Tervita Silverberry Landfill Amendment Application Project

Environmental Assessment Certificate Application for the Tervita Silverberry Landfill Amendment Application Project

Revision 1

December 2019

Tervita Corporation

Application Summary

Summary of Project

Project Description

Tervita Corporation (Tervita) is proposing to expand the depleted capacity of the Silverberry Secure Landfill (the existing landfill). The existing landfill, located on privately owned land at 8-88-20 W6M, approximately 50 kilometres (km) northwest of Fort St. John, British Columbia (BC), was originally constructed in 2003. The proposed Tervita Silverberry Landfill Amendment Application Project (the proposed Project expansion) will be located on land owned by Tervita, immediately east of the existing landfill, and will be approximately the same size as the existing landfill footprint (roughly 25 hectares [ha]). Landfill cells are constructed in a staged manner dependent on fill rate, typically with only one cell operational at a time. Associated infrastructure and facilities located on the existing Tervita property include access roads, drainage ditches, and groundwater monitoring wells, as well as the office and weigh scales. Infrastructure and associated facilities are in operation for the existing landfill and will continue to be used for the proposed Project expansion. In addition, stormwater and leachate management and monitoring systems are in place at the existing landfill, and will be expanded or upgraded, where appropriate, to account for stormwater retention and leachate generation associated with the proposed Project expansion.

Project Scope

Similar to the existing landfill, the proposed Project expansion will be developed as a series of cells. The future landfill development area has been conceptually designed to accommodate six cells of varying sizes. As additional cells are developed, the liner and leachate collection systems will be tied together to provide a continuous liner system under the entire proposed Project expansion footprint. This will allow final development of the area as one contiguous fill mass, rather than six individual pockets, as is standard landfill operating and construction practice. The location of the proposed Project expansion provides for a 50-metre (m) wide secure buffer zone on the property owned by Tervita, surrounding the active area of the existing landfill, as required under Section 25 (10) of the *Hazardous Waste Regulation*.

The type of waste accepted is not expected to change as a result of the proposed Project expansion, as the purpose of this Application is to replace depleted capacity. The types of waste that are currently accepted at the existing landfill include hydrocarbon-contaminated soils and sands, sulphur-contaminated soil, salt-contaminated soils, and other wastes associated with the oil and gas industry. Examples of other waste that may be accepted include construction and demolition materials such as cement, absorbents and desiccants, drill cuttings, and other sources of industrial waste.

The existing landfill consists of seven secure landfill cells, with one still to be developed under the existing approval, for a total of eight cells and an approved capacity of 3,933,000 cubic metres (m^3). It is anticipated that the final cell of the existing landfill will be constructed and filled to capacity by 2020. Tervita estimates that all amendments will be in place by spring 2020, with construction of the proposed Project expansion to commence in summer 2021. The landfill expansion area is located immediately east of the current landfill footprint. The expansion footprint will be approximately 25 ha (roughly the same size as the existing landfill footprint) and will be designed to handle approximately 5,275,000 m^3 of material. Similar to the existing landfill, the proposed Project expansion's landfill operation will be progressive in nature, with each cell being constructed and capped independently. These activities will be repeated approximately every 2 to 3 years thereafter as more cells are developed. At the end of its operational life, the proposed Project expansion will be decommissioned, and postclosure activities will commence. Any reclamation requirements will be determined at this time. Postclosure activities for the proposed Project expansion will be completed for a minimum of 25 years. The proposed Project expansion includes the following phases:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically [for example, every 2 or 3 years] during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading, and compaction. As each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).
- Closure/reclamation phase. When the capacity of all cells is reached, the landfill will be capped with an impermeable cap, and topsoil and seeding will occur (approximately 1 year following operations – Year 26).
- Postclosure phase is when the entire landfill has been capped and reclaimed, and monitoring will occur (approximately 25 years – Years 26 to 51).

Tervita has an Operations Plan in place for the existing landfill that includes a number of management and monitoring plans that describe environmental protection measures, instructions for carrying out proposed Project activities, environmental permit and approval conditions, and other environmental commitments, as well as applicable environmental laws and regulations that will be implemented by Tervita and their contractors during construction, operations, and closure/reclamation. The Operations Plan will be expanded to reflect the addition of the proposed Project expansion. Additional plans may be created, or existing plans may be modified, should the need arise as part of the adaptive environmental management of the existing landfill and the proposed Project expansion. Outlines of existing and proposed management plans are provided in Section 13 of this Application.

Project Purpose

The landfill amendment is required to replace depleted capacity and is therefore required to continue to provide service to the local area. The existing landfill currently holds approval (PR 17150) from the BC Ministry of Environment and Climate Change Strategy (MECCS) and approval (Environmental Assessment Certificate [EAC] WD02-01) from the BC Environmental Assessment Office [EAO]. Tervita (then Canadian Crude Separators Inc. [CCS]) was incorporated in the Province of Alberta in November 2007, and is registered as an Extraprovincial Company in the Province of BC (Attachment 1). In 2012, CCS and 12 owned subsidiaries (including HAZCO, Prodrill, Concord, and others) came together under the new name of Tervita Corporation. There were no ownership changes to the company. On May 21, 2019, Tervita requested that the name on EAC WD02-01 be changed from CCS to Tervita Corporation (see Attachment 2).

Applicable Permits

Pursuant to Section 19 of the BC *Environmental Assessment Act* (*EA Act*), the proposed Project expansion is subjected to review by the BC EAO for amendment of the existing Project Approval Certificate (PAC) (WD02-01; now known as the EAC) and BC MECCS for amendment of Permit PR 17150.

Environmental and Social Benefits

The proposed Project expansion will allow Tervita to continue to provide timely, orderly, environmentally sound, and economical options for the disposal of oilfield waste in northeastern BC. The advantages of the proposed Project expansion over constructing and operating a landfill at a new site include:

- Minimizing potential adverse effects by limiting the overall physical disturbance necessary to construct and operate the proposed Project expansion to locations where Tervita holds the disposition rights to that land.
- Incorporating operational activities associated with new infrastructure into existing activities.
- Leveraging existing data to understand potential interactions of the existing landfill and the environment, with over a decade of results through routine monitoring of surface and groundwater quality, air quality, and soil quality.

- Keeping the proposed Project expansion away from residential areas.
- Avoiding the creation of new access corridors, which may result in adverse and unintended consequences on wildlife and wildlife habitat and interfere with surrounding land uses.
- Minimizing potential adverse effects on aesthetic value of the landscape, since the proposed Project expansion will be co-located with an existing landfill that has already altered the viewshed in the area.
- Reducing the likelihood that the proposed Project expansion will interact with previously unidentified heritage resources, since the land is previously disturbed and has low potential for heritage resources.
- Reducing costs consistent with prudent company management and long-term sustainability; expanding the existing landfill site is substantially more cost-effective than constructing and operating a landfill at a new site.

Employment

- Contracting and employment opportunities: The capital cost of the Project is estimated at $43.5 million to be spent during the entire expansion. Approximately $9 million will be spent to expand the landfill every 3 to 4 years. Project development (construction) is expected to provide direct employment for approximately 20 workers during the 4- to 5-month construction period for each cell, which is the equivalent of a total of 36 person-years for construction of all 6 proposed cells. Types of job requirements for landfill cell construction include an environmental and regulatory advisor, a landfill project manager, third-party landfill engineering firms, a construction crew, a liner crew, and an inspector. Most skills required for the Project exist within the local Fort St. John area; Tervita intends to hire locally, where possible.
- Increased revenue for local, regional, provincial, and federal governments: the construction of the Project will generate a demand for goods, services, and workers, which will contribute to the local and regional economy. There will be direct and indirect business income, and direct and indirect employment income. There will also be increased tax revenues during construction and operations as a result of sales tax and fuel tax, for example. The operations of the Project will also generate revenue in the form of property taxes.

Summary of Assessment Process

Provincial Environmental Assessment Process

This subsection provides information on the stages of the BC EAO process, including the Pre-Application stage and the EAC Amendment Application (the Application) Review stage.

Pre-Application Stage

The BC *EA Act* provides the legal framework for provincial environmental assessments of major projects that fall within thresholds defined under the *Reviewable Projects Regulation*, or which are otherwise determined to be reviewable under the *EA Act*. Pursuant to Section 19 of the *EA Act*, the proposed Project expansion is subject to review by the BC EAO for amendment of the existing PAC (WD02-01; now known as the EAC) and BC MECCS for amendment of Permit PR 17150. This Application has been developed pursuant to the BC EAO-approved Amendment Application Information Requirements (AAIR). The Pre-Application stage has concluded with the Tervita filing of the proposed Project expansion Application to the BC EAO.

Application Review Stage

Upon submission of this Application to the BC EAO, the Application will be reviewed against the information requirements specified in the AAIR for completeness. If the Application does not include all of the required information, the BC EAO may return the Application or request that the missing information be provided.

Once the Application is deemed complete and is accepted, the BC EAO will determine if the amendment is simple, typical, or complex. Review period timing varies depending on the complexity of the amendment, and ranges from less than 3 months for simple, 3 to 6 months for typical, and 6 months or more for complex amendments. The BC EAO will also determine the need for, and extent of, consultation and engagement with the public, Working Group members, and Aboriginal groups. Tervita may be required to take an active role in public and Aboriginal consultation and Working Group meetings to resolve outstanding issues.

The BC EAO will then prepare an Assessment Report of the Application, including revised or new conditions, as necessary. For typical and complex amendments, the report will also be reviewed by Tervita, relevant Working Group members, and Aboriginal groups. Upon completion of the review of the Assessment Report, documents will be finalized and referred to the BC EAO's Executive Director for a decision whether to issue the amendment.

Executive Director's Decision

The BC EAO will inform Tervita once a decision has been made either to amend the EAC or to refuse the amendment. The BC EAO will also notify the Working Group and Aboriginal groups of the decision. If approved, the amendment certificate and Assessment Report will be posted to the BC EAO's project information centre website.

Environmental Assessment Participants

Tervita initiated communication with key stakeholders, Aboriginal groups, local, provincial, and federal governments, local communities, and interested parties. Consultation is planned throughout the planning, construction, and operations phases. Additional information is provided in Part C – Aboriginal Consultation and Part D – Public Consultation.

During the Application Review period, Tervita will continue to work with the BC EAO, the Working Group, Aboriginal groups, local governments, local communities, and interested parties to share information on Project-related issues. Relevant federal, provincial, regional, and municipal elected officials and staff will be informed of the Application submission, and opportunities to review and comment on the Application will be available throughout the BC EAO process.

Working Group

The Working Group consists of representatives from provincial and federal government agencies, local and regional governments, and Aboriginal groups. For the purposes of this Application, the AAIR indicated continued consultation with the Working Group to provide advice and input on assessment evaluation criteria, proposed mitigation measures, and any other items related to the assessment of the proposed amendment, as requested by the BC EAO.

Consultation Approaches with Aboriginal Groups, the Public, and Government Agencies

Aboriginal Consultation

Details on the methodology and approach to Aboriginal consultation activities are provided in Tervita's Aboriginal Consultation Plan, as approved by the BC EAO.

