2948	626 - 8	David Suzuki Foundation	Bowen Island, BC	<p>I would like to focus on one area that I believe this project must uphold if we are to hold companies responsible for the pollution they create and the remediation they promise. That area is financial sureties. I believe that it must be a requirement for this project to proceed to require substantial financial sureties up front before project approval is given.</p> <p>These sureties must include covenants and caveats that benefit both the environment and taxpayers. This requirement is supported by the 2012 federal Auditor General's report on environmental financial liability: <a href="http://www.oag-bvg.gc.ca/internet/English/parl_cesd_201212_02_e_37711.html">http://www.oag-bvg.gc.ca/internet/English/parl_cesd_201212_02_e_37711.html</a></p> <p>Chapter 2 of the report states: "The environmental costs resulting from natural resource development projects can run into tens of millions—or in rare cases billions of dollars". The report estimates the cost to clean up federal contaminated sites exceeded \$7 billion, with costs increasing every year.</p> <p>Environmental financial assurances are an important safeguard for the environment. They provide funds for future environmental liabilities to be paid by a proponent or operator. They also provide for liabilities arising from projects with long lifespans where costs associated with decommissioning may not become known for decades. In conjunction with a regulatory framework, they can act as a powerful incentive to industry to reduce environmental impacts as a core part of business.</p>	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>

2950	627 - 2	Anton van Walraven	Bowen Island, BC	<p>Comments to Environmental Assessment Office regarding Burnco Aggregate Project McNab Creek, Howe Sound, BC Submitted October 3, 2016 Ir. Johan Huibert Anton van Walraven 351 Eagles Nest Rd, Bowen Island, BC V0N1G1</p> <p>Background Ingenieur degree Industrial Design (7 year Master degree equivalent), Technical University of Delft, the Netherlands (1984-1991) 1992 – 1999 Graphic design, industrial design and architectural IT consultant. 2001 – 2009 Staff forest campaign, volunteer coordination and IT (Western Canada) Wilderness Committee, Vancouver BC Resident, Bowen Island, 2003 - present Member of lead team Concerned Citizens Bowen – ccbowen.ca, 2015 - present Member of volunteer research team regarding Herring spawn in Upper Howe Sound and possible effects of Woodfibre LNG's Once Through Cooling System proposal on Herring Spawn, August 2015 - present.</p>	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>
2951	627 - 3	Anton van Walraven	Bowen Island, BC	<p>Comment 1: The environmental Assessment process has been recognized to be 'broken' and its results to be lacking the public trust. One of the reasons EA process is considered 'broken' is due to the fact that the regulator's job is to judge the merits of the project proponents conclusions, and to be relying in their judgment on the work of the public during the public comment process, and the members of the Working Group. Both public comment process and Working Group participants lack time and resources to adequately do their work. (Acknowledged by Golder Associate representatives at the Burnco Information session on September 14 2016 in West Vancouver).</p>	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>

2952	627 - 4	Anton van Walraven	Bowen Island, BC	<p>- As of to date Burnco Rock Products Ltd. and its principal officers has, since July 27 2006, donated \$ 286,700 to the BC Liberal party, the party that has formed the BC Government since 2001. (Source Elections BC)</p> <p>- On November 24 2013, more than a year before the Environmental Assessment of the Woodfibre LNG project started, the Province of B.C. posted a video on youtube.com concerning a trade trip for Premier Clark to China. We hear the Premier speaking and this is part of the transcript: "I just came back from Rudong, Jiangsu Province near Shanghai. I saw the most incredible feat of engineering you will find in just about anywhere. The longest LNG pipeline in the world overland. It goes out about 20 kilometers, out from the shore. So they can receive LNG from around the world, AND THAT IS WHERE we are going to connect Squamish British Columbia to...China. As Woodfibre [LNG] build their facility in B.C. to export natural gas...over here [China]." <a href="https://www.youtube.com/watch?v=vwB2tN9xly8">https://www.youtube.com/watch?v=vwB2tN9xly8</a></p> <p>- As of to date, Woodfibre LNG and its principal officers have donated \$91, 689 to the BC Liberal party. (Source Elections BC)</p> <p>- How could the Premier make this statement with the clear emphasis and conviction that Squamish would connect to China through the natural gas exports of Woodfibre LNG?</p> <p>- The Environmental Assessment of the Woodfibre LNG project was flawed and clearly rigged, as the video proves, even before the assessment of the project started.</p>	Thank you for this information. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2953	627 - 5	Anton van Walraven	Bowen Island, BC	<p>Question 1.1: How can the public be certain that the recommendations coming out of the Environmental Assessment process properly reflect the real impact this proposal would have on the McNab creek estuary?</p>	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>
2954	627 - 6	Anton van Walraven	Bowen Island, BC	<p>Question 1.2: How can we trust that a Minister, whose party has received \$ 286,700 in donations from a company, will make a fair and unbiased decision, when the track record of this BC government shows an all together different pattern?</p>	Thank you for this information. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
2955	627 - 7	Anton van Walraven	Bowen Island, BC	<p>Comment 2: Estuaries deliver invaluable ecosystem services. The entire Howe Sound inlet has very limited wild and functional estuary. McNab Creek is the second largest estuary in Howe Sound that is still functional, while the other estuaries in Howe Sound were destroyed and replaced by urban or industrial development (Britania beach, Horseshoe Bay, Snug Cove Bowen Island, Mill creek at Woodfibre, etc).</p> <ul style="list-style-type: none"> <li>- Estuaries provide ecosystem services that are fundamental life-support processes upon which all organisms depend (Daily et al., 1997). Two ecosystem services that estuaries provide are water filtration and habitat protection.</li> <li>- McNab Creek is the second largest estuary of the few remaining natural estuaries in Howe Sound.</li> <li>- Estuaries form a tiny portion of Howe Sound's total shoreline but are its richest shoreline habitats in terms of biodiversity and biological productivity.</li> <li>- In the Howe Sound and broader context estuaries deserve the highest protection.</li> <li>- 'The options for adequate fish habitat compensation within McNab Creek or even the greater Howe Sound area are severely limited and may not allow the proposed development to meet DFO's fish habitat policy objectives, including the "No Net Loss" guiding principle' (DFO letter to Burnco R.P. Ltd – June 27 2011).</li> </ul> <p>Question 2.1: What is the justification for destroying 75% of the McNab estuary indefinitely when estuaries are regarded as seriously crucial to marine life and very few estuaries are found in Howe</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

2956	627 - 8	Anton van Walraven	Bowen Island, BC	<p>Comment 3. ...Distinction must be made between 'the need of the market for gravel' in general and the economical opportunity that wet-mining of gravel from McNab Creek would provide to Burnco. Howe Sound has been 'explored' before and some deposits are already depleted. In absence of careful planning for supply aggregates for the Lower Mainland , question marks should be placed with appropriateness of pursuing this project in a functioning estuary.</p> <p>The 'Need for the project' is described in the earlier project description dated December 26, 2011. Although the project description is not part of the submission, it is found on the EAO ePic webpage for the Burnco submission. The document is crucial since it provides Burnco's rationale for pursuing the project in McNab creek.</p> <p>- In the chapter 'Need for the project' it is stated: 'With the steady growth of the population of BC's South Coast, along with continued depletion of existing local aggregate supplies, there is a need to locate and develop new sources of aggregate in proximity to the Lower Mainland. The relative cost of aggregate is often low, but transportation costs are high, often eclipsing the cost of the product. Shipping by water is the most cost-effective way of transporting aggregate products, and shipping short distances by water further reduces environmental and societal costs.'</p> <p>- The need for aggregates is clear, but it is unclear how planning initiatives, like the 'Aggregate and Demand – Update and Analyses', Nov 2013, prepared for the Regional District of Central</p>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>Wet mining is the selected mining method because of the proximity of the aggregate deposit relative to the existing water table. Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>

2957	627 - 9	Anton van Walraven	Bowen Island, BC	<p>Comment 4. (Adopted from Dr. Bob Turner [Ref 407 and 597]) Burnco proposal largely blocks the animal corridor between upper McNab valley and shoreline, functionally disconnecting estuary from uplands. The proposal intends to fill three quarters of the lower one kilometer of the McNab Creek valley with a 24/7 industrial operation that will alienate that area from wildlife, and spread industrial noise throughout the lower valley for at least the project lifetime. It is inconceivable that this industrial noise and land alienation will not greatly limit the function of the lower valley as habitat and greatly disconnect migration of mammals such as elk, black bear, wolves, and grizzly bear between upper valley and the shore. Local observations show the estuary is heavily used by elk and black bear, and occasionally by grizzly bear and wolves. I have visited McNab Creek many times and have seen the tracks.</p> <p>Question 4.1: How will the project proposal offset the project impacts on elk, bear and wolf migration along the valley floor from upper valley to estuary?</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

2958	627 - 10	Anton van Walraven	Bowen Island, BC	<p>Question 4.2: Given ongoing forestry operations in McNab Creek valley, and extensive past cutting of valley floor forests, and recent construction of the Box Canyon power project, how does the additional impact of the Burnco proposal relate to the cumulative impacts of other past and ongoing industry in the valley?</p> <p>Question 4.3: What cumulative effects assessment has been made of ecosystem health of the McNab Creek valley?</p>	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for the following:</p> <ul style="list-style-type: none"> <li>- Marine mammals – behavioural disturbance</li> <li>- Amphibian species at risk – barriers to movement, change in mortality, habitat loss</li> <li>- Roosevelt elk – barriers to movement, change in mortality, habitat loss</li> <li>- Grizzly bear – change in mortality, habitat loss</li> <li>- Environmentally sensitive ecosystems – loss of extent</li> <li>- Ecosystems at risk – loss of extent</li> <li>- Air quality indicators – increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual)</li> <li>- Real estate – change in real estate value</li> <li>- Marine navigation – interference with navigation use and navigability due to Project-related vessel traffic</li> <li>- Harvesting fish and wildlife – change in environmental setting</li> <li>- Recreation and tourism – change in environmental setting</li> <li>- Visual quality – change in visual quality</li> <li>- Heritage resources – changes to heritage resource integrity, context and accessibility</li> <li>- People – Human health (air quality and particulate matter).</li> </ul> <p>All potential cumulative residual effects were determined to be negligible or not significant except net effects to grizzly bear; cumulative residual effects to the threatened Squamish-Lillooet Grizzly Bear Population Unit were determined to be significant due in large part to vehicle collisions that might result from the development of new logging roads. Grizzly bear have not been observed within the Proposed Project area and the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

2959	627 - 11	Anton van Walraven	Bowen Island, BC	<p>Comment 5: Proposed 'reclamation' plan narrow in scope and fails to identify what an estuary is. The 'reclamation' plan is designed in terms of growing forests, fails to recognize the need for providing area for the main creek to wander across its natural floodplain over time. The use of the word of reclamation, which refers to land, should be considered inappropriate and misleading, when 75% of the effected area is turned into a lake.</p> <p>- Within Canada it is understood that reclamation means "The process of reconvertng disturbed land to its former or other productive uses." (Powter, Chris, 2002).</p> <p>- The inventory of the soil across the area where the lake would be dug, is narrow in scope. It classifies the soil in terms of being good or poor, which should not be surprising since we are dealing with an estuary. The soil quality distribution across the flat floodplain signifies an estuary, in which the creek has wandered, had different creek beds and deposited sediments in changing areas over time. To project the model of a forest onto an area that is an estuary is odd and would do nothing in terms of reclamation, unless one prefers forests over estuaries.</p> <p>- In contrast with reality, subsequent B.C. governments and their ministries of Forests have declared over time that clearcut logging of old-growth forest, would be adequately replaced by tree planting and to follow second growth forests would be an equivalent replacement. The clearcut logging of Old growth, and subsequent logging of second growth in rotation cycles leads to the known "Falldown" effect on forests. (soil degradation, loss of biodiversity, lack of ability to grow forest – report: Kellogg, R.M.</p>	<p>Thank you for this information. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities. See responses to specific questions below.</p>
2960	627 - 12	Anton van Walraven	Bowen Island, BC	<p>Question 5.1 Is the downgrade of forest capability from Class 1 forest to Class 3 forest in some parts of the McNab estuary an acknowledgement that forest practices in B.C. are indeed highly destructive practices, a misunderstanding of the soil composition you would expect to find in an estuary, or is the reclassification from Class 1 forest to Class 3 a self-serving exercise?</p> <p>Question 5.2: Why is the reclamation plan not based on reestablishing a Class 1 forest after closure?</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>

	Ref #	Commenter (Name)	Location		
2961	627 - 13	Anton van Walraven	Bowen Island, BC	<p>Question 5.3: Why is there no mention of the mature forest areas that will be cleared for the Processing/Stockpiles Area at the shoreface?</p>	<p>We recognize that soils mapping was conducted at a reconnaissance level and based on existing geotechnical borehole and test pit data and existing publically available soils maps. We believe that this information was sufficient for EAC Application/EIS that required LSA soils mapping at a 1:5000-scale.</p> <p>Subsequent soil surveys including additional soil plot locations in the Processing Area, plus select soil sample collection and analytical testing for soil quality will be completed prior to surface preparation. This information combined with the preliminary EAC Application/EIS soils mapping and geotechnical subsurface data will be used to prepare updated soil maps and soil salvage and reclamation plans as required for the BURNCO Mines Act Permit Application (MAPA).</p> <p>Mature forest areas that will be cleared are noted in Volume 2, Section 5.3 of the EAC Application/EIS: The Proposed Project will remove approximately 3.3% (4 ha) of mature coniferous forest for the marine conveyor belt system in the LSA.</p>
2962	627 - 14	Anton van Walraven	Bowen Island, BC	<p>Comment 6: (partly adopted from Dr. Bob Turner [Ref 407 and 597]) The project will permanently isolate McNab Creek from migration across the majority of its natural floodplain. The suggestion that the pitlake would not effect flow levels in McNab creek is based on the premis of adequate precipitation to sustain an 'overpressure' on the area east of the lake and prevent 'leaking' from the Creek into the lake.</p> <p>The natural habit of the river is to wander back and forth across its natural floodplain and estuary. Berms surrounding the proposed pit will permanently restrict McNab Creek to the eastern margin of the estuary. The berms will isolate the Creek from three quarters of its natural fan delta, removing the Creek's ability to directly replenish sediment to the western part of the estuary and create diverse habitats. Given ongoing sea level rise, forecast to be at least 1 m rise by 2100, this lack of direct sedimentation to the western estuary will increase the risk of shoreline erosion, wet meadow and tidal flat erosion, and shoreline retreat, with consequent valuable habitat loss throughout this area.</p> <p>- The 'Historic Climate Analyses for Howe Sound' (Burnco EA App. Appendix 5.8-A) is limited to the West side of Howe Sound and limited to the period 1971 to 2010. Since 2010 we are experiencing the effects of climate change with dryer conditions in South Western B.C., characterized by longer spells of dry weather and alternated by sudden burst of precipitation. During these burst, the rain water tends to flow off rather than being absorbed by the soil and to cause soil erosion.</p>	<p>An assessment of avulsion risk on McNab Creek indicated that, on short time scales (decadal) the risk of lateral channel migration of McNab Creek into the area of the proposed project is considered to be Low. Appropriate engineering of the flood control dyke can reduce the risk to Very Low. Long term maintenance will be required to sustain the Very Low risk level.</p> <p>The proposed Project will lead to the loss of approximately 200 m2 of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. No other fisheries-related offset is proposed.</p>

2963	627 - 15	Anton van Walraven	Bowen Island, BC	Question 6.2: Will the sudden rising levels of the pitlake caused by precipitation burst demand the release of large amounts of water into the rearing channel projected to replace Water Course 2?	<p>During the operational phase of the Project the water level in the pit will be monitored but not be actively managed. Mining operational activities will need to accommodate fluctuations in the Pit Lake water levels. The owner shall monitor the groundwater gradient and the water levels within the pit lake. These monitored groundwater and pit lake water levels shall be used to refine the analysis of the closure groundwater gradient and pit lake water level. These analysis shall be used to inform the progressive planning of the mine. After closure, if necessary, the groundwater gradient can be altered (varying the rate of loss from McNab Creek) by adjusting the height of the weir at the outlet of the pit lake.</p> <p>The Pit Lake water levels provided in Table 5.5-7 (Volume 2 Section 5.5), include consideration of surface water and groundwater inflows and groundwater outflows from the Pit Lake on an average annual basis. Additional analysis indicated that during extreme wet periods ranging in duration from days to months, the increased rates of surface water and groundwater inflow would result in Pit Lake water levels in excess of the values presented in Table 5.5-7. Under these conditions the rate of groundwater outflow would also increase above those predicted under annual average conditions. The height of the Pit Lake Containment Berm was designed in order to contain the elevated Pit Lake water levels that would result from extreme prolonged wet periods. Details of the analysis and design of the Pit Lake Containment Berm will be provided in the Mines Act Application.</p>
2964	627 - 16	Anton van Walraven	Bowen Island, BC	Question 6.3: Would the need for releases due to precipitation burst overwhelm the proposed new rearing channel that is calculated to withstand a few artificial freshet events(lake releases) per year?	<p>During the operational phase of the Project the water level in the pit will be monitored but not be actively managed. Mining operational activities will need to accommodate fluctuations in the Pit Lake water levels. The owner shall monitor the groundwater gradient and the water levels within the pit lake. These monitored groundwater and pit lake water levels shall be used to refine the analysis of the closure groundwater gradient and pit lake water level. These analysis shall be used to inform the progressive planning of the mine. After closure, if necessary, the groundwater gradient can be altered (varying the rate of loss from McNab Creek) by adjusting the height of the weir at the outlet of the pit lake.</p> <p>The Pit Lake water levels provided in Table 5.5-7 (Volume 2 Section 5.5), include consideration of surface water and groundwater inflows and groundwater outflows from the Pit Lake on an average annual basis. Additional analysis indicated that during extreme wet periods ranging in duration from days to months, the increased rates of surface water and groundwater inflow would result in Pit Lake water levels in excess of the values presented in Table 5.5-7. Under these conditions the rate of groundwater outflow would also increase above those predicted under annual average conditions. The height of the Pit Lake Containment Berm was designed in order to contain the elevated Pit Lake water levels that would result from extreme prolonged wet periods. Details of the analysis and design of the Pit Lake Containment Berm will be provided in the Mines Act Application.</p> <p>A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken.</p>

2966	627 - 18	Anton van Walraven	Bowen Island, BC	<p>Comment 8: ( adopted from Dr. Bob Turner [Ref 407 and 597]) Inappropriate location for a Processing/Stockpiles Area At McNab, a forest 30-300m wide of second growth sitka spruce-hemlock forest 80-250 years old fringes the entire estuary shoreline. This mature forest is an essential element of the estuary, forming a natural transition between upland and wet meadow-tidal flats of the intertidal estuary. The entire one kilometer of estuary shoreline with fringing forest, intertidal marsh and mud-sand-cobble tidal flats intact at McNab Creek. This coastal strip is the most valuable and sensitive part of the estuary.</p> <p>The Processing/Stockpiles Area is proposed within the fringing forest of this coastal strip. This will require clearing of a large tract of mature second growth 80-250 year old hemlock-sitka spruce forest. This forest zone is 150-200m wide at the Processing/Stockpiles Area site and all but a sliver-thin buffer will be lost.</p> <p>Question 8.1: Why is the processing facility not located inland, north of the power line, and well back from the most ecologically sensitive area of the estuary?</p>	<p>The Proposed Project was thoughtfully designed to be environmentally responsible, sensitive to the environment of the proposed site while making use of existing conditions. Since the initial design, the project has changed considerably. Revisions and refinements have been made in response to our Project Team's feedback and to comments and concerns raised by regulatory agencies, Aboriginal Groups and the public.</p> <p>A few examples of project considerations, and subsequent changes and components designed to address feedback received to date include:</p> <ul style="list-style-type: none"> <li>- Using existing BC Hydro lines to electrically powered equipment to extract, process and load the aggregate resource to limit exhaust emissions from the burning of fossil fuels;</li> <li>- Revised the size and location of the processing area to avoid identified fish habitat and to mitigate potential noise effects.</li> <li>- Revised stockpile location and design to limit potential operational noise effects.</li> <li>- Refined berm design and location to limit potential noise and air quality effects.</li> <li>- Maintained tree buffer on foreshore to limit noise effects, dust emissions, and visual effects.</li> </ul> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
2967	627 - 19	Anton van Walraven	Bowen Island, BC	<p>Comment 9 : ( adopted from Dr. Bob Turner [Ref 407 and 597]) Environmental bonding Given the high ecological values of McNab Creek estuary, and the large impacts this proposal will impose on the estuary, and the critical role that estuaries play in Howe Sound, this proposal also poses serious risks to the larger ecosystem health of Howe Sound. Should a mine go ahead, it is critical that environmental reclamation and monitoring of reclamation works be successful to the highest standards. To ensure reclamation compliance, and public confidence that this will indeed be achieved, significant environmental bonds need to be in place.</p> <p>Question 9.1: What criteria are being used to evaluate the necessary level of environmental bonding for reclamation? Question 9.2: What amount of reclamation bonding is required of the proponent before start of works?</p>	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>

2968	627 - 20	Anton van Walraven	Bowen Island, BC	<p>Comment 10: ( adopted from Dr. Bob Turner [Ref 407 and 597] and added) This project will expand industrial activity to a new greenfield site in Howe Sound. This project is not compatible with the ongoing recovery of Howe Sound from past industrial activity, nor its recreational use. Is this the highest and best use for Howe Sound?</p> <p>It is widely recognized that Howe Sound was extensively damaged by past industrial activity and several aggregate deposits in Howe Sound are already depleted. Over the past 30 years, advances in environmental legislation and closure and remediation of past industrial sites has reduced pollution in Howe Sound. A recovery of marine life over the past 15 years, and particularly over the past 5 years, is indicated by the greatly increased presence of whales, dolphins, pink and Chinook salmon, and herring and anchovy.</p> <ul style="list-style-type: none"> <li>- The Province has invested heavily in this enterprise, not the least of which are the ongoing costs of managing Britannia Mine effluent.</li> <li>- Britania Beach Contamination Cleanup near Squamish to cost \$99Million (Vancouver Sun June 10 2006) (Article removed from Vancouver Sun website , but posted here: <a href="http://www.6717000.com/blog/2006/06/britania-beach-contamination-cleanup-nearsquamish-to-cost-99m/">http://www.6717000.com/blog/2006/06/britania-beach-contamination-cleanup-nearsquamish-to-cost-99m/</a> )</li> <li>- As a consequence of all these changes, and the increasing demands of the growing population of metropolitan Vancouver, recreational use of Howe Sound has increased dramatically. A new industrial operation on a new greenfield site with significant ecological impacts is out of step with these trends.</li> </ul>	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
2969	627 - 21	Anton van Walraven	Bowen Island, BC	<p>Currently, the footprint of industry (except for forestry) is absent from the entire 25 km long western shore of Howe Sound from Port Mellon to Woodfibre. Northern Thornborough Channel is a prime recreational area for boaters. The noise and visual impacts from the proposed project would be a significant intrusion on the recreational values of this area.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

2970	627 - 22	Anton van Walraven	Bowen Island, BC	Question 10.1: What criteria suggest that this proposal is compatible with the "highest and best use" of the McNab Creek estuary and northern Thorborough Channel?	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
2971	627 - 23	Anton van Walraven	Bowen Island, BC	Question 10.2: What criteria suggest that the impacts of this proposal will not be detrimental to the ongoing recovery of marine ecosystems of Howe Sound?	It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).  Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.
2972	627 - 24	Anton van Walraven	Bowen Island, BC	Question 10.3: What criteria suggest there is a need for pitlake when we have Howe Sound?	Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.
2973	627 - 25	Anton van Walraven	Bowen Island, BC	Overall conclusion: - With the changing weather patterns due to climate changes. Patterns of dry spells alternated by precipitation burst, are being reported everywhere around the world.	A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS.
2974	627 - 26	Anton van Walraven	Bowen Island, BC	- The idea to dig a pit mine in an area that is the floodplain of an existing salmon and trout bearing creek and build a dyke to prevent the creek from changing course, will translate into a permanent situation were the creek and every fish living it will be exposed to a combination of low flow levels and very high flow levels.	A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.  Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.  Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.
2975	627 - 27	Anton van Walraven	Bowen Island, BC	- The ability of the creek to self-mediate through flooding and/or changing course will be lost. Therefore the possibility of Serious Harm to fish should be seriously considered.	An assessment of avulsion risk on McNab Creek indicated that, on short time scales (decadal) the risk of lateral channel migration of McNab Creek into the area of the proposed project is considered to be Low. Appropriate engineering of the flood control dyke can reduce the risk to Very Low. Long term maintenance will be required to sustain the Very Low risk level.  The proposed Project will lead to the loss of approximately 200 m2 of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B).

2976	627 - 28	Anton van Walraven	Bowen Island, BC	- In the larger context, hundreds of Salmons stocks in B.C. have gone extinct due to bad logging practices. Stream and river keepers having been working hard to rebuild salmon habitat. In light of this it seems odd that a healthy Salmon and trout bearing stream would be unnecessarily exposed to the possibility of Serious Harm.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2977	627 - 29	Anton van Walraven	Bowen Island, BC	- Howe Sound has been exposed to enough industrial activity and has given up enough aggregate deposits. Time to let it heal.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
2978	628 - 1	Laurie Parkinson	Bowyer Island, BC	<p>Cumulative impact assessment should be done re dark night skies in Howe Sound.</p> <p>If Woodfibre LNG and BURNCO are built, that will make WF, BURNCO, and Howe Sound Pulp and Paper all with safety lights on at night at their industrial plants and dock facilities.</p>	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects, including visual quality. Changes in visual quality considered the potential for cumulative effects related to vegetation clearing and the installation and operation of land-based and marine-based infrastructure and night-time security lighting to the landscape visible from selected receptor sites. The Visual Quality CEA is presented in Section 7.4.5.7 of the EAC Application/EIS. All potential cumulative residual effects were determined to be negligible or not significant.</p>

2979	629 - 1	Claire Weeks and Peter Wing	Bowen Island, BC	Howe Sound was extensively damaged by past industrial activity. It has taken several decades to begin to reverse some of the resulting damage. Toxic and cancer-causing chemicals were being used in the paper mills, creosote was being used as a piling preservative with damage to the ecosystem resulting. The water below the surface layer was the colour of Coca Cola and has been slowly recovering. Over the past 30 years, advances in environmental legislation and closure and remediation of past industrial sites has reduced pollution in Howe Sound. Recovery of marine life over the past 15 years, and particularly over the past 5 years, is indicated by the greatly increased presence of whales, dolphins, pink and Chinook salmon, and herring and anchovy. The Province has invested heavily in this recovery, not the least of which is the ongoing cost of managing Britannia Mine effluent.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
2980	629 - 2	Claire Weeks and Peter Wing	Bowen Island, BC	As a consequence of all these changes, and the increasing demands of the growing population of metropolitan Vancouver, recreational use of Howe Sound has increased dramatically. We are Bowen residents and frequently kayak in the Sound.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
2981	629 - 3	Claire Weeks and Peter Wing	Bowen Island, BC	A large new industrial operation in McNab Creek's fertile estuary, with major disruption to animal, fish and bird habitats, is totally out of line with these trends.	A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.  The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.  The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.

2985	630 - 1	Birgitta von Krosigk	Lions Bay, BC	I am opposed to Burnco's proposed gravel mine at McNab Creek in Howe Sound, regardless of the company's proposed mitigation plans.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2986	630 - 2	Birgitta von Krosigk	Lions Bay, BC	This is the wrong development, in the wrong place, for the wrong reasons, at the wrong time, using a seriously flawed process.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
2987	630 - 3	Birgitta von Krosigk	Lions Bay, BC	Wrong Development Burnco proposes to mine 20 million tons of gravel from the ancient McNab Estuary for the next 16 years. This project will have large negative environmental and health impacts for residents, visitors, and future generations – of people, as well as land, air, and marine wildlife.	The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects.
2988	630 - 4	Birgitta von Krosigk	Lions Bay, BC	Such environmental destruction in exchange for corporate benefit flowing to a privately held, Alberta-owned company, and a handful of jobs, is not sustainable development in the sense of the United Nations Sustainable Development Goals, to which Canada is a signatory.	BURNCO is a 104-year old family-owned Canadian company with operations in British Columbia, Alberta, Saskatchewan and Texas.  BURNCO has over 1,150 employees (180 in BC) and is Canada's largest independent ready mix concrete and aggregate company.  BURNCO's BC operations currently transport sand and gravel by barge from Treat Creek (east of Powell River) and as far away as Port McNeil on northern Vancouver Island, to existing facilities along the Fraser River in Burnaby and Langley.

2992	630 - 8	Birgitta von Krosigk	Lions Bay, BC	<p>As noted by the David Suzuki Foundation in its 2015 report entitled "Sound Investment – Measuring the Return on Howe Sound's Ecosystem Assets":</p> <ul style="list-style-type: none"> <li>• The Howe Sound ecosystem is of critical importance to keeping our environment in balance</li> <li>• The sound provides habitat and sheltered access to a range of species and is high in biological diversity</li> <li>• The aquatic environments support over 650 different species of fish and invertebrates, including rock cod, salmon, shellfish and herring</li> <li>• Marine mammals include seals, sea lions, dolphins, orcas and humpback whales</li> </ul> <p>"One can estimate the health of the aquatic ecosystems by considering the status of salmon and orcas, which are keystone or indicator species that are sensitive to changes in water quality, trophic webs and pollution levels. The closure of the salmon fishery and rarity of orca sightings over the past few decades appear to fit the classic ecosystem theory that size of organisms declines with degraded ecosystems. To the amazement of all, this trend is reversing. The salmon fishery has re-opened, orcas have returned and humpback whales have been sighted." David Suzuki Foundation (2015) "Sound Investment – Measuring the Return on Howe Sound's Ecosystem Assets", p. 20</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
2993	630 - 9	Birgitta von Krosigk	Lions Bay, BC	<p>Wrong Reasons</p> <p>Burnco says it needs the gravel to meet ever increasing demands for aggregate in the Lower Mainland. However, by Burnco's own admission, "the volume of aggregate we are applying to mine through this project is up to 20 million tonnes, which by itself wouldn't even fulfill the need required in the Lower Mainland for one year — 30 million tonnes" (Burnco's website).</p> <p>So why risk ruining precious environmental resources and values in spectacular Howe Sound if it is only going to be a drop in the bucket?</p> <p>Giving a private Alberta company a way to off-set corporate profits elsewhere seems a very poor reason to allow re-industrialization of Howe Sound.</p>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resource is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>

2997	630 - 13	Birgitta von Krosigk	Lions Bay, BC	<p>Flawed Process</p> <p>Howe Sound is under threat from a number of big projects. The current environmental assessment process only looks at one project at a time, rather than considering the cumulative and knock-on effects of multiple projects. Once there is one facility creating noise, air and water pollution, it may seem “natural” to allow another.</p> <p>As noted by the David Suzuki Foundation”</p> <ul style="list-style-type: none"> <li>Industrial resurgence and nature recovery must be considered together — not in the current piecemeal approach that could set them on a collision course.</li> <li>The future of Howe Sound’s environment and economy is intricately connected.</li> <li>Careful choices must be made to ensure a healthy and sustainable future for natural systems and the economy.</li> </ul> <p>I attended one of the public information sessions hosted by Burnco.</p> <p>On my way out, I was offered a jar of “free” honey. No thank you. No amount of honey can make this a sweet deal.</p> <p>Do not grant Burnco permission to re-industrialize Howe Sound. Reject this proposal.</p> <p>(To access the David Suzuki Foundation report: <a href="http://www.davidsuzuki.org/publications/downloads/SoundInvestment-HoweSoundEcosystemAssets.pdf">http://www.davidsuzuki.org/publications/downloads/SoundInvestment-HoweSoundEcosystemAssets.pdf</a></p>	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for the following:</p> <ul style="list-style-type: none"> <li>Marine mammals – behavioural disturbance</li> <li>Amphibian species at risk – barriers to movement, change in mortality, habitat loss</li> <li>Roosevelt elk – barriers to movement, change in mortality, habitat loss</li> <li>Grizzly bear – change in mortality, habitat loss</li> <li>Environmentally sensitive ecosystems – loss of extent</li> <li>Ecosystems at risk – loss of extent</li> <li>Air quality indicators – increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual)</li> <li>Real estate – change in real estate value</li> <li>Marine navigation – interference with navigation use and navigability due to Project-related vessel traffic</li> <li>Harvesting fish and wildlife – change in environmental setting</li> <li>Recreation and tourism – change in environmental setting</li> <li>Visual quality – change in visual quality</li> <li>Heritage resources – changes to heritage resource integrity, context and accessibility</li> <li>People – Human health (air quality and particulate matter).</li> </ul> <p>All potential cumulative residual effects were determined to be negligible or not significant except net effects to grizzly bear; cumulative residual effects to the threatened Squamish-Lillooet Grizzly Bear Population Unit were determined to be significant due in large part to vehicle collisions that might result from the development of new logging roads. Grizzly bear have not been observed within the Proposed Project area and the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
2998	631 - 1	Personal Information Withheld	West Vancouver, BC	<p>A beautiful estuary full of life and part of a sensitive ecosystem should not be destroyed. Especially for the benefit of a very few. Granting rights to damage an area full of vitality would be backward thinking.</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

2999	632 - 1	Eoin Finn	Bowyer Island, BC	I am opposed to granting this project an Environmental Certificate.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3000	632 - 2	Eoin Finn	Bowyer Island, BC	Locating a dusty, noisy and environmentally destructive mine in the middle of iconic Howe Sound is simply unacceptable.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
3001	632 - 3	Eoin Finn	Bowyer Island, BC	Locating a dusty, noisy and environmentally destructive mine in the middle of iconic Howe Sound is simply unacceptable.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCR noise bylaw was considered as part of the assessment.</p>
3002	632 - 4	Eoin Finn	Bowyer Island, BC	Locating a dusty, noisy and environmentally destructive mine in the middle of iconic Howe Sound is simply unacceptable.	<p>Potential effects of the Proposed Project have been assessed for selected valued environmental components to address key issues related to fish and fish habitat, marine resources, terrestrial wildlife and vegetation, geotechnical and natural hazards, water resources, air quality and climate change.</p> <p>The assessment concludes that, with the application of design considerations and identified mitigation, no significant adverse environmental effects will result from the Proposed Project.</p> <p>A detailed assessment of potential environmental effects of the Proposed Project is presented in Volume 2, Part B of the EAC Application/EIS.</p>

3003	632 - 5	Eoin Finn	Bowyer Island, BC	I have attached a report from the U.S. National Institute for Occupational Safety and Health (NIOSH) organization on the noisiness of typical aggregate mines. This does not belong in Howe Sound - refuse it.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p> <p>Site and activity specific Health and Safety Plans will outline specific procedures and protocols for working around active construction sites. BURNCO's corporate Health, Safety and Environment (HSE) Management Plan is provided in Volume 4, Part G, Section 22, Appendix 16-B of th EAC Application/EIS.</p>
3004	633 - 1	Jeff and Sarra Gau	Not Stated	This letter is being submitted as a result of your request for public comment on the Environmental Impact Statement submitted by Burnco Rock Products regarding its proposal for an open pit mine at McNabb Creek. While we have significant concerns that this is a highly flawed and biased process, we have no option but to “play the game” and “trust in the process”.	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>
3005	633 - 2	Jeff and Sarra Gau	Not Stated	Burnco Rock Product's (Burnco's) proposed, large, open-pit aggregate mine and crushing facility is clearly contrary to regional commitments and development efforts in the area, and more importantly it is completely inconsistent with the established use of the area for primarily leisure purposes.	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>

3008	633 - 5	Jeff and Sarra Gau	Not Stated	<p>The proposed open pit mine should not be considered in isolation. The cumulative impact of other projects in the area need to form part of this assessment. In May 2015 the Auditor General of BC issued a report with nine recommendations and stated "it's in the interest of British Columbians to address cumulative effects management without delay" Howe Sound was selected as one of the Province's first regions for Cumulative Effects Assessment under the new framework.</p>	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for the following:</p> <ul style="list-style-type: none"> <li>- Marine mammals – behavioural disturbance</li> <li>- Amphibian species at risk – barriers to movement, change in mortality, habitat loss</li> <li>- Roosevelt elk – barriers to movement, change in mortality, habitat loss</li> <li>- Grizzly bear – change in mortality, habitat loss</li> <li>- Environmentally sensitive ecosystems – loss of extent</li> <li>- Ecosystems at risk – loss of extent</li> <li>- Air quality indicators – increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual)</li> <li>- Real estate – change in real estate value</li> <li>- Marine navigation – interference with navigation use and navigability due to Project-related vessel traffic</li> <li>- Harvesting fish and wildlife – change in environmental setting</li> <li>- Recreation and tourism – change in environmental setting</li> <li>- Visual quality – change in visual quality</li> <li>- Heritage resources – changes to heritage resource integrity, context and accessibility</li> <li>- People – Human health (air quality and particulate matter).</li> </ul> <p>All potential cumulative residual effects were determined to be negligible or not significant except net effects to grizzly bear; cumulative residual effects to the threatened Squamish-Lillooet Grizzly Bear Population Unit were determined to be significant due in large part to vehicle collisions that might result from the development of new logging roads. Grizzly bear have not been observed within the Proposed Project area and the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
3009	633 - 6	Jeff and Sarra Gau	Not Stated	<p>While the economic return will accrue to Burnco and a small number of local businesses, significant socio-economic costs and environmental damage to Howe Sound will be borne by the communities and residents of the area and the taxpayers of British Columbia who will derive little benefit from the project. The mine will generate only 12 full time jobs at around \$25/hr, similar to a less experienced construction worker. The aggregate itself may well replace aggregate from other parts of BC and thus the jobs may not be "net new" employment but rather "replacement employment", there is no benefit in this.</p>	<p>The local spatial study area for the operations phase labour market effects (including employment) of the Proposed project was described in the Application Information Requirements/EIS Guidelines, which was approved by the BCEAO and the CEA Agency on December 16, 2014 after review by the Technical Working Group established to guide this assessment. This local spatial study area is Sunshine Coast Regional District.</p> <p>The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.</p>
3010	633 - 7	Jeff and Sarra Gau	Not Stated	<p>Environmental Impacts</p>	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>

3011	633 - 8	Jeff and Sarra Gau	Not Stated	Howe Sound has a history of industrial abuse and is only now seeing return of marine mammal and fish life. In the past six years, whales and dolphins have been observed in the Sound for the first time in over a decade and herring and salmon have become increasingly abundant. This proposed project could clearly have a significant negative impact on marine wildlife and their habitat and freshwater fish and their habitat. There are only 3 estuaries in all of Howe Sound. They act as a nursery for prawns, scallops, oysters, rock-fish, salmon and countless other types of marine life. The harm from this proposed project to McNab's valley and alluvial fan and the habitat that rely on it cannot be overstated.	<p>It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).</p> <p>Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.</p>
3012	633 - 9	Jeff and Sarra Gau	Not Stated	Howe Sound has a history of industrial abuse and is only now seeing return of marine mammal and fish life. In the past six years, whales and dolphins have been observed in the Sound for the first time in over a decade and herring and salmon have become increasingly abundant. This proposed project could clearly have a significant negative impact on marine wildlife and their habitat and freshwater fish and their habitat. There are only 3 estuaries in all of Howe Sound. They act as a nursery for prawns, scallops, oysters, rock-fish, salmon and countless other types of marine life. The harm from this proposed project to McNab's valley and alluvial fan and the habitat that rely on it cannot be overstated.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
3013	633 - 10	Jeff and Sarra Gau	Not Stated	Howe Sound has a history of industrial abuse and is only now seeing return of marine mammal and fish life. In the past six years, whales and dolphins have been observed in the Sound for the first time in over a decade and herring and salmon have become increasingly abundant. This proposed project could clearly have a significant negative impact on marine wildlife and their habitat and freshwater fish and their habitat. There are only 3 estuaries in all of Howe Sound. They act as a nursery for prawns, scallops, oysters, rock-fish, salmon and countless other types of marine life. The harm from this proposed project to McNab's valley and alluvial fan and the habitat that rely on it cannot be overstated.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. 3014	633 - 11	Jeff and Sarra Gau	Not Stated	<p>In fact, Oceans and Fisheries Canada (aka DFO) has already rejected such proposals in the past. With respect to the Burnco project, In June of 2010, DFO determined that the project would result in harmful alteration, disruption or destruction (“HADD”) of fish habitat that cannot be compensated elsewhere in the Sound. As such DFO advised Burnco that DFO was not prepared to issue a HADD authorization.</p> <p>In response, I understand Burnco filed a judicial review application against DFO in Supreme Court. Subsequently, DFO agreed to participate in a full environmental review. However, in June, 2011, DFO issued a letter in which they stated that they “continue to have serious concerns about the extent of the impacts to fish and fish habitat that may result from this project” and that “The project presents a high risk to Salmon and Salmon habitat.”</p>	<p>Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO’s involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.</p> <p>Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.</p>
3015	633 - 12	Jeff and Sarra Gau	Not Stated	<p>There are major concerns from stakeholders throughout Howe Sound about the crushing and loading facilities and associated noise, glare from industrial lighting, vibrations, dust, emissions and destruction or damage to wildlife habitat both terrestrial and aquatic.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCR noise bylaw was considered as part of the assessment.</p>

3016	633 - 13	Jeff and Sarra Gau	Not Stated	There are major concerns from stakeholders throughout Howe Sound about the crushing and loading facilities and associated noise, glare from industrial lighting, vibrations, dust, emissions and destruction or damage to wildlife habitat both terrestrial and aquatic.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>
3017	633 - 14	Jeff and Sarra Gau	Not Stated	There are major concerns from stakeholders throughout Howe Sound about the crushing and loading facilities and associated noise, glare from industrial lighting, vibrations, dust, emissions and destruction or damage to wildlife habitat both terrestrial and aquatic.	<p>A predictive noise model was developed for the Proposed Project as described in Volume 2, Section 9.2. The Type 7810 Predictor® (Predictor®) software was used to assess the potential noise effects associated with the Proposed Project as well as the effectiveness of potential noise controls.</p> <p>Effects to wildlife related to noise were estimated by overlaying the output of noise models with species-specific habitat suitability mapping and summarizing the change in habitat for VCs for which noise thresholds were defined in literature (i.e., amphibian species at risk, northern goshawk, western screech-owl, marbled murrelet, and common nighthawk). Noise thresholds beyond which habitat loss is expected are defined for each VC in Section 5.3.1.5.2 of Vol 2, Section 5.3.</p> <p>Due to the paucity of literature regarding noise thresholds for Roosevelt elk and grizzly bear, effects of noise and other sensory disturbance were measured using published zones of influence (ZOI). A ZOI represents the distance at which avoidance of certain anthropogenic disturbances has been observed.</p> <p>Noise will be managed during the construction and operational phases according to the Environmental Objectives and Best Management Practices for Aggregate Extraction in BC (BC MWLAP 2002). Noise mitigation measures are detailed in Volume 2, Part B - Section 9.2 and include:</p> <ul style="list-style-type: none"> <li>- Maintaining vegetation and trees around the active work areas to act as a noise buffer;</li> <li>- Reducing the height aggregate falls along conveyors and within the crushing facility;</li> <li>- Enclosing conveyors which will assist in reducing noise emissions;</li> <li>- Minimizing speed on roadways;</li> <li>- Operating equipment within specifications and maintaining level roads; and</li> <li>- Reducing idling time.</li> </ul>

3020	633 - 17	Jeff and Sarra Gau	Not Stated	<p>A 2012 research project by Vancouver Aquarium found that the foreshore area directly in front of the proposed project is a marine rich habitat and an important and rare nursery area for various aquatic habitat.</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
3021	633 - 18	Jeff and Sarra Gau	Not Stated	<p>Burnco's Consultant's, Golder and Associates, clearly show in their assessments dust blooms extending far out to sea which over the 16 years of this projects lifetime will cause harmful silt and sediment build up across the foreshore area. The extent of these dust blooms directly contradict other Golder assurances that spraying mitigations will eliminate such dust blooms in the first place. Clearly Golder needs to do further work to get reconcile their opinions.</p> <p>The area can be very exposed to extreme wind conditions which are difficult to predict and monitor. The proponents air quality report shows particulate matter over the marine environment but the marine assessment contradicts this by saying there will be no sediment seems a little incongruous. We need to ensure that should the project go ahead this particulate matter is evaluated on a continuous basis both through air quality monitoring and monitoring of the marine ecosystems around the project. A build-up of silt in the marine environment cannot be allowed, over the course of the project it would destroy local marine life.</p>	<p>The air quality dispersion model predictions presented in Figures 5.7-2, 5.7-3, 5.7-4 and 5.7-5 represent in-air concentrations of particulate matter fractions and not predictions of dust deposition; the concentrations presented do not represent dust plumes. In addition, the dispersion modelling methods and associated assumptions - approved by the Ministry of Environment (MOE) - incorporated a high degree of conservatism. The air dispersion model was based on worst case daily emission rates and assumed worst case daily emissions every day of the year. These assumptions contributed to the high level of confidence in the air quality assessment predictions that there will no significant adverse effects.</p> <p>The same Ministry-approved CALPUFF model that was used to predict air quality concentrations (i.e., run in dynamic [3D] mode with a fine resolution meteorological data set) was used to predict deposition rates which were incorporated into the surface water quality model and the assessment of potential effects on water quality and aquatic health. With the effective implementation of the proposed erosion and sediment control measures and BMPs, the potential residual effects on water quality and aquatic health were determined to be negligible and not significant. Proposed mitigation for controlling the release of dust to the aquatic environment including the following:</p> <ul style="list-style-type: none"> <li>- Developing and implementing an Air Quality and Dust Control Management Plan that will detail measures to control fugitive particulates.</li> <li>- Developing and implementing an Erosion and Sediment Control Plan.</li> <li>- Establishing an on-site Air Quality and Meteorology Monitoring Program.</li> <li>- Fines/silt cakes berm should be vegetated as soon as possible and where possible by planting and seeding with native trees, shrubs, and grasses.</li> <li>- Placement of erosion control blankets on the berm to prevent dust.</li> <li>- Sediment and erosion control measures should be maintained at all times around the crushing areas and until vegetation is achieved on the berm.</li> <li>- Processing plant crushing and dry screening units will be partially enclosed.</li> <li>- Watering of 10 mm crushed gravel and 20 mm crush gravel stockpiles.</li> <li>- Watering of unpaved roads and restricting speed limits</li> </ul>

3022	633 - 19	Jeff and Sarra Gau	Not Stated	Golder Associates also indicate the site could be home to up to 21 Species at Risk including a population of Roosevelt Elk that were transplanted to McNab Creek by the BC Ministry of Environment in 2001 in an effort to re-introduce the species to the area.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
3023	633 - 20	Jeff and Sarra Gau	Not Stated	The current value of the McNabb area as salmon bearing habitat is downplayed in the proponent's report. Our own experience has been of a rejuvenation in fish stocks at McNab, reflecting the fish recovery seen elsewhere in Howe Sound. Greater scrutiny around this part of the report is necessary to reflect the true value of the creek as a salmon habitat.	<p>A description and quantification of potential spawning habitat in the upper section of WC2 is provided in section 3.1.3.1 of Appendix 5.1-A and in Table 6 of the same appendix. A spawner survey conducted on 13 November 2016 re-affirmed the baseline description and observed less than 200 m2 of suitable salmonid spawning habitat based on the presence of exposed gravels and adequate depth (&gt; 18cm).</p> <p>As described in section 3.1.3.2 of Appendix 5.1-A the lower section of WC2 consists of low gradient run and pool habitat with exposed gravels present in the runs and fines occurring in the pool areas. The distribution of pool to run habitat is approximately 1/1 along the length of the lower section. There is approximately 3,920 m2 of wetted area in the lower section of WC2 suggesting that there is approximately 1960 m2 of run habitat that may be suitable for spawning, based on the presence of exposed gravels and adequate depth. During the 13 November 2016 spawner survey chum salmon were observed to be spawning in the available run habitat present in the lower section of the channel (Figure 1, 30-Dec-2016 Technical Memo entitled BURNCO Aggregate Project: Additional Information Regarding Watercourse Two (WC2), Fish and Fish Habitat).</p> <p>The Fish Habitat Offset Plan proposes to create more than 5,000 m2 of additional groundwater-fed channel habitat with approximately a 1/1 ration of pool to run habitat. The offset channel extension uses the design of the existing lower channel as a template so it is reasonable to expected that approximately 2,500 m2 of the new habitat will have conditions similar to the run habitat present in the existing channel where chum salmon where observed to be spawning.</p> <p>A 30-Dec-2016 Technical Memo entitled BURNCO Aggregate Project: Additional Information Regarding Watercourse Two (WC2), Fish and Fish Habitat provides the results of 2016 spawner surveys for WC2 and a description of salmonid species utilization of habitat provided by groundwater-fed channels.</p>

