilight was absolutely magical. Now no more.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.

2349	566 - 5	Personal Information Withheld	Squamish, BC	I know that 12 jobs would be created by the mine. This is small number of jobs. Surely we have the potential of creating far more jobs in the tourism and recreation sectors if we keep Howe Sound as a jewel to showcase to the rest of the world. A world thirsting for the natural world. It is a place of healing. A sanctuary. Let's strive to keep it so.	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>
2350	566 - 6	Personal Information Withheld	Squamish, BC	I know that 12 jobs would be created by the mine. This is small number of jobs. Surely we have the potential of creating far more jobs in the tourism and recreation sectors if we keep Howe Sound as a jewel to showcase to the rest of the world. A world thirsting for the natural world. It is a place of healing. A sanctuary. Let's strive to keep it so.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

	Ref #	Commenter (Name)	Location		
2351	567 - 1	David Bonner	East Vancouver, BC	Please do not approve the application for the Burnco Aggregate Project proposed for McNab Creek. Mining in McNab Creek would destroy the estuary and decimate the natural beauty of the area.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
2352	567 - 2	David Bonner	East Vancouver, BC	This project would also have severely detrimental effect on fish habitat in the McNab estuary.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

2355	568 - 1	Ruth Simons	Howe Sound, BC	<p>Cumulative Impacts</p> <p>Page 4-33 states: that "no announcement from MFLNRO has yet been made with respect to the cumulative effects framework implementation in Howe Sound". This is not an accurate statement. In 2015 staff from MLFNRO announced CEF was moving forward and made this presentation to the Howe Sound Community Forum. Documentation exists to confirm this announcement and would be verified by FLNRO staff. Golder's assumptions in many instances throughout this document are not current or well researched which generates a level of distrust about the integrity of this assessment.</p>	<p>Page 4-33 of the EAC Application/EIS states: "MFLNRO is currently working on cumulative effects framework to help manage compounding changes to the environment. The cumulative effects framework is being actively applied in the Northeast, and MFLNRO plans to expand the framework to Howe Sound (MLFNRO 2015). Under this framework, Howe Sound will be considered as one region when impacts of major projects are assessed (Squamish Chief 2015). No announcement from MFLNRO has yet been made with respect to the cumulative effects framework implementation in Howe Sound."</p> <p>This remains the case. In the absence of a CEA Framework for Howe Sound, CEA Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada in accordance with:</p> <ul style="list-style-type: none"> <li>- BCEAO Guideline for the Selection of Valued Components and Assessment of Potential Effects (BCEAO 2013),</li> <li>- Operational Policy Statement: Addressing Cumulative Environmental Effects under the Canadian Environmental Assessment Act (CEA Agency 2007),</li> <li>- Addressing Cumulative Environmental Effects. A Reference Guide for the Canadian Environmental Assessment Act (CEA Agency 1994),</li> <li>- Cumulative Effects Practitioners Guide (CEA Agency 1999), and</li> <li>- A Reference Guide for the Canadian Environmental Assessment Act: Determining Whether a project is Likely to Cause Significant Environmental Effects (FEARO 1994a).</li> </ul> <p>A detailed methods framework is provided in Volume 2, Part B – Section 4 of the EAC Application/EIS.</p> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in initiatives related to the monitoring, assessment, or management of cumulative environmental effects if requested by federal, provincial or regional government agencies.</p>

2356	568 - 2	Ruth Simons	Howe Sound, BC	<p>Figures 4-4-6 should be compared to 2016 Google Earth images of the areas west of Port Mellon's Howe Sound Pulp and Paper. Log booming storage and processing activity is different in each of the maps and does not appear to be an accurate reflection of the current activity west of Port Mellon. This is relevant for setting the context of this project within Howe Sound. The list of projects considered in the Cumulative Assessment on pages 4-36-43 are missing the log sorting and processing operations taking place at the Hillside Industrial Park and Twin Creeks which can clearly be seen on Google Earth.</p> <p>To-date human activity has impacted most creeks and estuaries in Howe Sound. Along the Sunshine Coast – West Howe Sound area, active forestry operations at the base of McNair Creek and the Rainy River continue to impact the health of these rivers and estuaries and the ocean around the area. At the mouth of the McNab valley, logging activity is limited to the west end of the estuary and is minimal compared to the areas closer to Port Mellon that are large booming and processing operations where log booms and debris cover large areas of the water.</p>	Existing log dump and storage areas were considered in the CEA. There is no potetnial interaction between the these activities west of Port Mellon and potential residual effects of the proposed Project (i.e, after mitigation).

2357	568 - 3	Ruth Simons	Howe Sound, BC	The addition of gravel mining and its related processing and barging activities would add new resource activity to Howe Sound and permanently alter the natural flow of surface and groundwater that flows into the estuary.	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure.</p> <p>A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken. Adaptive management techniques to be implemented as required include:</p> <ul style="list-style-type: none"> <li>- Continue to evaluate the extent of the pit during operations.</li> <li>- During the wet season, if water levels in the pit lake become higher than has been designed for the Pit Lake Containment Berm then the valves in the culverts will be closed to reduce the amount of water reporting to the pit from the surface water on the western slope.</li> <li>- The height of the pit lake at the outlet structure can be adjusted to increase or decrease the level of the pit lake (e.g., adding or lowering stop logs) at closure to maintain the hydraulic gradient between McNab Creek and the Project Area following closure.</li> </ul>
2358	568 - 4	Ruth Simons	Howe Sound, BC	Alteration to this one remaining estuary is significant and should be protected. The environmental assessment should take into account the value of natural intact wetlands such as the McNab estuary.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

2359	569 - 1	Mark Smith	West Vancouver, BC	I'm writing to voice my vehement opposition to the construction of the gravel pitt at McNabb Creek. This is the jewel of Howe Sound and it would not only destroy the serene beauty of the area, but would have a significantly detrimental impact on the wild and marine life, which could reach well beyond to other surrounding lands and waters.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2360	569 - 2	Mark Smith	West Vancouver, BC	I'm writing to voice my vehement opposition to the construction of the gravel pitt at McNabb Creek. This is the jewel of Howe Sound and it would not only destroy the serene beauty of the area, but would have a significantly detrimental impact on the wild and marine life, which could reach well beyond to other surrounding lands and waters.	A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.  The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.  The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.
2361	569 - 3	Mark Smith	West Vancouver, BC	I'm writing to voice my vehement opposition to the construction of the gravel pitt at McNabb Creek. This is the jewel of Howe Sound and it would not only destroy the serene beauty of the area, but would have a significantly detrimental impact on the wild and marine life, which could reach well beyond to other surrounding lands and waters.	A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.  Potential effects were assessed for the following selected valued components: - Amphibian species at risk - Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet; - Roosevelt elk and grizzly bear; - Environmentally sensitive ecosystems; - Ecosystems at risk; and - Plant species a risk.  Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.  Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.
2362	569 - 4	Mark Smith	West Vancouver, BC	Our environment needs to be sustainable for future generations; therefore, I urge you to reconsider this poor decision.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.

2365	570 - 3	Dr. Chris Overall	Vancouver, BC	It is a crime to destroy a beautiful habitat for wildlife for so few jobs. Not impressed by long project but I get it...thats a lot of jobs and income, but this not..., Just USA economic interest.  My wife and I oppose this.	BURNCO is a 104-year old family-owned Canadian company with operations in British Columbia, Alberta, Saskatchewan and Texas.  BURNCO has over 1,150 employees (180 in BC) and is Canada's largest independent ready mix concrete and aggregate company.  BURNCO's BC operations currently transport sand and gravel by barge from Treat Creek (east of Powell River) and as far away as Port McNeil on northern Vancouver Island, to existing facilities along the Fraser River in Burnaby and Langley.
2366	571 - 1	Personal Information Withheld	Gibsons, BC	I really hope this project doesn't go ahead. It will ruin such a beautiful natural habitat and Howe Sound is just beginning to recover from years of abuse.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.

2367	572 - 1	Pamela Proctor	Gibsons, BC	Very important to the boating community, Howe Sound is a relatively compact area, which we are working hard to sustain and maintain.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2368	572 - 2	Pamela Proctor	Gibsons, BC	It is relatively 'clean' now and we need to keep the industrialization out in order to keep it that way. Howe Sound is a precious part of our coast, not to be tampered with.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
2369	573 - 1	Personal Information Withheld	Lions Bay, BC	I am writing to express my opposition to the Burnco gravel extraction plan proposed for McNab Creek in Howe Sound. The residents of Howe Sound rely on the maintenance of a thriving tourist industry for their livelihoods and the sustainability of their communities. The proposed gravel mine would severely impact the natural scenic beauty of the area and would have, therefore, a consequent negative effect on the area's major industry. The proposed mine and its activities would, therefore, negatively impact the quality of life of Howe Sound residents.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. 2370	573 - 2	Personal Information Withheld	Lions Bay, BC	<p>The proposed mine site is situated on the western shore of Howe Sound directly opposite the Sea to Sky Highway, which runs along the eastern shore of the Sound. The Sea to Sky Highway is the only direct land route to Whistler from Vancouver airport and is a direct route from United States/British Columbia border crossings. Hundred of thousands of tourists drive along the Sea to Sky Highway every year on their way to Whistler. This route directly supports and contributes to over one billion dollars per year in tourism income generated by Whistler and the greater Howe Sound area.</p> <p>Given the proposed placement of the Burnco mine, all users of the Sea to Sky Highway—local residents and tourists will see the mine as they drive along the highway.</p> <p>The route of the Sea to Sky Highway was chosen by the province in order to take advantage of the spectacular scenic beauty of Howe Sound.</p> <p>The Sea to Sky Highway is, itself, a major tourist attraction in its own right. The highway supports many small businesses along the Howe Sound corridor. For example, several companies rent out high-end cars to those wishing to experience the unique drive to Whistler—a drive rated as one of the top ten best drives in the world.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

2373	573 - 5	Personal Information Withheld	Lions Bay, BC	To claim, as Burnco is attempting to do, that the McNab Creek mine would be 'sustainable' is, in my view, ludicrous. How can a gravel mine be described as 'sustainable'? Gravel is a finite resource. If allowed to go ahead, Burnco's mining operations would last until the resource was exhausted. Once Burnco has extracted both its gravel and its profits, the residents of Howe Sound—human, animal, and vegetable will have to deal with the consequences of the company's actions—potentially for decades ahead.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
2374	573 - 6	Personal Information Withheld	Lions Bay, BC	To claim, as Burnco is attempting to do, that the McNab Creek mine would be 'sustainable' is, in my view, ludicrous. How can a gravel mine be described as 'sustainable'? Gravel is a finite resource. If allowed to go ahead, Burnco's mining operations would last until the resource was exhausted. Once Burnco has extracted both its gravel and its profits, the residents of Howe Sound—human, animal, and vegetable will have to deal with the consequences of the company's actions—potentially for decades ahead.	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resource is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
2375	573 - 7	Personal Information Withheld	Lions Bay, BC	<p>Those tasked with making the decision about whether or not to allow the McNab gravel pit to go ahead should be aware of the recent history of Howe Sound—specifically, the environmental damage caused by the copper mine at Britannia Beach. It has taken over a decade to revive the waters of Howe Sound and, to the present, \$46 million dollars to clean up its waters so that it once again can support the mammal and fish species we now see in the Sound. Why put this environmental revival at risk for the profit of so few and the detriment to so many?</p> <p>Decision-makers should also be aware that Howe Sound is an area of spectacular natural beauty—an area just outside the bounds of Greater Vancouver and, therefore, easily accessible to millions. Why desecrate this beauty and the joy it gives to both local residents and visitors for the profit of a very few individuals?</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

2376	573 - 8	Personal Information Withheld	Lions Bay, BC	The vibrancy and diversity of the aquatic life in Howe Sound is well-documented. It is either a permanent home or an important feeding ground for whales, dolphins, and seals as well as herring and salmon among many other sea creatures.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2377	573 - 9	Personal Information Withheld	Lions Bay, BC	The seabed below Howe Sound is home to glass sponges.	<p>Glass sponges are known to occur throughout Howe Sound, in water depths below -20 m (chart datum). As part of marine baseline investigations, detailed underwater biophysical surveys were conducted in the proposed subtidal footprints of the proposed marine infrastructure (as well as adjacent areas) using SCUBA and towed video survey methods, with detailed information recorded on existing habitat and species present in these areas. This included systematic surveys targeting potential sponge reef habitats. The field surveys concluded that no glass sponge reefs were present in the proposed marine infrastructure (load-out jetty or walkway/conveyor) footprint. This information agrees with known habitat preferences of these organisms (i.e., water depths in the proposed marine infrastructure footprint are shallower than the depth range in which glass sponge reefs occur). In terms of interaction of glass sponge reef habitat with shipping activities, known sponge reefs occur in proximity to the proposed shipping route in several locations, with the closest occurring at the mouth of Ramillies Channel (Volume 4, Part G - Section 22.0 - Appendix 5.2-A, Figure 3). However, water depths at these locations along the proposed shipping route are below -25 m (chart datum). As such, potential impacts from shipping would be limited to propeller wash effects at the corresponding depths of these glass sponge reef occurrences. To assess this potential impact, propeller scour impacts on the seabed were assessed at a modelled depth of -20 m (chart datum) to correspond with the uppermost depths of glass sponge habitat. Jet velocities generated by the tug propeller at -20 m were compared to natural velocities derived from wave and tidal activity in Howe Sound. Estimates of maximum horizontal velocity associated with wind waves were developed from wave hindcasts from available wind data for the Strait of Georgia using the Halibut Bank Ocean Buoy (Environment Canada Station 46146) and are summarized in Table 5.2-12. At -20 m depth, the jet velocities of the proposed tug-assisted barge movements were shown to be within the same magnitude as tidal currents present at this depth, and below the velocity threshold (0.25 m/s) required for seabed particle mobilization (USACE 1989). Given that water depths along the proposed shipping route in the RSA are typically below -20 m (chart datum), the potential effects of tug propeller scour on glass sponge assemblages in the proposed shipping corridors were considered negligible and were not carried forward in the assessment.</p>

2378	573 - 10	Personal Information Withheld	Lions Bay, BC	The banks of McNab Creek are frequented by bear and elk among many other mammals. If the proposed gravel pit goes ahead, it will undoubtedly effect all these species as well as countless others.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2379	573 - 11	Personal Information Withheld	Lions Bay, BC	As important as protecting the natural beauty and sustainability of the creatures of Howe Sound is, it should not be forgotten that the Sound is home to thousands of human residents. Any industrial activity along the shores of the Sound is bound to directly effect the lives and sustainability of its communities.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
2380	573 - 12	Personal Information Withheld	Lions Bay, BC	Speaking at an 'information session' for the company's first proposed development plan, a Burnco spokesperson said that the major reason Burnco chose Howe Sound for its expansion was because it contained the smallest population of any of the sites under consideration. Burnco reasoned that, because of the relatively low population of the area, the McNab site would generate less opposition from local residents than would be the case if they chose another site. This argument fails to take into account local conditions and the symbiotic relationship between the population, environment and economic viability of the Howe Sound region.	Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.

2383	573 - 15	Personal Information Withheld	Lions Bay, BC	The proposed gravel extraction pit would be located directly across from Lions Bay. It would be visible to almost every resident; its operations may be heard in every household; it lights would be visible at night in almost every window; and, the plant's vibrations could be felt through every foundation in the village.	The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.  Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.
2384	573 - 16	Personal Information Withheld	Lions Bay, BC	The proposed gravel extraction pit would be located directly across from Lions Bay. It would be visible to almost every resident; its operations may be heard in every household; it lights would be visible at night in almost every window; and, the plant's vibrations could be felt through every foundation in the village.	A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.  Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.  A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.
2385	573 - 17	Personal Information Withheld	Lions Bay, BC	In addition to the deterioration in their quality of life caused by the above effects, Lions Bay residents would also face financial disadvantage due to lowered house prices as a result of visual and noise pollution. Lions Bay has already suffered negative impacts due to the location of Highway 99, which runs through the heart of the village. Average house prices in Lions Bay are already significantly lower than in almost every other municipality and district on the North Shore. If even less potential house buyers view Lions Bay (and other effected communities) as a desirable place to buy a house, the tax base will shrink even further, more houses will be left vacant and Lions Bay may become nothing more than an unsustainable ghost town. Given the realities facing the community, the village of Lions Bay stands to lose the most of any constituency and will gain nothing by a Burnco development. In short, any industrialization on the McNab Creek site will erode the viability of Lions Bay as a sustainable community.	Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.  The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.  Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).  BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.

2386	573 - 18	Personal Information Withheld	Lions Bay, BC	<p>In the larger picture, granting Burnco's application for the McNab Creek mine makes no economic sense. It will put the province in the position of potentially losing millions of dollars to a vital tourist industry. It will effect local, provincial and federal economies all in the name of supporting corporate greed. Burnco has stated that the gravel mine will support twelve jobs. There is no guarantee that these jobs will be filled locally, as far as I am aware. However, twelve jobs is a very, very expensive price to pay for the loss of environmental habit, species diversity, quality of life for thousands of people not to mention the jeopardy such development will place on billions of dollars of income from tourism. It is, in my view, senseless, for such a project to go ahead given its costs.</p>	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. 2388	573 - 20	Personal Information Withheld	Lions Bay, BC	<p>If shortsightedness prevails and this act of environmental vandalism is approved, I submit that Burnco should be required to provide quantifiable data to show that its development and operational activities of its McNab site will have no negative effects, such as vibrations, noise or lights, on all co-habiting creatures including those in surrounding communities.</p>	<p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 and are summarized below. BURNCO commits to funding for these monitoring initiatives.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring.</p> <p>Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational Environmental Protection Plans (EPPS). Compliance monitoring will include assessment of Proponent and contractors' environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program.</p> <p>BURNCO will submit a report to the BCEAO on the status of compliance with the Certificate Conditions, at the following times:</p> <ul style="list-style-type: none"> <li>- At least 30 days prior to the start of Construction;</li> <li>- On or before January 31 in each year after the start of Construction;</li> <li>- At least 30 days prior to the start of Operations;</li> <li>- On or before January 31 in each year after the start of Operations;</li> <li>- At least 30 days prior to the start of Closure and Reclamation;</li> <li>- On or before January 31 in each year after the start of Closure and Reclamation; and</li> <li>- Within 30 days of completing Closure and Reclamation.</li> </ul> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>
2389	573 - 21	Personal Information Withheld	Lions Bay, BC	<p>If shortsightedness prevails and this act of environmental vandalism is approved, I submit that Burnco should be required to provide quantifiable data to show that its development and operational activities of its McNab site will have no negative effects, such as vibrations, noise or lights, on all co-habiting creatures including those in surrounding communities.</p>	<p>BURNCO will develop a project-specific website that will be maintained to keep stakeholders informed regarding the Project, including project schedule, construction activities, operating information, and noise and air quality monitoring data.</p>
2390	574 - 1	Personal Information Withheld	Lions Bay, BC	<p>I am writing to raise several concerns regarding the potential impact of the planned Burnco gravel mine at the McNab Creek site in Howe Sound.</p> <p>While I lack the expertise to speak to the impacts of this project to the flora and fauna of Howe Sound, the impacts of this project to the human environment of the Sound will be severe and prolonged, if not permanent.</p>	<p>Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>

	Ref #	Commenter (Name)	Location		
2391	574 - 2	Personal Information Withheld	Lions Bay, BC	<p>Howe Sound is extensively used for recreational purposes, such as boating, and hiking on an extensive trail network on the eastern edge of the sound, much of which has line-of-sight to the location of the planned mine. The eastern edge of the sound and the islands in the sound are also home to a small but non-trivial population, most of whom live in this area out of a desire for peace and quiet away from most human activity, including industry. The Burnco development is likely to severely impact both categories of people who visit or live in the Howe Sound region.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
2392	574 - 3	Personal Information Withheld	Lions Bay, BC	<p>Recreational use will be impacted by the visual pollution created by the mine. Howe Sound is known for its vistas and those vistas will be negatively impacted by the addition of a mine on the scale of the Burnco project. I have seen no data or estimates on the extent recreational use of the Sound will be impacted by the Burnco project but such data ought to be collected and all necessary steps ought to be taken to ensure that recreational use is not disturbed or reduced by the mine. 'All necessary steps,' in my view, may include denying permission for the mine to be built if the impact on recreational use will be too great.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

2393	574 - 4	Personal Information Withheld	Lions Bay, BC	The impact on residents will likely be more extensive. The largest community in Howe Sound, Lions Bay, has a direct line of sight to the mine location. The value of Howe Sound properties is highly dependent on views of the natural landscape and will likely be adversely impacted by the destruction of the natural landscape at the mine site. This is even more of a concern in light of the progressive clearcutting of the western shore of the Sound. It may well be the case that the Burnco project constitutes the thin end of the wedge where the views of the landscape in the Sound become perceived not—as they are now—as being overwhelmingly natural, but marred by the occasional clearcut, but rather as being industrial and only blessed with the occasional remains of a natural landscape. Such a change in perception, should it occur, will have negative impacts on property values because it will render the environment of the sound less desirable for human habitation. All necessary steps ought to be taken to minimize such impacts on existing property holders.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
2394	574 - 5	Personal Information Withheld	Lions Bay, BC	The most severe impact to existing residents, however, may well be due to noise and vibration from rock crushers and other industrial equipment at the Burnco site. Regional experience from the construction project to upgrade Highway 99 in preparation for the 2010 Olympics is that noise and vibration from rock crushers are disruptively perceptible at distances measured in the tens of kilometres. The prospects of noise pollution from the Burnco project do not appear to have been adequately addressed.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCR noise bylaw was considered as part of the assessment.</p>
2395	574 - 6	Personal Information Withheld	Lions Bay, BC	Ongoing noise, and especially vibration, for the duration of the Burnco project would be extremely disruptive to the peacefully quiet environment currently enjoyed by Howe Sound residents. All possible steps ought to be taken to ensure that vibration does not reach even the houses nearest to the mine site under any circumstances and that noise not be audible outside of extremely rare atmospheric conditions.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>

2396	574 - 7	Personal Information Withheld	Lions Bay, BC	<p>To be frank, I do not believe the Burnco mine project should proceed. The location is far better suited to remain as-is so that the natural beauty of the Howe Sound region can be enjoyed by future generations instead of permanently damaged by an inherently unsustainable non-renewable resource extraction project. However, if the project must proceed, I believe the following conditions ought to be imposed:</p> <p>* Unused areas of the mine pits should be filled in and replanted immediately upon disuse in order to minimize the visual footprint of the mine. Consideration ought to be given to covering as much of the site as is practicable with camouflage netting to further reduce the visual footprint of the mine.</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>
2397	574 - 8	Personal Information Withheld	Lions Bay, BC	<p>* Monitoring and mitigation measures should be implemented to ensure vibration and noise from mine equipment, such as site generator(s) and rock crusher(s), are not perceptible by area residents.</p>	<p>Noise monitoring locations will be included as part of the Noise Management Plan. Stations will be located to monitor noise levels at the McNab Strata and at Ekins Point on Gambier Island.</p>
2398	574 - 9	Personal Information Withheld	Lions Bay, BC	<p>Howe Sound is perceived as a natural gem thanks to its quiet natural vistas. This perception and the reality on which it is based is not compatible with large scale industrial development, such as the Burnco project. When taken in the context of continuing clearcutting of the western side of the Sound and the prospect for further re-industrialization at the Woodfibre site, I believe the Burnco project is a step too far that will ruin the character of the sound not just for the 16 years the site is intended to operate but potentially permanently. The mine does not belong here.</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
2399	575 - 1	Personal Information Withheld	Vancouver, BC	<p>I am writing to voice my concern over the proposed gravel mine at McNab Creek in Howe Sound. Approval of that mine would amount to short term thinking.</p>	<p>Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>
2400	575 - 2	Personal Information Withheld	Vancouver, BC	<p>Such a mine will destroy McNab Creek as a salmon spawning bed, one more blow to the salmon fishery on the west coast.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

2401	575 - 3	Personal Information Withheld	Vancouver, BC	A gravel mine would last a short time and then would be gone; the workers there would join the unemployed. Salmon fisheries on the other hand, if well managed, have the potential to provide employment, food for people, and vital support for wild life and the ecology in perpetuity. I urge you to take a long term view, and to choose salmon and the ecology over a short term gravel mine.	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>
2402	576 - 1	Janice Eckert	North Vancouver, BC	This proposed project scares the hell out of me. It should scare everyone. Have never visited Howe Sound and seen its pristine beauty.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. 2405	578 - 2	Steve Dietrich	Gambier Island, BC	<p>This is a place where silence and beauty is so spectacular that you can read a book while hearing only the occasional splash of a seal, the flapping of wings from a blue heron, and the crunching teeth of a sea otter while eating his morning fish. Mountains tower straight out of the ocean 3,000 - 5,000 feet in a 360 degree view. Kids paddle board in notoriously calm waters. There is recreational crabbing, prawning, fishing, and natural oysters beds, among many other forms of wildlife. You may think you are in Alaska but you are only 45 minutes from downtown Vancouver.</p> <p>It seems so long ago that the Howe Sound was so polluted that no one was even interested in enjoying the many wonders of this area. This is not the only area that has had a eye opener. Consider, the dump within the Whistler town center 40 years ago before it was really discovered. The logging dumps in Tofino and clear cutting in Clayoquot Sound, prior to it becoming a UNESCO biosphere or the recent success of the Sea to Sky Gondola in a town that has emerged from a rough industrial history. Even the shores of Vancouver were once filled with heavy industry and is now one of the most livable metropolitan areas in Canada. The beauty of McNab Valley is that it is not overcome by tourists, it is actually slightly hard to get to without a boat. However, there are many areas in BC (such as the ones above) that were also once hard to get to. Access to Howe Sounds is slowly changing with the growth in water taxi's more and more personal water craft, kayaks and paddle boards etc. Please be cognizant of the monetary value in increased marine resources and potential tourism dollars that will greatly</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. Once again no measures in place to rectify such a disaster.</li> </ul>	<p>During the operational phase of the Project the water level in the pit will be monitored but not be actively managed. Mining operational activities will need to accommodate fluctuations in the Pit Lake water levels. The owner shall monitor the groundwater gradient and the water levels within the pit lake. These monitored groundwater and pit lake water levels shall be used to refine the analysis of the closure groundwater gradient and pit lake water level. These analysis shall be used to inform the progressive planning of the mine. After closure, if necessary, the groundwater gradient can be altered (varying the rate of loss from McNab Creek) by adjusting the height of the weir at the outlet of the pit lake.</p> <p>The Pit Lake water levels provided in Table 5.5-7 (Volume 2 Section 5.5), include consideration of surface water and groundwater inflows and groundwater outflows from the Pit Lake on an average annual basis. Additional analysis indicated that during extreme wet periods ranging in duration from days to months, the increased rates of surface water and groundwater inflow would result in Pit Lake water levels in excess of the values presented in Table 5.5-7. Under these conditions the rate of groundwater outflow would also increase above those predicted under annual average conditions. The height of the Pit Lake Containment Berm was designed in order to contain the elevated Pit Lake water levels that would result from extreme prolonged wet periods. Details of the analysis and design of the Pit Lake Containment Berm will be provided in the Mines Act Application.</p>
2416	578 - 13	Steve Dietrich	Gambier Island, BC	<ul style="list-style-type: none"> <li>No benefit to the local community, no appreciation for Howe Sounds beauty, and no measure for social license.</li> <li>Sound unique biosphere and beauty, only loss of a spectacular valley just 30 minutes from Horseshoe Bay.</li> </ul>	<p>BURNCO has proposed a McNab Community Enhancement Fund (CEF) that would consist of money set aside each year of operation, based on output, to enhance the McNab community through targeted funding on projects throughout the region. Funding of projects would be given priority by BURNCO's Management Committee based on a number of criteria that would include:</p> <ul style="list-style-type: none"> <li>- Mitigation of project effects</li> <li>- Bringing amenities to our nearest neighbours</li> <li>- Supporting non-political groups actively improving Howe Sound through cleanup efforts, habitat improvements, etc.</li> <li>- Children's camps</li> <li>- Local united Way or similar organizations providing funding to community programs</li> <li>- Public amenities</li> </ul> <p>The CEF is a funding mechanism which may be replaced by a Sunshine Coast Regional District fee at some future date. If such a fee were introduced, then the CEF would cease.</p>

2424	579 - 1	Sean McAllindon	Toronto, ON	I live in Toronto and for the last 16 years I have traveled (with Family) to enjoy the unrivalled beauty of your home province - B.C. One of our favorite places to visit – boat, kayak, fish and swim is Howe Sound.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
2425	579 - 2	Sean McAllindon	Toronto, ON	We ask you not to take on the risks associated with the Burnco project. The minor economic merits for Burnco are certainly not worth the negative economic impact this will have on tourism and the environment.  The last thing we want to experience in the heart of this beautiful area is industrialization. Do the right thing and stop Burnco from building an open pit mine in the heart of one of our most cherished natural resource!	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2426	580 - 1	Hugh Wilson	Williamsons Landing, BC	As a resident of Williamsons Landing and a member of the Twin Creeks OCP review committee, I would like to register my concerns over the Burnco Proposed Gravel Pit at McNab Creek.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2427	580 - 2	Hugh Wilson	Williamsons Landing, BC	Although the proposed mining activities are planned for privately owned property, I feel the impact of the mining activities will extend well beyond the property boundaries. I think the noise and light pollution, along with the substantial loading facilities and pit, will impact the enjoyment and experience that boaters and campers currently have in this area. The negative impact on tourism will have a negative financial impact on the Sunshine Coast. In addition, wildlife in the area of the mine and in the Howe Sound will be negatively impacted.	A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.  Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCR noise bylaw was considered as part of the assessment.

2428	580 - 3	Hugh Wilson	Williamsons Landing, BC	Although the proposed mining activities are planned for privately owned property, I feel the impact of the mining activities will extend well beyond the property boundaries. I think the noise and light pollution, along with the substantial loading facilities and pit, will impact the enjoyment and experience that boaters and campers currently have in this area. The negative impact on tourism will have a negative financial impact on the Sunshine Coast. In addition, wildlife in the area of the mine and in the Howe Sound will be negatively impacted.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
2429	580 - 4	Hugh Wilson	Williamsons Landing, BC	Although the proposed mining activities are planned for privately owned property, I feel the impact of the mining activities will extend well beyond the property boundaries. I think the noise and light pollution, along with the substantial loading facilities and pit, will impact the enjoyment and experience that boaters and campers currently have in this area. The negative impact on tourism will have a negative financial impact on the Sunshine Coast. In addition, wildlife in the area of the mine and in the Howe Sound will be negatively impacted.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2430	580 - 5	Hugh Wilson	Williamsons Landing, BC	Although the proposed mining activities are planned for privately owned property, I feel the impact of the mining activities will extend well beyond the property boundaries. I think the noise and light pollution, along with the substantial loading facilities and pit, will impact the enjoyment and experience that boaters and campers currently have in this area. The negative impact on tourism will have a negative financial impact on the Sunshine Coast. In addition, wildlife in the area of the mine and in the Howe Sound will be negatively impacted.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

2431	580 - 6	Hugh Wilson	Williamsons Landing, BC	<p>Although the proposed mining activities are planned for privately owned property, I feel the impact of the mining activities will extend well beyond the property boundaries. I think the noise and light pollution, along with the substantial loading facilities and pit, will impact the enjoyment and experience that boaters and campers currently have in this area. The negative impact on tourism will have a negative financial impact on the Sunshine Coast. In addition, wildlife in the area of the mine and in the Howe Sound will be negatively impacted.</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2432	580 - 7	Hugh Wilson	Williamsons Landing, BC	<p>Clearly, at 20 million tons, this is a small gravel deposit with a low net value per ton that will generate little in the way of lasting benefits for the Sunshine Coast. The quantity of gravel that will be supplied to the Vancouver market will not be a major factor in gravel pricing. The lake that will remain at the end of the mine life will be on private land and unavailable for the public's enjoyment.</p> <p>I feel that the potential benefits to the Sunshine Coast of this proposed gravel pit do not warrant the the negative impact on the environment.</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit. Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until installed works are determined to be functioning as intended.</p> <p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>

2437	582 - 1	Reg Allen	West Vancouver, BC	It is my strong opinion that the Burnco aggregate removal project in Howe Sound is an unfortunate example of incredible poor land management. It is not in concert with the Sound communities and is a retrograde step environmentally.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2438	582 - 2	Reg Allen	West Vancouver, BC	An aggregate mine has surely to be one of the worst activities to site in such an area. The proposed volume of aggregate removal will cumulatively impact this recovering environment through dust generation, removal of vegetation, aquatic, noise and visual disturbance, to name but a few.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>

Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

2442	582 - 6	Reg Allen	West Vancouver, BC	The latest Golder study, though extensive in some areas still contains considerable weakness in its assumptions and methodology.	<p>The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada in accordance with:</p> <ul style="list-style-type: none"> <li>- BCEAO Guideline for the Selection of Valued Components and Assessment of Potential Effects (BCEAO 2013),</li> <li>- Operational Policy Statement: Addressing Cumulative Environmental Effects under the Canadian Environmental Assessment Act (CEA Agency 2007),</li> <li>- Addressing Cumulative Environmental Effects. A Reference Guide for the Canadian Environmental Assessment Act (CEA Agency 1994),</li> <li>- Cumulative Effects Practitioners Guide (CEA Agency 1999), and</li> <li>- A Reference Guide for the Canadian Environmental Assessment Act: Determining Whether a project is Likely to Cause Significant Environmental Effects (FEARO 1994a).</li> </ul> <p>A detailed methods framework is provided in Volume 2, Part B – Section 4 of the EAC Application/EIS.</p>
2443	582 - 7	Reg Allen	West Vancouver, BC	We understand that Burnco claim that the Sound's use over the last one hundred years has been one of industrial activity. This is a shameful statement as we the public and you the government have over recent years made such tremendous strides in its reparation. It is now becoming once again a beautiful natural Lower Mainland asset that we can have pride in, and visitors can admire.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

2444	582 - 8	Reg Allen	West Vancouver, BC	We urge the government to deny approval to a project of this nature. It has little economic upside outside of Burnco's profitability and yet has so much impact and risk to this scenic and natural environment on our doorstep.	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>
2445	582 - 9	Reg Allen	West Vancouver, BC	In summary a regional plan for the development of Howe Sound is crucial, it would enable criteria and guide lines for any proposed activities and avoid long expensive processes such as we are involved in at the moment.	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
2446	583 - 1	Lois Thompson	Gibsons, BC	As a resident of the sunshine coast, Gibsons, I am absolutely unequivocally against this proposed gravel mine.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

	Ref #	Commenter (Name)	Location		
2447	583 - 2	Lois Thompson	Gibsons, BC	We have just cleaned up how sound from many years of industrial waste. We finally have a jewel right next to the lower mainland. Please don't be so shortsighted.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2448	583 - 3	Lois Thompson	Gibsons, BC	Yes you need gravel but you really don't need to ruin the wetlands that actually are the nursery of the health of all water. Your water, whales water, ducks water, herring's water, my water.	The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.  Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by: - Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC; - Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and - Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.  The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.
2449	583 - 4	Lois Thompson	Gibsons, BC	Yes you need gravel but you really don't need to ruin the wetlands that actually are the nursery of the health of all water. Your water, whales water, ducks water, herring's water, my water.	A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.  The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.  The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.
2450	584 - 1	Kathy Swangard	Nanoose Bay, BC	The proposal from Burnco is not environmentally sustainable. The potential damage to tourism, water, wildlife (including the fishery) make this a project that should not be supported.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.