The proposed Project expansion is within Treaty 8 boundaries and the asserted traditional territories of several Aboriginal groups and Métis organizations. Per a letter from BC EAO dated August 6, 2015, Tervita is required to consult with the following Aboriginal groups with asserted traditional territories overlapping the proposed Project expansion:

- Blueberry River First Nations (BRFN)
- Doig River First Nation (DRFN)

The proposed Project expansion is also located near the following Indian Reserves (IRs):

- Approximately 5 km south of the Blueberry River IR No. 205
- Approximately 20 km southeast of the Beaton River IR No. 204 (South Half)
- Approximately 40 km west-southwest of the Doig River IR No. 206
- Approximately 40 km northwest of the Halfway River IR No. 168

In accordance with the AAIR, Tervita has conducted consultation with BRFN and DRFN through Working Group meetings to: review documents and technical information, community meetings, and public open houses; and respond to written submissions, including comments and information requests pertaining to the Application. A detailed description of all consultation activities with BRFN and DRFN is provided in Part C of this Application.

Public Consultation

Details on the methodology and approach to public consultation activities are provided in Tervita's Public Consultation Plan, as approved by the BC EAO.

Tervita initiated public consultation on July 1, 2015. Residences, occupants, and landowners within 3,200 m of the Project were consulted in-person and by phone on September 9 and 10, 2015. Residences, occupants, and landowners within 5,000 m of the Project were notified by registered mail on September 10, 2015. An open house was held in the Community of Buick on February 16, 2016. An "Invitation to Comment" by the BC EAO was posted on the May 11, 2017, Alaska Highway News seeking public comments on the draft Valued Components (VCs). Details of occurred and planned public consultation activities for the Project are provided in Part D of this Application. Tervita will maintain continued communication and stakeholder engagement throughout the Application process and during the course of the Project.

Government Consultation

The government agencies that form the BC EAO Working Group include:

- Provincial agencies:
  - BC EAO
  - BC Ministry of Agriculture
  - BC MECCS
  - BC Ministry of Forests, Lands, Natural Resource Operations and Rural Development (MFLNRORD)
  - BC Ministry of Health
  - BC Ministry of Natural Gas Development
  - Northern Health
- Municipal and regional agencies:
  - Peace River Regional District
  - City of Fort St. John

Tervita hosted a landfill site tour with the BC Oil and Gas Commission and BC MECCS staff on September 23, 2015. During the tour, the operation of the existing landfill and plans for the proposed expansion area were discussed. On January 27, 2016, Tervita met with the BC EAO Working Group for comments on the draft VCs. On March 22, 2018, Tervita met with the BC EAO Working Group for their review and comments on the draft AAIR. Details of comments and how they were, or continue to be, addressed are provided in Section 2 and Appendix 12 of this Application.

Key Issues Raised by Aboriginal Groups, the Public, and Government Agencies

Key Issues Raised by Aboriginal Groups that have been brought forward by BRFN include potential effects of the Project to:

- Aboriginal rights and Traditional Land Use (TLU) activities
- Impacts to culturally important wildlife
- Habitat loss and contamination
- Air quality and odour
- Noise and light pollution
- Groundwater and surface water quality
- Contribution to cumulative effects in the region

Concerns that have been identified by DRFN include potential effects of the Project to:

- Spatial boundaries
- Soil quality
- Air quality
- Acoustic environment
- Surface water and groundwater
- Terrestrial vegetation
- Wildlife
- Impacts on TLU activities
- Healthy watersheds
- Culturally important wildlife, fish, and plants

Additional details concerning issues raised by Aboriginal groups are provided in Part C of this Application.

Key Issues Raised by the Public

During the open house held in the Community of Buick on February 16, 2016, the following concerns were raised:

- Landfill material on public highway
- Dirt and mud on roadways
- Speed of trucks
- General concerns for residential or private property impacts
- Landfill reclamation

These raised concerns were responded to during the open house and are addressed in the Application. No concerns were raised by the public during other consultation activities occurred for the Project. Additional details on Tervita's public consultation are provided in Part D of this Application.

Key Issues Raised by Government Agencies

Key issues that have been raised by government agencies include:

- Rationale for selection of draft VCs and VC indicators, and details in the AAIR for terrain and soils, air quality, surface water, groundwater, terrestrial vegetation including plant species at risk, First Nation culturally important species, and invasive plant species, fish and fish habitat, community infrastructure, and human health
- Study methods for soil study and air study
- Inclusion of economic benefit information in the Application
- Inclusion of existing landfill in cumulative effects assessment
- Consultation

These issues have been addressed prior to the finalization of the AAIR, as indicated in the responses to the Working Group's comments (Appendix 12), or are addressed in this Application.

Assessment of Environmental, Economic, and Social Effects

This section provides information on the assessment process used to: identify potential adverse effects; characterize potential residual adverse effects and cumulative adverse effects; and evaluate for significance of these adverse effects related to the environmental, economic, and social VCs for the proposed Project expansion.

Terrain and Soils

The identification of the potential effects of the proposed Project expansion on the Terrain and Soils VC is based on the results of the soils assessment performed for the proposed Project expansion, inclusive of loss of surface soil material through wind or water erosion and reduction in soil productivity due to loss or mixing of topsoil and subsoil.

The mitigation identified for the potential adverse effects associated with the proposed Project expansion on the Terrain and Soils VC was developed in accordance with industry and provincial regulatory guidelines and best management practices (BMPs), as well as in accordance with Tervita standards. The key mitigation measures include: constructing the landfill using a phased approach; implementing topsoil stockpiles that are contoured, stabilized, and seeded to prevent soil loss; suspending topsoil and subsoil salvaging during poor conditions; monitoring erosion after major storms or catastrophic events; implementing an Erosion and Sediment Control Plan, a Soil Conservation Plan, and a Dust and Odour Control Plan; installing a leak detection program; and monitoring design failures.

No potential residual effects have been identified for the Terrain and Soils VC. Given that there are no identified residual effects, a characterization and evaluation of significance of residual effects is not warranted.

Air Quality

The identification of the potential effects of the proposed Project expansion on the Air Quality VC is based on the results of the assessment performed for the proposed Project expansion, inclusive of an increase in air emissions (such as, dust) and Project contribution to greenhouse gas (GHG) emission levels.

The mitigation identified for the potential adverse effects associated with the proposed Project expansion on the Air Quality VC was developed in accordance with industry and provincial regulatory guidelines and BMPs, as well as in accordance with Tervita standards. The key mitigation measures include watering of roadways and curtailment of activity during high wind events, ensuring that equipment is well-maintained, reducing the idling of equipment, progressive capping of the waste with Low Density Polyethylene (LLDPE) to minimize the open landfill area, and implementing a Dust and Odour Control Plan and an Air Quality Monitoring Plan.

Residual adverse effects on the Air Quality VC are identified as an increase in air and GHG emissions during all phases of the proposed Project expansion. With implementation of the proposed mitigation measures, an increase in Project-related air emissions is predicted to be short-term in duration and of medium magnitude during construction, since long-term average concentrations will stay below Ambient Air Quality Objectives, and negligible magnitude during operation and closure/reclamation; therefore, the predicted residual effect is considered to be not significant. The proposed Project expansion's contribution to GHG emissions will be minor compared to provincial or national emissions totals, and the residual effect is considered to be not significant. With implementation of the proposed mitigation measures, the proposed Project expansion's contribution to potential cumulative effects on air emissions is of short-term duration and low magnitude, and is considered to be reversible. Consequently, the proposed Project expansion's contribution to cumulative effects on air emissions will be not significant.

Acoustic Environment

The identification of the potential effect of the proposed Project expansion on the Acoustic Environment VC is based on the results of the assessment performed for the proposed Project expansion, inclusive of an increase in noise levels.

The mitigation identified for the potential adverse effect associated with the proposed Project expansion on the Acoustic Environment VC was developed in accordance with industry and provincial regulatory guidelines and BMPs, as well as in accordance with Tervita standards. The key mitigation measures include construction work being done in daylight hours and operational work being done between the hours of 7 a.m. and 7 p.m, and equipment being well-maintained with properly functioning mufflers.

Residual adverse effects on the Acoustic Environment VC are identified as increased noise emissions during all phases of the proposed Project expansion. Noise emissions associated with the proposed Project expansion are short-term, localized, low in magnitude, and reversible; therefore, a residual effect of increased noise emissions is considered to be not significant. With implementation of the proposed mitigation measures, the proposed Project expansion's contribution to potential cumulative effects on the acoustic environment is of short-term duration and low magnitude, and is considered to be reversible. Consequently, the proposed Project expansion's contribution to cumulative effects on the Acoustic Environment VC will be not significant.

Surface Water

The identification of the potential effects of the proposed Project expansion on the Surface Water VC is based on the results of the assessment performed for the proposed Project expansion, inclusive of increased sediment in stormwater runoff and contamination of surface water due to accidental release of chemicals, oil, or other fuels from stormwater or leachate. The potential effects of contamination of surface water due to accidental release of chemicals, oil, or other fuels from stormwater or leachate are assessed in the Accidents and Malfunctions VC.

The mitigation identified for the potential adverse effects associated with the proposed Project expansion on the Surface Water VC was developed in accordance with industry and provincial regulatory guidelines and BMPs, as well as in accordance with Tervita standards. The key mitigation measures include constructing the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized, inspecting surface water control works weekly and/or immediately after a major storm or catastrophic event, repairing and mitigating erosion occurring on surface water control works as soon as possible, using mitigation measures to prevent surface water erosion, which may include swales, hay bales, rock riprap, and/or coconut matting, and implementing the Erosion and Sediment Control Plan, the Leachate Management Plan, and the Stormwater Management Plan.

No potential residual effects have been identified for the Surface Water VC. The landfill design along with the implementation of mitigation measures are expected to sufficiently avoid and/or prevent residual adverse effects to surface water quality. With the implementation of appropriate mitigation and remedial measures, there are no potential residual effects predicted for the Surface Water VC. Given that there are no identified residual effects, a characterization and evaluation of significance of residual effects is not warranted.

Groundwater

The identification of the potential effects of the proposed Project expansion on the Groundwater VC is based on the results of the assessment performed for the proposed Project expansion, inclusive of alteration of groundwater hydrogeology and contamination of groundwater due to accidental release of leachate. The potential effects of contamination of groundwater are assessed in the Accidents and Malfunctions VC.

The mitigation identified for the potential adverse effects associated with the proposed Project expansion on the Groundwater VC was developed in accordance with industry and provincial regulatory guidelines

and BMPs, as well as in accordance with Tervita standards. The key mitigation measures include constructing using a phased approach so that the disturbed and potentially exposed areas will be minimized.

No potential residual effects have been identified for the Groundwater VC. The existing landfill has mitigation measures in place that will be applied to the proposed Project expansion and the landfill design to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system). With the implementation of appropriate mitigation and remedial measures, there are no potential residual effects predicted for the Groundwater VC. Given that there are no identified residual effects, a characterization and evaluation of significance of residual effects is not warranted.

Terrestrial Vegetation

The identification of the potential effects of the proposed Project expansion on the Terrestrial Vegetation VC is based on the results of the assessment performed for the proposed Project expansion, inclusive of an introduction or spread of Noxious weeds; vegetation uptake of contaminants from air quality and dust dispersion and deposition; and loss or alteration of native vegetation.

The mitigation identified for the potential adverse effects associated with the proposed Project expansion on the Terrestrial Vegetation VC was developed in accordance with industry and provincial regulatory guidelines and BMPs, as well as in accordance with Tervita standards. The key mitigation measures include: noting areas of Noxious weeds/invasive plants during weekly inspections; cleaning vehicles and equipment as best as reasonably possible; bringing in a certified pesticide applicator on an as-needed basis; occasional watering of roadways and curtailment of activity during high wind events; constructing the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized; implementing the Dust and Odour Control Plan and the Air Quality Monitoring Plan; reducing disturbance to native vegetation, to the extent possible; and using a cover crop to assist in weed and erosion control, where warranted.