3024	633 - 21	Jeff and Sarra Gau	Not Stated	<p>Even if Burnco make the best possible effort, there is no way they will be able to significantly mitigate the noise from loading millions of tonnes of aggregate into steel hulled barges. Noise and vibrations have been found to disturb large marine mammals' communication, navigation and food-finding abilities, and are increasingly believed to impact their fertility. Sadly, if Burnco is allowed to proceed with this mine, we can expect the dolphins, orcas, and grey whales to vacate the area.</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

3025	633 - 22	Jeff and Sarra Gau	Not Stated	An artificial lake is not a reasonable remediation to replace the habitat for the displaced wildlife.	<p>The pit lake is not proposed as mitigation for habitat loss. Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>
3026	633 - 23	Jeff and Sarra Gau	Not Stated	We find it difficult to believe that there will be no audible impact from the project on the north end of Gambier Island. Given the natural topography of the area and the fact that noise travels very clearly across water we have significant concerns about the noise of the barge loading in particular which we believe will have a significant negative impact of the peaceful nature of the area for humans as well as for marine and terrestrial life. While talking to representatives from Golder at the Open House in West Vancouver in September 2016 it became clear that the noise impact had been modelled with little firsthand knowledge of the area impacted; the lead representative on noise impact admitted he had never been onsite.	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Considering these factors, the modelled Project contributions to noise levels at NR4 (Eakins Point, inside the LSA and across the water from the Project) were below baseline and resulted in Negligible-Not Significant effects.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners, including receptors across the water such as Eakins Point.</p>

3030	633 - 27	Jeff and Sarra Gau	Not Stated	<p>A number of areas of the EIS identify possible environmental impacts of the project but allude to these being addressed by “best management practices”. There are significant concerns around approving a development with clear environmental risks based on the “hope” that best environmental practices will be adhered to. The resources available at the BCEAO for oversight of such projects seem fairly limited from a resource perspective (5-6 people cover the province). What is to stop the proponent from ignoring “best practise” and declining to follow mitigation strategies? The experience of residents adjacent to the Cougar Ridge Mine in Calgary, Alberta owned and operated by Burnco does not suggest that Burnco can be guaranteed to be a “good neighbour”.</p>	<p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 and are summarized below. BURNCO commits to funding for these monitoring initiatives.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring.</p> <p>Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational Environmental Protection Plans (EPPS). Compliance monitoring will include assessment of Proponent and contractors’ environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program.</p> <p>BURNCO will submit a report to the BCEAO on the status of compliance with the Certificate Conditions, at the following times:</p> <ul style="list-style-type: none"> <li>- At least 30 days prior to the start of Construction;</li> <li>- On or before January 31 in each year after the start of Construction;</li> <li>- At least 30 days prior to the start of Operations;</li> <li>- On or before January 31 in each year after the start of Operations;</li> <li>- At least 30 days prior to the start of Closure and Reclamation;</li> <li>- On or before January 31 in each year after the start of Closure and Reclamation; and</li> <li>- Within 30 days of completing Closure and Reclamation.</li> </ul> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>

3031	633 - 28	Jeff and Sarra Gau	Not Stated	<p>Economic Impacts</p> <p>While the project will create 12 full time jobs, it will jeopardize far more jobs than that by impacting the tourism and film industries irreparably.</p> <p>BC FILM INDUSTRY</p> <p>The BC Film industry contributes \$1.3 billion annually to the BC economy. Crews regularly use Howe Sound to represent many world locales, as it provides the key ingredients of wilderness, breathtaking scenery, and easy access from Vancouver, and silence. The introduction of an open pit mine, gravel barge and crusher will dramatically diminish this appeal—making Vancouver itself a less convenient place to film a movie, since its nearby wilderness will no longer be viable for filming.</p> <p>In a 2012 letter to the Future of Howe Sound Society (FHSS) from Thierry Tanguy, a Unit and Location Manager, in Greater Vancouver's Film Industry, Thierry had this to say: "In the last few years, a number of projects have been filmed in the Squamish corridor, as opposed to the other regions we typically compete with, such as California and Louisiana, precisely because of the pristine beauty of its coastline. To name a specific example, I just finished working on a project entitled 'Horns' for Mandalay Pictures. ... originally slated to be filmed in Savannah, Georgia. The one element that shifted the interest in favour of British Columbia is the beauty of the Squamish corridor and Howe Sound where we ended up filming Two-Thirds of the project. This is Twenty-Million</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
3032	633 - 29	Jeff and Sarra Gau	Not Stated	<p>The mine will be visible from the Cypress ski area and Lions Bay, a popular hiking and rock-climbing destination. Every visitor headed to Squamish or Whistler on the Sea-to-Sky Highway and Sea-to-Sky Gondola, as well as daily sightseeing flights from downtown on Harbour Air and others, will see this once-stunning valley being rendered into a gravel mine.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

3033	633 - 30	Jeff and Sarra Gau	Not Stated	<p><b>Property Values</b> Property values along the Howe Sound have already been negatively impacted. The 16 vacation homes at McNab Creek and 53 recreational properties directly across the channel at Douglas Bay on Gambier Island will be the hardest hit due to the obvious eyesore, increased barge traffic, noise and loss of natural beauty. The reduction in property values which has already occurred since the mine was first proposed 6 years ago, harms not only residents, but municipal governments' tax base. Given the considerable increases in property values in the Lower Mainland in the last 6 years it is quite staggering that properties anywhere close to this proposed mine have seen a decline in both assessed value and potential resale value, as evidenced by recent land sales in the area.</p> <p>Vancouver-based Burrard and West Vancouver-based Thunderbird Yacht Clubs have outstations directly opposite the mine site. The 600 members will suffer loss of land value, and outstations will suffer from significantly diminished use.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
3034	633 - 31	Jeff and Sarra Gau	Not Stated	<p><b>Social Impacts</b> Easy accessibility from Vancouver allows people across the lower mainland to enjoy wilderness on their doorstep. The impact of the mine will diminish Howe Sound for present and future generations, reducing Vancouver's much-vaunted "liveability."</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
3035	633 - 32	Jeff and Sarra Gau	Not Stated	<p>The immediate visual impact of the mine and crushing facilities has only been shown by the proponent at sea level. To understand the full visual impact an assessment from a higher elevation is needed. We believe that from a higher elevation the open pit mine and crushing facilities will be fully visible and have a further negative social and economic impact on the properties from which they are visible.</p>	<p>The visual resources assessment (Section 7.4 of the EAC Application/EIS) acknowledges that the residents of the McNab Strata would be most affected by the potential visual impacts due to their close proximity to the Proposed Project. The viewpoint was taken from the end of the breakwater where the view would be unobstructed, and it is a publicly accessible location that would be experienced by residents accessing the dock at the McNab Estates Strata. The lighting assessment indicated residential receptors at the Strata are located in a dark setting with existing lighting visible from adjacent industrial land use.</p> <p>Assessment of viewing locations and/or viewing conditions are limited to those locations that represent viewing opportunities that currently exist or that are certain or reasonably foreseeable.</p>

3036	633 - 33	Jeff and Sarra Gau	Not Stated	In the immediate vicinity of this proposed mine there are existing communities including McNab Creek Strata, Douglas Bay Strata, Brigade Bay, Burrard Yacht Club and Thunderbird Yacht Club. All of these communities enjoy the peace and tranquillity and abundant wildlife in this amazing section of Howe Sound. Families engage in all manner of sport and recreation including hiking, swimming, water sports, sailing, wind surfing, paddle boarding and kayaking. In addition numerous kids camps such as Potlach, Day Break, Artaban, Boys and Girls Club use this area for recreation and there are frequent excursions of kayakers in procession from these camps paddling by or visiting McNab Creek area.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
3037	633 - 34	Jeff and Sarra Gau	Not Stated	In its draft AIR Burnco committed to reporting on the status of consultations with private local land owners and tenure holders who will be affected by the project. However Volume 4, section 21 of the report shows little evidence that Burnco fulfilled these commitments. At section 21.2.4.1 – Social Communications the list of Personal Communications lacks engagement with the local stakeholders who will be impacted by the project. For instance, although Douglas Bay is the largest private land holding in the area and will be directly impacted if the project goes ahead no one from Burnco has attempted to contact the members of the Douglas Bay Strata.	The sample of key informants described in Section 7.3 of the EAC Application/EIS (Non-traditional Land and Resource Use) was not intended to be exhaustive of all stakeholders potentially affected by the Proposed Project, but rather was intended to be wide ranging enough to confirm and expand on non-traditional land and resource use information available from the referenced secondary sources. Key informants interviewed or provided data for this report included representatives from recreational groups and tourism operators, as well as DFO and MFLNRO. Specifically key informants included:  <ul style="list-style-type: none"> <li>- Burrard Yacht Club</li> <li>- Coastal Inlet Adventures</li> <li>- DFO</li> <li>- Don's Water Taxi</li> <li>- Gambier Island Local Trust</li> <li>- Gibson Chamber of Commerce</li> <li>- Islands Trust</li> <li>- MFLNRO</li> <li>- Recreation Sites and Trails BC</li> <li>- Sewell's Marina</li> <li>- Squamish Yacht Club</li> <li>- Sunshine Kayaks</li> <li>- Thunderbird Yacht Club</li> </ul> Conditions C-5.1 through C-5.3 (Table 19.1) outlines the Proponent commitment to ongoing engagement with the McNab Creek Strata. BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. BURNCO has also proposed a McNab Community Enhancement Fund (CEF) that would consist of money set aside each year of operation, based on output, to enhance the McNab community through targeted funding on projects throughout the region. Funding of projects would be given priority by BURNCO's Management Committee based on a number of criteria that would include: <ul style="list-style-type: none"> <li>- Mitigation of project effects</li> </ul>

3038	633 - 35	Jeff and Sarra Gau	Not Stated	In conclusion we cannot see how the joint goals of environmental, social and economic sustainability for Howe Sound can be achieved if this project is allowed to go ahead. We can only trust in the process and believe that our public servants and government will recognize that the value of McNab Creek and the whole Howe Sound region outweighs the business needs of one Alberta based company.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
3039	633 - 36	Jeff and Sarra Gau	Not Stated	If the project should go ahead we need to ensure that there are stringent conditions (including multi-million dollar environmental bonds) attached to its approval which are closely monitored on an ongoing basis by an independent third party and to ensure that the scope of the operation does not extend beyond that described in the EIS. A robust monitoring and safeguard system needs to be in place to ensure the commitments in this application are followed through and that Burnco is held accountable should the need arise.	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
3040	633 - 37	Jeff and Sarra Gau	Not Stated	Finally we suggest that Burnco is required to grant restrictive covenants in favour of the landowners surrounding the proposed project to ensure that the commitments and assurances given in the approval process are effectively monitored and enforced.	<p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 and are summarized below. BURNCO commits to funding for these monitoring initiatives.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring.</p> <p>Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational Environmental Protection Plans (EPPS). Compliance monitoring will include assessment of Proponent and contractors' environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program.</p> <p>BURNCO will submit a report to the BCEAO on the status of compliance with the Certificate Conditions, at the following times:</p> <ul style="list-style-type: none"> <li>- At least 30 days prior to the start of Construction;</li> <li>- On or before January 31 in each year after the start of Construction;</li> <li>- At least 30 days prior to the start of Operations;</li> <li>- On or before January 31 in each year after the start of Operations;</li> <li>- At least 30 days prior to the start of Closure and Reclamation;</li> <li>- On or before January 31 in each year after the start of Closure and Reclamation; and</li> <li>- Within 30 days of completing Closure and Reclamation.</li> </ul> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>
3041	634 - 1	Chris Gordon	Port Coquitlam, BC	Howe Sound is doing so well, thanks to the efforts of environmentally concerned citizens taking action. Please don't allow this mine to proceed and set back all the hard work done to date. We don't need it, we don't want it.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
3042	635 - 1	Personal Information Withheld	Gambier Island, BC	I am a long time resident of Gambier Island and I absolutely oppose this project. I resent having to spend time on this, since it should not even be considered due to complete incompatibility with the ecological and social values present. Please put an end to this.	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>

3045	636 - 3	Personal Information Withheld	Port Moody, BC	The noise from the gravel crushing facility and loading of barges will be significant.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p>
3046	636 - 4	Personal Information Withheld	Port Moody, BC	It will have a negative impact on the enjoyment of the area by boaters, kayakers, fishermen, tourists and other in Howe Sound.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
3047	636 - 5	Personal Information Withheld	Port Moody, BC	The mine developer has stated at meetings that if the demand is there, they want to run the mining and crushing facilities 24/7, 365 days a year.	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>
3048	636 - 6	Personal Information Withheld	Port Moody, BC	The mine developer has stated at meetings that if the demand is there, they want to run the mining and crushing facilities 24/7, 365 days a year.	<p>The Proposed Project is to extract approximately 20 million tonnes of sand and gravel over the 16 year life of the Proposed Project. This will be reflected in an approved EA certificate and mine plan.</p>
3049	636 - 7	Personal Information Withheld	Port Moody, BC	Noise and light pollution will have significant negative impacts on the land and aquatic animals in the area. Noise and vibration pollution have been found to negatively impact the ability of marine mammals to communicate, navigate, find food and it is believed increasingly to impact their fertility.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response

3050	636 - 8	Personal Information Withheld	Port Moody, BC	<p>Noise and light pollution will have significant negative impacts on the land and aquatic animals in the area. Noise and vibration pollution have been found to negatively impact the ability of marine mammals to communicate, navigate, find food and it is believed increasingly to impact their fertility.</p>	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response

3054	637 - 1	Lea Bancroft	North Vancouver, BC	The Burrard Yacht Club has owned 15 acres at Ekins Point on the north end of Gambier Island for roughly 25 years where our family oriented boating club has built and maintained a large Outstation (marine moorage facility) located directly across Thornborough Channel from the proposed BURNCO McNab Valley Aggregate Mine. This property is well used year round by the families of our 380+ members (5,500 man-days annually) who will be directly detrimentally affected by the proposed BURNCO McNab Valley Aggregate Mine. Our concerns that do not appear to have been correctly addressed within Burnco's Project Application documents are:	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3055	637 - 2	Lea Bancroft	North Vancouver, BC	References to Long Term Industrial Use in the McNab Valley: BURNCO's proposal comments that heavy industry has previously taken place in the McNab Valley over many decades and therefore their project should also be allowed and approved is misleading. Logging is a Primary Industry that has historically taken place intermittently throughout the McNab Valley over many decades harvesting the renewable forest resources. These operations have created employment and bolstered the provincial economy while creating temporary disturbance where forest regrowth has taken place in the valley within a few years. In recent years the size of the forest tenure cut-blocks have been reduced and the resulting detrimental effects have been reduced in both size and duration.  Conversely the proposed Burnco McNab Valley Aggregate Mine would be a Secondary "Processing" Industry that would operate continuously in one (1) fixed location close to local stakeholders, a minimum of 10 hours per day, 5 days per week, 52 weeks per year, over the next 15-20 years.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3056	637 - 3	Lea Bancroft	North Vancouver, BC	This continuous prolonged Secondary industry will have a far more detrimental permanent effect on local stakeholders than the previous Primary logging industry while permanently altering the habitat by forever removing a large portion of the McNab Valley alluvial fan leaving in its place a large water filled pit/pond. These are definitely two (2) distinctly different degrees of industrialization in this natural rural environment.	The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.  Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.

3057	637 - 4	Lea Bancroft	North Vancouver, BC	This continuous prolonged Secondary industry will have a far more detrimental permanent effect on local stakeholders than the previous Primary logging industry while permanently altering the habitat by forever removing a large portion of the McNab Valley alluvial fan leaving in its place a large water filled pit/pond. These are definitely two (2) distinctly different degrees of industrialization in this natural rural environment.	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>
3058	637 - 5	Lea Bancroft	North Vancouver, BC	<p>Noise Impacts:</p> <p>Based upon our many years of experience at this location, the noise level mapping provided within the proponent's application appears to be questionable. Low level noise currently created by periodic use of the log dump and booming grounds at the base of the McNab Valley are clearly heard across Thornborough Channel. As this log handling background noise is relatively subdued, temporary, and in keeping with historical usage it is accepted. However additional industrial noise created by the proposed BURNCO mine and barge loading terminal operating a minimum of ten (10) hours per day, (5) days per week, 52 weeks per year, over the next 15-20 years will have a long term detrimental effect on the use and enjoyment of this area by the long term property owners and recreational visitors using this area in Howe Sound.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>

3059	637 - 6	Lea Bancroft	North Vancouver, BC	<p>Noise Impacts: Based upon our many years of experience at this location, the noise level mapping provided within the proponent's application appears to be questionable. Low level noise currently created by periodic use of the log dump and booming grounds at the base of the McNab Valley are clearly heard across Thornborough Channel. As this log handling background noise is relatively subdued, temporary, and in keeping with historical usage it is accepted. However additional industrial noise created by the proposed BURNCO mine and barge loading terminal operating a minimum of ten (10) hours per day, (5) days per week, 52 weeks per year, over the next 15-20 years will have a long term detrimental effect on the use and enjoyment of this area by the long term property owners and recreational visitors using this area in Howe Sound.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
3060	637 - 7	Lea Bancroft	North Vancouver, BC	<p>Increased Marine Traffic Impacts: Concerns are noted in the application regarding the ongoing safety of recreational boaters in Thornborough Channel from increased commercial tug and barge traffic in the area. However, if the proposed terminal location goes ahead there is no mention of concern for the safety of the many docks and/or vessels securely moored in the surrounding area (up to 50 boats at our facilities alone). Increased tug and water taxi traffic in Thornborough Channel will have a significant detrimental effect on the safe ongoing use of our dock facilities located at Ekins Point. All it takes is one (1) commercial tug or water taxi coming or going too fast from the BURNCO terminal to create a very significant wake that could result in safety issues and/or personal injuries, along with significant damage to both the moored vessels and/or the dock facilities. Although we currently have substantial breakwaters at our Ekins Point Outstation this is a very real event that could occur many times over the projected 15-20 year life of the project. Has such an event been discussed with BURNCO and who will be responsible and/or liable for any damages and/or the costs of increased maintenance to our facilities associated with the additional marine traffic servicing the proposed project over the next 16 years?</p> <p>To help mitigate the previously noted concerns would it be feasible to relocate the proposed Barge Loading Terminal into the existing area currently zoned for Secondary Industry at Port Mellon to be fed by conveyors from the mine site. This area around Port Mellon is relatively uninhabited due to its long term Secondary Industrial use</p>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>

3063	637 - 10	Lea Bancroft	North Vancouver, BC	<p>As one (1) small example of the direct economic benefits of recreational use in this area, the Burrard Yacht Club's current contribution to the Sunshine Coast Regional District is roughly \$ 235,000.00 / year. This type of recreational economic input will be significantly reduced if the proposed BURNCO Open Pit/Pond Aggregate Mine is approved. Current and future residential and recreational users will simply decide to spend their leisure time and dollars elsewhere versus going to this area of Howe Sound, where industrial re-growth appears to be favoured over the previously promoted natural recreation and residential usage in this area of the Sea to Sky Corridor.</p> <p>This area of Howe Sound is a highly valued natural resource to the current local stakeholders, communities, and government bodies, who have collectively invested a lot more time and money in this area over a far longer period than BURNCO Rock Products has within only the last few years.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

3067	637 - 14	Lea Bancroft	North Vancouver, BC	How do you put a value on this easily accessed quiet natural "escape" environment that is now becoming a very rare and desirable commodity in such close proximity to the growing world class city of Vancouver?	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
3068	638 - 1	Kate Thomas-Peter	Bowen Island, BC	I live in Howe Sound on Bowen Island. The Sound has relatively recently shown signs of recovery from previous pollution sources. It is a jewel of nature so close to a major city, giving access to nature for millions of people, the benefits of which are well documented for physical, mental and spiritual health. It should be a protected area with great caution over agreeing to mines or quarries that are both a blot on the landscape and a potential source of pollution. Please do not grant permission for this gravel pit.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. 3069	639 - 1	Personal Information Withheld	Squamish, BC	I am concerned for the wildlife and decisions the government is making. Keep Howe sound clean. We don't want LNG or gravel mine.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3070	640 - 1	Personal Information Withheld	Not Stated	PLEASE don't build a gravel pit mine in any of the estuaries of Howe Sound.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3071	640 - 2	Personal Information Withheld	Not Stated	One Hundred and ninety acres is huge and disrupts (eliminates) one of only three river estuaries in Howe Sound. The Squamish River estuary is contaminated with Mercury and will remain so.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

3072	640 - 3	Personal Information Withheld	Not Stated	Who will defend the voiceless creatures that depend on this habitat ... this represents serious concerns as it is a high risk to Salmon and will limit access to bears and elk etc. What of the spotted owl ? It will create the noise and light pollution.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
3073	640 - 4	Personal Information Withheld	Not Stated	Who will defend the voiceless creatures that depend on this habitat ... this represents serious concerns as it is a high risk to Salmon and will limit access to bears and elk etc. What of the spotted owl ? It will create the noise and light pollution.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

3074	640 - 5	Personal Information Withheld	Not Stated	Who will defend the voiceless creatures that depend on this habitat ... this represents serious concerns as it is a high risk to Salmon and will limit access to bears and elk etc. What of the spotted owl ? It will create the noise and light pollution.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
3075	640 - 6	Personal Information Withheld	Not Stated	Who will defend the voiceless creatures that depend on this habitat ... this represents serious concerns as it is a high risk to Salmon and will limit access to bears and elk etc. What of the spotted owl ? It will create the noise and light pollution.	<p>A predictive noise model was developed for the Proposed Project as described in Volume 2, Section 9.2. The Type 7810 Predictor® (Predictor®) software was used to assess the potential noise effects associated with the Proposed Project as well as the effectiveness of potential noise controls.</p> <p>Effects to wildlife related to noise were estimated by overlaying the output of noise models with species-specific habitat suitability mapping and summarizing the change in habitat for VCs for which noise thresholds were defined in literature (i.e., amphibian species at risk, northern goshawk, western screech-owl, marbled murrelet, and common nighthawk). Noise thresholds beyond which habitat loss is expected are defined for each VC in Section 5.3.1.5.2 of Vol 2, Section 5.3.</p> <p>Due to the paucity of literature regarding noise thresholds for Roosevelt elk and grizzly bear, effects of noise and other sensory disturbance were measured using published zones of influence (ZOI). A ZOI represents the distance at which avoidance of certain anthropogenic disturbances has been observed.</p> <p>Noise will be managed during the construction and operational phases according to the Environmental Objectives and Best Management Practices for Aggregate Extraction in BC (BC MWLAP 2002). Noise mitigation measures are detailed in Volume 2, Part B - Section 9.2 and include:</p> <ul style="list-style-type: none"> <li>- Maintaining vegetation and trees around the active work areas to act as a noise buffer;</li> <li>- Reducing the height aggregate falls along conveyors and within the crushing facility;</li> <li>- Enclosing conveyors which will assist in reducing noise emissions;</li> <li>- Minimizing speed on roadways;</li> <li>- Operating equipment within specifications and maintaining level roads; and</li> <li>- Reducing idling time.</li> </ul>

3076	640 - 7	Personal Information Withheld	Not Stated	Who will defend the voiceless creatures that depend on this habitat ... this represents serious concerns as it is a high risk to Salmon and will limit access to bears and elk etc. What of the spotted owl ? It will create the noise and light pollution.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
3077	640 - 8	Personal Information Withheld	Not Stated	Pristine estuaries are rare ... gravel can be obtained elsewhere. Please do not allow this.	<p>Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. 3089	643 - 2	She Ronson	Vancouver, BC	The world does not need more concrete but it does need more fish and wildlife.	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
3090	643 - 3	She Ronson	Vancouver, BC	The world does not need more concrete but it does need more fish and wildlife.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
3091	643 - 4	She Ronson	Vancouver, BC	Be an ecologically responsible company instead & choose ethics over dollars. In your hearts you know this is right.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
3092	644 - 1	Personal Information Withheld	Gibsons, BC	no to pollution and development.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3093	645 - 1	Future of Howe Sound Society	Howe Sound, BC	The attached letter contains comments from the Future of Howe Sound Society.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. 	Ref #	Commenter (Name)	Location		
3097	645 - 5	Future of Howe Sound Society	Howe Sound, BC	The proponent's report shows little effort by the proponent to have engaged in discussion with neighbouring communities or other stakeholders to assess the adverse impact that this project would have on those stakeholders.	Phone based interviews are cited as personal communications (pers.comm.) within the text of the EAC Application/EIS and details included in the references (Part G, Section 21). The list of key informants included the following: Burrard Yacht Club, Coastal Inlet Adventures, District of Squamish, Don's Water Taxi, Gambier Island Local Trust, Gibsons and District Chamber of Commerce, Gibsons Landing Inn, Irwin Motel, Islands Trust, McNab Creek Strata, Sewell's Marina, Squamish Yacht Club, Sunshine Kayaking, Thunderbird Yacht Club, Recreation Sites and Trails BC and West Vancouver Fire & Rescue Services.
3098	645 - 6	Future of Howe Sound Society	Howe Sound, BC	There is little or no recent assessment of how this project would impact other initiatives for long term planning or sustainable development.	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
3099	645 - 7	Future of Howe Sound Society	Howe Sound, BC	There is no objective assessment on the impact this project could have on the tourism and film industries or other economic drivers for the region.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.

3100	645 - 8	Future of Howe Sound Society	Howe Sound, BC	Much of the reference material is outdated or deficient and cumulative effects assessment is deficient in many areas.	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for the following:</p> <ul style="list-style-type: none"> <li>- Marine mammals – behavioural disturbance</li> <li>- Amphibian species at risk – barriers to movement, change in mortality, habitat loss</li> <li>- Roosevelt elk – barriers to movement, change in mortality, habitat loss</li> <li>- Grizzly bear – change in mortality, habitat loss</li> <li>- Environmentally sensitive ecosystems – loss of extent</li> <li>- Ecosystems at risk – loss of extent</li> <li>- Air quality indicators – increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual)</li> <li>- Real estate – change in real estate value</li> <li>- Marine navigation – interference with navigation use and navigability due to Project-related vessel traffic</li> <li>- Harvesting fish and wildlife – change in environmental setting</li> <li>- Recreation and tourism – change in environmental setting</li> <li>- Visual quality – change in visual quality</li> <li>- Heritage resources – changes to heritage resource integrity, context and accessibility</li> <li>- People – Human health (air quality and particulate matter).</li> </ul> <p>All potential cumulative residual effects were determined to be negligible or not significant except net effects to grizzly bear; cumulative residual effects to the threatened Squamish-Lillooet Grizzly Bear Population Unit were determined to be significant due in large part to vehicle collisions that might result from the development of new logging roads. Grizzly bear have not been observed within the Proposed Project area and the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

3101	645 - 9	Future of Howe Sound Society	Howe Sound, BC	<p>The adverse socio-economic impact that this type of industrial activity could have on the region should not be underestimated. Both the Provincial and Federal Governments have spent considerable energy and taxpayer funds in promoting the Sea-to-Sky corridor as an international tourist destination primarily with an emphasis on what it offers for eco-tourism and recreation. The number of tourist visits to the Sea to Sky Corridor has increased dramatically over the last few years and contributed hundreds of millions of dollars to the local economy. The development of a mine project such as this with the attendant impact on a fragile eco-system as well as noise, dust and light pollution can only be detrimental to these efforts to promote the area as a tourist destination. It will have serious, adverse economic consequences to other communities, businesses and users of the Sound. The EIS is lacking in its assessment of impacts on the tourism and recreation economy of the region.</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

3103	645 - 11	Future of Howe Sound Society	Howe Sound, BC	<p>In September 2002, twelve local governments and First Nations representing the communities in the Sea to Sky corridor signed Principles of Co-operation which identified the importance of community involvement in the consideration of issues affecting Howe Sound and the need to “work together for the greater good because territorial lines on a map mean nothing in terms of sustainability”. Among other principles identified in the document, the signatories recognized the “need to effectively manage and maintain a balanced relationship between community development and the protection of unique biophysical qualities of the region”. Recently, these communities have re-affirmed the need to proceed with a comprehensive planning process for the region.</p> <p>The proposed processing facility is not permitted under current zoning. The fact that a proposal of this nature is being considered through an independent governmental assessment without any comprehensive land use plan having been developed for Howe Sound in spite of the stated desires of the communities and local governments in the area is astounding. Furthermore, initiatives are underway to pursue a marine or national park and to have the Howe Sound region recognized as a UNESCO Biosphere Reserve. The federal and provincial governments should be taking a leadership role to ensure that proper land use planning is undertaken prior to considering major industrial development proposals which can have dramatic socio-economic impacts on the surrounding region. In the absence of a comprehensive resource management plan, the Provincial Government should not be approving a project which is</p>	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. 3105	645 - 13	Future of Howe Sound Society	Howe Sound, BC	<p>Environmental Impact</p> <p>1. The Environmental Impact Statement has been prepared based on a project scope that has been substantially scaled back from Burnco's original proposal. The assessments that have been conducted are based on underlying assumptions as to both the scale of the project and the hours of operation.</p>	<p>The Proposed Project was thoughtfully designed to be environmentally responsible, sensitive to the environment of the proposed site while making use of existing conditions. Since the initial design, the project has changed considerably. Revisions and refinements have been made in response to our Project Team's feedback and to comments and concerns raised by regulatory agencies, Aboriginal Groups and the public.</p> <p>A few examples of project considerations, and subsequent changes and components designed to address feedback received to date include:</p> <ul style="list-style-type: none"> <li>- The project life has been reduced from 20-30 years to 16 years, and the maximum depth of excavation has been reduced from 55 metres to 35 metres;</li> <li>- There are no proposed discharges to, or withdrawals from, McNab Creek;</li> <li>- Using existing BC Hydro lines to electrically powered equipment to extract, process and load the aggregate resource to limit exhaust emissions from the burning of fossil fuels;</li> <li>- Reduced the size of the pit lake as the northern edge has been moved away from the McNab Creek Flood Protection Dyke.</li> <li>- Pit lake designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. The elevation of the pit lake will also be used to manage base flows in the natural groundwater watercourses below the pit lake.</li> <li>- Revised the size and location of the processing area to avoid identified fish habitat and to mitigate potential noise effects.</li> <li>- Revised stockpile location and design to limit potential operational noise effects.</li> <li>- Refined berm design and location to limit potential noise and air quality effects.</li> <li>- Areas progressively reclaimed during the operational phase will be re-vegetated to control erosion.</li> <li>- Maintained tree buffer on foreshore to limit noise effects, dust emissions, and visual effects.</li> <li>- Replaced wash water sedimentation ponds and associated discharges with a 95% efficient wash plant that uses recycled water from two large storage tanks. The 5% loss (via retention, evaporation and absorption) will be supplemented with make-up water from a ground water well. No wash water will be discharged.</li> <li>- Fines generated from the crushing, screening, washing of material will be extracted from the wash water and mechanically dried and compressed into sediment cakes which will be used in progressive reclamation of the onsite fines disposal area.</li> <li>- Covered or enclosed Project components and/or operating under wet conditions (e.g., fine water spray) to reduced potential</li> </ul>
3106	645 - 14	Future of Howe Sound Society	Howe Sound, BC	<p>However at the 2013 a Burnco senior executive stated that it was their long-term intention to expand the mine even beyond what had been proposed at that time. We have significant concerns about relying on the results of environmental assessments which are predicated on these assumptions of a reduced scope of operations since Burnco has clearly expressed its desire and intention to ultimately develop a substantially larger mine which will be operated 24 hours per day. We remain concerned that the scope of the project as described in the EIS has been contrived for the purposes of achieving initial approval and because the Environmental Impact Statement relies on the assumptions as to project scope, it does not properly assess the ultimate impact that this project will have if approved.</p>	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>

3107	645 - 15	Future of Howe Sound Society	Howe Sound, BC	However at the 2013 a Burnco senior executive stated that it was their long-term intention to expand the mine even beyond what had been proposed at that time. We have significant concerns about relying on the results of environmental assessments which are predicated on these assumptions of a reduced scope of operations since Burnco has clearly expressed its desire and intention to ultimately develop a substantially larger mine which will be operated 24 hours per day. We remain concerned that the scope of the project as described in the EIS has been contrived for the purposes of achieving initial approval and because the Environmental Impact Statement relies on the assumptions as to project scope, it does not properly assess the ultimate impact that this project will have if approved.	The Proposed Project is to extract approximately 20 million tonnes of sand and gravel over the 16 year life of the Proposed Project. This will be reflected in an approved EA certificate and mine plan.
3108	645 - 16	Future of Howe Sound Society	Howe Sound, BC	2. Even based on the questionable assumptions of project scope, the EIS is deficient and fails to properly assess the overall impact of this Project. An independent professional review of the EIS conducted by LGL Limited, Environmental Research Associates, (a copy of which has been submitted under separate cover) has identified a number of key deficiencies and concludes by stating: "it is our professional opinion that the BURNCO Aggregate Project EAC application did not effectively address potential adverse residual and cumulative effects to marine resources, recreational values and land management. We recommend that the British Columbia Environmental Assessment Office, in its environmental assessment report, conclude that the project will cause significant environmental effects."	BURNCO prepared a Technical Memo response to comments provided by the Future of Howe Sound Society in a letter to Ruth Simons (Executive Director) from LGL Limited dated September 27, 2016 titled Re: Review of the Environmental Assessment Certificate Application for the BURNCO Aggregate Project. See 10-Jan-2017 Technical Memo entitled 'Response to Re: Review of the Environmental Assessment Certificate Application for the BURNCO Aggregate Project'.

3109	645 - 17	Future of Howe Sound Society	Howe Sound, BC	<p>3. We are concerned that the various aspects of the EIS assessment have been prepared in isolation and that this compartmentalized approach has not provided a proper evaluation of the overall impact of the project. For example, at the recent Open House, the air quality presentation showed an air particulate coverage area that extended well out into the surrounding marine environment. When asked to explain the visual presentation, the air quality consultant advised that the coverage area was an averaged overview of the area that would be impacted and there would be times (particularly during the ongoing periods of surface construction activity as the pit area is expanded which are expected to occur at least annually) when the particulate coverage area would be larger than shown on the presentation. When asked to explain how the marine impact assessment could be predicated on the hypothesis that there would be no sediment created by the project even though the air quality analysis showed an expansive area that would be exposed to particulates which would necessarily settle over the marine area, the air quality consultant indicated that she was not aware of any exchange of data or cross-evaluation between the consultant groups to confirm whether the working hypothesis used in the marine assessment that there would be no sediment created was reasonable or correct. Based on the air quality consultant's projections about air quality impacts and actual impacts at other aggregate loading locations, we suggest that the hypothesis used in the marine assessment that that there will be no sediment impacting the marine area cannot be substantiated and is contradicted by the EIS's own air particulate assessment.</p>	<p>The air quality dispersion model predictions presented in Figures 5.7-2, 5.7-3, 5.7-4 and 5.7-5 represent in-air concentrations of particulate matter fractions and not predictions of dust deposition; the concentrations presented do not represent dust plumes. In addition, the dispersion modelling methods and associated assumptions - approved by the Ministry of Environment (MOE) - incorporated a high degree of conservatism. The air dispersion model was based on worst case daily emission rates and assumed worst case daily emissions every day of the year. These assumptions contributed to the high level of confidence in the air quality assessment predictions that there will no significant adverse effects.</p> <p>The same Ministry-approved CALPUFF model that was used to predict air quality concentrations (i.e., run in dynamic [3D] mode with a fine resolution meteorological data set) was used to predict deposition rates which were incorporated into the surface water quality model and the assessment of potential effects on water quality and aquatic health. With the effective implementation of the proposed erosion and sediment control measures and BMPs, the potential residual effects on water quality and aquatic health were determined to be negligible and not significant. Proposed mitigation for controlling the release of dust to the aquatic environment including the following:</p> <ul style="list-style-type: none"> <li>- Developing and implementing an Air Quality and Dust Control Management Plan that will detail measures to control fugitive particulates.</li> <li>- Developing and implementing an Erosion and Sediment Control Plan.</li> <li>- Establishing an on-site Air Quality and Meteorology Monitoring Program.</li> <li>- Fines/silt cakes berm should be vegetated as soon as possible and where possible by planting and seeding with native trees, shrubs, and grasses.</li> <li>- Placement of erosion control blankets on the berm to prevent dust.</li> <li>- Sediment and erosion control measures should be maintained at all times around the crushing areas and until vegetation is achieved on the berm.</li> <li>- Processing plant crushing and dry screening units will be partially enclosed.</li> <li>- Watering of 10 mm crushed gravel and 20 mm crush gravel stockpiles.</li> <li>- Watering of unpaved roads and restricting speed limits</li> </ul>

	Ref #	Commenter (Name)	Location		
3110	645 - 18	Future of Howe Sound Society	Howe Sound, BC	<p>4. The information included in the EIS does not appear to substantiate the claim that there will be no sediment impact on marine life and the air quality assessments seem to indicate the contrary. The recent discoveries by the Vancouver Aquarium's Howe Sound Research Group of important reefs in the very near vicinity to the loading area and of other sponge reefs in the near vicinity make a more extensive review of potential sediment impacts imperative. Sponge reefs are extremely sensitive to sediment and these extremely rare and very fragile areas must be properly protected. The analysis provided by Burnco does not properly address the potential impact on the nearby sponge reefs. The assumption that there will be no sediment created is very questionable and there should be further studies to assess what impact there would be if dust and other particulates are created (whether during dredging, storage or loading) which seems to be a much more likely event than the assumed case.</p>	<p>Glass sponges are known to occur throughout Howe Sound, in water depths below -20 m (chart datum). As part of marine baseline investigations, detailed underwater biophysical surveys were conducted in the proposed subtidal footprints of the proposed marine infrastructure (as well as adjacent areas) using SCUBA and towed video survey methods, with detailed information recorded on existing habitat and species present in these areas. This included systematic surveys targeting potential sponge reef habitats. The field surveys concluded that no glass sponge reefs were present in the proposed marine infrastructure (load-out jetty or walkway/conveyor) footprint. This information agrees with known habitat preferences of these organisms (i.e., water depths in the proposed marine infrastructure footprint are shallower than the depth range in which glass sponge reefs occur). In terms of interaction of glass sponge reef habitat with shipping activities, known sponge reefs occur in proximity to the proposed shipping route in several locations, with the closest occurring at the mouth of Ramillies Channel (Volume 4, Part G - Section 22.0 - Appendix 5.2-A, Figure 3). However, water depths at these locations along the proposed shipping route are below -25 m (chart datum). As such, potential impacts from shipping would be limited to propeller wash effects at the corresponding depths of these glass sponge reef occurrences. To assess this potential impact, propeller scour impacts on the seabed were assessed at a modelled depth of -20 m (chart datum) to correspond with the uppermost depths of glass sponge habitat. Jet velocities generated by the tug propeller at -20 m were compared to natural velocities derived from wave and tidal activity in Howe Sound. Estimates of maximum horizontal velocity associated with wind waves were developed from wave hindcasts from available wind data for the Strait of Georgia using the Halibut Bank Ocean Buoy (Environment Canada Station 46146) and are summarized in Table 5.2-12. At -20 m depth, the jet velocities of the proposed tug-assisted barge movements were shown to be within the same magnitude as tidal currents present at this depth, and below the velocity threshold (0.25 m/s) required for seabed particle mobilization (USACE 1989). Given that water depths along the proposed shipping route in the RSA are typically below -20 m (chart datum), the potential effects of tug propeller scour on glass sponge assemblages in the proposed shipping corridors were considered negligible and were not carried forward in the assessment.</p>
3111	645 - 19	Future of Howe Sound Society	Howe Sound, BC	<p>5. The EIS provided seems to be confined to the immediate impact on McNab Creek and the existing compensation channel. However, this location is one of the few areas in Howe Sound which is shallow enough to serve as a natural feeding and habitat area for marine life and serves as a staging area for salmon returning to other locations in Howe Sound, including the Squamish River. There appears to be no assessment of what impact the destruction of the estuary will have on salmon returning to the Squamish River or on forage fish and other fish stock which use the surrounding marine area for feeding. The baseline studies that were conducted were very limited in scope and did not cover seasonal periods and do not properly assess the migratory patterns of marine life in the area and the impact that the project could have on these populations.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

3112	645 - 20	Future of Howe Sound Society	Howe Sound, BC	6. Some of the baseline assessments used for various components of the EIS seem to be of questionable validity for the project location. For example, the baseline data for Air Quality was derived from data collected at Langdale, Squamish and Horseshoe Bay, all of which are urban areas with significant vehicular traffic and other factors affecting air quality. The air quality in a remote location such as McNab Creek can reasonably be expected to differ significantly from urban areas and it is unclear why an air quality monitoring station was not established at the site to provide accurate baseline data.	<p>The ambient air particulate monitoring data collected at the Proposed Project site during the month of November was not used to characterize the existing air quality. Instead, background air quality concentrations for TSP, PM10, PM2.5, NO2 and SO2 were characterized using data from existing air quality monitoring networks operated by the BC Ministry of Environment (BC MoE). Background air quality concentrations were established using methods consistent with the BC Air Quality Dispersion Modelling Guideline current at the time of assessment (BC MoE 2008). The method used to determine background concentrations was approved by the BC MoE within the detailed model plan, included in the EAC Application/EIS as Appendix 5.7-E.</p> <p>The most recent available data from the BC MoE at the time of the assessment was used to establish background conditions:</p> <ul style="list-style-type: none"> <li>- For the Langdale Elementary station PM10, NO2 and SO2 data were available between January 2010 and December 2013 and data for PM2.5 were available between December 2011 and December 2013.</li> <li>- For the Squamish station PM10 data were only available between January 2010 and January 2011, while PM2.5 data were available between February 2011 and December 2013. Data for NO2 and SO2 were available between January 2010 and December 2013.</li> <li>- For the Horseshoe Bay station PM2.5 data were available between January 2011 and December.</li> </ul> <p>Similarly, the total dustfall results collected at the Proposed Project site were not used to support the application. The metals composition within the dustfall sample was used to support the human health assessment.</p>
3113	645 - 21	Future of Howe Sound Society	Howe Sound, BC	7. The EIS indicates that no adverse impact on groundwater or adverse run-off effects are expected and claims that the resultant pit lake will be benign and contribute to the ecosystem. However in one point in the analysis, the study suggests that the existing compensation channel acts like a wick drawing water in its direction. There is no explanation as to why a huge pit lake will not have a similar, but hugely exacerbated impact, and act as a gigantic sponge absorbing water from the surrounding groundwater resources.	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>In the first year of mining, the portion of the WC 2 within the pit lake area would be deactivated by constructing a plug immediately adjacent to the pit. This will enable the pit lake groundwater recharge to re-establish and maintain natural groundwater levels. Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure.</p>
3114	645 - 22	Future of Howe Sound Society	Howe Sound, BC	8. The study also includes a conclusion that there is little liquefaction risk. This conclusion would appear to be at odds with a number of earthquake studies that highlight the potential risks in areas of sand and gravel which have a significant liquefaction risk. It is hard to understand how there would not be significant concern that a narrow strip of gravel and sand separating a large pit lake and the ocean would not be subject to liquefaction in the event of an earthquake. If this occurs, there presumably would be a significant interchange of the pit lake water and the foreshore. The analysis of this risk appears to be lacking and given that this area is in a high earthquake risk zone, that appears to be a significant omission.	<p>A detailed assessment of potential geotechnical and natural hazard effects of the Proposed Project is presented in Volume 2, Part B – Section 5.4 of the EAC Application/EIS. The objectives of this assessment were to identify and evaluate static and seismic ground conditions, and potential landslide, debris flow/flood and avalanche hazards that could be impacted by the Proposed Project, or that could impact the Proposed Project. The potential for damage or loss of proposed on-shore and marine facilities associated with the earthquake-related ground shaking, soil liquefaction-induced loss of strength and foundation support, lateral spreading movements and potential ground surface ruptures from faulting at depth have been considered in Volume 3, Part D, Section 14 of the EAC Application/EIS.</p> <p>The assessment of potential effects of earthquakes on the project consider seismic events that might occur throughout the region including local events. Existing earthquake data are used to assess seismic hazard, including potential earthquakes associated with the Cascadia Subduction zone.</p> <p>The pit lake containment berm will be designed and built to appropriate design criteria, which include seismic stability considerations.</p>

3115	645 - 23	Future of Howe Sound Society	Howe Sound, BC	<p>9. There also appears to be little analysis of the impact of climate change and the rising level of the ocean. This project will permanently alter the estuary with only a low elevation strip of land between the pit lake and the ocean. If ocean levels rise as almost universally predicted, what will be the risk of the pit lake and ocean intersecting or the low elevation separation being breached?</p>	<p>A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS. Potential effects considered were changes in GHG emissions as a result of the Project, the Project's contribution to climate change through the emission of GHG's, and how potential changes in climate will affect project-related infrastructure.</p> <p>Potential effects of future sea-level rise are addressed in Section 5.8.5.2 of the EAC Application/EIS. The predicted RSP2100 (sea-level height by 2100 relative to 2007 levels) using the mean sea-level rise was 18 cm, with a possible range of 6 to 30 cm. The predicted RSL2100 using the high predicted sea-level rise was 88 cm, with a possible range of 57 to 118 cm.</p> <p>Since the Proposed Project is expected to be completed by 2035 it is expected that rising sea levels of this amount will have little direct impact on the Proposed Project operation phase. The Proposed Project closure plan consists of removing surface infrastructure and site reclamation including a ground and surface water-fed lake (the pit lake), and therefore it is expected that the predicted rising sea level will have little impact on Proposed Project closure. The height of the Pit Lake Containment Berm was designed in order to contain the elevated Pit Lake water levels that would result from extreme prolonged wet periods. Details of the analysis and design of the Pit Lake Containment Berm will be provided in the Mines Act Application.</p>
3116	645 - 24	Future of Howe Sound Society	Howe Sound, BC	<p>10. The EIS does not include any substantive assessment of potential concerns about acid rock drainage. Acid rock drainage was a significant contributor to the environmental damage caused at the Britannia Mine. Remediation of the problems caused by this acid rock drainage cost taxpayers in excess of \$50 million. Acid rock drainage is caused by natural oxidization when sulphide minerals are exposed to water and air. It is logical to assume that the geology of the McNab Valley could very well be similar to the Britannia Creek valley and it is our understanding that an assessment report from a survey conducted in the McNab Valley in 1980 indicates the presence of significant quantities of sulphide rock. Burnco is proposing to mine and crush this rock at its McNab Creek project. The mining and crushing activities will necessarily expose sulphide materials to water and air and create the precise conditions that resulted in the damage at Britannia Creek. It is very difficult to rationalize how Burnco can assert that their proposed activities will not have any adverse (if not disastrous) impact on the McNab Creek environment or have any confidence that the resultant pit lake will not be filled with acid rock run-off that is toxic to fish and aquatic life.</p>	<p>Information regarding geochemical testing for ML-ARD potential is presented in Section 5.5.5.2.4 of the EAC Application/EIS. The results of geochemical testing are presenting in Appendix 5.6-C.</p> <p>Yes, geochemical testing was conducted on 3 composite samples collected from two test pits at the Project site. The geochemical testing program included acid base accounting, whole rock and trace metal analysis, and sequential leach tests. The objective of acid base accounting was to determine the material's potential to generate acidity. The acid base accounting results confirmed that the materials contained no sulphide minerals; oxidation of sulphide minerals is the primary source of long-term acid generation potential. Therefore, the materials are considered to have a low potential for long-term acid generation.</p> <p>The results of whole rock and trace metal analysis were used to identify parameters that may require further consideration in the context of metal leaching potential. Sequential leach testing was used to evaluate the metal leaching potential of the materials. Sequential leach testing is appropriate for evaluating the potential for metal leaching in the absence of reactive sulphide minerals, therefore this test method was used in place of the humidity cell test method (HCT). The results of the sequential leach tests were screened in the context of the BCWQ and CCME Guidelines for the protection of Freshwater Aquatic Life to identify parameters of potential environmental concern. The results of the sequential leach tests were used to develop inputs to the water quality predictions for the Proposed Project.</p>