2454	584 - 5	Kathy Swangard	Nanoose Bay, BC	The proposal from Burnco is not environmentally sustainable. The potential damage to tourism, water, wildlife (including the fishery) make this a project that should not be supported.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2455	584 - 6	Kathy Swangard	Nanoose Bay, BC	As a member of Schooner Cove Yacht Club, located in Nanoose Bay, B.C. (north of Nanaimo on Vancouver Island) I look, from our home and our marina, across to the Sunshine Coast, specifically Sechelt, and see the awful slab of grey on the hillside which is a gravel pit on First Nations land that has been there for many years. We see it every time we go out in our boat. We see that nothing is growing there, though we do not see much work activity. The same is the case on Texada Island, located between Vancouver Island and the Mainland – the view from Powell River is awful and the environmental damage is staggering. What must all the tourists on cruise ships (aside from all the recreational boaters) think of Canada's/B.C.'s environmental policies?	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

2456	584 - 7	Kathy Swangard	Nanoose Bay, BC	Please think in terms of development of smaller, staggered projects which are then reclaimed (made to look similar to the original landscape) before moving on to the next stage, i.e. Project #2. Do environmental homework on rivers, streams, potential landslides, loss of wildlife habitat, marine habitat, etc. versus the profit of a single corporation.	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit. Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until installed works are determined to be functioning as intended.</p> <p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>
2457	584 - 8	Kathy Swangard	Nanoose Bay, BC	Please accept my vote AGAINST approval of this project, and against similar projects on an environmentally sensitive coastline – in B.C. Or anywhere in Canada.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2458	585 - 1	Jon Povill	Lions Bay, BC	Howe Sound is only now finally recovering from decades of environmental abuse.	<p>It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).</p> <p>Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.</p>

2467	585 - 10	Jon Povill	Lions Bay, BC	Unless Burnco is willing to put up a bond of tens of millions of dollars to guarantee the restoration of the habitat, this project should not even receive consideration.	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>
2468	585 - 11	Jon Povill	Lions Bay, BC	And even if such a bond is offered, the disruption to the ecosystem, the noise and unsightliness of the site, along with the loss of value in tourism and filming location fees all speak to the undesirability of this project. Please do not grant it an approval.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2469	586 - 1	Merrien Loughead	Not Stated	Boating issues in Howe Sound regarding the BURNCO Aggregate Project - The northern reaches of Howe Sound exist as a recreational jewel: seemingly remote and pristine, and yet a short day trip from many areas of the Lower Mainland. Boaters seek this area out for its off-the-grid peace and quiet. There are 5 yacht clubs with outstations in various locations in Howe Sound. It is an attractive destination for recreational boaters outside the lower mainland with marinas in Snug Cove on Bowen Island and in Gibsons and offers the same spectacular vistas as Desolation Sound or Princess Louisa Inlet. After many decades of toxic industrial mining pollution, Howe Sound has emerged as a safe and clean area. The return of industry, specifically the BURNCO Aggregate Project located in the McNab Valley at McNab Creek, threatens the recovery and the increasing recreational usage of this southern-most fjord.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. 2470	586 - 2	Merrien Loughead	Not Stated	<p>The economic gain belongs solely to Burnco, while it destroys the peace and enjoyment of this spectacular vista: a dust/smoke/lights-at-night eyesore that will be visible greatly reduces the attractiveness of this area. This project brings with it the risk that both local and visiting boaters may choose other areas to spend their recreational dollars in Gibsons and on Bowen Island.</p>	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>
2471	586 - 3	Merrien Loughead	Not Stated	<p>The economic gain belongs solely to Burnco, while it destroys the peace and enjoyment of this spectacular vista: a dust/smoke/lights-at-night eyesore that will be visible greatly reduces the attractiveness of this area. This project brings with it the risk that both local and visiting boaters may choose other areas to spend their recreational dollars in Gibsons and on Bowen Island.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

2472	586 - 4	Merrien Loughead	Not Stated	The economic gain belongs solely to Burnco, while it destroys the peace and enjoyment of this spectacular vista: a dust/smoke/lights-at-night eyesore that will be visible greatly reduces the attractiveness of this area. This project brings with it the risk that both local and visiting boaters may choose other areas to spend their recreational dollars in Gibsons and on Bowen Island.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p>
2473	586 - 5	Merrien Loughead	Not Stated	The economic gain belongs solely to Burnco, while it destroys the peace and enjoyment of this spectacular vista: a dust/smoke/lights-at-night eyesore that will be visible greatly reduces the attractiveness of this area. This project brings with it the risk that both local and visiting boaters may choose other areas to spend their recreational dollars in Gibsons and on Bowen Island.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
2474	586 - 6	Merrien Loughead	Not Stated	Noise reverberates off the mountains surrounding this site. Although the Burnco plan includes a berm, it remains uncertain that berms offer much mitigation to sound over water and at the bottom of the surrounding 'bowl' of mountains. Although Burnco's application indicates that noise would be as loud as a 'fridge running', it is precisely this type of white urban noise, and machine/industrial noise that boaters seek out this area for it's current peace and silence.	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Considering these factors, the modelled Project contributions to noise levels at NR4 (Eakins Point, inside the LSA and across the water from the Project) were below baseline and resulted in Negligible-Not Significant effects. Therefore the LSA will not be expanded.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners, including receptors across the water such as Eakins Point.</p>

2475	586 - 7	Merrien Loughead	Not Stated	The wakes of commercial vessels travelling to/from this site (water taxis, tug boats and barges) present risks to all recreational vessels including kayakers, paddle-boarders, swimmers, water-skiers. Safety in this recreational area, considering the many small vessel users could be compromised if swamped by the increased commercial traffic. On-the-water marine events such as sailing races, yacht club sail-pasts, children's camps conducting canoeing or kayaking trips are vulnerable to commercial traffic.	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
2476	586 - 8	Merrien Loughead	Not Stated	Calgary-based Burnco Rock Products donated \$34,000 to the Liberals, bringing their eight year running total to \$219,700. Writes Dermot Travis, executive director of Integrity BC, 23 April 2014. This amount is considered by the author to be 'outlandish'. At this time \$286,700.00 has been donated by Burnco to the BC Liberal Government. We must question the intent of a company that already enjoys a lower tax rate (mining) imposed by the province donating this much money.	<p>BURNCO is a 104-year old family-owned Canadian company with operations in British Columbia, Alberta, Saskatchewan and Texas.</p> <p>BURNCO has over 1,150 employees (180 in BC) and is Canada's largest independent ready mix concrete and aggregate company.</p> <p>BURNCO's BC operations currently transport sand and gravel by barge from Treat Creek (east of Powell River) and as far away as Port McNeil on northern Vancouver Island, to existing facilities along the Fraser River in Burnaby and Langley.</p>
2477	586 - 9	Merrien Loughead	Not Stated	Many boaters use the foreshore area/estuary of McNabb Creek for recreation of fishing, prawning and crabbing. This area is attractive as it is the only estuary in this area. Not only will a mine and it's accompanying marine traffic greatly diminish the marine life populations that support fishing, the risk to small dingies/boats from the increased tug/barge and water taxi traffic exists as another consideration that reduces boater interest. The small anchorage immediately facing McNab Creek where boats can anchor will be destroyed as a tenable recreational anchoring area in the face of a large loading dock and water taxi/tug/barge traffic.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

2478	586 - 10	Merrien Loughead	Not Stated	Many boaters use the foreshore area/estuary of McNabb Creek for recreation of fishing, prawning and crabbing. This area is attractive as it is the only estuary in this area. Not only will a mine and it's accompanying marine traffic greatly diminish the marine life populations that support fishing, the risk to small dingies/boats from the increased tug/barge and water taxi traffic exists as another consideration that reduces boater interest. The small anchorage immediately facing McNab Creek where boats can anchor will be destroyed as a tenable recreational anchoring area in the face of a large loading dock and water taxi/tug/barge traffic.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
2479	586 - 11	Merrien Loughead	Not Stated	BURNCO's Environmental Assessment application has not clearly identified the following points: • The construction phase (4 months – 2 years).	The estimated duration of project construction will be up to two years. Some components will be constructed relatively quickly, while others will take longer depending on manufacturing times, construction windows and other limitations associated with the location of the Project site.
2480	586 - 12	Merrien Loughead	Not Stated	• The tonnage of gravel to be extracted: 1 million tonnes / year for 16 years or 20 million tonnes over the life of the project.	The Proposed Project is to extract approximately 20 million tonnes of sand and gravel over the 16 year life of the Proposed Project. This will be reflected in an approved EA certificate and mine plan.
2481	586 - 13	Merrien Loughead	Not Stated	• The number of tugs/barges required to move the above tonnes of gravel.	The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.  Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.
2482	586 - 14	Merrien Loughead	Not Stated	• The number of employees requiring water taxi transportation (the number of water taxis).	It is anticipated that during operations, the water taxi will make one return trip to/from the project site each day (520 trips per year).BURNCO will either provide its own water taxi or contract one from a local operator.

2483	586 - 15	Merrien Loughead	Not Stated	<ul style="list-style-type: none"> <li>Burnco's application mentions the development of a Marine Transportation Plan that is, in our many decades of experience as recreational boaters) unrealistic. Kayakers, children's camp canoes, paddle boaters, water-skiers and smaller boats cannot easily manoeuver in the face of high speed water taxis and tugs carrying empty barges. This plan offers local boaters some flexibility during marine on-the-water events, but this is unrealistic and lacks credibility in that this places the responsibility on individual or group users to inform Burnco of these events.</li> </ul>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
2484	586 - 16	Merrien Loughead	Not Stated	<ul style="list-style-type: none"> <li>The Fraser Valley Regional District Aggregate Inventory Atlas identified (in 2009) that there are sufficient sources of aggregate within the lower mainland to meet demand for 100 years. Burnco incorrectly identifies a growing need for gravel that requires additional sources.</li> </ul>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
2485	586 - 17	Merrien Loughead	Not Stated	<p>Howe Sound has no land or resource management plan and yet the Squamish/Lillooet Regional District has a plan as does the Sunshine Coast possess a Sustainability Plan. It behooves the approval process to consider a project such as this within the context of a land and resource/marine management plan.</p>	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>

2486	586 - 18	Merrien Loughead	Not Stated	For the above reasons, we respectfully request that the Burnco Aggregate Project be rejected.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2487	587 - 1	Angela and Chris Atkins	Lions Bay, BC	My husband and I live in Lions Bay, which we think of as paradise. Living on the edge of Howe Sound is a privilege we do not take for granted.  We understand that business is business and that your company needs a product to sell. However, we cannot understand why you have chosen McNab Creek as a place to be dug out for gravel.	The Proposed Project will provide sand and gravel that will be used to meet the growing demands of the BC marketplace.  Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.
2488	587 - 2	Angela and Chris Atkins	Lions Bay, BC	My husband and I live in Lions Bay, which we think of as paradise. Living on the edge of Howe Sound is a privilege we do not take for granted. Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.
2489	587 - 3	Angela and Chris Atkins	Lions Bay, BC	It is hard to believe that your company will only run for 16 years and only a few hours a day after the effort and cost to create the gravel pit. It seems that this is what you intend to gain approval.	The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.  Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.
2490	587 - 4	Angela and Chris Atkins	Lions Bay, BC	It is hard to believe that your company will only run for 16 years and only a few hours a day after the effort and cost to create the gravel pit. It seems that this is what you intend to gain approval.	The Proposed Project is to extract approximately 20 million tonnes of sand and gravel over the 16 year life of the Proposed Project. This will be reflected in an approved EA certificate and mine plan.
2491	587 - 5	Angela and Chris Atkins	Lions Bay, BC	The noise pollution alone will be an offence to anyone living in this amazing area. Simply put, sound travels so easily along waterways. Add in low marine cloud or fogs and the grating racket will become even more horrific. It is a fact that gravel pits are noisy; digging up rock is not a quiet pasttime. Anyone living near any gravel industry in the world will say the same thing.	A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.  Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.  A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.

2492	587 - 6	Angela and Chris Atkins	Lions Bay, BC	Please reconsider another use for the land you purchased. Allowing it to become an area that can benefit post-secondary students or researchers studying geology, environment, biology, marine biology, etc. may be a terrific tax incentive for your company. Perhaps creating camps for children or adults could be another tax incentive option. That way you aren't totally losing out on your purchase of the property and we believe everybody living here would be supportive of those endeavours.	A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.  Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.
2493	588 - 1	Hardy Goetsch	Lions Bay, BC	We moved to Lions Bay 48 years ago when Howe Sound had been biologically dead as a result of being used as a dump site for the Britannia Mine and Woodfibre Pulp Mill. Both operations provided hundreds of jobs for workers, so it was considered an “acceptable trade off” for the loss of the environment and the fishing industry.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2494	588 - 2	Hardy Goetsch	Lions Bay, BC	Both operations are now shut down for years and nature has re-juvenated itself. Many species of wildlife, including dolphins, salmon, herring as well as grizzlies have returned and were widely hailed by the News Media and have become attractions for the tourist industry.	It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).  Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.
2495	588 - 3	Hardy Goetsch	Lions Bay, BC	Both operations are now shut down for years and nature has re-juvenated itself. Many species of wildlife, including dolphins, salmon, herring as well as grizzlies have returned and were widely hailed by the News Media and have become attractions for the tourist industry.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2496	588 - 4	Hardy Goetsch	Lions Bay, BC	Both operations are now shut down for years and nature has re-juvenated itself. Many species of wildlife, including dolphins, salmon, herring as well as grizzlies have returned and were widely hailed by the News Media and have become attractions for the tourist industry.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.

2500	590 - 1	Ray Mason	Pemberton, BC	Gravel deposits act like a huge sponge storing water in the spring and releasing it the hot dry summer months. This water is estential for the eco system of McNab creek.	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>
2501	590 - 2	Ray Mason	Pemberton, BC	Gravel deposits act like a huge sponge storing water in the spring and releasing it the hot dry summer months. This water is estential for the eco system of McNab creek.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2502	590 - 3	Ray Mason	Pemberton, BC	Gravel mining can not be allowed to happen there.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2503	590 - 4	Ray Mason	Pemberton, BC	There are no mitigating actions that could replace the loss of the gravel.	<p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project.</p>

2504	591 - 1	Tom McConnell	Vancouver, BC	My concern is for the Resident Sea Run Cutthroat Trout of Mcnab creek Estuary and Creek.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2505	591 - 2	Tom McConnell	Vancouver, BC	Being an owner of Mcnab creek estates and a Father of two my son Colin who is now 29 has been brought up fishing this Estuary / Creek since he was 8 years old. As responsible Anglers in this area , having practiced Catch and Release fishing for this Fisheries for the past 20+ years .	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2506	591 - 3	Tom McConnell	Vancouver, BC	<p>I feel that the habitat report does not address this Fisheries adequately and extensive study needs to be done to study the species effects of ROCK DUST on the Ocean floor of the estuary the feeding grounds of this ENDANGERED. The Trout follow the fry out of the Creek and live in the Estuary until Late July / August at that time they follow the Salmon up the creek to feed. From April to August the Trout Habitat is all over the shallows of the Estuary / 3 spawning channels especially at the westerly channel around the The Rock were the proposed conveyor is projected to be.</p> <p>Thankyou for taking the time to read and address the concerns of such a sensitive Fisherie.</p>	<p>Coastal cutthroat trout inhabit a wide variety of diverse freshwater, estuarine and marine habitats. Cutthroat trout spawn in the late winter or early spring and their fry emerge in late spring or early summer after the salmon fry have emerged. After emerging cutthroat fry move down into slower pool and off-channel habitats unless they are displaced to shallower riffle habitat by larger and more aggressive coho fry. Cutthroat move into deeper pools in the fall for overwintering. The life histories and movements of coastal cutthroat trout populations are diverse between individual fish during rearing, overwintering, and spawning areas. Their life history strategies may include populations where most fish are anadromous but some individuals never go to sea, while others may utilize estuarine habitats on a seasonal basis and return to freshwater to overwinter. Multiple life-history forms often coexist within the same system and even within the same stream reach. This high level of individual flexibility allows coastal cutthroat trout to shift and exploit habitats that are seasonally utilized by other salmonids.</p> <p>The potential for rock dust being released and settling in aquatic habitat was considered during the assessment. With the effective implementation of the proposed erosion and sediment control measures and BMPs, the potential residual effects on water quality and aquatic health were determined to be negligible and not significant. Proposed mitigation for controlling the release of dust to the aquatic environment including the following:</p> <ul style="list-style-type: none"> <li>- Developing and implementing an Air Quality and Dust Control Management Plan that will detail measures to control fugitive particulates.</li> <li>- Developing and implementing an Erosion and Sediment Control Plan.</li> <li>- Establishing an on-site Air Quality and Meteorology Monitoring Program.</li> <li>- Fines/silt cakes berm should be vegetated as soon as possible and where possible by planting and seeding with native trees, shrubs, and grasses.</li> <li>- Placement of erosion control blankets on the berm to prevent dust.</li> <li>- Sediment and erosion control measures should be maintained at all times around the crushing areas and until vegetation is achieved on the berm.</li> <li>- Processing plant crushing and dry screening units will be partially enclosed.</li> <li>- Watering of 10 mm crushed gravel and 20 mm crush gravel stockpiles.</li> <li>- Watering of unpaved roads and restricting speed limits</li> </ul>

2507	592 - 1	Rudi and Gillian Darling Kovanic	Bowen Island, BC	We are writing this letter to express our strong opposition to the Alberta/Texas aggregate company BURNCO's application to construct and operate an open pit sand/ gravel mine and crushing facility proposed in the estuary on the productive fish/salmon bearing McNab Creek on the northwest shore of Howe Sound.	<p>BURNCO is a 104-year old family-owned Canadian company with operations in British Columbia, Alberta, Saskatchewan and Texas.</p> <p>BURNCO has over 1,150 employees (180 in BC) and is Canada's largest independent ready mix concrete and aggregate company.</p> <p>BURNCO's BC operations currently transport sand and gravel by barge from Treat Creek (east of Powell River) and as far away as Port McNeil on northern Vancouver Island, to existing facilities along the Fraser River in Burnaby and Langley.</p>
2508	592 - 2	Rudi and Gillian Darling Kovanic	Bowen Island, BC	As very long time residents of Howe Sound, we are extremely concerned about the severely adverse impact such a project will have on McNab Creek and the overall health of Howe Sound's marine ecosystem.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
2509	592 - 3	Rudi and Gillian Darling Kovanic	Bowen Island, BC	BURNCO indicates that the destruction of this sensitive fish habitat will be very profitable for it and create 12 full time jobs. But at what cost to the environment and sustainable economy of Howe Sound?	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

2512	592 - 6	Rudi and Gillian Darling Kovanic	Bowen Island, BC	As you are aware, after decades of industrial abuse making Howe Sound North America's most toxic mining waste site, about \$45 million of our tax payers dollars were spent cleaning up the Sound. Living on the shores of Howe Sound for almost 30 years, we have been delighted to see this investment of our tax dollars pay off with recovering fish populations and the concomitant recovery of sea mammal populations. While almost never seen in the first 15 to 20 years here, now almost weekly for the past decade we see cetaceans feeding. For example, last week we saw two rare false killer whales heading up Howe Sound. And a few days later we saw a vast, dense school of anchovies swimming along the shoreline. The size of this school was astonishing -- stretching over 220 feet in length, 50 feet wide and two to three feet depth. It's these rebounding stocks that are sustaining Howe Sound's recovering humpbacks and a myriad of other species.	It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).  Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.
2513	592 - 7	Rudi and Gillian Darling Kovanic	Bowen Island, BC	BURNCO's own consultants have identified 21 species that are on the Species at Risk list that will be negatively impacted by this proposed open pit gravel mine in McNab Estuary.	Potential effects of the Proposed Project have been assessed for selected valued environmental components to address key issues related to fish and fish habitat, marine resources, terrestrial wildlife and vegetation, geotechnical and natural hazards, water resources, air quality and climate change.  The assessment concludes that, with the application of design considerations and identified mitigation, no significant adverse environmental effects will result from the Proposed Project.  A detailed assessment of potential environmental effects of the Proposed Project is presented in Volume 2, Part B of the EAC Application/EIS.

2514	592 - 8	Rudi and Gillian Darling Kovanic	Bowen Island, BC	<p>In this age of rapid species disappearance and extinction across Canada and around our planet, can you imagine a more heartening and positive environmental story than the 'Great Howe Sound Recovery' and just 20 kilometers from Canada's the third largest city. For once, a positive story and in the backdoor 'play ground' to be enjoyed by Vancouver's 2.5 million people. Breath-taking!</p> <p>However, as we also witness daily, this recovery is still extremely fragile. Howe Sound remains largely unprotected and with no long term land use plan. Caught between many different political jurisdictions and impacted by rapidly rising ocean temperatures and acidification, the fragile ecosystem of Howe Sound remains at risk; with highly unusual and unprecedented marine occurrences like starfish wasting disease that continues to cause mysterious and dramatic die-offs along the Pacific coast from Mexico to Alaska including Howe Sound. Dr. Martin Haulena, veterinarian for the Vancouver Aquarium recently said, "This (wasting disease) is, if not THE, certainly one of the biggest wildlife die-offs that have ever been recorded, and we're not just talking marine die-offs." The summer of 2016 also saw a highly unusual and unprecedented explosion of phytoplankton causing the waters of Howe Sound (and Georgia Strait) to turn bright, almost florescent green. While the causes of these alarming phenomenon are still be investigated, scientists agree on the scale of the problem and say evidence points to rising ocean acidification.</p>	Thank you for this information. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2515	592 - 9	Rudi and Gillian Darling Kovanic	Bowen Island, BC	The impact of the noise, light and air pollution and the ugly scar of an open pit mine in one of the most beautiful fjords in the world and a BC landmark on the Sea to Sky corridor, will be immense.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCR noise bylaw was considered as part of the assessment.</p>

2516	592 - 10	Rudi and Gillian Darling Kovanic	Bowen Island, BC	The impact of the noise, light and air pollution and the ugly scar of an open pit mine in one of the most beautiful fjords in the world and a BC landmark on the Sea to Sky corridor, will be immense.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
2517	592 - 11	Rudi and Gillian Darling Kovanic	Bowen Island, BC	The impact of the noise, light and air pollution and the ugly scar of an open pit mine in one of the most beautiful fjords in the world and a BC landmark on the Sea to Sky corridor, will be immense.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>

2519	592 - 13	Rudi and Gillian Darling Kovanic	Bowen Island, BC	<p>It will damage BC's multi-billion dollar tourism industry, as well as having a negative impact on the recreational and commercial fishers, tourism operators, boaters, resident and recreational property owners and numerous children's camps with, literally thousands of campers each year that currently enjoy Howe Sound's ecosystem. There is a great potential in Howe Sound to continue to grow the tourism industry with significant economic multipliers that could accrue to the local economy. The area is used extensively by the movie and TV production sector for filming. Reindustrialization would put this at risk and, as taxpayers and residents, we are absolutely not prepared to take this risk.</p> <p>SUMMARY OF OBJECTIONS: 1. Why would anyone develop a gravel mine in Vancouver's ocean playground, an area of outstanding natural beauty? This is where an ever growing city comes to sail, dive, kayak, fish, camp and hike. Tourists flock from all over the world to see "SuperNatural, British Columbia", how would a gravel pit look in the tourism advertising?</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2520	592 - 14	Rudi and Gillian Darling Kovanic	Bowen Island, BC	<p>2. Howe Sound is only now showing encouraging signs of environmental recovery after decades of industrial misuse. Should we now allow a reindustrialization of the area?</p>	<p>It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. 2522	592 - 16	Rudi and Gillian Darling Kovanic	Bowen Island, BC	3. How can we consider developing a massive 77 hectare pit which will excavate the entire McNab estuary from one side of the valley to the other, completely eliminating one of only three river estuaries in Howe Sound, without developing an integrated, long term land and water use plan for the whole of Howe Sound?	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
2523	592 - 17	Rudi and Gillian Darling Kovanic	Bowen Island, BC	3. How can we consider developing a massive 77 hectare pit which will excavate the entire McNab estuary from one side of the valley to the other, completely eliminating one of only three river estuaries in Howe Sound, without developing an integrated, long term land and water use plan for the whole of Howe Sound?	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
2524	592 - 18	Rudi and Gillian Darling Kovanic	Bowen Island, BC	4. The size of the gravel pit will limit access to the foreshore for wildlife such as elk, deer and bears who currently frequent the area to forage for food.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

2525	592 - 19	Rudi and Gillian Darling Kovanic	Bowen Island, BC	5. The excavation of the river estuary will dramatically change the movement of water through the valley and have a significant negative impact on the freshwater habitat.	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>
2526	592 - 20	Rudi and Gillian Darling Kovanic	Bowen Island, BC	6. The proposed mine developer, Burnco, filed a judicial review application against DFO in BC Supreme Court to ‘strong arm’ the DFO to allow them to proceed to an environmental review. The DFO have since agreed to that review with serious concerns as “the project presents a high risk to Salmon and Salmon habitat”.	<p>Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO’s involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.</p> <p>Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.</p>
2527	592 - 21	Rudi and Gillian Darling Kovanic	Bowen Island, BC	7. In addition to the destruction to fish habitat, Burnco’s own consultants believe the mine site could be home to 21 species at risk including a population of Roosevelt Elk re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2528	592 - 22	Rudi and Gillian Darling Kovanic	Bowen Island, BC	8. The noise from the gravel crushing facility and loading of barges will be significant. It will have a negative impact on the enjoyment of the area by boaters, kayakers, fishermen, tourists and other in Howe Sound. The mine developer has stated at meetings that if the demand is there, they want to run the mining and crushing facilities 24/7, 365 days a year.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p>

2529	592 - 23	Rudi and Gillian Darling Kovanic	Bowen Island, BC	8. The noise from the gravel crushing facility and loading of barges will be significant. It will have a negative impact on the enjoyment of the area by boaters, kayakers, fishermen, tourists and other in Howe Sound. The mine developer has stated at meetings that if the demand is there, they want to run the mining and crushing facilities 24/7, 365 days a year.	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCR noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>
2530	592 - 24	Rudi and Gillian Darling Kovanic	Bowen Island, BC	9. Noise and light pollution will have significant negative impacts on the land and aquatic animals in the area. Noise and vibration pollution have been found to negatively impact the ability of marine mammals to communicate, navigate, find food and it is believed increasingly to impact their fertility.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response

2531	592 - 25	Rudi and Gillian Darling Kovanic	Bowen Island, BC	<p>9. Noise and light pollution will have significant negative impacts on the land and aquatic animals in the area. Noise and vibration pollution have been found to negatively impact the ability of marine mammals to communicate, navigate, find food and it is believed increasingly to impact their fertility.</p>	<p>A predictive noise model was developed for the Proposed Project as described in Volume 2, Section 9.2. The Type 7810 Predictor® (Predictor®) software was used to assess the potential noise effects associated with the Proposed Project as well as the effectiveness of potential noise controls.</p> <p>Effects to wildlife related to noise were estimated by overlaying the output of noise models with species-specific habitat suitability mapping and summarizing the change in habitat for VCs for which noise thresholds were defined in literature (i.e., amphibian species at risk, northern goshawk, western screech-owl, marbled murrelet, and common nighthawk). Noise thresholds beyond which habitat loss is expected are defined for each VC in Section 5.3.1.5.2 of Vol 2, Section 5.3.</p> <p>Due to the paucity of literature regarding noise thresholds for Roosevelt elk and grizzly bear, effects of noise and other sensory disturbance were measured using published zones of influence (ZOI). A ZOI represents the distance at which avoidance of certain anthropogenic disturbances has been observed.</p> <p>Noise will be managed during the construction and operational phases according to the Environmental Objectives and Best Management Practices for Aggregate Extraction in BC (BC MWLAP 2002). Noise mitigation measures are detailed in Volume 2, Part B - Section 9.2 and include:</p> <ul style="list-style-type: none"> <li>- Maintaining vegetation and trees around the active work areas to act as a noise buffer;</li> <li>- Reducing the height aggregate falls along conveyors and within the crushing facility;</li> <li>- Enclosing conveyors which will assist in reducing noise emissions;</li> <li>- Minimizing speed on roadways;</li> <li>- Operating equipment within specifications and maintaining level roads; and</li> <li>- Reducing idling time.</li> </ul>
2532	592 - 26	Rudi and Gillian Darling Kovanic	Bowen Island, BC	<p>9. Noise and light pollution will have significant negative impacts on the land and aquatic animals in the area. Noise and vibration pollution have been found to negatively impact the ability of marine mammals to communicate, navigate, find food and it is believed increasingly to impact their fertility.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

2533	592 - 27	Rudi and Gillian Darling Kovanic	Bowen Island, BC	10. The mine will have an impact on the economic potential of the Howe Sound area. There is considerable potential in Howe Sound to continue to grow the tourism industry with significant economic multipliers that would accrue to the local economy. A mine absolutely will not add to the beauty of the area but only severely detract.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
2534	592 - 28	Rudi and Gillian Darling Kovanic	Bowen Island, BC	The local residents of this area (and beyond) are committed to preserve the marine ecological viability and sustainability of our treasured Howe Sound.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2535	592 - 29	Rudi and Gillian Darling Kovanic	Bowen Island, BC	However, at this point, and for very justifiable reasons, we are extremely sceptical and disillusioned by the provincial and federal environmental review processes being applied provincially and federally. The environmental review process for another potentially hugely damaging re-industrialization project in Howe Sound, Woodfibre LNG, was the first to be approved after the 2015 election of the Trudeau Liberal government. Despite the new government's promises to revamp this process before putting such projects to the test, they used the extant, deeply flawed Harper Government environmental review process and gave the project the go-ahead. We, the public were not heard, thus giving democracy in our country a very black eye.	The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.  Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.

2536	592 - 30	Rudi and Gillian Darling Kovanic	Bowen Island, BC	The scientific research done (by the proponents themselves) for that project was deeply flawed as was the assessment of the actual fisheries values of Howe Sound.	<p>BURNCO engaged an independent and reputable team of qualified scientists and EA practitioners from Golder Associates Ltd. to conduct the required studies and prepare and environmental assessment for the Proposed Project. Golder is a global, employee-owned company with over 50 years of experience. They have over 400 BC-based staff involved in environmental assessment and related activities. All of Golder's work undergoes a high level of quality control and technical review. In addition, some of Golder's work for this project – specifically the groundwater modelling of the proposed mine plan – was subject to third-party technical review prior to being relied upon for the assessment.</p> <p>The qualifications and experience of the EA Project Team is presented in Section 2.1.1. of the EAC Application/EIS. Their work will be subject to further technical review through the ongoing EA review process.</p> <p>Many of the studies undertaken and changes made to the Proposed Project were a direct result of our consultants findings and recommendations.</p> <p>BURNCO is a 104-year old company that has built a reputation as a responsible resource developer. We depend upon independent assessments such as those conducted for the EA to help ensure we protect our reputation and don't put our business at risk.</p>
2537	592 - 31	Rudi and Gillian Darling Kovanic	Bowen Island, BC	Also the public comments received for that project were the highest number of public submissions for any project in the history of Canada and over 94% of these submissions were opposed to the project. Absolutely no social license was granted for that industrial project for Howe Sound by the vast majority of the 12,000 residents who live here, exposing a ugly tear in our democratic process.	<p>The Proposed Project was thoughtfully designed to be environmentally responsible, sensitive to the environment of the proposed site while making use of existing conditions. Since the initial design, the project has changed considerably. Revisions and refinements have been made in response to our Project Team's feedback and to comments and concerns raised by regulatory agencies, Aboriginal Groups and the public.</p> <p>A few examples of project considerations, and subsequent changes and components designed to address feedback received to date include:</p> <ul style="list-style-type: none"> <li>- The project life has been reduced from 20-30 years to 16 years, and the maximum depth of excavation has been reduced from 55 metres to 35 metres;</li> <li>- There are no proposed discharges to, or withdrawals from, McNab Creek;</li> <li>- Using existing BC Hydro lines to electrically powered equipment to extract, process and load the aggregate resource to limit exhaust emissions from the burning of fossil fuels;</li> <li>- Reduced the size of the pit lake as the northern edge has been moved away from the McNab Creek Flood Protection Dyke.</li> <li>- Pit lake designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. The elevation of the pit lake will also be used to manage base flows in the natural groundwater watercourses below the pit lake.</li> <li>- Revised the size and location of the processing area to avoid identified fish habitat and to mitigate potential noise effects.</li> <li>- Revised stockpile location and design to limit potential operational noise effects.</li> <li>- Refined berm design and location to limit potential noise and air quality effects.</li> <li>- Areas progressively reclaimed during the operational phase will be re-vegetated to control erosion.</li> <li>- Maintained tree buffer on foreshore to limit noise effects, dust emissions, and visual effects.</li> <li>- Replaced wash water sedimentation ponds and associated discharges with a 95% efficient wash plant that uses recycled water from two large storage tanks. The 5% loss (via retention, evaporation and absorption) will be supplemented with make-up water from a ground water well. No wash water will be discharged.</li> <li>- Fines generated from the crushing, screening, washing of material will be extracted from the wash water and mechanically dried and compressed into sediment cakes which will be used in progressive reclamation of the onsite fines disposal area.</li> <li>- Covered or enclosed Project components and/or operating under wet conditions (e.g., fine water spray) to reduced potential</li> </ul>

2538	592 - 32	Rudi and Gillian Darling Kovanic	Bowen Island, BC	This project has previously been turned down twice for consideration by the Province of BC.	Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO's involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.  Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.
2539	592 - 33	Rudi and Gillian Darling Kovanic	Bowen Island, BC	And now with threats from climate change and its impact upon our ecosystem, it's even less appropriate and justifiable.	A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS. Potential effects considered were changes in GHG emissions as a result of the Project, the Project's contribution to climate change through the emission of GHG's, and how potential changes in climate will affect project-related infrastructure.  Proposed mitigation includes the use of electricity instead of fossil fuels, routine maintenance of vehicles, and minimizing idling of vehicles and tugs. Mitigation measures that will reduce GHG emissions are consistent with specific actions within the Seas-to-Sky Air Quality Management Plan.  Following the application of proposed mitigation, the contribution of the proposed Project GHG emissions to provincial, federal and global totals were determined to be negligible.
2540	592 - 34	Rudi and Gillian Darling Kovanic	Bowen Island, BC	For this reason we are requesting that the Canadian Environmental Assessment Agency and the BC Environmental Assessment office fulfill their mandate as true environmental assessors and turn down this unacceptable open pit gravel mine proposal for McNab Creek, Howe Sound. A NO decision will go a long way to restoring our faith in the review process and our government agencies. Thank you for your attention to this critical issue.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2541	593 - 1	Alison Fischer	Lions Bay, BC	Please see the following list below for issues that should be seriously addressed seriously before this project proceeds.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2542	593 - 2	Alison Fischer	Lions Bay, BC	1. The gravel quarry would be hard on 21 species officially at risk - including Coastal Cutthroat Trout, and Roosevelt elk, which were re-introduced some years ago and are valued by hunters.	Potential effects of the Proposed Project have been assessed for selected valued environmental components to address key issues related to fish and fish habitat, marine resources, terrestrial wildlife and vegetation, geotechnical and natural hazards, water resources, air quality and climate change.  The assessment concludes that, with the application of design considerations and identified mitigation, no significant adverse environmental effects will result from the Proposed Project.  A detailed assessment of potential environmental effects of the Proposed Project is presented in Volume 2, Part B of the EAC Application/EIS.