Residual adverse effects on the Terrestrial Vegetation VC are identified as a loss or alteration of native vegetation. The residual effect of the proposed Project expansion on the loss or alteration of native vegetation is predicted to be of low magnitude and is considered to be not significant. With implementation of the proposed mitigation measures, the proposed Project expansion's contribution to potential cumulative effects on native vegetation resulting from existing activities in combination with the Project and reasonably foreseeable developments is of low magnitude, is not significant, and is likely to persist with or without the Project.

Fish and Fish Habitat

There are no identified potential effects of the proposed Project expansion on the Fish and Fish Habitat VC as there is no direct discharge of surface water to water bodies, and no known channel connections exist between the proposed Project expansion and nearby fish-bearing water bodies.

The proposed Project expansion is not expected to result in a change in habitat or mortality risk, and no potential impacts to the Fish and Fish Habitat VC are predicted. Consequently, no further assessment of the Fish and Fish Habitat VC is warranted.

Wildlife and Wildlife Habitat

The identification of the potential effects of the proposed Project expansion on the Wildlife and Wildlife Habitat VC is based on the results of the assessment performed for the proposed Project expansion, inclusive of loss or alteration of wildlife habitat, changes to wildlife movement, and increased wildlife mortality risk.

The mitigation identified for the potential adverse effects associated with the proposed Project expansion on the Wildlife and Wildlife Habitat VC was developed in accordance with industry and provincial

regulatory guidelines and BMPs, as well as in accordance with Tervita standards. The key mitigation measures include: scheduling construction activities outside of the migratory bird nesting period; suspending activities and notifying the Environment & Regulatory Advisor if previously unidentified wildlife species with special conservation status or their site-specific habitat (for example, dens and nests) are identified during construction; implementing the Dust and Odour Control Plan and the Air Quality Monitoring Plan surrounding the active landfill area with a fence to limit wildlife interactions; prohibiting feeding or harassment of livestock or wildlife; seeking an amphibian salvage permit from BC MFLNRORD to salvage any amphibians (if found) from the construction footprint prior to construction activities; and having all personnel abide by all speed limits on the Project site and on transit to the site.

Residual adverse effects on the Wildlife and Wildlife Habitat VC are identified as a loss or alteration of wildlife habitat, changes to wildlife movement, and increased wildlife mortality risk, and are considered to be not significant. With implementation of the proposed mitigation measures, the proposed Project expansion's contribution to potential cumulative effects on wildlife habitat resulting from existing activities in combination with the Project and reasonably foreseeable developments is of low magnitude, is not significant, and is likely to persist with or without the Project. The potential cumulative effects causing changes in wildlife movement in the Wildlife and Wildlife Habitat are of low-to-medium magnitude, are not significant, and are likely to persist with or without the Project. Increased wildlife mortality risk was assessed as having a low probability of occurrence and is not considered likely to interact spatially or temporally with the Project to have a cumulative effect.

Economy

The identification of the potential effects of the proposed Project expansion on the Economy VC is based on the results of the assessment performed for the proposed Project expansion, inclusive of increased contract procurement and employment opportunities, and increased local, provincial, and federal revenue.

The predicted residual effects for the Economy VC are positive, and therefore, do not warrant mitigation or effects assessments.

Land and Resource Use

The identification of the potential effects of the proposed Project expansion on the Land and Resource Use VC is based on the results of the assessment performed for the proposed Project expansion, inclusive of disruption of resource use activities (such as, agriculture, timber harvesting, industrial use, and trapping activities) and disruption of First Nation land and resource use (such as, access to lands).

The mitigation identified for the potential adverse effects associated with the proposed Project expansion on the Land and Resource Use VC was developed in accordance with industry and provincial regulatory guidelines and BMPs, as well as in accordance with Tervita standards. The key mitigation measures include fencing the proposed Project expansion footprint to restrict agricultural and recreational use, providing forest tenure holders and trappers with information and protocols regarding the timeframe for construction, placing signage on access roads in the vicinity of the construction activities to notify road users that construction activities are taking place, providing First Nations with information and protocols regarding the timeframe for construction, and consulting with First Nations and considering specific requests for mitigation.

With the implementation of appropriate mitigation measures, including mitigation measures for the VCs that support First Nation land and resource use, there are no potential residual effects predicted for the Land and Resource Use VC, and a characterization and evaluation of significance of residual effects is not warranted. Consequently, a cumulative effects assessment is not required.

Community Services

The identification of the potential effect of the proposed Project expansion on the Community Services VC is based on the results of the assessment performed for the proposed Project expansion, inclusive of disruption of community life by temporary workers.

The mitigation identified for the potential adverse effects associated with the proposed Project expansion on the Community Services VC was developed in accordance with industry and provincial regulatory guidelines and BMPs, as well as in accordance with Tervita standards. The key mitigation measures include informing all responsible federal and provincial resource agencies and interested municipal officials of the Project developments, providing potentially affected Aboriginal groups with the proposed Project expansion construction schedule and maps, and adhering to Tervita's Alcohol and Drug Policy, and Health, Safety, and the Environment (HSE) Program.

Due to the limited size of the Project workforce and the sufficient availability of services in the City of Fort St. John, construction and operations of the Project are expected to have a negligible adverse impact on the Community Services VC and, consequently, with implementation of the mitigation provided, no residual effects were identified for the Community Services VC. Consequently, a cumulative effects assessment is not required.

Community Infrastructure

The identification of the potential effect of the proposed Project expansion on the Community Infrastructure VC is based on the results of the assessment performed for the proposed Project expansion, inclusive of increased traffic volumes as a result of transporting workers, supplies, equipment, and incoming waste for disposal.

The mitigation identified for the potential adverse effects associated with the proposed Project expansion on the Community Infrastructure VC was developed in accordance with industry and provincial regulatory guidelines and BMPs, as well as in accordance with Tervita standards. The key mitigation measures include: restricting all construction and operations activities to the approved designated survey area; adhering to safety and traffic regulations for all Project-related traffic; informing all responsible federal and provincial resource agencies and interested municipal officials of the Project developments; prebooking all incoming waste before arrival at the landfill site for receival during daylight hours, unless it is an emergency situation; implementing traffic management measures outlined in the Operations Plan; and adhering to Tervita's Alcohol and Drug Policy, and the HSE Program.

It is anticipated that the capacity of community infrastructure can handle the slight incremental demands of Project-related traffic without overburdening it. Consequently, construction and operations of the Project are expected to have a negligible impact on the Community Infrastructure VC and, with implementation of mitigation, no residual effects were identified for the Community Infrastructure VC. Consequently, a cumulative effects assessment is not required.

Cultural and Heritage Resources

The identification of the potential effect of the proposed Project expansion on the Cultural and Heritage VC is based on the results of the assessment performed for the proposed Project expansion, inclusive of disturbance of previously unidentified cultural or heritage resources during construction or operations.

The mitigation identified for the potential adverse effects associated with the proposed Project expansion on the Cultural and Heritage VC was developed in accordance with provincial regulatory guidelines and in accordance with Tervita standards. The key mitigation measures include prohibiting the collection of historical resources by Project personnel, and, if historical features not previously identified are found on the construction footprint, immediately notifying the BC Archaeology Branch, stopping work within the site, and implementing any other measures identified by the BC Archaeology Branch.

Since no archaeological resources were found on the Project footprint during the Archaeological Impact Assessment, there is low potential to encounter previously undiscovered heritage resources during Project construction. Construction and operations of the Project are expected to have a negligible adverse impact on the Cultural and Heritage VC and, consequently, with implementation of the mitigation provided, no residual effects were identified for the Cultural and Heritage VC. Consequently, a cumulative effects assessment is not required.

Human Health

The identification of the potential effects of the proposed Project expansion on the Human Health VC is based on the results of the assessment performed for the proposed Project expansion, inclusive of: change in drinking water quality; potential adverse human health effects due to the disturbance of contaminated soil; leachate effects on surface water, groundwater, or soil quality; decreased quality of country foods in plant gathering areas, hunting sites, and fishing areas; air quality effects on respiratory and cardiovascular health; and noise disturbance to nearby land users, including First Nations.

The mitigation identified for the potential adverse effects associated with the proposed Project expansion on the Human Health VC was developed in accordance with industry and provincial regulatory guidelines and BMPs, as well as in accordance with Tervita standards. The key mitigation measures include: using the existing stormwater management system for discharging surface water; extension of the existing landfill liner, leachate collection system, and leak detection system to prevent waste materials and leachate from being released to the subsurface; continuing quarterly ground water monitoring programs to detect any impacts to groundwater; continued use of existing dust suppression systems; implementing additional suppression measures to minimize dust generated from vehicular traffic; air filter monitoring at the property boundary; conducting construction work in daylight hours only and operational work between 7 a.m. and 7 p.m.; confirming that construction equipment adheres to low-emission Tier 4 engine specifications; confirming that equipment is well-maintained with properly functioning mufflers; confirming that operators take reasonable measures to control construction-related noise; and confirming that operators comply with all health and safety requirements.

No potential residual effects have been identified for the Human Health VC with the implementation of the proposed mitigation. Given that there are no identified residual effects, a characterization and evaluation of significance of residual effects is not warranted.

A qualitative Screening Level Human Health Risk Assessment (SLHHRA) was conducted to provide a conservative evaluation of potential risks to human health associated with the proposed Project expansion. The SLHHRA (Appendix 11) predicts that there are not significant risks of adverse health effects to human receptors from the proposed Project expansion. All pathways are predicted to have risks that are low or unlikely.

Accidents and Malfunctions

Potential Project accidents and malfunctions include: traffic-related accidents; release or spill of contaminants, such as hydrocarbons, hazardous materials, and naturally occurring radioactive materials (NORMs) containing materials (terrestrial, surface water, or groundwater); structural failure of a landfill component during construction or operations; onsite fires; and damage to existing Silverberry Landfill infrastructure. Consequences of these events potentially include effects on human health and contamination of onsite surface water, soil, and groundwater, and release of contaminants to air, adversely affecting nearby terrestrial and aquatic habitats.

As identified in the risk evaluation completed for accidents and malfunctions, the likelihood of any accidents and malfunctions occurring ranges from may to unlikely, while consequence ranges from minor to severe. Confidence ranges from high-to-moderate and is based on Tervita's extensive experience operating hazardous waste landfills throughout western Canada, including the safe and successful operational history of the existing Silverberry Landfill, as well as the effectiveness of mitigation, including Tervita's Operations Plan, and professional judgment. For all potential effects assessed, the risk rating was determined to range from low-to-medium after implementation of mitigation. There are no situations where likelihood and consequence would result in a very high risk or a high-risk accident or malfunction taking place.

Effects of the Environment on the Project

The identification of potential effects of the environment on the Project is based on the results of the assessment performed for the proposed Project expansion, inclusive of changing climate trends, extreme weather events, and wildfire.

The mitigation identified for the potential adverse effects associated with effects of the environment on the Project was developed in accordance with industry and provincial regulatory guidelines and BMPs, as well as in accordance with Tervita standards. The key mitigation measures include implementing: Tervita's Silverberry Site Emergency Response Plan; measures for erosion control and stormwater management; and procedures for dealing with fires specified in the Fire Control section of the Operations Plan.