3117	645 - 25	Future of Howe Sound Society	Howe Sound, BC	<p>11. The EIS acknowledges that there will be a “temporary” loss of riparian ecosystem and wetland ecosystem as a result of the project. However this is rationalized by stating that “re-establishment to current conditions is expect to occur within 150 years”. There is no substantive explanation of why this “temporary” loss of riparian and wetland areas which are critical to the ecosystem will not have a lasting detrimental effect on the McNab Valley.</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement (including new riparian ecosystem and amphibian ponds), progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p>
3118	645 - 26	Future of Howe Sound Society	Howe Sound, BC	<p>12. The McNab Creek watershed is known for extreme rain fall and is identified as a high velocity stream yet the EIS Summary states that “It is unlikely that there is a significant potential for debris flows and debris floods to occur upstream of the Proposed Project Area”. It is difficult to rationalize this conclusion in light of the known characteristics of the valley. There seems to be no critical assessment of the potential flooding risks associated with unusual storm level activity and upstream debris blockage. In a natural delta and estuary, the flooding risk is naturally compensated by the delta fan however the construction of the sediment laden pit lake adjacent to the creek should raise significant concerns about flood potential yet this seems to be dismissed without any substantive evaluation.</p>	<p>A detailed assessment of potential geotechnical and natural hazard effects of the Proposed Project is presented in Volume 2, Part B – Section 5.4 of the EAC Application/EIS. The objectives of this assessment were to identify and evaluate static and seismic ground conditions, and potential landslide, debris flow/flood and avalanche hazards that could be impacted by the Proposed Project, or that could impact the Proposed Project.</p> <p>A terrain stability field assessment was completed on November 2-3, 2016. The results of the field assessment, together with the data in our existing hydrologic and geotechnical assessment reports (Hydrological and Hydraulic Characterization McNab Valley Aggregate Project Howe Sound BC, Concrete Aggregate Summary, Assessment of Avulsion Risk of McNab Creek (located in EA Vol. 4 Appendix 5.4 – C, F, A respectively) indicate that there is no evidence for historic debris flows or debris floods. Therefore, further investigations are not considered to be required.</p>

3119	645 - 27	Future of Howe Sound Society	Howe Sound, BC	13. The EIS acknowledges that there will be loss of various bird habitat particularly during the operational phases but concludes in a number of instances that populations are predicted to recover after reclamation is completed. However those predictions of recovery do not appear to be supported by any concrete analysis that shows evidence of self-sustaining populations of bird species which can withstand the loss of habitat for a minimum of 30 years before reclamation is undertaken so that there is a surviving population that can allow for recovery.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
3120	645 - 28	Future of Howe Sound Society	Howe Sound, BC	14. The EIS appears to make no mention of the possible effects on the Christie Islet Migratory Bird Sanctuary which is in close proximity to the proposed project site and immediately adjacent to the proposed barge route. It seems to be a startling omission that the potential impacts on the Christie Islet Bird Sanctuary are not even addressed.	<p>A detailed assessment of potential marine resource effects of the Proposed Project - including Marine Birds - is presented in Volume 2, Part B – Sections 5.2 (Marine Resources) of the EAC Application/EIS. The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p> <p>Christie Islet is shown on Figure 7.2-5 and is located outside the Marine Transportation RSA.</p>
3121	645 - 29	Future of Howe Sound Society	Howe Sound, BC	15. The analysis of the noise impacts is predicated on evaluation standards associated with industrial activity or urban locations. These threshold tests are not appropriate for this location. The McNab Valley is at the heart of one of the prime recreation areas in the Lower Mainland. Visitors and residents of the area are attracted to the location due to its natural beauty and tranquility.	<p>The Commission Guideline defines a pristine area as: “A pure, natural area that might have a dwelling but no industrial presence, including energy, agricultural, forestry, manufacturing, recreational, or other industries that already impact the noise environment.”</p> <p>McNab Creek is not considered to be a pristine because there is a known industrial presence activity (i.e. logging), as well as known recreation use of the area (e.g., boating, hunting). There is also a run-of-river power project in close proximity.</p>
3122	645 - 30	Future of Howe Sound Society	Howe Sound, BC	Youth’s camps in the immediate vicinity introduce urban youth to wilderness environments.	<p>A detailed assessment of potential recreation effects - including youth camps - are considered in Volume 2, Part B – Section 7.3 of the EAC Application/EIS. Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

3123	645 - 31	Future of Howe Sound Society	Howe Sound, BC	To quantify the impact that the project will have on the local environment by reference to industrial or urban testing standards ignores the fundamental reason that people are drawn to the location. Background noise levels that may be acceptable in urban or industrial environments will destroy the fundamental nature of this location and so the assessment methodology does not seem appropriate for the location in question.	<p>In the absence of relevant existing or approved industrial facilities, the Commission Guideline mandates the use of specific Ambient Specific Levels (ASL) values to represent Baseline Case noise levels. The Commission Guideline discusses the use of an Ambient Monitoring Adjustment (Section 2.3.4 of the Guideline), when the ASL's are not thought to be representative of the actual sound environment. The only two cases where it may be necessary to consider an ambient monitoring adjustment are:</p> <ul style="list-style-type: none"> <li>■ Areas considered to be pristine; and</li> <li>■ Areas with non-energy industrial activity that would influence the background noise levels.</li> </ul> <p>The Commission Guideline defines a pristine area as: "A pure, natural area that might have a dwelling but no industrial presence, including energy, agricultural, forestry, manufacturing, recreational, or other industries that already impact the noise environment."</p> <p>McNab Creek is not considered to be a pristine because there is a known industrial presence activity (i.e. logging), as well as known recreation use of the area (e.g., boating, hunting). There is also a run-of-river power project in close proximity.</p> <p>Although there is industrial activity in the area, it does not cause the baseline noise levels to exceed the Commission Guideline ASL's, and therefore the ambient monitoring correction is not used. As such, for the noise assessment based on the Commission Guideline, Baseline Case noise levels at relevant receptors were established based on the ASL values specified in the Commission Guideline.</p> <p>The HC Guidance indicates that Baseline Case noise levels should be established through field measurements. As such, for the noise assessment based on the HC Guidance, the Baseline Case noise levels at relevant receptors were established based on field measurements conducted in the summer of 2012 and fall of 2013 at five representative receptors within the LSA and RSA. Noise from birds, insects, and other animal activities very near the monitoring location was considered not representative of normal conditions at the monitoring locations and was removed as recommended in Directive 038. Other sources not considered representative of normal conditions were: technician activities, vehicular traffic near the monitoring location, airplane flyovers, rain, and thunder.</p>
3124	645 - 32	Future of Howe Sound Society	Howe Sound, BC	Additionally, from a review of the references, there appears to have been no effort undertaken to contact film industry representatives to assess what the noise, visual and dust impacts will have on the use of the area for filming.	Phone based interviews are cited as personal communications (pers.comm.) within the text of the EAC Application/EIS and details included in the references (Part G, Section 21). The list of key informants included the following: Burrard Yacht Club, Coastal Inlet Adventures, District of Squamish, Don's Water Taxi, Gambier Island Local Trust, Gibsons and District Chamber of Commerce, Gibsons Landing Inn, Irwin Motel, Islands Trust, McNab Creek Strata, Sewell's Marina, Squamish Yacht Club, Sunshine Kayaking, Thunderbird Yacht Club, Recreation Sites and Trails BC and West Vancouver Fire & Rescue Services.
3125	645 - 33	Future of Howe Sound Society	Howe Sound, BC	Additionally, from a review of the references, there appears to have been no effort undertaken to contact film industry representatives to assess what the noise, visual and dust impacts will have on the use of the area for filming.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCRD noise bylaw was considered as part of the assessment.</p>

3126	645 - 34	Future of Howe Sound Society	Howe Sound, BC	Additionally, from a review of the references, there appears to have been no effort undertaken to contact film industry representatives to assess what the noise, visual and dust impacts will have on the use of the area for filming.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
3127	645 - 35	Future of Howe Sound Society	Howe Sound, BC	Additionally, from a review of the references, there appears to have been no effort undertaken to contact film industry representatives to assess what the noise, visual and dust impacts will have on the use of the area for filming.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
3128	645 - 36	Future of Howe Sound Society	Howe Sound, BC	16. The conclusion expressed in the EIS that there will be no cumulative impacts from noise appears to be fundamentally flawed. The consultant at the public information session was not aware the Box Canyon power generation site was in the same valley or was now in operation. He also acknowledged that there had been no assessment work undertaken of the cumulative impact that would result from the concurrent operation of the Burnco project and the Box Canyon power generation facility. If other activities in the immediate vicinity are not even taken into account, it is hard to understand how it can be asserted there will be no cumulative impacts.	<p>Cumulative effects due to noise were not assessed because the significance of the noise VC was Negligible, Not Significant. This approach to cumulative effects assessment is consistent with accepted EA practice in BC and Canada.</p> <p>The cumulative contribution of noise from the Box Canyon project is expected to be minimal, based on previous assessments of run-of-river projects (e.g. Narrows Inlet Hydro Project, 2012).</p>

3129	645 - 37	Future of Howe Sound Society	Howe Sound, BC	17. The EIS study on the visual impact seems to be predicated on monitoring stations that, with one exception, are at sea-level. The study does not seem to take into account the potential impact on neighbouring locations at elevation even though there are a number of adjacent recreational properties with dwelling sites at higher elevations that will be impacted visually by this project. The analysis of the visual impacts appears to be deficient.	The visual resources assessment (Section 7.4 of the EAC Application/EIS) acknowledges that the residents of the McNab Strata would be most affected by the potential visual impacts due to their close proximity to the Proposed Project. The viewpoint was taken from the end of the breakwater where the view would be unobstructed, and it is publically accessible location that would be experienced by residents accessing the dock at the McNab Estates Strata. The lighting assessment indicated residential receptors at the Strata are located in a dark setting with existing lighting visible from adjacent industrial land use.  Assessment of viewing locations and/or viewing conditions are limited to those locations that represent viewing opportunities that currently exist or that are certain or reasonably foreseeable.
3130	645 - 38	Future of Howe Sound Society	Howe Sound, BC	<b>Social and-Economic Factors</b> 18. Burnco has attempted to justify the proposed project by inferring that there is a limited supply of gravel and aggregate and that this project is necessary to meet construction demands in the Lower Mainland. However the fact is that gravel and aggregate are not scarce commodities. The Fraser Valley Regional District Aggregate Inventory Atlas identifies 87 high rated deposits in the region and suggests that there are sufficient identified sources of aggregate to meet demand for well over 100 years. These resources are available at a far lower environmental, social and economic cost than Burnco's proposal. This project is not required to meet the needs of the greater good, it is being proposed simply to benefit Burnco at a significant cost to the public at large. Burnco will reap all of the benefits while the rest of the Howe Sound community and the residents of the Lower Mainland bear the significant costs of the project.	The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.  Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by: - Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC; - Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and - Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.  The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.
3131	645 - 39	Future of Howe Sound Society	Howe Sound, BC	19. The proponent points to the jobs that will be created as the economic justification for its proposal however it makes no attempt to analyze what jobs may be lost by the re-allocation of its supply source. Since it will only be changing its own internal supply of commodities that are otherwise plentiful and readily available, it may be that the net increase in jobs will be less than is suggested and perhaps negligible as the sources it previously used to meet its requirements will no longer be required.	The local spatial study area for the operations phase labour market effects (including employment) of the Proposed project was described in the Application Information Requirements/EIS Guidelines, which was approved by the BCEAO and the CEA Agency on December 16, 2014 after review by the Technical Working Group established to guide this assessment. This local spatial study area is Sunshine Coast Regional District.  The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.

3132	645 - 40	Future of Howe Sound Society	Howe Sound, BC	20. The EIS makes no attempt to quantify the potential economic impact on the established prawn fishery in the area even though the project can be expected to adversely impact the sustainability of the fishery. The McNab Creek area has been identified as having a prime rearing area for prawns. Due to the recent wasting disease that has decimated Howe Sound's starfish population resulting in an increase in sea urchins feeding on eel grass, juvenile prawn feeding areas are under stress with potential ramifications to the sustainability of the prawn population. The loss of rearing areas and impact on the prawn population due to this project and resultant impact on the prawn fishery has not been addressed in Burnco's submission.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
3133	645 - 41	Future of Howe Sound Society	Howe Sound, BC	20. The EIS makes no attempt to quantify the potential economic impact on the established prawn fishery in the area even though the project can be expected to adversely impact the sustainability of the fishery. The McNab Creek area has been identified as having a prime rearing area for prawns. Due to the recent wasting disease that has decimated Howe Sound's starfish population resulting in an increase in sea urchins feeding on eel grass, juvenile prawn feeding areas are under stress with potential ramifications to the sustainability of the prawn population. The loss of rearing areas and impact on the prawn population due to this project and resultant impact on the prawn fishery has not been addressed in Burnco's submission.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. 3134	645 - 42	Future of Howe Sound Society	Howe Sound, BC	21. Howe Sound is an extraordinary natural environment that is less than an hour away from a major metropolitan centre. The recreational opportunities it affords for residents of Metro Vancouver are unparalleled. The proximity to Howe Sound and the Sea to Sky corridor is a key factor in Vancouver being ranked as one of the most livable cities in the world and leads to immigration and investment which contribute greatly to Metro Vancouver's economy. The creation of a pit mine in a prime estuary will degrade the area and could cause an adverse economic impact on the growing and thriving tourism economy. There has been no attempt to quantify this cost.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

3135	645 - 43	Future of Howe Sound Society	Howe Sound, BC	<p>22. The natural capital associated with this unique environment cannot be underestimated but has been ignored. In a recent study (M. Molnar 2015, Sound Investment: Measuring the Return on Howe Sound's Ecosystem Assets, David Suzuki Foundation) Howe Sound was assessed as having a natural capital value of up to \$4.7 billion. Yet the EIS makes no attempt to quantify the cost of the loss to Howe Sound's natural capital that would result if this project proceeds even though Burnco concedes that there will be significant environmental impacts in a number of areas and a degradation of valuable ecosystems. The Molnar study suggests that the annual value per hectare of ecosystem services in Howe Sound ranges from \$36,045 per hectare to \$624,879 per hectare. Based on these numbers, for the 70 hectares of lands that will be consumed by this project, the net economic cost to the general public through loss of natural capital will range from \$2,524,150 per year to \$44,041,530 per year. Even the median value of this range would indicate a cost to the public of \$23,453,340 per year. Since this project will be consuming the last largely intact estuary in the region, it is likely that the true economic cost to the public of this project will be at the upper end of the range and could well exceed \$40 million per year.</p>	<p>The loss of wildlife habitat was described using wildlife habitat suitability index models and habitat associations as described in Section 5.3.1.5 of Volume 2, Section 5.3. A detailed vegetation assessment and discussion on proposed Project effects to vegetation is described in Section 5.3.2, Volume 2, Section 5.3.</p> <p>The trees and vegetation where the pit lake is planned will be permanently lost (28.2 ha). However, reclamation activities post-closure will re-establish mature forest on site. Roosevelt elk winter habitat will be restored through the creation of 24.3 ha of mature forest over approximately 25 years. In addition, a total of 31 ha of moderate to high suitability Roosevelt elk habitat (based on habitat suitability index modelling) to the north, east and south of the Project area will be protected and left unaffected by the Project. Establishing mature forest will also provide suitable habitat for other mature forest species such as northern goshawk and marbled murrelet. Therefore, the removal of trees to establish the pit lake will be compensated for.</p>

3136	645 - 44	Future of Howe Sound Society	Howe Sound, BC	<p>23. This project is being proposed at a time when the extensive environmental remediation efforts undertaken in Howe Sound over the last few decades have begun to show results. The success of these remediation efforts is evidenced by the recovery of marine life with increased herring runs and salmon returning to creeks that had historically been too polluted to support the fishery. Killer whales, humpback whales and other cetaceans have been sighted with increasing frequency in the last few years including in Ramilles Channel and Thornbrough Channel which are in the immediate vicinity of the project. The return of these marine mammals to Howe Sound is evidence of the recovery of the Howe Sound environment which has been accomplished at considerable cost to both industry and the taxpayer. The estimated aggregate amount that has been expended on remediation efforts is in excess of \$200 million including more than \$50 million of taxpayer money. However, this recovery remains in a fragile state. It is completely contradictory to the efforts of both private and public bodies that a proposal for renewed mining activity in an environmentally sensitive estuary is being considered even while extensive environmental remediation efforts continue in other areas of the Sound at a significant cost. There is no attempt to quantify the costs associated with the inevitable environmental degradation that will result from this project or the potential adverse impact it will have on other remediation efforts being undertaken at both public and private expense.</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

3137	645 - 45	Future of Howe Sound Society	Howe Sound, BC	<p>24. The proposed project is incompatible with the established recreational activity in the immediate vicinity of McNab Creek and in Howe Sound generally. There is an established recreational community immediately adjacent to the proposed site of the project as well as another established recreational community directly across Thornbrough Channel. This project will necessarily impair the use and enjoyment of these properties and will adversely affect their market value. Additionally, there are three youth's camps in the immediate vicinity as well as various other youth's camps in the Howe Sound area which use the McNab Creek estuary and surrounding waters for outdoor activities. Furthermore, the immediate vicinity of the proposed project is extensively used by kayakers, canoeists and other recreational boaters and there are established yacht club outstations directly across the Channel. The noise, dust and light pollution that would necessarily result from this project are clearly incompatible with these existing uses. There has been no attempt to quantify or value the adverse impact this project will have on these other stakeholders even though the social cost will be significant.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
3138	645 - 46	Future of Howe Sound Society	Howe Sound, BC	<p>25. The EIS concludes that there are no marine navigation impacts. However the increased barge traffic will run directly across a prime recreational boating area that during the summer months is used virtually on a daily basis by children from the neighbouring camps who travel in canoes and kayaks and cross Thornbrough Channel between McNab Creek and Ekins Point. Additionally, the proposed project is in the immediate vicinity of the newly designated marine trail that is designed to attract kayakers and other recreational users to the region. The proposed barge route transects the trail. The impact that this increased barge traffic could have cannot be readily quantified but could potentially endanger the safety of children and other recreational users of the maritime environment.</p>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>

3139	645 - 47	Future of Howe Sound Society	Howe Sound, BC	<p>26. Currently, local organization and local governments in the Howe Sound region are working to develop an overall land and marine use management plan for the region. In conjunction with these efforts, it has been recognized that it is important to understand the impact of cumulative effects. The Ministry of Forests, Lands and Natural Resource Operations announced in 2015 that it would be proceeding with a cumulative effects framework for Howe Sound but the EIS does not refer to that announcement or take into account the work undertaken to date in connection with that planning initiative. In the absence of a proper understanding of the cumulative effects, it is impossible to properly assess the overall impact of the proposed project and the results of the preliminary work done should be taken into account in properly assessing the full impact of this project.</p>	<p>Page 4-33 of the EAC Application/EIS states: "MFLNRO is currently working on cumulative effects framework to help manage compounding changes to the environment. The cumulative effects framework is being actively applied in the Northeast, and MFLNRO plans to expand the framework to Howe Sound (MFLNRO 2015). Under this framework, Howe Sound will be considered as one region when impacts of major projects are assessed (Squamish Chief 2015). No announcement from MFLNRO has yet been made with respect to the cumulative effects framework implementation in Howe Sound."</p> <p>This remains the case. In the absence of a CEA Framework for Howe Sound, CEA Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada in accordance with:</p> <ul style="list-style-type: none"> <li>- BCEAO Guideline for the Selection of Valued Components and Assessment of Potential Effects (BCEAO 2013),</li> <li>- Operational Policy Statement: Addressing Cumulative Environmental Effects under the Canadian Environmental Assessment Act (CEA Agency 2007),</li> <li>- Addressing Cumulative Environmental Effects. A Reference Guide for the Canadian Environmental Assessment Act (CEA Agency 1994),</li> <li>- Cumulative Effects Practitioners Guide (CEA Agency 1999), and</li> <li>- A Reference Guide for the Canadian Environmental Assessment Act: Determining Whether a project is Likely to Cause Significant Environmental Effects (FEARO 1994a).</li> </ul> <p>A detailed methods framework is provided in Volume 2, Part B – Section 4 of the EAC Application/EIS.</p> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in initiatives related to the monitoring, assessment, or management of cumulative environmental effects if requested by federal, provincial or regional government agencies.</p>
3140	645 - 48	Future of Howe Sound Society	Howe Sound, BC	<p>27. Approval of this project would have a negative effect on the efforts of local governments promoting the recreational and eco-tourism benefits of the Sea to Sky Corridor and Howe Sound. Renewed industrial activity without comprehensive, long-term planning can only have a significant detrimental impact on surrounding communities and the world's perception of British Columbia as "Super Natural BC". Full consideration should be given to the potential negative impact that this project and renewed industrial activity will have on the tourism and recreation potential of the region and the costs associated with that need to be taken into account in any socio-economic analysis of the value of this project. That analysis is missing from the EIS.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

3141	645 - 49	Future of Howe Sound Society	Howe Sound, BC	28. Similarly, due to its inherent natural beauty and proximity to Vancouver, there is extensive film production occurring in and around Howe Sound which has had a significant and ongoing positive economic impact for the region. A film location manager involved in a film which injected \$20 million into the local economy has stated that "the Burnco mine would be a strong deterrent for any film maker looking at working along the coastline". Noise, dust and visual impacts disrupt film activity and make the region less attractive to film production. Once again, the potential social cost to the region of this project thorough loss of film production activity could be significant but has been ignored in the EIS.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
3142	645 - 50	Future of Howe Sound Society	Howe Sound, BC	29. There has been no assessment of the social cost of project's adverse impact on recreational opportunities and outdoor activities even though it is proposed as a prime recreational location. What will be the impact on the livability of the region and Vancouver's reputation as one of the most livable cities in the world if the last largely intact estuary in the region is turned into an open pit mine for the next 30 years?	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
3143	645 - 51	Future of Howe Sound Society	Howe Sound, BC	30. Dr. Murray Newman (the founding director of the Vancouver Aquarium) once said that "anywhere else in the world, Howe Sound would be a great national park". Although it has taken decades to come to fruition, those words may now be prophetic as there are ongoing initiatives to designate parts of Howe Sound as a National Park or a Marine Park. The core areas fundamental to such a designation include the marine areas adjacent to McNab Creek which are considered prime recreational areas that should be given full protection status. Such a designation will bring significant economic and environmental value to the area. To allow the proposed project to proceed would have a significant adverse impact on these efforts at a social cost that cannot be measured but should be taken into account in assessing this project.	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
3144	645 - 52	Future of Howe Sound Society	Howe Sound, BC	In summary, we believe that this project simply does not measure up to the goals of environmental, economic and social sustainability which underlie the assessment process. The EIS that has been submitted does not adequately take into account or address a number of critical factors and fails to properly assess potential adverse residual and cumulative effects to marine resources, recreational values and land management.	The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.  Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.

3149	649 - 1	Jan Hagedorn	Gibsons, BC	<p>This application fails to properly address how local amenities of silence and the wilderness experience, that local residential communities/ camps/yacht outstations, and huge Howe Sound visitors have high on their priority list, will be protected.</p> <p>As this area is so close to Vancouver it has become a huge recreational hub for the lower mainland and it is only going to continue to rise as people crave to leave the city for a quiet serene wilderness experience.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
3150	649 - 2	Jan Hagedorn	Gibsons, BC	<p>In this proposal there seems to be 12 job gains and I see no comparison to the job losses that might occur if this gravel mine is permitted to come into this highly sought out recreational area.</p>	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>

3151	649 - 3	Jan Hagedorn	Gibsons, BC	The impact of marine noise (from the conveyor belts –tugs, barge loading and water taxis) is huge for humans who are attracted to this area for the silence and it is this silence that needs to be assessed as the driving force of future jobs in this area. Also the the impact of marine noise on underwater habitat, especially spawning salmon/young juvenile salmon and other at risk species is underestimated by the Science in this project proposal.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCR D noise bylaw was considered as part of the assessment.</p>
3152	649 - 4	Jan Hagedorn	Gibsons, BC	The impact of marine noise (from the conveyor belts –tugs, barge loading and water taxis) is huge for humans who are attracted to this area for the silence and it is this silence that needs to be assessed as the driving force of future jobs in this area. Also the the impact of marine noise on underwater habitat, especially spawning salmon/young juvenile salmon and other at risk species is underestimated by the Science in this project proposal.	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>
3153	649 - 5	Jan Hagedorn	Gibsons, BC	My understanding is that the project has been rejected twice by Fisheries & Oceans because of the likely loss of salmon habitat in McNab.	<p>Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO's involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.</p> <p>Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.</p>

3154	649 - 6	Jan Hagedorn	Gibsons, BC	Do we need more losses to a very fragile salmon returns?????	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
3155	649 - 7	Jan Hagedorn	Gibsons, BC	It seems that population data for many key aquatic and land-bases species specific to this unique wilderness estuary (salmon, trout, elk to name a few) was collected over a very small timeline(part year?) to really be useful for establishing accurate baselines, and without accurate baselines quantitative monitoring of the effects of this proposed project will not be possible. At lease 5 years would provide info for agreed norms. This would allow the local governing bodies (eg. SCRD), the power to compel a reduction/suspension or cessation of mine activites where habitat damage exceeds pre-agreed norms. Thank you for the space to comment.	<p>The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada. The baseline studies conducted are sufficient for the purpose of assessing potential effects of the Proposed Project on selected Valued Components. Additional years of supplemental field studies are not required or proposed for the assessment.</p> <p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS. Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>
3156	650 - 1	Pete Willis	Bowen Island, BC	I do not support the Burnco Aggregate McNab Creek project.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3157	650 - 2	Pete Willis	Bowen Island, BC	A lot of resources have gone into restoring the McNab Creek environment and placing a large industrial project on the estuary will nullify all of it. Howe Sound is just now recovering from its recent industrial past and mega projects with large eco footprints and a long future time line do not bode well for the newly expanding marine life in the sound. Please say no to the Burnco gravel mine.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. 3161	651 - 3	Peter von Puttkamer	West Vancouver, BC	I grew up on the Howe Sound, beginning in the late 50's. Just as the Howe Sound has been cleaned up from years of environmental damage from the Woodfibre Pulp Mill, and Anaconda Mines- now this? This gravel operation will be a threat to McNab Creek estuary-Salmon Habitat! We don't need any industry on Howe Sound. This is an ecological and tourism wonder- that should be left as a showcase to the world: viewed by millions of people heading to Squamish, Whistler and the interior of the Province. Leave Howe Sound alone industry!	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
3162	651 - 4	Peter von Puttkamer	West Vancouver, BC	I grew up on the Howe Sound, beginning in the late 50's. Just as the Howe Sound has been cleaned up from years of environmental damage from the Woodfibre Pulp Mill, and Anaconda Mines- now this? This gravel operation will be a threat to McNab Creek estuary-Salmon Habitat! We don't need any industry on Howe Sound. This is an ecological and tourism wonder- that should be left as a showcase to the world: viewed by millions of people heading to Squamish, Whistler and the interior of the Province. Leave Howe Sound alone industry!	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
3163	651 - 5	Peter von Puttkamer	West Vancouver, BC	I grew up on the Howe Sound, beginning in the late 50's. Just as the Howe Sound has been cleaned up from years of environmental damage from the Woodfibre Pulp Mill, and Anaconda Mines- now this? This gravel operation will be a threat to McNab Creek estuary-Salmon Habitat! We don't need any industry on Howe Sound. This is an ecological and tourism wonder- that should be left as a showcase to the world: viewed by millions of people heading to Squamish, Whistler and the interior of the Province. Leave Howe Sound alone industry!	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
3165	652 - 2	Deborah Geoffrion	Gibsons, BC	It has taken decades for the herring and salmon and subsequent whales and olphins to recover in this area and to pollute and destroy it with this gravel mine would be a huge disservice to the wildlife, tourist and recreation in the area. This area is far more valuable as an estuary, recreational boating and tourist destination.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. 3171	652 - 8	Deborah Geoffrion	Gibsons, BC	This area is much better suited to a world class marine park with its close proximity to Vancouver while offering unequalled marine habitat beauty and diversity	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
3172	652 - 9	Deborah Geoffrion	Gibsons, BC	This area is much better suited to a world class marine park with its close proximity to Vancouver while offering unequalled marine habitat beauty and diversity	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
3173	653 - 1	Krista Page-Cowan	North Vancouver, BC	As a life long North Shore resident and avid swimmer of Howe Sound I am opposed to the Burnco Mine Project proposal.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3174	653 - 2	Krista Page-Cowan	North Vancouver, BC	There are too many potential environmental risks associated with the project.	Potential effects of the Proposed Project have been assessed for selected valued environmental components to address key issues related to fish and fish habitat, marine resources, terrestrial wildlife and vegetation, geotechnical and natural hazards, water resources, air quality and climate change.  The assessment concludes that, with the application of design considerations and identified mitigation, no significant adverse environmental effects will result from the Proposed Project.  A detailed assessment of potential environmental effects of the Proposed Project is presented in Volume 2, Part B of the EAC Application/EIS.
3175	653 - 3	Krista Page-Cowan	North Vancouver, BC	Just recently we have seen an improvement in water quality in Howe Sound after many years of cleanup from the Britannia mine. There is enough industry impacting the waters of Howe Sound.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.

3176	653 - 4	Krista Page-Cowan	North Vancouver, BC	The salmon and other species that call the Howe Sound home need to be preserved and protected.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
3177	653 - 5	Krista Page-Cowan	North Vancouver, BC	The environment needs to be a priority over profit.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
3178	654 - 1	Personal Information Withheld	Tatlayoko Lake, BC	I am a property owner in BC. I lived several years in the Vancouver, Howe Sound area, and it is an incredibly beautiful place. I believe very strongly that you should be applying great care to preserve and protect this diverse and important area of the natural world. It is the playground of Vancouver, and as such it should be protected and shared. Please consider carefully your decisions to allow a aggregate mine in this area. It will be remembered for many years in the future	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
3179	655 - 1	Personal Information Withheld	Gibsons, BC	Howe Sound will be left with a hole filled with water that cannot grow trees, and estuary values for the future is reduced to near zero. The proponent takes away \$200 million of gravel and may leave 1/10 behind in economic value. There are other BC gravel deposits where the harm would be far less than removing the estuary. The proponent made a bad investment and the Howe Sound should not have to pay for a poor business decision. No one can predict how the loss of the estuary will factor into the future of howe sound in 20-100 years. There is no alternative to the habitat of the McNab estuary. Burnco cannot build another replacement estuary for any price.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

3180	656 - 1	Personal Information Withheld	Squamish, BC	<p>With the multiple projects planned for our region, it has been challenging to adequately review these projects sufficiently. That is an issue that needs to be addressed. If such a large number of significant projects are going to be proposed with such tight timeframes, it may be important to consider capacity funding to support adequate community evaluation of projects.</p> <p>Although I spent a lot of time reviewing the WoodfibreLNG proposal, it only came to light that they had significantly misrepresented their GHG emissions when I was reviewing the subsequent Mt. Mulligan proposal from FortisBC. (WoodfibreLNG used an unrealistically low GHG factor for their electricity consumption). When I tried to raise this with the CEAA during their GHG review of WoodfibreLNG, they said they weren't going to review something the BC EAO had signed off on, regardless if I was correct. If the BC EAO isn't going to catch such issues, and the CEAA won't review the BC EAO work then it's important to fund citizens to conduct a sufficient evaluation of these projects.</p> <p>The above is the reason why my own comments regarding the Burnco project are much shorter. I did take the time to thoroughly review the attached "Burnco - Issues - Chris Pettingill.pdf" document. Although I did not personally draft the document, I strongly agree with the concerns raised.</p>	Thank you for this information. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

3181	656 - 2	Personal Information Withheld	Squamish, BC	In addition to the issues raised in the attachment, I have serious concerns around deficiencies in cumulative impact analysis included in the Burnco application:	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for the following:</p> <ul style="list-style-type: none"> <li>- Marine mammals – behavioural disturbance</li> <li>- Amphibian species at risk – barriers to movement, change in mortality, habitat loss</li> <li>- Roosevelt elk – barriers to movement, change in mortality, habitat loss</li> <li>- Grizzly bear – change in mortality, habitat loss</li> <li>- Environmentally sensitive ecosystems – loss of extent</li> <li>- Ecosystems at risk – loss of extent</li> <li>- Air quality indicators – increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual)</li> <li>- Real estate – change in real estate value</li> <li>- Marine navigation – interference with navigation use and navigability due to Project-related vessel traffic</li> <li>- Harvesting fish and wildlife – change in environmental setting</li> <li>- Recreation and tourism – change in environmental setting</li> <li>- Visual quality – change in visual quality</li> <li>- Heritage resources – changes to heritage resource integrity, context and accessibility</li> <li>- People – Human health (air quality and particulate matter).</li> </ul> <p>All potential cumulative residual effects were determined to be negligible or not significant except net effects to grizzly bear; cumulative residual effects to the threatened Squamish-Lillooet Grizzly Bear Population Unit were determined to be significant due in large part to vehicle collisions that might result from the development of new logging roads. Grizzly bear have not been observed within the Proposed Project area and the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
3182	656 - 3	Personal Information Withheld	Squamish, BC	- The application seems to think that in terms of socio-economic impacts, it is too far from Woodfibre to have any interaction. However, both facilities are in the Sea-to-Sky “Corridor”, and are all part of “Howe Sound”. The many tourists travelling to Whistler experience the sound as a contiguous area that has a positive transition from over-industrialization back to natural beauty. Many new business and residents have arrived precisely because of this natural beauty.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
3183	- 1			A return of multiple significant industrial projects on Howe Sound should be evaluated for cumulative socio-economic impacts, especially on tourism, and the region's natural brand. An assessment that fails to recognize that all development on the whole Sound impacts the whole sound is seriously flawed. The assessment also makes absolutely no mention of the new compressor station planned for Mt. Mulligan which is again further re-industrialization of the area. Any significant shift in economic basis will have impacts, but these have not been addressed by the Environmental Impact Statement. A thorough Socio-Economic impact study that considers all proposed projects in the sound should be completed and made available for public comment before the project is considered for approval.	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
3184	656 - 1	Personal Information Withheld	Squamish, BC	- The application does not seem to address the approved Woodfibre LNG cooling system. Cetaceans and fish alike travel the whole Sound. Although these facilities may have distance between them, they represent a growing collection of stresses on fish and other wildlife that travel the whole sound. The cumulative stress needs to be addressed. We're not dealing with goldfish that stay confined to a little bowl. The project should not be considered for approval without a more comprehensive assessment on the cumulative impacts on fish and wildlife has been completed and made available for public comment.	A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.  The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.  The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.
3185	656 - 2	Personal Information Withheld	Squamish, BC	- The geography of the Sound makes it a funnel for pollution, and even today we see a concentration of pollution from the lower mainland funnel up through Squamish on some summer days. The cumulative impacts assessment fails to take the impacts on Squamish from the Burnco operations, and it fails to address the additional impacts from the proposed Mt. Mulligan compressor. An air quality assessment needs to consider how pollutants travel in the sound, and the cumulative impacts of all major projects. Mt. Garibaldi has also been excluded, and yet it represents a significant addition to regional traffic (pollution) and thus Howe Sound pollution. Once again, public comment on an adequate cumulative assessment of air impacts that actually considers all relevant projects in the Sound should be a necessary part of any consideration of approval.	A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.  Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.  Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.  Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
3186	656 - 3	Personal Information Withheld	Squamish, BC	I'd further like to add that the Woodfibre LNG impact statement did not include cumulative assessments that considered the Mt. Mulligan project, or the related hydro substation. The proposed Mt. Mulligan impact statement did not include a cumulative assessment that considered Woodfibre LNG or the related hydro substation to any significant degree in terms of pollution. Mt. Garibaldi also neglected to include some/all of these projects in its cumulative assessment. Now we have yet another major industrial project proposed, and still has been no comprehensive cumulative assessment of socio-economic or environmental impacts that includes all of these projects. Enough is enough. Before ANY significant project is allowed to proceed the public needs someone to provide a comprehensive cumulative assessment that considers all of these projects. Doing so is supposed to be a requirement of the EA process, and yet so far, everyone has managed to avoid doing the necessary work.	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
3187	656 - 4	Personal Information Withheld	Squamish, BC	Issue 1: Regional demand for additional aggregate is not demonstrated  The Vancouver market requirement for an additional gravel /aggregate source is not supported by the proponent's documentation. A greater profit margin for the Proponent should not be grounds for destroying the estuary of McNab Creek.  Recommendation: A supply/demand report showing strong evidence of the need for supply from this location (and the unavailability of supply from established locations), such as has been done for the Okanagan region, should be prepared before considering a permit for this project. See <a href="https://www.regionaldistrict.com/media/112368/2013_11_08___Full_Report___Aggregate_Supply_and_Demand_Update_and_Analysis.pdf">https://www.regionaldistrict.com/media/112368/2013_11_08___Full_Report___Aggregate_Supply_and_Demand_Update_and_Analysis.pdf</a>	The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resource is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.  Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by: - Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC; - Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and - Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.  The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.

3188	656 - 5	Personal Information Withheld	Squamish, BC	<p>Issue 2: Loss of productive salmon habitat</p> <p>The project has (twice) been rejected by Fisheries &amp; Oceans Canada because of the likely loss of salmon habitat in McNab Creek. In a year of disastrous returns to the Fraser and other runs, this proposal is ill-timed and ill-advised.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
3189	656 - 6	Personal Information Withheld	Squamish, BC	<p>Issue 3: Insufficient data for at-risk species baselines.</p> <p>For several key aquatic and land-based species (such as anadromous salmon, resident cutthroat trout and Roosevelt elk), population data was collected over far too narrow a timespan to be useful for establishing accurate baselines. Without accurate baselines, quantitative monitoring of the effects of this project will not be possible.</p> <p>Recommendation: Part-year data is utterly insufficient to establishing accurate baselines. At least five years of data should be collected to afford accurate baselines usable for ongoing monitoring of effects on species populations and habitat. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where habitat damage exceeds pre-agreed norms.</p>	<p>The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada. The baseline studies conducted are sufficient for the purpose of assessing potential effects of the Proposed Project on selected Valued Components. Additional years of supplemental field studies are not required or proposed for the assessment.</p> <p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS. Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., five years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>

3190	656 - 7	Personal Information Withheld	Squamish, BC	<p>Issue 4: 21 species officially at risk from Burnco.</p> <p>Burnco's consultants documented that the gravel quarry could be home to 21 species officially at risk. This includes Roosevelt elk , re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
3191	656 - 8	Personal Information Withheld	Squamish, BC	<p>Issue 5: Will McNab Creek and the estuary become salty?</p> <p>As rock is removed from the mine, fresh water from the estuary will creep into the resultant 25m pit. This will lead to salt water seeping into the estuary, and into McNab Creek. This will kill a variety of salmon and plants.</p> <p>Recommendation: Have thorough hydrological studies done over several years. Use the precautionary principle. Local authorities (eg. SCR D) should have the power to compel a reduction, suspension or cessation of mine activities where salination exceeds preagreed norms.</p>	<p>The hydraulic conductivity of the valley sediments is much higher than hydraulic conductivity of any bedrock structures, if they exist. Therefore, the groundwater flow in the valley sediments will dominate and it will provide key control on the position of the salt water-freshwater interface. Furthermore, because of topographic highs that surround the valley, the hydraulic heads are expected to be higher than in the valley sediments, inhibiting saltwater ingress. As presented in Section 3.3 in Appendix 5.6-A of the EAC Application/EIS, based on monitoring data (2010-2014), tidal elevations exceeded groundwater elevation only in rare occasions between July and September of each monitoring year. During these high tide intervals, there is an inferred landward gradient in the immediate vicinity of the shoreline; however, its duration is inherently less than the corresponding periods of southwards gradient associated with lower tidal position. Accordingly, the net groundwater flow direction during the entire monitoring period is confirmed to be southwards toward the marine foreshore. Moreover, monitoring data indicate that the saltwater wedge could be located at greater depths than approximately -30 m elevation; analytical calculations based on methodology presented in Domenico and Schwartz (1990) showed that, due to relatively high groundwater flow in the alluvial sediments, the saltwater edge could be depressed to the depth of the overburden/bedrock contact within 50 m to 150 m of the ocean shore. Based on these observations, the potential presence of a fault structure in bedrock in the vicinity of the project area is not considered to influence groundwater flow direction in the valley sediments or increase the risk of saltwater intrusion.</p>

	Ref #	Commenter (Name)	Location		
3192	656 - 9	Personal Information Withheld	Squamish, BC	<p>Issue 6: Unsuitable location</p> <p>This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area. In 2009 SCRD said no to a permit for an aggregate operation at McNab Creek. There was concern re noise and dust from onsite crushing, sorting, weighing, and stockpiling, all of which Burnco plans to do. Why allow these activities now?</p> <p>Recommendation: To do so would represent atrocious planning, with little/no obvious compensating factors. It should not be permitted.</p>	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>

3193	656 - 10	Personal Information Withheld	Squamish, BC	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). The proposed “compensation channel” is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Recommendation: Any approval of this proposal should include a contingency bond to fund maintenance of the new streamway, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project.</p>	<p>The proposed Project will lead to the loss of approximately 200 m2 of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. The proposed design for the channel extension uses the existing lower channel as a template and it will meet the factors and criteria that are generally accepted for the construction of a functional groundwater-fed spawning channel. It should provide conditions similar to the existing run habitat in the lower section of WC2 that was designed as chum spawning habitat by DFO and where spawning activity was observed during the November 2016 survey.</p> <p>The creation of the pit lake is predicted to cause a doubling of groundwater influx into the lower section of WC2. The increase in ground water influx will lead to additional groundwater upwelling and the increased upwelling is expected to provide increased levels of intergravel flow that will be suitable for eggs and alevins. The average depth in the proposed offset habitat extension and the remaining section of WC2 is predicted to be above 0.3 m making it suitable for salmon spawning. As described in the Aquatic Health assessment provided in Surface Water Resources (Section 5.5.7.2), the water quality and temperature of ground and surface water entering the offset habitat and existing lower section of WC2 will be suitable for salmonids to complete all stages of their life history including spawning.</p> <p>In response to comments from the Technical Working Group, the design of the habitat offset plan was revised to allow approximately 20 m of pool habitat upstream of the culvert and approximately 20 m of gravel bed run habitat downstream of the culvert to be retained which will avoid approximately 232 m2 of habitat loss. The design of the channel extension incorporates run and pool habitat in approximately a 1 : 1 ratio, based on this design and the use of run habitat for spawning in the existing lower channel it is expected that more than 2, 000 m2 of the offset channel habitat will provide conditions suitable for salmonid spawning.</p>
3194	656 - 11	Personal Information Withheld	Squamish, BC	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). 3200	656 - 17	Personal Information Withheld	Squamish, BC	<p>Issue 10: The impact of marine noise is insufficiently studied in the application</p> <p>The impact of marine noise (from the conveyor belts –tugs, barge loading and water taxis) on cetaceans, herring, salmon (spawning adult and habituating juveniles) and other at-risk species (including waterfowl) is underestimated in the “science” work done by the Proponent</p> <p>Recommendation: Marine noise transmits 5-10 times farther &amp; faster through water than through air. Marine noise should be carefully baselined and monitored in wide spatial and temporal dimensions around the site Periodic reporting of results that are auditable and accessible to the public should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where marine noise exceeds pre-agreed norms.</p>	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

3203	656 - 20	Personal Information Withheld	Squamish, BC	<p>Issue 12: Water Quality is insufficiently characterized in the application</p> <p>Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs.</p> <p>Recommendation: Siltation monitoring (both in the original and compensation channels and in the nearby ocean), with periodic reporting of results that are auditable and accessible to the public, should be part of any approval of the project. Local authorities (eg. SCR D) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.</p>	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>
3204	656 - 21	Personal Information Withheld	Squamish, BC	<p>Issue 12: Water Quality is insufficiently characterized in the application</p> <p>Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs.</p> <p>Recommendation: Siltation monitoring (both in the original and compensation channels and in the nearby ocean), with periodic reporting of results that are auditable and accessible to the public, should be part of any approval of the project. Local authorities (eg. SCR D) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.</p>	<p>A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken. Adaptive management techniques to be implemented as required include:</p> <ul style="list-style-type: none"> <li>- Continue to evaluate the extent of the pit during operations.</li> <li>- During the wet season, if water levels in the pit lake become higher than has been designed for the Pit Lake Containment Berm then the valves in the culverts will be closed to reduce the amount of water reporting to the pit from the surface water on the western slope.</li> <li>- The height of the pit lake at the outlet structure can be adjusted to increase or decrease the level of the pit lake (e.g., adding or lowering stop logs) at closure to maintain the hydraulic gradient between McNab Creek and the Project Area following closure.</li> </ul>
3205	656 - 22	Personal Information Withheld	Squamish, BC	<p>Issue 13: "Daytime Hours" definition</p> <p>The Proponent advertises that the plant will operate only on weekdays and during "daytime hours". Daylight hours vary seasonally, but the definition of "daytime hours" is unclear.</p> <p>Recommendation: Clearly define "daytime hours" in the proposal.</p>	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCR D noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>

3206	656 - 23	Personal Information Withheld	Squamish, BC	<p>Issue 14: The nearshore strip of forest cover is too narrow</p> <p>The strip of forest cover between the pit and the ocean is too narrow to be sustainable. Blowdown and saltwater invasion will threaten its existence</p> <p>Recommendation: For reasons of sustainability and visual camouflage, increase the width of the ocean-pit separation strip, and lessen the size of the proposed pit and crushing area.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. Maintaining a treed buffer along the foreshore (approx. 25-50 m wide adjacent to the processing area) will also limit dust and noise emissions to the marine environment. Additional screening of lan-based structures may be possible around project components not currently screened by existing vegetation. The nature and extent of vegetation screening incorporated into the site design will be described in the Vegetation Management Plan (Volume 3, Part E, Section 16 of the EAC Application/EIS).</p> <p>A detailed assessment of potential vegetation effects (including windthrow effects) of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS. The significance of windthrow effects were determined to be negligible; few new windward edges will be created. Monitoring of treeline edges will be conducted to evaluate potential windthrow effects and adaptive management will be employed, if necessary.</p>
3207	656 - 24	Personal Information Withheld	Squamish, BC	<p>Issue 15: Loss of property values in the nearby strata units</p> <p>The proponent claims little or no loss of value for nearby properties. This assertion is contradicted by many studies that have highlighted the loss of value (including the value associated with quiet enjoyment) at or near industrial sites adjacent to established residential areas. Recent jurisprudence in BC has borne out the right of homeowners to receive compensation for that loss. See <a href="http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882">http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882</a></p> <p>Recommendation: Fair market value compensation for loss of property value must form part of the economic analysis of any approval for this mine.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
3208	656 - 25	Personal Information Withheld	Squamish, BC	<p>Issue 16: First Nation consultation – Sechelt FN was omitted this time</p> <p>Squamish and Tseil-Waututh First Nations have been consulted re Burnco, but not the Sechelt FN. The Sechelt First Nations weren't consulted about the gravel quarry at McNab Creek in 2009 either. McNab Creek is in Sechelt traditional territory.</p> <p>Recommendation: Respect/consult with Sechelt First Nations re Burnco.</p>	<p>First Nation consultation requirements are delegated to Proponents by the Crown. For the Proposed Project, only Squamish Nation and the Tsleil-Waututh Nation were identified as potentially affected first Nations by the BCEAO. The CEA Agency identified additional Aboriginal Group, however, the Sechelt First Nation was not among these, presumably because of the proximity of the proposed Project to their Traditional Territory.</p>