2543	593 - 3	Alison Fischer	Lions Bay, BC	<p>2. Fish/fish habitat:</p> <p>a) The project's potential to cause serious harm to fish and fish habitat, due to changing hydrological patterns that would:</p> <ul style="list-style-type: none"> <li>-Affect the water and salinity levels in McNab Creek, As they dig down to remove gravel, the fresh water from the estuary will be siphoned into the pit, which will change the salinity of McNab Creek and impact the salmon runs.</li> <li>-Lead to salt water seeping into the estuary ground water – which would kill the plants there.</li> </ul>	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>
2544	593 - 4	Alison Fischer	Lions Bay, BC	<p>2. Fish/fish habitat:</p> <p>a) The project's potential to cause serious harm to fish and fish habitat, due to changing hydrological patterns that would:</p> <ul style="list-style-type: none"> <li>-Affect the water and salinity levels in McNab Creek, As they dig down to remove gravel, the fresh water from the estuary will be siphoned into the pit, which will change the salinity of McNab Creek and impact the salmon runs.</li> <li>-Lead to salt water seeping into the estuary ground water – which would kill the plants there.</li> </ul>	<p>The hydraulic conductivity of the valley sediments is much higher than hydraulic conductivity of any bedrock structures, if they exist. Therefore, the groundwater flow in the valley sediments will dominate and it will provide key control on the position of the salt water-freshwater interface. Furthermore, because of topographic highs that surround the valley, the hydraulic heads are expected to be higher than in the valley sediments, inhibiting saltwater ingress. As presented in Section 3.3 in Appendix 5.6-A of the EAC Application/EIS, based on monitoring data (2010-2014), tidal elevations exceeded groundwater elevation only in rare occasions between July and September of each monitoring year. During these high tide intervals, there is an inferred landward gradient in the immediate vicinity of the shoreline; however, its duration is inherently less than the corresponding periods of southwards gradient associated with lower tidal position. Accordingly, the net groundwater flow direction during the entire monitoring period is confirmed to be southwards toward the marine foreshore. Moreover, monitoring data indicate that the saltwater wedge could be located at greater depths than approximately -30 m elevation; analytical calculations based on methodology presented in Domenico and Schwartz (1990) showed that, due to relatively high groundwater flow in the alluvial sediments, the saltwater edge could be depressed to the depth of the overburden/bedrock contact within 50 m to 150 m of the ocean shore. Based on these observations, the potential presence of a fault structure in bedrock in the vicinity of the project area is not considered to influence groundwater flow direction in the valley sediments or increase the risk of saltwater intrusion.</p>

2545	593 - 5	Alison Fischer	Lions Bay, BC	<p>2. Fish/fish habitat:</p> <p>a) The project's potential to cause serious harm to fish and fish habitat, due to changing hydrological patterns that would:</p> <ul style="list-style-type: none"> <li>-Affect the water and salinity levels in McNab Creek, As they dig down to remove gravel, the fresh water from the estuary will be siphoned into the pit, which will change the salinity of McNab Creek and impact the salmon runs.</li> <li>-Lead to salt water seeping into the estuary ground water – which would kill the plants there.</li> </ul>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
2546	593 - 6	Alison Fischer	Lions Bay, BC	<p>b) DFO is very worried about the fish and fish habitat in McNab Creek, particularly chum and coho salmon. The Vancouver Aquarium is concerned re the salmon, and re rockfish at the estuary mouth.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2547	593 - 7	Alison Fischer	Lions Bay, BC	<p>c) The planned artificial salmon spawning channel would do nothing to compensate for the damage to fish and fish habitat in the McNab estuary.</p>	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m<sup>2</sup> of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>
2548	593 - 8	Alison Fischer	Lions Bay, BC	<p>3. The effects of wet mining (digging the gravel out of water, where the estuary forest used to be): Burnco's argument that there won't be dust because they're mining "wet" is also misleading because the dust just becomes silt. The silt will kill the plant and animal life in the estuary.</p>	<p>Wash water will be processed for removal of fines and silt in a 95% efficient wash plant to be fed using recycled water from two large storage tanks. Fines will not be discharged to the estuary; they will be deposited in a designated inland fines area and covered in accordance with an approved Reclamation and Effective Closure Plan.</p>

2549	593 - 9	Alison Fischer	Lions Bay, BC	4. The project will cause dust, noise and light pollution (both on land and at sea – on the dock) for wildlife, local residents and also for recreational users of the area.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
2550	593 - 10	Alison Fischer	Lions Bay, BC	4. The project will cause dust, noise and light pollution (both on land and at sea – on the dock) for wildlife, local residents and also for recreational users of the area.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCR noise bylaw was considered as part of the assessment.</p>
2551	593 - 11	Alison Fischer	Lions Bay, BC	4. The project will cause dust, noise and light pollution (both on land and at sea – on the dock) for wildlife, local residents and also for recreational users of the area.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

2552	593 - 12	Alison Fischer	Lions Bay, BC	4. The project will cause dust, noise and light pollution (both on land and at sea – on the dock) for wildlife, local residents and also for recreational users of the area.	<p>A predictive noise model was developed for the Proposed Project as described in Volume 2, Section 9.2. The Type 7810 Predictor® (Predictor®) software was used to assess the potential noise effects associated with the Proposed Project as well as the effectiveness of potential noise controls.</p> <p>Effects to wildlife related to noise were estimated by overlaying the output of noise models with species-specific habitat suitability mapping and summarizing the change in habitat for VCs for which noise thresholds were defined in literature (i.e., amphibian species at risk, northern goshawk, western screech-owl, marbled murrelet, and common nighthawk). Noise thresholds beyond which habitat loss is expected are defined for each VC in Section 5.3.1.5.2 of Vol 2, Section 5.3.</p> <p>Due to the paucity of literature regarding noise thresholds for Roosevelt elk and grizzly bear, effects of noise and other sensory disturbance were measured using published zones of influence (ZOI). A ZOI represents the distance at which avoidance of certain anthropogenic disturbances has been observed.</p> <p>Noise will be managed during the construction and operational phases according to the Environmental Objectives and Best Management Practices for Aggregate Extraction in BC (BC MWLAP 2002). Noise mitigation measures are detailed in Volume 2, Part B - Section 9.2 and include:</p> <ul style="list-style-type: none"> <li>- Maintaining vegetation and trees around the active work areas to act as a noise buffer;</li> <li>- Reducing the height aggregate falls along conveyors and within the crushing facility;</li> <li>- Enclosing conveyors which will assist in reducing noise emissions;</li> <li>- Minimizing speed on roadways;</li> <li>- Operating equipment within specifications and maintaining level roads; and</li> <li>- Reducing idling time.</li> </ul>
2553	593 - 13	Alison Fischer	Lions Bay, BC	4. The project will cause dust, noise and light pollution (both on land and at sea – on the dock) for wildlife, local residents and also for recreational users of the area.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

2554	593 - 14	Alison Fischer	Lions Bay, BC	4. The project will cause dust, noise and light pollution (both on land and at sea – on the dock) for wildlife, local residents and also for recreational users of the area.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2555	593 - 15	Alison Fischer	Lions Bay, BC	4. The project will cause dust, noise and light pollution (both on land and at sea – on the dock) for wildlife, local residents and also for recreational users of the area.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2556	593 - 16	Alison Fischer	Lions Bay, BC	5. Would require SLRD to rezone this land, moving this land into industrial zoning forever.	<p>The proposed Project lies within Electoral Area F of the Sunshine Coast Regional District. While there are three OCPs in Electoral Area F, none of them overlap with the local study area (LSA). Regional zoning for the LSA is discussed in Volume 2, Part B, Section 6 of the EAC Application/EIS.</p> <p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>

2561	595 - 3	Nancy Wigen	Not Stated	<p>Millions of dollars and much dedicated work has been invested in the recovery of Howe Sound from damage caused by past industrialization. The expensive Sea to Sky highway makes the beauty of Howe Sound known to visitors from around the world, as well as all of us. Now that whales, orcas, dolphins, herring and many other fish and animals have returned to these waters it seems very regressive to allow a return to destructive industrial use.</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

2566	595 - 8	Nancy Wigen	Not Stated	The value of Howe Sound for recreation, tourism, and environmental enjoyment by the ever increasing population in the area would outweigh the 12 jobs and cheap gravel with its constant noise and light pollution day and night 365 days a year for the next 16 or more years. Really ! Please save Howe Sound from this destructive open pit gravel mine.	The Proposed Project is to extract approximately 20 million tonnes of sand and gravel over the 16 year life of the Proposed Project. This will be reflected in an approved EA certificate and mine plan.
2567	596 - 1	McNab Strata Community	McNab Creek, BC	As Chairperson of The McNab Strata Community, adjacent to the Burnco Lands, we continue to have outstanding questions and concerns of Burnco's gravel mining proposal. Many of our community members attended the recent information sessions in Squamish, Gibsons , and West Vancouver. We have had many meetings with Burnco since their first project proposal eight years ago. Our community has been cooperative and engaging with Burnco and their consultants ( Golder ) on conducting studies.	BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.
2568	596 - 2	McNab Strata Community	McNab Creek, BC	It is important to clarify, from our perspective, statements made in the EIS:  - Properties at McNab should not be referred to as "seasonal". Due to the temperate BC Climate, property owners occupy their homes at different times throughout the year, including the winter months. Many of the residents over the years have considered McNab as their principal residence, and we anticipate this to continue.	Acknowledged. We have not intended to refer to the McNab Strata as seasonal residences. For the purposed of the effects assessment, they have been considered the closest community to the proposed Project site.
2569	596 - 3	McNab Strata Community	McNab Creek, BC	It is important to clarify, from our perspective, statements made in the EIS:  - The last study date indicates that one generator was in use by a McNab resident. Our community does not rely on generators for our electrical power and those that have them do not use them regularly. Solar and battery banks are more representative of our energy use.	In the baseline report (Appendix 9.2-A) the following statement was made regarding generators "Likewise, the baseline noise levels at the Community are also likely influenced by noise from temporary power generators and human activities, whereas the baseline noise levels at NR1 are not." No other mention of generators was made within the report. Baseline noise measurements at the Community were taken over a four day period to determine the baseline noise at this receptor.

	Ref #	Commenter (Name)	Location		
2570	596 - 4	McNab Strata Community	McNab Creek, BC	Noise - Peace and quiet is highly valued by our community. We believe the noise baseline studies are not representative of the local and regional study areas.	<p>In BC, there are no provincial noise requirements or standard methods for completing baseline noise surveys or environmental noise assessments for gravel load-out facilities like the Project. In the absence of formal guidance, the environmental noise from the Project was assessed in accordance with noise regulations specified by the BC Oil and Gas Commission (the Commission) in the document British Columbia Noise Control Best Practices Guideline (Commission 2009). The Guideline is only strictly applicable to oil and gas facilities, but is assumed to represent best practices for treatment of environmental noise from all industrial facilities in BC. Additional guidance for conducting the noise baseline study and processing the data was obtained from the Alberta Energy Resources Conservation Board (ERCB) document Directive 038: Noise Control (EUB 2007). In many ways Directive 038 is similar to the Guideline, but Directive 038 provides more details on appropriate methods for conducting field measurements than are available in the Guideline. Further guidance on the processing of noise baseline data was taken from the Health Canada document Useful Information for Environmental Assessments (Health Canada 2010).</p> <p>Noise measurements at the Strata were performed on both October 15-16 and October 26-28, 2013; one monitoring period had active logging and the other did not. Directive 038 requires three hours of valid monitoring data for the monitoring result to be deemed valid. The valid monitoring duration far exceeded this minimum duration and is therefore considered valid by Direction 038. The nighttime period results of the two measurements, when monitoring would not impact the measurements, were within 1 dBA of each other (see Table 9.2-9 in Section 9.2 of the EAC Application/EIS), which is within the error of the monitoring equipment.</p>
2571	596 - 5	McNab Strata Community	McNab Creek, BC	Noise - At a recent meeting with Burnco our strata council had, they are saying that the average noise is anticipated to be an average of 45 decibels, but at the information sessions, we are told different numbers.	Average noise levels are not presented in the EAC Application/EIS. Average noise levels are only discussed in terms of baseline noise levels.
2572	596 - 6	McNab Strata Community	McNab Creek, BC	Noise - Are both study dates conducted in our community representative of Alberta's directive 38 guidelines, such as being conducted during summertime conditions? Both studies were performed during autumn, where creek flows are historically higher.	Baseline monitoring program was conducted at four receptors, NR1 – NR4 during the summer months. The baseline monitoring at the Community (e.g., NR5) was conducted during October to capture on-going logging activities in the area.
2573	596 - 7	McNab Strata Community	McNab Creek, BC	Noise - Do the guidelines and the Oil and Gas Commission account for noise during the construction period of between 4 months and 2 years?	<p>The noise assessment presented in the EAC Application/EIS assessed the potential effects of noise throughout the construction (2 years), operation (16 years) and reclamation and closure phases. The British Columbia Noise Control Best Practices Guideline (Commission 2009), the Alberta Energy Resources Conservation Board (ERCB) document Directive 038: Noise Control (EUB 2007) and guidance on the processing of noise baseline data in the Health Canada document Useful Information for Environmental Assessments (Health Canada 2010) were used in the assessment.</p> <p>As discussion in Section 9.2.2.1 of the EAC Application/EIS, the Commission Guideline does not provide noise limits for construction. They provide recommendations for mitigation measures to reduce construction noise, which are outlined in Section 9.2.5.3. Health Canada provides criteria for assessing construction noise depending on the anticipated length of construction. As discussed in Section 9.2.2.2, on the grounds of conservatism, it was assumed all construction phases would last longer than one year and therefore were subject to the same criteria as operations.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2574	596 - 8	McNab Strata Community	McNab Creek, BC	Noise - This project is in BC and so why are there no regulations applicable to operating next to a residential community? The BC building code requires sound proofing between residential units up to a certain decibel. The same should apply here.	In the absence of formal guidance, the environmental noise from the Project was assessed in accordance with noise regulations specified by the BC Oil and Gas Commission in the document British Columbia Noise Control Best Practices Guideline, by Health Canada in Useful Information for Environmental Assessments, and the Sunshine Coast Regional District Noise Control Bylaw No. 597, 2008. Operations will be restricted to 7 AM to 9 PM, consistent with the SCR D Noise Control Bylaw section regarding Machine Noise. The BC building code that requires sound proofing between attached residential and commercial units do not apply to the Proposed Project.
2575	596 - 9	McNab Strata Community	McNab Creek, BC	Noise - The noise assumption that logging 1.2 kilometers from the McNab Strata community receptor would continue throughout the lifetime of mining operations. The assumptions do not detail the exact types of equipment in use 1.2 kilometres away and it assumes logging is continuous which is not the case.	The baseline monitoring at the Community (e.g., NR5) was conducted during October to capture logging and non-logging monitoring data. The exact equipment that was being used during the logging activities is unknown but is assumed to be consistent with the type of logging equipment that will continue to be used throughout the Proposed Project.
2576	596 - 10	McNab Strata Community	McNab Creek, BC	Noise - Summertime creek flow conditions are not representative of actual baseline noise in the LSA, and cumulatively during the lifetime of the mine.	The Commission Guideline and Directive 038 specify that the assessment should be conducted under summertime conditions.
2577	596 - 11	McNab Strata Community	McNab Creek, BC	Noise - Are the wind conditions representative of the average annual conditions?	Directive 038 specifies that baseline noise monitoring should only be conducted when wind speeds are less than 15 km/h. As discussed in Section 9.2.4.3.2.1 of the EAC Application/EIS, weather data were collected using Kestrel 4500 pocket weather meters during the noise monitoring, set-up near the noise monitoring sites. The weather meters recorded wind speed and direction, temperature, and relative humidity data every five minutes. Data from the weather meters were used as required by Directive 038 for the interpretation of the logged noise data. When wind speeds were higher than this limit or when wind noise was audible in the sound recording, noise data were considered to be invalid such that wind did not increase the baseline noise levels.

	Ref #	Commenter (Name)	Location		
2578	596 - 12	McNab Strata Community	McNab Creek, BC	Noise - We do not consider the natural ambient sounds of bird calls and creek flows the same as equipment noise.	<p>In the absence of relevant existing or approved industrial facilities, the Commission Guideline mandates the use of specific Ambient Specific Levels (ASL) values to represent Baseline Case noise levels. The Commission Guideline discusses the use of an Ambient Monitoring Adjustment (Section 2.3.4 of the Guideline), when the ASL's are not thought to be representative of the actual sound environment. The only two cases where it may be necessary to consider an ambient monitoring adjustment are:</p> <ul style="list-style-type: none"> <li>■ Areas considered to be pristine; and</li> <li>■ Areas with non-energy industrial activity that would influence the background noise levels.</li> </ul> <p>The Commission Guideline defines a pristine area as: "A pure, natural area that might have a dwelling but no industrial presence, including energy, agricultural, forestry, manufacturing, recreational, or other industries that already impact the noise environment."</p> <p>McNab Creek is not considered to be a pristine because there is a known industrial presence activity (i.e. logging), as well as known recreation use of the area (e.g., boating, hunting). There is also a run-of-river power project in close proximity.</p> <p>Although there is industrial activity in the area, it does not cause the baseline noise levels to exceed the Commission Guideline ASL's, and therefore the ambient monitoring correction is not used. As such, for the noise assessment based on the Commission Guideline, Baseline Case noise levels at relevant receptors were established based on the ASL values specified in the Commission Guideline.</p> <p>The HC Guidance indicates that Baseline Case noise levels should be established through field measurements. As such, for the noise assessment based on the HC Guidance, the Baseline Case noise levels at relevant receptors were established based on field measurements conducted in the summer of 2012 and fall of 2013 at five representative receptors within the LSA and RSA. Noise from birds, insects, and other animal activities very near the monitoring location was considered not representative of normal conditions at the monitoring locations and was removed as recommended in Directive 038. Other sources not considered representative of normal conditions were: technician activities, vehicular traffic near the monitoring location, airplane flyovers, rain, and thunder.</p>
2579	596 - 13	McNab Strata Community	McNab Creek, BC	Noise - On the two occasions of baseline studies in question, I was present at the community receptor between residents 5-10, and am not confident that the monitoring equipment was placed in the recommended location( i.e., 10 metres from a building or sloped bank). Has the proposed clamshell dredger with grisly crusher and its associated processing equipment been factored into the noise studies?	<p>Yes. The Clamshell Dredge and Grizzly Screen were considered in the noise assessment. The noise associated with these two pieces of equipment are presented in Table 9.2-39 of Section 9.2 of the EAC Application/EIS.</p> <p>Directive 038 specifies that the distance requirement to the nearest building may be altered if it is physically impossible or acoustically illogical. The meter was placed in an appropriate position based on the surrounding conditions and topography.</p>

	Ref #	Commenter (Name)	Location		
2580	596 - 14	McNab Strata Community	McNab Creek, BC	Noise - Why are vibrations and low frequency noises not studied? Are studies on the proposed vibrating conveyor being assessed?	<p>Based on Directive 038, potential Low Frequency Noise issues associated with the Proposed Project operation were assessed as presented in Section 9.2.5.2.2.2.2 of the EAC Application/EIS.</p> <p>Several aspects of the conveyor system required for the Proposed Project were included in the noise assessment, these are Conveyor System in Clamshell Dredge Operation, Conveyor System in Crush Plant, Conveyor System in Wash Plant, Conveyor System in Barge Loading Area, Conveyor Motors in Clamshell Dredge Operation, Conveyor Motors in Crush Plant, Conveyor Motors in Wash Plant, and Conveyor Motors in Barge Loading Area. The noise associated with these pieces of equipment are presented in Table 9.2-39 of Section 9.2 of the EAC Application/EIS.</p> <p>The Project will not be a significant source of vibration due to the nature of the on-site sources and therefore a full assessment was not included.</p>
2581	596 - 15	McNab Strata Community	McNab Creek, BC	Noise - We are told there will be only 1 wheel loader in the processing area where there is a possibility of using strobe lights, rather than a back-up alarm. Does best management practices allow these options?	Broadband alarms and strobe lights will be used during operations to reduce environmental annoyance.
2582	596 - 16	McNab Strata Community	McNab Creek, BC	Noise - We understand there is a substantial increase of noise, but why are the effects predicted to be negligible or not significant to our rural community? Does this mean there are no potential noise effects on our community, the LSA and the RSA?	<p>The significance of noise effects were considered negligible-not significant if they satisfied the following requirements (presented in Table 9.2-7 of the EAC application/EIS):</p> <ul style="list-style-type: none"> <li>- Had a negligible magnitude based on the worst-case of the Commission Guideline and HC Guidance noise assessment.</li> <li>- Had a low magnitude, was considered local in extent with a short or medium term duration.</li> <li>- Had a low magnitude, was considered regional or beyond regional in extent with a short-term duration.</li> </ul> <p>As all potential noise effect were considered to be of negligible magnitude (e.g., did not exceed the established Commission Guideline and HC Guidance), all residual effects were considered negligible-not significant.</p>
2583	596 - 17	McNab Strata Community	McNab Creek, BC	Noise - We believe more studies are needed, with complete information, sharing the actual baselines of the Local and Regional Study areas.	<p>A comprehensive baseline report is provided in Appendix 9.2-A. The baseline is consistent with guidance provided in the British Columbia Noise Control Best Practices Guideline (Commission 2009), the Alberta Energy Resources Conservation Board (ERCB) document Directive 038: Noise Control (EUB 2007) and guidance on the processing of noise baseline data in the Health Canada document Useful Information for Environmental Assessments (Health Canada 2010).</p> <p>BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. BURNCO will also develop a project-specific website that will be maintained to keep stakeholders informed regarding the Project, including project schedule, construction activities, operating information, and noise and air quality monitoring data.</p>
2584	596 - 18	McNab Strata Community	McNab Creek, BC	Operating Hours: In the application it states "work hours up to 14 hours a day, and will commit to abide to the Sunshine Coast Regional District 'Noise Bylaw' 7am-9pm." Burnco's operations manager said they are basing operations on four ten hour shifts per week. If the operations are being planned on this number of shifts then why don't the work hours reflect this? We don't trust the hours of operation.	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>

	Ref #	Commenter (Name)	Location		
2585	596 - 19	McNab Strata Community	McNab Creek, BC	Future Use of the Property - There is potential of Burnco applying for an addendum to this application of alternate areas to mine within the Burnco Lands. We are concerned the mine will continue to be in operation beyond the 20 year period of this application.	The Proposed Project is to extract approximately 20 million tonnes of sand and gravel over the 16 year life of the Proposed Project. This will be reflected in an approved EA certificate and mine plan.
2586	596 - 20	McNab Strata Community	McNab Creek, BC	Visual - We are concerned about the visual impacts changing with the future use of our common property. To state that only 6 residents will be able to view the barge loading facility and buildings on the foreshore is simply not true. Depictions of other light sources are not adequately addressed, and at least 10 of the 14 current dwellings do not look directly at the Port Mellon pulp mill. More information is needed since there may be more residential dwellings in the future. The visual baseline studies are not representative of our community. Possible safety and security lighting on pit lake and processing area, stockpiles size changing as mitigation for noise. If the stockpiles are changing in size, how effective are those to minimize noise? Our common property if logged and trees falling along McNab creek and berm/dykes will enable more visual of mine site.	<p>The visual resources assessment (Section 7.4 of the EAC Application/EIS) acknowledges that the residents of the McNab would be most affected by the potential visual impacts due to their close proximity to the Proposed Project. The viewpoint was taken from the end of the breakwater where the view would be unobstructed, and it is a publically accessible location that would be experienced by residents accessing the dock at the McNab Estates Strata. The lighting assessment indicated residential receptors at the Strata are located in a dark setting with existing lighting visible from adjacent industrial land use. Assessment of viewing locations and/or viewing conditions are limited to those locations that represent viewing opportunities that currently exist or that are certain or reasonably foreseeable.</p> <p>The Proposed Project will be in operations 8 to 10 hrs./day, 260 days/year (i.e., 5 days/week). All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. No operational lighting of the pit lake or processing area is proposed. Lighting will be limited to what is required for worker safety, site security and navigation. Mitigation of light effects includes the use of fixtures that reduce light 'spillage' beyond the direct area of illumination. The proposed heights of stockpiles of processed material are presented in Table 2-11 as assessed in the EAC Application/EIS.</p> <p>Assessment of viewing locations and/or viewing conditions are limited to those locations that represent viewing opportunities that currently exist or that are certain or reasonably foreseeable.</p>

	Ref #	Commenter (Name)	Location		
2587	596 - 21	McNab Strata Community	McNab Creek, BC	<p>Flooding: We are concerned about our domestic water quality and quantity should there be any flooding due to increased volumes of water flows down the creek due to those diversions. More studies should be conducted to consider the potential for erosion due to increasing water volumes factoring in changes in the future due to climate change. Can the dykes proposed be effective, and will they divert more water during storm events toward our community? Throughout operations and after closure, will the groundwater table change and affect our community's health and wellbeing?</p>	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines. Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p> <p>A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken. Adaptive management techniques to be implemented as required include:</p> <ul style="list-style-type: none"> <li>- Continue to evaluate the extent of the pit during operations.</li> <li>- During the wet season, if water levels in the pit lake become higher than has been designed for the Pit Lake Containment Berm then the valves in the culverts will be closed to reduce the amount of water reporting to the pit from the surface water on the western slope.</li> <li>- The height of the pit lake at the outlet structure can be adjusted to increase or decrease the level of the pit lake (e.g., adding or lowering stop logs) at closure to maintain the hydraulic gradient between McNab Creek and the Project Area following closure.</li> </ul>
2588	596 - 22	McNab Strata Community	McNab Creek, BC	<p>Marine Resources: Has there been adequate studies conducted outside the proposed project footprint and adjoining intertidal areas to consider if marine resources will be adversely affected?</p>	<p>A detailed assessment of potential marine resource effects of the Proposed Project is presented in Volume 2, Part B – 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

	Ref #	Commenter (Name)	Location		
2589	596 - 23	McNab Strata Community	McNab Creek, BC	Is it in the best interests of Burnco to create a new habitat fisheries compensation channel on the estuary in return for displacing a functioning and productive one in the centre of the project area?	<p>The proposed Project will lead to the loss of approximately 200 m<sup>2</sup> of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. The proposed design for the channel extension uses the existing lower channel as a template and it will meet the factors and criteria that are generally accepted for the construction of a functional groundwater-fed spawning channel. It should provide conditions similar to the existing run habitat in the lower section of WC2 that was designed as chum spawning habitat by DFO and where spawning activity was observed during the November 2016 survey.</p> <p>The creation of the pit lake is predicted to cause a doubling of groundwater influx into the lower section of WC2. The increase in ground water influx will lead to additional groundwater upwelling and the increased upwelling is expected to provide increased levels of intergravel flow that will be suitable for eggs and alevins. The average depth in the proposed offset habitat extension and the remaining section of WC2 is predicted to be above 0.3 m making it suitable for salmon spawning. As described in the Aquatic Health assessment provided in Surface Water Resources (Section 5.5.7.2), the water quality and temperature of ground and surface water entering the offset habitat and existing lower section of WC2 will be suitable for salmonids to complete all stages of their life history including spawning.</p> <p>In response to comments from the Technical Working Group, the design of the habitat offset plan was revised to allow approximately 20 m of pool habitat upstream of the culvert and approximately 20 m of gravel bed run habitat downstream of the culvert to be retained which will avoid approximately 232 m<sup>2</sup> of habitat loss. The design of the channel extension incorporates run and pool habitat in approximately a 1 : 1 ratio, based on this design and the use of run habitat for spawning in the existing lower channel it is expected that more than 2, 000 m<sup>2</sup> of the offset channel habitat will provide conditions suitable for salmonid spawning.</p>
2590	596 - 24	McNab Strata Community	McNab Creek, BC	Will Harlequin Creek on the west side of the valley be negatively affected by construction, operations, and reclamation?	<p>Potential effects to Harlequin Creek as a result of the Proposed Project were assessed in the EAC Application/EIS. The potential effects to fish in Harlequin Creek assessed included increases in suspended sediments and artificial lighting (provided in Section 5.2.5.2 of the EAC Application/EIS). With the application of known and effective mitigation (i.e., in-water works during fisheries work windows, environmental monitoring by a qualified Environmental Monitor (EM), and implementation of a Construction Environmental Management Plan (CEMP)), the significance of these residual effects were considered to be negligible – not significant.</p>

2591	596 - 25	McNab Strata Community	McNab Creek, BC	We are concerned about increased wake from Burnco boat traffic causing damage to our breakwater and dock. Speed must be regulated and monitored. Cumulative impacts of increased boat traffic especially during construction need to be accounted for.	<p>The matter of Proposed Project associated wake effects on the shoreline and other vessels was considered in Vol. 2 Section 7.2 Marine Transportation. Vessel Wake and Marine Navigation were the identified VCs for marine transportation. Potential effects to recreational and tourism are provided in Volume 2, Part B - Section 7.3. A vessel wake wash analysis was undertaken for the Proposed Project environmental assessment and is presented in Appendix 7.2-A. Wave intensity based on vessel characteristics was a measureable indicator used in the environmental assessment.</p> <p>Wake wash associated with BURNCO vessel traffic is anticipated to be relatively minor. Wake wash energy from BURNCO associated tug and barge movements is anticipated to be less than 1% when compared to the total energy from naturally occurring wind waves along both routes.</p> <p>As described in Part E of the Application, mitigation measures to ensure vessel safety will include, but not be limited to the following:</p> <ul style="list-style-type: none"> <li>- Marking the marine waters of the Project construction zone with appropriate lighting, buoys and signage; and</li> <li>- Providing the appropriate notice to mariners and notices to shipping.</li> </ul> <p>The following additional measures will also be included in the Marine Transport Management Plan prepared by BURNCO:</p> <ul style="list-style-type: none"> <li>- Maintaining radio watch;</li> <li>- Timing of work; and</li> <li>- Providing tug assist services.</li> </ul> <p>BURNCO is committed to providing additional mitigation measures to ensure the safety of other mariners as put forth in the Navigation Protection Act review report issued by Transport Canada.</p>
2592	596 - 26	McNab Strata Community	McNab Creek, BC	Cumulative Impacts: We do not believe the studies reflect the total cumulative impact of dust from conveyor and operations. During the summertime dry season, we are especially concerned about dust and the increased trucking during reclamation and ongoing logging operations.	Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for air quality indicators (increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual) - See Section 5.7.5.7). All potential cumulative residual effects were determined to be negligible or not significant.
2593	596 - 27	McNab Strata Community	McNab Creek, BC	Fish and Wildlife Concerns: We are concerned that the permanent loss of small rearing pools in McNab due to increased flows during operations could result in a permanent loss of habitat. This mine removes productive land that sustains life forever and restricts wildlife corridors to the estuary. Just the other day our neighbour saw a black bear by the mouth of McNab Creek looking for fish. Black bears were not studied and yet they rely on access to wild fish for food and they are an important part of our ecosystem. We are concerned that important species at risk are missing from the studies, such as wild trumpeter swans we have recently seen on the estuary on their migrating routes?	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

2594	596 - 28	McNab Strata Community	McNab Creek, BC	<p>Fish and Wildlife Concerns: We are concerned that the permanent loss of small rearing pools in McNab due to increased flows during operations could result in a permanent loss of habitat. This mine removes productive land that sustains life forever and restricts wildlife corridors to the estuary. Just the other day our neighbour saw a black bear by the mouth of McNab Creek looking for fish. Black bears were not studied and yet they rely on access to wild fish for food and they are an important part of our ecosystem. We are concerned that important species at risk are missing from the studies, such as wild trumpeter swans we have recently seen on the estuary on their migrating routes?</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
2595	596 - 29	McNab Strata Community	McNab Creek, BC	<p>Fish and Wildlife Concerns: We are concerned that the permanent loss of small rearing pools in McNab due to increased flows during operations could result in a permanent loss of habitat. 2596	596 - 30	McNab Strata Community	McNab Creek, BC	Fish and Wildlife Concerns: We are concerned that the permanent loss of small rearing pools in McNab due to increased flows during operations could result in a permanent loss of habitat. This mine removes productive land that sustains life forever and restricts wildlife corridors to the estuary. Just the other day our neighbour saw a black bear by the mouth of McNab Creek looking for fish. Black bears were not studied and yet they rely on access to wild fish for food and they are an important part of our ecosystem. We are concerned that important species at risk are missing from the studies, such as wild trumpeter swans we have recently seen on the estuary on their migrating routes?	A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.  Black bear was not specifically identified as candidate or selected valued component for the purpose of the EA. Potential effects on Grizzly Bear are a reasonable surrogate representing mobile and wide ranging mammals such as wolverine, black bear and wolf.
2597	596 - 31	McNab Strata Community	McNab Creek, BC	Fish and Wildlife Concerns: We are concerned that the permanent loss of small rearing pools in McNab due to increased flows during operations could result in a permanent loss of habitat. This mine removes productive land that sustains life forever and restricts wildlife corridors to the estuary. Just the other day our neighbour saw a black bear by the mouth of McNab Creek looking for fish. Black bears were not studied and yet they rely on access to wild fish for food and they are an important part of our ecosystem. We are concerned that important species at risk are missing from the studies, such as wild trumpeter swans we have recently seen on the estuary on their migrating routes?	The rationale for the identification of candidate and selected valued components (VCs) is presented in Section 4.2 of the EAC Application/EIS.  Trumpeter Swan ( <i>Cygnus buccinator</i> ) is not an at-risk species in BC.
2598	596 - 32	McNab Strata Community	McNab Creek, BC	We are concerned the titanium levels will be high enough to impact fish outside the pit area escaping through the groundwater. Has this been considered?	Predictions for surface water concentrations of total and dissolved titanium are available for two locations downstream of the pit lake (MCF-6 and MCF-12) where fish are present. The predicted concentrations of titanium at these locations are within 10% of the baseline concentration, therefore the project is not expected to increase the titanium concentration in streams downstream of the pit lake.
2599	596 - 33	McNab Strata Community	McNab Creek, BC	Removal of Trees: We have been told by Burnco on a number of occasions that no mature trees will be removed. The processing area being proposed is now below the BC hydro powerline, where productive land, second growth trees, and fish and wildlife habitat will be displaced during construction and operations. How is this the best location?	The terrestrial LSA is 569 ha in size and does not contain any old growth forest. Approximately 20.0% (113.8 ha) of the Terrestrial LSA is considered mature forest, occurring mainly on the east side of McNab Creek, and as elevation increases from the valley bottom on either side of the LSA. These areas could be considered merchantable timber. Merchantable timber will be salvaged on site.  The trees and vegetation where the pit lake is planned will be permanently lost (28.2 ha). However, reclamation activities post-closure will re-establish mature forest on site. Roosevelt elk winter habitat will be restored through the creation of 24.3 ha of mature forest over approximately 25 years. In addition, a total of 31 ha of moderate to high suitability Roosevelt elk habitat (based on habitat suitability index modelling) to the north, east and south of the Project area will be protected and left unaffected by the Project. Establishing mature forest will also provide suitable habitat for other mature forest species such as northern goshawk and marbled murrelet. Therefore, the removal of trees to establish the pit lake will be compensated for.