The potential effects vary depending upon the timing, location, and magnitude of the event. However, given the implementation of the proposed mitigation, the probability of potential adverse effects to the Project are low. The magnitude of damage to the Project is considered to range from low-to-high depending on the variability of residual effects, but is immediate to short-term in duration and reversible. As a result, the predicted residual effects are not significant.

Conclusions

Based on the assessment results presented in this Application, Tervita concludes that the proposed Project expansion is not considered likely to result in significant residual adverse effects or cumulative effects.

Summary of Key Adverse Effects on Aboriginal Interests and Mitigation Measures

The potential Project-related effects identified by BRFN are as follows:

- Effects on TLU activities, including sensory disturbance (noise, odour, light, and visual effects) and effects on sense of place, cultural identity, and intergenerational transfer of knowledge
- Effects on resources used for TLU activities, including water, culturally important vegetation, fish, and wildlife
- Effects on traditional economy

The potential Project-related effects identified by DRFN are as follows:

- Effects on TLU activities, including sensory disturbance (noise and dust)
- Effects on resources used for TLU activities, including water, culturally important vegetation, trees, and wildlife

Mitigation measures to avoid or reduce adverse effects on Aboriginal interests identified by the Aboriginal groups include those relating to noise (see Section 4.3.4), air quality, including odour (see Section 4.2.4), light pollution at night (see Sections 4.8.4 and 4.2.4), surface water (see Section 4.4.4), groundwater (see Section 4.5.4), wildlife and wildlife habitat (see Section 4.8.4), and vegetation (see Section 4.6.4). As no effects have been identified for fish and fish habitat (Section 4.7), no mitigation measures are required.

Management Plans

To avoid or reduce the potential adverse effects and risk of adverse effects on the proposed Project expansion, Tervita has a number of management plans in place that describe: environmental protection measures; instructions for carrying out proposed Project expansion activities; environmental permit and approval conditions and other environmental commitments; and applicable environmental laws and regulations that will be implemented by Tervita and their contractors during construction, operations, and closure/reclamation. Outlines of existing and proposed management plans for all phases of the proposed

Project expansion are provided in Section 13 of this Application. These management plans include the following:

- Erosion and Sediment Control Plan
- Soil Conservation Plan
- Traffic Management Plan
- Emergency Preparedness and Response Plan
- Noxious Weeds Plan
- Vegetation Management Plan
- Wildlife Management Plan
- Air Quality Monitoring Plan
- Dust and Odour Control Plan
- Radiation Protection Plan
- Groundwater Monitoring Plan
- Leachate Management Plan
- Stormwater Management Plan
- Landfill Leak Detection Monitoring Plan
- Night Time Light Management Plan

Monitoring and Follow-up

Environmental monitoring refers to the procedures and activities that Tervita will implement as part of its environmental management systems to manage the environmental aspects of the proposed Project expansion. Environmental monitoring is a key component of Tervita's environmental compliance strategy and will be conducted by trained professionals, including the Environment & Regulatory Advisor, the Site Inspector, and resource-specific specialists, as needed. Trained personnel will monitor, advise, and work with Tervita construction management, as necessary, throughout all phases of the proposed Project expansion, to ensure continuous and consistent compliance with the environmental protection and socio-economic commitments.

Postconstruction monitoring (PCM) will be integrated with current operations and incorporated with other routine operational monitoring activities that will be expanded for the proposed Project expansion, including monitoring of soil erosion and dust control, groundwater quality, surface water quality, leachate generation, and air monitoring for NORM activity. Any environmental issues, associated mitigation, and follow-up will be incorporated into the annual operating reports and submitted to BC MECCS per guidance contained in the Operations Plan. Annual reclamation and closure reports will also be incorporated into the annual operating reports, as needed, detailing reclamation activities, such as drainage restoration, soil replacement, erosion control and revegetation, and associated follow-up, as needed.

While Tervita will integrate the proposed Project expansion into monitoring and reporting requirements currently in place for existing operations, Tervita will adhere to additional construction or PCM, follow-up, and reporting requirements required under Certificate Conditions.

Preface

Tervita Corporation (Tervita) is proposing to expand the depleted capacity of the Silverberry Secure Landfill (the existing landfill). The existing landfill was originally constructed in 2003. The proposed Tervita Silverberry Landfill Amendment Application Project (the proposed Project expansion) will be located on land owned by Tervita, immediately east of the existing landfill, and will be approximately the same size as the existing landfill footprint (roughly 25 hectares). Landfill cells are constructed in a staged manner dependent on fill rate, typically with only one cell operational at a time. Associated infrastructure and facilities located on the existing Tervita property include access roads, drainage ditches, and groundwater monitoring wells, as well as the office and weigh scales. Infrastructure and associated facilities are in operation for the existing landfill and will continue to be used for the proposed Project expansion. In addition, stormwater and leachate management and monitoring systems are in place at the existing landfill, and will be expanded or upgraded, where appropriate, to account for stormwater retention and leachate generation associated with the proposed Project expansion.

Pursuant to Section 19 of the British Columbia (BC) *Environmental Assessment Act*, the proposed Project expansion is subjected to review by the BC Environmental Assessment Office (EAO) for amendment of the existing Project Approval Certificate (PAC WD02-01; now known as the Environmental Assessment Certificate [EAC]) and the BC Ministry of Environment and Climate Change Strategy (MECCS) for amendment of Permit PR 17150.

This EAC Amendment Application (the Application) has been developed pursuant to the Amendment Application Information Requirements dated January 23, 2019 (Tervita 2019). This Application has been developed in consultation with relevant provincial, municipal, and regional agencies. Aboriginal consultation and public consultation conducted during preparation of the Application are provided in Parts C and D, respectively.

Members of the BC EAO Working Group involved in the development of the Application are listed in Table P-1.

		• Community Services				
		• Community Infrastructure				
		• Cultural and Heritage Resources				
		• Human Health				
		• Economy				
		• The Application will summarize the process and methodologies used to identify and select the VCs for assessment. The Application will also include the rationale for any differences in the list of VCs presented in the Application from those listed in the final AAIR.				
3.2	Assessment Boundaries	The Application will describe the methods used in identifying spatial, temporal, administrative and technical boundaries. Information on spatial, temporal, administrative and technical boundaries for specific VCs will be included in the appropriate VC sections of this document and will encompass all relevant Project phases, components and activities. It is standard practice for information gathered during each VC study and effects assessment to result in alterations to the spatial and temporal boundaries of a VC's LAAs and RAAs. If information is produced that indicates assessment boundaries should be adjusted to better reflect ecosystem boundaries and divides, study area boundaries will be revised. The Application will include the rationale for any differences in boundaries from those presented in the final AAIR.	3.2	Assessment Boundaries	Pages 3-4 to 3-5

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
3.2.1	Spatial, Temporal, Administrative, and Technical Boundaries	The spatial boundaries are considered as follows.	3.2.1 – 3.2.4	Spatial Boundaries, Temporal Boundaries, Administrative Boundaries, Technical Boundaries	Pages 3-5 to 3-10 Figures 3.2-1, 3.2-2, 3.2-3, and 3.2-4	
		• Project Footprint: The land area directly disturbed by Project construction and cleanup activities, including associated physical works and activities.				
		• Project Footprint: The land area directly disturbed by Project construction and cleanup activities, including associated physical works and activities.				
		• LAA: The LAA varies with the VC being considered. The LAA includes the Project Footprint and extends beyond it to incorporate the area within which the VC is most likely to be affected by the Project.				
		• RAA: The RAA varies with the VC being considered and includes the Project Footprint and LAA, and the area extending beyond the LAA where there is potential for the Project to have regional effects on the VC.				
		• Provincial: The area extending beyond regional or administrative boundaries, but confined to BC.				
		• National: The area extending beyond BC but confined to Canada.				
		• International: The area extending beyond Canada.				
		Each VC has specific definitions for spatial and temporal boundaries described under Sections 4.0 through Section 8.0 of the EA. The Application will identify any requested revisions for each VC and provide the rationale for boundary revisions or the retention of original boundaries.				
3.3	Existing Conditions	For each VC section (Environmental, Economic, Social, Heritage, and Health), the Application will include a description of the existing (or baseline) conditions within the study area in sufficient detail to enable potential Project-VC interactions to be identified, understood, and assessed:	3.3	Existing Conditions	Pages 3-10 to 3-11	Appendices 1 to 11
		• A description of the quality and reliability of the existing (or baseline) data and its applicability for the purpose used, including any gaps, insufficiencies and uncertainties, particularly for the purpose of monitoring activities				
		• Tervita will consider baseline conditions prior to construction of the original landfill as context for the cumulative effects assessment on environmental, economic, social, heritage, and health effects				
		• Reference to natural and/or human-caused trends that may alter the environmental, economic, social, heritage, and health setting, irrespective of the changes that may occur as a result of the proposed Project or other Project and/or activities in the area				
		• An explanation of if and how other past and present Projects and activities in the study area have affected or are affecting each VC				
		• Documentation of the methods and data sources used to compile information on existing (or baseline) conditions, including any standards or guidelines followed				
		• Where additional Project and VC-specific field studies are conducted, the scope and methods to be used will follow published documents pertaining to data collection and analysis methods, where these are available. Where methods used for the assessment deviate from applicable published guidance, the rationale for the variance will be provided in the Application				
		• Description of what TEK, was used in the VC assessment; an effort should be made, and the effort described in the Application, to integrate TEK with western data to identify both mutually supporting conclusions and areas of disagreement. Areas of disagreement may point to areas where further data collection is required				
		The Application will contain the existing (or baseline) technical reports in the Appendices and will summarize key findings contained in these technical reports directly in the Application, in a manner that allows the reader to understand each VC's effects assessment.				

Tervita Corporation Silverberry Secure Landfill Project

Table of Concordance - Application for Amendment of Project Approval Certificate WD02-01 (now known as Environmental Assessment Certificate) for Landfill Expansion

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
3.4	Potential Effects	The Application will summarize the overall process and methodologies used to identify and assess the potential effects of the proposed Project on the identified VCs.	3.4	Potential Effects	Pages 3-11 to 3-12	
		For each VC section, the Application will:				
		• Identify the potential interactions of the proposed Project and the considered and selected VCs				
		• Identify and describe the potential adverse effects resulting from the proposed Project				
		• Demonstrate how feedback from Aboriginal Groups, the public, stakeholders and government agencies on VC selection and assessment was incorporated, as appropriate				
		The Application will identify any Project activity-VC interactions that were excluded from further assessment, including the methods and criteria used to justify the exclusion and input received from BC EAO, government agencies, Aboriginal groups, and the public regarding the exclusion.				
3.5	Mitigation Measures	For each VC section, the Application will:	3.5	Mitigation Measures	Subsections 3.5.1 – 3.5.2 Pages 3-12 to 3-14	
		• Describe the approach to identify and analyze mitigation measures, including any management and compensation plans proposed by the Proponent, which will be implemented to address potential effects				
		• Describe the mitigation measures incorporated into the Project, including site and route selection, Project scheduling, Project design (for example, equipment selection, placement, and emissions abatement measures), and construction and operation procedures and practices				
		• Identify any mitigation measures associated with land use planning processes or bilateral and government to government agreements				
		• Describe any standard mitigation assumed or proposed to be implemented, including consideration of best management practices, environmental management plans, environmental protection plans, contingency plans, emergency response plans, and other general practices				
		• Clearly indicate how the mitigation measures will mitigate the potential adverse effects on the VC				
		• Provide the rationale for the proposed mitigation measures, including why further avoidance or reduction measures for adverse effects may not be considered feasible, and the need for and scope of any proposed compensation or offset				
		• Evaluate the anticipated success of each mitigation measure and describe rationale and analysis for these evaluations. If there is little relevant or applicable experience with a proposed mitigation measure and there may be some question as to its effectiveness, describe the potential risks and uncertainties associated with use of the mitigation				
		• Include the time required for mitigation to become effective, to enable understanding of the duration of residual effects and the temporal characteristics of reversibility				
		• Summarize the mitigation measures for potential Project effects by Project phase and identify any mitigation measures that are in management or compensation plans				
3.6	Characterization of Residual Effects	The following subsections summarize the assessment criteria to be used in the Application to characterize potential residual effects and make a significance determination.	3.6	Characterization of Residual Effects	Pages 3-14 to 3-16 Table 3.6-1	
3.6.1	Context	Context is informed by information on existing conditions, as well as ecological thresholds and levels of existing disturbance. Context provides an indication of the sensitivity and resilience of the VC to effects.	3.6	Characterization of Residual Effects	Pages 3-14 to 3-16 Table 3.6-1	