3209	656 - 26	Personal Information Withheld	Squamish, BC	<p>Issue 17: Advisory Committee of voluntary citizens</p> <p>In 2009 when a gravel quarry at McNab Creek was turned down by SCRD, one requirement was an Advisory Committee of volunteer citizens to provide ongoing input with the goal of community acceptance of the project.</p> <p>Recommendation: Require the formation of an Advisory Committee of volunteer citizens.</p>	<p>BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.</p>
3210	656 - 27	Personal Information Withheld	Squamish, BC	<p>Issue 18: The job benefits were analyzed on the basis of too narrow an RAA.</p> <p>BURNCO currently sources its aggregate from Jervis Inlet, Port McNeil and Coquitlam. To gauge the benefits to the BC economy, the net job creation figures (i.e. McNab's 12 jobs less the job losses at the above aggregate sources) as a consequence of allowing the McNab Creek operation must be considered.</p> <p>Recommendation: If there is little or no net job gain to BC as a result of this proposal, it should be firmly rejected. Jobs in areas like Port McNeil are much harder to come by than in the Lower Mainland/ Howe Sound.</p>	<p>The local spatial study area for the operations phase labour market effects (including employment) of the Proposed project was described in the Application Information Requirements/EIS Guidelines, which was approved by the BCEAO and the CEA Agency on December 16, 2014 after review by the Technical Working Group established to guide the assessment. This local spatial study area is Sunshine Coast Regional District.</p> <p>The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.</p>

	Ref #	Commenter (Name)	Location		
3211	656 - 28	Personal Information Withheld	Squamish, BC	<p>Issue 19: Barge traffic will diminish Howe Sound's recreational and tourism potential and add to the cumulative traffic hazard in Howe Sound</p> <p>Shipping 1-4 million tonnes of aggregate annually from this location will make for 2-6 tug/barge movements daily through Southern Howe Sound,. Routes would cross very busy sailing and small-boat recreational areas, the Howe Sound Marine Trail and ferry routes, the path of LNG tankers exiting from the Woodfibre LNG plant and freighters from Squamish Terminals. This exponentially increases the risk of collisions and loss of life in a narrow waterway and diminishes the amenity and tourism use of the Sound. The cumulative effects and worst-case hazard analysis of this project have been underestimated by the Proponent.</p> <p>Recommendation: A cumulative impact assessment, including loss of amenity and tourism value of the Sound, should be completed prior to deciding on this application. So too should a study of the increased hazards associated with increasing the large-vessel traffic in Howe Sound. Improvements to vessel tracking, buoys and channel markers in the area will be necessary.</p>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
3212	656 - 29	Personal Information Withheld	Squamish, BC	<p>Issue 20: The job benefits analysis used the questionable input-output econometric model.</p> <p>BURNCO has used input-output econometric analysis to predict the job creation benefits accruing to the project For resource projects, this is a highly questionable analysis technique. The Australian Institute has written a convincing argument highlighting the inadequacies of input-output analysis. See <a href="http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf">http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf</a> (Input-output was used by the BC Government in arriving at its inflated job estimates for BC's LNG industry.)</p> <p>Recommendation: Red-do the employment estimates and repost/ allow additional time for public scrutiny and comments</p>	<p>The environmental assessment of the Proposed Project used an input-output (I-O) impact modelling methodology to estimate the Project's potential effect on employment (as well as other economic parameters). The B.C. Input-Output Model (BCIOM) was used. The BCIOM is maintained by BC Stats, which is the central statistics agency of the B.C. government. The BCIOM is a version of Statistics Canada's Inter-Provincial Input-Output Model (IPIOM) which BC Stats calibrated for undertaking economic analyses of B.C.-based projects. The BCIOM is a robust, calibrated, third party provided input-output model, and has been previously accepted for use by by the BCEAO and the CEA Agency to assist with estimating the economic impact of proposed projects.</p>

3213	656 - 30	Personal Information Withheld	Squamish, BC	<p>Issue 21: There was an inconsistency between the job creation figures shown in 2 different slides in the Open Houses</p> <p>One showed about 300 person-years of employment (over 25years). The other (derived from input-output analysis) showed person-year employment benefits several times that amount.</p> <p>Recommendation: This misleading discrepancy should be resolved by further analysis, and that section of the application re-submitted, with additional time allowed for public scrutiny and comment</p>	<p>The estimated number of jobs created by the proposed Project during construction and operations phases are presented in Section 2.5.4 of the EAC Application/EIS.</p> <p>Employment numbers were presented on three Open House display panels, as follows:</p> <ul style="list-style-type: none"> <li>- Project Specifications: 80 person years during construction and 360 person years during operations (direct, indirect and induced);</li> <li>- Project Benefits: 12 full-time jobs at the site (i.e. direct only);</li> <li>- Sustainable Economy: 119 jobs during construction and 99 jobs during operations (direct, indirect and induced); 33 long-term jobs during operations are expected to be filled by Sunshine Coast residents.</li> </ul>
3214	656 - 31	Personal Information Withheld	Squamish, BC	<p>Issue 22: Preservation of marine tourism, hiking access to the vicinity of McNab</p> <p>Moorages, anchorages, swimming facilities and back-country access have long been part of the McNab Creek area's attractions for Howe Sound visitors and local boating clubs</p> <p>Recommendation: The application fails to properly address how these local amenities will be protected. Neither does it propose how loss of these amenities will be compensated for. The Management Plan should address this issue.</p>	<p>Harvesting fish and wildlife' and 'Outdoor recreation and tourism' are valued components in the environmental assessment of the Proposed Project (see Table 7.3-1). No displacement effects on recreational hunting or other recreational activities is anticipated due to the Proposed Project because the primary access to the local study area is through the Proposed Property, and public access and use of the Proposed Property has never been permitted. During the construction and operation phases, recreationists and tourists would continue to have access to the foreshore area below the high water mark and to the anchorage area in the vicinity of where McNab Creek enters Howe Sound.</p> <p>Proposed Project construction and operations would prevent marine-based recreational and tourism activities occurring around the Project jetty. As the jetty is located within an existing log boom tenure and recreational and tourism activities are concentrated on the eastern side of the local study area (where McNab Creek enters Howe Sound), this effect is considered to be negligible.</p> <p>Displacement on the water would occur on an intermittent basis as a result of Proposed Project-related vessel traffic, which would require smaller vessels to alter direction and/or speed when navigating at the same time as water taxis or barges (Volume 2, Part B - Section 7.2). These navigational challenges are present in the LSA due to forestry activity, and are subject to the Collision Regulations of the Canada Shipping Act. Any resulting effects on recreational boating recreational activities due to potential interactions of recreational vessels and equipment and Project-associated vessels are not detectable or not measureable, so potential effects of the Proposed Project on water-based recreation and tourism access matters in the construction and operation phases are determined to be negligible.</p> <p>As part of the Marine Transport Management Plan outlined in Marine Transport (Volume 2, Part B - Section 7.2), BURNCO would also develop and implement strategies, best management practices and guidelines to avoid and minimise Proposed Project - related disruption of marine-based recreational activities during construction and operations. As part of the development of this plan, BURNCO would consult with key marine user groups (e.g., McNab Strata, yacht clubs, camps, and kayaking operators) to discuss strategies (including but not limited to routing options) to manage the interaction of Proposed Project vessel traffic with recreational and tourism areas during the high season months.</p>

3222	659 - 1	Chris Dietrich	North Vancouver, BC	<p>I just wanted to voice my concern about the gravel mine that Burnco has proposed to put in beautiful Howe Sound. Howe Sound has inspired me in so many ways. It has been my childhood escape where I could just be a kid, playing with my friends in the forest or enjoying paddle boarding, kayaking and fishing of the dock in the early morning.</p> <p>I was so inspired in fact, that I made many movies there, capturing the glorious scenery. Little did I know that there were other people interested in the Howe Sound, and it was not people who necessarily aiming to make things better for the community in the area. When I heard about the mine, I was appalled and scared about the future of the community, the peacefulness, the spectacular scenery, and of course the wildlife.</p> <p>I decided to get my camera out once again and create a short 5 minute video, giving awareness about the multitude of recreational activities and the nature within this region along with the increasingly-real threat that looms over it. I also knew that there were mines there before. Britannia Mine being one of the biggest polluters in Canada, harmed the Howe Sound immensely. Only recently have the prawns, crab, salmon, orcas and dolphins come back. We do not want to make that same environmental mistake twice in such a fragile ecosystem...and that was the drive for my video. Next summer I'm planning a more professional documentary on the history, threats and sustainability of Howe Sound.</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. 3227	661 - 4	Personal Information Withheld	North Vancouver, BC	There will be increased barge traffic in the sound and significant noise pollution which won't only impact boaters and residents, but also marine life. I trust that you will listen to the pleas of those that live and frequent this area, and the effects on the environment if this project should move forward. We only have one earth, we must treat it with respect.	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
3228	662 - 1	Joan McCullough	Lions Bay, BC	Here we go again for the third time. When will Burnco and the Eao finally stop contemplating that this project would even be a possibility in Howe Sound. You have seen and heard all the comments from very qualified environmentalists and residents here. Over 99% according to our math are against this disgusting project FOR THE 3RD TIME. When are you going to realise that the Residents and Friends of Howe Sound will not allow this project to go ahead.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3229	662 - 2	Joan McCullough	Lions Bay, BC	There is no shortage of gravel and according to our local gravel suppliers in Squamish and North Vancouver there is no reason to destroy our environment and flood the market.	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>

3230	662 - 3	Joan McCullough	Lions Bay, BC	If Alberta wants more gravel, they can dig up in Alberta, not here in Howe Sound.	<p>BURNCO is a 104-year old family-owned Canadian company with operations in British Columbia, Alberta, Saskatchewan and Texas.</p> <p>BURNCO has over 1,150 employees (180 in BC) and is Canada's largest independent ready mix concrete and aggregate company.</p> <p>BURNCO's BC operations currently transport sand and gravel by barge fro Treat Creek (eas of Powell River) and as far away as Port McNeil on northern Vancouver Island, to existing facilities along the Fraser River in Burnaby and Langley.</p>
3231	662 - 4	Joan McCullough	Lions Bay, BC	99% of respondents have voiced their opinion AGAINST this project,YES 99% Therefore you have no social licence to say yes to this project. All local press comments are against this project. I cannot imagine what the fall-out will be if you say yes. No matter what you decide, our local citizens will make sure it will not go ahead. This affront on our fishing and wild life habitat will not be allowed.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3232	663 - 1	Kelly Smith	Bowen Island, BC	<p>The proposed gravel mine at McNab Creek, along with the recently approved LNG project at Woodfibre, and with other proposed, current, and past developments in Howe Sound have had, and will continue to have a number of significant direct and cumulative environmental effects to Howe Sound.</p> <p>As a resident living at the mouth of Howe Sound, I have seen Howe Sound slowly recover from the environmental impacts of past industrialization. For example, a few weeks ago my six year old grandson and I saw four Orca's close to Hutt Island. There also have been several sightings of humpback whales in our areas. Some fisheries are also making a comeback. This is a sign of slow recovery, since such events were a very uncommon in the past century that marked the height of environmental destruction in Howe Sound.</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

3233	663 - 2	Kelly Smith	Bowen Island, BC	<p>The proposed gravel mine represents a significant threat to the recovery of Howe Sound. Furthermore, in recent years there has been significant loss in the science-based capabilities of provincial and federal environmental agencies, that threatens the credibility of environmental reviews.</p> <p>Accordingly, the project must not be considered, approved or constructed until:</p> <ol style="list-style-type: none"> <li>1) Howe Sound's environmental recovery is complete and the project is reassessed at that time, and</li> <li>2) Decision-making agencies clearly demonstrate that their decisions are based on the recommendations of qualified professional scientists and engineers with specialized environmental knowledge.</li> </ol>	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>
3234	664 - 1	Bill Anderson	Gibsons, BC	<p>To have machinery digging in the riparian area of McNab Creek and valley is definitely wrong, as these areas are extremely sensitive to disturbances. Even modest changes in the amount and timing of water flow may result in significant changes to the physical and biological functioning of these ecosystems.</p>	<p>No disturbance of McNab Creek riparian areas is proposed. Riparian buffers will be retained along watercourses with the exception of the upper segment of the existing constructed groundwater-fed channel WC2 which will be removed as part of the Proposed Project. The banks within this segment are steep and long with slopes as high as 45 degrees and a bank slope approximately 10 m long throughout much of the watercourse. The slopes are exposed and have little riparian vegetation, resulting in erosion and deposition of fines and sand on the channel bed. The lack of riparian vegetation limits shade and overhanging vegetation cover for fish in this segment. The removal of this segment will be offset by the construction of a 790 m long channel extension which will provide 5,341 m<sup>2</sup> of new fish habitat and a net gain of more than 22,000 m<sup>2</sup> of riparian habitat.</p>
3235	664 - 2	Bill Anderson	Gibsons, BC	<p>Work in the area would interfere with natural flood cycles that are critical to healthy riparian zones. Floods bring essential supplies of water, nutrients and sediment. They also help to create backwater that serve as critical fish nurseries.</p>	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 (Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>

3236	664 - 3	Bill Anderson	Gibsons, BC	The McNab Creek riparian area and estuary is critical to a healthy marine environment. Please do not allow any industrialization of this sensitive area.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
3237	664 - 4	Bill Anderson	Gibsons, BC	The McNab Creek riparian area and estuary is critical to a healthy marine environment. Please do not allow any industrialization of this sensitive area.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

3241	666 - 1	Personal Information Withheld	Bowen Island, BC	This project carries too much risk for McNab Creek and Howe Sound and will negatively impact the resurgence of marine life, ecotourism and recreation which are all part of the sustainable use of the area. Please do not approve this plan.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
3242	667 - 1	Steve Richardson	Gambier Island, BC	60 odd yrs on Gambier have watched the rape & foul pollution of Howe sound & its watersheds.the discharge from Port Mellon pulp mill fouled the water so much visibility was limited to a few inches.How,in this day and age can we allow any more of this carnage,the mere fact that it has to be debated is a disgrace to anyone who remotely cares about the natural world that's being killed around us. Please prove that greed and money doesn't always win!	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
3243	668 - 1	Janine MacLeod	Vancouver, BC	I do not believe that the proposed Burnco Aggregate Project constitutes an appropriate development for the McNab Creek Site.	A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.  The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.  The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.
3244	668 - 2	Janine MacLeod	Vancouver, BC	First, the project would compromise the second largest estuary in Howe Sound. These environments are some of the richest parts of the shoreline in terms of sheer density of life. As someone who experiences a great deal of hope and comfort in connection with recent signs of ecological recovery in Howe Sound, I would be devastated to see such a critical marine habitat disturbed by the mine.	A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.  The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout. 3245	668 - 3	Janine MacLeod	Vancouver, BC	<p>First, the project would compromise the second largest estuary in Howe Sound. These environments are some of the richest parts of the shoreline in terms of sheer density of life. As someone who experiences a great deal of hope and comfort in connection with recent signs of ecological recovery in Howe Sound, I would be devastated to see such a critical marine habitat disturbed by the mine.</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
3246	668 - 4	Janine MacLeod	Vancouver, BC	<p>Vibrations will interfere with the reproduction, food finding and navigational activities of marine life such as orcas and dolphins, who have just begin returning to this area.</p>	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

3247	668 - 5	Janine MacLeod	Vancouver, BC	Secondly, the mine would essentially block the movement of wildlife between the upper parts of the valley and the estuary, eliminating this important corridor between the estuary and the uplands. I am very concerned about this displacement of wildlife. Burnco's own consultants identified 23 species at risk that would be threatened by the mine.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
3248	668 - 6	Janine MacLeod	Vancouver, BC	Finally, I am concerned about the cumulative impacts of the proposed aggregate project, run of river projects in the area, and logging. How many stresses from human extractive activity should that valley be expected to handle?	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for the following:</p> <ul style="list-style-type: none"> <li>- Marine mammals – behavioural disturbance</li> <li>- Amphibian species at risk – barriers to movement, change in mortality, habitat loss</li> <li>- Roosevelt elk – barriers to movement, change in mortality, habitat loss</li> <li>- Grizzly bear – change in mortality, habitat loss</li> <li>- Environmentally sensitive ecosystems – loss of extent</li> <li>- Ecosystems at risk – loss of extent</li> <li>- Air quality indicators – increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual)</li> <li>- Real estate – change in real estate value</li> <li>- Marine navigation – interference with navigation use and navigability due to Project-related vessel traffic</li> <li>- Harvesting fish and wildlife – change in environmental setting</li> <li>- Recreation and tourism – change in environmental setting</li> <li>- Visual quality – change in visual quality</li> <li>- Heritage resources – changes to heritage resource integrity, context and accessibility</li> <li>- People – Human health (air quality and particulate matter).</li> </ul> <p>All potential cumulative residual effects were determined to be negligible or not significant except net effects to grizzly bear; cumulative residual effects to the threatened Squamish-Lillooet Grizzly Bear Population Unit were determined to be significant due in large part to vehicle collisions that might result from the development of new logging roads. Grizzly bear have not been observed within the Proposed Project area and the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

3252	670 - 3	Personal Information Withheld	Squamish, BC	If industry were made to pay the true costs of their pollution and also cleanup their mess after their operations come to an end, then they likely wouldn't be economically viable.	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>
3253	670 - 4	Personal Information Withheld	Squamish, BC	Gravel is not is short supply - there is no need for a new mine to satisfy needs.	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
3254	670 - 5	Personal Information Withheld	Squamish, BC	This project has already been rejected by Fisheries & Oceans because of the likely loss of salmon habitat - I don't understand the system - it seems that companies just keep resubmitting until they finally get approval. Rejections are for valid reasons and they shouldn't be easily overturned by successive tweaks.	<p>Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO's involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.</p> <p>Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.</p>
3255	670 - 6	Personal Information Withheld	Squamish, BC	This project has already been rejected by Fisheries & Oceans because of the likely loss of salmon habitat - I don't understand the system - it seems that companies just keep resubmitting until they finally get approval. Rejections are for valid reasons and they shouldn't be easily overturned by successive tweaks.	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>

3256	670 - 7	Personal Information Withheld	Squamish, BC	Increased marine traffic - it seems that the environmental approval process doesn't consider the combined impacts of all proposed projects - if you add the barges from this project to the LNG tankers for the proposed Woodfibre LNG project, we are adding a lot of traffic.	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
3257	670 - 8	Personal Information Withheld	Squamish, BC	Noise from these will affect whales and generally diminish the natural environment.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

3258	670 - 9	Personal Information Withheld	Squamish, BC	We have the wonderful new Sea to Sky Marine Trail which is bringing more kayakers to the area.	<p>Harvesting fish and wildlife' and 'Outdoor recreation and tourism' are valued components in the environmental assessment of the Proposed Project (see Table 7.3-1). No displacement effects on recreational hunting or other recreational activities is anticipated due to the Proposed Project because the primary access to the local study area is through the Proposed Property, and public access and use of the Proposed Property has never been permitted. During the construction and operation phases, recreationists and tourists would continue to have access to the foreshore area below the high water mark and to the anchorage area in the vicinity of where McNab Creek enters Howe Sound.</p> <p>Proposed Project construction and operations would prevent marine-based recreational and tourism activities occurring around the Project jetty. As the jetty is located within an existing log boom tenure and recreational and tourism activities are concentrated on the eastern side of the local study area (where McNab Creek enters Howe Sound), this effect is considered to be negligible.</p> <p>Displacement on the water would occur on an intermittent basis as a result of Proposed Project-related vessel traffic, which would require smaller vessels to alter direction and/or speed when navigating at the same time as water taxis or barges (Volume 2, Part B - Section 7.2). These navigational challenges are present in the LSA due to forestry activity, and are subject to the Collision Regulations of the Canada Shipping Act. Any resulting effects on recreational boating recreational activities due to potential interactions of recreational vessels and equipment and Project-associated vessels are not detectable or not measureable, so potential effects of the Proposed Project on water-based recreation and tourism access matters in the construction and operation phases are determined to be negligible.</p> <p>As part of the Marine Transport Management Plan outlined in Marine Transport (Volume 2, Part B - Section 7.2), BURNCO would also develop and implement strategies, best management practices and guidelines to avoid and minimise Proposed Project - related disruption of marine-based recreational activities during construction and operations. As part of the development of this plan, BURNCO would consult with key marine user groups (e.g., McNab Strata, yacht clubs, camps, and kayaking operators) to discuss strategies (including but not limited to routing options) to manage the interaction of Proposed Project vessel traffic with recreational and tourism areas during the high season months.</p>
3259	670 - 10	Personal Information Withheld	Squamish, BC	These large vessels will decrease the experience for these tourists.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

3264	671 - 1	Personal Information Withheld	Gibsons, BC	<p>The following from Golder Associates to Burnco Aggregate Project. Why was this report relying on old information from 2005 and beyond? The geological hazards in the McNab area are significant as this report shows. An "assessment comprising a desktop review of existing information" is not acceptable, especially knowing the fact that this project is in the Cascadia Subduction earthquake zone. (5.4.4 Baseline Conditions) "The natural hazards baseline conditions was completed by conducting a terrain and terrain stability mapping assessment comprising a desktop review of existing information, production of a terrain base map, and analysis of the potential for the terrain hazards to affect the Proposed Project facilities". (5.4.4.5 Discussion) "avalanching and steep valley sidewall debris and rock slides are common in the McNab Creek watershed, they are not expected to directly affect the LSA. Activities associated with the Proposed Project Area are not anticipated to increase the potential for initiating mass wasting (i.e., landslide) events. How was this determined?</p>	<p>A detailed assessment of potential geotechnical and natural hazard effects of the Proposed Project is presented in Volume 2, Part B – Section 5.4 of the EAC Application/EIS. The objectives of this assessment were to identify and evaluate static and seismic ground conditions, and potential landslide, debris flow/flood and avalanche hazards that could be impacted by the Proposed Project, or that could impact the Proposed Project.</p> <p>A terrain stability field assessment was completed on November 2-3, 2016. The results of the field assessment, together with the data in our existing hydrologic and geotechnical assessment reports (Hydrological and Hydraulic Characterization McNab Valley Aggregate Project Howe Sound BC, Concrete Aggregate Summary, Assessment of Avulsion Risk of McNab Creek (located in EA Vol. 4 Appendix 5.4 – C, F, A respectively) indicate that there is no evidence for historic debris flows or debris floods. Therefore, further investigations are not considered to be required.</p>
3265	671 - 2	Personal Information Withheld	Gibsons, BC	<p>Landslides and snow avalanches can transport debris and sediment to creeks, increase water volumes, increase fine sediment transport, and in some cases debris jams can cause outburst floods (as seen with debris flood events). Evidence for significant debris flows and debris floods (including outburst floods) was not identified in this desktop assessment".</p> <p>Current geological data would be critical for making sound sensible decisions on outcomes for this area.</p> <p>At the end of production, a huge water filled pit remains, with man made silt berms to the North and one to the South, just one good avalanche, or an extreme winter rainstorm could push through the berm and take out the whole pit. This would ruin the McNab estuary for many years. Could we experience another Mount Polley? or a failed Bafokeng Dam? "The report, which was released on Friday morning in Victoria, said the design failed to take into account the complexity of the instability of underlying glacial and pre-glacial layers under the retaining wall". This is a project that could become a huge environmental disaster, something we do not need!</p>	<p>A terrain stability field assessment was completed on November 2-3, 2016. The results of the field assessment, together with the data in our existing hydrologic and geotechnical assessment reports (Hydrological and Hydraulic Characterization McNab Valley Aggregate Project Howe Sound BC, Concrete Aggregate Summary, Assessment of Avulsion Risk of McNab Creek (located in EA Vol. 4 Appendix 5.4 – C, F, A respectively) indicate that there is no evidence for historic debris flows or debris floods. Therefore, further investigations are not considered to be required.</p> <p>Based on a conservative assessment using the existing geotechnical data from subsurface investigations previously carried out, the risk of significant and extensive liquefaction in the Project area is considered to be low to very low, and likely only to be associated with a large earthquake (i.e. 1 in 2,475 year event). Therefore, supplementary geotechnical investigations and analyses are not considered to be required.</p> <p>The Flood Protection Dyke and Pit Lake Containment Berm will be designed and built to appropriate design criteria, which include seismic stability considerations.</p>

3266	672 - 1	Lynn Chapman	Roberts Creek, BC	I am writing in opposition to the Burnco Mine Project on the basis that it will cause harm to McNab Creek and the McNab Creek estuary which cannot be mitigated.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
3267	672 - 2	Lynn Chapman	Roberts Creek, BC	I am writing in opposition to the Burnco Mine Project on the basis that it will cause harm to McNab Creek and the McNab Creek estuary which cannot be mitigated.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

3269	672 - 4	Lynn Chapman	Roberts Creek, BC	<p>There is no justification, save private interest by the proponents, for re-industrializing Howe Sound now that it is finally returning to life sustaining capacity. I am not a biologist or an expert but I have seen the biodiversity that the estuary currently supports and I also know there are only two such estuaries in Howe Sound. if that rare and fragile ecosystem is destroyed it will harm the recovery of the whole of Howe Sound. That is not in the Public's interest. The new science around the excavation and removal of vast amounts of sand and gravel needs to be reviewed and considered. Unfortunately, the lack of quality, depth and breadth of focus of the current Environmental Assessment process cannot be trusted to actually protect biodiversity and ecosystem integrity over the short term interests of business. Notwithstanding that I urge you sincerely to protect McNab Creek, its estuary and the recovering lands above it and to reject the Burnco Application.</p>	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>

3273	673 - 3	Personal Information Withheld	Bowen Island, BC	<p>B) Professional Science and Engineering Signoff</p> <p>The EAO and CEAA websites seldom provide review details or the analysis undertaken by individual government scientists and engineers. Usually, websites provide larger, carefully written reports that do not attribute analysis.</p> <p>Furthermore, formal agencies' correspondence or reports, provide little or no information on the professional qualifications of those government scientists and engineers taking professional responsibility for the science and engineering elements in the review. In its early days, the EAO was much more transparent and published almost all internal government analysis on reviews.</p> <p>Accordingly, it is now difficult for the public to determine whether the review analysis was undertaken by a suitably qualified professional, or by others. The public credibility of EA reviews has suffered tremendously, with the perception and sometimes of the reality of government making decisions in the absence of sound science advice.</p> <p>Therefore, government reviewing agencies need to explicitly list the professional qualifications and affiliations of their reviewers and the topics they reviewed. This is particularly important for engineering or geosciences issues where the "BC Engineers and Geoscientists Act", requires that work that falls within the Act be undertaken or directly supervised by a suitably professional engineer or</p>	<p>BURNCO engaged an independent and reputable team of qualified scientists and EA practitioners from Golder Associates Ltd. to conduct the required studies and prepare and environmental assessment for the Proposed Project. Golder is a global, employee-owned company with over 50 years of experience. They have over 400 BC-based staff involved in environmental assessment and related activities. All of Golder's work undergoes a high level of quality control and technical review. In addition, some of Golder's work for this project – specifically the groundwater modelling of the proposed mine plan – was subject to third-party technical review prior to being relied upon for the assessment.</p> <p>The qualifications and experience of the EA Project Team is presented in Section 2.1.1. of the EAC Application/EIS. Their work will be subject to further technical review through the ongoing EA review process.</p> <p>Many of the studies undertaken and changes made to the Proposed Project were a direct result of our consultants findings and recommendations.</p> <p>BURNCO is a 104-year old company that has built a reputation as a responsible resource developer. We depend upon independent assessments such as those conducted for the EA to help ensure we protect our reputation and don't put our business at risk.</p>
3274	674 - 1	Personal Information Withheld	Squamish, BC	<p>RE: Key concerns regarding BURNCO Aggregate Mine Project</p> <p>Thank you for the opportunity to comment on proposed BURNCO Aggregate Mine Project, proposed at McNab Creek in Howe Sound. While I have had very limited time to adequately review this proposal within the short timeframe permitted by the BC EAO/CEAA, I have outlined a few of my key concerns follows:</p>	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>

3275	674 - 2	Personal Information Withheld	Squamish, BC	<p>1) Estuaries are an irreplaceable natural resource.</p> <p>Estuaries deliver invaluable ecosystem services, as well as providing economic, cultural, and ecological benefits to communities.</p> <p>Estuaries and wetlands are one of the ecosystems most threatened by development, however they trap (sequester) more carbon than rainforests. Both seagrasses and salt marsh grasses are incredibly productive carbon sinks, as the carbon they use to make their leaves are incorporated into the layers of sediment every year. Estuaries worldwide sequester up to 100 teragrams of carbon per year. Saltmarshes sequester up to 24 tonnes of carbon per hectare per year.</p> <p>Estuaries and wetlands also help to make our water cleaner, as they act like a giant liver that filters and traps pollutants such as herbicides, pesticides, and heavy metals, as well as sediments and nutrients. They are hotspots for biodiversity, and are vital as habitat for migrating birds, and nurseries for juvenile fish. They stabilize shorelines, minimize erosion, and protect coastal areas from floods and storm surges, acting like a sponge and soaking up the excess floodwater.</p> <p>Vegetated coastal habitats such as seagrasses and saltmarsh habitat rank amongst the most threatened marine ecosystems. About 25% of the area originally covered by salt-marshes has been globally lost due to development, with current loss rates at about 1 to 2% per</p>	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. 3276	674 - 3	Personal Information Withheld	Squamish, BC	<p>McNab Creek is the second-largest estuary in Howe Sound, one of only three estuaries located in this southern-most fjord. It deserves to be protected.</p> <p>QUESTIONS: Given the proximity of alternative, undeveloped gravel resources, why should this gravel mine be permitted in such a vitally important and sensitive ecosystem? How does the proponent propose to adequately compensate for the loss of the invaluable ecosystem services outlined above? How does the proponent propose to adequately compensate for the loss of the McNab Creek estuary as a carbon sink?</p> <p>SOURCES:</p> <p>Bridgham, S.D., J.P. Magonigal, J.K. Keller, N.B. Bliss, and C. Trettin. 2006. The carbon balance of North American wetlands. <i>Wetlands</i> 26: 889–916.</p> <p>Cebrian, J. and C. M. Duarte. 1996. Plant growth-rate dependence of detrital carbon storage in ecosystems. <i>Science</i> 268: 1606-1608.</p> <p>Duarte, C.M., W.C. Dennison, R.J.W. Orth and T.J.B. Carruthers. 2008. The charisma of coastal ecosystems: addressing the imbalance”- <i>Estuaries and Coasts</i> 31:233–238.</p> <p>Duarte, C.M., M. Holmer, Y. Olsen, D. Soto, N. Marbà, J. Guiu, K. Black and I. Karakassis. 2009. Will the Oceans Help Feed Humanity?</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

	Ref #	Commenter (Name)	Location		
3277	674 - 4	Personal Information Withheld	Squamish, BC	<p>2) Loss of channel complexity and sediment replenishment</p> <p>The proponent proposes to build a dike along the northern and eastern edge of the gravel extraction area which will permanently restrict the flow of McNab Creek. While it appears that the current channel hasn't changed in quite some time, the restriction of creeks/rivers limits channel complexity by restricting the powerful currents that would typically shape the watercourse and surrounding floodplain. These changes to how creeks/rivers flow results in the loss of the complex network of side channels, sloughs, alcoves, ponds, and wetlands, as well as a loss of floodplain forest. These diverse and dynamic habitats are very important for salmon, beavers, river otters, and birds, and other fauna.</p> <p>These dikes will isolate McNab Creek from its natural fan delta, restricting sediment replenishment in the western part of the estuary. This in turn will likely increase the risk of erosion of the shoreline and tidal flat, resulting in loss of diverse habitats.</p> <p>Water flowing beneath creeks/rivers periodically resurfaces to create coldwater refuges for temperature-sensitive fish like salmon and trout. These coldwater refuges are vital, especially given the current and future impacts of climate change on these iconic west-coast species.</p> <p>Question 3.1: What mitigation is proposed to offset the loss of natural river-mouth migration, and the loss of sediment deposition</p>	<p>An assessment of avulsion risk on McNab Creek indicated that, on short time scales (decadal) the risk of lateral channel migration of McNab Creek into the area of the proposed project is considered to be Low. Appropriate engineering of the flood control dyke can reduce the risk to Very Low. Long term maintenance will be required to sustain the Very Low risk level.</p> <p>The proposed Project will lead to the loss of approximately 200 m2 of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. No other fisheries-related offset is proposed.</p>
3278	674 - 5	Personal Information Withheld	Squamish, BC	<p>QUESTIONS: How will the proponent offset the loss of sediment deposition on the western part of the estuary? How does the proponent propose to adequately compensate for the loss of channel complexity and diverse habitats vital to salmon and other species as outlined above?</p> <p>SOURCES:</p> <p>Hulse, D. &amp; Gregory, S. (2004) Integrating resilience into floodplain restoration. Urban Ecosystems 7: 295.</p>	<p>The biological function of the estuary is influenced by the sediment supply currently entering the estuary from McNab Creek which is derived from actively eroding locations within the watershed. The extraction of terrestrial gravel deposits from the pit is not expected to impact or change the function of the estuary because the alluvial fan is not a contributor to the sediment/gravel budget.</p> <p>Assessing the accuracy of the assessment predictions and the effectiveness of mitigation measures will be done through an Environmental Effects Monitoring Program (EEMP) that will include consistent monitoring before, during and after activities that have the potential to affect fish and fish habitat. Where practical the design of the EEMP will include the use of reference sites unlikely to be impacted by the Project as a means of distinguishing natural variation from Project caused effects</p>
3279	675 - 1	Personal Information Withheld	North Vancouver, BC	See attached	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. 3280	675 - 2	Personal Information Withheld	North Vancouver, BC	RE: Burnco's Application for an Environmental Assessment permit This letter is being submitted as a result of your request for public comment on the Environmental Impact Statement submitted by Burnco Rock Products regarding its proposal for an open pit mine at McNabb Creek.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3281	675 - 3	Personal Information Withheld	North Vancouver, BC	Its apparent that there is a lot of people "going through the motions" to attempt to justify the re-introduction of industry to the Howe Sound area. Each project proposed, a strip mine here, an LNG terminal there, the potential for a logging operation somewhere else, a garbage incinerator, a power generation plant, enough. The cumulative effects are going to be overwhelming, its plan to see that if we let one project grow others will follow, so say NO to this project, tell the rest of the region that we still possess a government that works for the people.	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for the following:</p> <ul style="list-style-type: none"> <li>- Marine mammals – behavioural disturbance</li> <li>- Amphibian species at risk – barriers to movement, change in mortality, habitat loss</li> <li>- Roosevelt elk – barriers to movement, change in mortality, habitat loss</li> <li>- Grizzly bear – change in mortality, habitat loss</li> <li>- Environmentally sensitive ecosystems – loss of extent</li> <li>- Ecosystems at risk – loss of extent</li> <li>- Air quality indicators – increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual)</li> <li>- Real estate – change in real estate value</li> <li>- Marine navigation – interference with navigation use and navigability due to Project-related vessel traffic</li> <li>- Harvesting fish and wildlife – change in environmental setting</li> <li>- Recreation and tourism – change in environmental setting</li> <li>- Visual quality – change in visual quality</li> <li>- Heritage resources – changes to heritage resource integrity, context and accessibility</li> <li>- People – Human health (air quality and particulate matter).</li> </ul> <p>All potential cumulative residual effects were determined to be negligible or not significant except net effects to grizzly bear; cumulative residual effects to the threatened Squamish-Lillooet Grizzly Bear Population Unit were determined to be significant due in large part to vehicle collisions that might result from the development of new logging roads. Grizzly bear have not been observed within the Proposed Project area and the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

3282	675 - 4	Personal Information Withheld	North Vancouver, BC	<p>This project in particular is troubling. Though every environmental and geologic consultant will affirm that they can “mitigate” (aka destroy now and attempt to fix later the damage done, we have never see this. Once Burnco remove the volume of 10 x BC place stadiums from the estuary there is no recovery possible. Any reasonable human being can predict the outcome. Like Britannia Mine before the rock sediment will eventually leach into the ocean. Like Britannia the acidic nature of this rock will destroy the at least part of the food chain. That was work restored by tax dollars.</p>	<p>Information regarding geochemical testing for ML-ARD potential is presented in Section 5.5.5.2.4 of the EAC Application/EIS. The results of geochemical testing are presenting in Appendix 5.6-C.</p> <p>Yes, geochemical testing was conducted on 3 composite samples collected from two test pits at the Project site. The geochemical testing program included acid base accounting, whole rock and trace metal analysis, and sequential leach tests. The objective of acid base accounting was to determine the material’s potential to generate acidity. The acid base accounting results confirmed that the materials contained no sulphide minerals; oxidation of sulphide minerals is the primary source of long-term acid generation potential. Therefore, the materials are considered to have a low potential for long-term acid generation.</p> <p>The results of whole rock and trace metal analysis were used to identify parameters that may require further consideration in the context of metal leaching potential. Sequential leach testing was used to evaluate the metal leaching potential of the materials. Sequential leach testing is appropriate for evaluating the potential for metal leaching in the absence of reactive sulphide minerals, therefore this test method was used in place of the humidity cell test method (HCT). The results of the sequential leach tests were screened in the context of the BCWQ and CCME Guidelines for the protection of Freshwater Aquatic Life to identify parameters of potential environmental concern. The results of the sequential leach tests were used to develop inputs to the water quality predictions for the Proposed Project.</p>
3283	675 - 5	Personal Information Withheld	North Vancouver, BC	<p>McNab creek itself will inevitably change course, flow to the lowest possible ground, the pit and stop flowing its current course. The spot prawn breeding ground will affect the fishery. It doesn’t take a string of degrees to see this has happened in this place before, and its take 100 years of effort to bring it all back.</p>	<p>The primary purpose of the McNab Creek Flood Control Dyke considered when illustrating the extent of the structure in the EAC Application/EIS was the management of floods from McNab Creek. The primary purpose of the Pit Lake Containment Berm considered when illustrating the extent of this structure was the containment of floods from within the Pit Lake. The Site topography and the design flood stage of the Pit Lake did not necessitate the extension of the berm to intersect with the McNab Creek Flood Control Dyke. Both the McNab Creek Flood Control Dyke and the Pit Lake Containment Berm are being engineered to serve the function of a training berm as discussed in the avulsion risk assessment provided in Appendix 5.4-A of the EAC Application/EIS.</p>

3284	675 - 6	Personal Information Withheld	North Vancouver, BC	<p>These are just a couple concerns, there are more. All of these concerns can be "mitigated", that is destroyed forever with the hope of recovery later.</p>	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>
3285	675 - 7	Personal Information Withheld	North Vancouver, BC	<p>Its likely that the thin wall of land and trees between the ocean and proposed pit (a pit that will grow large enough by Burnco's own volume measurements to engulf 10 BC place stadiums) will be eroded by the seasonal winter storms until there is no more wall of land and trees, just a bay. First hand I've see a dock capable of 20 foot tide swings ripped from its moorings in a winter storm in that exact location. The dock was lost. What would 24 hours of 5 foot tall wave do. You don't need a degree to understand the likely outcome. Burnco plans to operate the mine for at least 20 years. That's 7,300 chances for that one storm from which there can be no mitigation.</p>	<p>The pit lake is located more than 400 metres in land and is not at risk of being inundated by marine waves. The primary purpose of the Pit Lake Containment Berm considered when illustrating the extent of this structure was the containment of floods from within the Pit Lake, however it would also serve to protect the pit lake, if needed.</p> <p>A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS. Potential effects considered were changes in GHG emissions as a result of the Project, the Project's contribution to climate change through the emission of GHG's, and how potential changes in climate will affect project-related infrastructure.</p> <p>Potential effects of future sea-level rise are addressed in Section 5.8.5.2 of the EAC Application/EIS. The predicted RSP2100 (sea-level height by 2100 relative to 2007 levels) using the mean sea-level rise was 18 cm, with a possible range of 6 to 30 cm. The predicted RSL2100 using the high predicted sea-level rise was 88 cm, with a possible range of 57 to 118 cm.</p>

	Ref #	Commenter (Name)	Location		
3286	675 - 8	Personal Information Withheld	North Vancouver, BC	Put the environmental concerns on hold and look at the economic concerns. The plans would grow the pit at work staff with a huge increase on boat traffic at the beginning along with construction work. Labor jobs. Now don't get me wrong there is nothing wrong will skilled trades or jobs but the net employment of the mine is said to be between 12 and 20. That's not a large number of jobs.	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
3287	675 - 9	Personal Information Withheld	North Vancouver, BC	<p>By comparison a single film crew could employ thousands, and as some have commented can spend as much as \$10 million in a summer, leaving no trace either. Will they come with the noise of a rock crusher running 7x24, no. And these jobs Burnco creates, low skill labor. People who will take the job at say 20 something and when the mine closes in 20 years, what? Retire at 40, or get injected into the workforce at 40 something with no skills and dependent on the government (the taxpayers) to retrain them. At best the tax revenue comes close to the cost of reclamation, retraining, remediating what the mining operations leave behind. We've see this story before, we are about to repeat it again.</p>	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>
3288	675 - 10	Personal Information Withheld	North Vancouver, BC	<p>The only conclusion financially I can make is that this project is NOT good for the people of BC. The company must not be allowed to destroy this habitat in exchange for the paltry revenue that might be generated in lieu of the potential revenue lost.</p>	<p>Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>

3289	675 - 11	Personal Information Withheld	North Vancouver, BC	<p>So if it fails on the environmental level and the economic level what about claims that this area has always been an industrial area. This is true, but changing. Recall of course that the entire north shore was logged multiple times before it became cottage country. Recreational properties gave way to rural. Residential areas flourished and eventually bridges built. Today the North shore comprises one of the larger municipalities in Greater Vancouver. A Vancouver that has grown to encompass Langley, Surrey, and most recently Squamish is becoming a rural suburb. With the value in land alone the province should be considering this as potential residential growth areas, yet the proposal is to strip 10 time the volume of BC place stadium from a visible and picturesque valley. It just doesn't make sense.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
3290	675 - 12	Personal Information Withheld	North Vancouver, BC	<p>The continued push by this company in the face of a major opposition by all parties in the region simply highlights to disparity between Burnco's management's actions and their words.</p> <p>If a reasonable expectation is that our government and process is to express the wishes of the people the only answer here can be NO. No more industrialization in the areas we are expanding to live in.</p> <p>There is no way a reasonable person can mitigate the loss of revenue to the people of the province choosing this mine.</p>	<p>Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>

3291	676 - 1	Ray Kisser	Lions Bay, BC	<p>Please add the following to the Burnco submissions, the deadline for submissions is October 3, 2016. It is currently 11:20 pm on October 3, 2016 and the form for submissions is not available on the website. This is a serious piece of information regarding the environment at McNab Creek. Lady and gentlemen of Burnco. The pic attached was taken yesterday at McNab.</p> <p>In this message please know that I am one of a significant group of citizens who live in Lions Bay, Howe Sound. We also, because of where we live, enjoy Howe Sound. Every summer, all summer, we take our families over to McNab Creek and enjoy this pristine area. It's not just us though, it's many people who live in what we all refer to as the Sea to Sky Corridor.</p> <p>You would too if you lived here. You would also take your kids here, your kid's kids, and then they would begin the same cycle. The same, very positive cycle, of caring for this planet. Especially the places like McNab Creek.</p> <p>Because of where you live, I can't expect you to really understand this. When I read through all of your corporate history, one point stands out quite clearly. You care a lot about your family history.</p> <p>Well we all do too. And you would if you lived here, and experienced what we all do.</p>	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>
3292	676 - 2	Ray Kisser	Lions Bay, BC	<p>No matter what you believe based on your studies, you will do harm to this area. I am saying you, because although you all work for a company, you directly are making this decision to try to bring your company's plant here.</p>	<p>The Proposed Project will provide sand and gravel that will be used to meet the growing demands of the BC marketplace.</p> <p>Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>
3293	676 - 3	Ray Kisser	Lions Bay, BC	<p>Please go back to your families and look at your kids and grandkids and then quietly ask yourselves, would they understand your decision if you had been taking them to this special place since they were old enough to remember it, and your helped to degrade it?</p> <p>You all know what the answer is. Please, think about what you are doing in this context, not just about how much money you will make.</p>	<p>BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.</p>

3294	677 - 1	Personal Information Withheld	Whistler, BC	I would like to express my concerns regarding the proposed gravel mine at McNabb Creek in Howe Sound British Columbia. First would be McNabb Creek has been logged before without regard for the environment. It is now on its way to recovery and the last thing it needs is a open pit Gravel Mine.	BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.  BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.
3295	677 - 2	Personal Information Withheld	Whistler, BC	I went to the open house in Squamish and it's the same old story we are just going to do it anyway.  The company dressed up their presentation with a lot of pretty pictures showing us how nice it looks but that's the problem. All the pictures are showing us what it looks like now but not what it will look like later. I spoke with one of the companies employees regarding legal requirements and facts I asked how far must the mine be from the creek?  The answer was 100 hundred meters. But because this is law that is the only reason the company will comply and only if they are being watched. This fact of 100 meters is a requirement by law one would think that if the company had good intentions it would show the public a much larger distance between the mine and the creek in good faith. Good faith is defiantly lacking regarding this mining project.  Rather than just the bare minimum I think the company can do better than that.	A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.  Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.  Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.