2600	596 - 34	McNab Strata Community	McNab Creek, BC	Invasive Species: Has equipment wash stations been considered to minimize the spread of invasive plant species?	The conceptual Invasive Plant Species Management Plan is provided in section 16.2.2.4.1 of the EAC Application/EIS. The Invasive Species Management Plan will include information on cleaning/washing procedures for Project vehicles and equipment to minimize the potential for introduction and proliferation of invasive plants.
2601	596 - 35	McNab Strata Community	McNab Creek, BC	Key informants: Burnco refers to a list of Key Informants for local knowledge, however there was no interview conducted of residents of the area. We are happy to provide our observations of the area over the past 45 years, including sightings of fish and wildlife to the Working Group committee.	<p>The sample of key informants described in Section 7.3 of the EAC Application/EIS (Non-traditional Land and Resource Use) was not intended to be exhaustive of all stakeholders potentially affected by the Proposed Project, but rather was intended to be wide ranging enough to confirm and expand on non-traditional land and resource use information available from the referenced secondary sources. Key informants interviewed or provided data for this report included representatives from recreational groups and tourism operators, as well as DFO and MFLNRO. Specifically key informants included:</p> <ul style="list-style-type: none"> <li>- Burrard Yacht Club</li> <li>- Coastal Inlet Adventures</li> <li>- DFO</li> <li>- Don's Water Taxi</li> <li>- Gambier Island Local Trust</li> <li>- Gibson Chamber of Commerce</li> <li>- Islands Trust</li> <li>- MFLNRO</li> <li>- Recreation Sites and Trails BC</li> <li>- Sewell's Marina</li> <li>- Squamish Yacht Club</li> <li>- Sunshine Kayaks</li> <li>- Thunderbird Yacht Club</li> </ul> <p>Conditions C-5.1 through C-5.3 (Table 19.1) outlines the Proponent commitment to ongoing engagement with the McNab Creek Strata. BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. BURNCO has also proposed a McNab Community Enhancement Fund (CEF) that would consist of money set aside each year of operation, based on output, to enhance the McNab community through targeted funding on projects throughout the region. Funding of projects would be given priority by BURNCO's Management Committee based on a number of criteria that would include:</p> <ul style="list-style-type: none"> <li>- Mitigation of project effects</li> </ul>

2602	596 - 36	McNab Strata Community	McNab Creek, BC	Significant Social and Economic Effects: The noise and industrial activity associated with this mine will result in our loss of enjoyment of our property and surrounding McNab Valley. People come here to spend time with family and friends. They hunt, fish and enjoy the quiet. This is not measured or considered in the EIS.	<p>Harvesting fish and wildlife' and 'Outdoor recreation and tourism' are valued components in the environmental assessment of the Proposed Project (see Table 7.3-1). A change in the quality of the environmental setting (noise, air, and visual quality conditions) of these experiences was a potential effect that was considered in the assessment of each of these valued components. Expected changes in air, noise and visual qualities due to the Proposed Project were also considered in reaged to potential effects of the Proposed Project on the Real estate valued component. These expected changes are summarised in Table 6.1-17. These changes would alter the current environmental character of the Project Property and its surrounding area, including the McNab Creek Strata property, through changes to existing noise, air quality and visual resource conditions, but residual air and noise emissions associated with the Proposed Project are not anticipated to change air quality and noise conditions to the extent that they exceed government regulatory standards. Screening by natural vegetation on the McNab Creek Strata lots and the Property is expected to shield the majority of McNab Creek Strata residences from having a view of either the Proposed Project's facilities or activities.</p> <p>Mitigation measures outlined in the assessments of noise, air quality, visual resource and marine transportation would serve to help address the potential effects of the Proposed Project on the quality of the environmental setting of outdoor recreation and tourism experiences and on the Real Estate valued component.</p>
2603	596 - 37	McNab Strata Community	McNab Creek, BC	Loss of revenue from hunting permits are not noted.	<p>Harvesting fish and wildlife' is a valued component in the environmental assessment of the Proposed Project (see Table 7.3-1). No displacement or other effects on recreational hunting are anticipated due to the Proposed Project because the primary access to the local study area is through the Proposed Property, and public access and use has never been permitted here. As no effect due to the Proposed Project on recreational hunting activity is anticipated, then there would be no change in hunting permit revenues.</p>

2604	596 - 38	McNab Strata Community	McNab Creek, BC	<p>Our property values are perceived to be greatly affected. No real estate agents were interviewed by Burnco. The pit lake is not a benefit or vision for this area residents want.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS. The assessment of the Real Estate valued component concluded that a moderate adverse effect on McNab Creek Strata real estate is predicted due to an unquantified negative effect on real estate values resulting from the changed land use on the Proposed Project site and small changes in noise, air quality and the visual resource due to the Proposed Project (see Section 6.1.5.2.4). To support the assessment of the Real Estate valued component, several substantive studies, focused on the effects of mining on residential property values, were sourced and reviewed to collect information on past experience with direction and magnitude of value effects and the drivers of those value effects on residential properties due to nearby mining operations.</p> <p>Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant. Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.</p> <p>BURNCO has proposed a McNab Community Enhancement Fund (CEF) that would consist of money set aside each year of operation, based on output, to enhance the McNab community through targeted funding on projects throughout the region. Funding of projects would be given priority by BURNCO's Management Committee based on a number of criteria that would include:</p> <ul style="list-style-type: none"> <li>- Mitigation of project effects</li> <li>- Bringing amenities to our nearest neighbours</li> <li>- Supporting non-political groups actively improving Howe Sound through cleanup efforts, habitat improvements, etc.</li> <li>- Children's camps</li> <li>- Local united Way or similar organizations providing funding to community programs</li> </ul>

2605	596 - 39	McNab Strata Community	McNab Creek, BC	There are no benefits accruing to our community.	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>

2606	596 - 40	McNab Strata Community	McNab Creek, BC	<p>Mitigation and monitoring - There is no information on who is monitoring this project and we do not believe it should be up to residents and First Nations to do this work. We do not have confidence mitigation will be enough to offset the negative impacts on our community. We have low confidence mitigation and monitoring will be followed through and be effective.</p>	<p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 and are summarized below. BURNCO commits to funding for these monitoring initiatives.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring.</p> <p>Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational Environmental Protection Plans (EPPS). Compliance monitoring will include assessment of Proponent and contractors' environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program.</p> <p>BURNCO will submit a report to the BCEAO on the status of compliance with the Certificate Conditions, at the following times:</p> <ul style="list-style-type: none"> <li>- At least 30 days prior to the start of Construction;</li> <li>- On or before January 31 in each year after the start of Construction;</li> <li>- At least 30 days prior to the start of Operations;</li> <li>- On or before January 31 in each year after the start of Operations;</li> <li>- At least 30 days prior to the start of Closure and Reclamation;</li> <li>- On or before January 31 in each year after the start of Closure and Reclamation; and</li> <li>- Within 30 days of completing Closure and Reclamation.</li> </ul> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>
2607	596 - 41	McNab Strata Community	McNab Creek, BC	<p>In conclusion, based on the information provided, the McNab Creek Strata VAS 850 believe the BURNCO Aggregate Project will cause significant social, economic, environmental harm, and affect the health of our community.</p>	<p>Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>
2608	597 - 1	Robert Turner	Bowen Island, BC	<p>Comments to Environmental Assessment Office regarding Burnco Aggregate Project McNab Creek, Howe Sound, BC Submitted October 2, 2016</p> <p>Dr. Robert Turner, 710 Minnows Lane, Bowen Island, BC V0N1G2 Personal background BSc Geological Engineering, Queens University; MSc, PhD Geology, Stanford University Research scientist, Geological Survey of Canada, Vancouver 1989-2014 Resident, Bowen Island, 1989 - present Mayor, Bowen Island, 2005-2011 Lead organizer, 1991 Howe Sound Environmental Science Workshop and co-editor of conference proceedings (Levings et al, 1991).</p>	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>

2609	597 - 2	Robert Turner	Bowen Island, BC	<p>Estuaries are ecological jewels. The entire Howe Sound inlet has very limited wild and functional estuary. McNab Creek is the second largest estuary in Howe Sound. Why would you mine it?</p> <p>McNab Creek is the second largest estuary in Howe Sound. Estuaries form a tiny portion of Howe Sound's total shoreline but are its richest shoreline habitats in terms so biodiversity and biological productivity. Estuaries are ecological jewels in the broader context of Howe Sound's ecological function and deserve our highest protection.</p> <p>Question 1.1: Where else in BC has an estuary been mined for gravel? If there is/has been such a mine, what environmental mitigation strategies where employed. Was remediation successful? If not, why would the Burnco application be allowed to set a precedent for such an ecologically damaging activity?</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
2610	597 - 3	Robert Turner	Bowen Island, BC	<p>Burnco proposal largely blocks the animal corridor between upper McNab valley and shoreline, functionally disconnecting estuary from uplands.</p> <p>The proposal intends to fill three quarters of the lower one kilometer of the McNab Creek valley with a 24/7 industrial operation that will alienate that area from wildlife, and spread industrial noise throughout the lower valley for at least the project lifetime. It is inconceivable that this industrial noise and land alienation will not greatly limit the function of the lower valley as habitat and greatly disconnect migration of mammals such as elk, black bear, wolves, and grizzly bear between upper valley and the shore. Local observations show the estuary is heavily used by elk and black bear, and occasionally by grizzly bear and wolves. I have visited McNab Creek many times and have seen the tracks.</p> <p>Question 2.1: How will the project proposal offset the project impacts on elk, bear and wolf migration along the valley floor from upper valley to estuary?</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

	Ref #	Commenter (Name)	Location		
2611	597 - 4	Robert Turner	Bowen Island, BC	<p>Question 2.2: Given ongoing forestry operations in McNab Creek valley, and extensive past cutting of valley floor forests, and recent construction of the Box Canyon power project, how does the additional impact of the Burnco proposal relate to the cumulative impacts of other past and ongoing industry in the valley?</p> <p>Question 2.3: What cumulative effects assessment has been made of ecosystem health of the McNab Creek valley?</p>	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for the following:</p> <ul style="list-style-type: none"> <li>- Marine mammals – behavioural disturbance</li> <li>- Amphibian species at risk – barriers to movement, change in mortality, habitat loss</li> <li>- Roosevelt elk – barriers to movement, change in mortality, habitat loss</li> <li>- Grizzly bear – change in mortality, habitat loss</li> <li>- Environmentally sensitive ecosystems – loss of extent</li> <li>- Ecosystems at risk – loss of extent</li> <li>- Air quality indicators – increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual)</li> <li>- Real estate – change in real estate value</li> <li>- Marine navigation – interference with navigation use and navigability due to Project-related vessel traffic</li> <li>- Harvesting fish and wildlife – change in environmental setting</li> <li>- Recreation and tourism – change in environmental setting</li> <li>- Visual quality – change in visual quality</li> <li>- Heritage resources – changes to heritage resource integrity, context and accessibility</li> <li>- People – Human health (air quality and particulate matter).</li> </ul> <p>All potential cumulative residual effects were determined to be negligible or not significant except net effects to grizzly bear; cumulative residual effects to the threatened Squamish-Lillooet Grizzly Bear Population Unit were determined to be significant due in large part to vehicle collisions that might result from the development of new logging roads. Grizzly bear have not been observed within the Proposed Project area and the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2612	597 - 5	Robert Turner	Bowen Island, BC	<p>The project will permanently isolate McNab Creek from migration across the majority of its natural floodplain.</p> <p>The natural habit of the river is to wander back and forth across its natural floodplain and estuary. Berms surrounding the proposed pit will permanently restrict McNab Creek to the eastern margin of the estuary. The berms will isolate the Creek from three quarters of its natural fan delta, removing the Creek's ability to directly replenish sediment to the western part of the estuary and create diverse habitats. Given ongoing sea level rise, forecast to be at least 1 m rise by 2100, this lack of direct sedimentation to the western estuary will increase the risk of shoreline erosion, wet meadow and tidal flat erosion, and shoreline retreat, with consequent valuable habitat loss throughout this area.</p> <p>Question 3.1: What mitigation is proposed to offset the loss of natural river-mouth migration, and the loss of sediment deposition and natural aggradation across the western side of the estuary?</p>	<p>An assessment of avulsion risk on McNab Creek indicated that, on short time scales (decadal) the risk of lateral channel migration of McNab Creek into the area of the proposed project is considered to be Low. Appropriate engineering of the flood control dyke can reduce the risk to Very Low. Long term maintenance will be required to sustain the Very Low risk level.</p> <p>The proposed Project will lead to the loss of approximately 200 m2 of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. No other fisheries-related offset is proposed.</p>
2613	597 - 6	Robert Turner	Bowen Island, BC	<p>Why permit a "wet" gravel mine?</p> <p>Almost all of BC's gravel resources are located on forested hillsides. These "dry" aggregate resources are abundant in the south coast region, sufficient for decades of development needs. Dry deposits typically do not occupy vital ecological landscapes given that forested slopes are extensive (and therefore not unique) throughout the region. Burnco on the other hand is applying to mine a "wet" gravel resource that occupies a critical high ecological value estuary. This makes no sense to my geological experience. It is well understood that the mining industry doesn't get to choose where a resource is. Sometimes the resource is in the wrong place to mine. McNab Creek estuary is just such a location.</p> <p>Question 4.1: Why should a gravel mine be permitted in an ecologically sensitive area, when there are extensive undeveloped gravel resources in much less sensitive areas?</p>	<p>Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>

2614	597 - 7	Robert Turner	Bowen Island, BC	<p>Inappropriate location for a Processing/Stockpiles Area</p> <p>At McNab, a forest 30-300m wide of second growth sitka spruce-hemlock forest 80-250 years old fringes the entire estuary shoreline. This mature forest is an essential element of the estuary, forming a natural transition between upland and wet meadow-tidal flats of the intertidal estuary. The entire one kilometer of estuary shoreline with fringing forest, intertidal marsh and mud-sand-cobble tidal flats intact at McNab Creek. This coastal strip is the most valuable and sensitive part of the estuary.</p> <p>The Processing/Stockpiles Area is proposed within the fringing forest of this coastal strip. This will require clearing of a large tract of mature second growth 80-250 year old hemlock-sitka spruce forest. This forest zone is 150-200m wide at the Processing/Stockpiles Area site and all but a sliver-thin buffer will be lost.</p> <p>Question 5.1: Why is the processing facility not located inland, north of the power line, and well back from the most ecologically sensitive area of the estuary?</p>	<p>The Proposed Project was thoughtfully designed to be environmentally responsible, sensitive to the environment of the proposed site while making use of existing conditions. Since the initial design, the project has changed considerably. Revisions and refinements have been made in response to our Project Team's feedback and to comments and concerns raised by regulatory agencies, Aboriginal Groups and the public.</p> <p>A few examples of project considerations, and subsequent changes and components designed to address feedback received to date include:</p> <ul style="list-style-type: none"> <li>- Using existing BC Hydro lines to electrically powered equipment to extract, process and load the aggregate resource to limit exhaust emissions from the burning of fossil fuels;</li> <li>- Revised the size and location of the processing area to avoid identified fish habitat and to mitigate potential noise effects.</li> <li>- Revised stockpile location and design to limit potential operational noise effects.</li> <li>- Refined berm design and location to limit potential noise and air quality effects.</li> <li>- Maintained tree buffer on foreshore to limit noise effects, dust emissions, and visual effects.</li> </ul> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

2615	597 - 8	Robert Turner	Bowen Island, BC	<p>Inadequate proposed reclamation plan due to incorrect downgrade of forest capability from Class 1 forest to Class 3 forest</p> <p>The following is based on 4.0 Reclamation and Effective Closure Plan Document, Golder Associates. Forest capability mapping done prior to logging and published in 1984 (Serryk and Perry 1984) rated the project area forests as a Class 1 forest. The proponents argue that, because it is “disturbed”, the area should be downgraded to a Class 3 forest area, and that required reclamation only need to compensate to a Class 3 forest level (page 6). But the proponents provide no evidence of disturbance beyond previous logging.</p> <p>Question 6.1: Why would a provincial government “forest capability” map that was based on observation of the existing forest type (Serryk and Perry 1984) not be the accurate assessment of what the forest capable of growing in the project area? Why would logging of the forest change the capability of the site to grow a forest?</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>
2616	597 - 9	Robert Turner	Bowen Island, BC	<p>Proponent soil assessment is inadequate.</p> <p>No soils mapping was conducted by the proponent. Rather a series of soil pits were used to test the soils and interpolate soil characteristics between pits (Figure 3). The pit locations are not on any type of grid, or guided by existing soil mapping, and so the location of the test pits appears arbitrary, and provides no confidence that the soil pits are representative of the soils in the project area.</p> <p>Further, the proponent excludes examination and discussion of the soils in the Processing/Stockpiles Area. The Golder report states on page 6 “The Proposed Project Area consists of unvegetated or sparsely vegetated areas; small pockets of shrub dominated, sapling forest, and young forest structural stages. Mature forest is located to the north and east, outside of the Proposed Project Area.”</p> <p>Question 7.1: Why is there no mention of the mature forest areas that will be cleared for the Processing/Stockpiles Area at the shoreface?</p>	<p>We recognize that soils mapping was conducted at a reconnaissance level and based on existing geotechnical borehole and test pit data and existing publically available soils maps. We believe that this information was sufficient for EAC Application/EIS that required LSA soils mapping at a 1:5000-scale.</p> <p>Subsequent soil surveys including additional soil plot locations in the Processing Area, plus select soil sample collection and analytical testing for soil quality will be completed prior to surface preparation. This information combined with the preliminary EAC Application/EIS soils mapping and geotechnical subsurface data will be used to prepare updated soil maps and soil salvage and reclamation plans as required for the BURNCO Mines Act Permit Application (MAPA).</p> <p>Mature forest areas that will be cleared are noted in Volume 2, Section 5.3 of the EAC Application/EIS: The Proposed Project will remove approximately 3.3% (4 ha) of mature coniferous forest for the marine conveyor belt system in the LSA.</p>

	Ref #	Commenter (Name)	Location		
2617	597 - 10	Robert Turner	Bowen Island, BC	<p>Curiously, no soil pits were dug in the proposed Processing/Stockpiles Area area where a mature Class 1 forest currently stands.</p> <p>Question 7.2: Why did the proponent not sample any of the soils in the Processing/Stockpiles Area?</p>	<p>No soil pits were dug in the noted areas. Soil sampling and analytical testing for soil quality and reclamation is required to satisfy the Mines Act Permit Application (MAPA). As approved by the Ministry of Energy and Mines (MEM), a detailed soil sampling program will be provided in the Reclamation and Closure Plan of the BURNCO MAPA. Proposed soil surveys and select sampling will be completed in the Processing Area and mature forest areas prior to construction activities.</p>
2618	597 - 11	Robert Turner	Bowen Island, BC	<p>The proponents arguments that given that the land has been logged, therefore its "forest capability" has been reduced from a Class 1 to a Class 3 forest appears to lack basis. The proponents soil pit study does not provide evidence that the sites chosen for sampling are indeed representative of the project area. Confidence in this study is further eroded by the lack of soil sampling of the proposed Processing/Stockpiles Area, a standing Class 1 forest. All this leads to a larger question.</p> <p>Question 7.3: Why is the reclamation plan not based on reestablishing a Class 1 forest after closure?</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>
2619	597 - 12	Robert Turner	Bowen Island, BC	<p>Environmental bonding</p> <p>Given the high ecological values of McNab Creek estuary, and the large impacts this proposal will impose on the estuary, and the critical role that estuaries play in Howe Sound, this proposal also poses serious risks to the larger ecosystem health of Howe Sound. Should a mine go ahead, it is critical that environmental reclamation and monitoring of reclamation works be successful to the highest standards. To ensure reclamation compliance, and public confidence that this will indeed be achieved, significant environmental bonds need to be in place.</p> <p>Question 8.1: What criteria are being used to evaluate the necessary level of environmental bonding for reclamation?</p> <p>Question 8.2: What amount of reclamation bonding is required of the proponent before start of works?</p>	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>

2620	597 - 13	Robert Turner	Bowen Island, BC	<p>This project will expand industrial activity to a new greenfield site in Howe Sound. This project is not compatible with the ongoing recovery of Howe Sound from past industrial activity, nor its recreational use. Is this the highest and best use for Howe Sound?</p> <p>It is widely recognized that Howe Sound was extensively damaged by past industrial activity. Over the past 30 years, advances in environmental legislation and closure and remediation of past industrial sites has reduced pollution in Howe Sound. A recovery of marine life over the past 15 years, and particularly over the past 5 years, is indicated by the greatly increased presence of whales, dolphins, pink and Chinook salmon, and herring and anchovy. The Province has invested heavily in this enterprise, not the least of which are the ongoing costs of managing Britannia Mine effluent. As a consequence of all these changes, and the increasing demands of the growing population of metropolitan Vancouver, recreational use of Howe Sound has increased dramatically. A new industrial operation on a new greenfield site with significant ecological impacts is out of step with these trends.</p> <p>Currently, the footprint of industry (except for forestry) is absent from the entire 25 km long western shore of Howe Sound from Port Mellon to Woodfibre. Northern Thornborough Channel is a prime recreational area for boaters. The noise and visual impacts from the proposed project would be a significant intrusion on the recreational values of this area.</p>	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
2621	597 - 14	Robert Turner	Bowen Island, BC	<p>Currently, the footprint of industry (except for forestry) is absent from the entire 25 km long western shore of Howe Sound from Port Mellon to Woodfibre. Northern Thornborough Channel is a prime recreational area for boaters. The noise and visual impacts from the proposed project would be a significant intrusion on the recreational values of this area.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

2622	597 - 15	Robert Turner	Bowen Island, BC	Question 9.1: What criteria suggest that this proposal is compatible with the "highest and best use" of the McNab Creek estuary and northern Thorborough Channel?	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
2623	597 - 16	Robert Turner	Bowen Island, BC	Question 9.2: What criteria suggest that the impacts of this proposal will not be detrimental to the ongoing recovery of marine ecosystems of Howe Sound?	It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).  Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.
2624	598 - 1	Donald Townson	Gibsons, BC	Herewith my additional comments (Sections 1-6) and addenda regarding the Burnco Howe Sound Mine Application.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2625	598 - 2	Donald Townson	Gibsons, BC	1. Please consider my signed comments in the North Shore News, News section, page A9, September 28, 2016, headline "Holistic plan not a mine needed for Howe Sound".	Thank you for providing this article. I has been documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities. See URL below:  <a href="http://www.nsnews.com/opinion/letters/letter-holistic-plan-not-a-mine-needed-for-howe-sound-1.2353305">http://www.nsnews.com/opinion/letters/letter-holistic-plan-not-a-mine-needed-for-howe-sound-1.2353305</a>
2626	598 - 3	Donald Townson	Gibsons, BC	2. Please consider my different signed comments in Coast Reporter, page 9, September 30, 2016, headline "Deny Burnco mine".	Thank you for providing this article. I has been documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities. See link URL below:  <a href="http://www.coastreporter.net/opinion/letters/deny-burnco-mine-1.2354661">http://www.coastreporter.net/opinion/letters/deny-burnco-mine-1.2354661</a>
2627	598 - 4	Donald Townson	Gibsons, BC	3. Please consider the comments by Mr. Mark Lebbell et al in the Coast Reporter, September 30, 2016, page 11, headline "Directors debate Burnco submission". Mr. Lebbell, SCR D Director for Roberts Creek, is quoted that he "has yet to hear from any of his constituents who support the project".	Thank you for providing this article. I has been documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities. See link URL below:  <a href="http://www.coastreporter.net/news/local-news/directors-debate-burnco-submission-1.2354740">http://www.coastreporter.net/news/local-news/directors-debate-burnco-submission-1.2354740</a>
2628	598 - 5	Donald Townson	Gibsons, BC	4. Please consider my signed comments, following in this document, to Hon. Pamela Goldsmith-Jones, MP for West Vancouver-Sunshine Coast-Sea to Sky Country, October 2, 2016, and to Squamish Mayor Patricia Heintzman.	See additional comments contained in this submission listed below.

2629	598 - 6	Donald Townson	Gibsons, BC	5. Please make yourself familiar with Vince Beiser's disturbing and pertinent reporting on the mining of sand and gravel, supported by the Pulitzer Center on Crisis Reporting. It discusses how aggregate mining is disrupting sensitive ecosystems. Beiser's reporting has been widely praised by informed reviewers, and featured at length on the CBC (September 25, 2016 "The Sunday Edition".) Click on The Sunday Edition with Michael Enright for Sept 25, 2016.	Thank you for providing this article. I has been documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities. See link URL below:  <a href="http://www.cbc.ca/radio/thesundayedition/lethal-force-running-out-of-sand-helping-hoarders-hosanna-then-and-now-inside-butter-tarts-1.3770809/the-world-is-starting-to-run-out-of-sand-1.3770813">http://www.cbc.ca/radio/thesundayedition/lethal-force-running-out-of-sand-helping-hoarders-hosanna-then-and-now-inside-butter-tarts-1.3770809/the-world-is-starting-to-run-out-of-sand-1.3770813</a>
2630	598 - 7	Donald Townson	Gibsons, BC	6. Please also consider these additional comments:	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2631	598 - 8	Donald Townson	Gibsons, BC	6.1 Who will acquire and reclaim the exhausted Burnco site and make it, as Burnco slyly suggests with photos, video and texts on its various public websites and dog and pony shows, into another Quarry Park in Calgary? Fact: Quarry Park was acquired in 2005 by a development corporation; Burnco, which mined the site out, has had little, if anything, to do with its financing, engineering, development and upkeep. Worse, why does Burnco compare the Howe Sound mine site's possibilities to the results achieved at Queen Elizabeth Park in Vancouver and Butchart Gardens in Victoria? Burnco had nothing to do with these two projects, and they are in no way comparable to the Howe Sound property. Burnco has a long history of abandoning its exhausted mine sites.	A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit. Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until installed works are determined to be functioning as intended.  Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.  Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.
2632	598 - 9	Donald Townson	Gibsons, BC	6.2 Burnco is aware of the international and national trends toward outlawing mining operations, particularly sand and gravel operations, near rivers and oceans. Is that why it is in such a hurry to exploit the unnecessary Howe Sound site? BC is currently mine-friendly, but with a provincial election coming up, and public protests over environmentally-damaging projects increasing, is this not to be considered an overriding "social" concern?	The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.  Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by: - Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC; - Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and - Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.  The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.

	Ref #	Commenter (Name)	Location		
2633	598 - 10	Donald Townson	Gibsons, BC	6.3 Burnco has owned the Howe Sound mine site for almost a decade. Salmon have spawned on the property during that time, but not in the past two years. Has Burnco done anything to improve this situation? Is it not convenient to Burnco that it can state at this moment, despite a century of recorded salmon spawning there, that it not now a salmon-spawning property?	<p>BURNCO has historically supported the communities in which it operates in the form of sponsoring community events, raising money for charities and various forms of donation.</p> <p>Specifically in relation to the existing fish compensation channel, BURNCO has been monitoring its effectiveness and conducting fisheries surveys throughout the property since acquiring the site in 2008.</p>
2634	598 - 11	Donald Townson	Gibsons, BC	6.4 Burnco is a privately-held company and does not reveal its financial position or projections with regard to this property. However, even assigning a highly conservative \$10 a tonne average value for the mine's production of 16,000,000-20,000,000 tons of product over the next 20 years, compared to the mine's extremely low initial acquisition cost, low taxes, and the low plant, development and estimated operating costs over the same period, the return on investment will be remarkable. Are the low property taxes, concessionary mining taxes, and the negligible reclamation costs sufficient to offset the cost of environmental damage and related social costs that, inevitably, will be borne by the public? Will this be considered by economists and others trained to properly assess the data?	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>

	Ref #	Commenter (Name)	Location		
2635	598 - 12	Donald Townson	Gibsons, BC	<p>6.5 What are Burnco's "proprietary" mining techniques that allegedly will reduce significantly the dust and other pollution created by the proposed mine. Will they be revealed adequately for assessment? ? The Howe Sound mine site and shipping routes are subject to extremely high winds (especially the infamous Squamish blowing down the Sound to Vancouver, great for extreme sailing, very bad for this kind of mining, product storage, port operations and shipping). Will you be told? It would appear that they are little more than lightly covered conveyor belts, the use of liquid dampening, and other unsophisticated applications.. The scoop and dredge operation is a crude mining technique, basically a small step up from pick and shovel. The scoop/ dredging equipment is primitive, cheap to source, and highly damaging to the environment.</p>	<p>BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.</p>
2636	598 - 13	Donald Townson	Gibsons, BC	<p>6.6. On September 8, the Woodfibre LNG property near Squamish had a serious waste water and leachate spill. There was an unacceptable delay in reporting this accident, according to Squamish Mayor Patricia Heintzman. Woodfibre LNG did not follow proper protocol, "and did not inform the District appropriately." Woodfibre LNG spokesperson's response: "The spill does underscore the challenges of managing a 100-year-old site." (Squamish chief, September 22, 2016)</p> <p>Subsequently, Woodfibre stated that it "has no legal requirement to inform" DOS for small incidents (Squamish Chief, September 22, 2016).</p> <p>This recent incident points out the ongoing inadequacies of reporting and monitoring of environmentally damaging incidents. The Howe Sound pulp mill has a long record of not reporting or underreporting serious incidents. Air quality, for example, is monitored primarily by a small, old, unmanned station on the Langdale elementary school grounds. Does it even matter? The objectionable smell from this plant continues, although promises of more and better monitoring stations that have been promised by government over the years have never been fulfilled. In situ monitoring by Fisheries, at the federal level, and by wildlife personnel from various levels of government, and other agencies charged with protection of the environment, are inadequate or non-existent.</p>	<p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 and are summarized below. BURNCO commits to funding for these monitoring initiatives.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring.</p> <p>Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational Environmental Protection Plans (EPPS). Compliance monitoring will include assessment of Proponent and contractors' environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program.</p> <p>BURNCO will submit a report to the BCEAO on the status of compliance with the Certificate Conditions, at the following times:</p> <ul style="list-style-type: none"> <li>- At least 30 days prior to the start of Construction;</li> <li>- On or before January 31 in each year after the start of Construction;</li> <li>- At least 30 days prior to the start of Operations;</li> <li>- On or before January 31 in each year after the start of Operations;</li> <li>- At least 30 days prior to the start of Closure and Reclamation;</li> <li>- On or before January 31 in each year after the start of Closure and Reclamation; and</li> <li>- Within 30 days of completing Closure and Reclamation.</li> </ul> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>

2637	598 - 14	Donald Townson	Gibsons, BC	6.7. Bad faith industrial operations in Howe Sound have been the norm for more than a century. Governments, local, provincial and federal, have failed to provide the necessary monitoring of the land, air, water, and the social damage these activities have caused. They have failed to prosecute offenders in any meaningful way. Fines, rarely levied, are inconsequential to the offenders.	BURNCO is a 104-year old family-owned Canadian company with operations in British Columbia, Alberta, Saskatchewan and Texas.  BURNCO has over 1,150 employees (180 in BC) and is Canada's largest independent ready mix concrete and aggregate company.  BURNCO's BC operations currently transport sand and gravel by barge from Treat Creek (east of Powell River) and as far away as Port McNeil on northern Vancouver Island, to existing facilities along the Fraser River in Burnaby and Langley.
2638	598 - 15	Donald Townson	Gibsons, BC	Howe Sound deserve environmental protection, and no further industrial activity should be allowed until adequate safeguards are in place, and certainly not before a holistic plan for the Sound is in place. The Burnco application provides no assurance that the legitimate public interest in proper environmental safeguards will be served.  An unnecessary aggregate mine and processing plant at its heart is pointless.	Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.  Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.  Examples of mitigation measures to reduce or minimize potential effects are: - Sediment and erosion control planning and monitoring the effectiveness of prescribed measures - Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering - Installing nest boxes for Western screech-owls in nearby forest habitat - Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals. - Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.  Examples of compensation or offset measure are: - Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2. - Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.
2639	599 - 1	Michael and Mildred Watson	Bowen Island, BC	My Husband and I are opposed to this project.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

2640	599 - 2	Michael and Mildred Watson	Bowen Island, BC	Howe Sound has finally recovered in a spectacular manner from many years of industrial pollution. Why then is there a desire to re-industrialise this most valuable area? To do so would be a negative step back in time.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
2641	599 - 3	Michael and Mildred Watson	Bowen Island, BC	There is no need trade the local environment for a few jobs, particularly as the Sea to Sky area is already prospering and producing "clean" modern employment for so many people. Why put that at risk? Thank you for your consideration.	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. 2647	600 - 6	Ian Heathcote	Not Stated	As you can see the benefit is clearly to Burnco. We need to speak for the future of all related to the Howe Sound Ecosystem and for those who cannot speak and act and ensure they protected and put a stop to the Burnco proposed aggregate mine at McNab Creek.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2648	601 - 1	Star Morris	Squamish, BC	I have attended open houses, presentations and reviewed the application on this Project. I appreciate that Burnco has done their utmost to mitigate risks towards a sustainable project. However, I believe that, cumulatively, the risks outweigh the benefits and cannot support the Project. I submit and concur with the specifics in the attached comments.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2649	601 - 2	Star Morris	Squamish, BC	Issue 1: Regional demand for additional aggregate is not demonstrated  The Vancouver market requirement for an additional gravel /aggregate source is not supported by the proponent's documentation. A greater profit margin for the Proponent should not be grounds for destroying the estuary of McNab Creek.  Recommendation: A supply/demand report showing strong evidence of the need for supply from this location (and the unavailability of supply from established locations), such as has been done for the Okanagan region, should be prepared before considering a permit for this project. See <a href="https://www.regionaldistrict.com/media/112368/2013_11_08__Full_Report__Aggregate_Supply_and_Demand_Update_and_Analysis.pdf">https://www.regionaldistrict.com/media/112368/2013_11_08__Full_Report__Aggregate_Supply_and_Demand_Update_and_Analysis.pdf</a>	The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.  Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by: - Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC; - Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and - Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.  The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.