Tervita Corporation Silverberry Secure Landfill Project

Table of Concordance - Application for Amendment of Project Approval Certificate WD02-01 (now known as Environmental Assessment Certificate) for Landfill Expansion

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
3.6.2	Spatial Boundary	Each VC has a specific definition for the LAA and RAA described under Section 4.0 through Section 8.0 of the EA. The following categories will be used to characterize extent:	3.6	Characterization of Residual Effects	Pages 3-14 to 3-16 Table 3.6-1	
		• Project area and Site-specific – Residual effect is restricted to the Project area or a specific area of the LAA				
		• Local – Residual effect is restricted to the LAA				
		• Regional – Residual effect is restricted to the RAA				
		• Beyond Regional – Residual effect extends beyond the RAA				
		• Global – Residual effect extends globally				
		It is standard practice for information gathered during each VC study and effects assessment to result in alterations to the spatial and temporal boundaries of a VC's LAAs and RAAs. If information is produced that indicates assessment boundaries should be adjusted to better reflect ecosystem boundaries and divides, study area boundaries will be revised.				
3.6.3	Temporal Context	Duration (the length of time the residual effect persists (which may be longer than the duration of the physical work or activity that gave rise to the residual effect):	3.6	Characterization of Residual Effects	Pages 3-14 to 3-16 Table 3.6-1	
		• Immediate: Residual effect is limited to less than or equal to 2 days				
		• Short-term: Residual effect is limited to the initial construction phase, or any 1 year during the life of the Project				
		• Medium-term: Residual effect extends into the operations phase for up to 10 years				
		• Long-term: Residual effect extends into the operations phase for more than 10 years, but ceases during the operational life of the Project or upon decommissioning				
		• Extended-term: Residual effect extends beyond the decommissioning phase				
		Frequency (how often would the potential residual effect would occur):				
		• Single or Rare: Residual effect occurs one time or rarely occurs				
		• Infrequent: Residual effect occurs infrequently at multiple times				
		• Frequent or Regular: Residual effect occurs frequently, at regular intervals				
		• Continuous: Residual effect occurs continuously				
		Reversibility (period of time over which the residual adverse effect extends):				
		• Reversible: Residual effect is reversible to pre-construction or equivalent conditions • Irreversible: Residual effect is permanent				
		The temporal boundaries identified for the proposed Project include:				
		• Construction phase (approximately 6 months at the initiation of the proposed Project)				
		• Operations phase, including ongoing landfill clearing and construction activities, and progressive closure (approximately 25 years – Years 1 to 25)				
		• Closure/reclamation phase (approximately 1 year following operations – Year 26)				
		• Post-closure phase (approximately 25 years – Years 26 to 51)				

Tervita Corporation Silverberry Secure Landfill Project

Table of Concordance - Application for Amendment of Project Approval Certificate WD02-01 (now known as Environmental Assessment Certificate) for Landfill Expansion

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
3.6.4	Magnitude	Magnitude of the residual adverse effect on the Environment, Social, Economic, and Health Pillars:	3.6	Characterization of Residual Effects	Pages 3-14 to 3-16 Table 3.6-1	
		• Negligible: There is no detectable change from baseline conditions				
		• Low: The effect results in conditions that differ from the average value for baseline conditions, but remain within the range of natural variation and below a guideline or threshold value where applicable				
		• Medium: The effect results in conditions that differ measurably from the average value for baseline conditions and are equal to or slightly above the limits of natural variation, and/or are equal to or slightly above a guideline or threshold value, where applicable				
		• High: The effect results in conditions that differ substantially from baseline conditions, resulting in a clearly detectable change beyond the range of natural variation, and/or are measurable beyond a guideline or threshold value or at a regional population level, where applicable				
		Magnitude of the residual adverse effect on the Heritage Pillar:				
		• Negligible: No detectable changes to heritage or archaeology sites				
		• Minor: There are detectable changes to heritage or archaeology sites, but limited to small portions of sites of low significance, or portions of sites of higher significance that are already substantially disturbed				
		• Medium: Changes to small but intact portions of heritage or archaeological sites of moderate or high significance, or substantial and intact portions of sites of low significance				
		• High: Changes to substantial and intact heritage or archaeology sites of moderate or high significance				
		Magnitude of the residual adverse effect on GHG Emissions:				
		• Negligible: No measurable contribution to provincial or national emissions; very little or no measurable change based on comparison with national and provincial inventories				
		• Low: Emissions represent a small contribution to provincial or national emissions				
		• Medium: Emissions represent a moderate contribution to provincial or national emissions but are within regulatory limits and objectives				
		• High: Emissions cause exceedances of provincial or national emissions objectives or standards				
		The assessment period for the effects assessment includes planning, construction, operations, and decommissioning phases for the Project. In addition to the phases included in the assessment period of the effects assessment, the assessment period for the cumulative effects assessment includes the planning, construction, and operations phases of activities or projects that have previously occurred and those that are planned (publicly disclosed). The Application will describe, in a table format, the residual effects using the residual effects criteria context, magnitude, extent, duration, reversibility, and frequency, as defined in BC EAO's Guideline for the Selection of VCs and Assessment of Potential Effects (BC EAO 2013a). Where feasible, these criteria will be described quantitatively in the Application for each VC. When residual effects cannot be characterized quantitatively, the Application will characterize these effects qualitatively. Definitions will be provided when qualitative terms are used. The use of any qualitative terms (for example, high, moderate, or low) will be accompanied by distinct definitions for each of these rankings. An explanation will be included for the conclusion reached for each criterion used to characterize a residual effect. When residual effects on a VC are determined and the VC is also considered a “pathway” for other potential effects on other VCs, the Application will identify the linkages between the VCs and the discipline-specific studies to which the information has been forwarded for further evaluation.					

Tervita Corporation Silverberry Secure Landfill Project

Table of Concordance - Application for Amendment of Project Approval Certificate WD02-01 (now known as Environmental Assessment Certificate) for Landfill Expansion

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
3.7	Likelihood	The Application will assess the likelihood for all residual adverse effects using appropriate quantitative or qualitative terms and sufficient description to understand how the conclusions were reached. Definitions of any qualitative terms, such as 'low', 'moderate', or 'high' probability will be provided.	3.6	Characterization of Residual Effects	Pages 3-14 to 3-16 Table 3.6-1	
		• Low: The effect is unlikely to occur (as in a malfunction or accident or other low probability event)				
		• Medium: The effect may occur, depending upon the effectiveness of mitigation measures				
		• High: The effect will occur should the Project proceed				
3.8	Proponents Determination of significance	The Application will present the process and methodology used to define and evaluate the significance of residual effects, including how the term "significance" has been used in relation to each VC using quantitative and qualitative thresholds. A conclusion of significance of residual adverse effects will be provided for each VC.	3.7	Proponents Determination of significance	Page 3-16	
3.9	Confidence and Risk	The Application will summarize the process and methodology used to evaluate the levels of confidence associated with residual effects predictions and, in particular, how any identified uncertainty may affect either the likelihood or the significance of the predicted residual effect. The Application will also describe any measures to reduce uncertainty through monitoring, adaptive management, or other follow-up programs. The Application will summarize the process and methodology used to determine if additional risk analysis is required. If additional risk analysis is required, the Application will summarize the process and methodology used for this analysis and the conclusions, including the range of likely, plausible and possible outcomes with respect to likelihood and significance.	3.8	Confidence and Risk	Pages 3-16 to 3-17	
3.1	Cumulative Effects Assessment		3.9	Cumulative Effects Assessment	Pages 3-17 to 3-30 Subsections 3.9.1 to 3.9.8 Table 3.9-1 Figures 3.9-1 and 3.9-2	
3.10.1	Identifying Past, Present and Reasonably Foreseeable Projects, and/or Activities	The following development categories will be considered in the Application:				
		• Projects or activities that have already been built or conducted for which the environmental effects overlap with those of the proposed Project (that is, certain)				
		• Projects that are either proposed (public disclosure) or have been approved to be built, but are not yet built, for which the environmental effects overlap the proposed Project (that is, reasonably foreseeable)				
		The preliminary list of reasonably foreseeable projects that will be used in the cumulative effects assessment was developed using regulatory registries of major projects in BC (including BC Major Projects, BC Oil and Gas Commission, Canadian Environmental Assessment Agency, and BC EAO). See preliminary list on pages 26-27 for a minimum list of Projects that must be included (Tervita 2019). The search for future developments will be cut off 3 months prior to the submission of the Amendment Application to allow time for assessment of cumulative effects and mapping.				
		The Application will describe the methodology for identifying potential interactions between residual Project effects and the effects of other developments, including a description of the following:				
		• The spatial boundaries for the cumulative effects assessment for each VC, including maps				
		• The spatial and temporal boundaries of other developments				
		• The potential for interaction (spatial and temporal) and linkages (overlap) of VCs with other developments				
		The Application will include:				
		• A table of all past, present and reasonably foreseeable developments that will be included in the cumulative effects assessment, should one be required for a particular VC				
		• A general description of the information sources used to identify reasonably foreseeable developments and activities				
		• A map showing the location of the Projects and activities				
		• A discussion of cumulative effects since European contact to provide a context for the Project and development in the region