3296	677 - 3	Personal Information Withheld	Whistler, BC	<p>I went to the open house in Squamish and it's the same old story we are just going to do it anyway.</p> <p>The company dressed up their presentation with a lot of pretty pictures showing us how nice it looks but that's the problem. All the pictures are showing us what it looks like now but not what it will look like later. I spoke with one of the companies employees regarding legal requirements and facts I asked how far must the mine be from the creek.?</p> <p>The answer was 100 hundred meters. But because this is law that is the only reason the company will comply and only if they are being watched. This fact of 100 meters is a requirement by law one would think that if the company had good intentions it would show the public a much larger distance between the mine and the creek in good faith. Good faith is defiantly lacking regarding this mining project.</p> <p>Rather than just the bare minimum I think the company can do better than that.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
3297	677 - 4	Personal Information Withheld	Whistler, BC	<p>I also looked at all the other environmental facts regarding the risk of this mine. It shows a lot of risk including minimal spills and what the company will do when this happens. The company didn't mention anything about the maximum spills that could happen.</p>	<p>Potential effects of Project-related accidents, malfunctions and unplanned events have been assessed. The following potential accidents, malfunctions and unplanned events – and associated mitigation - are presented in Volume 3, Part G – Section 15.4.1 of the EAC Application/EIS:</p> <ul style="list-style-type: none"> <li>- Geohazards: Earthquake-related ground movements and land-based mass movements;</li> <li>- Power outages;</li> <li>- Accidental discharge of sediment or fines into watercourses;</li> <li>- Accidental hazardous material spills – Land and marine based; and</li> <li>- Vessel and barge accidents (e.g., barge capsizing). – Aggregate spills.</li> </ul> <p>Project residual effects of Project-related accidents, malfunctions and unplanned events were determined to be negligible or not significant.</p>
3298	677 - 5	Personal Information Withheld	Whistler, BC	<p>I also looked at all the other environmental facts regarding the risk of this mine. It shows a lot of risk including minimal spills and what the company will do when this happens. The company didn't mention anything about the maximum spills that could happen.</p>	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>

3299	677 - 6	Personal Information Withheld	Whistler, BC	The EAO will pass this project like all the others just because the mine company says it will comply with al the environmental request. But once they mine starts there is no going back even if it becomes a environmental disaster. We all know that all the requirements will not be met and some will just be brushed off like no big deal.	The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway. Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.
3300	677 - 7	Personal Information Withheld	Whistler, BC	The EAO will pass this project like all the others just because the mine company says it will comply with al the environmental request. But once they mine starts there is no going back even if it becomes a environmental disaster. We all know that all the requirements will not be met and some will just be brushed off like no big deal.	<p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 and are summarized below. BURNCO commits to funding for these monitoring initiatives.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring.</p> <p>Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational Environmental Protection Plans (EPPS). Compliance monitoring will include assessment of Proponent and contractors’ environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program.</p> <p>BURNCO will submit a report to the BCEAO on the status of compliance with the Certificate Conditions, at the following times:</p> <ul style="list-style-type: none"> <li>- At least 30 days prior to the start of Construction;</li> <li>- On or before January 31 in each year after the start of Construction;</li> <li>- At least 30 days prior to the start of Operations;</li> <li>- On or before January 31 in each year after the start of Operations;</li> <li>- At least 30 days prior to the start of Closure and Reclamation;</li> <li>- On or before January 31 in each year after the start of Closure and Reclamation; and</li> <li>- Within 30 days of completing Closure and Reclamation.</li> </ul> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>
3301	678 - 1	Coridon Henshaw	Not Stated	<p>I am writing to raise several concerns regarding the potential impact of the planned Burnco gravel mine at the McNab Creek site in Howe Sound.</p> <p>While I lack the expertise to speak to the impacts of this project to the flora and fauna of Howe Sound, the impacts of this project to the human environment of the Sound will be severe and prolonged, if not permanent.</p>	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

3302	678 - 2	Coridon Henshaw	Not Stated	<p>Howe Sound is extensively used for recreational purposes, such as boating, and hiking on an extensive trail network on the eastern edge of the sound, much of which has line-of-sight to the location of the planned mine. The eastern edge of the sound and the islands in the sound are also home to a small but non-trivial population, most of whom live in this area out of a desire for peace and quiet away from most human activity, including industry. The Burnco development is likely to severely impact both categories of people who visit or live in the Howe Sound region.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
3303	678 - 3	Coridon Henshaw	Not Stated	<p>Recreational use will be impacted by the visual pollution created by the mine. Howe Sound is known for its vistas and those vistas will be negatively impacted by the addition of a mine on the scale of the Burnco project. I have seen no data or estimates on the extent recreational use of the Sound will be impacted by the Burnco project but such data ought to be collected and all necessary steps ought to be taken to ensure that recreational use is not disturbed or reduced by the mine. 'All necessary steps,' in my view, may include denying permission for the mine to be built if the impact on recreational use will be too great.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

3304	678 - 4	Coridon Henshaw	Not Stated	<p>The impact on residents will likely be more extensive. The largest community in Howe Sound, Lions Bay, has a direct line of sight to the mine location. The value of Howe Sound properties is highly dependent on views of the natural landscape and will likely be adversely impacted by the destruction of the natural landscape at the mine site. This is even more of a concern in light of the progressive clearcutting of the western shore of the Sound. It may well be the case that the Burnco project constitutes the thin end of the wedge where the views of the landscape in the Sound become perceived not—as they are now—as being overwhelmingly natural, but marred by the occasional clearcut, but rather as being industrial and only blessed with the occasional remains of a natural landscape. Such a change in perception, should it occur, will have negative impacts on property values because it will render the environment of the sound less desirable for human habitation. All necessary steps ought to be taken to minimize such impacts on existing property holders.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
3305	678 - 5	Coridon Henshaw	Not Stated	<p>The most severe impact to existing residents, however, may well be due to noise and vibration from rock crushers and other industrial equipment at the Burnco site. Regional experience from the construction project to upgrade Highway 99 in preparation for the 2010 Olympics is that noise and vibration from rock crushers are disruptively perceptible at distances measured in the tens of kilometres. The prospects of noise pollution from the Burnco project do not appear to have been adequately addressed.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCR noise bylaw was considered as part of the assessment.</p>
3306	678 - 6	Coridon Henshaw	Not Stated	<p>Ongoing noise, and especially vibration, for the duration of the Burnco project would be extremely disruptive to the peacefully quiet environment currently enjoyed by Howe Sound residents. All possible steps ought to be taken to ensure that vibration does not reach even the houses nearest to the mine site under any circumstances and that noise not be audible outside of extremely rare atmospheric conditions.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.</p>

3307	678 - 7	Coridon Henshaw	Not Stated	<p>To be frank, I do not believe the Burnco mine project should proceed. The location is far better suited to remain as-is so that the natural beauty of the Howe Sound region can be enjoyed by future generations instead of permanently damaged by an inherently unsustainable non-renewable resource extraction project. However, if the project must proceed, I believe the following conditions ought to be imposed:</p> <p>* Unused areas of the mine pits should be filled in and replanted immediately upon disuse in order to minimize the visual footprint of the mine. Consideration ought to be given to covering as much of the site as is practicable with camouflage netting to further reduce the visual footprint of the mine.</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>
3308	678 - 8	Coridon Henshaw	Not Stated	<p>* Monitoring and mitigation measures should be implemented to ensure vibration and noise from mine equipment, such as site generator(s) and rock crusher(s), are not perceptible by area residents.</p>	<p>Noise monitoring locations will be included as part of the Noise Management Plan. Stations will be located to monitor noise levels at the McNab Strata and at Ekins Point on Gambier Island.</p>
3309	678 - 9	Coridon Henshaw	Not Stated	<p>Howe Sound is perceived as a natural gem thanks to its quiet natural vistas. This perception and the reality on which it is based is not compatible with large scale industrial development, such as the Burnco project. When taken in the context of continuing clearcutting of the western side of the Sound and the prospect for further re-industrialization at the Woodfibre site, I believe the Burnco project is a step too far that will ruin the character of the sound not just for the 16 years the site is intended to operate but potentially permanently. The mine does not belong here.</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
3310	679 - 1	Personal Information Withheld	Not Stated	<p>I wish to voice my concerns regarding the proposed gravel extraction project by Burnco at the McNab Creek area. My concerns are as follows the claim by Burnco representatives that this project is sustainable, the impact that this project could have on the tourist industry in the Howe Sound area, the effects that this project could have on the newly recovered marine life of the sound and the impact of this project on the people who live in the Howe Sound region.</p>	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>
3311	679 - 2	Personal Information Withheld	Not Stated	<p>At a meeting I attended a Burnco representative claimed that this project would be sustainable. I question how such a project could be sustainable when there is only a finite amount of gravel at this site so how can the extraction be sustainable. Once there is a hole in the ground what will replace the hole?</p>	<p>BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response

3312	679 - 3	Personal Information Withheld	Not Stated	At a meeting I attended a Burnco representative claimed that this project would be sustainable. I question how such a project could be sustainable when there is only a finite amount of gravel at this site so how can the extraction be sustainable. Once there is a hole in the ground what will replace the hole?	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
3313	679 - 4	Personal Information Withheld	Not Stated	The Howe Sound area relies heavily on the tourist industry bringing in millions of dollars annually to this area. I see the scars from this project being detrimental to the tourist industry. People do not want to see scarred areas.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. 3315	679 - 6	Personal Information Withheld	Not Stated	I am also concerned about the impact this project would have on the marine life in the Sound due the noise and the vibrations that would be generated by this project. The marine life in the Sound is only now recovering and the ocean is coming back to health after millions of dollars have been spent on clean up. Why throw all this improvement away?	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>
3316	679 - 7	Personal Information Withheld	Not Stated	The impact of this project will also effect the people who live on the shores of Howe sound with the threat of noise, light visual pollution plus the more marine traffic in the Sound increases the quality of the air in the Sound.	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. 3319	679 - 10	Personal Information Withheld	Not Stated	The impact of this project will also effect the people who live on the shores of Howe sound with the threat of noise, light visual pollution plus the more marine traffic in the Sound increases the quality of the air in the Sound.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
3320	679 - 11	Personal Information Withheld	Not Stated	Howe Sound is a beautiful place that should be protected from industrial development, not a place where some company like Burnco can come for a short period of time and take away part of the Sound leaving the scars behind for a minimum number of people who may not be hired locally for the duration of the project. The approval of this project could be the thin edge of the wedge for more industrial development on the shores of Howe Sound.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
3321	679 - 12	Personal Information Withheld	Not Stated	The location for this mine was according to a representative of Burnco was chosen over other alternative sites because they believed there would be less opposition from local people. This seems to me to be sheer arrogance and total disregard for a nation treasure driven by greed on the part of Burnco.	<p>Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>
3322	680 - 1	Pauline Brider	Not Stated	I am writing to express my opposition to the Burnco gravel extraction plan proposed for McNab Creek in Howe Sound. The residents of Howe Sound rely on the maintenance of a thriving tourist industry for their livelihoods and the sustainability of their communities. The proposed gravel mine would severely impact the natural scenic beauty of the area and would have, therefore, a consequent negative effect on the area's major industry. The proposed mine and its activities would, therefore, negatively impact the quality of life of Howe Sound residents.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

	Ref #	Commenter (Name)	Location		
3323	680 - 2	Pauline Brider	Not Stated	<p>The proposed mine site is situated on the western shore of Howe Sound directly opposite the Sea to Sky Highway, which runs along the eastern shore of the Sound. The Sea to Sky Highway is the only direct land route to Whistler from Vancouver airport and is a direct route from United States/British Columbia border crossings. Hundred of thousands of tourists drive along the Sea to Sky Highway every year on their way to Whistler. This route directly supports and contributes to over one billion dollars per year in tourism income generated by Whistler and the greater Howe Sound area.</p> <p>Given the proposed placement of the Burnco mine, all users of the Sea to Sky Highway—local residents and tourists will see the mine as they drive along the highway.</p> <p>The route of the Sea to Sky Highway was chosen by the province in order to take advantage of the spectacular scenic beauty of Howe Sound.</p> <p>The Sea to Sky Highway is, itself, a major tourist attraction in its own right. The highway supports many small businesses along the Howe Sound corridor. For example, several companies rent out high-end cars to those wishing to experience the unique drive to Whistler—a drive rated as one of the top ten best drives in the world.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

3326	680 - 5	Pauline Brider	Not Stated	To claim, as Burnco is attempting to do, that the McNab Creek mine would be 'sustainable' is, in my view, ludicrous. How can a gravel mine be described as 'sustainable'? Gravel is a finite resource. If allowed to go ahead, Burnco's mining operations would last until the resource was exhausted. Once Burnco has extracted both its gravel and its profits, the residents of Howe Sound—human, animal, and vegetable will have to deal with the consequences of the company's actions—potentially for decades ahead.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
3327	680 - 6	Pauline Brider	Not Stated	To claim, as Burnco is attempting to do, that the McNab Creek mine would be 'sustainable' is, in my view, ludicrous. How can a gravel mine be described as 'sustainable'? Gravel is a finite resource. If allowed to go ahead, Burnco's mining operations would last until the resource was exhausted. Once Burnco has extracted both its gravel and its profits, the residents of Howe Sound—human, animal, and vegetable will have to deal with the consequences of the company's actions—potentially for decades ahead.	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resource is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
3328	680 - 7	Pauline Brider	Not Stated	<p>Those tasked with making the decision about whether or not to allow the McNab gravel pit to go ahead should be aware of the recent history of Howe Sound—specifically, the environmental damage caused by the copper mine at Britannia Beach. It has taken over a decade to revive the waters of Howe Sound and, to the present, \$46 million dollars to clean up its waters so that it once again can support the mammal and fish species we now see in the Sound. Why put this environmental revival at risk for the profit of so few and the detriment to so many?</p> <p>Decision-makers should also be aware that Howe Sound is an area of spectacular natural beauty—an area just outside the bounds of Greater Vancouver and, therefore, easily accessible to millions. Why desecrate this beauty and the joy it gives to both local residents and visitors for the profit of a very few individuals?</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. 3329	680 - 8	Pauline Brider	Not Stated	The vibrancy and diversity of the aquatic life in Howe Sound is well-documented. It is either a permanent home or an important feeding ground for whales, dolphins, and seals as well as herring and salmon among many other sea creatures.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
3330	680 - 9	Pauline Brider	Not Stated	The seabed below Howe Sound is home to glass sponges.	<p>Glass sponges are known to occur throughout Howe Sound, in water depths below -20 m (chart datum). As part of marine baseline investigations, detailed underwater biophysical surveys were conducted in the proposed subtidal footprints of the proposed marine infrastructure (as well as adjacent areas) using SCUBA and towed video survey methods, with detailed information recorded on existing habitat and species present in these areas. This included systematic surveys targeting potential sponge reef habitats. The field surveys concluded that no glass sponge reefs were present in the proposed marine infrastructure (load-out jetty or walkway/conveyor) footprint. This information agrees with known habitat preferences of these organisms (i.e., water depths in the proposed marine infrastructure footprint are shallower than the depth range in which glass sponge reefs occur). In terms of interaction of glass sponge reef habitat with shipping activities, known sponge reefs occur in proximity to the proposed shipping route in several locations, with the closest occurring at the mouth of Ramillies Channel (Volume 4, Part G - Section 22.0 - Appendix 5.2-A, Figure 3). However, water depths at these locations along the proposed shipping route are below -25 m (chart datum). As such, potential impacts from shipping would be limited to propeller wash effects at the corresponding depths of these glass sponge reef occurrences. To assess this potential impact, propeller scour impacts on the seabed were assessed at a modelled depth of -20 m (chart datum) to correspond with the uppermost depths of glass sponge habitat. Jet velocities generated by the tug propeller at -20 m were compared to natural velocities derived from wave and tidal activity in Howe Sound. Estimates of maximum horizontal velocity associated with wind waves were developed from wave hindcasts from available wind data for the Strait of Georgia using the Halibut Bank Ocean Buoy (Environment Canada Station 46146) and are summarized in Table 5.2-12. At -20 m depth, the jet velocities of the proposed tug-assisted barge movements were shown to be within the same magnitude as tidal currents present at this depth, and below the velocity threshold (0.25 m/s) required for seabed particle mobilization (USACE 1989). Given that water depths along the proposed shipping route in the RSA are typically below -20 m (chart datum), the potential effects of tug propeller scour on glass sponge assemblages in the proposed shipping corridors were considered negligible and were not carried forward in the assessment.</p>

3331	680 - 10	Pauline Brider	Not Stated	The banks of McNab Creek are frequented by bear and elk among many other mammals. If the proposed gravel pit goes ahead, it will undoubtedly effect all these species as well as countless others.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
3332	680 - 11	Pauline Brider	Not Stated	As important as protecting the natural beauty and sustainability of the creatures of Howe Sound is, it should not be forgotten that the Sound is home to thousands of human residents. Any industrial activity along the shores of the Sound is bound to directly effect the lives and sustainability of its communities.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
3333	680 - 12	Pauline Brider	Not Stated	Speaking at an 'information session' for the company's first proposed development plan, a Burnco spokesperson said that the major reason Burnco chose Howe Sound for its expansion was because it contained the smallest population of any of the sites under consideration. Burnco reasoned that, because of the relatively low population of the area, the McNab site would generate less opposition from local residents than would be the case if they chose another site. This argument fails to take into account local conditions and the symbiotic relationship between the population, environment and economic viability of the Howe Sound region.	Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.

3336	680 - 15	Pauline Brider	Not Stated	The proposed gravel extraction pit would be located directly across from Lions Bay. It would be visible to almost every resident; its operations may be heard in every household; it lights would be visible at night in almost every window; and, the plant's vibrations could be felt through every foundation in the village.	The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCR noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.  Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.
3337	680 - 16	Pauline Brider	Not Stated	The proposed gravel extraction pit would be located directly across from Lions Bay. It would be visible to almost every resident; its operations may be heard in every household; it lights would be visible at night in almost every window; and, the plant's vibrations could be felt through every foundation in the village.	A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.  Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.  A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.
3338	680 - 17	Pauline Brider	Not Stated	In addition to the deterioration in their quality of life caused by the above effects, Lions Bay residents would also face financial disadvantage due to lowered house prices as a result of visual and noise pollution. Lions Bay has already suffered negative impacts due to the location of Highway 99, which runs through the heart of the village. Average house prices in Lions Bay are already significantly lower than in almost every other municipality and district on the North Shore. If even less potential house buyers view Lions Bay (and other effected communities) as a desirable place to buy a house, the tax base will shrink even further, more houses will be left vacant and Lions Bay may become nothing more than an unsustainable ghost town. Given the realities facing the community, the village of Lions Bay stands to lose the most of any constituency and will gain nothing by a Burnco development. In short, any industrialization on the McNab Creek site will erode the viability of Lions Bay as a sustainable community.	Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.  The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.  Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).  BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.

3339	680 - 18	Pauline Brider	Not Stated	<p>In the larger picture, granting Burnco's application for the McNab Creek mine makes no economic sense. It will put the province in the position of potentially losing millions of dollars to a vital tourist industry. It will effect local, provincial and federal economies all in the name of supporting corporate greed. Burnco has stated that the gravel mine will support twelve jobs. There is no guarantee that these jobs will be filled locally, as far as I am aware. However, twelve jobs is a very, very expensive price to pay for the loss of environmental habit, species diversity, quality of life for thousands of people not to mention the jeopardy such development will place on billions of dollars of income from tourism. It is, in my view, senseless, for such a project to go ahead given its costs.</p>	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>
3340	680 - 19	Pauline Brider	Not Stated	<p>I submit that no industrial development be permitted in Howe Sound—an area worthy of provincial, federal and international heritage site protection. Instead, I submit that the entire Howe Sound region should be comprehensively studied with the aim of maintaining and protecting this wonderful resource for the people of Canada.</p>	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>

3341	680 - 20	Pauline Brider	Not Stated	If shortsightedness prevails and this act of environmental vandalism is approved, I submit that Burnco should be required to provide quantifiable data to show that its development and operational activities of its McNab site will have no negative effects, such as vibrations, noise or lights, on all co-habiting creatures including those in surrounding communities.	<p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 and are summarized below. BURNCO commits to funding for these monitoring initiatives.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring.</p> <p>Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational Environmental Protection Plans (EPPS). Compliance monitoring will include assessment of Proponent and contractors' environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program.</p> <p>BURNCO will submit a report to the BCEAO on the status of compliance with the Certificate Conditions, at the following times:</p> <ul style="list-style-type: none"> <li>- At least 30 days prior to the start of Construction;</li> <li>- On or before January 31 in each year after the start of Construction;</li> <li>- At least 30 days prior to the start of Operations;</li> <li>- On or before January 31 in each year after the start of Operations;</li> <li>- At least 30 days prior to the start of Closure and Reclamation;</li> <li>- On or before January 31 in each year after the start of Closure and Reclamation; and</li> <li>- Within 30 days of completing Closure and Reclamation.</li> </ul> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>
3342	680 - 21	Pauline Brider	Not Stated	If shortsightedness prevails and this act of environmental vandalism is approved, I submit that Burnco should be required to provide quantifiable data to show that its development and operational activities of its McNab site will have no negative effects, such as vibrations, noise or lights, on all co-habiting creatures including those in surrounding communities.	BURNCO will develop a project-specific website that will be maintained to keep stakeholders informed regarding the Project, including project schedule, construction activities, operating information, and noise and air quality monitoring data.

3343	681 - 1	Nancy	Not Stated	<p>Hello;</p> <p>I would like to add my voice to those that would like to see Howe Sound continue on it's path to recovery. Like many others I live on the Sea to Sky Corridor. Like many others too I have cancer. Fortunately I am in remission for an advanced, aggressive and atypical form of lymphoma. Currently I am healthy and very happy spending time doing what I love - being outdoors kayaking, walking,,birdwatching. Every day I am so grateful to be alive. To live in such a wonderful place and be so connected to nature and the land. I draw strength from our place of land, sea and sky. On my trips to and from the Cancer Agency and hospital I drink in Howe Sound. It fills me up and settles me.</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
3344	681 - 2	Nancy	Not Stated	<p>I take delight in the whale sightings, the news of the recovering Elk population, the annual migration of both sea and songbirds.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
3345	681 - 3	Nancy	Not Stated	<p>I take delight in the whale sightings, the news of the recovering Elk population, the annual migration of both sea and songbirds.</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

3346	681 - 4	Nancy	Not Stated	The Burnco Gravel mine is one more industry that will irrevocably alter Howe Sound and undo much good that has taken place in recent years. Twelve full time jobs are not worth the effect it will have on the McNabb estuary. It is with great sadness I have seen the redwing blackbird nesting grounds at Nexen Beach be bulldozed under for the new oceanfront development. To hear their song at twilight was absolutely magical. Now no more.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
3347	681 - 5	Nancy	Not Stated	I know that 12 jobs would be created by the mine. This is small number of jobs. Surely we have the potential of creating far more jobs in the tourism and recreation sectors if we keep Howe Sound as a jewel to showcase to the rest of the world. A world thirsting for the natural world. It is a place of healing. A sanctuary. Let's strive to keep it so.	<p>Details regarding Proposed Project benefits are provided in Volume 1, Part A – Section 2.10 of the EAC Application/EIS.</p> <p>Benefits of the Proposed Project include:</p> <ul style="list-style-type: none"> <li>- capital expenditures (\$21.5 million),</li> <li>- operational expenditures (\$13 million/year),</li> <li>- direct, indirect and induced employment, and</li> <li>- taxation revenue.</li> </ul> <p>Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the uses of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers. The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>BURNCO will enhance local economic benefits by implementing policies and practices to support local hiring and procurement when possible.</p> <p>Other benefits or positive effects of the Proposed Project are:</p> <ul style="list-style-type: none"> <li>- Increased baseflows, wetted area and average flow depth in McNab Creek and several of the other watercourses;</li> <li>- Increased wetted are in the lower segment of WC2 through the construction of a new 790m groundwater-fed channel;</li> <li>- New amphibian breeding habitat ;</li> <li>- Improved aesthetic qualities of the Property after closure would likely have a positive effect on nearby property use and value, and positive social and recreational effects.</li> </ul>
3348	681 - 6	Nancy	Not Stated	I know that 12 jobs would be created by the mine. This is small number of jobs. Surely we have the potential of creating far more jobs in the tourism and recreation sectors if we keep Howe Sound as a jewel to showcase to the rest of the world. A world thirsting for the natural world. It is a place of healing. A sanctuary. Let's strive to keep it so.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

3349	682 - 1	Anton van Walraven	Bowen Island, BC	Please find my comments concerning the Burnco proposal for McNab creek in the attached file.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3350	682 - 2	Anton van Walraven	Bowen Island, BC	<p>Comments to Environmental Assessment Office regarding Burnco Aggregate Project McNab Creek, Howe Sound, BC Submitted October 3, 2016</p> <p>Mr. Johan Huibert Anton van Walraven 351 Eagles Nest Rd, Bowen Island, BC V0N1G1</p> <p>Background Ingenieur degree Industrial Design (7 year Master degree equivalent), Technical University of Delft, the Netherlands (1984-1991) 1992 – 1999 Graphic design, industrial design and architectural IT consultant. 2001 – 2009 Staff forest campaign, volunteer coordination and IT (Western Canada) Wilderness Committee, Vancouver BC Resident, Bowen Island, 2003 - present Member of lead team Concerned Citizens Bowen – ccbowen.ca, 2015 - present Member of volunteer research team regarding Herring spawn in Upper Howe Sound and possible effects of Woodfibre LNG's Once Through Cooling System proposal on Herring Spawn, August 2015 - present.</p>	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3351	682 - 3	Anton van Walraven	Bowen Island, BC	<p>Comment 1: The environmental Assessment process has been recognized to be 'broken' and its results to be lacking the public trust. One of the reasons EA process is considered 'broken' is due to the fact that the regulator's job is to judge the merits of the project proponents conclusions, and to be relying in their judgment on the work of the public during the public comment process, and the members of the Working Group. Both public comment process and Working Group participants lack time and resources to adequately do their work. (Acknowledged by Golder Associate representatives at the Burnco Information session on September 14 2016 in West Vancouver).</p>	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>

3352	682 - 4	Anton van Walraven	Bowen Island, BC	<p>- As of to date Burnco Rock Products Ltd. and its principal officers has, since July 27 2006, donated \$ 286,700 to the BC Liberal party, the party that has formed the BC Government since 2001. (Source Elections BC)</p> <p>- On November 24 2013, more than a year before the Environmental Assessment of the Woodfibre LNG project started, the Province of B.C. posted a video on youtube.com concerning a trade trip for Premier Clark to China. We hear the Premier speaking and this is part of the transcript: "I just came back from Rudong, Jiangsu Province near Shanghai. I saw the most incredible feat of engineering you will find in just about anywhere. The longest LNG pipeline in the world overland. It goes out about 20 kilometers, out from the shore. So they can receive LNG from around the world, AND THAT IS WHERE we are going to connect Squamish British Columbia to...China. As Woodfibre [LNG] build their facility in B.C. to export natural gas...over here [China]." <a href="https://www.youtube.com/watch?v=vwB2tN9xly8">https://www.youtube.com/watch?v=vwB2tN9xly8</a></p> <p>- As of to date, Woodfibre LNG and its principal officers have donated \$91, 689 to the BC Liberal party. (Source Elections BC)</p> <p>- How could the Premier make this statement with the clear emphasis and conviction that Squamish would connect to China through the natural gas exports of Woodfibre LNG?</p> <p>- The Environmental Assessment of the Woodfibre LNG project was flawed and clearly rigged, as the video proves, even before the assessment of the project started.</p>	Thank you for this information. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3353	682 - 5	Anton van Walraven	Bowen Island, BC	<p>Question 1.1: How can the public be certain that the recommendations coming out of the Environmental Assessment process properly reflect the real impact this proposal would have on the McNab creek estuary?</p>	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>
3354	682 - 6	Anton van Walraven	Bowen Island, BC	<p>Question 1.2: How can we trust that a Minister, whose party has received \$ 286,700 in donations from a company, will make a fair and unbiased decision, when the track record of this BC government shows an all together different pattern?</p>	Thank you for this information. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.

	Ref #	Commenter (Name)	Location		
3355	682 - 7	Anton van Walraven	Bowen Island, BC	<p>Comment 2: Estuaries deliver invaluable ecosystem services. The entire Howe Sound inlet has very limited wild and functional estuary. McNab Creek is the second largest estuary in Howe Sound that is still functional, while the other estuaries in Howe Sound were destroyed and replaced by urban or industrial development (Britania beach, Horseshoe Bay, Snug Cove Bowen Island, Mill creek at Woodfibre, etc).</p> <ul style="list-style-type: none"> <li>- Estuaries provide ecosystem services that are fundamental life-support processes upon which all organisms depend (Daily et al., 1997). Two ecosystem services that estuaries provide are water filtration and habitat protection.</li> <li>- McNab Creek is the second largest estuary of the few remaining natural estuaries in Howe Sound.</li> <li>- Estuaries form a tiny portion of Howe Sound's total shoreline but are its richest shoreline habitats in terms of biodiversity and biological productivity.</li> <li>- In the Howe Sound and broader context estuaries deserve the highest protection.</li> <li>- 'The options for adequate fish habitat compensation within McNab Creek or even the greater Howe Sound area are severely limited and may not allow the proposed development to meet DFO's fish habitat policy objectives, including the "No Net Loss" guiding principle' (DFO letter to Burnco R.P. Ltd – June 27 2011).</li> </ul> <p>Question 2.1: What is the justification for destroying 75% of the McNab estuary indefinitely when estuaries are regarded as seriously crucial to marine life and very few estuaries are found in Howe</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

3356	682 - 8	Anton van Walraven	Bowen Island, BC	<p>Comment 3. ..Distinction must be made between 'the need of the market for gravel' in general and the economical opportunity that wet-mining of gravel from McNab Creek would provide to Burnco. Howe Sound has been 'explored' before and some deposits are already depleted. In absence of careful planning for supply aggregates for the Lower Mainland , question marks should be placed with appropriateness of pursuing this project in a functioning estuary.</p> <p>The 'Need for the project' is described in the earlier project description dated December 26, 2011. Although the project description is not part of the submission, it is found on the EAO ePic webpage for the Burnco submission. The document is crucial since it provides Burnco's rationale for pursuing the project in McNab creek.</p> <p>- In the chapter 'Need for the project' it is stated: 'With the steady growth of the population of BC's South Coast, along with continued depletion of existing local aggregate supplies, there is a need to locate and develop new sources of aggregate in proximity to the Lower Mainland. The relative cost of aggregate is often low, but transportation costs are high, often eclipsing the cost of the product. Shipping by water is the most cost-effective way of transporting aggregate products, and shipping short distances by water further reduces environmental and societal costs.'</p> <p>- The need for aggregates is clear, but it is unclear how planning initiatives, like the 'Aggregate and Demand – Update and Analyses', Nov 2013, prepared for the Regional District of Central</p>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p> <p>Wet mining is the selected mining method because of the proximity of the aggregate deposit relative to the existing water table. Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.</p>

3357	682 - 9	Anton van Walraven	Bowen Island, BC	<p>Comment 4. (Adopted from Dr. Bob Turner [Ref 407 and 597]) Burnco proposal largely blocks the animal corridor between upper McNab valley and shoreline, functionally disconnecting estuary from uplands. The proposal intends to fill three quarters of the lower one kilometer of the McNab Creek valley with a 24/7 industrial operation that will alienate that area from wildlife, and spread industrial noise throughout the lower valley for at least the project lifetime. It is inconceivable that this industrial noise and land alienation will not greatly limit the function of the lower valley as habitat and greatly disconnect migration of mammals such as elk, black bear, wolves, and grizzly bear between upper valley and the shore. Local observations show the estuary is heavily used by elk and black bear, and occasionally by grizzly bear and wolves. I have visited McNab Creek many times and have seen the tracks.</p> <p>Question 4.1: How will the project proposal offset the project impacts on elk, bear and wolf migration along the valley floor from upper valley to estuary?</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

	Ref #	Commenter (Name)	Location		
3358	682 - 10	Anton van Walraven	Bowen Island, BC	<p>Question 4.2: Given ongoing forestry operations in McNab Creek valley, and extensive past cutting of valley floor forests, and recent construction of the Box Canyon power project, how does the additional impact of the Burnco proposal relate to the cumulative impacts of other past and ongoing industry in the valley?</p> <p>Question 4.3: What cumulative effects assessment has been made of ecosystem health of the McNab Creek valley?</p>	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for the following:</p> <ul style="list-style-type: none"> <li>- Marine mammals – behavioural disturbance</li> <li>- Amphibian species at risk – barriers to movement, change in mortality, habitat loss</li> <li>- Roosevelt elk – barriers to movement, change in mortality, habitat loss</li> <li>- Grizzly bear – change in mortality, habitat loss</li> <li>- Environmentally sensitive ecosystems – loss of extent</li> <li>- Ecosystems at risk – loss of extent</li> <li>- Air quality indicators – increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual)</li> <li>- Real estate – change in real estate value</li> <li>- Marine navigation – interference with navigation use and navigability due to Project-related vessel traffic</li> <li>- Harvesting fish and wildlife – change in environmental setting</li> <li>- Recreation and tourism – change in environmental setting</li> <li>- Visual quality – change in visual quality</li> <li>- Heritage resources – changes to heritage resource integrity, context and accessibility</li> <li>- People – Human health (air quality and particulate matter).</li> </ul> <p>All potential cumulative residual effects were determined to be negligible or not significant except net effects to grizzly bear; cumulative residual effects to the threatened Squamish-Lillooet Grizzly Bear Population Unit were determined to be significant due in large part to vehicle collisions that might result from the development of new logging roads. Grizzly bear have not been observed within the Proposed Project area and the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

3359	682 - 11	Anton van Walraven	Bowen Island, BC	<p>Comment 5: Proposed 'reclamation' plan narrow in scope and fails to identify what an estuary is. The 'reclamation' plan is designed in terms of growing forests, fails to recognize the need for providing area for the main creek to wander across its natural floodplain over time. The use of the word of reclamation, which refers to land, should be considered inappropriate and misleading, when 75% of the effected area is turned into a lake.</p> <p>- Within Canada it is understood that reclamation means "The process of reconvertng disturbed land to its former or other productive uses." (Powter, Chris, 2002).</p> <p>- The inventory of the soil across the area where the lake would be dug, is narrow in scope. It classifies the soil in terms of being good or poor, which should not be surprising since we are dealing with an estuary. The soil quality distribution across the flat floodplain signifies an estuary, in which the creek has wandered, had different creek beds and deposited sediments in changing areas over time. To project the model of a forest onto an area that is an estuary is odd and would do nothing in terms of reclamation, unless one prefers forests over estuaries.</p> <p>- In contrast with reality, subsequent B.C. governments and their ministries of Forests have declared over time that clearcut logging of old-growth forest, would be adequately replaced by tree planting and to follow second growth forests would be an equivalent replacement. The clearcut logging of Old growth, and subsequent logging of second growth in rotation cycles leads to the known "Falldown" effect on forests. (soil degradation, loss of biodiversity, lack of ability to grow forest – report: Kellogg, R.M.</p>	<p>Thank you for this information. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities. See responses to specific questions below.</p>
3360	682 - 12	Anton van Walraven	Bowen Island, BC	<p>Question 5.1 Is the downgrade of forest capability from Class 1 forest to Class 3 forest in some parts of the McNab estuary an acknowledgement that forest practices in B.C. are indeed highly destructive practices, a misunderstanding of the soil composition you would expect to find in an estuary, or is the reclassification from Class 1 forest to Class 3 a self-serving exercise?</p> <p>Question 5.2: Why is the reclamation plan not based on reestablishing a Class 1 forest after closure?</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>

	Ref #	Commenter (Name)	Location		
3361	682 - 13	Anton van Walraven	Bowen Island, BC	<p>Question 5.3: Why is there no mention of the mature forest areas that will be cleared for the Processing/Stockpiles Area at the shoreface?</p>	<p>We recognize that soils mapping was conducted at a reconnaissance level and based on existing geotechnical borehole and test pit data and existing publically available soils maps. We believe that this information was sufficient for EAC Application/EIS that required LSA soils mapping at a 1:5000-scale.</p> <p>Subsequent soil surveys including additional soil plot locations in the Processing Area, plus select soil sample collection and analytical testing for soil quality will be completed prior to surface preparation. This information combined with the preliminary EAC Application/EIS soils mapping and geotechnical subsurface data will be used to prepare updated soil maps and soil salvage and reclamation plans as required for the BURNCO Mines Act Permit Application (MAPA).</p> <p>Mature forest areas that will be cleared are noted in Volume 2, Section 5.3 of the EAC Application/EIS: The Proposed Project will remove approximately 3.3% (4 ha) of mature coniferous forest for the marine conveyor belt system in the LSA.</p>
3362	682 - 14	Anton van Walraven	Bowen Island, BC	<p>Comment 6: (partly adopted from Dr. Bob Turner [Ref 407 and 597]) The project will permanently isolate McNab Creek from migration across the majority of its natural floodplain. The suggestion that the pitlake would not effect flow levels in McNab creek is based on the premis of adequate precipitation to sustain an 'overpressure' on the area east of the lake and prevent 'leaking' from the Creek into the lake.</p> <p>The natural habit of the river is to wander back and forth across its natural floodplain and estuary. Berms surrounding the proposed pit will permanently restrict McNab Creek to the eastern margin of the estuary. The berms will isolate the Creek from three quarters of its natural fan delta, removing the Creek's ability to directly replenish sediment to the western part of the estuary and create diverse habitats. Given ongoing sea level rise, forecast to be at least 1 m rise by 2100, this lack of direct sedimentation to the western estuary will increase the risk of shoreline erosion, wet meadow and tidal flat erosion, and shoreline retreat, with consequent valuable habitat loss throughout this area.</p> <p>- The 'Historic Climate Analyses for Howe Sound' (Burnco EA App. Appendix 5.8-A) is limited to the West side of Howe Sound and limited to the period 1971 to 2010. Since 2010 we are experiencing the effects of climate change with dryer conditions in South Western B.C., characterized by longer spells of dry weather and alternated by sudden burst of precipitation. During these burst, the rain water tends to flow off rather than being absorbed by the soil and to cause soil erosion.</p>	<p>An assessment of avulsion risk on McNab Creek indicated that, on short time scales (decadal) the risk of lateral channel migration of McNab Creek into the area of the proposed project is considered to be Low. Appropriate engineering of the flood control dyke can reduce the risk to Very Low. Long term maintenance will be required to sustain the Very Low risk level.</p> <p>The proposed Project will lead to the loss of approximately 200 m2 of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. No other fisheries-related offset is proposed.</p>

3363	682 - 15	Anton van Walraven	Bowen Island, BC	Question 6.2: Will the sudden rising levels of the pitlake caused by precipitation burst demand the release of large amounts of water into the rearing channel projected to replace Water Course 2?	<p>During the operational phase of the Project the water level in the pit will be monitored but not be actively managed. Mining operational activities will need to accommodate fluctuations in the Pit Lake water levels. The owner shall monitor the groundwater gradient and the water levels within the pit lake. These monitored groundwater and pit lake water levels shall be used to refine the analysis of the closure groundwater gradient and pit lake water level. These analysis shall be used to inform the progressive planning of the mine. After closure, if necessary, the groundwater gradient can be altered (varying the rate of loss from McNab Creek) by adjusting the height of the weir at the outlet of the pit lake.</p> <p>The Pit Lake water levels provided in Table 5.5-7 (Volume 2 Section 5.5), include consideration of surface water and groundwater inflows and groundwater outflows from the Pit Lake on an average annual basis. Additional analysis indicated that during extreme wet periods ranging in duration from days to months, the increased rates of surface water and groundwater inflow would result in Pit Lake water levels in excess of the values presented in Table 5.5-7. Under these conditions the rate of groundwater outflow would also increase above those predicted under annual average conditions. The height of the Pit Lake Containment Berm was designed in order to contain the elevated Pit Lake water levels that would result from extreme prolonged wet periods. Details of the analysis and design of the Pit Lake Containment Berm will be provided in the Mines Act Application.</p>
3364	682 - 16	Anton van Walraven	Bowen Island, BC	Question 6.3: Would the need for releases due to precipitation burst overwhelm the proposed new rearing channel that is calculated to withstand a few artificial freshet events(lake releases) per year?	<p>During the operational phase of the Project the water level in the pit will be monitored but not be actively managed. Mining operational activities will need to accommodate fluctuations in the Pit Lake water levels. The owner shall monitor the groundwater gradient and the water levels within the pit lake. These monitored groundwater and pit lake water levels shall be used to refine the analysis of the closure groundwater gradient and pit lake water level. These analysis shall be used to inform the progressive planning of the mine. After closure, if necessary, the groundwater gradient can be altered (varying the rate of loss from McNab Creek) by adjusting the height of the weir at the outlet of the pit lake.</p> <p>The Pit Lake water levels provided in Table 5.5-7 (Volume 2 Section 5.5), include consideration of surface water and groundwater inflows and groundwater outflows from the Pit Lake on an average annual basis. Additional analysis indicated that during extreme wet periods ranging in duration from days to months, the increased rates of surface water and groundwater inflow would result in Pit Lake water levels in excess of the values presented in Table 5.5-7. Under these conditions the rate of groundwater outflow would also increase above those predicted under annual average conditions. The height of the Pit Lake Containment Berm was designed in order to contain the elevated Pit Lake water levels that would result from extreme prolonged wet periods. Details of the analysis and design of the Pit Lake Containment Berm will be provided in the Mines Act Application.</p> <p>A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken.</p>

3366	682 - 18	Anton van Walraven	Bowen Island, BC	<p>Comment 8: ( adopted from Dr. Bob Turner [Ref 407 and 597]) Inappropriate location for a Processing/Stockpiles Area At McNab, a forest 30-300m wide of second growth sitka spruce-hemlock forest 80-250 years old fringes the entire estuary shoreline. This mature forest is an essential element of the estuary, forming a natural transition between upland and wet meadow-tidal flats of the intertidal estuary. The entire one kilometer of estuary shoreline with fringing forest, intertidal marsh and mud-sand-cobble tidal flats intact at McNab Creek. This coastal strip is the most valuable and sensitive part of the estuary.</p> <p>The Processing/Stockpiles Area is proposed within the fringing forest of this coastal strip. This will require clearing of a large tract of mature second growth 80-250 year old hemlock-sitka spruce forest. This forest zone is 150-200m wide at the Processing/Stockpiles Area site and all but a sliver-thin buffer will be lost.</p> <p>Question 8.1: Why is the processing facility not located inland, north of the power line, and well back from the most ecologically sensitive area of the estuary?</p>	<p>The Proposed Project was thoughtfully designed to be environmentally responsible, sensitive to the environment of the proposed site while making use of existing conditions. Since the initial design, the project has changed considerably. Revisions and refinements have been made in response to our Project Team's feedback and to comments and concerns raised by regulatory agencies, Aboriginal Groups and the public.</p> <p>A few examples of project considerations, and subsequent changes and components designed to address feedback received to date include:</p> <ul style="list-style-type: none"> <li>- Using existing BC Hydro lines to electrically powered equipment to extract, process and load the aggregate resource to limit exhaust emissions from the burning of fossil fuels;</li> <li>- Revised the size and location of the processing area to avoid identified fish habitat and to mitigate potential noise effects.</li> <li>- Revised stockpile location and design to limit potential operational noise effects.</li> <li>- Refined berm design and location to limit potential noise and air quality effects.</li> <li>- Maintained tree buffer on foreshore to limit noise effects, dust emissions, and visual effects.</li> </ul> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
3367	682 - 19	Anton van Walraven	Bowen Island, BC	<p>Comment 9 : ( adopted from Dr. Bob Turner [Ref 407 and 597]) Environmental bonding Given the high ecological values of McNab Creek estuary, and the large impacts this proposal will impose on the estuary, and the critical role that estuaries play in Howe Sound, this proposal also poses serious risks to the larger ecosystem health of Howe Sound. Should a mine go ahead, it is critical that environmental reclamation and monitoring of reclamation works be successful to the highest standards. To ensure reclamation compliance, and public confidence that this will indeed be achieved, significant environmental bonds need to be in place.</p> <p>Question 9.1: What criteria are being used to evaluate the necessary level of environmental bonding for reclamation? Question 9.2: What amount of reclamation bonding is required of the proponent before start of works?</p>	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>

3368	682 - 20	Anton van Walraven	Bowen Island, BC	<p>Comment 10: ( adopted from Dr. Bob Turner [Ref 407 and 597] and added) This project will expand industrial activity to a new greenfield site in Howe Sound. This project is not compatible with the ongoing recovery of Howe Sound from past industrial activity, nor its recreational use. Is this the highest and best use for Howe Sound?</p> <p>It is widely recognized that Howe Sound was extensively damaged by past industrial activity and several aggregate deposits in Howe Sound are already depleted. Over the past 30 years, advances in environmental legislation and closure and remediation of past industrial sites has reduced pollution in Howe Sound. A recovery of marine life over the past 15 years, and particularly over the past 5 years, is indicated by the greatly increased presence of whales, dolphins, pink and Chinook salmon, and herring and anchovy.</p> <ul style="list-style-type: none"> <li>- The Province has invested heavily in this enterprise, not the least of which are the ongoing costs of managing Britannia Mine effluent.</li> <li>- Britania Beach Contamination Cleanup near Squamish to cost \$99Million (Vancouver Sun June 10 2006) (Article removed from Vancouver Sun website , but posted here: <a href="http://www.6717000.com/blog/2006/06/britania-beach-contamination-cleanup-nearsquamish-to-cost-99m/">http://www.6717000.com/blog/2006/06/britania-beach-contamination-cleanup-nearsquamish-to-cost-99m/</a> )</li> <li>- As a consequence of all these changes, and the increasing demands of the growing population of metropolitan Vancouver, recreational use of Howe Sound has increased dramatically. A new industrial operation on a new greenfield site with significant ecological impacts is out of step with these trends.</li> </ul>	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
3369	682 - 21	Anton van Walraven	Bowen Island, BC	<p>Currently, the footprint of industry (except for forestry) is absent from the entire 25 km long western shore of Howe Sound from Port Mellon to Woodfibre. Northern Thornborough Channel is a prime recreational area for boaters. The noise and visual impacts from the proposed project would be a significant intrusion on the recreational values of this area.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>

3370	682 - 22	Anton van Walraven	Bowen Island, BC	Question 10.1: What criteria suggest that this proposal is compatible with the "highest and best use" of the McNab Creek estuary and northern Thorborough Channel?	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
3371	682 - 23	Anton van Walraven	Bowen Island, BC	Question 10.2: What criteria suggest that the impacts of this proposal will not be detrimental to the ongoing recovery of marine ecosystems of Howe Sound?	It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).  Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.
3372	682 - 24	Anton van Walraven	Bowen Island, BC	Question 10.3: What criteria suggest there is a need for pitlake when we have Howe Sound?	Alternatives to the Proposed Project and the rationale for selecting the preferred alternative are provided in Volume 1, Part A – Section 2.8 of the EAC Application/EIS. Also included are alternative means of carrying out the Proposed Project (e.g., alternative locations, transportation, mine layout, processing, loading and barging layouts, and mining methods). Criteria considered in the alternative assessment are environmental effects, social effects, cost effectiveness, and technical applicability.
3373	682 - 25	Anton van Walraven	Bowen Island, BC	Overall conclusion: - With the changing weather patterns due to climate changes. Patterns of dry spells alternated by precipitation burst, are being reported everywhere around the world.	A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS.
3374	682 - 26	Anton van Walraven	Bowen Island, BC	- The idea to dig a pit mine in an area that is the floodplain of an existing salmon and trout bearing creek and build a dyke to prevent the creek from changing course, will translate into a permanent situation were the creek and every fish living it will be exposed to a combination of low flow levels and very high flow levels.	A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.  Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.  Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.
3375	682 - 27	Anton van Walraven	Bowen Island, BC	- The ability of the creek to self-mediate through flooding and/or changing course will be lost. Therefore the possibility of Serious Harm to fish should be seriously considered.	An assessment of avulsion risk on McNab Creek indicated that, on short time scales (decadal) the risk of lateral channel migration of McNab Creek into the area of the proposed project is considered to be Low. Appropriate engineering of the flood control dyke can reduce the risk to Very Low. Long term maintenance will be required to sustain the Very Low risk level.  The proposed Project will lead to the loss of approximately 200 m2 of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B).