2650	601 - 3	Star Morris	Squamish, BC	<p>Issue 2: Loss of productive salmon habitat</p> <p>The project has (twice) been rejected by Fisheries &amp; Oceans Canada because of the likely loss of salmon habitat in McNab Creek. In a year of disastrous returns to the Fraser and other runs, this proposal is ill-timed and ill-advised.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2651	601 - 4	Star Morris	Squamish, BC	<p>Issue 3: Insufficient data for at-risk species baselines.</p> <p>For several key aquatic and land-based species (such as anadromous salmon, resident cutthroat trout and Roosevelt elk), population data was collected over far too narrow a timespan to be useful for establishing accurate baselines. Without accurate baselines, quantitative monitoring of the effects of this project will not be possible.</p> <p>Recommendation: Part-year data is utterly insufficient to establishing accurate baselines. At least five years of data should be collected to afford accurate baselines usable for ongoing monitoring of effects on species populations and habitat. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where habitat damage exceeds pre-agreed norms.</p>	<p>The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada. The baseline studies conducted are sufficient for the purpose of assessing potential effects of the Proposed Project on selected Valued Components. Additional years of supplemental field studies are not required or proposed for the assessment.</p> <p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS. Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>

2652	601 - 5	Star Morris	Squamish, BC	<p>Issue 4: 21 species officially at risk from Burnco.</p> <p>Burnco's consultants documented that the gravel quarry could be home to 21 species officially at risk. This includes Roosevelt elk , re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2653	601 - 6	Star Morris	Squamish, BC	<p>Issue 5: Will McNab Creek and the estuary become salty?</p> <p>As rock is removed from the mine, fresh water from the estuary will creep into the resultant 25m pit. This will lead to salt water seeping into the estuary, and into McNab Creek. This will kill a variety of salmon and plants.</p> <p>Recommendation: Have thorough hydrological studies done over several years. Use the precautionary principle. Local authorities (eg. SCR D) should have the power to compel a reduction, suspension or cessation of mine activities where salination exceeds preagreed norms.</p>	<p>The hydraulic conductivity of the valley sediments is much higher than hydraulic conductivity of any bedrock structures, if they exist. Therefore, the groundwater flow in the valley sediments will dominate and it will provide key control on the position of the salt water-freshwater interface. Furthermore, because of topographic highs that surround the valley, the hydraulic heads are expected to be higher than in the valley sediments, inhibiting saltwater ingress. As presented in Section 3.3 in Appendix 5.6-A of the EAC Application/EIS, based on monitoring data (2010-2014), tidal elevations exceeded groundwater elevation only in rare occasions between July and September of each monitoring year. During these high tide intervals, there is an inferred landward gradient in the immediate vicinity of the shoreline; however, its duration is inherently less than the corresponding periods of southwards gradient associated with lower tidal position. Accordingly, the net groundwater flow direction during the entire monitoring period is confirmed to be southwards toward the marine foreshore. Moreover, monitoring data indicate that the saltwater wedge could be located at greater depths than approximately -30 m elevation; analytical calculations based on methodology presented in Domenico and Schwartz (1990) showed that, due to relatively high groundwater flow in the alluvial sediments, the saltwater edge could be depressed to the depth of the overburden/bedrock contact within 50 m to 150 m of the ocean shore. Based on these observations, the potential presence of a fault structure in bedrock in the vicinity of the project area is not considered to influence groundwater flow direction in the valley sediments or increase the risk of saltwater intrusion.</p>

2654	601 - 7	Star Morris	Squamish, BC	<p>Issue 6: Unsuitable location</p> <p>This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area. In 2009 SCRD said no to a permit for an aggregate operation at McNab Creek. There was concern re noise and dust from onsite crushing, sorting, weighing, and stockpiling, all of which Burnco plans to do. Why allow these activities now?</p> <p>Recommendation: To do so would represent atrocious planning, with little/no obvious compensating factors. It should not be permitted.</p>	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>

2655	601 - 8	Star Morris	Squamish, BC	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). The proposed “compensation channel” is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Recommendation: Any approval of this proposal should include a contingency bond to fund maintenance of the new streamway, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project.</p>	<p>The proposed Project will lead to the loss of approximately 200 m<sup>2</sup> of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. The proposed design for the channel extension uses the existing lower channel as a template and it will meet the factors and criteria that are generally accepted for the construction of a functional groundwater-fed spawning channel. It should provide conditions similar to the existing run habitat in the lower section of WC2 that was designed as chum spawning habitat by DFO and where spawning activity was observed during the November 2016 survey.</p> <p>The creation of the pit lake is predicted to cause a doubling of groundwater influx into the lower section of WC2. The increase in ground water influx will lead to additional groundwater upwelling and the increased upwelling is expected to provide increased levels of intergravel flow that will be suitable for eggs and alevins. The average depth in the proposed offset habitat extension and the remaining section of WC2 is predicted to be above 0.3 m making it suitable for salmon spawning. As described in the Aquatic Health assessment provided in Surface Water Resources (Section 5.5.7.2), the water quality and temperature of ground and surface water entering the offset habitat and existing lower section of WC2 will be suitable for salmonids to complete all stages of their life history including spawning.</p> <p>In response to comments from the Technical Working Group, the design of the habitat offset plan was revised to allow approximately 20 m of pool habitat upstream of the culvert and approximately 20 m of gravel bed run habitat downstream of the culvert to be retained which will avoid approximately 232 m<sup>2</sup> of habitat loss. The design of the channel extension incorporates run and pool habitat in approximately a 1 : 1 ratio, based on this design and the use of run habitat for spawning in the existing lower channel it is expected that more than 2, 000 m<sup>2</sup> of the offset channel habitat will provide conditions suitable for salmonid spawning.</p>
2656	601 - 9	Star Morris	Squamish, BC	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). The proposed “compensation channel” is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Recommendation: Any approval of this proposal should include a contingency bond to fund maintenance of the new streamway, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project.</p>	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>

The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken. Adaptive management techniques to be implemented as required include:</p> <ul style="list-style-type: none"> <li>- Continue to evaluate the extent of the pit during operations.</li> <li>- During the wet season, if water levels in the pit lake become higher than has been designed for the Pit Lake Containment Berm then the valves in the culverts will be closed to reduce the amount of water reporting to the pit from the surface water on the western slope.</li> <li>- The height of the pit lake at the outlet structure can be adjusted to increase or decrease the level of the pit lake (e.g., adding or lowering stop logs) at closure to maintain the hydraulic gradient between McNab Creek and the Project Area following closure.</li> </ul>
2667	601 - 20	Star Morris	Squamish, BC	<p>Issue 13: "Daytime Hours" definition</p> <p>The Proponent advertises that the plant will operate only on weekdays and during "daytime hours". Daylight hours vary seasonally, but the definition of "daytime hours" is unclear.</p> <p>Recommendation: Clearly define "daytime hours" in the proposal.</p>	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2668	601 - 21	Star Morris	Squamish, BC	<p>Issue 14: The nearshore strip of forest cover is too narrow</p> <p>The strip of forest cover between the pit and the ocean is too narrow to be sustainable. Blowdown and saltwater invasion will threaten its existence</p> <p>Recommendation: For reasons of sustainability and visual camouflage, increase the width of the ocean-pit separation strip, and lessen the size of the proposed pit and crushing area.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. Maintaining a treed buffer along the foreshore (approx. 25-50 m wide adjacent to the processing area) will also limit dust and noise emissions to the marine environment. Additional screening of lan-based structures may be possible around project components not currently screened by existing vegetation. The nature and extent of vegetation screening incorporated into the site design will be described in the Vegetation Management Plan (Volume 3, Part E, Section 16 of the EAC Application/EIS).</p> <p>A detailed assessment of potential vegetation effects (including windthrow effects) of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS. The significance of windthrow effects were determined to be negligible; few new windward edges will be created. Monitoring of treeline edges will be conducted to evaluate potential windthrow effects and adaptive management will be employed, if necessary.</p>
2669	601 - 22	Star Morris	Squamish, BC	<p>Issue 15: Loss of property values in the nearby strata units</p> <p>The proponent claims little or no loss of value for nearby properties. This assertion is contradicted by many studies that have highlighted the loss of value (including the value associated with quiet enjoyment) at or near industrial sites adjacent to established residential areas. Recent jurisprudence in BC has borne out the right of homeowners to receive compensation for that loss. See <a href="http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882">http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882</a></p> <p>Recommendation: Fair market value compensation for loss of property value must form part of the economic analysis of any approval for this mine.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
2670	601 - 23	Star Morris	Squamish, BC	<p>Issue 16: First Nation consultation – Sechelt FN was omitted this time</p> <p>Squamish and Tseil-Waututh First Nations have been consulted re Burnco, but not the Sechelt FN. The Sechelt First Nations weren't consulted about the gravel quarry at McNab Creek in 2009 either. McNab Creek is in Sechelt traditional territory.</p> <p>Recommendation: Respect/consult with Sechelt First Nations re Burnco.</p>	<p>First Nation consultation requirements are delegated to Proponents by the Crown. For the Proposed Project, only Squamish Nation and the Tseil-Waututh Nation were identified as potentially affected first Nations by the BCEAO. The CEA Agency identified additional Aboriginal Group, however, the Sechelt First Nation was not among these, presumably because of the proximity of the proposed Project to their Traditional Territory.</p>

2671	601 - 24	Star Morris	Squamish, BC	<p>Issue 17: Advisory Committee of voluntary citizens</p> <p>In 2009 when a gravel quarry at McNab Creek was turned down by SCRD, one requirement was an Advisory Committee of volunteer citizens to provide ongoing input with the goal of community acceptance of the project.</p> <p>Recommendation: Require the formation of an Advisory Committee of volunteer citizens.</p>	<p>BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.</p>
2672	601 - 25	Star Morris	Squamish, BC	<p>Issue 18: The job benefits were analyzed on the basis of too narrow an RAA.</p> <p>BURNCO currently sources its aggregate from Jervis Inlet, Port McNeil and Coquitlam. To gauge the benefits to the BC economy, the net job creation figures (i.e. McNab's 12 jobs less the job losses at the above aggregate sources) as a consequence of allowing the McNab Creek operation must be considered.</p> <p>Recommendation: If there is little or no net job gain to BC as a result of this proposal, it should be firmly rejected. Jobs in areas like Port McNeil are much harder to come by than in the Lower Mainland/Howe Sound.</p>	<p>The local spatial study area for the operations phase labour market effects (including employment) of the Proposed project was described in the Application Information Requirements/EIS Guidelines, which was approved by the BCEAO and the CEA Agency on December 16, 2014 after review by the Technical Working Group established to guide this assessment. This local spatial study area is Sunshine Coast Regional District.</p> <p>The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.</p>

2673	601 - 26	Star Morris	Squamish, BC	<p>Issue 19: Barge traffic will diminish Howe Sound's recreational and tourism potential and add to the cumulative traffic hazard in Howe Sound</p> <p>Shipping 1-4 million tonnes of aggregate annually from this location will make for 2-6 tug/barge movements daily through Southern Howe Sound,. Routes would cross very busy sailing and small-boat recreational areas, the Howe Sound Marine Trail and ferry routes, the path of LNG tankers exiting from the Woodfibre LNG plant and freighters from Squamish Terminals. This exponentially increases the risk of collisions and loss of life in a narrow waterway and diminishes the amenity and tourism use of the Sound. The cumulative effects and worst-case hazard analysis of this project have been underestimated by the Proponent.</p> <p>Recommendation: A cumulative impact assessment, including loss of amenity and tourism value of the Sound, should be completed prior to deciding on this application. So too should a study of the increased hazards associated with increasing the large-vessel traffic in Howe Sound. Improvements to vessel tracking, buoys and channel markers in the area will be necessary.</p>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
2674	601 - 27	Star Morris	Squamish, BC	<p>Issue 20: The job benefits analysis used the questionable input-output econometric model.</p> <p>BURNCO has used input-output econometric analysis to predict the job creation benefits accruing to the project For resource projects, this is a highly questionable analysis technique. The Australian Institute has written a convincing argument highlighting the inadequacies of input-output analysis. See <a href="http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf">http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf</a> (Input-output was used by the BC Government in arriving at its inflated job estimates for BC's LNG industry.)</p> <p>Recommendation: Red-do the employment estimates and repost/ allow additional time for public scrutiny and comments</p>	<p>The environmental assessment of the Proposed Project used an input-output (I-O) impact modelling methodology to estimate the Project's potential effect on employment (as well as other economic parameters). The B.C. Input-Output Model (BCIOM) was used. The BCIOM is maintained by BC Stats, which is the central statistics agency of the B.C. government. The BCIOM is a version of Statistics Canada's Inter-Provincial Input-Output Model (IPIOM) which BC Stats calibrated for undertaking economic analyses of B.C.-based projects. The BCIOM is a robust, calibrated, third party provided input-output model, and has been previously accepted for use by by the BCEAO and the CEA Agency to assist with estimating the economic impact of proposed projects.</p>

2675	601 - 28	Star Morris	Squamish, BC	<p>Issue 21: There was an inconsistency between the job creation figures shown in 2 different slides in the Open Houses</p> <p>One showed about 300 person-years of employment (over 25years). The other (derived from input-output analysis) showed person-year employment benefits several times that amount.</p> <p>Recommendation: This misleading discrepancy should be resolved by further analysis, and that section of the application re-submitted, with additional time allowed for public scrutiny and comment</p>	<p>The estimated number of jobs created by the proposed Project during construction and operations phases are presented in Section 2.5.4 of the EAC Application/EIS.</p> <p>Employment numbers were presented on three Open House display panels, as follows:</p> <ul style="list-style-type: none"> <li>- Project Specifications: 80 person years during construction and 360 person years during operations (direct, indirect and induced);</li> <li>- Project Benefits: 12 full-time jobs at the site (i.e. direct only);</li> <li>- Sustainable Economy: 119 jobs during construction and 99 jobs during operations (direct, indirect and induced); 33 long-term jobs during operations are expected to be filled by Sunshine Coast residents.</li> </ul>
2676	601 - 29	Star Morris	Squamish, BC	<p>Issue 22: Preservation of marine tourism, hiking access to the vicinity of McNab</p> <p>Moorages, anchorages, swimming facilities and back-country access have long been part of the McNab Creek area's attractions for Howe Sound visitors and local boating clubs</p> <p>Recommendation: The application fails to properly address how these local amenities will be protected. Neither does it propose how loss of these amenities will be compensated for. The Management Plan should address this issue.</p>	<p>Harvesting fish and wildlife' and 'Outdoor recreation and tourism' are valued components in the environmental assessment of the Proposed Project (see Table 7.3-1). No displacement effects on recreational hunting or other recreational activities is anticipated due to the Proposed Project because the primary access to the local study area is through the Proposed Property, and public access and use of the Proposed Property has never been permitted. During the construction and operation phases, recreationists and tourists would continue to have access to the foreshore area below the high water mark and to the anchorage area in the vicinity of where McNab Creek enters Howe Sound.</p> <p>Proposed Project construction and operations would prevent marine-based recreational and tourism activities occurring around the Project jetty. As the jetty is located within an existing log boom tenure and recreational and tourism activities are concentrated on the eastern side of the local study area (where McNab Creek enters Howe Sound), this effect is considered to be negligible.</p> <p>Displacement on the water would occur on an intermittent basis as a result of Proposed Project-related vessel traffic, which would require smaller vessels to alter direction and/or speed when navigating at the same time as water taxis or barges (Volume 2, Part B - Section 7.2). These navigational challenges are present in the LSA due to forestry activity, and are subject to the Collision Regulations of the Canada Shipping Act. Any resulting effects on recreational boating recreational activities due to potential interactions of recreational vessels and equipment and Project-associated vessels are not detectable or not measureable, so potential effects of the Proposed Project on water-based recreation and tourism access matters in the construction and operation phases are determined to be negligible.</p> <p>As part of the Marine Transport Management Plan outlined in Marine Transport (Volume 2, Part B - Section 7.2), BURNCO would also develop and implement strategies, best management practices and guidelines to avoid and minimise Proposed Project - related disruption of marine-based recreational activities during construction and operations. As part of the development of this plan, BURNCO would consult with key marine user groups (e.g., McNab Strata, yacht clubs, camps, and kayaking operators) to discuss strategies (including but not limited to routing options) to manage the interaction of Proposed Project vessel traffic with recreational and tourism areas during the high season months.</p>

2677	601 - 30	Star Morris	Squamish, BC	<p>Issue 23: End-of-project remediation</p> <p>The compensation channel is an artificial structure which will likely not survive long after project's end.</p> <p>Recommendation: Restoring the natural streamway should be a firm end-state requirement.</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>
2678	602 - 1	Chris Dietrich	North Vancouver, BC	<p>I just wanted to voice my concern about the gravel mine that Burnco has proposed to put in beautiful Howe Sound. Howe Sound has inspired me in so many ways. It has been my childhood escape where I could just be a kid, playing with my friends in the forest or enjoying fishing on the dock in the early morning.</p> <p>I was so inspired in fact, that I made many movies there, capturing the glorious scenery. Little did I know that there were other people interested in the Howe Sound, and it was not people who necessarily aimed to make things better for the community in the area. When I heard about the mine, I was appalled and scared about the future of the community, not just the community of people, but the wildlife too.</p> <p>I decided to get my camera out once again and create a short 5 minute video, giving awareness about the nature of the place and the increasingly-real threat that looms over it. And I knew that there were mines there before. Britannia Mine being one of them. Britannia Mine, was one of the biggest polluters in Canada, harmed the Howe Sound immensely. Only now have the salmon and the dolphins come back. We do not want to make that same environmental mistake twice...and that was the drive for my video.</p> <p>That video published back in 2013 totally changed what I wanted to do with my life. I discovered throughout he making of the short, that I wanted to go into film and be the person who can share with the people, the natural beauty of the world. I enrolled in film school at</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
2679	603 - 1	Vel Anderson	Gibsons, BC	Please see attached document.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2680	603 - 2	Vel Anderson	Gibsons, BC	Burnco proposes environmental degradation to a huge riparian area. Modification of the riparian zone including bank erosion, direct destruction from heavy equipment operation, discharges from equipment and refueling, reduction in groundwater elevations, impacts on structures and access, disturbance to flora and fauna and all life forms, impacts on coastal processes.	<p>Potential effects of the Proposed Project have been assessed for selected valued environmental components to address key issues related to fish and fish habitat, marine resources, terrestrial wildlife and vegetation, geotechnical and natural hazards, water resources, air quality and climate change.</p> <p>The assessment concludes that, with the application of design considerations and identified mitigation, no significant adverse environmental effects will result from the Proposed Project.</p> <p>A detailed assessment of potential environmental effects of the Proposed Project is presented in Volume 2, Part B of the EAC Application/EIS.</p>
2681	603 - 3	Vel Anderson	Gibsons, BC	<p>The area encompasses many smaller streams which provide necessary nutrients to fish in the estuary. This project will wipe out a major feed source, which would harm or disturb lifeforms in the estuary. Increased sediment loads from the proposed new channels will be flowing to the estuary causing detrimental effect on marine lifeforms.</p> <p>To disturb the McNab Creek riparian area would be extremely harmful to all life forms in the estuary including fish in the Sound. This project will do more harm than good.</p> <p>As stated at Provincial site <a href="http://www2.gov.bc.ca/gov/content/industry/agriculture-seafood/agricultural-land-and-environment/water/riparian-areas/resources">http://www2.gov.bc.ca/gov/content/industry/agriculture-seafood/agricultural-land-and-environment/water/riparian-areas/resources</a> "A riparian zone, or riparian area, is the interface between land and a river or stream. Although riparian areas make up only a small fraction of the land, they are among the most productive and valuable of all landscape types". Therefore, let's keep this most productive and valuable McNab Creek riparian area undisturbed.</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2682	603 - 4	Vel Anderson	Gibsons, BC	<p>Issue 1: Regional demand for additional aggregate is not demonstrated</p> <p>The Vancouver market requirement for an additional gravel /aggregate source is not supported by the proponent's documentation. A greater profit margin for the Proponent should not be grounds for destroying the estuary of McNab Creek.</p> <p>Recommendation: A supply/demand report showing strong evidence of the need for supply from this location (and the unavailability of supply from established locations), such as has been done for the Okanagan region, should be prepared before considering a permit for this project. See <a href="https://www.regionaldistrict.com/media/112368/2013_11_08__Full_Report__Aggregate_Supply_and_Demand_Update_and_Analysis.pdf">https://www.regionaldistrict.com/media/112368/2013_11_08__Full_Report__Aggregate_Supply_and_Demand_Update_and_Analysis.pdf</a></p>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
2683	603 - 5	Vel Anderson	Gibsons, BC	<p>Issue 2: Loss of productive salmon habitat</p> <p>The project has (twice) been rejected by Fisheries &amp; Oceans Canada because of the likely loss of salmon habitat in McNab Creek. In a year of disastrous returns to the Fraser and other runs, this proposal is ill-timed and ill-advised.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

	Ref #	Commenter (Name)	Location		
2684	603 - 6	Vel Anderson	Gibsons, BC	<p>Issue 3: Insufficient data for at-risk species baselines.</p> <p>For several key aquatic and land-based species (such as anadromous salmon, resident cutthroat trout and Roosevelt elk), population data was collected over far too narrow a timespan to be useful for establishing accurate baselines. Without accurate baselines, quantitative monitoring of the effects of this project will not be possible.</p> <p>Recommendation: Part-year data is utterly insufficient to establishing accurate baselines. At least five years of data should be collected to afford accurate baselines usable for ongoing monitoring of effects on species populations and habitat. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where habitat damage exceeds pre-agreed norms.</p>	<p>The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada. The baseline studies conducted are sufficient for the purpose of assessing potential effects of the Proposed Project on selected Valued Components. Additional years of supplemental field studies are not required or proposed for the assessment.</p> <p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS. Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>
2685	603 - 7	Vel Anderson	Gibsons, BC	<p>Issue 4: 21 species officially at risk from Burnco.</p> <p>Burnco's consultants documented that the gravel quarry could be home to 21 species officially at risk. This includes Roosevelt elk , re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

	Ref #	Commenter (Name)	Location		
2686	603 - 8	Vel Anderson	Gibsons, BC	<p>Issue 5: Will McNab Creek and the estuary become salty?</p> <p>As rock is removed from the mine, fresh water from the estuary will creep into the resultant 25m pit. This will lead to salt water seeping into the estuary, and into McNab Creek. This will kill a variety of salmon and plants.</p> <p>Recommendation: Have thorough hydrological studies done over several years. Use the precautionary principle. Local authorities (eg. SCR D) should have the power to compel a reduction, suspension or cessation of mine activities where salination exceeds preagreed norms.</p>	<p>The hydraulic conductivity of the valley sediments is much higher than hydraulic conductivity of any bedrock structures, if they exist. Therefore, the groundwater flow in the valley sediments will dominate and it will provide key control on the position of the salt water-freshwater interface. Furthermore, because of topographic highs that surround the valley, the hydraulic heads are expected to be higher than in the valley sediments, inhibiting saltwater ingress. As presented in Section 3.3 in Appendix 5.6-A of the EAC Application/EIS, based on monitoring data (2010-2014), tidal elevations exceeded groundwater elevation only in rare occasions between July and September of each monitoring year. During these high tide intervals, there is an inferred landward gradient in the immediate vicinity of the shoreline; however, its duration is inherently less than the corresponding periods of southwards gradient associated with lower tidal position. Accordingly, the net groundwater flow direction during the entire monitoring period is confirmed to be southwards toward the marine foreshore. Moreover, monitoring data indicate that the saltwater wedge could be located at greater depths than approximately -30 m elevation; analytical calculations based on methodology presented in Domenico and Schwartz (1990) showed that, due to relatively high groundwater flow in the alluvial sediments, the saltwater edge could be depressed to the depth of the overburden/bedrock contact within 50 m to 150 m of the ocean shore. Based on these observations, the potential presence of a fault structure in bedrock in the vicinity of the project area is not considered to influence groundwater flow direction in the valley sediments or increase the risk of saltwater intrusion.</p>
2687	603 - 9	Vel Anderson	Gibsons, BC	<p>Issue 6: Unsuitable location</p> <p>This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area. In 2009 SCR D said no to a permit for an aggregate operation at McNab Creek. There was concern re noise and dust from onsite crushing, sorting, weighing, and stockpiling, all of which Burnco plans to do. Why allow these activities now?</p> <p>Recommendation: To do so would represent atrocious planning, with little/no obvious compensating factors. It should not be permitted.</p>	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>

2688	603 - 10	Vel Anderson	Gibsons, BC	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). The proposed “compensation channel” is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Recommendation: Any approval of this proposal should include a contingency bond to fund maintenance of the new streamway, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project.</p>	<p>The proposed Project will lead to the loss of approximately 200 m2 of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. The proposed design for the channel extension uses the existing lower channel as a template and it will meet the factors and criteria that are generally accepted for the construction of a functional groundwater-fed spawning channel. It should provide conditions similar to the existing run habitat in the lower section of WC2 that was designed as chum spawning habitat by DFO and where spawning activity was observed during the November 2016 survey.</p> <p>The creation of the pit lake is predicted to cause a doubling of groundwater influx into the lower section of WC2. The increase in ground water influx will lead to additional groundwater upwelling and the increased upwelling is expected to provide increased levels of intergravel flow that will be suitable for eggs and alevins. The average depth in the proposed offset habitat extension and the remaining section of WC2 is predicted to be above 0.3 m making it suitable for salmon spawning. As described in the Aquatic Health assessment provided in Surface Water Resources (Section 5.5.7.2), the water quality and temperature of ground and surface water entering the offset habitat and existing lower section of WC2 will be suitable for salmonids to complete all stages of their life history including spawning.</p> <p>In response to comments from the Technical Working Group, the design of the habitat offset plan was revised to allow approximately 20 m of pool habitat upstream of the culvert and approximately 20 m of gravel bed run habitat downstream of the culvert to be retained which will avoid approximately 232 m2 of habitat loss. The design of the channel extension incorporates run and pool habitat in approximately a 1 : 1 ratio, based on this design and the use of run habitat for spawning in the existing lower channel it is expected that more than 2, 000 m2 of the offset channel habitat will provide conditions suitable for salmonid spawning.</p>
2689	603 - 11	Vel Anderson	Gibsons, BC	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). 2695	603 - 17	Vel Anderson	Gibsons, BC	<p>Issue 10: The impact of marine noise is insufficiently studied in the application</p> <p>The impact of marine noise (from the conveyor belts –tugs, barge loading and water taxis) on cetaceans, herring, salmon (spawning adult and habituating juveniles) and other at-risk species (including waterfowl) is underestimated in the “science” work done by the Proponent</p> <p>Recommendation: Marine noise transmits 5-10 times farther &amp; faster through water than through air. Marine noise should be carefully baselined and monitored in wide spatial and temporal dimensions around the site Periodic reporting of results that are auditable and accessible to the public should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where marine noise exceeds pre-agreed norms.</p>	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

2701	603 - 23	Vel Anderson	Gibsons, BC	<p>Issue 14: The nearshore strip of forest cover is too narrow</p> <p>The strip of forest cover between the pit and the ocean is too narrow to be sustainable. Blowdown and saltwater invasion will threaten its existence</p> <p>Recommendation: For reasons of sustainability and visual camouflage, increase the width of the ocean-pit separation strip, and lessen the size of the proposed pit and crushing area.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. Maintaining a treed buffer along the foreshore (approx. 25-50 m wide adjacent to the processing area) will also limit dust and noise emissions to the marine environment. Additional screening of lan-based structures may be possible around project components not currently screened by existing vegetation. The nature and extent of vegetation screening incorporated into the site design will be described in the Vegetation Management Plan (Volume 3, Part E, Section 16 of the EAC Application/EIS).</p> <p>A detailed assessment of potential vegetation effects (including windthrow effects) of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS. The significance of windthrow effects were determined to be negligible; few new windward edges will be created. Monitoring of treeline edges will be conducted to evaluate potential windthrow effects and adaptive management will be employed, if necessary.</p>
2702	603 - 24	Vel Anderson	Gibsons, BC	<p>Issue 15: Loss of property values in the nearby strata units</p> <p>The proponent claims little or no loss of value for nearby properties. This assertion is contradicted by many studies that have highlighted the loss of value (including the value associated with quiet enjoyment) at or near industrial sites adjacent to established residential areas. Recent jurisprudence in BC has borne out the right of homeowners to receive compensation for that loss. See <a href="http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882">http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882</a></p> <p>Recommendation: Fair market value compensation for loss of property value must form part of the economic analysis of any approval for this mine.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
2703	603 - 25	Vel Anderson	Gibsons, BC	<p>Issue 16: First Nation consultation – Sechelt FN was omitted this time</p> <p>Squamish and Tseil-Waututh First Nations have been consulted re Burnco, but not the Sechelt FN. The Sechelt First Nations weren't consulted about the gravel quarry at McNab Creek in 2009 either. McNab Creek is in Sechelt traditional territory.</p> <p>Recommendation: Respect/consult with Sechelt First Nations re Burnco.</p>	<p>First Nation consultation requirements are delegated to Proponents by the Crown. For the Proposed Project, only Squamish Nation and the Tseil-Waututh Nation were identified as potentially affected first Nations by the BCEAO. The CEA Agency identified additional Aboriginal Group, however, the Sechelt First Nation was not among these, presumably because of the proximity of the proposed Project to their Traditional Territory.</p>

2706	603 - 28	Vel Anderson	Gibsons, BC	<p>Issue 19: Barge traffic will diminish Howe Sound's recreational and tourism potential and add to the cumulative traffic hazard in Howe Sound</p> <p>Shipping 1-4 million tonnes of aggregate annually from this location will make for 2-6 tug/barge movements daily through Southern Howe Sound,. Routes would cross very busy sailing and small-boat recreational areas, the Howe Sound Marine Trail and ferry routes, the path of LNG tankers exiting from the Woodfibre LNG plant and freighters from Squamish Terminals. This exponentially increases the risk of collisions and loss of life in a narrow waterway and diminishes the amenity and tourism use of the Sound. The cumulative effects and worst-case hazard analysis of this project have been underestimated by the Proponent.</p> <p>Recommendation: A cumulative impact assessment, including loss of amenity and tourism value of the Sound, should be completed prior to deciding on this application. So too should a study of the increased hazards associated with increasing the large-vessel traffic in Howe Sound. Improvements to vessel tracking, buoys and channel markers in the area will be necessary.</p>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
2707	603 - 29	Vel Anderson	Gibsons, BC	<p>Issue 20: The job benefits analysis used the questionable input-output econometric model.</p> <p>BURNCO has used input-output econometric analysis to predict the job creation benefits accruing to the project For resource projects, this is a highly questionable analysis technique. The Australian Institute has written a convincing argument highlighting the inadequacies of input-output analysis. See <a href="http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf">http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf</a> (Input-output was used by the BC Government in arriving at its inflated job estimates for BC's LNG industry.)</p> <p>Recommendation: Red-do the employment estimates and repost/ allow additional time for public scrutiny and comments</p>	<p>The environmental assessment of the Proposed Project used an input-output (I-O) impact modelling methodology to estimate the Project's potential effect on employment (as well as other economic parameters). The B.C. Input-Output Model (BCIOM) was used. The BCIOM is maintained by BC Stats, which is the central statistics agency of the B.C. government. The BCIOM is a version of Statistics Canada's Inter-Provincial Input-Output Model (IPIOM) which BC Stats calibrated for undertaking economic analyses of B.C.-based projects. The BCIOM is a robust, calibrated, third party provided input-output model, and has been previously accepted for use by by the BCEAO and the CEA Agency to assist with estimating the economic impact of proposed projects.</p>

2708	603 - 30	Vel Anderson	Gibsons, BC	<p>Issue 21: There was an inconsistency between the job creation figures shown in 2 different slides in the Open Houses</p> <p>One showed about 300 person-years of employment (over 25years). The other (derived from input-output analysis) showed person-year employment benefits several times that amount.</p> <p>Recommendation: This misleading discrepancy should be resolved by further analysis, and that section of the application re-submitted, with additional time allowed for public scrutiny and comment</p>	<p>The estimated number of jobs created by the proposed Project during construction and operations phases are presented in Section 2.5.4 of the EAC Application/EIS.</p> <p>Employment numbers were presented on three Open House display panels, as follows:</p> <ul style="list-style-type: none"> <li>- Project Specifications: 80 person years during construction and 360 person years during operations (direct, indirect and induced);</li> <li>- Project Benefits: 12 full-time jobs at the site (i.e. direct only);</li> <li>- Sustainable Economy: 119 jobs during construction and 99 jobs during operations (direct, indirect and induced); 33 long-term jobs during operations are expected to be filled by Sunshine Coast residents.</li> </ul>
2709	603 - 31	Vel Anderson	Gibsons, BC	<p>Issue 22: Preservation of marine tourism, hiking access to the vicinity of McNab</p> <p>Moorages, anchorages, swimming facilities and back-country access have long been part of the McNab Creek area's attractions for Howe Sound visitors and local boating clubs</p> <p>Recommendation: The application fails to properly address how these local amenities will be protected. Neither does it propose how loss of these amenities will be compensated for. The Management Plan should address this issue.</p>	<p>Harvesting fish and wildlife' and 'Outdoor recreation and tourism' are valued components in the environmental assessment of the Proposed Project (see Table 7.3-1). No displacement effects on recreational hunting or other recreational activities is anticipated due to the Proposed Project because the primary access to the local study area is through the Proposed Property, and public access and use of the Proposed Property has never been permitted. During the construction and operation phases, recreationists and tourists would continue to have access to the foreshore area below the high water mark and to the anchorage area in the vicinity of where McNab Creek enters Howe Sound.</p> <p>Proposed Project construction and operations would prevent marine-based recreational and tourism activities occurring around the Project jetty. As the jetty is located within an existing log boom tenure and recreational and tourism activities are concentrated on the eastern side of the local study area (where McNab Creek enters Howe Sound), this effect is considered to be negligible.</p> <p>Displacement on the water would occur on an intermittent basis as a result of Proposed Project-related vessel traffic, which would require smaller vessels to alter direction and/or speed when navigating at the same time as water taxis or barges (Volume 2, Part B - Section 7.2). These navigational challenges are present in the LSA due to forestry activity, and are subject to the Collision Regulations of the Canada Shipping Act. Any resulting effects on recreational boating recreational activities due to potential interactions of recreational vessels and equipment and Project-associated vessels are not detectable or not measureable, so potential effects of the Proposed Project on water-based recreation and tourism access matters in the construction and operation phases are determined to be negligible.</p> <p>As part of the Marine Transport Management Plan outlined in Marine Transport (Volume 2, Part B - Section 7.2), BURNCO would also develop and implement strategies, best management practices and guidelines to avoid and minimise Proposed Project - related disruption of marine-based recreational activities during construction and operations. As part of the development of this plan, BURNCO would consult with key marine user groups (e.g., McNab Strata, yacht clubs, camps, and kayaking operators) to discuss strategies (including but not limited to routing options) to manage the interaction of Proposed Project vessel traffic with recreational and tourism areas during the high season months.</p>

2710	603 - 32	Vel Anderson	Gibsons, BC	<p>Issue 23: End-of-project remediation</p> <p>The compensation channel is an artificial structure which will likely not survive long after project's end.</p> <p>Recommendation: Restoring the natural streamway should be a firm end-state requirement.</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>
2711	604 - 1	Cheryl Wozny	Lions Bay, BC	I believe the Burnco Aggregate Mine Project should not be allowed to proceed based on a long list of items. They include the following:	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2712	604 - 2	Cheryl Wozny	Lions Bay, BC	<p>Health</p> <p>Sightline, noise and dust: The proposed mine is far too close to existing residential properties and the McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of the confined topography of the area, mitigation of these damaging effects is impractical.</p>	The McNab Creek strata title properties are located more than 1000' from any component of the proposed Project.
2713	604 - 3	Cheryl Wozny	Lions Bay, BC	<p>Health</p> <p>Sightline, noise and dust: The proposed mine is far too close to existing residential properties and the McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of the confined topography of the area, mitigation of these damaging effects is impractical.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

2714	604 - 4	Cheryl Wozny	Lions Bay, BC	<p>Health Sightline, noise and dust: The proposed mine is far too close to existing residential properties and the McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of the confined topography of the area, mitigation of these damaging effects is impractical.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>
2715	604 - 5	Cheryl Wozny	Lions Bay, BC	<p>Health Sightline, noise and dust: The proposed mine is far too close to existing residential properties and the McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of the confined topography of the area, mitigation of these damaging effects is impractical.</p>	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
2716	604 - 6	Cheryl Wozny	Lions Bay, BC	<p>Noise - The impact of marine noise is insufficiently studied in the application. The amount of noise generated by the crushing facility and mining operation on a consistent basis, will create Noise health effects. Marine noise transmits 5-10 times farther &amp; faster through water than through air. Health consequences of regular exposure, to consistent elevated sound levels, from the new noise generated by this facility, is known to cause hearing impairment, hypertension, ischemic heart disease, annoyance, and sleep disturbance.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>

2717	604 - 7	Cheryl Wozny	Lions Bay, BC	Air Quality including dust - Dust and particulate matter generated from the crushing facility and mining operation will impact the health of residents of the Howe Sound region. These harmful allergens can trigger allergic reactions and asthma in many people. Air quality, which will inevitably deteriorate in the vicinity of the mine, is insufficiently characterized in the application.	<p>A detailed assessment of potential public health effects of the Proposed Project is presented in Volume 2, Part B – Section 9.1 of the EAC Application/EIS.</p> <p>Potential effects of the Proposed Project on human health assessed considered activities contributing to air emissions, deposition of particulate matter to terrestrial environments, and emission of substances to aquatic environments.</p> <p>Following the application of proposed mitigation, all potential health effects were determined to be negligible or not significant.</p>
2718	604 - 8	Cheryl Wozny	Lions Bay, BC	Water Quality is insufficiently characterized in the application. Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs. Siltation monitoring should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.	<p>Wash water will be processed for removal of fines and silt in a 95% efficient wash plant to be fed using recycled water from two large storage tanks. Fines will not be discharged to the estuary; they will be deposited in a designated inland fines area and covered in accordance with an approved Reclamation and Effective Closure Plan.</p>
2719	604 - 9	Cheryl Wozny	Lions Bay, BC	Economy Howe Sound directly contributes hundreds of millions of dollars of revenue from tourism, entertainment and commercial fishing industries. The Burnco Aggregate Mine Project will reduce this revenue significantly and not provide corresponding off setting revenue for the losses incurred.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2720	604 - 10	Cheryl Wozny	Lions Bay, BC	Also, Regional demand for additional aggregate is not demonstrated. A greater profit margin for the Proponent should not be grounds for destroying the estuary of McNab Creek.	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response

2721	604 - 11	Cheryl Wozny	Lions Bay, BC	The amount of noise generated by the crushing facility and mining operation on a consistent basis will lower the property value of homes located in the area including Lions Bay, Furry Creek, the proposed Porteau Cove housing development, Gambier Island, Anvil Island, Britania Mines and of course McNab Creek.	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
2722	604 - 12	Cheryl Wozny	Lions Bay, BC	Dust and particulate matter generated by the crushing facility and mining operation will increase health costs to BC Taxpayers.	<p>A detailed assessment of potential public health effects of the Proposed Project is presented in Volume 2, Part B – Section 9.1 of the EAC Application/EIS.</p> <p>Potential effects of the Proposed Project on human health assessed considered activities contributing to air emissions, deposition of particulate matter to terrestrial environments, and emission of substances to aquatic environments.</p> <p>Following the application of proposed mitigation, all potential health effects were determined to be negligible or not significant.</p>
2723	604 - 13	Cheryl Wozny	Lions Bay, BC	Wakes from commercial barge traffic will increase insurance claims and Barge traffic will diminish Howe Sound's recreational and tourism potential and add to the cumulative traffic hazard in Howe Sound.	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>

2729	604 - 19	Cheryl Wozny	Lions Bay, BC	Loss of productive salmon habitat, that will be impacted negatively from mining a pristine estuary. The project has (twice) been rejected by Fisheries & Oceans Canada because of the likely loss of salmon habitat in McNab Creek. In a year of disastrous returns to the Fraser and other runs, this proposal is ill-timed and ill-advised.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
2730	604 - 20	Cheryl Wozny	Lions Bay, BC	Marine resources such as killer whales, dolphins, crabs, and trout will all be negatively impacted from the noise and disturbance of the estuary.	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

2731	604 - 21	Cheryl Wozny	Lions Bay, BC	Burnco's consultants documenting that the gravel quarry could be home to 21 species officially at risk. This includes Roosevelt elk, re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2732	604 - 22	Cheryl Wozny	Lions Bay, BC	<p>The McNab creek region is a known as a tourism and recreation area. Introducing a mining operation will severely impact and change the use of the region. The mine will:</p> <ul style="list-style-type: none"> <li>• limit the recreational activities enjoyed on the water in front of the estuary</li> <li>• limit if not stop the fishing and crabbing opportunities on the water in front of the area</li> <li>• severely impact the recreational opportunities on Gambier Island directly across from the area</li> <li>• the increase commercial barge traffic will create a hazardous situation for boaters, recreational kayakers and children on the water from the surrounding commercial kids camps</li> </ul>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2733	604 - 23	Cheryl Wozny	Lions Bay, BC	Also, the proposed mine is far too close to existing residential properties and the McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of the confined topography of the area, mitigation of these damaging effects is impractical. Because of unsightliness, the adverse effects on property values, noise and dust issues, gravel mining operations are generally not allowed within 1000' of any residential property.	The McNab Creek strata title properties are located more than 1000' from any component of the proposed Project.