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
3.10.2	Conducting a Cumulative Effects Assessment	The Application will summarize the process and methodology used to conduct the cumulative effects assessment, including the identification of potential cumulative effects, identification of additional mitigation measures, and evaluation of any (residual) cumulative effects using the same methodology described above in Sections 3.6 to 3.9 of this AAIR template.	See above	See above	See above	
3.11	Follow-up Strategy	Where a residual adverse effect and/or cumulative effect has been identified for a specific VC, the Application will include a description of a follow-up strategy, where appropriate, that:	3.10	Follow-up Strategy	Page 3-30	
		• Identifies the measures to evaluate the accuracy of the original effects prediction				
		• Identifies the measures to evaluate the effectiveness of proposed mitigation measures				
		• Proposes an appropriate strategy to apply in the event that original predictions of effects and mitigation effectiveness are not as expected; this includes reference to further mitigation, involvement of key stakeholders, Aboriginal groups, government agencies, and any other measures deemed necessary to manage the issue				
		• The follow-up strategy shall be sufficiently described with timelines and structures such that its efficacy can be assessed				
4	Environmental Affects Assessment	The Application will include an assessment of Environmental Effects VCs identified in the AAIR. The assessment will be conducted in accordance with the methodology specified in Section 3.0, Assessment Methodology of the AAIR, using the organizational structure demonstrated in this section.	4	Environmental Affects Assessment	Page 4-1	
4.1	Terrain and Soils	The Application will identify the VCs selected for assessment according to the methodology specified in Section 3.1, Issues Scoping and Selection of VCs. The Application will also include the rationale for any differences in the list of VCs presented in the Application from those listed in the final AAIR.	4.1	Terrain and Soils	Pages 4-1 to 4-10 Table 4.1-1	
		The Terrain and Soils VC includes the following subcomponents: Soils and Terrain				
		The KIs that will be used to measure the potential adverse effects of the proposed Project on the Terrain and Soils VC include soil quality and erosion.				
4.1.1	Context and Boundaries	The Application will identify the spatial, temporal, administrative and technical study area boundaries, as applicable of the VC, including maps, in a manner consistent with Section 3.2, Assessment Boundaries, of the AAIR template. The following assessment boundaries have been defined for the Terrain and Soils VC.	4.1.1	Assessment Boundaries	Page 4-1	
4.1.1.1	Spatial Boundaries	The spatial boundaries for the Terrain and Soils VC are shown on Figure A 2 and Figure A 3 and include the Project Footprint as well as:	4.1.1.1	Spatial Boundaries	Page 4-2	
		• LAA - Same as Project Footprint				
		• RAA – A 1-km radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities				
4.1.1.2	Temporal Boundaries	The temporal boundaries identified for the Terrain and Soils VC include:	4.1.1.2	Temporal Boundaries	Page 4-2	
		• Construction phase (approximately 6 months at the initiation of the proposed Project)				
		• Operations phase, including ongoing landfill clearing and construction activities, and progressive closure (approximately 25 years – Years 1 to 25)				
		• Closure and reclamation phase (approximately 1 year following operations – Year 26)				
		• Post-closure phase (approximately 25 years – Years 26 to 51)				
4.1.1.3	Administrative Boundaries	Administrative boundaries refer to the effects of political, economic or social boundaries on an EA. No administrative boundaries have been identified for the Terrain and Soils VC at this time.	4.1.1.3	Administrative Boundaries	Page 4-2	
4.1.1.4	Technical Boundaries	Technical boundaries refer to a proponent's ability to predict the effects of a Project. No technical boundaries have been identified for the Terrain and Soils VC at this time.	4.1.1.4	Technical Boundaries	Page 4-2

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
4.1.2	Existing Conditions	The Application will summarize existing conditions in a manner consistent with Section 3.3, Existing Conditions, of this AAIR template.	4.1.2 to 4.1.3	Existing Conditions	Subsections 4.1.2.1 to 4.1.2.4 Pages 4-2 to 4-6 Figure 4.1-1	Appendix 1
		The following methods of data collection will be used to inform the description of existing conditions for the Terrain and Soils VC:				
		• Desktop review of provincial and regional information sources				
		• Site investigations and field data collection efforts, including results of soil sampling activities conducted in August 23 and 24, 2016 (provided in report dated March 6, 2017)				
		• Field Manual for Describing Terrestrial Ecosystems - Second Edition (BC Ministry of Forests and Range and BC Ministry of Environment 2010)				
		• CCME Environmental Quality Guidelines (CCME 2014) and BC Contaminated Sites Regulation				
		• Existing information will be provided in the Contaminated Soils Technical Report, which will be attached as an appendix to the Amendment Application and will include the results of the soil sampling activities conducted August 23 and 24, 2016				
4.1.3	Potential Effects	The Application will identify potential adverse effects to the VC in a manner consistent with section 3.4 Potential Effects of this AAIR template.	4.1.4	Terrain and Soils Effects Assessment	Subsections 4.1.3.1 to 4.1.3.3 Pages 4-8 to 4-10 Table 4.1-2	
		The proposed Project is anticipated to interact with the Terrain and Soils VC during the following construction, operations, and closure/reclamation activities:				
		• Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure				
		• Leachate management, storm water management, and ongoing monitoring				
		• Cell capping				
		• Post-closure maintenance and monitoring				
4.1.4	Mitigation Measures	The Application will identify measures to avoid, manage or otherwise mitigate potential adverse effects to the VC in a manner consistent with Section 3.5, Mitigation Measures, of this AAIR template. Relevant management plans will be referenced. Linkages to other sections in the Application must be identified.				
4.1.5	Residual Effects and Their Significance	Where an adverse residual effect is identified, the Application will characterize the residual effect based on the context, magnitude, extent, duration, reversibility, and frequency as described in Section 3.6, Characterization of Residual Effects, of this AAIR template.				
		Where an adverse residual effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Sections 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template.				
4.1.6	Cumulative Effects and Their Significance	If a residual effect is identified, unless stated otherwise by BC EAO, the Application will:				
		• Determine whether any cumulative interactions between residual effects of the proposed Project and the potential residual effects of other developments, based on the preliminary list of past, present and reasonably foreseeable developments provided in the AAIR, are likely to occur, consistent with Section 3.10.1, Identifying Past, Present or Reasonably Foreseeable Projects and/or Activities, of this AAIR template				
		• Conduct a cumulative effects assessment consistent with Section 3.10.2, Conducting a Cumulative Effects Assessment, of this AAIR template				
		• Identify any additional mitigation measures, consistent with Section 3.5, Mitigation Measures, of this AAIR template				
		• Where an adverse residual cumulative effect is identified, the Application will also describe the likelihood, Proponent's significance determination, and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template				
4.1.7	Follow-up Strategy	Where a residual effect and/or cumulative effect have been identified, the Application will include a description of a follow-up strategy that is consistent with Section 3.11, Follow-up Strategy, of this AAIR template.	4.1.5	Follow-up Strategy	Page 4-9

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
4.2	Air Quality	The Application will identify the VCs selected for assessment according to the methodology specified in section 3.1 Issues Scoping and Selection of VCs. The Application will also include the rationale for any differences in the list of VCs presented in the Application from those listed in the final AAIR.	4.2	Air Quality	Page 4-11 Table 4.2-1	Appendix 2
		The Air Quality VC includes the following subcomponents: • Dust, odours, emissions from combustion, fugitive emissions, and emissions for other sources				
		The KIs that will be used to measure the potential adverse effects of the proposed Project on the Air Quality VC include:				
		• Visible dust				
		• Detectable odour at sensitive receptor				
		• Ambient air concentrations of particulate matter, nitrogen oxides, and other landfill gases				
		• VOCs				
		• GHG emissions				
4.2.1	Context and Boundaries	The Application will identify the spatial, temporal, administrative and technical study area boundaries, as applicable of the VC, including maps, in a manner consistent with Section 3.2, Assessment Boundaries, of the AAIR template. The following assessment boundaries have been defined for the Air Quality VC.	4.2.1	Assessment Boundaries	Page 4-11	
4.2.1.1	Spatial Boundaries	The spatial boundaries for the Air Quality VC are shown on Figure A 3 and include the Project Footprint as well as:	4.2.1.1	Spatial Boundaries	Page 4-11	
		• RAA – A 10-km radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities				
4.2.1.2	Temporal Boundaries	The temporal boundaries identified for the Air Quality VC include:	4.2.1.2	Temporal Boundaries	Page 4-11	
		• Construction phase (approximately 6 months at the initiation of the proposed Project)				
		• Operations phase, including ongoing landfill clearing and construction activities, and progressive closure (approximately 25 years – Years 1 to 25)				
		• Closure/reclamation phase (approximately 1 year following operations – Year 26)				
		• Post-closure phase (approximately 25 years – Years 26 to 51)				
4.2.1.3	Administrative Boundaries	Administrative boundaries refer to the effects of political, economic or social boundaries on an EA. No administrative boundaries have been identified for the Air Quality VC at this time.	4.2.1.3	Administrative Boundaries	Page 4-12	
4.2.1.4	Technical Boundaries	Technical boundaries refer to a proponent's ability to predict the effects of a Project. No technical boundaries have been identified for the Air Quality VC at this time.	4.2.1.4	Technical Boundaries	Page 4-12	
4.2.2	Existing Conditions	The Application will summarize existing conditions in a manner consistent with section 3.3 Existing Conditions of this AAIR template.	4.2.2 – 4.2.3	Existing Conditions	Pages 4-12 to 4-15 Subsections 4.2.2.1 – 4.2.2.2 Tables 4.2-2, 4.2-3, and 4.2-4	
		The following methods of data collection will be used to inform the description of existing conditions for the Air Quality VC:				
		• Desktop review of Environment and Climate Change Canada and BC air monitoring station data				
		• Bi-annual air monitoring to determine the effect of received NORM waste on air quality at the site				
		• Information from other ongoing monitoring and data collection efforts, including the results of VOC air sampling activities conducted August 23 and 24, 2016 (provided in report dated October 28, 2016).				
		• A review of the nature and number of equipment to be used, and review of the nature of landfill waste and likely construction equipment emissions and odours.				
		• Existing information and recommendations for ongoing monitoring will be provided in the Air Quality Technical Report, which will be attached as an appendix to the Amendment Application and will include the results of the VOC air sampling activities conducted August 23 and 24, 2016.

Table of Concordance - Application for Amendment of Project Approval Certificate WD02-01 (now known as Environmental Assessment Certificate) for Landfill Expansion

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
4.2.3	Potential Effects	The Application will identify potential adverse effects to the VC in a manner consistent with section 3.4 Potential Effects of this AAIR template.	4.2.4	Air Quality Affects assessment	Pages 4-13 to 4-16 Subsections 4.2.4.1 to 4.2.4.5 Tables 4.2-5, 4.2-6, and 4.2-7	
		The proposed Project is anticipated to interact with the Air Quality VC during the following construction, operations, and closure and reclamation activities:				
		• Transportation and mobilization of equipment and workers to site				
		• Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure				
		• Waste acceptance, placement, and compaction				
		• Air quality and dust dispersion and deposition of contaminants, including the results of modelling to assess potential effects within the RAA				
		• Cell capping				
4.2.4	Mitigation Measures	The Application will identify measures to avoid, manage or otherwise mitigate potential adverse effects to the VC in a manner consistent with Section 3.5, Mitigation Measures, of this AAIR template. Relevant management plans will be referenced. Linkages to other sections in the Application must be identified.				
4.2.5	Residual Effects and their Significance	Where an adverse residual effect is identified, the Application will characterize the residual effect based on the context, magnitude, extent, duration, reversibility, and frequency as described in Section 3.6, Characterization of Residual Effects, of this AAIR template. Where an adverse residual effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template.				
4.2.6	Cumulative Effects and Their Significance	If a residual effect is identified, unless stated otherwise by BC EAO, the Application will:				
		• Determine whether any cumulative interactions between residual effects of the proposed Project and the potential residual effects of other developments, based on the preliminary list of past, present, and reasonably foreseeable developments provided in the AAIR, are likely to occur, consistent with Section, 3.10.1, Identifying Past, Present, or Reasonably Foreseeable Projects and/or Activities, of this AAIR template				
		• Conduct a cumulative effects assessment consistent with Section 3.10.2, Conducting a Cumulative Effects Assessment, of this AAIR template				
		• Identify any additional mitigation measures, consistent with Section 3.5, Mitigation Measures, of this AAIR template				
		• Where an adverse residual cumulative effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template				
4.2.7	Follow-up Strategy	Where a residual effect and/or cumulative effect have been identified, the Application will include a description of a follow-up strategy that is consistent with Section 3.11, Follow-up Strategy, of this AAIR template.	4.2.5	Follow-up Strategy	Page 4-19	
4.3	Acoustic Environment	The Application will identify the VCs selected for assessment according to the methodology specified in Section 3.1, Issues Scoping and Selection, of VCs. The Application will also include the rationale for any differences in the list of VCs presented in the Application from those listed in the final AAIR.	4.3	Acoustic Environment	Page 4-19 Table 4.3-1	
		The Acoustic Environment VC includes the following subcomponents: • Wildlife and Land and Resource Use				
		The KI that will be used to measure the potential adverse effects of the proposed Project on the Acoustic Environment VC is: • Noise levels and Level of Annoyance				
4.3.1	Context and Boundaries	The Application will identify the spatial, temporal, administrative and technical study area boundaries, as applicable of the VC, including maps, in a manner consistent with Section 3.2, Assessment Boundaries, of the AAIR template. The following assessment boundaries have been defined for the Acoustic Environment VC.	4.3.1	Assessment Boundaries	Page 4-19