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
3376	682 - 28	Anton van Walraven	Bowen Island, BC	- In the larger context, hundreds of Salmons stocks in B.C. have gone extinct due to bad logging practices. Stream and river keepers having been working hard to rebuild salmon habitat. In light of this it seems odd that a healthy Salmon and trout bearing stream would be unnecessarily exposed to the possibility of Serious Harm.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
3377	682 - 29	Anton van Walraven	Bowen Island, BC	- Howe Sound has been exposed to enough industrial activity and has given up enough aggregate deposits. Time to let it heal.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
3378	683 - 1	Jeff and Sarra Gau	Not Stated	This letter is being submitted as a result of your request for public comment on the Environmental Impact Statement submitted by Burnco Rock Products regarding its proposal for an open pit mine at McNabb Creek. While we have significant concerns that this is a highly flawed and biased process, we have no option but to “play the game” and “trust in the process”.	<p>The proposed Project has undergone a rigorous assessment that has considered a broad range of potential environmental, socio-economic, heritage and health effects. A cooperative federal-provincial technical review of the Application is currently underway.</p> <p>Additional details regarding the BCEAO environmental assessment review process is provided in Volume 1, Part A –Section 3.1.2. of the EAC Application/EIS.</p>
3379	683 - 2	Jeff and Sarra Gau	Not Stated	Burnco Rock Product’s (Burnco’s) proposed, large, open-pit aggregate mine and crushing facility is clearly contrary to regional commitments and development efforts in the area, and more importantly it is completely inconsistent with the established use of the area for primarily leisure purposes.	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>

3382	683 - 5	Jeff and Sarra Gau	Not Stated	<p>The proposed open pit mine should not be considered in isolation. The cumulative impact of other projects in the area need to form part of this assessment. In May 2015 the Auditor General of BC issued a report with nine recommendations and stated "it's in the interest of British Columbians to address cumulative effects management without delay" Howe Sound was selected as one of the Province's first regions for Cumulative Effects Assessment under the new framework.</p>	<p>Potential cumulative effects of the Proposed Project and other certain and reasonably foreseeable projects and activities have been assessed for all non-negligible residual effects (i.e., for all potential effects of the Proposed Project determined to be significant or not significant following the application of proposed mitigation) in accordance with an assessment methodology that reflects accepted EA practice in BC and Canada. The significance of potential cumulative residual effects was characterized for the following:</p> <ul style="list-style-type: none"> <li>- Marine mammals – behavioural disturbance</li> <li>- Amphibian species at risk – barriers to movement, change in mortality, habitat loss</li> <li>- Roosevelt elk – barriers to movement, change in mortality, habitat loss</li> <li>- Grizzly bear – change in mortality, habitat loss</li> <li>- Environmentally sensitive ecosystems – loss of extent</li> <li>- Ecosystems at risk – loss of extent</li> <li>- Air quality indicators – increase in PM2.5 (24 hr, annual), PM10 (24 hr), TSP (24 hr, annual)</li> <li>- Real estate – change in real estate value</li> <li>- Marine navigation – interference with navigation use and navigability due to Project-related vessel traffic</li> <li>- Harvesting fish and wildlife – change in environmental setting</li> <li>- Recreation and tourism – change in environmental setting</li> <li>- Visual quality – change in visual quality</li> <li>- Heritage resources – changes to heritage resource integrity, context and accessibility</li> <li>- People – Human health (air quality and particulate matter).</li> </ul> <p>All potential cumulative residual effects were determined to be negligible or not significant except net effects to grizzly bear; cumulative residual effects to the threatened Squamish-Lillooet Grizzly Bear Population Unit were determined to be significant due in large part to vehicle collisions that might result from the development of new logging roads. Grizzly bear have not been observed within the Proposed Project area and the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
3383	683 - 6	Jeff and Sarra Gau	Not Stated	<p>While the economic return will accrue to Burnco and a small number of local businesses, significant socio-economic costs and environmental damage to Howe Sound will be borne by the communities and residents of the area and the taxpayers of British Columbia who will derive little benefit from the project. The mine will generate only 12 full time jobs at around \$25/hr, similar to a less experienced construction worker. The aggregate itself may well replace aggregate from other parts of BC and thus the jobs may not be "net new" employment but rather "replacement employment", there is no benefit in this.</p>	<p>The local spatial study area for the operations phase labour market effects (including employment) of the Proposed project was described in the Application Information Requirements/EIS Guidelines, which was approved by the BCEAO and the CEA Agency on December 16, 2014 after review by the Technical Working Group established to guide this assessment. This local spatial study area is Sunshine Coast Regional District.</p> <p>The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.</p>
3384	683 - 7	Jeff and Sarra Gau	Not Stated	<p>Environmental Impacts</p>	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>

3385	683 - 8	Jeff and Sarra Gau	Not Stated	Howe Sound has a history of industrial abuse and is only now seeing return of marine mammal and fish life. In the past six years, whales and dolphins have been observed in the Sound for the first time in over a decade and herring and salmon have become increasingly abundant. This proposed project could clearly have a significant negative impact on marine wildlife and their habitat and freshwater fish and their habitat. There are only 3 estuaries in all of Howe Sound. They act as a nursery for prawns, scallops, oysters, rock-fish, salmon and countless other types of marine life. The harm from this proposed project to McNab's valley and alluvial fan and the habitat that rely on it cannot be overstated.	<p>It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).</p> <p>Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.</p>
3386	683 - 9	Jeff and Sarra Gau	Not Stated	Howe Sound has a history of industrial abuse and is only now seeing return of marine mammal and fish life. In the past six years, whales and dolphins have been observed in the Sound for the first time in over a decade and herring and salmon have become increasingly abundant. This proposed project could clearly have a significant negative impact on marine wildlife and their habitat and freshwater fish and their habitat. There are only 3 estuaries in all of Howe Sound. They act as a nursery for prawns, scallops, oysters, rock-fish, salmon and countless other types of marine life. The harm from this proposed project to McNab's valley and alluvial fan and the habitat that rely on it cannot be overstated.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
3387	683 - 10	Jeff and Sarra Gau	Not Stated	Howe Sound has a history of industrial abuse and is only now seeing return of marine mammal and fish life. In the past six years, whales and dolphins have been observed in the Sound for the first time in over a decade and herring and salmon have become increasingly abundant. This proposed project could clearly have a significant negative impact on marine wildlife and their habitat and freshwater fish and their habitat. There are only 3 estuaries in all of Howe Sound. They act as a nursery for prawns, scallops, oysters, rock-fish, salmon and countless other types of marine life. The harm from this proposed project to McNab's valley and alluvial fan and the habitat that rely on it cannot be overstated.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

3388	683 - 11	Jeff and Sarra Gau	Not Stated	<p>In fact, Oceans and Fisheries Canada (aka DFO) has already rejected such proposals in the past. With respect to the Burnco project, In June of 2010, DFO determined that the project would result in harmful alteration, disruption or destruction (“HADD”) of fish habitat that cannot be compensated elsewhere in the Sound. As such DFO advised Burnco that DFO was not prepared to issue a HADD authorization.</p> <p>In response, I understand Burnco filed a judicial review application against DFO in Supreme Court. Subsequently, DFO agreed to participate in a full environmental review. However, in June, 2011, DFO issued a letter in which they stated that they “continue to have serious concerns about the extent of the impacts to fish and fish habitat that may result from this project” and that “The project presents a high risk to Salmon and Salmon habitat.”</p>	<p>Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO’s involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.</p> <p>Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.</p>
3389	683 - 12	Jeff and Sarra Gau	Not Stated	<p>There are major concerns from stakeholders throughout Howe Sound about the crushing and loading facilities and associated noise, glare from industrial lighting, vibrations, dust, emissions and destruction or damage to wildlife habitat both terrestrial and aquatic.</p>	<p>A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.</p> <p>Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCR noise bylaw was considered as part of the assessment.</p>

3390	683 - 13	Jeff and Sarra Gau	Not Stated	There are major concerns from stakeholders throughout Howe Sound about the crushing and loading facilities and associated noise, glare from industrial lighting, vibrations, dust, emissions and destruction or damage to wildlife habitat both terrestrial and aquatic.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>
3391	683 - 14	Jeff and Sarra Gau	Not Stated	There are major concerns from stakeholders throughout Howe Sound about the crushing and loading facilities and associated noise, glare from industrial lighting, vibrations, dust, emissions and destruction or damage to wildlife habitat both terrestrial and aquatic.	<p>A predictive noise model was developed for the Proposed Project as described in Volume 2, Section 9.2. The Type 7810 Predictor® (Predictor®) software was used to assess the potential noise effects associated with the Proposed Project as well as the effectiveness of potential noise controls.</p> <p>Effects to wildlife related to noise were estimated by overlaying the output of noise models with species-specific habitat suitability mapping and summarizing the change in habitat for VCs for which noise thresholds were defined in literature (i.e., amphibian species at risk, northern goshawk, western screech-owl, marbled murrelet, and common nighthawk). Noise thresholds beyond which habitat loss is expected are defined for each VC in Section 5.3.1.5.2 of Vol 2, Section 5.3.</p> <p>Due to the paucity of literature regarding noise thresholds for Roosevelt elk and grizzly bear, effects of noise and other sensory disturbance were measured using published zones of influence (ZOI). A ZOI represents the distance at which avoidance of certain anthropogenic disturbances has been observed.</p> <p>Noise will be managed during the construction and operational phases according to the Environmental Objectives and Best Management Practices for Aggregate Extraction in BC (BC MWLAP 2002). Noise mitigation measures are detailed in Volume 2, Part B - Section 9.2 and include:</p> <ul style="list-style-type: none"> <li>- Maintaining vegetation and trees around the active work areas to act as a noise buffer;</li> <li>- Reducing the height aggregate falls along conveyors and within the crushing facility;</li> <li>- Enclosing conveyors which will assist in reducing noise emissions;</li> <li>- Minimizing speed on roadways;</li> <li>- Operating equipment within specifications and maintaining level roads; and</li> <li>- Reducing idling time.</li> </ul>

3392	683 - 15	Jeff and Sarra Gau	Not Stated	There are major concerns from stakeholders throughout Howe Sound about the crushing and loading facilities and associated noise, glare from industrial lighting, vibrations, dust, emissions and destruction or damage to wildlife habitat both terrestrial and aquatic.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
3393	683 - 16	Jeff and Sarra Gau	Not Stated	There are major concerns from stakeholders throughout Howe Sound about the crushing and loading facilities and associated noise, glare from industrial lighting, vibrations, dust, emissions and destruction or damage to wildlife habitat both terrestrial and aquatic.	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>

3394	683 - 17	Jeff and Sarra Gau	Not Stated	<p>A 2012 research project by Vancouver Aquarium found that the foreshore area directly in front of the proposed project is a marine rich habitat and an important and rare nursery area for various aquatic habitat.</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>
3395	683 - 18	Jeff and Sarra Gau	Not Stated	<p>Burnco's Consultant's, Golder and Associates, clearly show in their assessments dust blooms extending far out to sea which over the 16 years of this projects lifetime will cause harmful silt and sediment build up across the foreshore area. The extent of these dust blooms directly contradict other Golder assurances that spraying mitigations will eliminate such dust blooms in the first place. Clearly Golder needs to do further work to get reconcile their opinions.</p> <p>The area can be very exposed to extreme wind conditions which are difficult to predict and monitor. The proponents air quality report shows particulate matter over the marine environment but the marine assessment contradicts this by saying there will be no sediment seems a little incongruous. We need to ensure that should the project go ahead this particulate matter is evaluated on a continuous basis both through air quality monitoring and monitoring of the marine ecosystems around the project. A build-up of silt in the marine environment cannot be allowed, over the course of the project it would destroy local marine life.</p>	<p>The air quality dispersion model predictions presented in Figures 5.7-2, 5.7-3, 5.7-4 and 5.7-5 represent in-air concentrations of particulate matter fractions and not predictions of dust deposition; the concentrations presented do not represent dust plumes. In addition, the dispersion modelling methods and associated assumptions - approved by the Ministry of Environment (MOE) - incorporated a high degree of conservatism. The air dispersion model was based on worst case daily emission rates and assumed worst case daily emissions every day of the year. These assumptions contributed to the high level of confidence in the air quality assessment predictions that there will no significant adverse effects.</p> <p>The same Ministry-approved CALPUFF model that was used to predict air quality concentrations (i.e., run in dynamic [3D] mode with a fine resolution meteorological data set) was used to predict deposition rates which were incorporated into the surface water quality model and the assessment of potential effects on water quality and aquatic health. With the effective implementation of the proposed erosion and sediment control measures and BMPs, the potential residual effects on water quality and aquatic health were determined to be negligible and not significant. Proposed mitigation for controlling the release of dust to the aquatic environment including the following:</p> <ul style="list-style-type: none"> <li>- Developing and implementing an Air Quality and Dust Control Management Plan that will detail measures to control fugitive particulates.</li> <li>- Developing and implementing an Erosion and Sediment Control Plan.</li> <li>- Establishing an on-site Air Quality and Meteorology Monitoring Program.</li> <li>- Fines/silt cakes berm should be vegetated as soon as possible and where possible by planting and seeding with native trees, shrubs, and grasses.</li> <li>- Placement of erosion control blankets on the berm to prevent dust.</li> <li>- Sediment and erosion control measures should be maintained at all times around the crushing areas and until vegetation is achieved on the berm.</li> <li>- Processing plant crushing and dry screening units will be partially enclosed.</li> <li>- Watering of 10 mm crushed gravel and 20 mm crush gravel stockpiles.</li> <li>- Watering of unpaved roads and restricting speed limits</li> </ul>

3396	683 - 19	Jeff and Sarra Gau	Not Stated	Golder Associates also indicate the site could be home to up to 21 Species at Risk including a population of Roosevelt Elk that were transplanted to McNab Creek by the BC Ministry of Environment in 2001 in an effort to re-introduce the species to the area.	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>
3397	683 - 20	Jeff and Sarra Gau	Not Stated	The current value of the McNabb area as salmon bearing habitat is downplayed in the proponent's report. Our own experience has been of a rejuvenation in fish stocks at McNab, reflecting the fish recovery seen elsewhere in Howe Sound. Greater scrutiny around this part of the report is necessary to reflect the true value of the creek as a salmon habitat.	<p>A description and quantification of potential spawning habitat in the upper section of WC2 is provided in section 3.1.3.1 of Appendix 5.1-A and in Table 6 of the same appendix. A spawner survey conducted on 13 November 2016 re-affirmed the baseline description and observed less than 200 m2 of suitable salmonid spawning habitat based on the presence of exposed gravels and adequate depth (&gt; 18cm).</p> <p>As described in section 3.1.3.2 of Appendix 5.1-A the lower section of WC2 consists of low gradient run and pool habitat with exposed gravels present in the runs and fines occurring in the pool areas. The distribution of pool to run habitat is approximately 1/1 along the length of the lower section. There is approximately 3,920 m2 of wetted area in the lower section of WC2 suggesting that there is approximately 1960 m2 of run habitat that may be suitable for spawning, based on the presence of exposed gravels and adequate depth. During the 13 November 2016 spawner survey chum salmon were observed to be spawning in the available run habitat present in the lower section of the channel (Figure 1, 30-Dec-2016 Technical Memo entitled BURNCO Aggregate Project: Additional Information Regarding Watercourse Two (WC2), Fish and Fish Habitat).</p> <p>The Fish Habitat Offset Plan proposes to create more than 5,000 m2 of additional groundwater-fed channel habitat with approximately a 1/1 ration of pool to run habitat. The offset channel extension uses the design of the existing lower channel as a template so it is reasonable to expected that approximately 2,500 m2 of the new habitat will have conditions similar to the run habitat present in the existing channel where chum salmon were observed to be spawning.</p> <p>A 30-Dec-2016 Technical Memo entitled BURNCO Aggregate Project: Additional Information Regarding Watercourse Two (WC2), Fish and Fish Habitat provides the results of 2016 spawner surveys for WC2 and a description of salmonid species utilization of habitat provided by groundwater-fed channels.</p>

3399	683 - 22	Jeff and Sarra Gau	Not Stated	An artificial lake is not a reasonable remediation to replace the habitat for the displaced wildlife.	<p>The pit lake is not proposed as mitigation for habitat loss. Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>
3400	683 - 23	Jeff and Sarra Gau	Not Stated	We find it difficult to believe that there will be no audible impact from the project on the north end of Gambier Island. Given the natural topography of the area and the fact that noise travels very clearly across water we have significant concerns about the noise of the barge loading in particular which we believe will have a significant negative impact of the peaceful nature of the area for humans as well as for marine and terrestrial life. While talking to representatives from Golder at the Open House in West Vancouver in September 2016 it became clear that the noise impact had been modelled with little firsthand knowledge of the area impacted; the lead representative on noise impact admitted he had never been onsite.	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Considering these factors, the modelled Project contributions to noise levels at NR4 (Eakins Point, inside the LSA and across the water from the Project) were below baseline and resulted in Negligible-Not Significant effects.</p> <p>A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners, including receptors across the water such as Eakins Point.</p>

3404	683 - 27	Jeff and Sarra Gau	Not Stated	<p>A number of areas of the EIS identify possible environmental impacts of the project but allude to these being addressed by “best management practices”. There are significant concerns around approving a development with clear environmental risks based on the “hope” that best environmental practices will be adhered to. The resources available at the BCEAO for oversight of such projects seem fairly limited from a resource perspective (5-6 people cover the province). What is to stop the proponent from ignoring “best practise” and declining to follow mitigation strategies? The experience of residents adjacent to the Cougar Ridge Mine in Calgary, Alberta owned and operated by Burnco does not suggest that Burnco can be guaranteed to be a “good neighbour”.</p>	<p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 and are summarized below. BURNCO commits to funding for these monitoring initiatives.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring.</p> <p>Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational Environmental Protection Plans (EPPS). Compliance monitoring will include assessment of Proponent and contractors’ environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program.</p> <p>BURNCO will submit a report to the BCEAO on the status of compliance with the Certificate Conditions, at the following times:</p> <ul style="list-style-type: none"> <li>- At least 30 days prior to the start of Construction;</li> <li>- On or before January 31 in each year after the start of Construction;</li> <li>- At least 30 days prior to the start of Operations;</li> <li>- On or before January 31 in each year after the start of Operations;</li> <li>- At least 30 days prior to the start of Closure and Reclamation;</li> <li>- On or before January 31 in each year after the start of Closure and Reclamation; and</li> <li>- Within 30 days of completing Closure and Reclamation.</li> </ul> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>

3405	683 - 28	Jeff and Sarra Gau	Not Stated	<p><b>Economic Impacts</b> While the project will create 12 full time jobs, it will jeopardize far more jobs than that by impacting the tourism and film industries irreparably.</p> <p><b>BC FILM INDUSTRY</b> The BC Film industry contributes \$1.3 billion annually to the BC economy. Crews regularly use Howe Sound to represent many world locales, as it provides the key ingredients of wilderness, breathtaking scenery, and easy access from Vancouver, and silence. The introduction of an open pit mine, gravel barge and crusher will dramatically diminish this appeal—making Vancouver itself a less convenient place to film a movie, since its nearby wilderness will no longer be viable for filming.</p> <p>In a 2012 letter to the Future of Howe Sound Society (FHSS) from Thierry Tanguy, a Unit and Location Manager, in Greater Vancouver's Film Industry, Thierry had this to say: "In the last few years, a number of projects have been filmed in the Squamish corridor, as opposed to the other regions we typically compete with, such as California and Louisiana, precisely because of the pristine beauty of its coastline. To name a specific example, I just finished working on a project entitled 'Horns' for Mandalay Pictures. ... originally slated to be filmed in Savannah, Georgia. The one element that shifted the interest in favour of British Columbia is the beauty of the Squamish corridor and Howe Sound where we ended up filming Two-Thirds of the project. This is Twenty-Million</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
3406	683 - 29	Jeff and Sarra Gau	Not Stated	<p>The mine will be visible from the Cypress ski area and Lions Bay, a popular hiking and rock-climbing destination. Every visitor headed to Squamish or Whistler on the Sea-to-Sky Highway and Sea-to-Sky Gondola, as well as daily sightseeing flights from downtown on Harbour Air and others, will see this once-stunning valley being rendered into a gravel mine.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

3407	683 - 30	Jeff and Sarra Gau	Not Stated	<p><b>Property Values</b> Property values along the Howe Sound have already been negatively impacted. The 16 vacation homes at McNab Creek and 53 recreational properties directly across the channel at Douglas Bay on Gambier Island will be the hardest hit due to the obvious eyesore, increased barge traffic, noise and loss of natural beauty. The reduction in property values which has already occurred since the mine was first proposed 6 years ago, harms not only residents, but municipal governments' tax base. Given the considerable increases in property values in the Lower Mainland in the last 6 years it is quite staggering that properties anywhere close to this proposed mine have seen a decline in both assessed value and potential resale value, as evidenced by recent land sales in the area.</p> <p>Vancouver-based Burrard and West Vancouver-based Thunderbird Yacht Clubs have outstations directly opposite the mine site. The 600 members will suffer loss of land value, and outstations will suffer from significantly diminished use.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
3408	683 - 31	Jeff and Sarra Gau	Not Stated	<p><b>Social Impacts</b> Easy accessibility from Vancouver allows people across the lower mainland to enjoy wilderness on their doorstep. The impact of the mine will diminish Howe Sound for present and future generations, reducing Vancouver's much-vaunted "liveability."</p>	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
3409	683 - 32	Jeff and Sarra Gau	Not Stated	<p>The immediate visual impact of the mine and crushing facilities has only been shown by the proponent at sea level. To understand the full visual impact an assessment from a higher elevation is needed. We believe that from a higher elevation the open pit mine and crushing facilities will be fully visible and have a further negative social and economic impact on the properties from which they are visible.</p>	<p>The visual resources assessment (Section 7.4 of the EAC Application/EIS) acknowledges that the residents of the McNab Strata would be most affected by the potential visual impacts due to their close proximity to the Proposed Project. The viewpoint was taken from the end of the breakwater where the view would be unobstructed, and it is a publicly accessible location that would be experienced by residents accessing the dock at the McNab Estates Strata. The lighting assessment indicated residential receptors at the Strata are located in a dark setting with existing lighting visible from adjacent industrial land use.</p> <p>Assessment of viewing locations and/or viewing conditions are limited to those locations that represent viewing opportunities that currently exist or that are certain or reasonably foreseeable.</p>

3410	683 - 33	Jeff and Sarra Gau	Not Stated	In the immediate vicinity of this proposed mine there are existing communities including McNab Creek Strata, Douglas Bay Strata, Brigade Bay, Burrard Yacht Club and Thunderbird Yacht Club. All of these communities enjoy the peace and tranquillity and abundant wildlife in this amazing section of Howe Sound. Families engage in all manner of sport and recreation including hiking, swimming, water sports, sailing, wind surfing, paddle boarding and kayaking. In addition numerous kids camps such as Potlach, Day Break, Artaban, Boys and Girls Club use this area for recreation and there are frequent excursions of kayakers in procession from these camps paddling by or visiting McNab Creek area.	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
3411	683 - 34	Jeff and Sarra Gau	Not Stated	In its draft AIR Burnco committed to reporting on the status of consultations with private local land owners and tenure holders who will be affected by the project. However Volume 4, section 21 of the report shows little evidence that Burnco fulfilled these commitments. At section 21.2.4.1 – Social Communications the list of Personal Communications lacks engagement with the local stakeholders who will be impacted by the project. For instance, although Douglas Bay is the largest private land holding in the area and will be directly impacted if the project goes ahead no one from Burnco has attempted to contact the members of the Douglas Bay Strata.	The sample of key informants described in Section 7.3 of the EAC Application/EIS (Non-traditional Land and Resource Use) was not intended to be exhaustive of all stakeholders potentially affected by the Proposed Project, but rather was intended to be wide ranging enough to confirm and expand on non-traditional land and resource use information available from the referenced secondary sources. Key informants interviewed or provided data for this report included representatives from recreational groups and tourism operators, as well as DFO and MFLNRO. Specifically key informants included:  <ul style="list-style-type: none"> <li>- Burrard Yacht Club</li> <li>- Coastal Inlet Adventures</li> <li>- DFO</li> <li>- Don's Water Taxi</li> <li>- Gambier Island Local Trust</li> <li>- Gibson Chamber of Commerce</li> <li>- Islands Trust</li> <li>- MFLNRO</li> <li>- Recreation Sites and Trails BC</li> <li>- Sewell's Marina</li> <li>- Squamish Yacht Club</li> <li>- Sunshine Kayaks</li> <li>- Thunderbird Yacht Club</li> </ul> Conditions C-5.1 through C-5.3 (Table 19.1) outlines the Proponent commitment to ongoing engagement with the McNab Creek Strata. BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. BURNCO has also proposed a McNab Community Enhancement Fund (CEF) that would consist of money set aside each year of operation, based on output, to enhance the McNab community through targeted funding on projects throughout the region. Funding of projects would be given priority by BURNCO's Management Committee based on a number of criteria that would include: <ul style="list-style-type: none"> <li>- Mitigation of project effects</li> </ul>

3412	683 - 35	Jeff and Sarra Gau	Not Stated	In conclusion we cannot see how the joint goals of environmental, social and economic sustainability for Howe Sound can be achieved if this project is allowed to go ahead. We can only trust in the process and believe that our public servants and government will recognize that the value of McNab Creek and the whole Howe Sound region outweighs the business needs of one Alberta based company.	BURNCO will support sustainable development by designing, constructing, operating and reclaiming the proposed Project in accordance with practices that reflect environmental, economic, social and cultural sustainability. The Sustainable Development Framework for the proposed Project is presented in Section 2.5.4.2 of the EAC Application/EIS.
3413	683 - 36	Jeff and Sarra Gau	Not Stated	If the project should go ahead we need to ensure that there are stringent conditions (including multi-million dollar environmental bonds) attached to its approval which are closely monitored on an ongoing basis by an independent third party and to ensure that the scope of the operation does not extend beyond that described in the EIS. A robust monitoring and safeguard system needs to be in place to ensure the commitments in this application are followed through and that Burnco is held accountable should the need arise.	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>

	Ref #	Commenter (Name)	Location		
3414	683 - 37	Jeff and Sarra Gau	Not Stated	<p>Finally we suggest that Burnco is required to grant restrictive covenants in favour of the landowners surrounding the proposed project to ensure that the commitments and assurances given in the approval process are effectively monitored and enforced.</p>	<p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 and are summarized below. BURNCO commits to funding for these monitoring initiatives.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring.</p> <p>Compliance monitoring will occur during all phases of Proposed Project activities as a part of the Proposed Project construction and operational Environmental Protection Plans (EPPS). Compliance monitoring will include assessment of Proponent and contractors' environmental performance using specifically developed performance indicators and benchmarks. Where possible, an adaptive management approach will be used to modify management plans as needed based on the results of the monitoring program.</p> <p>BURNCO will submit a report to the BCEAO on the status of compliance with the Certificate Conditions, at the following times:</p> <ul style="list-style-type: none"> <li>- At least 30 days prior to the start of Construction;</li> <li>- On or before January 31 in each year after the start of Construction;</li> <li>- At least 30 days prior to the start of Operations;</li> <li>- On or before January 31 in each year after the start of Operations;</li> <li>- At least 30 days prior to the start of Closure and Reclamation;</li> <li>- On or before January 31 in each year after the start of Closure and Reclamation; and</li> <li>- Within 30 days of completing Closure and Reclamation.</li> </ul> <p>Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>
3415	684 - 1	Sheera von Puttkamer	Not Stated	<p>I was going to say something but this says it all...I would only start cursing and using expletives about what stupid people do to their world all for the sake of a few bucks and short term gain. Why can't you just go some place else...I think it starts with "H". Seriously though, give your heads a shake and think about what a world you are going to leave to your grandchildren? Do we really need another gravel pit destroying our natural world. I just get so terribly depressed when people like you are allowed to reign over my world. What is the point of living in a world with so many ugly people who just want to make everything ugly for a lousy dirty dollar? Why...indeed read why you should not.</p>	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>

3416	684 - 2	Sheera von Puttkamer	Not Stated	1. Why would anyone develop a gravel mine in Vancouver's ocean playground, an area of outstanding natural beauty? This is where an ever growing city comes to sail, dive, kayak, fish, camp and hike. Tourists flock from all over the world to see "SuperNatural, British Columbia", how would a gravel pit look in the tourism advertising?	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
3417	684 - 3	Sheera von Puttkamer	Not Stated	2. Howe Sound is only now showing encouraging signs of environmental recovery after decades of industrial misuse. Should we now allow a reindustrialization of the area?	<p>It is acknowledged that historical industrial activities have impacted Howe Sound and that the ecological health of the area has been improving. The current state of Howe Sound is reflected in the baseline conditions against which potential effects were assessed. Baseline/existing conditions environment are summarized within each technical section of the EAC Application/EIS (5.1 through 9.2).</p> <p>Baseline reports are provided in Volume 4, Part G – Section 22.0 of the EAC Application/EIS.</p>
3418	684 - 4	Sheera von Puttkamer	Not Stated	2. Howe Sound is only now showing encouraging signs of environmental recovery after decades of industrial misuse. Should we now allow a reindustrialization of the area?	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>
3419	684 - 5	Sheera von Puttkamer	Not Stated	3. How can we consider developing a massive 77 hectare pit which will excavate the entire McNab estuary from one side of the valley to the other, completely eliminating one of only three river estuaries in Howe Sound, without developing an integrated, long term land and water use plan for the whole of Howe Sound?	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

	Ref #	Commenter (Name)	Location		
3420	684 - 6	Sheera von Puttkamer	Not Stated	3. How can we consider developing a massive 77 hectare pit which will excavate the entire McNab estuary from one side of the valley to the other, completely eliminating one of only three river estuaries in Howe Sound, without developing an integrated, long term land and water use plan for the whole of Howe Sound?	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
3421	684 - 7	Sheera von Puttkamer	Not Stated	4. The size of the gravel pit will limit access to the foreshore for wildlife such as elk, deer and bears who currently frequent the area to forage for food.	A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.  Potential effects were assessed for the following selected valued components: - Amphibian species at risk - Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet; - Roosevelt elk and grizzly bear; - Environmentally sensitive ecosystems; - Ecosystems at risk; and - Plant species a risk.  Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.  Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.
3422	684 - 8	Sheera von Puttkamer	Not Stated	5. The excavation of the river estuary will dramatically change the movement of water through the valley and have a significant negative impact on the freshwater habitat.	A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.  Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.  Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.

3423	684 - 9	Sheera von Puttkamer	Not Stated	6. The proposed mine developer, Burnco, filed a judicial review application against DFO in BC Supreme Court to 'strong arm' the DFO to allow them to proceed to an environmental review. The DFO have since agreed to that review with serious concerns as "the project presents a high risk to Salmon and Salmon habitat".	Documentation of government agency consultation is provided in Volume 1, Part A – Section 3 of the EAC Application/EIS. Key issues raised by government agencies and First Nations are presented and the nature and extent of their involvement is described, including participation on the Technical Working Group established to review the Proposed Project. A summary of the federal EA review, including DFO's involvement is specifically addressed and responses to concerns related to potential effect effects on fish and fish habitat are provided.  Detailed issues tracking tables are provided in Volume 4, Part G – Section 22.0: Appendix 2-A (Technical Working Group), Appendix 2-B (Aboriginal), and Appendix 2-C (Public) of the EAC Application/EIS.
3424	684 - 10	Sheera von Puttkamer	Not Stated	7. In addition to the destruction to fish habitat, Burnco's own consultants believe the mine site could be home to 21 species at risk including a population of Roosevelt Elk re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.	A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.  Potential effects were assessed for the following selected valued components: - Amphibian species at risk - Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet; - Roosevelt elk and grizzly bear; - Environmentally sensitive ecosystems; - Ecosystems at risk; and - Plant species a risk.  Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.  Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.
3425	684 - 11	Sheera von Puttkamer	Not Stated	8. The noise from the gravel crushing facility and loading of barges will be significant. It will have a negative impact on the enjoyment of the area by boaters, kayakers, fishermen, tourists and other in Howe Sound. The mine developer has stated at meetings that if the demand is there, they want to run the mining and crushing facilities 24/7, 365 days a year.	A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.  Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible. The SCR noise bylaw was considered as part of the assessment.
3426	684 - 12	Sheera von Puttkamer	Not Stated	8. The noise from the gravel crushing facility and loading of barges will be significant. It will have a negative impact on the enjoyment of the area by boaters, kayakers, fishermen, tourists and other in Howe Sound. The mine developer has stated at meetings that if the demand is there, they want to run the mining and crushing facilities 24/7, 365 days a year.	The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCR noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.  Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.

3427	684 - 13	Sheera von Puttkamer	Not Stated	<p>9. Noise and light pollution will have significant negative impacts on the land and aquatic animals in the area. Noise and vibration pollution have been found to negatively impact the ability of marine mammals to communicate, navigate, find food and it is believed increasingly to impact their fertility.</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>
3428	684 - 14	Sheera von Puttkamer	Not Stated	<p>9. Noise and light pollution will have significant negative impacts on the land and aquatic animals in the area. Noise and vibration pollution have been found to negatively impact the ability of marine mammals to communicate, navigate, find food and it is believed increasingly to impact their fertility.</p>	<p>A predictive noise model was developed for the Proposed Project as described in Volume 2, Section 9.2. The Type 7810 Predictor® (Predictor®) software was used to assess the potential noise effects associated with the Proposed Project as well as the effectiveness of potential noise controls.</p> <p>Effects to wildlife related to noise were estimated by overlaying the output of noise models with species-specific habitat suitability mapping and summarizing the change in habitat for VCs for which noise thresholds were defined in literature (i.e., amphibian species at risk, northern goshawk, western screech-owl, marbled murrelet, and common nighthawk). Noise thresholds beyond which habitat loss is expected are defined for each VC in Section 5.3.1.5.2 of Vol 2, Section 5.3.</p> <p>Due to the paucity of literature regarding noise thresholds for Roosevelt elk and grizzly bear, effects of noise and other sensory disturbance were measured using published zones of influence (ZOI). A ZOI represents the distance at which avoidance of certain anthropogenic disturbances has been observed.</p> <p>Noise will be managed during the construction and operational phases according to the Environmental Objectives and Best Management Practices for Aggregate Extraction in BC (BC MWLAP 2002). Noise mitigation measures are detailed in Volume 2, Part B - Section 9.2 and include:</p> <ul style="list-style-type: none"> <li>- Maintaining vegetation and trees around the active work areas to act as a noise buffer;</li> <li>- Reducing the height aggregate falls along conveyors and within the crushing facility;</li> <li>- Enclosing conveyors which will assist in reducing noise emissions;</li> <li>- Minimizing speed on roadways;</li> <li>- Operating equipment within specifications and maintaining level roads; and</li> <li>- Reducing idling time.</li> </ul>

3429	684 - 15	Sheera von Puttkamer	Not Stated	9. Noise and light pollution will have significant negative impacts on the land and aquatic animals in the area. Noise and vibration pollution have been found to negatively impact the ability of marine mammals to communicate, navigate, find food and it is believed increasingly to impact their fertility.	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
3430	684 - 16	Sheera von Puttkamer	Not Stated	10. The mine will have an impact on the economic potential of the Howe Sound area. There is considerable potential in Howe Sound to continue to grow the tourism industry with significant economic multipliers that would accrue to the local economy. A mine is not going to add to the beauty of the area.	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
3431	684 - 17	Sheera von Puttkamer	Not Stated	How can you help? Howe Sound needs to be protected for the enjoyment of both current and future generations so we are asking you to be an ambassador for Howe Sound in telling the government that you support the recovery of Howe Sound.	<p>BURNCO understands this concern for Howe Sound and is a proud steward of the Proposed Project site and surrounding area.</p> <p>BURNCO is committed to avoiding, reducing or otherwise mitigating potential effects of the Proposed Project through design features, best management practices and other measures described in Volume 3, Part G - Section 18. The EAC Application/EIS provides technically and economically feasible mitigation measures which first avoid and second reduce potential adverse effects for all VCs. VCs were assessed across all phases of the Proposed Project lifecycle (construction, operations, reclamation and closure), including Proposed Project activities, accidents and malfunctions and cumulative effects. The conclusion of the assessment is that, with the application of design considerations and identified mitigation, no significant adverse effects will result from the Proposed Project.</p>

3432	685 - 1	Lynn Chapman	Roberts Creek, BC	I am writing in opposition to the Burnco Mine Project on the basis that it will cause harm to McNab Creek and the McNab Creek estuary which cannot be mitigated.	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>
3433	685 - 2	Lynn Chapman	Roberts Creek, BC	I am writing in opposition to the Burnco Mine Project on the basis that it will cause harm to McNab Creek and the McNab Creek estuary which cannot be mitigated.	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

3435	685 - 4	Lynn Chapman	Roberts Creek, BC	<p>There is no justification, save private interest by the proponents, for re-industrializing Howe Sound now that it is finally returning to life sustaining capacity. I am not a biologist or an expert but I have seen the biodiversity that the estuary currently supports and I also know there are only two such estuaries in Howe Sound. if that rare and fragile ecosystem is destroyed it will harm the recovery of the whole of Howe Sound. That is not in the Public's interest. The new science around the excavation and removal of vast amounts of sand and gravel needs to be reviewed and considered. Unfortunately, the lack of quality, depth and breadth of focus of the current Environmental Assessment process cannot be trusted to actually protect biodiversity and ecosystem integrity over the short term interests of business. Notwithstanding that I urge you sincerely to protect McNab Creek, its estuary and the recovering lands above it and to reject the Burnco Application.</p>	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>

	Ref #	Commenter (Name)	Location		
3438	686 - 2	Association of Whistler Area Residents for the Environment	Whistler, BC	<p>BURNCO Aggregate Mine Project – 54754 Comments Relating to Environmental Impact Statement</p> <p>Context for Comments: Howe Sound is undergoing an ecological renaissance following decades of pollution by industrial operations. Clean up costs relating to the Britannia mine operations required an investment of over \$75 million of which only \$30 million was contributed by the mine's former operators. To date, the province has spent in excess of \$46 million on remediation at Britannia. The investment of public monies at this scale, to restore Howe Sound, has led to a subsequent boom in eco-tourism activities. This means industrial proposals such as the BURNCO Aggregate Mine not only risk impacting the marine and terrestrial environments around the Sound but also directly conflict with eco-tourism and recreation activities for which the area has become known.</p> <p>Comments On The Proposal: The following points highlight our primary concerns relating to the proposed development.</p> <ul style="list-style-type: none"> <li>- The proposal estimates removal of 20 million tonnes of sand and gravel, with pit depths of up to 15 metres across an area of 30 hectares, over a period of 16 years. In addition to aggregate pits the site will house auxiliary sorting, crushing, cleaning, transportation, administration and supporting facilities. The entire site will be based in 70 hectares.</li> </ul>	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>
3439	686 - 3	Association of Whistler Area Residents for the Environment	Whistler, BC	<ul style="list-style-type: none"> <li>- The proposal is based around the extraction of a non-renewable resource. This resource is being used for building materials, such as concrete, which have high energy and ghg footprints and are non-sustainable.</li> </ul>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>

3443	686 - 7	Association of Whistler Area Residents for the Environment	Whistler, BC	<ul style="list-style-type: none"> <li>Additional concerns relate to vibrations from the site (during all phases), which will impact key species such as herring and interfere with marine mammals' navigation, food finding, and reproductive systems—effectively alienating orcas and dolphins from habitat they have only recently returned too.</li> </ul>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges.</p> <p>Overviews on hearing sensitivity and noise thresholds for marine fish and marine mammals are presented in Sections 5.2.5.2.3.1.3 and 5.2.5.2.4.1.2, respectively.</p> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish and marine mammals, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

3452	687 - 2	Tracey Saxby	Squamish, BC	<p>1) Estuaries are an irreplaceable natural resource.</p> <p>Estuaries deliver invaluable ecosystem services, as well as providing economic, cultural, and ecological benefits to communities.</p> <p>Estuaries and wetlands are one of the ecosystems most threatened by development, however they trap (sequester) more carbon than rainforests. Both seagrasses and salt marsh grasses are incredibly productive carbon sinks, as the carbon they use to make their leaves are incorporated into the layers of sediment every year. Estuaries worldwide sequester up to 100 teragrams of carbon per year. Saltmarshes sequester up to 24 tonnes of carbon per hectare per year.</p> <p>Estuaries and wetlands also help to make our water cleaner, as they act like a giant liver that filters and traps pollutants such as herbicides, pesticides, and heavy metals, as well as sediments and nutrients. They are hotspots for biodiversity, and are vital as habitat for migrating birds, and nurseries for juvenile fish. They stabilize shorelines, minimize erosion, and protect coastal areas from floods and storm surges, acting like a sponge and soaking up the excess floodwater.</p> <p>Vegetated coastal habitats such as seagrasses and saltmarsh habitat rank amongst the most threatened marine ecosystems. About 25% of the area originally covered by salt-marshes has been globally lost due to development, with current loss rates at about 1 to 2% per</p>	<p>No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.</p>

3453	687 - 3	Tracey Saxby	Squamish, BC	<p>McNab Creek is the second-largest estuary in Howe Sound, one of only three estuaries located in this southern-most fjord. It deserves to be protected.</p> <p>QUESTIONS: Given the proximity of alternative, undeveloped gravel resources, why should this gravel mine be permitted in such a vitally important and sensitive ecosystem? How does the proponent propose to adequately compensate for the loss of the invaluable ecosystem services outlined above? How does the proponent propose to adequately compensate for the loss of the McNab Creek estuary as a carbon sink?</p> <p>SOURCES:</p> <p>Bridgham, S.D., J.P. Magonigal, J.K. Keller, N.B. Bliss, and C. Trettin. 2006. The carbon balance of North American wetlands. <i>Wetlands</i> 26: 889–916.</p> <p>Cebrian, J. and C. M. Duarte. 1996. Plant growth-rate dependence of detrital carbon storage in ecosystems. <i>Science</i> 268: 1606-1608.</p> <p>Duarte, C.M., W.C. Dennison, R.J.W. Orth and T.J.B. Carruthers. 2008. The charisma of coastal ecosystems: addressing the imbalance"- <i>Estuaries and Coasts</i> 31:233–238.</p> <p>Duarte, C.M., M. Holmer, Y. Olsen, D. Soto, N. Marbà, J. Guiu, K. Black and I. Karakassis. 2009. Will the Oceans Help Feed Humanity?</p>	<p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>An estuary is a semi-enclosed body of sea water where salinity is measurably diluted by freshwater from a stream or river. It is where the fresh water meets the salt water. They are often characterized as having low salinities, shallow depths, high turbidity, high levels of nutrients, and high productivity.</p> <p>The McNab Creek estuary overlaps with the proposed marine infrastructure (ie. the electric conveyor) and a portion of the proposed shipping routes, but the Project will have no effect on the estuary. We will not be mining within the estuary.</p> <p>The other considerations assessed in regards to the estuary are changes to the amount of freshwater dilution from watercourses in the proposed Project area. Based on surface water models, the water courses at the proposed Project site will contribute similar combined freshwater flow outputs as currently exist. This will result in no change in the amount of freshwater output into the estuary and no predicted change to the extent of the McNab Creek estuary. The estuary will be unchanged by the Project.</p>

3454	687 - 4	Tracey Saxby	Squamish, BC	<p>2) Loss of channel complexity and sediment replenishment</p> <p>The proponent proposes to build a dike along the northern and eastern edge of the gravel extraction area which will permanently restrict the flow of McNab Creek. While it appears that the current channel hasn't changed in quite some time, the restriction of creeks/rivers limits channel complexity by restricting the powerful currents that would typically shape the watercourse and surrounding floodplain. These changes to how creeks/rivers flow results in the loss of the complex network of side channels, sloughs, alcoves, ponds, and wetlands, as well as a loss of floodplain forest. These diverse and dynamic habitats are very important for salmon, beavers, river otters, and birds, and other fauna.</p> <p>These dikes will isolate McNab Creek from its natural fan delta, restricting sediment replenishment in the western part of the estuary. This in turn will likely increase the risk of erosion of the shoreline and tidal flat, resulting in loss of diverse habitats.</p> <p>Water flowing beneath creeks/rivers periodically resurfaces to create coldwater refuges for temperature-sensitive fish like salmon and trout. These coldwater refuges are vital, especially given the current and future impacts of climate change on these iconic west-coast species.</p> <p>Question 3.1: What mitigation is proposed to offset the loss of natural river-mouth migration, and the loss of sediment deposition</p>	<p>An assessment of avulsion risk on McNab Creek indicated that, on short time scales (decadal) the risk of lateral channel migration of McNab Creek into the area of the proposed project is considered to be Low. Appropriate engineering of the flood control dyke can reduce the risk to Very Low. Long term maintenance will be required to sustain the Very Low risk level.</p> <p>The proposed Project will lead to the loss of approximately 200 m2 of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. No other fisheries-related offset is proposed.</p>
3455	687 - 5	Tracey Saxby	Squamish, BC	<p>QUESTIONS: How will the proponent offset the loss of sediment deposition on the western part of the estuary? How does the proponent propose to adequately compensate for the loss of channel complexity and diverse habitats vital to salmon and other species as outlined above?</p> <p>SOURCES:</p> <p>Hulse, D. &amp; Gregory, S. (2004) Integrating resilience into floodplain restoration. Urban Ecosystems 7: 295.</p>	<p>The biological function of the estuary is influenced by the sediment supply currently entering the estuary from McNab Creek which is derived from actively eroding locations within the watershed. The extraction of terrestrial gravel deposits from the pit is not expected to impact or change the function of the estuary because the alluvial fan is not a contributor to the sediment/gravel budget.</p> <p>Assessing the accuracy of the assessment predictions and the effectiveness of mitigation measures will be done through an Environmental Effects Monitoring Program (EEMP) that will include consistent monitoring before, during and after activities that have the potential to affect fish and fish habitat. Where practical the design of the EEMP will include the use of reference sites unlikely to be impacted by the Project as a means of distinguishing natural variation from Project caused effects</p>

3457	689 - 1	Vel Anderson	Not Stated	<p>The following from Golder Associates to Burnco Aggregate Project. Why was this report relying on old information from 2005 and beyond? The geological hazards in the McNab area are significant as this report shows. An "assessment comprising a desktop review of existing information" is not acceptable, especially knowing the fact that this project is in the Cascadia Subduction earthquake zone. (5.4.4 Baseline Conditions) "The natural hazards baseline conditions was completed by conducting a terrain and terrain stability mapping assessment comprising a desktop review of existing information, production of a terrain base map, and analysis of the potential for the terrain hazards to affect the Proposed Project facilities". (5.4.4.5 Discussion) "avalanching and steep valley sidewall debris and rock slides are common in the McNab Creek watershed, they are not expected to directly affect the LSA. Activities associated with the Proposed Project Area are not anticipated to increase the potential for initiating mass wasting (i.e., landslide) events. How was this determined?</p>	<p>A detailed assessment of potential geotechnical and natural hazard effects of the Proposed Project is presented in Volume 2, Part B – Section 5.4 of the EAC Application/EIS. The objectives of this assessment were to identify and evaluate static and seismic ground conditions, and potential landslide, debris flow/flood and avalanche hazards that could be impacted by the Proposed Project, or that could impact the Proposed Project.</p> <p>A terrain stability field assessment was completed on November 2-3, 2016. The results of the field assessment, together with the data in our existing hydrologic and geotechnical assessment reports (Hydrological and Hydraulic Characterization McNab Valley Aggregate Project Howe Sound BC, Concrete Aggregate Summary, Assessment of Avulsion Risk of McNab Creek (located in EA Vol. 4 Appendix 5.4 – C, F, A respectively) indicate that there is no evidence for historic debris flows or debris floods. Therefore, further investigations are not considered to be required.</p>
3458	689 - 2	Vel Anderson	Not Stated	<p>Landslides and snow avalanches can transport debris and sediment to creeks, increase water volumes, increase fine sediment transport, and in some cases debris jams can cause outburst floods (as seen with debris flood events). Evidence for significant debris flows and debris floods (including outburst floods) was not identified in this desktop assessment".</p> <p>Current geological data would be critical for making sound sensible decisions on outcomes for this area.</p> <p>At the end of production, a huge water filled pit remains, with man made silt berms to the North and one to the South, just one good avalanche, or an extreme winter rainstorm could push through the berm and take out the whole pit. This would ruin the McNab estuary for many years. Could we experience another Mount Polley? or a failed Bafokeng Dam? "The report, which was released on Friday morning in Victoria, said the design failed to take into account the complexity of the instability of underlying glacial and pre-glacial layers under the retaining wall". This is a project that could become a huge environmental disaster, something we do not need!</p>	<p>A terrain stability field assessment was completed on November 2-3, 2016. The results of the field assessment, together with the data in our existing hydrologic and geotechnical assessment reports (Hydrological and Hydraulic Characterization McNab Valley Aggregate Project Howe Sound BC, Concrete Aggregate Summary, Assessment of Avulsion Risk of McNab Creek (located in EA Vol. 4 Appendix 5.4 – C, F, A respectively) indicate that there is no evidence for historic debris flows or debris floods. Therefore, further investigations are not considered to be required.</p> <p>Based on a conservative assessment using the existing geotechnical data from subsurface investigations previously carried out, the risk of significant and extensive liquefaction in the Project area is considered to be low to very low, and likely only to be associated with a large earthquake (i.e. 1 in 2,475 year event). Therefore, supplementary geotechnical investigations and analyses are not considered to be required.</p> <p>The Flood Protection Dyke and Pit Lake Containment Berm will be designed and built to appropriate design criteria, which include seismic stability considerations.</p>

3459	690 - 1	Dennis and Barb MacPherson	McNab Creek, BC	We purchased a cabin at McNab Creek Estates in 1998 with the intent of retiring there. We have had 18 years of family and friend quality times weekends and vacation periods there though out the years. Our children, grand-children and all others have thrived on the McNab Creek life style, such as the wildlife, sea life, birdlife, ever-changing views, community and recreation etc. Having been there first we have concerns about the Burnco gravel mine proposal:	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3460	690 - 2	Dennis and Barb MacPherson	McNab Creek, BC	1. How will the very popular beach dunes where swimming for the local communities be affected?	A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.  The Proposed Project will not interfere with the used of the beach dunes adjacent to McNab Creek. Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.
3461	690 - 3	Dennis and Barb MacPherson	McNab Creek, BC	2. Will Lot 1, strata properties and McNab strata common properties be exposed to greater erosion from McNab Creek?	A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.  Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Any change will move McNab Creek flows closer to what would have been experienced prior to the installation of the existing constructed groundwater channel. No increase in erosion from McNab Creek is anticipated.
3462	690 - 4	Dennis and Barb MacPherson	McNab Creek, BC	3. Machinery noise, vibrations, dust, lighting, visuals, safety & accidental pollution are all concerns that we have....	A detailed assessment of potential noise effects of the Proposed Project is presented in Volume 2, Part B – Section 9.2 of the in the EAC Application/EIS.  Construction and operational noise levels were predicted using computer noise models for various construction phases and operational scenarios using the same type of equipment that will be used on site. The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project. Following the application of proposed mitigation (e.g., layout, schedule screening, equipment maintenance), potential residual noise effects of the Proposed Project were determined to be negligible.  A noise management plan will be developed prior to construction, which will include a commitment to noise monitoring and a response plan to noise concerns received from nearby property owners.