2744	605 - 1	Future of Howe Sound Society	Howe Sound, BC	<p>We enclose a letter from LGL Limited who has undertaken an independent review of the Burnco Environmental Impact Study that has been submitted by Burnco in connection with its application for an Environmental Assessment Certificate.</p> <p>As you will see from the attached, the independent consultant has identified a number of deficiencies in the EAC application and concludes by saying, "it is our professional opinion that the BURNCO Aggregate Project EAC application did not effectively address potential adverse residual and cumulative effects to marine resources, recreational values and land management. We recommend that the British Columbia Environmental Assessment Office, in its environmental assessment report, conclude that the project will cause significant environmental effects."</p> <p>We wholeheartedly agree with the consultant's conclusion that the Environmental Impact Study does not properly address the impacts that the proposed aggregate mine will have. We strongly urge the BC EAO to recommend that the application for approval of this proposed project be denied.</p>	BURNCO prepared a Technical Memo response to comments provided by the Future of Howe Sound Society in a letter to Ruth Simons (Executive Director) from LGL Limited dated September 27, 2016 titled Re: Review of the Environmental Assessment Certificate Application for the BURNCO Aggregate Project. See 10-Jan-2017 Technical Memo entitled 'Response to Re: Review of the Environmental Assessment Certificate Application for the BURNCO Aggregate Project'.
2745	606 - 1	Peter Kowalczyk	Bowyer Island, BC	I wish to register my strong objection to the Proposed BURNCO McNab Creek gravel pit.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2746	606 - 2	Peter Kowalczyk	Bowyer Island, BC	The damage done to the environment, and the costs to the recreation industry in the Howe Sound area outweigh the benefits this mine will bring to the economy.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2747	606 - 3	Peter Kowalczyk	Bowyer Island, BC	There is no shortage of gravel, present gravel sources can supply the demand for gravel. The McNab Creek gravel pit represents cheap gravel, if the costs to others is not calculated in the equation.	<p>The Proposed Project will provide sand and gravel that will be used to meet the growing demands of the BC marketplace.</p> <p>Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>
2748	606 - 4	Peter Kowalczyk	Bowyer Island, BC	The application has been denied before. The situation has not changed. It should be denied again.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

2749	606 - 5	Peter Kowalczyk	Bowyer Island, BC	I attach a tabulated list of problems with the new application that have not been addressed properly by the project proponent.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2750	606 - 6	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 1: Regional demand for additional aggregate is not demonstrated</p> <p>The Vancouver market requirement for an additional gravel /aggregate source is not supported by the proponent's documentation. A greater profit margin for the Proponent should not be grounds for destroying the estuary of McNab Creek.</p> <p>Recommendation: A supply/demand report showing strong evidence of the need for supply from this location (and the unavailability of supply from established locations), such as has been done for the Okanagan region, should be prepared before considering a permit for this project. See <a href="https://www.regionaldistrict.com/media/112368/2013_11_08__Full_Report__Aggregate_Supply_and_Demand_Update_and_Analysis.pdf">https://www.regionaldistrict.com/media/112368/2013_11_08__Full_Report__Aggregate_Supply_and_Demand_Update_and_Analysis.pdf</a></p>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
2751	606 - 7	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 2: Loss of productive salmon habitat</p> <p>The project has (twice) been rejected by Fisheries &amp; Oceans Canada because of the likely loss of salmon habitat in McNab Creek. In a year of disastrous returns to the Fraser and other runs, this proposal is ill-timed and ill-advised.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

	Ref #	Commenter (Name)	Location		
2752	606 - 8	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 3: Insufficient data for at-risk species baselines.</p> <p>For several key aquatic and land-based species (such as anadromous salmon, resident cutthroat trout and Roosevelt elk), population data was collected over far too narrow a timespan to be useful for establishing accurate baselines. Without accurate baselines, quantitative monitoring of the effects of this project will not be possible.</p> <p>Recommendation: Part-year data is utterly insufficient to establishing accurate baselines. At least five years of data should be collected to afford accurate baselines usable for ongoing monitoring of effects on species populations and habitat. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where habitat damage exceeds pre-agreed norms.</p>	<p>The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada. The baseline studies conducted are sufficient for the purpose of assessing potential effects of the Proposed Project on selected Valued Components. Additional years of supplemental field studies are not required or proposed for the assessment.</p> <p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS. Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>
2753	606 - 9	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 4: 21 species officially at risk from Burnco.</p> <p>Burnco's consultants documented that the gravel quarry could be home to 21 species officially at risk. This includes Roosevelt elk , re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

	Ref #	Commenter (Name)	Location		
2754	606 - 10	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 5: Will McNab Creek and the estuary become salty?</p> <p>As rock is removed from the mine, fresh water from the estuary will creep into the resultant 25m pit. This will lead to salt water seeping into the estuary, and into McNab Creek. This will kill a variety of salmon and plants.</p> <p>Recommendation: Have thorough hydrological studies done over several years. Use the precautionary principle. Local authorities (eg. SCR D) should have the power to compel a reduction, suspension or cessation of mine activities where salination exceeds preagreed norms.</p>	<p>The hydraulic conductivity of the valley sediments is much higher than hydraulic conductivity of any bedrock structures, if they exist. Therefore, the groundwater flow in the valley sediments will dominate and it will provide key control on the position of the salt water-freshwater interface. Furthermore, because of topographic highs that surround the valley, the hydraulic heads are expected to be higher than in the valley sediments, inhibiting saltwater ingress. As presented in Section 3.3 in Appendix 5.6-A of the EAC Application/EIS, based on monitoring data (2010-2014), tidal elevations exceeded groundwater elevation only in rare occasions between July and September of each monitoring year. During these high tide intervals, there is an inferred landward gradient in the immediate vicinity of the shoreline; however, its duration is inherently less than the corresponding periods of southwards gradient associated with lower tidal position. Accordingly, the net groundwater flow direction during the entire monitoring period is confirmed to be southwards toward the marine foreshore. Moreover, monitoring data indicate that the saltwater wedge could be located at greater depths than approximately -30 m elevation; analytical calculations based on methodology presented in Domenico and Schwartz (1990) showed that, due to relatively high groundwater flow in the alluvial sediments, the saltwater edge could be depressed to the depth of the overburden/bedrock contact within 50 m to 150 m of the ocean shore. Based on these observations, the potential presence of a fault structure in bedrock in the vicinity of the project area is not considered to influence groundwater flow direction in the valley sediments or increase the risk of saltwater intrusion.</p>
2755	606 - 11	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 6: Unsuitable location</p> <p>This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area. In 2009 SCR D said no to a permit for an aggregate operation at McNab Creek. There was concern re noise and dust from onsite crushing, sorting, weighing, and stockpiling, all of which Burnco plans to do. Why allow these activities now?</p> <p>Recommendation: To do so would represent atrocious planning, with little/no obvious compensating factors. It should not be permitted.</p>	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>

2756	606 - 12	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). The proposed “compensation channel” is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Recommendation: Any approval of this proposal should include a contingency bond to fund maintenance of the new streamway, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project.</p>	<p>The proposed Project will lead to the loss of approximately 200 m<sup>2</sup> of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. The proposed design for the channel extension uses the existing lower channel as a template and it will meet the factors and criteria that are generally accepted for the construction of a functional groundwater-fed spawning channel. It should provide conditions similar to the existing run habitat in the lower section of WC2 that was designed as chum spawning habitat by DFO and where spawning activity was observed during the November 2016 survey.</p> <p>The creation of the pit lake is predicted to cause a doubling of groundwater influx into the lower section of WC2. The increase in ground water influx will lead to additional groundwater upwelling and the increased upwelling is expected to provide increased levels of intergravel flow that will be suitable for eggs and alevins. The average depth in the proposed offset habitat extension and the remaining section of WC2 is predicted to be above 0.3 m making it suitable for salmon spawning. As described in the Aquatic Health assessment provided in Surface Water Resources (Section 5.5.7.2), the water quality and temperature of ground and surface water entering the offset habitat and existing lower section of WC2 will be suitable for salmonids to complete all stages of their life history including spawning.</p> <p>In response to comments from the Technical Working Group, the design of the habitat offset plan was revised to allow approximately 20 m of pool habitat upstream of the culvert and approximately 20 m of gravel bed run habitat downstream of the culvert to be retained which will avoid approximately 232 m<sup>2</sup> of habitat loss. The design of the channel extension incorporates run and pool habitat in approximately a 1 : 1 ratio, based on this design and the use of run habitat for spawning in the existing lower channel it is expected that more than 2, 000 m<sup>2</sup> of the offset channel habitat will provide conditions suitable for salmonid spawning.</p>
2757	606 - 13	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). 2763	606 - 19	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 10: The impact of marine noise is insufficiently studied in the application</p> <p>The impact of marine noise (from the conveyor belts –tugs, barge loading and water taxis) on cetaceans, herring, salmon (spawning adult and habituating juveniles) and other at-risk species (including waterfowl) is underestimated in the “science” work done by the Proponent</p> <p>Recommendation: Marine noise transmits 5-10 times farther &amp; faster through water than through air. Marine noise should be carefully baselined and monitored in wide spatial and temporal dimensions around the site Periodic reporting of results that are auditable and accessible to the public should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where marine noise exceeds pre-agreed norms.</p>	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

2766	606 - 22	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 12: Water Quality is insufficiently characterized in the application</p> <p>Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs.</p> <p>Recommendation: Siltation monitoring (both in the original and compensation channels and in the nearby ocean) , with periodic reporting of results that are auditable and accessible to the public , should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.</p>	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>
2767	606 - 23	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 12: Water Quality is insufficiently characterized in the application</p> <p>Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs.</p> <p>Recommendation: Siltation monitoring (both in the original and compensation channels and in the nearby ocean) , with periodic reporting of results that are auditable and accessible to the public , should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.</p>	<p>A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken. Adaptive management techniques to be implemented as required include:</p> <ul style="list-style-type: none"> <li>- Continue to evaluate the extent of the pit during operations.</li> <li>- During the wet season, if water levels in the pit lake become higher than has been designed for the Pit Lake Containment Berm then the valves in the culverts will be closed to reduce the amount of water reporting to the pit from the surface water on the western slope.</li> <li>- The height of the pit lake at the outlet structure can be adjusted to increase or decrease the level of the pit lake (e.g., adding or lowering stop logs) at closure to maintain the hydraulic gradient between McNab Creek and the Project Area following closure.</li> </ul>
2768	606 - 24	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 13: "Daytime Hours" definition</p> <p>The Proponent advertises that the plant will operate only on weekdays and during "daytime hours". Daylight hours vary seasonally, but the definition of "daytime hours" is unclear.</p> <p>Recommendation: Clearly define "daytime hours" in the proposal.</p>	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2769	606 - 25	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 14: The nearshore strip of forest cover is too narrow</p> <p>The strip of forest cover between the pit and the ocean is too narrow to be sustainable. Blowdown and saltwater invasion will threaten its existence</p> <p>Recommendation: For reasons of sustainability and visual camouflage, increase the width of the ocean-pit separation strip, and lessen the size of the proposed pit and crushing area.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. Maintaining a treed buffer along the foreshore (approx. 25-50 m wide adjacent to the processing area) will also limit dust and noise emissions to the marine environment. Additional screening of lan-based structures may be possible around project components not currently screened by existing vegetation. The nature and extent of vegetation screening incorporated into the site design will be described in the Vegetation Management Plan (Volume 3, Part E, Section 16 of the EAC Application/EIS).</p> <p>A detailed assessment of potential vegetation effects (including windthrow effects) of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS. The significance of windthrow effects were determined to be negligible; few new windward edges will be created. Monitoring of treeline edges will be conducted to evaluate potential windthrow effects and adaptive management will be employed, if necessary.</p>
2770	606 - 26	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 15: Loss of property values in the nearby strata units</p> <p>The proponent claims little or no loss of value for nearby properties. This assertion is contradicted by many studies that have highlighted the loss of value (including the value associated with quiet enjoyment) at or near industrial sites adjacent to established residential areas. Recent jurisprudence in BC has borne out the right of homeowners to receive compensation for that loss. See <a href="http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882">http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882</a></p> <p>Recommendation: Fair market value compensation for loss of property value must form part of the economic analysis of any approval for this mine.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
2771	606 - 27	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 16: First Nation consultation – Sechelt FN was omitted this time</p> <p>Squamish and Tseil-Waututh First Nations have been consulted re Burnco, but not the Sechelt FN. The Sechelt First Nations weren't consulted about the gravel quarry at McNab Creek in 2009 either. McNab Creek is in Sechelt traditional territory.</p> <p>Recommendation: Respect/consult with Sechelt First Nations re Burnco.</p>	<p>First Nation consultation requirements are delegated to Proponents by the Crown. For the Proposed Project, only Squamish Nation and the Tseil-Waututh Nation were identified as potentially affected first Nations by the BCEAO. The CEA Agency identified additional Aboriginal Group, however, the Sechelt First Nation was not among these, presumably because of the proximity of the proposed Project to their Traditional Territory.</p>

2772	606 - 28	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 17: Advisory Committee of voluntary citizens</p> <p>In 2009 when a gravel quarry at McNab Creek was turned down by SCRD, one requirement was an Advisory Committee of volunteer citizens to provide ongoing input with the goal of community acceptance of the project.</p> <p>Recommendation: Require the formation of an Advisory Committee of volunteer citizens.</p>	<p>BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.</p>
2773	606 - 29	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 18: The job benefits were analyzed on the basis of too narrow an RAA.</p> <p>BURNCO currently sources its aggregate from Jervis Inlet, Port McNeil and Coquitlam. To gauge the benefits to the BC economy, the net job creation figures (i.e. McNab's 12 jobs less the job losses at the above aggregate sources) as a consequence of allowing the McNab Creek operation must be considered.</p> <p>Recommendation: If there is little or no net job gain to BC as a result of this proposal, it should be firmly rejected. Jobs in areas like Port McNeil are much harder to come by than in the Lower Mainland/ Howe Sound.</p>	<p>The local spatial study area for the operations phase labour market effects (including employment) of the Proposed project was described in the Application Information Requirements/EIS Guidelines, which was approved by the BCEAO and the CEA Agency on December 16, 2014 after review by the Technical Working Group established to guide this assessment. This local spatial study area is Sunshine Coast Regional District.</p> <p>The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.</p>

2774	606 - 30	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 19: Barge traffic will diminish Howe Sound's recreational and tourism potential and add to the cumulative traffic hazard in Howe Sound</p> <p>Shipping 1-4 million tonnes of aggregate annually from this location will make for 2-6 tug/barge movements daily through Southern Howe Sound,. Routes would cross very busy sailing and small-boat recreational areas, the Howe Sound Marine Trail and ferry routes, the path of LNG tankers exiting from the Woodfibre LNG plant and freighters from Squamish Terminals. This exponentially increases the risk of collisions and loss of life in a narrow waterway and diminishes the amenity and tourism use of the Sound. The cumulative effects and worst-case hazard analysis of this project have been underestimated by the Proponent.</p> <p>Recommendation: A cumulative impact assessment, including loss of amenity and tourism value of the Sound, should be completed prior to deciding on this application. So too should a study of the increased hazards associated with increasing the large-vessel traffic in Howe Sound. Improvements to vessel tracking, buoys and channel markers in the area will be necessary.</p>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
2775	606 - 31	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 20: The job benefits analysis used the questionable input-output econometric model.</p> <p>BURNCO has used input-output econometric analysis to predict the job creation benefits accruing to the project For resource projects, this is a highly questionable analysis technique. The Australian Institute has written a convincing argument highlighting the inadequacies of input-output analysis. See <a href="http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf">http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf</a> (Input-output was used by the BC Government in arriving at its inflated job estimates for BC's LNG industry.)</p> <p>Recommendation: Red-do the employment estimates and repost/ allow additional time for public scrutiny and comments</p>	<p>The environmental assessment of the Proposed Project used an input-output (I-O) impact modelling methodology to estimate the Project's potential effect on employment (as well as other economic parameters). The B.C. Input-Output Model (BCIOM) was used. The BCIOM is maintained by BC Stats, which is the central statistics agency of the B.C. government. The BCIOM is a version of Statistics Canada's Inter-Provincial Input-Output Model (IPIOM) which BC Stats calibrated for undertaking economic analyses of B.C.-based projects. The BCIOM is a robust, calibrated, third party provided input-output model, and has been previously accepted for use by by the BCEAO and the CEA Agency to assist with estimating the economic impact of proposed projects.</p>

2776	606 - 32	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 21: There was an inconsistency between the job creation figures shown in 2 different slides in the Open Houses</p> <p>One showed about 300 person-years of employment (over 25years). The other (derived from input-output analysis) showed person-year employment benefits several times that amount.</p> <p>Recommendation: This misleading discrepancy should be resolved by further analysis, and that section of the application re-submitted, with additional time allowed for public scrutiny and comment</p>	<p>The estimated number of jobs created by the proposed Project during construction and operations phases are presented in Section 2.5.4 of the EAC Application/EIS.</p> <p>Employment numbers were presented on three Open House display panels, as follows:</p> <ul style="list-style-type: none"> <li>- Project Specifications: 80 person years during construction and 360 person years during operations (direct, indirect and induced);</li> <li>- Project Benefits: 12 full-time jobs at the site (i.e. direct only);</li> <li>- Sustainable Economy: 119 jobs during construction and 99 jobs during operations (direct, indirect and induced); 33 long-term jobs during operations are expected to be filled by Sunshine Coast residents.</li> </ul>
2777	606 - 33	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 22: Preservation of marine tourism, hiking access to the vicinity of McNab</p> <p>Moorages, anchorages, swimming facilities and back-country access have long been part of the McNab Creek area's attractions for Howe Sound visitors and local boating clubs</p> <p>Recommendation: The application fails to properly address how these local amenities will be protected. Neither does it propose how loss of these amenities will be compensated for. The Management Plan should address this issue.</p>	<p>Harvesting fish and wildlife' and 'Outdoor recreation and tourism' are valued components in the environmental assessment of the Proposed Project (see Table 7.3-1). No displacement effects on recreational hunting or other recreational activities is anticipated due to the Proposed Project because the primary access to the local study area is through the Proposed Property, and public access and use of the Proposed Property has never been permitted. During the construction and operation phases, recreationists and tourists would continue to have access to the foreshore area below the high water mark and to the anchorage area in the vicinity of where McNab Creek enters Howe Sound.</p> <p>Proposed Project construction and operations would prevent marine-based recreational and tourism activities occurring around the Project jetty. As the jetty is located within an existing log boom tenure and recreational and tourism activities are concentrated on the eastern side of the local study area (where McNab Creek enters Howe Sound), this effect is considered to be negligible.</p> <p>Displacement on the water would occur on an intermittent basis as a result of Proposed Project-related vessel traffic, which would require smaller vessels to alter direction and/or speed when navigating at the same time as water taxis or barges (Volume 2, Part B - Section 7.2). These navigational challenges are present in the LSA due to forestry activity, and are subject to the Collision Regulations of the Canada Shipping Act. Any resulting effects on recreational boating recreational activities due to potential interactions of recreational vessels and equipment and Project-associated vessels are not detectable or not measureable, so potential effects of the Proposed Project on water-based recreation and tourism access matters in the construction and operation phases are determined to be negligible.</p> <p>As part of the Marine Transport Management Plan outlined in Marine Transport (Volume 2, Part B - Section 7.2), BURNCO would also develop and implement strategies, best management practices and guidelines to avoid and minimise Proposed Project - related disruption of marine-based recreational activities during construction and operations. As part of the development of this plan, BURNCO would consult with key marine user groups (e.g., McNab Strata, yacht clubs, camps, and kayaking operators) to discuss strategies (including but not limited to routing options) to manage the interaction of Proposed Project vessel traffic with recreational and tourism areas during the high season months.</p>

2778	606 - 34	Peter Kowalczyk	Bowyer Island, BC	<p>Issue 23: End-of-project remediation</p> <p>The compensation channel is an artificial structure which will likely not survive long after project's end.</p> <p>Recommendation: Restoring the natural streamway should be a firm end-state requirement.</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>
2779	607 - 1	Albert Roos	North Vancouver, BC	<p>As a frequent boater on Howe Sound for the past 20 years, I have seen enormous improvements in the Sound's marine wildlife population. Where once it appeared nearly "dead", whales are now frequently seen, as are Pacific White Sided Dolphins. Recreational fishing has rebounded. The McNab Creek estuary is a vital part of the marine ecosystem in this area. Burnco's proposed gravel pit site is ludicrous. On a simple cost vs. benefit analysis, we have a gravel operation employing a few people on the one hand vs. the health of a major recreational area and tourist attraction located minutes from a metropolitan area of almost 3 million people (and growing). We have one chance to make the correct decision. Burnco's application should be denied.</p>	<p>It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).</p> <p>Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.</p>
2780	607 - 2	Albert Roos	North Vancouver, BC	<p>As a frequent boater on Howe Sound for the past 20 years, I have seen enormous improvements in the Sound's marine wildlife population. 2783	607 - 5	Albert Roos	North Vancouver, BC	As a frequent boater on Howe Sound for the past 20 years, I have seen enormous improvements in the Sound's marine wildlife population. Where once it appeared nearly "dead", whales are now frequently seen, as are Pacific White Sided Dolphins. Recreational fishing has rebounded. The McNab Creek estuary is a vital part of the marine ecosystem in this area. Burnco's proposed gravel pit site is ludicrous. On a simple cost vs. benefit analysis, we have a gravel operation employing a few people on the one hand vs. the health of a major recreational area and tourist attraction located minutes from a metropolitan area of almost 3 million people (and growing). We have one chance to make the correct decision. Burnco's application should be denied.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
2784	607 - 6	Albert Roos	North Vancouver, BC	As a frequent boater on Howe Sound for the past 20 years, I have seen enormous improvements in the Sound's marine wildlife population. Where once it appeared nearly "dead", whales are now frequently seen, as are Pacific White Sided Dolphins. Recreational fishing has rebounded. The McNab Creek estuary is a vital part of the marine ecosystem in this area. Burnco's proposed gravel pit site is ludicrous. On a simple cost vs. benefit analysis, we have a gravel operation employing a few people on the one hand vs. the health of a major recreational area and tourist attraction located minutes from a metropolitan area of almost 3 million people (and growing). We have one chance to make the correct decision. Burnco's application should be denied.	The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.  Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by: - Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC; - Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and - Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.  The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.
2785	608 - 1	Eoin Finn	Bowyer Island, BC	I do not want this mine in Howe Sound.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

2786	608 - 2	Eoin Finn	Bowyer Island, BC	McNab Creek is normally a quiet area of the Sound - a significant reason why the strata owners at McNab and many others live thereabouts. The Burnco mine operation will be noisy- how noisy is clearly documented in the attached study of aggregate mines by the U.S. National Institute for Occupational Safety and Health (NIOSH), which shows typical noise levels exceeding 100dba in the immediate vicinity of such facilities. This noise level is not only unacceptable in such an area, it is highly annoying to local receptors and can cause permanent hearing loss in mine workers. As the valley topography will amplify the sound, I think a far more detailed assessment of probable noise and its damage to the quiet enjoyment of the area be done before any permits are considered for this operation.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p> <p>Site and activity specific Health and Safety Plans will outline specific procedures and protocols for working around active construction sites. BURNCO's corporate Health, Safety and Environment (HSE) Management Plan is provided in Volume 4, Part G, Section 22, Appendix 16-B of th EAC Application/EIS.</p>
2787	609 - 1	Personal Information Withheld	New Westminster, BC	This is absurd project the and should not be allowed.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

2795	613 - 1	Personal Information Withheld	Oshawa, ON	I call on you to take action today and stand with the communities and municipalities around the Sound who say NO to Woodfibre LNG and increased greenhouse gas emissions into the airshed.	<p>A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS. Potential effects considered were changes in GHG emissions as a result of the Project, the Project's contribution to climate change through the emission of GHG's, and how potential changes in climate will affect project-related infrastructure.</p> <p>Proposed mitigation includes the use of electricity instead of fossil fuels, routine maintenance of vehicles, and minimizing idling of vehicles and tugs. Mitigation measures that will reduce GHG emissions are consistent with specific actions within the Seas-to-Sky Air Quality Management Plan.</p> <p>Following the application of proposed mitigation, the contribution of the proposed Project GHG emissions to provincial, federal and global totals were determined to be negligible.</p>
2796	614 - 1	Personal Information Withheld	Gibsons, BC	Salmon returns in BC hit an all time low in 2016. As water temperatures warm to dangerous levels, the BCEAO must take a proactive approach and ensure Proponents include current data and analysis of the effects of climate change on fish/habitat as part of the Environmental Assessment process. Projects such as this, which will negatively impact fish/habitat in the short, medium and/or long-term, should not be approved.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2797	614 - 2	Personal Information Withheld	Gibsons, BC	Water quality is insufficiently characterized in the application. Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs. The project should not be approved until the proponent can show that siltation will not cause harm to fish/habitat.	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>

2798	614 - 3	Personal Information Withheld	Gibsons, BC	As gravel is extracted from the ground, fresh water from the estuary would flow into the pit. and change the hydraulic nature of the land, resulting in saltwater seeping into the estuary, and into McNab Creek. Saltwater in the estuary and creek could kill a variety of salmon and plants. This project should not be approved before thorough hydrological studies have been done, over several years, and this issue has been adequately addressed.	The hydraulic conductivity of the valley sediments is much higher than hydraulic conductivity of any bedrock structures, if they exist. Therefore, the groundwater flow in the valley sediments will dominate and it will provide key control on the position of the salt water-freshwater interface. Furthermore, because of topographic highs that surround the valley, the hydraulic heads are expected to be higher than in the valley sediments, inhibiting saltwater ingress. As presented in Section 3.3 in Appendix 5.6-A of the EAC Application/EIS, based on monitoring data (2010-2014), tidal elevations exceeded groundwater elevation only in rare occasions between July and September of each monitoring year. During these high tide intervals, there is an inferred landward gradient in the immediate vicinity of the shoreline; however, its duration is inherently less than the corresponding periods of southwards gradient associated with lower tidal position. Accordingly, the net groundwater flow direction during the entire monitoring period is confirmed to be southwards toward the marine foreshore. Moreover, monitoring data indicate that the saltwater wedge could be located at greater depths than approximately -30 m elevation; analytical calculations based on methodology presented in Domenico and Schwartz (1990) showed that, due to relatively high groundwater flow in the alluvial sediments, the saltwater edge could be depressed to the depth of the overburden/bedrock contact within 50 m to 150 m of the ocean shore. Based on these observations, the potential presence of a fault structure in bedrock in the vicinity of the project area is not considered to influence groundwater flow direction in the valley sediments or increase the risk of saltwater intrusion.
2799	614 - 4	Personal Information Withheld	Gibsons, BC	Burnco's consultants documented that the gravel quarry could be home to 21 species officially at risk. This includes Roosevelt elk. For several key aquatic and land-based species (such as anadromous salmon, resident cutthroat trout and Roosevelt elk), population data was collected over far too narrow a timespan to be useful for establishing accurate baselines. Without accurate baselines, quantitative monitoring of the effects of this project will not be possible. Part-year data is utterly insufficient to establishing accurate baselines. At least five years of data should be collected to afford accurate baselines usable for ongoing monitoring of effects on species populations and habitat.	The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada. The baseline studies conducted are sufficient for the purpose of assessing potential effects of the Proposed Project on selected Valued Components. Additional years of supplemental field studies are not required or proposed for the assessment.  Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS. Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.
2800	614 - 5	Personal Information Withheld	Gibsons, BC	This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area. It would have very serious impacts on residents and property owners in West Howe Sound and on Gambier Island. Moorages, anchorages, swimming facilities and back-country access have long been part of the McNab Creek area's attractions for Howe Sound visitors and local boating clubs. The application utterly fails to address impacts on residents, property owners and local amenities.	A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.  Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCR noise bylaw was considered as part of the assessment.