4.3.1.4	Technical Boundaries	Technical boundaries refer to a proponent's ability to predict the effects of a Project. No technical boundaries have been identified for the Acoustic Environment VC at this time.	4.3.1.4	Technical Boundaries	Page 4-17	
4.3.2	Existing Conditions	The Application will summarize existing conditions in a manner consistent with Section 3.3, Existing Conditions, of this AAIR template. The following methods of data collection will be used to inform the description of existing conditions for the Acoustic Environment VC: • Desktop review of provincial and regional information sources • A review of the nature and number of equipment to be used during construction • A qualitative noise study based on observed increases above current facility level, if any • Noise pathways will feed into the SLHHRA, and the assessment of effects on Wildlife and Wildlife Habitat and TLU	4.3.2 – 4.3.3	Existing Conditions	Page 4-20 - 4-21	
4.3.3	Potential Effects	The Application will identify potential adverse effects to the VC in a manner consistent with section 3.4 Potential Effects of this AAIR template. The proposed Project is anticipated to interact with the Acoustic Environment VC during the following construction, operations, and closure/reclamation activities: • Transportation/mobilization of equipment and workers to site • Waste acceptance, placement, and compaction • Leachate management, storm water management, and ongoing monitoring • Cell capping • Post-closure maintenance and monitoring	4.3.4	Acoustic Environmental Effects Assessment	Pages 4-21 to 4-23 Subsections 4.3.4.1 to 4.3.4.4 Tables 4.3-2 and 4.3-3	
4.3.4	Mitigation Measures	The Application will identify measures to avoid, manage or otherwise mitigate potential adverse effects to the VC in a manner consistent with Section 3.5, Mitigation Measures, of this AAIR template. Relevant management plans will be referenced. Linkages to other sections in the Application must be identified.

Table of Concordance - Application for Amendment of Project Approval Certificate WD02-01 (now known as Environmental Assessment Certificate) for Landfill Expansion

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
4.3.5	Residual Effects and Their Significance	Where an adverse residual effect is identified, the Application will characterize the residual effect based on the context, magnitude, extent, duration, reversibility, and frequency as described in Section 3.6, Characterization of Residual Effects, of this AAIR template.	See above	See above	See above	
		Where an adverse residual effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template.				
4.3.6	Cumulative Effects and Their Significance	If a residual effect is identified, unless stated otherwise by BC EAO, the Application will:				
		• Determine whether any cumulative interactions between residual effects of the proposed Project and the potential residual effects of other developments, based on the preliminary list of past, present and reasonably foreseeable developments provided in the AAIR, are likely to occur, consistent with Section 3.10.1, Identifying Past, Present or Reasonably Foreseeable Projects and/or Activities, of this AAIR template				
		• Conduct a cumulative effects assessment consistent with Section 3.10.2, Conducting a Cumulative Effects Assessment, of this AAIR template				
		• Identify any additional mitigation measures, consistent with Section 3.5, Mitigation Measures, of this AAIR template				
		• Where an adverse residual cumulative effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template				
4.3.7	Follow-up Strategy	Where a residual effect and/or cumulative effect have been identified, the Application will include a description of a follow-up strategy that is consistent with Section 3.11, Follow-up Strategy, of this AAIR template.	4.3.5	Follow-up Strategy	Page 4-24	
4.4	Surface Water	The Application will identify the VCs selected for assessment according to the methodology specified in Section 3.1, Issues Scoping and Selection, of VCs. The Application will also include the rationale for any differences in the list of VCs presented in the Application from those listed in the final AAIR.	4.4	Surface Water	Page 4-24 Table 4.4-1	
		The Surface Water VC includes the following subcomponents: • Water quality • Water quantity				
		The KIs that will be used to measure the potential adverse effects of the proposed Project on the Surface Water VC include: • Water quality parameters (for example,, sediment, metals, hydrocarbons, perceived taste and smell) Water volume and movement				
4.4.1	Context and Boundaries	The Application will identify the spatial, temporal, administrative and technical study area boundaries, as applicable of the VC, including maps, in a manner consistent with Section 3.2, Assessment Boundaries, of the AAIR template. The following assessment boundaries have been defined for the Surface Water VC.	4.4.1	Assessment Boundaries	Page 4-25	
4.4.1.1	Spatial Boundaries	The spatial boundaries for the Surface Water VC are shown on Figure A 2 and Figure A 3 and include the Project Footprint as well as:	4.4.1.1	Spatial Boundaries	Page 4-25	
		• LAA – A 500-m radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities				
		• RAA – The watershed of Monnery Creek from the headwaters of its main branch, including the watersheds of all tributaries, downstream from the headwater of Monnery Creek for a distance of 15 km, and the watershed of the Blueberry River and its tributaries for a distance of 15 km upstream and downstream of the confluence with the Blueberry River, of the unnamed creek located immediately west of the Project site				
4.4.1.2	Temporal Boundaries	The temporal boundaries identified for the Surface Water VC include:	4.4.1.2	Temporal Boundaries	Page 4-25	
		• Construction phase (approximately 6 months at the initiation of the proposed Project)				
		• Operations phase, including ongoing landfill clearing and construction activities, and progressive closure (approximately 25 years – Years 1 to 25)				
		• Closure and reclamation phase (approximately 1 year following operations – Year 26)				
		• Post-closure phase (approximately 25 years – Years 26 to 51)				

Tervita Corporation Silverberry Secure Landfill Project

Table of Concordance - Application for Amendment of Project Approval Certificate WD02-01 (now known as Environmental Assessment Certificate) for Landfill Expansion

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
4.4.1.3	Administrative Boundaries	Administrative boundaries refer to the effects of political, economic or social boundaries on an EA. No administrative boundaries have been identified for the Surface Water VC at this time.	4.4.1.3	Administrative Boundaries	Page 4-26	
4.4.1.4	Technical Boundaries	Technical boundaries refer to a proponent's ability to predict the effects of a Project. No technical boundaries have been identified for the Surface Water VC at this time.	4.4.1.4	Technical Boundaries	Page 4-26	
4.4.2	Existing Conditions	The Application will summarize existing conditions in a manner consistent with section 3.3 Existing Conditions of this AAIR template.	4.4.2 – 4.4.3	Existing Conditions	Pages 4-26 to 4-27 Subsections 4.4.2.1 to 4.4.2.3	Appendix 3 and 4
		The following methods of data collection will be used to inform the description of existing conditions for the Surface Water VC:				
		• Desktop review of provincial and regional information sources				
		• Information from site investigations, ongoing surface water discharge analytical data at the existing facility and data collection efforts				
		• Comparison of the surface water quality data to the BC WQGs, at a minimum; this comparison should cover a number of water uses including aquatic life, wildlife, agriculture, and drinking water and if there are no BC WQGs applicable, Tervita could expand their comparison to other guidelines such as CCME guidelines				
4.4.3	Potential Effects	The Application will identify potential adverse effects to the VC in a manner consistent with section 3.4 Potential Effects of this AAIR template.	4.4.4	Surface Water Effects Assessment	Page 2-27 to 4-32 Subsections 4.4.3.1 to 4.4.3.4 Tables 4.4-2 and 4.4-3	
		The proposed Project is anticipated to interact with the Surface Water VC during the following construction, operations, and closure/reclamation activities:				
		• Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure				
		• Waste acceptance, placement, and compaction				
		• Leachate management, storm water management, and ongoing monitoring				
		• Cell capping				
		• Post-closure maintenance and monitoring				
4.4.4	Mitigation Measures	The Application will identify measures to avoid, manage or otherwise mitigate potential adverse effects to the VC in a manner consistent with Section 3.5, Mitigation Measures, of this AAIR template. Relevant management plans will be referenced. Linkages to other sections in the Application must be identified.				
4.4.5	Residual Effects and their Significance	Where an adverse residual effect is identified, the Application will characterize the residual effect based on the context, magnitude, extent, duration, reversibility, and frequency as described in Section 3.6, Characterization of Residual Effects, of this AAIR template.				
		Where an adverse residual effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template.				
4.4.6	Cumulative Effects and their Significance	If a residual effect is identified, unless stated otherwise by BC EAO, the Application will:				
		• Determine whether any cumulative interactions between residual effects of the proposed Project and the potential residual effects of other developments, based on the preliminary list of past, present and reasonably foreseeable developments provided in the AAIR, are likely to occur, consistent with Section 3.10.1, Identifying Past, Present or Reasonably Foreseeable Projects and/or Activities, of this AAIR template				
		• Conduct a cumulative effects assessment consistent with Section 3.10.2, Conducting a Cumulative Effects Assessment of this AAIR template				
		• Identify any additional mitigation measures, consistent with Section 3.5, Mitigation Measures of this AAIR template				
		• Where an adverse residual cumulative effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template				
4.4.7	Follow-up Strategy	Where a residual effect and/or cumulative effect have been identified, the Application will include a description of a follow-up strategy that is consistent with Section 3.11, Follow-up Strategy, of this AAIR template.	4.4.5	Follow-up Strategy	Page 4-32