3463	690 - 5	Dennis and Barb MacPherson	McNab Creek, BC	3. Machinery noise, vibrations, dust, lighting, visuals, safety & accidental pollution are all concerns that we have....	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
3464	690 - 6	Dennis and Barb MacPherson	McNab Creek, BC	3. Machinery noise, vibrations, dust, lighting, visuals, safety & accidental pollution are all concerns that we have....	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>
3465	690 - 7	Dennis and Barb MacPherson	McNab Creek, BC	Until we have confirmation of how these things will be handled, we are against the proposal.	<p>BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.</p>

3469	691 - 3	Laurie Parkinson	Bowyer Island, BC	<p>1. Socio-economic impacts: The application for Burnco seems to think that in terms of socio-economic impacts, Burnco is too far from Woodfibre LNG to have any interaction. However, both facilities are in the Sea-to-Sky Corridor, and are all part of Howe Sound. The many tourists travelling to Whistler experience the Sound as a contiguous area that has a positive transition from over-industrialization (Vancouver) back to natural beauty. Many new business and residents have arrived precisely because of this natural beauty. A return of multiple significant industrial projects on Howe Sound should be evaluated for cumulative impacts, especially on tourism, and the region's natural brand. An assessment that fails to recognize that all development on the Sound impacts the whole Sound is seriously flawed. The assessment also makes absolutely no mention of the new compressor station (run on natural gas) planned for Mt. Mulligan, which is again further re-industrialization of the area. Any significant shift in economic basis will have impacts, but these have not been addressed by the Environmental Impact Statement.</p>	<p>A detailed assessment of potential recreation and tourism effects of the Proposed Project is presented in Volume 2, Part B – Section 7.3 of the EAC Application/EIS.</p> <p>Measures proposed to address key nuisance concerns (noise, air quality, visual quality) also mitigate potential effects on the quality of the environmental setting. Recreation and tourism activities are not expected to be displaced and potential residual effects will be limited to the life of the Proposed Project and were determined to be negligible or not significant.</p>
3470	691 - 4	Laurie Parkinson	Bowyer Island, BC	<p>An assessment that fails to recognize that all development on the Sound impacts the whole Sound is seriously flawed. The assessment also makes absolutely no mention of the new compressor station (run on natural gas) planned for Mt. Mulligan, which is again further re-industrialization of the area. Any significant shift in economic basis will have impacts, but these have not been addressed by the Environmental Impact Statement.</p>	<p>Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows:</p> <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> <p>As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.</p>
3471	691 - 5	Laurie Parkinson	Bowyer Island, BC	<p>2. Health of the ocean: The application does not seem to address the approved Woodfibre LNG cooling system. Cetaceans and fish alike travel the whole Sound. Although these facilities may have distance between them, they represent a growing collection of stresses on fish and other wildlife that travel the whole Sound. The cumulative stress needs to be addressed. We're not dealing with goldfish that stay confined to a little bowl.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will be mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

3472	691 - 6	Laurie Parkinson	Bowyer Island, BC	<p>3. Air quality: The geography of the Sound makes it a funnel for pollution, and even today we see a concentration of pollution from the Lower Mainland funnel up through Squamish on some Summer days. The cumulative impacts assessment fails to take the impacts on Squamish from the Burnco operations. It also fails to address the additional impacts from the proposed Mt. Mulligan compressor, and Mt. Garibaldi. Mt. Garibaldi will result in a significant addition to regional traffic (pollution) and thus Howe Sound pollution. An air quality assessment needs to consider how pollutants travel in the Sound, and the cumulative impacts of all major projects.</p>	<p>A detailed assessment of potential air quality effects of the Proposed Project is presented in Volume 2, Part B – Section 5.7 of the EAC Application/EIS.</p> <p>Proposed mitigation such as enclosing material drop areas and use of mist sprays were incorporated into the air quality model develop to assess particulate matter concentrations (TSP, PM10 and PM 2.5) at the closest potential receptors sites. NO2 and SO2 predictions were also determined for sensitive receptor sites.</p> <p>Within Section 5.7.6 of the EAC Application/EIS, BURNCO has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7 of the EAC Application/EIS.</p> <p>Following the application of proposed mitigation, all potential air quality effects were determined to be negligible or not significant.</p>
3473	691 - 7	Laurie Parkinson	Bowyer Island, BC	<p>4. Light pollution at night: If Woodfibre LNG and Burnco are both built, safety lights will be on at night - both at the industrial plant and on the docks - for Woodfibre LNG, Burnco, and Howe Sound Pulp &amp; Paper. This will have a big effect on dark night skies in Howe Sound. This will reduce the pleasure many take in Howe Sound. The cumulative effect of these 3 industries on night light pollution in Howe Sound needs to be analyzed. All 4 points above need to be analyzed and quantified, and presented to the public before further decisions are made.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. 3474	691 - 8	Laurie Parkinson	Bowyer Island, BC	<p>Issue 1: Regional demand for additional aggregate is not demonstrated</p> <p>The Vancouver market requirement for an additional gravel /aggregate source is not supported by the proponent's documentation. A greater profit margin for the Proponent should not be grounds for destroying the estuary of McNab Creek.</p> <p>Recommendation: A supply/demand report showing strong evidence of the need for supply from this location (and the unavailability of supply from established locations), such as has been done for the Okanagan region, should be prepared before considering a permit for this project. See <a href="https://www.regionaldistrict.com/media/112368/2013_11_08__Full_Report__Aggregate_Supply_and_Demand_Update_and_Analysis.pdf">https://www.regionaldistrict.com/media/112368/2013_11_08__Full_Report__Aggregate_Supply_and_Demand_Update_and_Analysis.pdf</a></p>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
3475	691 - 9	Laurie Parkinson	Bowyer Island, BC	<p>Issue 2: Loss of productive salmon habitat</p> <p>The project has (twice) been rejected by Fisheries &amp; Oceans Canada because of the likely loss of salmon habitat in McNab Creek. In a year of disastrous returns to the Fraser and other runs, this proposal is ill-timed and ill-advised.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

3476	691 - 10	Laurie Parkinson	Bowyer Island, BC	<p>Issue 3: Insufficient data for at-risk species baselines.</p> <p>For several key aquatic and land-based species (such as anadromous salmon, resident cutthroat trout and Roosevelt elk), population data was collected over far too narrow a timespan to be useful for establishing accurate baselines. Without accurate baselines, quantitative monitoring of the effects of this project will not be possible.</p> <p>Recommendation: Part-year data is utterly insufficient to establishing accurate baselines. At least five years of data should be collected to afford accurate baselines usable for ongoing monitoring of effects on species populations and habitat. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where habitat damage exceeds pre-agreed norms.</p>	<p>The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada. The baseline studies conducted are sufficient for the purpose of assessing potential effects of the Proposed Project on selected Valued Components. Additional years of supplemental field studies are not required or proposed for the assessment.</p> <p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS. Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>
3477	691 - 11	Laurie Parkinson	Bowyer Island, BC	<p>Issue 4: 21 species officially at risk from Burnco.</p> <p>Burnco's consultants documented that the gravel quarry could be home to 21 species officially at risk. This includes Roosevelt elk , re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

3478	691 - 12	Laurie Parkinson	Bowyer Island, BC	<p>Issue 5: Will McNab Creek and the estuary become salty?</p> <p>As rock is removed from the mine, fresh water from the estuary will creep into the resultant 25m pit. This will lead to salt water seeping into the estuary, and into McNab Creek. This will kill a variety of salmon and plants.</p> <p>Recommendation: Have thorough hydrological studies done over several years. Use the precautionary principle. Local authorities (eg. SCR D) should have the power to compel a reduction, suspension or cessation of mine activities where salination exceeds preagreed norms.</p>	<p>The hydraulic conductivity of the valley sediments is much higher than hydraulic conductivity of any bedrock structures, if they exist. Therefore, the groundwater flow in the valley sediments will dominate and it will provide key control on the position of the salt water-freshwater interface. Furthermore, because of topographic highs that surround the valley, the hydraulic heads are expected to be higher than in the valley sediments, inhibiting saltwater ingress. As presented in Section 3.3 in Appendix 5.6-A of the EAC Application/EIS, based on monitoring data (2010-2014), tidal elevations exceeded groundwater elevation only in rare occasions between July and September of each monitoring year. During these high tide intervals, there is an inferred landward gradient in the immediate vicinity of the shoreline; however, its duration is inherently less than the corresponding periods of southwards gradient associated with lower tidal position. Accordingly, the net groundwater flow direction during the entire monitoring period is confirmed to be southwards toward the marine foreshore. Moreover, monitoring data indicate that the saltwater wedge could be located at greater depths than approximately -30 m elevation; analytical calculations based on methodology presented in Domenico and Schwartz (1990) showed that, due to relatively high groundwater flow in the alluvial sediments, the saltwater edge could be depressed to the depth of the overburden/bedrock contact within 50 m to 150 m of the ocean shore. Based on these observations, the potential presence of a fault structure in bedrock in the vicinity of the project area is not considered to influence groundwater flow direction in the valley sediments or increase the risk of saltwater intrusion.</p>
3479	691 - 13	Laurie Parkinson	Bowyer Island, BC	<p>Issue 6: Unsuitable location</p> <p>This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area. In 2009 SCR D said no to a permit for an aggregate operation at McNab Creek. There was concern re noise and dust from onsite crushing, sorting, weighing, and stockpiling, all of which Burnco plans to do. Why allow these activities now?</p> <p>Recommendation: To do so would represent atrocious planning, with little/no obvious compensating factors. It should not be permitted.</p>	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>

3480	691 - 14	Laurie Parkinson	Bowyer Island, BC	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). The proposed “compensation channel” is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Recommendation: Any approval of this proposal should include a contingency bond to fund maintenance of the new streamway, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project.</p>	<p>The proposed Project will lead to the loss of approximately 200 m<sup>2</sup> of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. The proposed design for the channel extension uses the existing lower channel as a template and it will meet the factors and criteria that are generally accepted for the construction of a functional groundwater-fed spawning channel. It should provide conditions similar to the existing run habitat in the lower section of WC2 that was designed as chum spawning habitat by DFO and where spawning activity was observed during the November 2016 survey.</p> <p>The creation of the pit lake is predicted to cause a doubling of groundwater influx into the lower section of WC2. The increase in ground water influx will lead to additional groundwater upwelling and the increased upwelling is expected to provide increased levels of intergravel flow that will be suitable for eggs and alevins. The average depth in the proposed offset habitat extension and the remaining section of WC2 is predicted to be above 0.3 m making it suitable for salmon spawning. As described in the Aquatic Health assessment provided in Surface Water Resources (Section 5.5.7.2), the water quality and temperature of ground and surface water entering the offset habitat and existing lower section of WC2 will be suitable for salmonids to complete all stages of their life history including spawning.</p> <p>In response to comments from the Technical Working Group, the design of the habitat offset plan was revised to allow approximately 20 m of pool habitat upstream of the culvert and approximately 20 m of gravel bed run habitat downstream of the culvert to be retained which will avoid approximately 232 m<sup>2</sup> of habitat loss. The design of the channel extension incorporates run and pool habitat in approximately a 1 : 1 ratio, based on this design and the use of run habitat for spawning in the existing lower channel it is expected that more than 2, 000 m<sup>2</sup> of the offset channel habitat will provide conditions suitable for salmonid spawning.</p>
3481	691 - 15	Laurie Parkinson	Bowyer Island, BC	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). 3487	691 - 21	Laurie Parkinson	Bowyer Island, BC	<p>Issue 10: The impact of marine noise is insufficiently studied in the application</p> <p>The impact of marine noise (from the conveyor belts –tugs, barge loading and water taxis) on cetaceans, herring, salmon (spawning adult and habituating juveniles) and other at-risk species (including waterfowl) is underestimated in the “science” work done by the Proponent</p> <p>Recommendation: Marine noise transmits 5-10 times farther &amp; faster through water than through air. Marine noise should be carefully baselined and monitored in wide spatial and temporal dimensions around the site Periodic reporting of results that are auditable and accessible to the public should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where marine noise exceeds pre-agreed norms.</p>	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>
3491	691 - 25	Laurie Parkinson	Bowyer Island, BC	<p>Issue 12: Water Quality is insufficiently characterized in the application</p> <p>Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs.</p> <p>Recommendation: Siltation monitoring (both in the original and compensation channels and in the nearby ocean), with periodic reporting of results that are auditable and accessible to the public, should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.</p>	<p>A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken. Adaptive management techniques to be implemented as required include:</p> <ul style="list-style-type: none"> <li>- Continue to evaluate the extent of the pit during operations.</li> <li>- During the wet season, if water levels in the pit lake become higher than has been designed for the Pit Lake Containment Berm then the valves in the culverts will be closed to reduce the amount of water reporting to the pit from the surface water on the western slope.</li> <li>- The height of the pit lake at the outlet structure can be adjusted to increase or decrease the level of the pit lake (e.g., adding or lowering stop logs) at closure to maintain the hydraulic gradient between McNab Creek and the Project Area following closure.</li> </ul>
3492	691 - 26	Laurie Parkinson	Bowyer Island, BC	<p>Issue 13: "Daytime Hours" definition</p> <p>The Proponent advertises that the plant will operate only on weekdays and during "daytime hours". Daylight hours vary seasonally, but the definition of "daytime hours" is unclear.</p> <p>Recommendation: Clearly define "daytime hours" in the proposal.</p>	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
3493	691 - 27	Laurie Parkinson	Bowyer Island, BC	<p>Issue 14: The nearshore strip of forest cover is too narrow</p> <p>The strip of forest cover between the pit and the ocean is too narrow to be sustainable. Blowdown and saltwater invasion will threaten its existence</p> <p>Recommendation: For reasons of sustainability and visual camouflage, increase the width of the ocean-pit separation strip, and lessen the size of the proposed pit and crushing area.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. Maintaining a treed buffer along the foreshore (approx. 25-50 m wide adjacent to the processing area) will also limit dust and noise emissions to the marine environment. Additional screening of lan-based structures may be possible around project components not currently screened by existing vegetation. The nature and extent of vegetation screening incorporated into the site design will be described in the Vegetation Management Plan (Volume 3, Part E, Section 16 of the EAC Application/EIS).</p> <p>A detailed assessment of potential vegetation effects (including windthrow effects) of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS. The significance of windthrow effects were determined to be negligible; few new windward edges will be created. Monitoring of treeline edges will be conducted to evaluate potential windthrow effects and adaptive management will be employed, if necessary.</p>
3494	691 - 28	Laurie Parkinson	Bowyer Island, BC	<p>Issue 15: Loss of property values in the nearby strata units</p> <p>The proponent claims little or no loss of value for nearby properties. This assertion is contradicted by many studies that have highlighted the loss of value (including the value associated with quiet enjoyment) at or near industrial sites adjacent to established residential areas. Recent jurisprudence in BC has borne out the right of homeowners to receive compensation for that loss. See <a href="http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882">http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882</a></p> <p>Recommendation: Fair market value compensation for loss of property value must form part of the economic analysis of any approval for this mine.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
3495	691 - 29	Laurie Parkinson	Bowyer Island, BC	<p>Issue 16: First Nation consultation – Sechelt FN was omitted this time</p> <p>Squamish and Tseil-Waututh First Nations have been consulted re Burnco, but not the Sechelt FN. The Sechelt First Nations weren't consulted about the gravel quarry at McNab Creek in 2009 either. McNab Creek is in Sechelt traditional territory.</p> <p>Recommendation: Respect/consult with Sechelt First Nations re Burnco.</p>	<p>First Nation consultation requirements are delegated to Proponents by the Crown. For the Proposed Project, only Squamish Nation and the Tseil-Waututh Nation were identified as potentially affected first Nations by the BCEAO. The CEA Agency identified additional Aboriginal Group, however, the Sechelt First Nation was not among these, presumably because of the proximity of the proposed Project to their Traditional Territory.</p>

3496	691 - 30	Laurie Parkinson	Bowyer Island, BC	<p>Issue 17: Advisory Committee of voluntary citizens</p> <p>In 2009 when a gravel quarry at McNab Creek was turned down by SCRD, one requirement was an Advisory Committee of volunteer citizens to provide ongoing input with the goal of community acceptance of the project.</p> <p>Recommendation: Require the formation of an Advisory Committee of volunteer citizens.</p>	<p>BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.</p>
3497	691 - 31	Laurie Parkinson	Bowyer Island, BC	<p>Issue 18: The job benefits were analyzed on the basis of too narrow an RAA.</p> <p>BURNCO currently sources its aggregate from Jervis Inlet, Port McNeil and Coquitlam. To gauge the benefits to the BC economy, the net job creation figures (i.e. McNab's 12 jobs less the job losses at the above aggregate sources) as a consequence of allowing the McNab Creek operation must be considered.</p> <p>Recommendation: If there is little or no net job gain to BC as a result of this proposal, it should be firmly rejected. Jobs in areas like Port McNeil are much harder to come by than in the Lower Mainland/ Howe Sound.</p>	<p>The local spatial study area for the operations phase labour market effects (including employment) of the Proposed project was described in the Application Information Requirements/EIS Guidelines, which was approved by the BCEAO and the CEA Agency on December 16, 2014 after review by the Technical Working Group established to guide this assessment. This local spatial study area is Sunshine Coast Regional District.</p> <p>The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.</p>

3498	691 - 32	Laurie Parkinson	Bowyer Island, BC	<p>Issue 19: Barge traffic will diminish Howe Sound's recreational and tourism potential and add to the cumulative traffic hazard in Howe Sound</p> <p>Shipping 1-4 million tonnes of aggregate annually from this location will make for 2-6 tug/barge movements daily through Southern Howe Sound,. Routes would cross very busy sailing and small-boat recreational areas, the Howe Sound Marine Trail and ferry routes, the path of LNG tankers exiting from the Woodfibre LNG plant and freighters from Squamish Terminals. This exponentially increases the risk of collisions and loss of life in a narrow waterway and diminishes the amenity and tourism use of the Sound. The cumulative effects and worst-case hazard analysis of this project have been underestimated by the Proponent.</p> <p>Recommendation: A cumulative impact assessment, including loss of amenity and tourism value of the Sound, should be completed prior to deciding on this application. So too should a study of the increased hazards associated with increasing the large-vessel traffic in Howe Sound. Improvements to vessel tracking, buoys and channel markers in the area will be necessary.</p>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
3499	691 - 33	Laurie Parkinson	Bowyer Island, BC	<p>Issue 20: The job benefits analysis used the questionable input-output econometric model.</p> <p>BURNCO has used input-output econometric analysis to predict the job creation benefits accruing to the project For resource projects, this is a highly questionable analysis technique. The Australian Institute has written a convincing argument highlighting the inadequacies of input-output analysis. See <a href="http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf">http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf</a> (Input-output was used by the BC Government in arriving at its inflated job estimates for BC's LNG industry.)</p> <p>Recommendation: Red-do the employment estimates and repost/ allow additional time for public scrutiny and comments</p>	<p>The environmental assessment of the Proposed Project used an input-output (I-O) impact modelling methodology to estimate the Project's potential effect on employment (as well as other economic parameters). The B.C. Input-Output Model (BCIOM) was used. The BCIOM is maintained by BC Stats, which is the central statistics agency of the B.C. government. The BCIOM is a version of Statistics Canada's Inter-Provincial Input-Output Model (IPIOM) which BC Stats calibrated for undertaking economic analyses of B.C.-based projects. The BCIOM is a robust, calibrated, third party provided input-output model, and has been previously accepted for use by by the BCEAO and the CEA Agency to assist with estimating the economic impact of proposed projects.</p>

3500	691 - 34	Laurie Parkinson	Bowyer Island, BC	<p>Issue 21: There was an inconsistency between the job creation figures shown in 2 different slides in the Open Houses</p> <p>One showed about 300 person-years of employment (over 25years). The other (derived from input-output analysis) showed person-year employment benefits several times that amount.</p> <p>Recommendation: This misleading discrepancy should be resolved by further analysis, and that section of the application re-submitted, with additional time allowed for public scrutiny and comment</p>	<p>The estimated number of jobs created by the proposed Project during construction and operations phases are presented in Section 2.5.4 of the EAC Application/EIS.</p> <p>Employment numbers were presented on three Open House display panels, as follows:</p> <ul style="list-style-type: none"> <li>- Project Specifications: 80 person years during construction and 360 person years during operations (direct, indirect and induced);</li> <li>- Project Benefits: 12 full-time jobs at the site (i.e. direct only);</li> <li>- Sustainable Economy: 119 jobs during construction and 99 jobs during operations (direct, indirect and induced); 33 long-term jobs during operations are expected to be filled by Sunshine Coast residents.</li> </ul>
3501	691 - 35	Laurie Parkinson	Bowyer Island, BC	<p>Issue 22: Preservation of marine tourism, hiking access to the vicinity of McNab</p> <p>Moorages, anchorages, swimming facilities and back-country access have long been part of the McNab Creek area's attractions for Howe Sound visitors and local boating clubs</p> <p>Recommendation: The application fails to properly address how these local amenities will be protected. Neither does it propose how loss of these amenities will be compensated for. The Management Plan should address this issue.</p>	<p>Harvesting fish and wildlife' and 'Outdoor recreation and tourism' are valued components in the environmental assessment of the Proposed Project (see Table 7.3-1). No displacement effects on recreational hunting or other recreational activities is anticipated due to the Proposed Project because the primary access to the local study area is through the Proposed Property, and public access and use of the Proposed Property has never been permitted. During the construction and operation phases, recreationists and tourists would continue to have access to the foreshore area below the high water mark and to the anchorage area in the vicinity of where McNab Creek enters Howe Sound.</p> <p>Proposed Project construction and operations would prevent marine-based recreational and tourism activities occurring around the Project jetty. As the jetty is located within an existing log boom tenure and recreational and tourism activities are concentrated on the eastern side of the local study area (where McNab Creek enters Howe Sound), this effect is considered to be negligible.</p> <p>Displacement on the water would occur on an intermittent basis as a result of Proposed Project-related vessel traffic, which would require smaller vessels to alter direction and/or speed when navigating at the same time as water taxis or barges (Volume 2, Part B - Section 7.2). These navigational challenges are present in the LSA due to forestry activity, and are subject to the Collision Regulations of the Canada Shipping Act. Any resulting effects on recreational boating recreational activities due to potential interactions of recreational vessels and equipment and Project-associated vessels are not detectable or not measureable, so potential effects of the Proposed Project on water-based recreation and tourism access matters in the construction and operation phases are determined to be negligible.</p> <p>As part of the Marine Transport Management Plan outlined in Marine Transport (Volume 2, Part B - Section 7.2), BURNCO would also develop and implement strategies, best management practices and guidelines to avoid and minimise Proposed Project - related disruption of marine-based recreational activities during construction and operations. As part of the development of this plan, BURNCO would consult with key marine user groups (e.g., McNab Strata, yacht clubs, camps, and kayaking operators) to discuss strategies (including but not limited to routing options) to manage the interaction of Proposed Project vessel traffic with recreational and tourism areas during the high season months.</p>

3502	691 - 36	Laurie Parkinson	Bowyer Island, BC	<p>Issue 23: End-of-project remediation</p> <p>The compensation channel is an artificial structure which will likely not survive long after project's end.</p> <p>Recommendation: Restoring the natural streamway should be a firm end-state requirement.</p>	<p>A Reclamation and Effective Closure Plan is provided in Volume 4, Part G – Section 22.0: Appendix 4 of the EAC Application/EIS. The plan describes the proposed measures and commitments to manage, maintain and monitor water management structures, remove surface facilities, and reclaim areas and develop a functional ecosystem in the freshwater pit.</p> <p>Progressive and ongoing reclamation activities will occur throughout all phases of mine development. The Proposed Project will use progressive reclamation of the site that includes ongoing reclamation activities taking place alongside active extraction and pit area around the proposed operations area. Site planning will include landscaping, further design and development of the existing berm along the north edge logging road of the pit area, along with the creation of southern pit containment berm, surface water features, fisheries habitats and vegetation throughout the site consistent with the operational extraction schedule. Ongoing monitoring will be conducted for relevant noise and dust, water quality parameters, and fish, vegetation and wildlife resources. Details regarding the monitoring program (in addition to the reclamation monitoring suggested in the plan) is provided in Volume 3, Part E – Section 17.0 of the EAC Application/EIS.</p>
3503	692 - 1	My Sea to Sky	Not Stated	I am authorized to submit the attached comments in regard to this proposed project.	Your position is understood and will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3504	692 - 2	My Sea to Sky	Not Stated	<p>Issue 1: Regional demand for additional aggregate is not demonstrated</p> <p>The Vancouver market requirement for an additional gravel /aggregate source is not supported by the proponent's documentation. A greater profit margin for the Proponent should not be grounds for destroying the estuary of McNab Creek.</p> <p>Recommendation: A supply/demand report showing strong evidence of the need for supply from this location (and the unavailability of supply from established locations), such as has been done for the Okanagan region, should be prepared before considering a permit for this project. See <a href="https://www.regionaldistrict.com/media/112368/2013_11_08_Full_Report_Aggregate_Supply_and_Demand_Update_and_Analysis.pdf">https://www.regionaldistrict.com/media/112368/2013_11_08_Full_Report_Aggregate_Supply_and_Demand_Update_and_Analysis.pdf</a></p>	<p>The purpose underlying the Proposed Project is outlined in Section 2.2 of the EAC Application/EIS. Aggregate is a non-renewable resource. Once land is developed, access to underlying aggregate is forever lost on that site. If an aggregate resources is not developed locally, aggregate materials will have to be hauled from another site - one that could be many more kilometres away and require the use of trucks. The further a community needs to travel to find sources of aggregates for all types of construction, the more expensive the aggregate becomes to local consumers.</p> <p>Gravel from the Proposed Project will be used to supply gravel to Lower Mainland located processing plants owned and operated by the proponent. These facilities are currently supplied by:</p> <ul style="list-style-type: none"> <li>- Polaris Material Corp.'s Orca Quarry at Port McNeil located on northern Vancouver Island, BC;</li> <li>- Jack Cewe Ltd.'s Treat Creek Operations located in Jervis Inlet, BC; and</li> <li>- Construction Aggregates Ltd.'s gravel mine located in Sechelt, BC.</li> </ul> <p>The development of the Project would result a reduction in barge tow distance of up to 280 km between current aggregate sources and processing facilities, thereby improving the environmental impacts.</p>
3505	692 - 3	My Sea to Sky	Not Stated	<p>Issue 2: Loss of productive salmon habitat</p> <p>The project has (twice) been rejected by Fisheries &amp; Oceans Canada because of the likely loss of salmon habitat in McNab Creek. In a year of disastrous returns to the Fraser and other runs, this proposal is ill-timed and ill-advised.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential fisheries, freshwater habitat and marine resource effects of the Proposed Project is presented in Volume 2, Part B – Sections 5.1 (Fisheries and Freshwater Resources) and 5.2 (Marine Resources) of the EAC Application/EIS.</p> <p>The Proposed Project will not lead to a reduction in the quantity of quality of fish habitat. The loss of riparian and in-stream habitat will be offset by the construction of a new 790m groundwater-fed channel which will provide increased habitat for anadromous salmonids and resident Cutthroat Trout.</p> <p>The Proposed Project will not lead to a reduction in the quality of marine habitat. Any loss of marine habitat will be offset and potential effects on marine resources will mitigated through the planning and implementation of known and effective measures and practices. All potential residual effects were determined to be negligible or not significant.</p>

	Ref #	Commenter (Name)	Location		
3506	692 - 4	My Sea to Sky	Not Stated	<p>Issue 3: Insufficient data for at-risk species baselines.</p> <p>For several key aquatic and land-based species (such as anadromous salmon, resident cutthroat trout and Roosevelt elk), population data was collected over far too narrow a timespan to be useful for establishing accurate baselines. Without accurate baselines, quantitative monitoring of the effects of this project will not be possible.</p> <p>Recommendation: Part-year data is utterly insufficient to establishing accurate baselines. At least five years of data should be collected to afford accurate baselines usable for ongoing monitoring of effects on species populations and habitat. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where habitat damage exceeds pre-agreed norms.</p>	<p>The Assessment Methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada. The baseline studies conducted are sufficient for the purpose of assessing potential effects of the Proposed Project on selected Valued Components. Additional years of supplemental field studies are not required or proposed for the assessment.</p> <p>Details regarding the proposed environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS. Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with EA certificate conditions and with conditions of all required permits and approvals. Effects monitoring will include periodic sampling or studies on/of groundwater, vegetation, wildlife, fish, air quality, surface water and aquatic health. The studies will be conducted with a Proposed Project study area (receiving environment) and a reference area. Monitoring plans will establish timelines and schedule for each monitoring activity (e.g., give years for post-construction monitoring). Monitoring data will be assessed against Proposed Project-specific guidelines which will be developed based on Canadian and BC guidelines and baseline benchmarks.</p>
3507	692 - 5	My Sea to Sky	Not Stated	<p>Issue 4: 21 species officially at risk from Burnco.</p> <p>Burnco's consultants documented that the gravel quarry could be home to 21 species officially at risk. This includes Roosevelt elk , re-introduced to McNab Creek in 2001 by the BC Ministry of the Environment.</p> <p>Recommendation: The Precautionary Principle, properly applied, should see this proposal firmly rejected.</p>	<p>A detailed assessment of potential wildlife and vegetation effects of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS.</p> <p>Potential effects were assessed for the following selected valued components:</p> <ul style="list-style-type: none"> <li>- Amphibian species at risk</li> <li>- Western screech owl, Common nighthawk, Northern goshawk Band-tailed pigeon and Marbled murrelet;</li> <li>- Roosevelt elk and grizzly bear;</li> <li>- Environmentally sensitive ecosystems;</li> <li>- Ecosystems at risk; and</li> <li>- Plant species a risk.</li> </ul> <p>Following the application of proposed mitigation (e.g., design features and operational requirements, environmental management planning, habitat enhancement, progressive reclamation, etc.), potential residual effects were determined to be negligible or not significant.</p> <p>Cumulative effects on grizzly bear were determined to be significant however the Proposed Project is not predicted to contribute to the potential mortality of the species.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
3508	692 - 6	My Sea to Sky	Not Stated	<p>Issue 5: Will McNab Creek and the estuary become salty?</p> <p>As rock is removed from the mine, fresh water from the estuary will creep into the resultant 25m pit. This will lead to salt water seeping into the estuary, and into McNab Creek. This will kill a variety of salmon and plants.</p> <p>Recommendation: Have thorough hydrological studies done over several years. Use the precautionary principle. Local authorities (eg. SCR D) should have the power to compel a reduction, suspension or cessation of mine activities where salination exceeds preagreed norms.</p>	<p>The hydraulic conductivity of the valley sediments is much higher than hydraulic conductivity of any bedrock structures, if they exist. Therefore, the groundwater flow in the valley sediments will dominate and it will provide key control on the position of the salt water-freshwater interface. Furthermore, because of topographic highs that surround the valley, the hydraulic heads are expected to be higher than in the valley sediments, inhibiting saltwater ingress. As presented in Section 3.3 in Appendix 5.6-A of the EAC Application/EIS, based on monitoring data (2010-2014), tidal elevations exceeded groundwater elevation only in rare occasions between July and September of each monitoring year. During these high tide intervals, there is an inferred landward gradient in the immediate vicinity of the shoreline; however, its duration is inherently less than the corresponding periods of southwards gradient associated with lower tidal position. Accordingly, the net groundwater flow direction during the entire monitoring period is confirmed to be southwards toward the marine foreshore. Moreover, monitoring data indicate that the saltwater wedge could be located at greater depths than approximately -30 m elevation; analytical calculations based on methodology presented in Domenico and Schwartz (1990) showed that, due to relatively high groundwater flow in the alluvial sediments, the saltwater edge could be depressed to the depth of the overburden/bedrock contact within 50 m to 150 m of the ocean shore. Based on these observations, the potential presence of a fault structure in bedrock in the vicinity of the project area is not considered to influence groundwater flow direction in the valley sediments or increase the risk of saltwater intrusion.</p>
3509	692 - 7	My Sea to Sky	Not Stated	<p>Issue 6: Unsuitable location</p> <p>This proposal would locate a noisy, dusty gravel mine and crush mill next to an existing multi-residential area. In 2009 SCR D said no to a permit for an aggregate operation at McNab Creek. There was concern re noise and dust from onsite crushing, sorting, weighing, and stockpiling, all of which Burnco plans to do. Why allow these activities now?</p> <p>Recommendation: To do so would represent atrocious planning, with little/no obvious compensating factors. It should not be permitted.</p>	<p>Accepted EA practice in BC and Canada includes the identification of mitigation measures that are technically and economically feasible (i.e., practical) means of preventing or reducing to an acceptable level any potential adverse effect of the proposed project. BCEAO (2013) considers mitigation to be any practical means or measures taken to avoid, minimize, restore on-site, compensate, or offset the potential adverse effects of a project. Compensation means measures taken to further reduce the residual effect, and may include direct physical measures (e.g., habitat enhancement, restoration or creation on, near or away from the project site), or financial mechanisms that have the outcome of reducing the residual effect (e.g., contributions to research, recovery plans, population enhancement programs for endangered species). Offset is defined in the BCMOE's Procedures for Mitigating Impacts on Environmental Values (2012) as means to counteract, or make up for, a residual impact on an environmental component.</p> <p>Potential effects on McNab Creek are being mitigated through avoidance. There are no proposed discharges to or withdrawals from McNab Creek. The pit lake is being designed such that lake elevation can be used to manage hydrostatic pressure during operations so changes to groundwater flow do not lead to a loss of flow within McNab Creek. Similarly, the size and location of the processing area was selected to avoid identified fish habitat.</p> <p>Examples of mitigation measures to reduce or minimize potential effects are:</p> <ul style="list-style-type: none"> <li>- Sediment and erosion control planning and monitoring the effectiveness of prescribed measures</li> <li>- Restricting clearing of wildlife habitat during breeding and calving periods, bird nesting periods and elk overwintering</li> <li>- Installing nest boxes for Western screech-owls in nearby forest habitat</li> <li>- Maintaining vegetation linkages and buffers to minimize habitat fragmentation and to allow escape routes for large mammals.</li> <li>- Monitoring for marine mammals during impact pile driving activities and maintaining a marine mammal safety zone based on injury noise threshold criteria.</li> </ul> <p>Examples of compensation or offset measure are:</p> <ul style="list-style-type: none"> <li>- Constructing a 790 metre extension of the lower segment of groundwater channel WC2 that will collect surface flow diverted through loss of the upper segment of WC2. This offset will increase the wetted area of the lower segment of WC2.</li> <li>- Establishing 1,250 m2 of new amphibian breeding ponds to offset the loss of existing amphibian habitat.</li> </ul>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
3510	692 - 8	My Sea to Sky	Not Stated	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). The proposed “compensation channel” is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Recommendation: Any approval of this proposal should include a contingency bond to fund maintenance of the new streamway, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project.</p>	<p>The proposed Project will lead to the loss of approximately 200 m<sup>2</sup> of spawning habitat in the upper section of WC2 however, this loss is addressed by the Fish Habitat Offset Plan (Appendix 5.1-B). The offset plan proposes to extend the length of the existing lower section of WC2 by approximately 790 m. The proposed design for the channel extension uses the existing lower channel as a template and it will meet the factors and criteria that are generally accepted for the construction of a functional groundwater-fed spawning channel. It should provide conditions similar to the existing run habitat in the lower section of WC2 that was designed as chum spawning habitat by DFO and where spawning activity was observed during the November 2016 survey.</p> <p>The creation of the pit lake is predicted to cause a doubling of groundwater influx into the lower section of WC2. The increase in ground water influx will lead to additional groundwater upwelling and the increased upwelling is expected to provide increased levels of intergravel flow that will be suitable for eggs and alevins. The average depth in the proposed offset habitat extension and the remaining section of WC2 is predicted to be above 0.3 m making it suitable for salmon spawning. As described in the Aquatic Health assessment provided in Surface Water Resources (Section 5.5.7.2), the water quality and temperature of ground and surface water entering the offset habitat and existing lower section of WC2 will be suitable for salmonids to complete all stages of their life history including spawning.</p> <p>In response to comments from the Technical Working Group, the design of the habitat offset plan was revised to allow approximately 20 m of pool habitat upstream of the culvert and approximately 20 m of gravel bed run habitat downstream of the culvert to be retained which will avoid approximately 232 m<sup>2</sup> of habitat loss. The design of the channel extension incorporates run and pool habitat in approximately a 1 : 1 ratio, based on this design and the use of run habitat for spawning in the existing lower channel it is expected that more than 2, 000 m<sup>2</sup> of the offset channel habitat will provide conditions suitable for salmonid spawning.</p>
3511	692 - 9	My Sea to Sky	Not Stated	<p>Issue 7: The Fish Habitat offset plan may not work</p> <p>The Proponent has no experience operating aggregate mine in the marine environment (contrary to claims by the Project Manager, a mine near the Bow River in Calgary does not qualify as “marine”). The proposed “compensation channel” is key to attempts to mitigate the loss of fish habitat in this project. Should it fail, even partially, accountability and compensation for the loss should be automatic.</p> <p>Recommendation: Any approval of this proposal should include a contingency bond to fund maintenance of the new streamway, an overflow gate from the pit lake, and a fully-funded alternate solution should the offset plan fail. The bond should also be sufficient to cover site remediation at end-of-project.</p>	<p>Mines Act permitting is required which includes provisions for a performance and reclamation bond. In addition, a letter of credit is typically required as part of the Fisheries Act authorization until the works are determined to be functioning as intended.</p> <p>Details regarding the proposed Environmental management and monitoring programs for the Proposed Project are provided in Volume 3, Part E – Section 16 and 17 of the EAC Application/EIS.</p> <p>Environment monitoring plans will be developed by qualified environmental professionals and implemented to achieve compliance with Certificate conditions and with terms and conditions of regulatory permits and approvals. Monitoring will consist of two main components: compliance monitoring and effects monitoring. BURNCO commits to providing the funding for these monitoring initiatives.</p>

3512	692 - 10	My Sea to Sky	Not Stated	<p>Issue 8: Sightline, noise and dust: The proposed mine is far too close to existing residential properties.</p> <p>The McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of unsightliness, the adverse effects on property values, noise and dust issues, gravel mining operations are generally not allowed within 1000' of any residential property. Other BURNCO properties have had 1,000' separation zones stipulated as conditions of their licenses to operate. Example: BURNCO property in Parkland County, Alberta. See <a href="http://www.parklandcounty.com/Assets/Governance/Subdivision+and+Development+Appeal+Board+Minutes/SDAB+Minutes+Jan+21.pdf">http://www.parklandcounty.com/Assets/Governance/Subdivision+and+Development+Appeal+Board+Minutes/SDAB+Minutes+Jan+21.pdf</a></p> <p>Recommendation: Because of the confined topography of the area, mitigation of these damaging effects is impractical. Should full compensation for loss not be acceptable to local homeowners, this mine should not be approved.</p>	The McNab Creek strata title properties are located more than 1000' from any component of the proposed Project.
3513	692 - 11	My Sea to Sky	Not Stated	<p>Issue 8: Sightline, noise and dust: The proposed mine is far too close to existing residential properties.</p> <p>The McNab Creek strata title properties are well within 500' of the proposed mining operations. Because of unsightliness, the adverse effects on property values, noise and dust issues, gravel mining operations are generally not allowed within 1000' of any residential property. Other BURNCO properties have had 1,000' separation zones stipulated as conditions of their licenses to operate. Example: BURNCO property in Parkland County, Alberta. See <a href="http://www.parklandcounty.com/Assets/Governance/Subdivision+and+Development+Appeal+Board+Minutes/SDAB+Minutes+Jan+21.pdf">http://www.parklandcounty.com/Assets/Governance/Subdivision+and+Development+Appeal+Board+Minutes/SDAB+Minutes+Jan+21.pdf</a></p> <p>Recommendation: Because of the confined topography of the area, mitigation of these damaging effects is impractical. Should full compensation for loss not be acceptable to local homeowners, this mine should not be approved.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. Potential visual effect of installed artificial lighting on sensitive night-time receptors have also been considered as part of the assessment.</p> <p>The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Residents of McNab Creek Strata and recreational marine users in Thornbrough Channel are likely to be most affected. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. There is a potential to contribute to an increase in scenic character post closure. Potential residual effects were determined to be not significant.</p> <p>Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.</p>

3517	692 - 15	My Sea to Sky	Not Stated	<p>Issue 10: The impact of marine noise is insufficiently studied in the application</p> <p>The impact of marine noise (from the conveyor belts –tugs, barge loading and water taxis) on cetaceans, herring, salmon (spawning adult and habituating juveniles) and other at-risk species (including waterfowl) is underestimated in the “science” work done by the Proponent</p> <p>Recommendation: Marine noise transmits 5-10 times farther &amp; faster through water than through air. Marine noise should be carefully baselined and monitored in wide spatial and temporal dimensions around the site Periodic reporting of results that are auditable and accessible to the public should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where marine noise exceeds pre-agreed norms.</p>	<p>The noise model developed for the prediction of noise effects for this project accounted for noise propagation over water and attenuation (or lack thereof) due to barriers and topography. The model included conservative assumptions such as modelling a downwind condition in every direction from the project.</p> <p>A detailed assessment of potential effects on marine resources is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS, including</p> <ul style="list-style-type: none"> <li>- potential injury/mortality and behavioural disturbance of marine fish and marine mammals from underwater noise generated by impact pile driving, vessel traffic, and loading aggregate onto barges, and</li> <li>- potential behavioural disturbance in marine birds from in-air noise generated during site clearing, construction, and operations.</li> </ul> <p>After mitigation, the significance of potential injury/mortality effects of underwater noise on marine fish and marine mammals was determined to be negligible. The significance of potential for behaviour disturbance of marine fish and marine birds was negligible. The significance of potential for behavioural disturbance of marine mammals was not significant; any potential behavioral disturbance of marine mammals as a result of Proposed Project vessel noise is predicted to be localized, temporary, and reversible, with marine mammals either habituating to noise and remaining in the area, or leaving temporarily and returning once the noise has subsided. Given that no hearing impairment effects are likely and that no critical or sensitive marine mammal habitats occur within the RSA, no effects at the population level are anticipated for any marine mammal species known to frequent the RSA. Potential behavioral disturbance due to cumulative vessel noise effects is not predicted to result in a substantial change to the viability of marine mammal health in the RSA (i.e., the ability of the population to function over time within the defined spatial and temporal boundary).</p> <p>Measures for mitigating potential effects on Marine Resources, including noise effects on marine fish, mammals and birds, are detailed in Volume 2, Part B - Section 5.2.5.3 of the EAC Application/EIS.</p>

3520	692 - 18	My Sea to Sky	Not Stated	<p>Issue 12: Water Quality is insufficiently characterized in the application</p> <p>Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs.</p> <p>Recommendation: Siltation monitoring (both in the original and compensation channels and in the nearby ocean), with periodic reporting of results that are auditable and accessible to the public, should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.</p>	<p>A detailed assessment of potential surface water and groundwater effects of the Proposed Project are presented in Volume 2, Part B – Sections 5.5 Surface Water Resources) and 5.6 (Groundwater Resources) of the EAC Application/EIS.</p> <p>Positive effects on the flows in McNab Creek are predicted to result from reducing the rate of flow loss to the groundwater system. Increased baseflows are also predicted in the foreshore minor streams. Water quality predictions are below applicable Water Quality Guidelines.</p> <p>Groundwater flow is predicted to be less than the baseline during the first 15 years of operation. This loss represents a gain in flow in McNab Creek. Groundwater flow at closure will be controlled through adaptive management of the overflow structure. No water quality parameters are predicted to exceed BCWQG or CCME Guidelines.</p>
3521	692 - 19	My Sea to Sky	Not Stated	<p>Issue 12: Water Quality is insufficiently characterized in the application</p> <p>Removing sediment in the water discharged into the ocean is critical to habitat protection, not least for the nearby eel grass beds and glass sponge reefs.</p> <p>Recommendation: Siltation monitoring (both in the original and compensation channels and in the nearby ocean), with periodic reporting of results that are auditable and accessible to the public, should be part of any approval of the project. Local authorities (eg. SCRD) should have the power to compel a reduction, suspension or cessation of mine activities where sediment/siltation exceeds pre-agreed norms.</p>	<p>A Water Management Plan, currently being prepared for inclusion in the Mines Act and Water Sustainability Act Permit applications, will provide a long-term water management strategy that includes the management of water resources, a mitigation plan to reduce potential effects to water resources and an effects monitoring plan to monitor water resources in the receiving environment. The plan is designed to meeting the preliminary mitigation measures and commitments and assurances outlined in the EAC Application/EIS and those required by the Water Sustainability Act. Based on the water quantity and water quality monitoring programs (hydraulic heads and quality), if observed water levels and water quality start to show a trend towards potential negative effects to the receiving environment, then adaptive management will be undertaken. Adaptive management techniques to be implemented as required include:</p> <ul style="list-style-type: none"> <li>- Continue to evaluate the extent of the pit during operations.</li> <li>- During the wet season, if water levels in the pit lake become higher than has been designed for the Pit Lake Containment Berm then the valves in the culverts will be closed to reduce the amount of water reporting to the pit from the surface water on the western slope.</li> <li>- The height of the pit lake at the outlet structure can be adjusted to increase or decrease the level of the pit lake (e.g., adding or lowering stop logs) at closure to maintain the hydraulic gradient between McNab Creek and the Project Area following closure.</li> </ul>
3522	692 - 20	My Sea to Sky	Not Stated	<p>Issue 13: "Daytime Hours" definition</p> <p>The Proponent advertises that the plant will operate only on weekdays and during "daytime hours". Daylight hours vary seasonally, but the definition of "daytime hours" is unclear.</p> <p>Recommendation: Clearly define "daytime hours" in the proposal.</p>	<p>The Proposed Project will be in operations 8 to 10 hrs/day, 260 days/year (i.e., 5 days/week). The frequency of barge loading will be one every other day and it will take approximately 2 to 3 hrs to load each barge. All operational work will occur during seasonal daylight hours; the duration of work hours will vary depending on the time of year. As per the SCRD noise bylaw, operations will be limited to 7 AM to 9 PM, with the exception of holidays.</p> <p>Additional details regarding Proposed Project operations are provided in Volume 1, Part A – Section 2 of the EAC Application/EIS.</p>