2801	614 - 6	Personal Information Withheld	Gibsons, BC	This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area. It would have very serious impacts on residents and property owners in West Howe Sound and on Gambier Island. Moorages, anchorages, swimming facilities and back-country access have long been part of the McNab Creek area's attractions for Howe Sound visitors and local boating clubs. The application utterly fails to address impacts on residents, property owners and local amenities.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
2802	614 - 7	Personal Information Withheld	Gibsons, BC	This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area. It would have very serious impacts on residents and property owners in West Howe Sound and on Gambier Island. Moorages, anchorages, swimming facilities and back-country access have long been part of the McNab Creek area's attractions for Howe Sound visitors and local boating clubs. The application utterly fails to address impacts on residents, property owners and local amenities.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2803	614 - 8	Personal Information Withheld	Gibsons, BC	Barge traffic would diminish Howe Sound's recreational and tourism potential and add to the cumulative traffic hazard in Howe Sound. Routes would cross very busy sailing and small-boat recreational areas, the Howe Sound Marine Trail and ferry routes, the path of proposed LNG tankers exiting from the Woodfibre LNG plant and freighters from Squamish Terminals. This exponentially increases the risk of collisions and loss of life in a narrow waterway and diminishes the amenity and tourism use of the Sound. The cumulative effects and worst-case hazard analysis of this project have been underestimated by the Proponent. A cumulative impact assessment, including loss of amenity and tourism value of the Sound, should be completed prior to deciding on this application. So too should a study of the increased hazards associated with increasing the large-vessel traffic in Howe Sound.	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
2804	615 - 1	Thomasina Pidgeon	Squamish, BC	I am writing to state my strong opposition to the proposed gravel pit mine in McNab Creek.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2805	615 - 2	Thomasina Pidgeon	Squamish, BC	First of all- aggregate is a non-renewable resource. For the sake of sustainability, we should as humans immediately stop and realize the long term impact of our choices with regards to the environment, quality of life and our use of non-renewables. Will more roads and traffic really increase our quality of life? No. How sustainable is it to keep going after non-renewables? Especially in such an area as Howe Sound.	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
2806	615 - 3	Thomasina Pidgeon	Squamish, BC	In regards to use of fossil fuel- Burnco argues for the use of barges to transport the gravel so it isn't traveling on the roads... But what happens once the barge lands?? It will go onto trucks! Just because it isn't loaded onto trucks immediately- does not mean its impact and use of fossil fuel will be less. Why isn't this more long term travel of the gravel taken into account for impact to the environment?	<p>The incremental change in tug/barge traffic of associated with the Proposed Project is as follows:</p> <ul style="list-style-type: none"> <li>▪ 0% net change from south of Passage Island, along the Strait of Georgia, to the North and South Arms of the Fraser River; and</li> <li>▪ 0% net change along the Fraser River to the load-out facilities in Burnaby and Langley.</li> </ul> <p>There is therefore no additional truck traffic associated with unloading gravel from with the Proposed Project.</p>
2807	615 - 4	Thomasina Pidgeon	Squamish, BC	The barges themselves will impact the water on which is travels. What happens if it spills into the ocean?	<p>Potential effects of Project-related accidents, malfunctions and unplanned events have been assessed. The following potential accidents, malfunctions and unplanned events – and associated mitigation - are presented in Volume 3, Part G – Section 15.4.1 of the EAC Application/EIS:</p> <ul style="list-style-type: none"> <li>- Geohazards: Earthquake-related ground movements and land-based mass movements;</li> <li>- Power outages;</li> <li>- Accidental discharge of sediment or fines into watercourses;</li> <li>- Accidental hazardous material spills – Land and marine based; and</li> <li>- Vessel and barge accidents (e.g., barge capsizing). – Aggregate spills.</li> </ul> <p>Project residual effects of Project-related accidents, malfunctions and unplanned events were determined to be negligible or not significant.</p>
2808	615 - 5	Thomasina Pidgeon	Squamish, BC	The gravel pit mine will have a negative impact on tourism. Howe Sound is a beautiful place, which would should be considered a national park. We should strive to protect it instead of re-industrializing it. Which brings me to one of Burncos main arguments: that the area isn't pristine and has had previous damage. And the point is..?? Just because a certain piece of land isn't pristine, does not give a good excuse to develop it. McNab creek is home to salmon, elk, bears, and fish and animals of all sorts. Let them be. Rearrange things to accommodate for the impact this mine will have isn't better" than what's natural there; man made isn't better then how things are natural formed...	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

2809	615 - 6	Thomasina Pidgeon	Squamish, BC	Howe Sound is recovering from previous industry. To re-industrialize this area is backwards thinking and inexcusable. This 77 acre pit is one of only three River estuaries in this area. Seems ludicrous to destroy it without a long term land and water use plan.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2810	615 - 7	Thomasina Pidgeon	Squamish, BC	The project will limit access to the shore for animals that frequent the area to forage. Will you call them on their cell phone to tell them the new path?! Sure, they excuse providing new habitat for that they are killing but new isn't necessarily better.	A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS. Potential effects considered included barriers to movement. Proposed mitigation includes maintaining vegetation linkages and buffers and installing amphibian passageways, where appropriate. Following the application of proposed mitigation, potential residual effects were determined to be negligible or not significant.
2811	615 - 8	Thomasina Pidgeon	Squamish, BC	The change in water patterns will negatively fresh water habitat. There is risk to salmon habitat and the other fish of the area is not worth taking.	A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.  The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.  The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.
2812	615 - 9	Thomasina Pidgeon	Squamish, BC	McNab creek is home to 21 species at risk including the Roosevelt Elk who were re-introduced to the area just 15 years ago!!! Talk about confusing the animals!	A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.  Potential effects were assessed for the following selected valued components: - Amphibian species at risk - Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet; - Roosevelt elk and grizzly bear; - Environmentally sensitive ecosystems; - Ecosystems at risk; and - Plant species a risk.  Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.  Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.

2813	615 - 10	Thomasina Pidgeon	Squamish, BC	Noise- this will impact all in the area including fish and animals, tourist and locals. It will negatively impact and confuse underwater creatures.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p>
2814	615 - 11	Thomasina Pidgeon	Squamish, BC	Noise- this will impact all in the area including fish and animals, tourist and locals. It will negatively impact and confuse underwater creatures.	<p>A predictive noise model was developed for the Proposed Project as described in Volume 2, Section 9.2. The Type 7810 Predictor® (Predictor®) software was used to assess the potential noise effects associated with the Proposed Project as well as the effectiveness of potential noise controls.</p> <p>Effects to wildlife related to noise were estimated by overlaying the output of noise models with species-specific habitat suitability mapping and summarizing the change in habitat for VCs for which noise thresholds were defined in literature (i.e., amphibian species at risk, northern goshawk, western screech-owl, marbled murrelet, and common nighthawk). Noise thresholds beyond which habitat loss is expected are defined for each VC in Section 5.3.1.5.2 of Vol 2, Section 5.3.</p> <p>Due to the paucity of literature regarding noise thresholds for Roosevelt elk and grizzly bear, effects of noise and other sensory disturbance were measured using published zones of influence (ZOI). A ZOI represents the distance at which avoidance of certain anthropogenic disturbances has been observed.</p> <p>Noise will be managed during the construction and operational phases according to the Environmental Objectives and Best Management Practices for Aggregate Extraction in BC (BC MWLAP 2002). Noise mitigation measures are detailed in Volume 2, Part B - Section 9.2 and include:</p> <ul style="list-style-type: none"> <li>- Maintaining vegetation and trees around the active work areas to act as a noise buffer;</li> <li>- Reducing the height aggregate falls along conveyors and within the crushing facility;</li> <li>- Enclosing conveyors which will assist in reducing noise emissions;</li> <li>- Minimizing speed on roadways;</li> <li>- Operating equipment within specifications and maintaining level roads; and</li> <li>- Reducing idling time.</li> </ul>

2816	615 - 13	Thomasina Pidgeon	Squamish, BC	The vibration of the electric clamshell will be bad for the marine life.	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>
2817	615 - 14	Thomasina Pidgeon	Squamish, BC	Light pollution- how nice it is to drive along the sea to sky and not be blinded by lights from buildings and such. We need the night sky and the impact of lights to this area will absolutely destroy this!! We need to see the stars. Already, this is getting more difficult. When is enough, enough!!!	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

2818	615 - 15	Thomasina Pidgeon	Squamish, BC	This project will also be an eyesore to the many camps in the areas. Is setting up a gravel pit mine that will be surrounded by numerous kids camps really what we want to teach our kids?	A detailed assessment of potential recreation effects - including youth camps - are considered in Volume 2, Part B – Section 7.3 of the EAC Application/EIS. Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
2819	615 - 16	Thomasina Pidgeon	Squamish, BC	At the open house I saw that Burnco made adjustments for damage that will be done but this isn't enough. This area is too beautiful for a gravel pit mine. Further investing in the fossil fuel industry (gravel for roads..) is NOT sustainable. We need to change our ways and immediately stop this destructive path we are on and find new, improved and sustainable ways of living which will not have such adverse effects to that which we love. Howe Sound.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
2820	616 - 1	Islands Trust	Victoria, BC	Please find attached letter from Islands Trust Council Chair Peter Luckham. Re: Comments on the Environmental Impact Statement / Application for the Proposed BURNCO Aggregate Mine Project I am writing on behalf of the Islands Trust Council regarding the proposed BURNCO Aggregate Mine Project. I understand you will also be receiving a separate submission from the Gambier Island Local Trust Committee. We are limiting our comments to the marine aspects of the project which are within our jurisdiction.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2821	616 - 2	Islands Trust	Victoria, BC	We appreciate that the EAO invited Islands Trust and Bowen Island Municipality staff and elected officials to participate in the Advisory Working Group. We also appreciate that the EAO held information sessions in September in Squamish, West Vancouver and Gibsons.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2822	616 - 3	Islands Trust	Victoria, BC	We have heard from constituents that they would appreciate more time to comment on this application that could have lasting implications for the culture, environment, and economy of Howe Sound communities.	The formal Public Comment Period was extended by 5 days (to October 3, 2016) to accommodate those who required more time to comment on the EAC Application/EIS.
2823	616 - 4	Islands Trust	Victoria, BC	In our Policy Statement the Islands Trust Council holds that economic opportunities should be compatible with the conservation of resources and protection of community character. For years now, we have heard constituents express a clear desire for governments at all levels to support Howe Sound's ongoing transition from a polluted industrial zone to a thriving environment that supports sustainable businesses, including a world-class tourism industry. The proposed BURNCO Aggregate Mine Project is not compatible with that vision or with the community character of Howe Sound.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.

2824	616 - 5	Islands Trust	Victoria, BC	I understand that at this point of the environmental assessment process you are seeking feedback on the project and its potential to cause environmental, heritage, health, social, and economic effects. With regard to the BURNCO Aggregate Mine Project application, we have heard strong concerns in our communities on the topics listed below. While I provide suggestions below about potential project conditions, this should in no way be interpreted as Trust Council's endorsement of conditional approval of the project.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2825	616 - 6	Islands Trust	Victoria, BC	- That the EAO be cautious in approving any new industrial projects, including the BURNCO Aggregate Mine Project, until there is a better understanding of the cumulative effects of existing and approved projects in Howe Sound. Stakeholders in the region are still awaiting results of the Ministry of Forest, Land and Natural Resource Operations cumulative effects assessment and monitoring project for the Howe Sound area. In the absence of critical knowledge regarding cumulative effects within Howe Sound, we encourage the EAO to take a precautionary approach.	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for the following:</p> <ul style="list-style-type: none"> <li>- Marine mammals – behavioural disturbance</li> <li>- Amphibian species at risk – barriers to movement, change in mortality, habitat loss</li> <li>- Roosevelt elk – barriers to movement, change in mortality, habitat loss</li> <li>- Grizzly bear – change in mortality, habitat loss</li> <li>- Environmentally sensitive ecosystems – loss of extent</li> <li>- Ecosystems at risk – loss of extent</li> <li>- Air quality indicators – increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual)</li> <li>- Real estate – change in real estate value</li> <li>- Marine navigation – interference with navigation use and navigability due to Project-related vessel traffic</li> <li>- Harvesting fish and wildlife – change in environmental setting</li> <li>- Recreation and tourism – change in environmental setting</li> <li>- Visual quality – change in visual quality</li> <li>- Heritage resources – changes to heritage resource integrity, context and accessibility</li> <li>- People – Human health (air quality and particulate matter).</li> </ul> <p>All potential cumulative residual effects were determined to be negligible or not significant except net effects to grizzly bear; cumulative residual effects to the threatened Squamish-Lillooet Grizzly Bear Population Unit were determined to be significant due in large part to vehicle collisions that might result from the development of new logging roads. Grizzly bear have not been observed within the Proposed Project area and the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

2826	616 - 7	Islands Trust	Victoria, BC	- That industrial noises from the Project are not compatible with the peaceful, quiet enjoyment of nature that residents and visitors treasure in Howe Sound. There are concerns that the application does not sufficiently address the impacts of noise across water on residents of Gambier Island and recreational boaters who may be at anchor.	A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.  Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.
2827	616 - 8	Islands Trust	Victoria, BC	o Suggested condition: The EAO should require the proponent to undertake the four-month construction phase between October and April when there are fewer recreational visitors in Howe Sound.	The estimated duration of project construction will be up to two years. Some components will be constructed relatively quickly, while others will take longer depending on manufacturing times, construction windows and other limitations associated with the location of the Project site.  BURNCO defers to the BCEAO on potential conditions of environmental assessment certification.
2828	616 - 9	Islands Trust	Victoria, BC	o Suggestion condition: Barge loading activity should limited to 9 a.m. to 5 p.m. on weekdays (no loading on weekends or statutory holidays). We've heard that 7 a.m. in the summertime is too early for a region known as a relaxing recreational destination.	The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, , with the exception of holidays.  Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.  BURNCO defers to the BCEAO on potential conditions of environmental assessment certification.
2829	616 - 10	Islands Trust	Victoria, BC	- That the application did not provide sufficient information on: o ecological baseline to support conclusions that the Project would not have significant effects in the marine environment during its 16 years of operation.	The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada in accordance with: - BCEAO Guideline for the Selection of Valued Components and Assessment of Potential Effects (BCEAO 2013), - Operational Policy Statement: Addressing Cumulative Environmental Effects under the Canadian Environmental Assessment Act (CEA Agency 2007), - Addressing Cumulative Environmental Effects. A Reference Guide for the Canadian Environmental Assessment Act (CEA Agency 1994), - Cumulative Effects Practitioners Guide (CEA Agency 1999), and - A Reference Guide for the Canadian Environmental Assessment Act: Determining Whether a project is Likely to Cause Significant Environmental Effects (FEARO 1994a).  A detailed methods framework is provided in Volume 2, Part B – Section 4 of the EAC Application/EIS.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2830	616 - 11	Islands Trust	Victoria, BC	o projected sea level rise (combined with predicted storms surges and periodic king tides) to support conclusions that the Project would not cause significant effects to the environment after 2035.	<p>A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS. Potential effects considered were changes in GHG emissions as a result of the Project, the Project's contribution to climate change through the emission of GHG's, and how potential changes in climate will affect project-related infrastructure.</p> <p>Potential effects of future sea-level rise are addressed in Section 5.8.5.2 of the EAC Application/EIS. The predicted RSP2100 (sea-level height by 2100 relative to 2007 levels) using the mean sea-level rise was 18 cm, with a possible range of 6 to 30 cm. The predicted RSL2100 using the high predicted sea-level rise was 88 cm, with a possible range of 57 to 118 cm.</p> <p>Since the Proposed Project is expected to be completed by 2035 it is expected that rising sea levels of this amount will have little direct impact on the Proposed Project operation phase. The Proposed Project closure plan consists of removing surface infrastructure and site reclamation including a ground and surface water-fed lake (the pit lake), and therefore it is expected that the predicted rising sea level will have little impact on Proposed Project closure.</p>
2831	616 - 12	Islands Trust	Victoria, BC	o the potential for dust during loading of barges and during barge transport to determine potential impacts to the marine environment, marine users and island residents	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Mitigation measures for fugitive barge emissions will include:</p> <ul style="list-style-type: none"> <li>- Barges will only be travelling loaded in one direction;</li> <li>- The barges will have 2.74 m boxwalls which will act as partial windscreens;</li> <li>- The loaded aggregate material will be wet; and</li> <li>- Five of the seven aggregate types will have material silt content less than 1.5%.</li> </ul> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
2832	616 - 13	Islands Trust	Victoria, BC	- That a spill from the site could contaminate the marine environment.	<p>Potential effects of Project-related accidents, malfunctions and unplanned events have been assessed. The following potential accidents, malfunctions and unplanned events – and associated mitigation - are presented in Volume 3, Part G – Section 15.4.1 of the EAC Application/EIS:</p> <ul style="list-style-type: none"> <li>- Geohazards: Earthquake-related ground movements and land-based mass movements;</li> <li>- Power outages;</li> <li>- Accidental discharge of sediment or fines into watercourses;</li> <li>- Accidental hazardous material spills – Land and marine based; and</li> <li>- Vessel and barge accidents (e.g., barge capsizing). – Aggregate spills.</li> </ul> <p>Project residual effects of Project-related accidents, malfunctions and unplanned events were determined to be negligible or not significant.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2833	616 - 14	Islands Trust	Victoria, BC	<p>o Suggested condition: Requirement for the proponent's Spill Prevention and Emergency Response plan to include a staff person with spill-response training on-site at all times during the life of the project in order to respond to and mitigate the effects of a chemical or hydrocarbon spill.</p>	<p>BURNCO plans to have a caretaker onsite to respond to any issues that may arise. Since the project is primarily electric powered, there are very few potential sources of hydrocarbons. The hydraulic fluid would be biodegradable such as Mobil EAL™ Hydraulic Oil 32 and 46 or equivalent.</p> <p>Potential impacts on surface water quality from possible fuel spills will be mitigated through the implementation of task-specific Materials Storage, Handling and Waste Management Plan(s) (MSHWMP) and a site-specific Spill Prevention and Emergency Response Plan(s) (SPERP; details provided in Volume 3, Part E – Section 16.0). An environmental monitor will monitor the implementation and performance of the material handling, spill prevention and emergency response plans. Operational water quality monitoring will be undertaken according to permit requirements.</p> <p>BURNCO defers to the BCEAO on potential conditions of environmental assessment certification.</p>
2834	616 - 15	Islands Trust	Victoria, BC	<p>- That there should be on-going formal opportunities for regional stakeholders to provide feedback to BURNCO on impacts related to the project.</p> <p>o Suggested condition: Require BURNCO to fund a residents committee that includes at least two Gambier Island Local Trust Area residents that would offer an opportunity to meet at least twice a year to discuss issues related to the Project.</p>	<p>BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.</p> <p>BURNCO defers to the BCEAO on potential conditions of environmental assessment certification.</p>
2835	616 - 16	Islands Trust	Victoria, BC	<p>The Islands Trust Policy Statement, a statutory document founded in extensive community consultation and approved in 1994 by the then Minister of Municipal Affairs, contains policies that should be taken into account by the BC Environmental Assessment Office:</p>	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway. The Islands Trust is represented on the Technical Working Group established to review the Proposed Project.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>

2836	616 - 17	Islands Trust	Victoria, BC	<p>3.1.6 Trust Council encourages all government agencies and non-government organizations to consider both monetary and non-monetary costs when making resource management and land use decisions.</p>	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>
2837	616 - 18	Islands Trust	Victoria, BC	<p>3.1.9 Trust Council encourages actions and programs of other government agencies which:</p> <ul style="list-style-type: none"> <li>- place priority on the side of protection for Trust Area ecosystems when judgment must be exercised,</li> <li>- protect the diversity of native species and habitats in the Trust Area, and</li> <li>- prevent pollution of the air, land and fresh and marine waters of the Trust Area.</li> </ul>	<p>Potential effects of the Proposed Project have been assessed for selected valued environmental components to address key issues related to fish and fish habitat, marine resources, terrestrial wildlife and vegetation, geotechnical and natural hazards, water resources, air quality and climate change.</p> <p>The assessment concludes that, with the application of design considerations and identified mitigation, no significant adverse environmental effects will result from the Proposed Project.</p> <p>A detailed assessment of potential environmental effects of the Proposed Project is presented in Volume 2, Part B of the EAC Application/EIS.</p>

2838	616 - 19	Islands Trust	Victoria, BC	3.1.10 Trust Council encourages the Provincial government to enforce standards for control of emissions polluting the air of the Trust Area.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
2839	616 - 20	Islands Trust	Victoria, BC	3.1.11 Trust Council encourages agents of the government of British Columbia or the government of Canada, Crown corporations, municipalities, regional districts, non-government organizations, property owners and occupiers to protect environmentally sensitive areas and significant natural sites, features and landforms through voluntary stewardship, acquisitions, conservation covenants and careful management.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
2840	616 - 21	Islands Trust	Victoria, BC	4.5.3 It is the position of Trust Council that development, activity, buildings or structures should not result in a loss of significant marine or coastal habitat, or interfere with natural coastal processes.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

	Ref #	Commenter (Name)	Location		
2841	616 - 22	Islands Trust	Victoria, BC	4.5.4 It is the position of Trust Council that development, activity, buildings or structures should not restrict public access to, from or along the marine shoreline.	<p>Harvesting fish and wildlife' and 'Outdoor recreation and tourism' are valued components in the environmental assessment of the Proposed Project (see Table 7.3-1). No displacement effects on recreational hunting or other recreational activities is anticipated due to the Proposed Project because the primary access to the local study area is through the Proposed Property, and public access and use of the Proposed Property has never been permitted. During the construction and operation phases, recreationists and tourists would continue to have access to the foreshore area below the high water mark and to the anchorage area in the vicinity of where McNab Creek enters Howe Sound.</p> <p>Proposed Project construction and operations would prevent marine-based recreational and tourism activities occurring around the Project jetty. As the jetty is located within an existing log boom tenure and recreational and tourism activities are concentrated on the eastern side of the local study area (where McNab Creek enters Howe Sound), this effect is considered to be negligible.</p> <p>Displacement on the water would occur on an intermittent basis as a result of Proposed Project-related vessel traffic, which would require smaller vessels to alter direction and/or speed when navigating at the same time as water taxis or barges (Volume 2, Part B - Section 7.2). These navigational challenges are present in the LSA due to forestry activity, and are subject to the Collision Regulations of the Canada Shipping Act. Any resulting effects on recreational boating recreational activities due to potential interactions of recreational vessels and equipment and Project-associated vessels are not detectable or not measureable, so potential effects of the Proposed Project on water-based recreation and tourism access matters in the construction and operation phases are determined to be negligible.</p> <p>As part of the Marine Transport Management Plan outlined in Marine Transport (Volume 2, Part B - Section 7.2), BURNCO would also develop and implement strategies, best management practices and guidelines to avoid and minimise Proposed Project - related disruption of marine-based recreational activities during construction and operations. As part of the development of this plan, BURNCO would consult with key marine user groups (e.g., McNab Strata, yacht clubs, camps, and kayaking operators) to discuss strategies (including but not limited to routing options) to manage the interaction of Proposed Project vessel traffic with recreational and tourism areas during the high season months.</p>
2842	616 - 23	Islands Trust	Victoria, BC	4.5.5 It is Trust Council's policy that development should be directed to sites away from: - areas of environmental sensitivity, and - areas of naturally occurring stocks of clams or oysters.	<p>Potential effects of the Proposed Project have been assessed for selected valued environmental components to address key issues related to fish and fish habitat, marine resources, terrestrial wildlife and vegetation, geotechnical and natural hazards, water resources, air quality and climate change.</p> <p>The assessment concludes that, with the application of design considerations and identified mitigation, no significant adverse environmental effects will result from the Proposed Project.</p> <p>A detailed assessment of potential environmental effects of the Proposed Project is presented in Volume 2, Part B of the EAC Application/EIS.</p>

2843	616 - 24	Islands Trust	Victoria, BC	<p>5.1.1 Trust Council holds that the overall visual quality of the Trust Area and its scenic values should be protected from disturbance, particularly those areas that have distinctive features or are highly visible.</p> <p>5.1.2 It is Trust Council's policy that the intensity of noise and lighting in and through the Trust Area should be compatible with community character.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
2844	616 - 25	Islands Trust	Victoria, BC	<p>5.1.2 It is Trust Council's policy that the intensity of noise and lighting in and through the Trust Area should be compatible with community character.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p>
2845	616 - 26	Islands Trust	Victoria, BC	<p>5.3.8 Trust Council encourages Provincial and Federal agencies to ensure safe shipment of materials hazardous to the environment.</p>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>

2849	616 - 30	Islands Trust	Victoria, BC	The Islands Trust Council is a federation of local government bodies representing 25,000 people living within the Islands Trust Area. The Islands Trust is responsible for preserving and protecting the unique environment and amenities of the Islands Trust Area through planning and regulating land use, development management, education, cooperation with other agencies, and land conservation. The area covers the islands and waters between the British Columbia mainland and southern Vancouver Island. It includes 13 major and more than 450 smaller islands covering 5200 square kilometres. On behalf of the Islands Trust Council, thank you for accepting this submission.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2850	617 - 1	Drs. Karen and Brian Funt	West Vancouver, BC	My husband and I live directly on Howe Sound. Any commercial enterprise that will compromise our recovering environmental treasure is pure short-term insanity. I strongly oppose the Burnco Aggregate Project.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2851	617 - 2	Drs. Karen and Brian Funt	West Vancouver, BC	Howe Sound should be designated a National Park.	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
2852	617 - 3	Drs. Karen and Brian Funt	West Vancouver, BC	Our Howe Sound environment is just recovering, with whales, stellar sea lions, and dophins returning.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.

2853	617 - 4	Drs. Karen and Brian Funt	West Vancouver, BC	This is a tourist attraction from the entire lower mainland.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
2854	617 - 5	Drs. Karen and Brian Funt	West Vancouver, BC	A gravel pit with it's increased ship traffic and tailings that would endanger salmon and other species should definitely be OFF the table if the Liberal Government on both the Provincial and Federal levels cares about the environment like it says that it does.	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
2855	617 - 6	Drs. Karen and Brian Funt	West Vancouver, BC	A gravel pit with it's increased ship traffic and tailings that would endanger salmon and other species should definitely be OFF the table if the Liberal Government on both the Provincial and Federal levels cares about the environment like it says that it does.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2856	617 - 7	Drs. Karen and Brian Funt	West Vancouver, BC	A gravel pit with it's increased ship traffic and tailings that would endanger salmon and other species should definitely be OFF the table if the Liberal Government on both the Provincial and Federal levels cares about the environment like it says that it does.	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>

	Ref #	Commenter (Name)	Location		
2857	618 - 1	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	Further to BURNCO Rock Products Ltd.'s application for an environmental assessment certificate for an aggregate project in the McNab Valley, West Howe Sound, The SCRDC considered the application at two Regular Board meetings (September 8, 2016 and September 22, 2016). The Board adopted resolutions that included the following submission regarding the application:	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2858	618 - 2	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	i. The Fish Habitat Offset Plan needs to be implemented at the outset of the project to allow for mature vegetation cover and for adjustments to be made to ensure the plan functions as expected;	BURNCO has committed to constructing the habitat offset channel extension prior to construction of the Project and effects to the existing groundwater fed channel.
2859	618 - 3	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	ii. Sufficient funds should be set aside by BURNCO to allow for long term maintenance of the new stream and related infrastructure, such as the overflow gate and a channel from the pit lake, to ensure the plan functions as expected and to include a contingency plan to be followed if the compensation plan fails.	Agreed, BURNCO expects that the provision of a letter of credit covering monitoring, construction and maintenance of any habitat offsetting will be required under the fisheries protection provisions of the Fisheries Act.
2860	618 - 4	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	iii. Designs of the aggregate processing and storage area must include elements to mitigate any negative impact due to sediment runoff into Harlequin Creek and Watercourse 5.	It is recognized that surface run off control is a key aspect to the Erosion and Sediment Control Plan (ESCP) which is included in Part G, Section 22, Appendix 3 of the EAC Application/EIS. Harlequin Creek and WC5 are identified as critical areas within the ESCP; control measures are proposed for construction, operations and closure phases of the Project.  As the surficial soils are highly permeable, we do not anticipate a high volume of surface runoff. The primary approach to storm water management is collection and infiltration. No point source discharges of surface water are proposed. Revegetation, vegetation covers, geotextile matting, resurfacing and water course armouring will be primary control measure. In addition, reclamation (revegetation) will occur in a progressive matter. Silt fencing is proposed as needed for temporary sediment control.
2861	618 - 5	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	iv. If a new federal legislative criteria for negative impacts to fish habitat due to artificial lighting become applicable during the life of the project then impacts from artificial lighting need to be re-evaluated and updated mitigation measures applied.	If new federal government legislative criteria for negative impacts to fish habitat due to artificial lighting becomes applicable, then mitigation measures with respect to managing artificial lighting will be based on the most current legislation.
2862	618 - 6	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	v. If new federal government legislative criteria for acoustic injury or disturbance to fish habitat becomes applicable during the life of the project then impacts from noise generating activity need to be re-evaluated and updated mitigation measures applied;	If new federal government legislative criteria for acoustic injury or disturbance to fish habitat becomes applicable during the Project, then mitigation measures with respect to managing acoustic noise emissions will be based on the most current legislation.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2863	618 - 7	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	vi. BURNCO should evaluate the impacts of climate change, and specifically sea level rise. In the post closure phase of the project and factor into the analysis the cumulative effects of periodic king tides and storm surges on the maximum of the range of high predicted sea level rise.	<p>A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS. Potential effects considered were changes in GHG emissions as a result of the Project, the Project's contribution to climate change through the emission of GHG's, and how potential changes in climate will affect project-related infrastructure.</p> <p>Potential effects of future sea-level rise are addressed in Section 5.8.5.2 of the EAC Application/EIS. The predicted RSP2100 (sea-level height by 2100 relative to 2007 levels) using the mean sea-level rise was 18 cm, with a possible range of 6 to 30 cm. The predicted RSL2100 using the high predicted sea-level rise was 88 cm, with a possible range of 57 to 118 cm.</p> <p>Since the Proposed Project is expected to be completed by 2035 it is expected that rising sea levels of this amount will have little direct impact on the Proposed Project operation phase. The Proposed Project closure plan consists of removing surface infrastructure and site reclamation including a ground and surface water-fed lake (the pit lake), and therefore it is expected that the predicted rising sea level will have little impact on Proposed Project closure.</p>
2864	618 - 8	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	i. The impact on salmonids of contaminants in the water column due to disturbance of sediment needs to be assessed;	<p>Project activities with potential to result in re-suspension of sediments as a result of seafloor disturbance are limited to the following: pile installation, vessel propeller scour, and vessel wake wash. The impacts of altered water quality (including increased contaminant exposure) on salmonids as a result of seabed disturbance and subsequent sediment resuspension from the above listed activities has been assessed under Vol. 2 of the EAC Application (refer to Section 5.2.5.2.1.1, Section 5.2.5.2.3.1, Section 5.2.5.4.1.1 and Section 5.2.5.4.1.3). Mitigation measures that will be implemented to avoid or minimize potential adverse effects associated with sediment disturbance are outlined in Section 5.2.5.3.1 and Table 5.2-18 of the EAC Application/EIS.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2865	618 - 9	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	ii. More thorough studies and surveys should be completed on glass sponge reef presence within 200m of any part of the project area, and along any loaded barge transit routes, during the life of the project;	Glass sponges are known to occur throughout Howe Sound, in water depths below -20 m (chart datum). As part of marine baseline investigations, detailed underwater biophysical surveys were conducted in the proposed subtidal footprints of the proposed marine infrastructure (as well as adjacent areas) using SCUBA and towed video survey methods, with detailed information recorded on existing habitat and species present in these areas. This included systematic surveys targeting potential sponge reef habitats. The field surveys concluded that no glass sponge reefs were present in the proposed marine infrastructure (load-out jetty or walkway/conveyor) footprint. This information agrees with known habitat preferences of these organisms (i.e., water depths in the proposed marine infrastructure footprint are shallower than the depth range in which glass sponge reefs occur). In terms of interaction of glass sponge reef habitat with shipping activities, known sponge reefs occur in proximity to the proposed shipping route in several locations, with the closest occurring at the mouth of Ramillies Channel (Volume 4, Part G - Section 22.0 - Appendix 5.2-A, Figure 3). However, water depths at these locations along the proposed shipping route are below -25 m (chart datum). As such, potential impacts from shipping would be limited to propeller wash effects at the corresponding depths of these glass sponge reef occurrences. To assess this potential impact, propeller scour impacts on the seabed were assessed at a modelled depth of -20 m (chart datum) to correspond with the uppermost depths of glass sponge habitat. Jet velocities generated by the tug propeller at -20 m were compared to natural velocities derived from wave and tidal activity in Howe Sound. Estimates of maximum horizontal velocity associated with wind waves were developed from wave hindcasts from available wind data for the Strait of Georgia using the Halibut Bank Ocean Buoy (Environment Canada Station 46146) and are summarized in Table 5.2-12. At -20 m depth, the jet velocities of the proposed tug-assisted barge movements were shown to be within the same magnitude as tidal currents present at this depth, and below the velocity threshold (0.25 m/s) required for seabed particle mobilization (USACE 1989). Given that water depths along the proposed shipping route in the RSA are typically below -20 m (chart datum), the potential effects of tug propeller scour on glass sponge assemblages in the proposed shipping corridors were considered negligible and were not carried forward in the assessment.
2866	618 - 10	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	iii. The possible presence and impact on Northern Abalone, a species at risk, needs to be assessed;	As part of marine baseline investigations, detailed underwater biophysical surveys were conducted in the proposed intertidal and subtidal footprints of the proposed marine infrastructure (as well as adjacent areas) using SCUBA and towed video survey methods, with detailed information recorded on existing habitat and species present in these areas. This included systematic dive surveys in the marine environment using DFO-certified abalone biologists. The field surveys concluded that no abalone or abalone habitat were present in the proposed marine infrastructure footprint, as indicated in Section 5.2.5.5.1.2 of the EAC Application. Potential adverse impacts of the Project on abalone and abalone habitat were therefore considered to be negligible – not significant (Table 5.2-25).
2867	618 - 11	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	iv. If new federal government legislative criteria for acoustic injury or disturbance to marine mammals, or marine birds, becomes applicable during the life of the project then impacts of noise generating activity need to be re-evaluated and updated mitigation measures applied;	If new federal government legislative criteria for acoustic injury or disturbance to marine mammals or marine birds becomes applicable during the construction phase of the Project, then mitigation measures with respect to managing acoustic noise emissions will be based on the most current legislation.
2868	618 - 12	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	v. Vessel operators should receive an appropriate amount of training on how to avoid impact with marine mammals, as part of overall environmental related training, and records need to be kept of any incidents.	Mitigation measures applicable to vessel operators to avoid and/or minimize potential physical interactions between vessels and marine mammals are outlined in Section 5.2.5.3.1.4 of the EAC Application/EIS. This includes methods in how to avoid ship strikes on marine mammals. Vessel operators will be required to record any potential incidents involving a marine mammal strike.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2869	618 - 13	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	vi. An on-site 24 hour/seven days a week attendant should be required during the life of the project in order to respond to and mitigate the effects of a chemical or hydrocarbon spill.	BURNCO plans to have a caretaker onsite to respond to any issues that may arise. Since the project is primarily electric powered, there are very few potential sources of hydrocarbons. The hydraulic fluid would be biodegradable such as Mobil EAL™ Hydraulic Oil 32 and 46 or equivalent.  Potential impacts on surface water quality from possible fuel spills will be mitigated through the implementation of task-specific Materials Storage, Handling and Waste Management Plan(s) (MSHWMP) and a site-specific Spill Prevention and Emergency Response Plan(s) (SPERP; details provided in Volume 3, Part E – Section 16.0). An environmental monitor will monitor the implementation and performance of the material handling, spill prevention and emergency response plans. Operational water quality monitoring will be undertaken according to permit requirements.
2870	618 - 14	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	vii. The proponent should be encouraged to engage in and be an active and ongoing contributor to the BC Ministry of Forests, Lands and Natural Resources Operations process to develop a Cumulative Effects Assessment Framework and the Squamish Nation Marine Environmental Plan.	As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.  BURNCO is committed to supporting the Squamish Nation's Marine Environmental Planning process.
2871	618 - 15	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	i. Consideration to reclamation of other portions of BURNCO's property should be set out as a means of identifying potential offset areas to mitigate negative impacts, such as the loss of land to the pit lake, and provide habitat enhancements.	The Proposed Project footprint was sited in an area with a long history of anthropogenic disturbance to minimize impacts to undisturbed habitat (including mature forest) and to generally minimize adverse effects on terrestrial resources. A Reclamation and Effective Closure Plan will be developed and will outline the goals associated with wildlife habitat restoration, methods of rehabilitating wildlife habitat, and parameters to gauge the success of reclamation. Habitat reclamation will occur progressively over the life of the Proposed Project to return habitat to a functional capability for supporting wildlife as soon as possible. A detailed wildlife mitigation and monitoring plan has not yet been developed but will be developed as part of the Wildlife Management (Protection) Plan to minimize impacts on terrestrial resources and to collect data that will help evaluate the effectiveness of implemented mitigations.
2872	618 - 16	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	ii. Regarding amphibian habitat replacement, the proposed pond within the BC Hydro right-of-way should be relocated so it is not impacted by maintenance of the right-of-way.	BURNCO is working with FLNRO and DFO on the suitable locations of proposed new amphibian ponds. The current location is not anticipated to affect routine maintenance of the existing transmission line. The existing access road will remain in place.
2873	618 - 17	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	i. Air quality monitoring stations should be located within or near the McNab Strata community and in the northern part of Gambier Island, and in a location along the Sea to Sky corridor, for the life of the project and these monitoring stations should be established at the outset of the project in order to establish meaningful baseline information;	Air quality monitoring will begin prior to the Project operations.  Within Section 5.7.6 of the EAC Application/EAC the Project Proponent has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7.  The predicted air quality concentrations as a result of the Proposed Project, in combination with existing levels were predicted to be well below the relevant air quality criteria at Gambier Island (Ekins Point) and along the Sea to Sky Corridor.
2874	618 - 18	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	ii. Information from the air quality monitoring stations must be made publicly available;	Air quality monitoring results can be made publicly available through arrangements with BURNCO and relevant government agencies.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2875	618 - 19	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	iii. The environmental certificate needs to include strong measures to address air quality problems and clearly identify the provincial or federal agency that is responsible for enforcement;	The comment is noted.  In addition to conditions stipulated in the Environmental Assessment Certificate, relevant permitting will also be undertaken following receipt of an Environmental Assessment Certificate.
2876	618 - 20	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	iv. Aggregate composition tests need to be done to ensure that harmful chemicals are not released during processing.	The project related release of metals within particulate matter to the air (that was used in the human health risk assessment) was based on site specific testing of the aggregate. No significant effects to public health were predicted (Volume 2, Part B, Section 9.1).
2877	618 - 21	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	i. Noise monitoring stations need to be located within or near the McNab Strata community and in the northern area of Gambier Island for the life of the project;	Noise monitoring locations will be included as part of the Noise Management Plan. Stations will be located to monitor noise levels at the McNab Strata and at Ekins Point on Gambier Island.
2878	618 - 22	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	ii. Information from the noise monitoring stations must be made publicly available;	Details of processing the noise monitoring results will be determined in the Noise Management Plan. Noise monitoring results can be made publicly available through arrangements with BURNCO and relevant government agencies.
2879	618 - 23	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	iii. The environmental certificate needs to include strong measures to address noise problems and clearly identify the provincial or federal agency that is responsible for enforcement;	Measures for mitigating potential noise effects are presented in Table 18-1 of the EAC Application/EIS. A Noise Management Plan will be developed, which will include a response plan to noise concerns received from nearby property owners. BURNCO will establish a mutually agreeable mechanism for engaging with the McNab Creek Strata owners regarding issues of benefit or concern.
2880	618 - 24	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	iv. Site operations shall be consistent with Sunshine Coast Regional District Noise Control Bylaw No. 597, 2008.	Operations will be restricted to 7 AM to 9 PM, consistent with the SCRD Noise Control Bylaw section regarding Machine Noise.
2881	618 - 25	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	v. The design of noise mitigation berms, especially on the north side of the site, should pay particular attention to the topographical amplifications of the McNab Valley and its surrounding steep and mountainous terrain.	The noise model developed for the prediction of noise effects for this project considered the design of the proposed berms and accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.  A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.
2882	618 - 26	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	vi. Consideration should be given that the four month construction phase be completed within the period of time when McNab Creek residential properties, recreational activities and facilities on North Gambier are less frequently used. Construction in the late fall to early spring timeframe may be more prudent to reduce impacts.	The estimated duration of project construction will be up to two years. Some components will be constructed relatively quickly, while others will take longer depending on manufacturing times, construction windows and other limitations associated with the location of the Project site.  A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners, including receptors across the water such as Ekins Point.
2883	618 - 27	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	i. The SCRD supports BURNCO'S commitment to local hiring and procurement;	Comment acknowledged. Information is noted as being present. No further information required.
2884	618 - 28	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	ii. The SCRD supports BURNCO'S commitment to reaching a benefit agreement with the McNab Strata community;	Comment acknowledged. Information is noted as being present. No further information required.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2885	618 - 29	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	iii. Marine tourism activities should be incorporated into the Access Management Plan.	The Marine Transport Management Plan (see Sec. 16.2.2.11) will have relevant information for all marine vessels, including marine tourism vessels, and for operators of tourism facilities that have a marine component, such as summer camps.
2886	618 - 30	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	iv. Should the project proceed the SCRD wishes to enter into a discussion with BURNCO regarding a mutually acceptable community benefits agreement.	BURNCO has proposed a McNab Community Enhancement Fund (CEF) that would consist of money set aside each year of operation, based on output, to enhance the McNab community through targeted funding on projects throughout the region. Funding of projects would be given priority by BURNCO's Management Committee based on a number of criteria that would include: <ul style="list-style-type: none"> <li>- Mitigation of project effects</li> <li>- Bringing amenities to our nearest neighbours</li> <li>- Supporting non-political groups actively improving Howe Sound through cleanup efforts, habitat improvements, etc.</li> <li>- Children's camps</li> <li>- Local united Way or similar organizations providing funding to community programs</li> <li>- Public amenities</li> </ul> <p>The CEF is a funding mechanism which may be replaced by a Sunshine Coast Regional District fee at some future date. If such a fee were introduced, then the CEF would cease.</p>
2887	618 - 31	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	i. Recreational access to existing anchorages in the area need to be maintained;	Anchorage by Project and non-project vessels within the Project's marine control zone will be subject to the direction and specifications of the Marine Transport Management Plan, and this document will incorporate Transport Canada requirements and reflect Navigation Protection Program permitting (which the Proposed Project is subject to).
2888	618 - 32	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	ii. Adequate safety lighting needs to be installed on marine facilities.	The Marine Transport Management Plan (see Sec. 16.2.2.11) will specify aids and navigational lights as per Project planning and the Navigation Protection Program permitting process. The navigational aids and lights specified in this plan will be installed and maintained.
2889	618 - 33	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	i. The SCRD Lighting Guidelines must be followed for the lifetime of the project.	Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.
2890	618 - 34	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	i. Post-closure maintenance of the lake outflow supported by sufficient bonding should be a condition of the environmental assessment certificate.	BURNCO defers to the BCEAO on potential conditions of environmental assessment certification.  Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.  Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.  Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2891	618 - 35	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	ii. BURNCO needs to provide clarification of the impacts of the well on surface water is needed.	As presented in Section 5.6.5.2.1.2 of the EAC Application/EIS, the well will be pumped at a daily rate of 160 m <sup>3</sup> /day during operations. Although groundwater flow will be affected near to the well, which will be installed near the wash plant, it represents less than 0.3 % of the total groundwater flow through the valley deposits and as such will have negligible effect to overall groundwater flow. The specific well design is not complete but will meet the requirements of the 2016 Groundwater Protection Regulation (part of the Water Sustainability Act brought into force in February 2016).
2892	618 - 36	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	iii. BURNCO's commitment to monitoring site conditions for groundwater and surface water and to recalibrate the model as the project progresses needs to be a condition of the environmental certificate. This should also include making this information public.	BURNCO defers to the BCEAO on potential conditions of environmental certification.  A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken. Adaptive management techniques to be implemented as required include: - Continue to evaluate the extent of the pit during operations. - During the wet season, if water levels in the pit lake become higher than has been designed for the Pit Lake Containment Berm then the valves in the culverts will be closed to reduce the amount of water reporting to the pit from the surface water on the western slope. - The height of the pit lake at the outlet structure can be adjusted to increase or decrease the level of the pit lake (e.g., adding or lowering stop logs) at closure to maintain the hydraulic gradient between McNab Creek and the Project Area following closure.  BURNCO will develop a project-specific website that will be maintained to keep stakeholders informed regarding the Project, including project schedule, construction activities, operating information, and noise and air quality monitoring data.
2893	618 - 37	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	iv. The sediment and erosion prevention measures need to be documented in a mitigation plan need to be provided for review.	Suspended sediment sampling will be conducted in accordance with the Environmental Management Plan for the Project. A site-specific erosion and sediment control plan has been developed for each Project phase (please see Volume 4, Part G – Section 22.0: Appendix 3). Weekly inspections by a qualified environmental monitor will be conducted during periods when ground disturbance activities are being undertaken. Inspections will include a description of pre-site activity conditions, implementation of erosion and sediment control measures, monitoring of control measures, and records of visual observations. Additional event-based inspections, in response to expected storm events or heavy rain events, will also be undertaken to inspect erosion control measurements according to the Sediment and Erosion Control Plan (see Section 7.0). Monitoring will be conducted immediately upstream and downstream of disturbed areas in order to compare potential sediment inputs against background levels. These inspections will help determine the effectiveness of erosion and sediment control measures and the potential need to implement additional measures.