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
3523	692 - 21	My Sea to Sky	Not Stated	<p>Issue 14: The nearshore strip of forest cover is too narrow</p> <p>The strip of forest cover between the pit and the ocean is too narrow to be sustainable. Blowdown and saltwater invasion will threaten its existence</p> <p>Recommendation: For reasons of sustainability and visual camouflage, increase the width of the ocean-pit separation strip, and lessen the size of the proposed pit and crushing area.</p>	<p>A detailed assessment of potential visual effects of the Proposed Project is presented in Volume 2, Part B – Section 7.4 of the EAC Application/EIS. The Proposed Project is predicted to present a relatively small level of visual change to the landscape with effects diminishing with increasing viewing distance. Following the application of proposed mitigation (e.g., layout, screening, revegetation, suitable lighting), potential effects are not predicted to demonstrate an evident contrast with the current landscape character or to produce a noticeable decline in the current level of visual quality. Maintaining a treed buffer along the foreshore (approx. 25-50 m wide adjacent to the processing area) will also limit dust and noise emissions to the marine environment. Additional screening of lan-based structures may be possible around project components not currently screened by existing vegetation. The nature and extent of vegetation screening incorporated into the site design will be described in the Vegetation Management Plan (Volume 3, Part E, Section 16 of the EAC Application/EIS).</p> <p>A detailed assessment of potential vegetation effects (including windthrow effects) of the Proposed Project is presented in Volume 2, Part B – Section 5.3 of the EAC Application/EIS. The significance of windthrow effects were determined to be negligible; few new windward edges will be created. Monitoring of treeline edges will be conducted to evaluate potential windthrow effects and adaptive management will be employed, if necessary.</p>
3524	692 - 22	My Sea to Sky	Not Stated	<p>Issue 15: Loss of property values in the nearby strata units</p> <p>The proponent claims little or no loss of value for nearby properties. This assertion is contradicted by many studies that have highlighted the loss of value (including the value associated with quiet enjoyment) at or near industrial sites adjacent to established residential areas. Recent jurisprudence in BC has borne out the right of homeowners to receive compensation for that loss. See <a href="http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882">http://www.cbc.ca/news/canada/british-columbia/grace-isletcontroversy-ends-as-b-c-steps-in-to-buy-land-1.2906882</a></p> <p>Recommendation: Fair market value compensation for loss of property value must form part of the economic analysis of any approval for this mine.</p>	<p>Potential effects on real estate values are presented in Section 6.1 of the EAC Application/EIS.</p> <p>The closest property owners to the Proposed Project is the McNab Creek Strata located east of McNab Creek, approximately 500 metres from the northern boundary of the BURNCO property. Mitigation is proposed to address potential nuisance effects such as changes in air quality, visual quality and noise levels; all related potential effects were determined to be negligible or not significant.</p> <p>Additional mitigation is proposed that is designed to offset potential changes in real estate values of these properties that will likely enhance their marketplace value (e.g., access arrangements and potential interconnection to BC Hydro electricity service to enable the elimination of fossil fuel fired generator use).</p> <p>BURNCO is committed to being a good neighbour and has initiated discussions with the McNab Creek Strata owners regarding issues of mutual benefit and concern. BURNCO is consulting with the community on a Community Enhancement Fund that would be allocated to the surrounding community. These discussion are ongoing.</p>
3525	692 - 23	My Sea to Sky	Not Stated	<p>Issue 16: First Nation consultation – Sechelt FN was omitted this time</p> <p>Squamish and Tseil-Waututh First Nations have been consulted re Burnco, but not the Sechelt FN. The Sechelt First Nations weren't consulted about the gravel quarry at McNab Creek in 2009 either. McNab Creek is in Sechelt traditional territory.</p> <p>Recommendation: Respect/consult with Sechelt First Nations re Burnco.</p>	<p>First Nation consultation requirements are delegated to Proponents by the Crown. For the Proposed Project, only Squamish Nation and the Tseil-Waututh Nation were identified as potentially affected first Nations by the BCEAO. The CEA Agency identified additional Aboriginal Group, however, the Sechelt First Nation was not among these, presumably because of the proximity of the proposed Project to their Traditional Territory.</p>

	Ref #	Commenter (Name)	Location		
3526	692 - 24	My Sea to Sky	Not Stated	<p>Issue 17: Advisory Committee of voluntary citizens</p> <p>In 2009 when a gravel quarry at McNab Creek was turned down by SCRD, one requirement was an Advisory Committee of volunteer citizens to provide ongoing input with the goal of community acceptance of the project.</p> <p>Recommendation: Require the formation of an Advisory Committee of volunteer citizens.</p>	<p>BURNCO will establish a Community Advisory Group (CAG) to provide a forum for interested stakeholders to review, discuss and make recommendations. CAG terms of reference and meeting minutes will be made available online.</p>
3527	692 - 25	My Sea to Sky	Not Stated	<p>Issue 18: The job benefits were analyzed on the basis of too narrow an RAA.</p> <p>BURNCO currently sources its aggregate from Jervis Inlet, Port McNeil and Coquitlam. To gauge the benefits to the BC economy, the net job creation figures (i.e. McNab's 12 jobs less the job losses at the above aggregate sources) as a consequence of allowing the McNab Creek operation must be considered.</p> <p>Recommendation: If there is little or no net job gain to BC as a result of this proposal, it should be firmly rejected. Jobs in areas like Port McNeil are much harder to come by than in the Lower Mainland/ Howe Sound.</p>	<p>The local spatial study area for the operations phase labour market effects (including employment) of the Proposed project was described in the Application Information Requirements/EIS Guidelines, which was approved by the BCEAO and the CEA Agency on December 16, 2014 after review by the Technical Working Group established to guide the assessment. This local spatial study area is Sunshine Coast Regional District.</p> <p>The current and future demand for aggregates in BC's Lower Mainland and in major cities along the US west coast from various buyers for construction projects is robust. As a result of this demand, aggregate supply sources on and near the BC coast are expected to continue to experience strong buyer interest over the long term for their products.</p>

3528	692 - 26	My Sea to Sky	Not Stated	<p>Issue 19: Barge traffic will diminish Howe Sound's recreational and tourism potential and add to the cumulative traffic hazard in Howe Sound</p> <p>Shipping 1-4 million tonnes of aggregate annually from this location will make for 2-6 tug/barge movements daily through Southern Howe Sound,. Routes would cross very busy sailing and small-boat recreational areas, the Howe Sound Marine Trail and ferry routes, the path of LNG tankers exiting from the Woodfibre LNG plant and freighters from Squamish Terminals. This exponentially increases the risk of collisions and loss of life in a narrow waterway and diminishes the amenity and tourism use of the Sound. The cumulative effects and worst-case hazard analysis of this project have been underestimated by the Proponent.</p> <p>Recommendation: A cumulative impact assessment, including loss of amenity and tourism value of the Sound, should be completed prior to deciding on this application. So too should a study of the increased hazards associated with increasing the large-vessel traffic in Howe Sound. Improvements to vessel tracking, buoys and channel markers in the area will be necessary.</p>	<p>Section 7.2 of the EAC Application/EIS presents a marine transportation assessment, including potential wake effects from the Proposed Project-related vessel traffic on shoreline infrastructure, and potential interference with navigation use and navigability due to Proposed Project-related infrastructure and vessel traffic.</p> <p>There is no potential interaction between potential wake effects and shoreline infrastructure, therefore the nature of this interaction was determined to be negligible. The potential effects of the Proposed Project on navigation use and navigability associated with Project-related infrastructure was determined to be negligible following the implementation of proposed mitigation.</p> <p>Potential effects of the Proposed Project on navigation use and navigability due to Project associated vessel traffic during construction and operations was determined to be not significant as the frequency of small vessels changing direction and speed to move out of the paths of larger vessels is expected to increase only slightly.</p> <p>Proposed Project-related barging may interact with Woodfibre LNG carriers along a small section of the Project's barging route. However, potential interactions between vessels would occur infrequently and potential cumulative residual effects are expected to be not significant following implementation of mitigation measures which include marine transportation management planning involving Canada Coast Guard, Pacific Pilotage Authority, the selected tug operator, BURNCO and other key maritime stakeholders – including Woodfibre LNG – to identify mutually agreeable operating practices.</p>
3529	692 - 27	My Sea to Sky	Not Stated	<p>Issue 20: The job benefits analysis used the questionable input-output econometric model.</p> <p>BURNCO has used input-output econometric analysis to predict the job creation benefits accruing to the project For resource projects, this is a highly questionable analysis technique. The Australian Institute has written a convincing argument highlighting the inadequacies of input-output analysis. See <a href="http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf">http://www.tai.org.au/sites/default/files/TB%2012%20The%20use%20and%20abuse%20of%20economic%20modelling%20in%20Australia_4.pdf</a> (Input-output was used by the BC Government in arriving at its inflated job estimates for BC's LNG industry.)</p> <p>Recommendation: Red-do the employment estimates and repost/ allow additional time for public scrutiny and comments</p>	<p>The environmental assessment of the Proposed Project used an input-output (I-O) impact modelling methodology to estimate the Project's potential effect on employment (as well as other economic parameters). The B.C. Input-Output Model (BCIOM) was used. The BCIOM is maintained by BC Stats, which is the central statistics agency of the B.C. government. The BCIOM is a version of Statistics Canada's Inter-Provincial Input-Output Model (IPIOM) which BC Stats calibrated for undertaking economic analyses of B.C.-based projects. The BCIOM is a robust, calibrated, third party provided input-output model, and has been previously accepted for use by by the BCEAO and the CEA Agency to assist with estimating the economic impact of proposed projects.</p>

3530	692 - 28	My Sea to Sky	Not Stated	<p>Issue 21: There was an inconsistency between the job creation figures shown in 2 different slides in the Open Houses</p> <p>One showed about 300 person-years of employment (over 25years). The other (derived from input-output analysis) showed person-year employment benefits several times that amount.</p> <p>Recommendation: This misleading discrepancy should be resolved by further analysis, and that section of the application re-submitted, with additional time allowed for public scrutiny and comment</p>	<p>The estimated number of jobs created by the proposed Project during construction and operations phases are presented in Section 2.5.4 of the EAC Application/EIS.</p> <p>Employment numbers were presented on three Open House display panels, as follows:</p> <ul style="list-style-type: none"> <li>- Project Specifications: 80 person years during construction and 360 person years during operations (direct, indirect and induced);</li> <li>- Project Benefits: 12 full-time jobs at the site (i.e. direct only);</li> <li>- Sustainable Economy: 119 jobs during construction and 99 jobs during operations (direct, indirect and induced); 33 long-term jobs during operations are expected to be filled by Sunshine Coast residents.</li> </ul>
3531	692 - 29	My Sea to Sky	Not Stated	<p>Issue 22: Preservation of marine tourism, hiking access to the vicinity of McNab</p> <p>Moorages, anchorages, swimming facilities and back-country access have long been part of the McNab Creek area's attractions for Howe Sound visitors and local boating clubs</p> <p>Recommendation: The application fails to properly address how these local amenities will be protected. Neither does it propose how loss of these amenities will be compensated for. The Management Plan should address this issue.</p>	<p>Harvesting fish and wildlife' and 'Outdoor recreation and tourism' are valued components in the environmental assessment of the Proposed Project (see Table 7.3-1). No displacement effects on recreational hunting or other recreational activities is anticipated due to the Proposed Project because the primary access to the local study area is through the Proposed Property, and public access and use of the Proposed Property has never been permitted. During the construction and operation phases, recreationists and tourists would continue to have access to the foreshore area below the high water mark and to the anchorage area in the vicinity of where McNab Creek enters Howe Sound.</p> <p>Proposed Project construction and operations would prevent marine-based recreational and tourism activities occurring around the Project jetty. As the jetty is located within an existing log boom tenure and recreational and tourism activities are concentrated on the eastern side of the local study area (where McNab Creek enters Howe Sound), this effect is considered to be negligible.</p> <p>Displacement on the water would occur on an intermittent basis as a result of Proposed Project-related vessel traffic, which would require smaller vessels to alter direction and/or speed when navigating at the same time as water taxis or barges (Volume 2, Part B - Section 7.2). These navigational challenges are present in the LSA due to forestry activity, and are subject to the Collision Regulations of the Canada Shipping Act. Any resulting effects on recreational boating recreational activities due to potential interactions of recreational vessels and equipment and Project-associated vessels are not detectable or not measureable, so potential effects of the Proposed Project on water-based recreation and tourism access matters in the construction and operation phases are determined to be negligible.</p> <p>As part of the Marine Transport Management Plan outlined in Marine Transport (Volume 2, Part B - Section 7.2), BURNCO would also develop and implement strategies, best management practices and guidelines to avoid and minimise Proposed Project - related disruption of marine-based recreational activities during construction and operations. As part of the development of this plan, BURNCO would consult with key marine user groups (e.g., McNab Strata, yacht clubs, camps, and kayaking operators) to discuss strategies (including but not limited to routing options) to manage the interaction of Proposed Project vessel traffic with recreational and tourism areas during the high season months.</p>

3536	693 - 4	Squamish-Lillooet Regional District	Pemberton, BC	The SLRD, through involvement with the Howe Sound Community Forum, is aware of and supportive of research work currently underway regarding glass sponge reefs in Howe Sound. As such, SLRD staff echo SCRD's recommendation that more thorough studies and surveys should be completed on glass sponge reef presence within 200 m of any at of the project area. SLRD staff are also supportive of the other recommendations made by SCRD staff, included below.	<p>A detailed assessment of potential effects on marine resources, including marine benthic communities, is presented in Volume 2, Part B –Section 5.2 of the EAC Application/EIS.</p> <p>Glass sponges are a group of filter feeding organisms which can form large sponge reefs that provide habitat for other marine invertebrate and fish species. Glass sponges in Howe Sound live at depths as shallow as -20 m (chart datum). BURNCO has included glass sponges in the assessment of potential effects on marine resources.</p> <p>Although no glass sponges were observed during the dive and towed video surveys of the Proposed Project area, foreshore and sub-tidal nearshore conducted for the assessment, their known occurrences throughout Howe Sound have been documented. The marine footprint of the Proposed Project does not overlap with any known or mapped locations of glass sponges or glass sponge reefs occurrences.</p> <p>Potential residual effects of propeller scour and aggregate spills on glass sponges were assessed. Propeller wash velocities at the depths at which glass sponges occur are predicted to be within the same magnitude as tidal currents present at this depth. With the application of proposed mitigation, the likelihood of an aggregate spill adversely affecting glass sponge colonies is low. The significance of potential residual effects on marine benthic communities, including glass sponges, were determined to be negligible or not significant.</p>
3537	693 - 5	Squamish-Lillooet Regional District	Pemberton, BC	i. The Fish Habitat Offset Plan needs to be implemented at the outset of the project to allow for mature vegetation cover and for adjustments to be made to ensure the plan functions as expected;	BURNCO has committed to constructing the habitat offset channel extension prior to construction of the Project and effects to the existing groundwater fed channel.
3538	693 - 6	Squamish-Lillooet Regional District	Pemberton, BC	ii. Sufficient funds should be set aside by BURNCO to allow for long term maintenance of the new stream and related infrastructure, such as the overflow gate and a channel from the pit lake, to ensure the plan functions as expected and to include a contingency plan to be followed if the compensation plan fails.	Agreed, BURNCO expects that the provision of a letter of credit covering monitoring, construction and maintenance of any habitat offsetting will be required under the fisheries protection provisions of the Fisheries Act.
3539	693 - 7	Squamish-Lillooet Regional District	Pemberton, BC	i. The impact on salmonids of contaminants in the water column due to disturbance of sediment needs to be assessed;	Project activities with potential to result in re-suspension of sediments as a result of seafloor disturbance are limited to the following: pile installation, vessel propeller scour, and vessel wake wash. The impacts of altered water quality (including increased contaminant exposure) on salmonids as a result of seabed disturbance and subsequent sediment resuspension from the above listed activities has been assessed under Vol. 2 of the EAC Application (refer to Section 5.2.5.2.1.1, Section 5.2.5.2.3.1, Section 5.2.5.4.1.1 and Section 5.2.5.4.1.3). Mitigation measures that will be implemented to avoid or minimize potential adverse effects associated with sediment disturbance are outlined in Section 5.2.5.3.1 and Table 5.2-18 of the EAC Application/EIS.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
3540	693 - 8	Squamish-Lillooet Regional District	Pemberton, BC	ii. More thorough studies and surveys should be completed on glass sponge reef presence within 200m of any part of the project area, and along any loaded barge transit routes, during the life of the project;	Glass sponges are known to occur throughout Howe Sound, in water depths below -20 m (chart datum). As part of marine baseline investigations, detailed underwater biophysical surveys were conducted in the proposed subtidal footprints of the proposed marine infrastructure (as well as adjacent areas) using SCUBA and towed video survey methods, with detailed information recorded on existing habitat and species present in these areas. This included systematic surveys targeting potential sponge reef habitats. The field surveys concluded that no glass sponge reefs were present in the proposed marine infrastructure (load-out jetty or walkway/conveyor) footprint. This information agrees with known habitat preferences of these organisms (i.e., water depths in the proposed marine infrastructure footprint are shallower than the depth range in which glass sponge reefs occur). In terms of interaction of glass sponge reef habitat with shipping activities, known sponge reefs occur in proximity to the proposed shipping route in several locations, with the closest occurring at the mouth of Ramillies Channel (Volume 4, Part G - Section 22.0 - Appendix 5.2-A, Figure 3). However, water depths at these locations along the proposed shipping route are below -25 m (chart datum). As such, potential impacts from shipping would be limited to propeller wash effects at the corresponding depths of these glass sponge reef occurrences. To assess this potential impact, propeller scour impacts on the seabed were assessed at a modelled depth of -20 m (chart datum) to correspond with the uppermost depths of glass sponge habitat. Jet velocities generated by the tug propeller at -20 m were compared to natural velocities derived from wave and tidal activity in Howe Sound. Estimates of maximum horizontal velocity associated with wind waves were developed from wave hindcasts from available wind data for the Strait of Georgia using the Halibut Bank Ocean Buoy (Environment Canada Station 46146) and are summarized in Table 5.2-12. At -20 m depth, the jet velocities of the proposed tug-assisted barge movements were shown to be within the same magnitude as tidal currents present at this depth, and below the velocity threshold (0.25 m/s) required for seabed particle mobilization (USACE 1989). Given that water depths along the proposed shipping route in the RSA are typically below -20 m (chart datum), the potential effects of tug propeller scour on glass sponge assemblages in the proposed shipping corridors were considered negligible and were not carried forward in the assessment.
3541	693 - 9	Squamish-Lillooet Regional District	Pemberton, BC	iii. The possible presence and impact on Northern Abalone, a species at risk, needs to be assessed;	As part of marine baseline investigations, detailed underwater biophysical surveys were conducted in the proposed intertidal and subtidal footprints of the proposed marine infrastructure (as well as adjacent areas) using SCUBA and towed video survey methods, with detailed information recorded on existing habitat and species present in these areas. This included systematic dive surveys in the marine environment using DFO-certified abalone biologists. The field surveys concluded that no abalone or abalone habitat were present in the proposed marine infrastructure footprint, as indicated in Section 5.2.5.5.1.2 of the EAC Application. Potential adverse impacts of the Project on abalone and abalone habitat were therefore considered to be negligible – not significant (Table 5.2-25).
3542	693 - 10	Squamish-Lillooet Regional District	Pemberton, BC	iv. If new federal government legislative criteria for acoustic injury or disturbance to marine mammals, or marine birds, becomes applicable during the life of the project then impacts of noise generating activity need to be re-evaluated and updated mitigation measures applied;	If new federal government legislative criteria for acoustic injury or disturbance to marine mammals or marine birds becomes applicable during the construction phase of the Project, then mitigation measures with respect to managing acoustic noise emissions will be based on the most current legislation.
3543	693 - 11	Squamish-Lillooet Regional District	Pemberton, BC	v. Vessel operators should receive an appropriate amount of training on how to avoid impact with marine mammals, as part of overall environmental related training, and records need to be kept of any incidents.	Mitigation measures applicable to vessel operators to avoid and/or minimize potential physical interactions between vessels and marine mammals are outlined in Section 5.2.5.3.1.4 of the EAC Application/EIS. This includes methods in how to avoid ship strikes on marine mammals. Vessel operators will be required to record any potential incidents involving a marine mammal strike.

Issue No.	Source			Public Comment/Issue	Proponent Response

3544	693 - 12	Squamish-Lillooet Regional District	Pemberton, BC	i. Consideration to reclamation of other portions of BURNCO's property should be set out as a means of identifying potential offset areas to mitigate negative impacts, such as the loss of land to the pit lake, and provide habitat enhancements.	The Proposed Project footprint was sited in an area with a long history of anthropogenic disturbance to minimize impacts to undisturbed habitat (including mature forest) and to generally minimize adverse effects on terrestrial resources. A Reclamation and Effective Closure Plan will be developed and will outline the goals associated with wildlife habitat restoration, methods of rehabilitating wildlife habitat, and parameters to gauge the success of reclamation. Habitat reclamation will occur progressively over the life of the Proposed Project to return habitat to a functional capability for supporting wildlife as soon as possible. A detailed wildlife mitigation and monitoring plan has not yet been developed but will be developed as part of the Wildlife Management (Protection) Plan to minimize impacts on terrestrial resources and to collect data that will help evaluate the effectiveness of implemented mitigations.
3545	693 - 13	Squamish-Lillooet Regional District	Pemberton, BC	i. Air quality monitoring stations should be located within or near the McNab Strata community and in the northern part of Gambier Island, and in a location along the Sea to Sky corridor, for the life of the project and these monitoring stations should be established at the outset of the project in order to establish meaningful baseline information;	Air quality monitoring will begin prior to the Project operations.  Within Section 5.7.6 of the EAC Application/EAC the Project Proponent has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7.  The predicted air quality concentrations as a result of the Proposed Project, in combination with existing levels were predicted to be well below the relevant air quality criteria at Gambier Island (Ekins Point) and along the Sea to Sky Corridor.
3546	693 - 14	Squamish-Lillooet Regional District	Pemberton, BC	ii. Information from the air quality monitoring stations must be made publicly available;	Air quality monitoring results can be made publicly available through arrangements with BURNCO and relevant government agencies.
3547	693 - 15	Squamish-Lillooet Regional District	Pemberton, BC	iii. The environmental certificate needs to include strong measures to address air quality problems and clearly identify the provincial or federal agency that is responsible for enforcement;	The comment is noted.  In addition to conditions stipulated in the Environmental Assessment Certificate, relevant permitting will also be undertaken following receipt of an Environmental Assessment Certificate.
3548	693 - 16	Squamish-Lillooet Regional District	Pemberton, BC	iv. Aggregate composition tests need to be done to ensure that harmful chemicals are not released during processing.	The project related release of metals within particulate matter to the air (that was used in the human health risk assessment) was based on site specific testing of the aggregate. No significant effects to public health were predicted (Volume 2, Part B, Section 9.1).
3549	693 - 17	Squamish-Lillooet Regional District	Pemberton, BC	i. Noise monitoring stations need to be located within or near the McNab Strata community and in the northern area of Gambier Island for the life of the project;	Noise monitoring locations will be included as part of the Noise Management Plan. Stations will be located to monitor noise levels at the McNab Strata and at Ekins Point on Gambier Island.
3550	693 - 18	Squamish-Lillooet Regional District	Pemberton, BC	ii. Information from the noise monitoring stations must be made publicly available;	Details of processing the noise monitoring results will be determined in the Noise Management Plan. Noise monitoring results can be made publicly available through arrangements with BURNCO and relevant government agencies.
3551	693 - 19	Squamish-Lillooet Regional District	Pemberton, BC	iii. The environmental certificate needs to include strong measures to address noise problems and clearly identify the provincial or federal agency that is responsible for enforcement;	Measures for mitigating potential noise effects are presented in Table 18-1 of the EAC Application/EIS. A Noise Management Plan will be developed, which will include a response plan to noise concerns received from nearby property owners. BURNCO will establish a mutually agreeable mechanism for engaging with the McNab Creek Strata owners regarding issues of benefit or concern.
3552	693 - 20	Squamish-Lillooet Regional District	Pemberton, BC	iv. Site operations shall be consistent with Sunshine Coast Regional District Noise Control Bylaw No. 597, 2008.	Operations will be restricted to 7 AM to 9 PM, consistent with the SCRDC Noise Control Bylaw section regarding Machine Noise.
3553	693 - 21	Squamish-Lillooet Regional District	Pemberton, BC	i. The SCRDC supports BURNCO'S commitment to local hiring and procurement;	Comment acknowledged. Information is noted as being present. No further information required.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
3554	693 - 22	Squamish-Lillooet Regional District	Pemberton, BC	ii. The SCRDC supports BURNCO'S commitment to reaching a benefit agreement with the McNab Strata community;	Comment acknowledged. Information is noted as being present. No further information required.
3555	693 - 23	Squamish-Lillooet Regional District	Pemberton, BC	iii. Marine tourism activities should be incorporated into the Access Management Plan.	The Marine Transport Management Plan (see Sec. 16.2.2.11) will have relevant information for all marine vessels, including marine tourism vessels, and for operators of tourism facilities that have a marine component, such as summer camps.
3556	693 - 24	Squamish-Lillooet Regional District	Pemberton, BC	i. Recreational access to existing anchorages in the area need to be maintained;	Anchorage by Project and non-project vessels within the Project's marine control zone will be subject to the direction and specifications of the Marine Transport Management Plan, and this document will incorporate Transport Canada requirements and reflect Navigation Protection Program permitting (which the Proposed Project is subject to).
3557	693 - 25	Squamish-Lillooet Regional District	Pemberton, BC	ii. Adequate safety lighting needs to be installed on marine facilities.	The Marine Transport Management Plan (see Sec. 16.2.2.11) will specify aids and navigational lights as per Project planning and the Navigation Protection Program permitting process. The navigational aids and lights specified in this plan will be installed and maintained.
3558	693 - 26	Squamish-Lillooet Regional District	Pemberton, BC	i. The SCRDC Lighting Guidelines must be followed for the lifetime of the project.	Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.
3559	693 - 27	Squamish-Lillooet Regional District	Pemberton, BC	As the net cumulative residual effects for grizzly bear were determined to be significant, with the Proposed Project contributing to factors limiting the population, and combined with the effects of other past, present and reasonably foreseeable project and activities (7% (528 ha) of suitable grizzly bear foraging habitat is predicted to be lost in the RSA), SLRD staff feel that significant attention must be given to this cumulative issue with EA conditions reflecting this.	BURNCO defers to the BCEAO on potential conditions of environmental assessment certification.  Grizzly bears in the RSA are limited by mortality due to human interactions (hunting, poaching, destruction of problem bears) rather than habitat. The project will not contribute to the factors limiting this sensitive population because the Project will not contribute to grizzly bear mortality. Therefore, the effects of the Project on grizzly bears are not significant. Other anthropogenic activities in the RSA have the potential to result in grizzly bear mortality, and therefore may contribute to the factor limiting grizzly bear populations in the RSA. As a result, the cumulative effects of human activities in the RSA on grizzly bears are significant.
3560	693 - 28	Squamish-Lillooet Regional District	Pemberton, BC	Finally, comparing Project GHG emissions to provincial, national and global emissions and thus determining the contribution of Project emissions are considered negligible undermines local efforts and local Climate Plans, targets and goals. Local governments are mandated to include GHG reduction targets in their Official Community Plans and Regional Growth Strategies. It would be helpful for local governments if the Proposed Project GHG emissions were compared to local emissions, as well as provincial, national and global emissions. This local comparison is conducted for other Valued Components, such as Labour Market, and allows local governments and the public to understand how such project contribute to local plans, targets and goals.	A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS. Potential effects considered were changes in GHG emissions as a result of the Project, the Project's contribution to climate change through the emission of GHG's, and how potential changes in climate will affect project-related infrastructure. The assessment methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada. Estimated Project-related direct and indirect GHG emissions are presented in Table 5.8-10 and Table 5.8-11. respectively.  Proposed mitigation includes the use of electricity instead of fossil fuels, routine maintenance of vehicles, and minimizing idling of vehicles and tugs. Mitigation measures that will reduce GHG emissions are consistent with specific actions within the Seas-to-Sky Air Quality Management Plan.

3561	693 - 29	Squamish-Lillooet Regional District	Pemberton, BC	SLRD Board consideration of the Proposed Project further highlights the need for the Province to complete its Cumulative Effects Assessment of Howe Sound. The Agency and EAO indicated that they are very interested in understanding SLRD's key issues and concern with the Project - cumulative effects are a key issue and concern of the SLRD. The SLRD strongly encourages the Province to obtain more information on cumulative impacts before projects like the BURNCO Aggregate Mine Project (BURNCO) move forward and to complete the CEA so that it is available to local governments to help inform their decision making when assessing projects such as BURNCO.	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: - Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2. - Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4. - Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4. - Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.  As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
3562	694 - 1	Squamish-Lillooet Regional District	Pemberton, BC	Please find attached the Squamish-Lillooet Regional District (SLRD) submission in response to the Canadian Environmental Assessment Agency (the Agency) and B.C.'s Environmental Assessment Office (EAO) invitation for the public to comment as part of the ongoing environmental assessment of the BURNCO Aggregate Mine Project. The SLRD is appreciative of the opportunity to provide comments and the extension received to accommodate SLRD Board meeting schedules.	No specific response to this item is required in relation to the EAC Application/EIS which is the focus of the public comment period. It will be documented in the Application Review Public Issues Tracking and included in the documentation of public consultation activities.
3563	694 - 2	Squamish-Lillooet Regional District	Pemberton, BC	With respect to Air Quality and Noise issues, should the Ministers decide to issue an Environmental Assessment Certificate (EAC), SLRD staff feel that the EAC needs to include conditions to address Air Quality and Noise problems and clearly identify the province or federal agency that is responsible for enforcement.	BURNCO defers to the BCEAO on potential conditions of environmental assessment certification.
3564	694 - 3	Squamish-Lillooet Regional District	Pemberton, BC	Further, information from monitoring must be made publically available.	BURNCO has proposed a McNab Community Enhancement Fund (CEF) that would consist of money set aside each year of operation, based on output, to enhance the McNab community through targeted funding on projects throughout the region. Funding of projects would be given priority by BURNCO's Management Committee based on a number of criteria that would include: - Mitigation of project effects - Bringing amenities to our nearest neighbours - Supporting non-political groups actively improving Howe Sound through cleanup efforts, habitat improvements, etc. - Children's camps - Local united Way or similar organizations providing funding to community programs - Public amenities  The CEF is a funding mechanism which may be replaced by a Sunshine Coast Regional District fee at some future date. If such a fee were introduced, then the CEF would cease.

The significance of potential residual effects on marine benthic communities, including glass sponges, were determined to be negligible or not significant.</p>
3566	694 - 5	Squamish-Lillooet Regional District	Pemberton, BC	i. The Fish Habitat Offset Plan needs to be implemented at the outset of the project to allow for mature vegetation cover and for adjustments to be made to ensure the plan functions as expected;	BURNCO has committed to constructing the habitat offset channel extension prior to construction of the Project and effects to the existing groundwater fed channel.
3567	694 - 6	Squamish-Lillooet Regional District	Pemberton, BC	ii. Sufficient funds should be set aside by BURNCO to allow for long term maintenance of the new stream and related infrastructure, such as the overflow gate and a channel from the pit lake, to ensure the plan functions as expected and to include a contingency plan to be followed if the compensation plan fails.	Agreed, BURNCO expects that the provision of a letter of credit covering monitoring, construction and maintenance of any habitat offsetting will be required under the fisheries protection provisions of the Fisheries Act.
3568	694 - 7	Squamish-Lillooet Regional District	Pemberton, BC	i. The impact on salmonids of contaminants in the water column due to disturbance of sediment needs to be assessed;	Project activities with potential to result in re-suspension of sediments as a result of seafloor disturbance are limited to the following: pile installation, vessel propeller scour, and vessel wake wash. The impacts of altered water quality (including increased contaminant exposure) on salmonids as a result of seabed disturbance and subsequent sediment resuspension from the above listed activities has been assessed under Vol. 2 of the EAC Application (refer to Section 5.2.5.2.1.1, Section 5.2.5.2.3.1, Section 5.2.5.4.1.1 and Section 5.2.5.4.1.3). Mitigation measures that will be implemented to avoid or minimize potential adverse effects associated with sediment disturbance are outlined in Section 5.2.5.3.1 and Table 5.2-18 of the EAC Application/EIS.

3569	694 - 8	Squamish-Lillooet Regional District	Pemberton, BC	ii. More thorough studies and surveys should be completed on glass sponge reef presence within 200m of any part of the project area, and along any loaded barge transit routes, during the life of the project;	Glass sponges are known to occur throughout Howe Sound, in water depths below -20 m (chart datum). As part of marine baseline investigations, detailed underwater biophysical surveys were conducted in the proposed subtidal footprints of the proposed marine infrastructure (as well as adjacent areas) using SCUBA and towed video survey methods, with detailed information recorded on existing habitat and species present in these areas. This included systematic surveys targeting potential sponge reef habitats. The field surveys concluded that no glass sponge reefs were present in the proposed marine infrastructure (load-out jetty or walkway/conveyor) footprint. This information agrees with known habitat preferences of these organisms (i.e., water depths in the proposed marine infrastructure footprint are shallower than the depth range in which glass sponge reefs occur). In terms of interaction of glass sponge reef habitat with shipping activities, known sponge reefs occur in proximity to the proposed shipping route in several locations, with the closest occurring at the mouth of Ramillies Channel (Volume 4, Part G - Section 22.0 - Appendix 5.2-A, Figure 3). However, water depths at these locations along the proposed shipping route are below -25 m (chart datum). As such, potential impacts from shipping would be limited to propeller wash effects at the corresponding depths of these glass sponge reef occurrences. To assess this potential impact, propeller scour impacts on the seabed were assessed at a modelled depth of -20 m (chart datum) to correspond with the uppermost depths of glass sponge habitat. Jet velocities generated by the tug propeller at -20 m were compared to natural velocities derived from wave and tidal activity in Howe Sound. Estimates of maximum horizontal velocity associated with wind waves were developed from wave hindcasts from available wind data for the Strait of Georgia using the Halibut Bank Ocean Buoy (Environment Canada Station 46146) and are summarized in Table 5.2-12. At -20 m depth, the jet velocities of the proposed tug-assisted barge movements were shown to be within the same magnitude as tidal currents present at this depth, and below the velocity threshold (0.25 m/s) required for seabed particle mobilization (USACE 1989). Given that water depths along the proposed shipping route in the RSA are typically below -20 m (chart datum), the potential effects of tug propeller scour on glass sponge assemblages in the proposed shipping corridors were considered negligible and were not carried forward in the assessment.
3570	694 - 9	Squamish-Lillooet Regional District	Pemberton, BC	iii. The possible presence and impact on Northern Abalone, a species at risk, needs to be assessed;	As part of marine baseline investigations, detailed underwater biophysical surveys were conducted in the proposed intertidal and subtidal footprints of the proposed marine infrastructure (as well as adjacent areas) using SCUBA and towed video survey methods, with detailed information recorded on existing habitat and species present in these areas. This included systematic dive surveys in the marine environment using DFO-certified abalone biologists. The field surveys concluded that no abalone or abalone habitat were present in the proposed marine infrastructure footprint, as indicated in Section 5.2.5.5.1.2 of the EAC Application. Potential adverse impacts of the Project on abalone and abalone habitat were therefore considered to be negligible – not significant (Table 5.2-25).
3571	694 - 10	Squamish-Lillooet Regional District	Pemberton, BC	iv. If new federal government legislative criteria for acoustic injury or disturbance to marine mammals, or marine birds, becomes applicable during the life of the project then impacts of noise generating activity need to be re-evaluated and updated mitigation measures applied;	If new federal government legislative criteria for acoustic injury or disturbance to marine mammals or marine birds becomes applicable during the construction phase of the Project, then mitigation measures with respect to managing acoustic noise emissions will be based on the most current legislation.
3572	694 - 11	Squamish-Lillooet Regional District	Pemberton, BC	v. Vessel operators should receive an appropriate amount of training on how to avoid impact with marine mammals, as part of overall environmental related training, and records need to be kept of any incidents.	Mitigation measures applicable to vessel operators to avoid and/or minimize potential physical interactions between vessels and marine mammals are outlined in Section 5.2.5.3.1.4 of the EAC Application/EIS. This includes methods in how to avoid ship strikes on marine mammals. Vessel operators will be required to record any potential incidents involving a marine mammal strike.

3573	694 - 12	Squamish-Lillooet Regional District	Pemberton, BC	i. Consideration to reclamation of other portions of BURNCO's property should be set out as a means of identifying potential offset areas to mitigate negative impacts, such as the loss of land to the pit lake, and provide habitat enhancements.	The Proposed Project footprint was sited in an area with a long history of anthropogenic disturbance to minimize impacts to undisturbed habitat (including mature forest) and to generally minimize adverse effects on terrestrial resources. A Reclamation and Effective Closure Plan will be developed and will outline the goals associated with wildlife habitat restoration, methods of rehabilitating wildlife habitat, and parameters to gauge the success of reclamation. Habitat reclamation will occur progressively over the life of the Proposed Project to return habitat to a functional capability for supporting wildlife as soon as possible. A detailed wildlife mitigation and monitoring plan has not yet been developed but will be developed as part of the Wildlife Management (Protection) Plan to minimize impacts on terrestrial resources and to collect data that will help evaluate the effectiveness of implemented mitigations.
3574	694 - 13	Squamish-Lillooet Regional District	Pemberton, BC	i. Air quality monitoring stations should be located within or near the McNab Strata community and in the northern part of Gambier Island, and in a location along the Sea to Sky corridor, for the life of the project and these monitoring stations should be established at the outset of the project in order to establish meaningful baseline information;	Air quality monitoring will begin prior to the Project operations.  Within Section 5.7.6 of the EAC Application/EAC the Project Proponent has committed to developing an Air Quality and Dust Control Management Plan. This plan will include details on ambient air and meteorological monitoring such as monitoring locations, parameters to be monitoring and instruments used to monitor. In addition, establishment of an air quality and meteorological monitoring program has been identified as a specific mitigation measure within Section 5.7.  The predicted air quality concentrations as a result of the Proposed Project, in combination with existing levels were predicted to be well below the relevant air quality criteria at Gambier Island (Ekins Point) and along the Sea to Sky Corridor.
3575	694 - 14	Squamish-Lillooet Regional District	Pemberton, BC	ii. Information from the air quality monitoring stations must be made publicly available;	Air quality monitoring results can be made publicly available through arrangements with BURNCO and relevant government agencies.
3576	694 - 15	Squamish-Lillooet Regional District	Pemberton, BC	iii. The environmental certificate needs to include strong measures to address air quality problems and clearly identify the provincial or federal agency that is responsible for enforcement;	The comment is noted.  In addition to conditions stipulated in the Environmental Assessment Certificate, relevant permitting will also be undertaken following receipt of an Environmental Assessment Certificate.
3577	694 - 16	Squamish-Lillooet Regional District	Pemberton, BC	iv. Aggregate composition tests need to be done to ensure that harmful chemicals are not released during processing.	The project related release of metals within particulate matter to the air (that was used in the human health risk assessment) was based on site specific testing of the aggregate. No significant effects to public health were predicted (Volume 2, Part B, Section 9.1).
3578	694 - 17	Squamish-Lillooet Regional District	Pemberton, BC	i. Noise monitoring stations need to be located within or near the McNab Strata community and in the northern area of Gambier Island for the life of the project;	Noise monitoring locations will be included as part of the Noise Management Plan. Stations will be located to monitor noise levels at the McNab Strata and at Ekins Point on Gambier Island.
3579	694 - 18	Squamish-Lillooet Regional District	Pemberton, BC	ii. Information from the noise monitoring stations must be made publicly available;	Details of processing the noise monitoring results will be determined in the Noise Management Plan. Noise monitoring results can be made publicly available through arrangements with BURNCO and relevant government agencies.
3580	694 - 19	Squamish-Lillooet Regional District	Pemberton, BC	iii. The environmental certificate needs to include strong measures to address noise problems and clearly identify the provincial or federal agency that is responsible for enforcement;	Measures for mitigating potential noise effects are presented in Table 18-1 of the EAC Application/EIS. A Noise Management Plan will be developed, which will include a response plan to noise concerns received from nearby property owners. BURNCO will establish a mutually agreeable mechanism for engaging with the McNab Creek Strata owners regarding issues of benefit or concern.
3581	694 - 20	Squamish-Lillooet Regional District	Pemberton, BC	iv. Site operations shall be consistent with Sunshine Coast Regional District Noise Control Bylaw No. 597, 2008.	Operations will be restricted to 7 AM to 9 PM, consistent with the SCRDC Noise Control Bylaw section regarding Machine Noise.
3582	694 - 21	Squamish-Lillooet Regional District	Pemberton, BC	i. The SCRDC supports BURNCO'S commitment to local hiring and procurement;	Comment acknowledged. Information is noted as being present. No further information required.

Issue No.	Source			Public Comment/Issue	Proponent Response
	Ref #	Commenter (Name)	Location		
3583	694 - 22	Squamish-Lillooet Regional District	Pemberton, BC	ii. The SCRDC supports BURNCO'S commitment to reaching a benefit agreement with the McNab Strata community;	Comment acknowledged. Information is noted as being present. No further information required.
3584	694 - 23	Squamish-Lillooet Regional District	Pemberton, BC	iii. Marine tourism activities should be incorporated into the Access Management Plan.	The Marine Transport Management Plan (see Sec. 16.2.2.11) will have relevant information for all marine vessels, including marine tourism vessels, and for operators of tourism facilities that have a marine component, such as summer camps.
3585	694 - 24	Squamish-Lillooet Regional District	Pemberton, BC	i. Recreational access to existing anchorages in the area need to be maintained;	Anchorage by Project and non-project vessels within the Project's marine control zone will be subject to the direction and specifications of the Marine Transport Management Plan, and this document will incorporate Transport Canada requirements and reflect Navigation Protection Program permitting (which the Proposed Project is subject to).
3586	694 - 25	Squamish-Lillooet Regional District	Pemberton, BC	ii. Adequate safety lighting needs to be installed on marine facilities.	The Marine Transport Management Plan (see Sec. 16.2.2.11) will specify aids and navigational lights as per Project planning and the Navigation Protection Program permitting process. The navigational aids and lights specified in this plan will be installed and maintained.
3587	694 - 26	Squamish-Lillooet Regional District	Pemberton, BC	i. The SCRDC Lighting Guidelines must be followed for the lifetime of the project.	Volume 2, Part B, Section 7.4.5.3.2 of the EAC Application/EIS indicates adherence to design goals contained within the Sunshine Coast Regional District Outdoor Lighting Guidelines to maintain the quality of the night-time lighting environment and avoid lighting impacts as a proposed mitigation for potential lighting effects. Additional recommendations are identified from the Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations (CIE) to avoid lighting impacts.
3588	694 - 27	Squamish-Lillooet Regional District	Pemberton, BC	As the net cumulative residual effects for grizzly bear were determined to be significant, with the Proposed Project contributing to factors limiting the population, and combined with the effects of other past, present and reasonably foreseeable project and activities (7% (528 ha) of suitable grizzly bear foraging habitat is predicted to be lost in the RSA), SLRD staff feel that significant attention must be given to this cumulative issue with EA conditions reflecting this.	BURNCO defers to the BCEAO on potential conditions of environmental assessment certification.  Grizzly bears in the RSA are limited by mortality due to human interactions (hunting, poaching, destruction of problem bears) rather than habitat. The project will not contribute to the factors limiting this sensitive population because the Project will not contribute to grizzly bear mortality. Therefore, the effects of the Project on grizzly bears are not significant. Other anthropogenic activities in the RSA have the potential to result in grizzly bear mortality, and therefore may contribute to the factor limiting grizzly bear populations in the RSA. As a result, the cumulative effects of human activities in the RSA on grizzly bears are significant.
3589	694 - 28	Squamish-Lillooet Regional District	Pemberton, BC	Finally, comparing Project GHG emissions to provincial, national and global emissions and thus determining the contribution of Project emissions are considered negligible undermines local efforts and local Climate Plans, targets and goals. Local governments are mandated to include GHG reduction targets in their Official Community Plans and Regional Growth Strategies. It would be helpful for local governments if the Proposed Project GHG emissions were compared to local emissions, as well as provincial, national and global emissions. This local comparison is conducted for other Valued Components, such as Labour Market, and allows local governments and the public to understand how such project contribute to local plans, targets and goals.	A detailed assessment of potential climate change effects of the Proposed Project is presented in Volume 2, Part B – Section 5.8 of the EAC Application/EIS. Potential effects considered were changes in GHG emissions as a result of the Project, the Project's contribution to climate change through the emission of GHG's, and how potential changes in climate will affect project-related infrastructure. The assessment methodology for the EAC Application/EIS reflects accepted EA practice in BC and Canada. Estimated Project-related direct and indirect GHG emissions are presented in Table 5.8-10 and Table 5.8-11. respectively.  Proposed mitigation includes the use of electricity instead of fossil fuels, routine maintenance of vehicles, and minimizing idling of vehicles and tugs. Mitigation measures that will reduce GHG emissions are consistent with specific actions within the Seas-to-Sky Air Quality Management Plan.

3590	694 - 29	Squamish-Lillooet Regional District	Pemberton, BC	SLRD Board consideration of the Proposed Project further highlights the need for the Province to complete its Cumulative Effects Assessment of Howe Sound. The Agency and EAO indicated that they are very interested in understanding SLRD's key issues and concern with the Project - cumulative effects are a key issue and concern of the SLRD. The SLRD strongly encourages the Province to obtain more information on cumulative impacts before projects like the BURNCO Aggregate Mine Project (BURNCO) move forward and to complete the CEA so that it is available to local governments to help inform their decision making when assessing projects such as BURNCO.	Existing Land and Resource Management Plans and protection or conservation area designations were considered in assessing potential effects on land and resource uses. These are summarized in the following technical sections as follows: <ul style="list-style-type: none"> <li>- Land and Resource Management Plans: Volume 2, Part B – Section 7.3.4.2.</li> <li>- Protection and conservation designations for Terrestrial Wildlife: Volume 2, Part B – Section 5.3.1.4.</li> <li>- Protection and conservation designations for Terrestrial Vegetation: Volume 2, Part B – Section 5.3.2.4.</li> <li>- Protection and conservation designations for Marine Resources: Volume 2, Part B – Section 5.2.4.</li> </ul> As a property owner and stakeholder in the area, BURNCO would be pleased to participate in a broader planning exercise for Howe Sound. EA is not typically a forum for developing new land and resource use planning areas, designations, or objectives.