2894	618 - 38	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	v. BURNCO needs to provide clarification if increased evapotranspiration from the lake was incorporated into water modeling.	<p>The hydrogeological modelling and analysis conducted for the Project is presented in Part G, Section 22, Appendix 5.6-D of the EAC Application/EIS.</p> <p>Confirming that increased evaporation resulting from the change in pit lake surface area was incorporated into the model. specified flux boundary that represents recharge to groundwater from precipitation was automatically adjusted during model simulation in the area of the pit lake for increased evaporation at each phase of mine development.</p>
2895	618 - 39	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	vi. BURNCO needs to provide clarification if recharge applied in the groundwater model looked at difference rates for construction, operation and closure due to different ground cover and whether the groundwater modelling did sensitivity studies to look at different hydraulic properties of the bedrock.	<p>The hydrogeological modelling and analysis conducted for the Project, including sensitivity analyses, are presented in Part G, Section 22, Appendix 5.6-D of the EAC Application/EIS.</p> <p>The groundwater model simulated groundwater conditions resulting from aggregate removal throughout the Project life, including at closure. The model boundaries were adjusted over time to account for changes in ground cover and lake surface area. The assessment of uncertainty in model predictions was carried out by conducting a model sensitivity analysis, including simulations of the flux representing groundwater discharge from bedrock to the valley fill aquifer (base case +/- 2).</p>
2896	618 - 40	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	vii. The environmental assessment certificate needs to include monitoring requirements following closure/reclamation of the site to ensure that the model's conclusions were accurate.	<p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 and are summarized below. BURNCO commits to funding for these monitoring initiatives.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring.</p> <p>Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational Environmental Protection Plans (EPPS). Compliance monitoring will include assessment of Proponent and contractors' environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program.</p> <p>BURNCO will submit a report to the BCEAO on the status of compliance with the Certificate Conditions, at the following times:</p> <ul style="list-style-type: none"> <li>- At least 30 days prior to the start of Construction;</li> <li>- On or before January 31 in each year after the start of Construction;</li> <li>- At least 30 days prior to the start of Operations;</li> <li>- On or before January 31 in each year after the start of Operations;</li> <li>- At least 30 days prior to the start of Closure and Reclamation;</li> <li>- On or before January 31 in each year after the start of Closure and Reclamation; and</li> <li>- Within 30 days of completing Closure and Reclamation.</li> </ul> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2897	618 - 41	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	viii. The influence of the pit lake level on flow and level of McNab Creek should be monitored seasonally and during peak and reduced precipitation periods, and over a long enough period, to find the best level to maintain tin the pit and McNab Creek.	A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken. Adaptive management techniques to be implemented as required include: - Continue to evaluate the extent of the pit during operations. - During the wet season, if water levels in the pit lake become higher than has been designed for the Pit Lake Containment Berm then the valves in the culverts will be closed to reduce the amount of water reporting to the pit from the surface water on the western slope. - The height of the pit lake at the outlet structure can be adjusted to increase or decrease the level of the pit lake (e.g., adding or lowering stop logs) at closure to maintain the hydraulic gradient between McNab Creek and the Project Area following closure.
2898	618 - 42	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	ix. The effect of any upwelling of groundwater originating from the pit and entering McNab Creek or directly into Howe Sound via the foreshore should be assessed to determine if it is likely to disturb spawning area or contribute to undesirable siting effects.	Please refer to Technical Memo entitled BURNCO Aggregate Project: Additional Information Regarding Watercourse Two (WC2), Fish and Fish Habitat. There is predicted to be increased groundwater influx into the groundwater-fed channels below the proposed pit lake. The increased levels of influx and more stable baseflows is expected to improve conditions for spawning by improving intergravel flow supporting egg and alevin survival. The total amount of freshwater input into the estuary will not be changed but it will be more uniformly distributed amongst the groundwater-fed channels. The Aquatic Health Assessment found that the Water quality of the pit lake Outflow (both surface and groundwater) would be suitable for all life history stages of salmonids.
2899	618 - 43	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	x. A plan for post-project use of the pit lake should be in place to consider issues such as potential stocking of fish.	A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.  Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.
2900	618 - 44	Sunshine Coast Regional District, Board Submission	Sunshine Coast, BC	i. The lakeshore slope should be designed to ensure that people and animals that use the lake can easily get on shore.	A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit. The perimeter of the pit lake will be designed to allow for an escape route for large mammals (See Mitigation Measure M-5.3-55 described in Section 5.3 of the EAC Application/EIS).

2901	619 - 1	Sunshine Coast Regional District, Natural Resource Advisory Committee	Sunshine Coast, BC	<p>Further to BURNCO Rock Products Ltd.'s application for an environmental assessment certificate for an aggregate project in the McNab Valley, West Howe Sound, The SCRD's Natural Resource Advisory Committee considered the proposal at its meeting of September 21, 2016.</p> <p>Previous NRAC reviews and recommendations were incorporated into the SCRD Board's input, however it was not possible for the SCRD Board to consider the NRAC's most recent recommendations due to the tight timeline between the two meetings. Thus the following are not a formal SCRD Board submission:</p>	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2902	619 - 2	Sunshine Coast Regional District, Natural Resource Advisory Committee	Sunshine Coast, BC	1. That the Proponent monitors turbidity and total suspended solids when lake water is discharged into the stream channel.	<p>Suspended sediment sampling will be conducted in accordance with the Environmental Management Plan for the Project. A site-specific erosion and sediment control plan has been developed for each Project phase (please see Volume 4, Part G – Section 22.0: Appendix 3).</p> <p>A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act.</p>
2903	619 - 3	Sunshine Coast Regional District, Natural Resource Advisory Committee	Sunshine Coast, BC	2. That sediment, erosion and water management practices are reassessed as the water balance model is updated, and that any changes to water, sediment and erosion management practices are communicated to the SCRD.	Suspended sediment sampling will be conducted in accordance with the Environmental Management Plan for the Project. A site-specific erosion and sediment control plan has been developed for each Project phase (please see Volume 4, Part G – Section 22.0: Appendix 3). Weekly inspections by a qualified environmental monitor will be conducted during periods when ground disturbance activities are being undertaken. Inspections will include a description of pre-site activity conditions, implementation of erosion and sediment control measures, monitoring of control measures, and records of visual observations. Additional event-based inspections, in response to expected storm events or heavy rain events, will also be undertaken to inspect erosion control measurements according to the Sediment and Erosion Control Plan (see Section 7.0). Monitoring will be conducted immediately upstream and downstream of disturbed areas in order to compare potential sediment inputs against background levels. These inspections will help determine the effectiveness of erosion and sediment control measures and the potential need to implement additional measures.

2904	619 - 4	Sunshine Coast Regional District, Natural Resource Advisory Committee	Sunshine Coast, BC	3. That the SCRD request a detailed conceptual plan for closure conditions and consider how to best support appropriate future land use in the area.	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>
2905	620 - 1	Personal Information Withheld	Ontario	WAKE UP. Please don't destroy Howe Sound again.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2906	621 - 1	Personal Information Withheld	Squamish, BC	I do not agree with this project because of its impact on critical salmon habitat, eco tourism, and the future of Howe sound.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2907	621 - 2	Personal Information Withheld	Squamish, BC	I do not agree with this project because of its impact on critical salmon habitat, eco tourism, and the future of Howe sound.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response

2908	621 - 3	Personal Information Withheld	Squamish, BC	I do not agree with this project because of its impact on critical salmon habitat, eco tourism, and the future of Howe sound.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
2909	622 - 1	Tim Turner	Gibsons, BC	When will the politicians who represent us have the courage, the vision and the boldness to act in our collective best interest and say no to the Burnco proposal? Now I hope.	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>
2910	622 - 2	Tim Turner	Gibsons, BC	There is nothing as valuable to the people of the Sea to Sky region than a large healthy estuary, the integrity of its sound scape and the powerful symbol of a wild place that we protected because we knew that the McNab Creek estuary is worth way more than the gravel beneath it.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2911	622 - 3	Tim Turner	Gibsons, BC	There is nothing as valuable to the people of the Sea to Sky region than a large healthy estuary, the integrity of its sound scape and the powerful symbol of a wild place that we protected because we knew that the McNab Creek estuary is worth way more than the gravel beneath it.	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
2912	623 - 1	Personal Information Withheld	Howe Sound, BC	<p>I oppose the Burnco application for following reasons:</p> <p>* LOCATION UNSUITABLE. Far too close to existing residential properties. The unsightliness, noise and pollution from gravel mine and crush mill would be intolerable. SCRD in 2009 refused permit for McNab Creek aggregate mine.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
2913	623 - 2	Personal Information Withheld	Howe Sound, BC	<p>I oppose the Burnco application for following reasons:</p> <p>* LOCATION UNSUITABLE. Far too close to existing residential properties. The unsightliness, noise and pollution from gravel mine and crush mill would be intolerable. SCRD in 2009 refused permit for McNab Creek aggregate mine.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>

2914	623 - 3	Personal Information Withheld	Howe Sound, BC	* LOSS OF HABITAT. The likely loss of salmon habitat in McNab creek due to aggregate mining has caused Fisheries and Oceans Canada twice to reject the project application. That should be the end of it.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2915	623 - 4	Personal Information Withheld	Howe Sound, BC	* LOSS OF HABITAT. The likely loss of salmon habitat in McNab creek due to aggregate mining has caused Fisheries and Oceans Canada twice to reject the project application. That should be the end of it.	<p>Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO's involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.</p> <p>Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.</p>
2916	623 - 5	Personal Information Withheld	Howe Sound, BC	* SPECIES AT RISK. If, as has been documented by Burnco consultants, McNab creek is home to more than a dozen species at risk, including Roosevelt Elk which were reintroduced there in 2001 by the BC Ministry of Environment, it follows that project approval should be rejected under the terms of the Precautionary Principle.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2917	623 - 6	Personal Information Withheld	Howe Sound, BC	* BARGE TRAFFIC HAZARD. Howe Sound is a thriving tourist destination. The addition of up to half a dozen tug/gravel barge transits daily through the sound further would complicate already busy commercial and recreational vessel traffic patterns in that narrow waterway, thereby increasing significantly the risk of serious accident.	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
2918	623 - 7	Personal Information Withheld	Howe Sound, BC	*PRIOR CONSULTATION. McNab Creek lies in Sechelt traditional territory. The Sechelt First Nation has not been consulted by Burnco regarding the proposed gravel quarry. Community approval not granted.	First Nation consultation requirements are delegated to Proponents by the Crown. For the Proposed Project, only Squamish Nation and the Tsleil-Waututh Nation were identified as potentially affected first Nations by the BCEAO. The CEA Agency identified additional Aboriginal Group, however, the Sechelt First Nation was not among these, presumably because of the proximity of the proposed Project to their Traditional Territory.
2919	624 - 1	Krista Page-Cowan	North Vancouver, BC	As a life long North Shore resident and avid swimmer of Howe Sound I am opposed to the Burnco Mine Project proposal. There are too many potential environmental risks associated with the project. Just recently we have seen an improvement in water quality in Howe Sound after many years of cleanup from the Britannia mine. There is enough industry impacting the waters of Howe Sound.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

2923	625 - 2	Gambier Island Local Trust Committee	Gambier Island, BC	<p>The Gambier Island Local Trust Committee is a local government with the land use planning responsibility for the land and marine areas for Howe Sound (apart from the Municipality of Bowen Island). As well, our Local Trust Committee, and the Islands Trust as a whole, has a unique legislative mandate to preserve and protect the fragile ecology and communities of the islands in the Salish Sea. To that end, we have a number of submissions to make related to the BURNCO proposal to develop a gravel extraction, processing and shipping facility at McNab Creek.</p> <p>The Executive Committee of the Islands Trust has the responsibility of speaking to issues of marine safety and environmental health within the Trust Area. The Chair of the Executive Committee is sending a letter addressing Trust wide policy's regarding this project. We have not addressed in this submission the concerns of many related to impacts on marine and terrestrial habitats surrounding the project and that is not because we do not share those concerns but because we wish to focus on certain issues as set out below.</p>	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2924	625 - 3	Gambier Island Local Trust Committee	Gambier Island, BC	<p>Our Official Community Plans, extending 300 metres beyond Gambier Island and 150 metres beyond all Associated Islands, commit to the following Community Goals which are relevant to this proposed project:</p> <ul style="list-style-type: none"> <li>- To fulfill the object of the Islands Trust, which is to preserve and protect the trust area and its unique amenities and environment for the benefit of the residents of the trust area and of British Columbia generally, in cooperation with municipalities, regional districts, improvement districts, other persons and organizations and the government of British Columbia.</li> <li>- To preserve, protect and enhance the rural character, peacefulness, natural beauty and views of the Gambier Island Planning Area.</li> <li>- To provide for a variety of quality natural recreational experiences for residents and visitors in a manner that leaves the land in a relatively undisturbed or wilderness condition consistent with maintaining the local trust area's rural tranquility and ecological balance.</li> </ul>	<p>The proposed Project lies within Electoral Area F of the Sunshine Coast Regional District. While there are three OCPs in Electoral Area F, none of them overlap with the local study area (LSA). Regional zoning for the LSA is discussed in Volume 2, Part B, Section 6 of the EAC Application/EIS.</p> <p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>

2925	625 - 4	Gambier Island Local Trust Committee	Gambier Island, BC	As the Islands Trust Executive Committee will be reviewing wider marine issues of this proposed project, the Gambier Island Local Trust Committee has determined to limit its submissions to affected neighbour issues that impact the goals of the Gambier Island Official Community Plan: a) Air pollution issues b) Noise issues and operating hours c) Visual impacts and operating hours d) General Community Concerns and acceptability of industrial activity in Howe Sound.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2926	625 - 5	Gambier Island Local Trust Committee	Gambier Island, BC	Air Pollution concerns We note that here, along with elsewhere in the application, the applicant addresses cumulative impacts from the perspective of current conditions and levels of activity. This reflects the flaw in our current assessment system in that it doesn't take into account the cumulative impact of this project, the Woodfibre LNG project, increased traffic on the Sea to Sky Highway, and industrial activity elsewhere on the Sunshine Coast. Each project is viewed in isolation against a backdrop of what is happening at this point in time rather than what is likely to happen in the near term. The Howe Sound air-shed, similar to the marine environment, is currently in a recovery state due to the cessation of some industrial activity and controls on other activities but that improvement is fragile. We urge the EAO to review the cumulative impact of this project on the air-shed (and on other values) including all the planned and projected activity that would affect this air-shed, rather than just based on the current background pollution concerns.	Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for the following:  <ul style="list-style-type: none"> <li>- Marine mammals – behavioural disturbance</li> <li>- Amphibian species at risk – barriers to movement, change in mortality, habitat loss</li> <li>- Roosevelt elk – barriers to movement, change in mortality, habitat loss</li> <li>- Grizzly bear – change in mortality, habitat loss</li> <li>- Environmentally sensitive ecosystems – loss of extent</li> <li>- Ecosystems at risk – loss of extent</li> <li>- Air quality indicators – increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual)</li> <li>- Real estate – change in real estate value</li> <li>- Marine navigation – interference with navigation use and navigability due to Project-related vessel traffic</li> <li>- Harvesting fish and wildlife – change in environmental setting</li> <li>- Recreation and tourism – change in environmental setting</li> <li>- Visual quality – change in visual quality</li> <li>- Heritage resources – changes to heritage resource integrity, context and accessibility</li> <li>- People – Human health (air quality and particulate matter).</li> </ul> All potential cumulative residual effects were determined to be negligible or not significant except net effects to grizzly bear; cumulative residual effects to the threatened Squamish-Lillooet Grizzly Bear Population Unit were determined to be significant due in large part to vehicle collisions that might result from the development of new logging roads. Grizzly bear have not been observed within the Proposed Project area and the Proposed Project is not predicted to contribute to the potential mortality of the species.

2927	625 - 6	Gambier Island Local Trust Committee	Gambier Island, BC	Regarding the dust and solid particulate emitting from the processing and transport of the gravel, we recognize that the applicant has put in place procedures to control the emissions in the processing area both through the use of "below ground" or enclosed procedures and through the use of "watering" processes. We urge that those processes be a condition of any approval.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p> <p>BURNCO defers to the BCEAO on potential conditions of environmental assessment certification.</p>
2928	625 - 7	Gambier Island Local Trust Committee	Gambier Island, BC	We remain concerned with the impacts from conveying the processed gravel to barges and then the barging process itself. Controls on emissions of particulate from these processes appears inadequate; when loading barges, the gravel will have to "fall" some distance which will inevitably lead to dust and other emissions. The facility in Sechelt emits a lot of gravel dust which is a nuisance to the community surrounding the facility. Methods to control this (enclosed tubes for example) are an important measure that should be required for the project.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. Mitigation measures for fugitive barge emissions will include:</p> <ul style="list-style-type: none"> <li>- Barges will only be travelling loaded in one direction;</li> <li>- The barges will have 2.74 m boxwalls which will act as partial windscreens;</li> <li>- The loaded aggregate material will be wet; and</li> <li>- Five of the seven aggregate types will have material silt content less than 1.5%.</li> </ul> <p>NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>

2929	625 - 8	Gambier Island Local Trust Committee	Gambier Island, BC	The applicant has indicated that an Air Quality and Dust Control Plan and an Air Quality and Meteorological Monitoring Program will be established prior to the construction phase. The LTC urges the EAO to require that both plans be submitted for review prior to approval of the project, and that they also include information on what steps the barging companies will take to prevent emissions while the gravel is in transit.	BURNCO will develop a project-specific website that will be maintained to keep stakeholders informed regarding the Project, including project schedule, construction activities, operating information, and noise and air quality monitoring data.  BURNCO defers to the BCEAO on potential conditions of environmental assessment certification.
2930	625 - 9	Gambier Island Local Trust Committee	Gambier Island, BC	We also urge the EAO to require the applicant to include the full extent of the Regional Study Area in both the Air Quality and Dust Control Plan and the Air Quality Monitoring Program.	Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS. The Regional Study Area is 80 km by 80 km (corresponding with the dispersion model domain) and is not likely a suitable extent for a project-specific plan and monitoring program.  BURNCO defers to the BCEAO on potential conditions of environmental assessment certification.
2931	625 - 10	Gambier Island Local Trust Committee	Gambier Island, BC	Noise Issues While there are many concerns related to the environmental impacts, in terms of quality of life for neighbour, noise is probably the biggest concern. What is proposed is a gravel crushing and loading facility that will emit industrial noise. A number of matters seem problematic with the study: i) The EAO is unable to know from the information provided if account was made of the fact that sound travels over water in a far different manner than it does over land especially in the absence of wind which is a frequent occurrence in the summer months in this part of Howe Sound. In addition, it is not clear if calculations took into account the fact that the project will be take place in a valley surrounded by mountains reflecting sound.	A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.  Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.  A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.
2932	625 - 11	Gambier Island Local Trust Committee	Gambier Island, BC	ii) The study prepared concludes that the impact will be “negligible”, which is defined as <3Db change from the Ambient Sound Levels. The ASLs for the receptor NR4 at Camp Latona are lower than at other receptors and a change in sound would likely be more noticeable. Likely, most levels of Low Frequency Noise and High Annoyance Noise will have an impact on the remote experience for landowners and visitors to this area.	The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Considering these factors, the modelled Project contributions to noise levels at NR4 (Eakins Point, inside the LSA and across the water from the Project) were below baseline and resulted in Negligible-Not Significant effects. Therefore the LSA will not be expanded.  A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners, including receptors across the water such as Eakins Point.

2933	625 - 12	Gambier Island Local Trust Committee	Gambier Island, BC	<p>iii) Decibel levels do not reflect that fundamental change in the experience of the environment. The baseline study recognizes that, with very limited exceptions, current ambient noise is from birds, water flowing, wind, and waves. Natural sounds that are one of the reasons people come to this area to experience nature. If that background sound is replaced instead with industrial noise, it will completely change the nature experience.</p> <p>In this instance, we believe that the EAO require a separate independent study related to noise effects, where the actual noise of the facility is simulated and the effects measured in a variety of weather conditions in a variety of locations.</p>	Noise monitoring locations will be included as part of the Noise Management Plan. Stations will be located to monitor noise levels at the McNab Strata and at Ekins Point on Gambier Island.
2934	625 - 13	Gambier Island Local Trust Committee	Gambier Island, BC	We are also concerned with the noise that will emanate from the barge loading as this will occur beyond any barriers. The chances of this producing unsatisfactory noise, in our view, is great and there appear to be no "noise deadening" measures proposed beyond raising or lowering the conveyor belt. We propose that some method of deadening the noise of gravel entering a barge should be a condition of any approval.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p> <p>BURNCO defers to the BCEAO on potential conditions of environmental assessment certification.</p>
2935	625 - 14	Gambier Island Local Trust Committee	Gambier Island, BC	We are concerned as well that the berms placed around the processing facility are not high enough or extensive enough to contain noise from that facility and submit that the berms should be higher than piles of material and planted with sound absorbing vegetation such as large trees.	<p>Project details, including the location of the processing plant, the configuration of the stockpiles and the Processing Plant Dirt Berm, have been designed in part to mitigate potential noise effects. Other noise mitigation include the use of mufflers/silencers and fabric enclosures, equipment maintenance and scheduling of activities to reduce disruption to nearby residents.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation, potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p> <p>A Noise Management Plan will describe how noise will be managed on site in accordance with the Environmental Objectives and Best Management Practices for Aggregate Extraction in BC. Noise monitoring locations and measures that can be implemented to reduce noise effects will be included in the Noise Management Plan. BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations.</p>

2936	625 - 15	Gambier Island Local Trust Committee	Gambier Island, BC	The facility should only emit noise while it is operating and thus the hours of operation are an important consideration. At present, the applicant indicates that it will operate during "daylight hours" which it defines as 7am to 10pm. We submit that to have the least impact on the surrounding communities, both operation and barging hours should be strictly limited to a 9am to 5pm period all year round and that no operations be permitted on weekends or statutory holidays. The communities surrounding the proposed facility are most heavily used during summer months and on weekends. The EAO should also require the proponent to undertake the four-month construction phase between October and April when there are fewer recreational visitors in Howe Sound.	The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCR noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.  Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.
2937	625 - 16	Gambier Island Local Trust Committee	Gambier Island, BC	The facility should only emit noise while it is operating and thus the hours of operation are an important consideration. At present, the applicant indicates that it will operate during "daylight hours" which it defines as 7am to 10pm. We submit that to have the least impact on the surrounding communities, both operation and barging hours should be strictly limited to a 9am to 5pm period all year round and that no operations be permitted on weekends or statutory holidays. The communities surrounding the proposed facility are most heavily used during summer months and on weekends. The EAO should also require the proponent to undertake the four-month construction phase between October and April when there are fewer recreational visitors in Howe Sound.	The estimated duration of project construction will be up to two years. Some components will be constructed relatively quickly, while others will take longer depending on manufacturing times, construction windows and other limitations associated with the location of the Project site.

2938	625 - 17	Gambier Island Local Trust Committee	Gambier Island, BC	<p><b>Visual Impacts</b></p> <p>The study indicates that Viewpoint 5 from Camp Latona would be impacted by changes to the landscape, scenic character, and light at night. While the study assesses the impact as Low, account must be made for the impact such a change would have on the current use. Enjoyment of the natural viewscape is a key current use of Camp Latona, the Burrard Yacht Club outstation at Ekins Point, and the secured strip of shoreline park Crown land along the northern side of Gambier Island. We urge any approval to require sufficient tree cover to ensure that the operations are not visible from any of these locations.</p> <p>We believe much of the light pollution issues would be addressed by limiting operations to occur during the hours of 9am to 5pm. We submit that this should also be the case for loading and barging as light pollution will emanate from that activity as well. We have been advised that when no operations or loading is occurring, there will only be minimal lighting on the water for navigation purposes and minimal lighting in the plant area. This should be a condition of any permit.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
2939	625 - 18	Gambier Island Local Trust Committee	Gambier Island, BC	<p><b>Community Concerns</b></p> <p>The Gambier Island Local Trust Area includes a number of communities that are affected by this proposal. We submit that many of the concerns being expressed by those community members and by others stem from their experience of this area as a wilderness jewel that is not suitable for industrial development despite its history. There is no doubt that Howe Sound has a history of industrial use, but the resurgence of industrial use in Howe Sound is not consistent with the mandate of the Islands Trust.</p> <p>While we appreciate that the applicant has taken some steps to ameliorate concerns relative to the environment, in the end the proposal is not consistent with the Local Trust Area's official community plans nor the Trust mandate to "preserve and protect the environment and unique amenities" of our Local Trust Area for the benefit of all British Columbia.</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
2940	625 - 19	Gambier Island Local Trust Committee	Gambier Island, BC	<p>As a result, we urge:</p> <p>a) The EAO to recommend rejection of the proposal.</p> <p>b) Alternatively, to include in its condition or recommendations the specific points set out above.</p>	<p>Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>

2941	626 - 1	David Suzuki Foundation	Bowen Island, BC	Please accept this submission for the EAO process for Burnco's aggregate mine project proposal on McNab Creek. I am submitting this based on my knowledge of Howe Sound in my work with the David Suzuki Foundation and as a Bowen Island resident who cares deeply about the sustainability of projects in this region.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2942	626 - 2	David Suzuki Foundation	Bowen Island, BC	I have convened numerous community forums and meetings in the Howe Sound region over the past three years. People consistently speak to the desire to help nurture a fragile marine recovery we're experiencing after years of pollution to the region. No one wants to see us return to an era when marine dead zones defined our ocean. I've heard many express a desire to live within the bounds of nature and to be guided by an understanding that economic opportunities must be based on an understanding of ecosystem health.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2943	626 - 3	David Suzuki Foundation	Bowen Island, BC	I understand that environmental risks associated with this project may include mitigating for the impact of climate change on water quality and flows and potential effects on wildlife, in particular, salmon.	A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS. Potential effects considered were changes in GHG emissions as a result of the Project, the Project's contribution to climate change through the emission of GHG's, and how potential changes in climate will affect project-related infrastructure.  Proposed mitigation includes the use of electricity instead of fossil fuels, routine maintenance of vehicles, and minimizing idling of vehicles and tugs. Mitigation measures that will reduce GHG emissions are consistent with specific actions within the Seas-to-Sky Air Quality Management Plan.  Following the application of proposed mitigation, the contribution of the proposed Project GHG emissions to provincial, federal and global totals were determined to be negligible.
2944	626 - 4	David Suzuki Foundation	Bowen Island, BC	I understand that environmental risks associated with this project may include mitigating for the impact of climate change on water quality and flows and potential effects on wildlife, in particular, salmon.	A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 (Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.  Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.  Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.

2945	626 - 5	David Suzuki Foundation	Bowen Island, BC	I understand that environmental risks associated with this project may include mitigating for the impact of climate change on water quality and flows and potential effects on wildlife, in particular, salmon.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2946	626 - 6	David Suzuki Foundation	Bowen Island, BC	I understand that environmental risks associated with this project may include mitigating for the impact of climate change on water quality and flows and potential effects on wildlife, in particular, salmon.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2947	626 - 7	David Suzuki Foundation	Bowen Island, BC	Unfortunately, the short time given to read and comment on technical information and project-related communications between the government and industry limits me from more substantive comments.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