4.5	Groundwater	The Application will identify the VCs selected for assessment according to the methodology specified in section 3.1 Issues Scoping and Selection of VCs. The Application will also include the rationale for any differences in the list of VCs presented in the Application from those listed in the final AAIR.	4.5	Groundwater	Page 4-28 Table 4.5-1	Appendix 2
		The Groundwater VC includes the following subcomponents: • Water quality • Water quantity				
		The KIs that will be used to measure the potential adverse effects of the proposed Project on the Groundwater VC include:				
		• Water quality parameters (for example,, inorganic parameters, ions, dissolved metals, perceived taste and smell, and other contaminants)				
		• Water volume and movement				
4.5.1	Context and Boundaries	The Application will identify the spatial, temporal, administrative and technical study area boundaries, as applicable of the VC, including maps, in a manner consistent with Section 3.2, Assessment Boundaries, of the AAIR template. The following assessment boundaries have been defined for the Groundwater VC.	4.5.1	Assessment Boundaries	Page 4-33	
4.5.1.1	Spatial Boundaries	The spatial boundaries for the Groundwater VC are shown on Figures 3.2-1 and 3.2-2 of the EA and include the Project Footprint as well as:	4.5.1.1	Spatial Boundaries	Page 4-33	
		• LAA – A 500-m radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities				
		• RAA – The watershed of Monnery Creek from the headwaters of its main branch, including the watersheds of all tributaries, downstream from the headwater of Monnery Creek for a distance of 15 km, and the watershed of the Blueberry River and its tributaries for a distance of 15 km upstream and downstream of the confluence with the Blueberry River, of the unnamed creek located immediately west of the Project site				
4.5.1.2	Temporal Boundaries	The temporal boundaries identified for the Groundwater VC include:	4.5.1.2	Temporal Boundaries	Page 4-33 – 4-34	
		• Operations phase, including ongoing landfill clearing and construction activities, and progressive closure (approximately 25 years – Years 1 to 25)				
		• Closure and reclamation phase (approximately 1 year following operations – Year 26)				
		• Post-closure phase (approximately 25 years – Years 26 to 51)				
4.5.1.3	Administrative Boundaries	Administrative boundaries refer to the effects of political, economic or social boundaries on an EA. No administrative boundaries have been identified for the Groundwater VC at this time.	4.5.1.3	Administrative Boundaries	Page 4-34	
4.5.1.4	Technical Boundaries	Technical boundaries refer to a proponent's ability to predict the effects of a Project. No technical boundaries have been identified for the Groundwater VC at this time.	4.5.1.4	Technical Boundaries	Page 4-34	
4.5.2	Existing Conditions	The Application will summarize existing conditions in a manner consistent with section 3.3 Existing Conditions of this AAIR template.	4.5.2 – 4.5.3	Existing Conditions	Pages 4-43 to 4-35 Subsections 4.5.2.1 to 4.5.2.3	Appendix 5
		The following methods of data collection will be used to inform the description of existing conditions for the Groundwater VC:				
		• Desktop review of provincial and regional information sources				
		• Information from site investigations and data collection efforts (that is,, annual groundwater monitoring program)

Table of Concordance - Application for Amendment of Project Approval Certificate WD02-01 (now known as Environmental Assessment Certificate) for Landfill Expansion

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
4.5.3	Potential Effects	The Application will identify potential adverse effects to the VC in a manner consistent with Section 3.4, Potential Effects, of this AAIR template.	4.5.4	Groundwater Effects Assessment	Pages 4-36 - 4-38 Subsections 4.5.4.1 - 4.5.4.4 Tables 4.5-2, 4.5-3	
		The proposed Project is anticipated to interact with the Groundwater VC during the following construction, operations, and closure and reclamation activities:				
		• Leachate management, storm water management, and ongoing monitoring				
		• Cell capping				
		• Post-closure maintenance and monitoring				
4.5.4	Mitigation Measures	The Application will identify measures to avoid, manage or otherwise mitigate potential adverse effects to the VC in a manner consistent with Section 3.5, Mitigation Measures, of this AAIR template. Relevant management plans will be referenced. Linkages to other sections in the Application must be identified.				
4.5.5	Residual Effects and Their Significance	Where an adverse residual effect is identified, the Application will characterize the residual effect based on the context, magnitude, extent, duration, reversibility, and frequency as described in Section 3.6, Characterization of Residual Effects, of this AAIR template.				
		Where an adverse residual effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk of this AAIR template.				
4.5.6	Cumulative Effects and Their Significance	If a residual effect is identified, unless stated otherwise by BC EAO, the Application will:				
		• Determine whether any cumulative interactions between residual effects of the proposed Project and the potential residual effects of other developments, based on the preliminary list of past, present and reasonably foreseeable developments provided in the AAIR, are likely to occur, consistent with Section 3.10.1, Identifying Past, Present or Reasonably Foreseeable Projects and/or Activities, of this AAIR template				
		• Conduct a cumulative effects assessment consistent with section 3.10.2 Conducting a Cumulative Effects Assessment of this AAIR template				
		• Identify any additional mitigation measures, consistent with section 3.5 Mitigation Measures of this AAIR template				
		• Where an adverse residual cumulative effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Sections 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk of this AAIR template				
4.5.7	Follow-up Strategy	Where a residual effect and/or cumulative effect have been identified, the Application will include a description of a follow-up strategy that is consistent with Section 3.11, Follow-up Strategy of this AAIR template.	4.5.5	Follow-up Strategy	Page 4-38	
4.6	Terrestrial Vegetation	The Application will identify the VCs selected for assessment according to the methodology specified in Section 3.1, Issues Scoping and Selection of VCs. The Application will also include the rationale for any differences in the list of VCs presented in the Application from those listed in the final AAIR.	4.6	Terrestrial Vegetation	Page 4-39 Table 4.6-1	Appendix 4
		The Terrestrial Vegetation VC includes the following subcomponents:				
		• Plant species of concern, including rare plant species and plant species used for traditional purposes				
		• Vegetation communities of concern				
		• Invasive plant species				
		The KIs that will be used to measure the potential adverse effects of the proposed Project on the Terrestrial Vegetation VC include:				
		• Loss of plant species of concern, including rare plant species and plant species used for traditional purposes				
		• Loss of vegetation communities of concern				
		• Vegetation uptake of contaminants from air quality and dust dispersion and deposition				
		• Introduction or spread of Noxious weeds

The Application will also include the rationale for any differences in the list of VCs presented in the Application from those listed in the final AAIR.	4.8	Wildlife and Wildlife Habitat	Page 4-48 Table 4.8-1	Appendices 5 to 8
		The Wildlife and Wildlife Habitat VC includes the following subcomponents:				
		• Moose				
		• Other ungulates (including deer)				
		• Black bear				
		• Furbearers (including species of importance to First Nations such as porcupine and beaver)				
		• Mature and old-forest birds				
		• Early seral forest birds				
		• Western toad				
		The KIs that will be used to measure the potential adverse effects of the proposed Project on the Wildlife and Wildlife Habitat VC include:				
		• Change in habitat (including usage of mineral licks, changes to diet, and vegetation uptake of contaminants from air quality and dust dispersion)				
		• Change in movement and distribution				
		• Change in mortality risk				
4.8.1	Context and Boundaries	The Application will identify the spatial, temporal, administrative and technical study area boundaries, as applicable of the VC, including maps, in a manner consistent with Section 3.2, Assessment Boundaries, of the AAIR template. The following assessment boundaries have been defined for the Wildlife and Wildlife Habitat VC.	4.8.1	Assessment Boundaries	Page 4-48	
4.8.1.1	Spatial Boundaries	The spatial boundaries for the Wildlife and Wildlife Habitat VC are shown on Figure A 2 and Figure A 3 and include the Project Footprint as well as:	4.8.1.1	Spatial Boundaries	Page 4-48	
		• LAA – A 1-km radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities				
		• RAA – A 5-km radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities				
4.8.1.2	Temporal Boundaries	The temporal boundaries identified for the Wildlife and Wildlife Habitat VC include:	4.8.1.2	Temporal Boundaries	Page 4-48	
		• Construction phase (approximately 6 months at the initiation of the proposed Project)				
		• Operations phase, including ongoing landfill clearing and construction activities, and progressive closure (approximately 25 years – Years 1 to 25)				
		• Closure and reclamation phase (approximately 1 year following operations – Year 26)				
		• Post-closure phase (approximately 25 years – Years 26 to 51)				
4.8.1.3	Administrative Boundaries	Administrative boundaries refer to the effects of political, economic or social boundaries on an EA. No administrative boundaries have been identified for the Wildlife and Wildlife Habitat VC at this time.	4.8.1.3	Administrative Boundaries	Page 4-50	
4.8.1.4	Technical Boundaries	Technical boundaries refer to a proponent's ability to predict the effects of a Project. No technical boundaries have been identified for the Wildlife and Wildlife Habitat VC at this time.	4.8.1.4	Technical Boundaries	Page 4-50	

Tervita Corporation Silverberry Secure Landfill Project

Table of Concordance - Application for Amendment of Project Approval Certificate WD02-01 (now known as Environmental Assessment Certificate) for Landfill Expansion

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
4.8.2	Existing Conditions	The Application will summarize existing conditions in a manner consistent with Section 3.3, Existing Conditions, of this AAIR template.	4.8.2 – 4.8.3	Existing Conditions	Pages 4-50 to 4-52 Subsections 4.8.2.1 to 4.8.2.3	Appendix 7, 8, 9 and 10
		The following methods of data collection will be used to inform the description of existing conditions for the Wildlife and Wildlife Habitat VC:				
		• Desktop review of provincial and regional information sources				
		• Site investigations and data collection efforts				
		• Soil sampling program for the Potential Dust Migration Area				
		• Traditional Knowledge information regarding species presence, abundance, distribution, and the presence of game trails, bear dens, stick nests, lick sites, amphibian movement corridors, etc.				
		Field survey based on the following:				
		• Inventory Methods for Forest and Grassland Songbirds (BC Ministry of Environment, Lands, and Parks 1999)				
		• Inventory Methods for Raptors (BC Ministry of Sustainable Resource Management 2001)				
		Existing information will be provided in the Wildlife and Wildlife Habitat Technical Report, which will be attached as an appendix to the Amendment Application.				
4.8.3	Potential Effects	The Application will identify potential adverse effects to the VC in a manner consistent with Section 3.4 Potential Effects of this AAIR template.	4.8.4	Wildlife and Wildlife Habitat Effects Assessment	Page 4-52 to 4-59 Subsections 4.8.4.1 to 4.8.4.8 Table 4.8-2 and 4.8-3	
		The proposed Project is anticipated to interact with the Wildlife and Wildlife Habitat VC during the following construction, operations, and closure/reclamation activities:				
		• Transportation and mobilization of equipment and workers to site				
		• Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure				
		• Waste acceptance, placement, and compaction				
		• Leachate management, storm water management, and ongoing monitoring				
		• Cell capping				
		• Post-closure maintenance and monitoring				
		• Air quality and dust dispersion, deposition and vegetation uptake of contaminants				
4.8.4	Mitigation Measures	The Application will identify measures to avoid, manage or otherwise mitigate potential adverse effects to the VC in a manner consistent with Section 3.5 Mitigation Measures of this AAIR template. Relevant management plans will be referenced. Linkages to other Sections in the Application must be identified.				
4.8.5	Residual Effects and their Significance	Where an adverse residual effect is identified, the Application will characterize the residual effect based on the context, magnitude, extent, duration, reversibility, and frequency as described in Section 3.6, Characterization of Residual Effects, of this AAIR template.				
		Where an adverse residual effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template.				

Tervita Corporation Silverberry Secure Landfill Project

Table of Concordance - Application for Amendment of Project Approval Certificate WD02-01 (now known as Environmental Assessment Certificate) for Landfill Expansion

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
4.8.6	Cumulative Effects and their Significance	Where an adverse residual effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template.	See above	See above	See above	
		If a residual effect is identified, unless stated otherwise by BC EAO, the Application will:				
		• Determine whether any cumulative interactions between residual effects of the proposed Project and the potential residual effects of other developments, based on the preliminary list of past, present and reasonably foreseeable developments provided in the AAIR, are likely to occur, consistent with Section 3.10.1, Identifying Past, Present or Reasonably Foreseeable Projects and/or Activities, of this AAIR template				
		• Conduct a cumulative effects assessment consistent with Section 3.10.2, Conducting a Cumulative Effects Assessment, of this AAIR template				
		• Identify any additional mitigation measures, consistent with Section 3.5, Mitigation Measures, of this AAIR template				
		• Where an adverse residual cumulative effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Sections 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template				
4.8.7	Follow-up Strategy	Where a residual effect and/or cumulative effect have been identified, the Application will include a description of a follow-up strategy that is consistent with Section 3.11, Follow-up Strategy, of this AAIR template.	4.8.5	Follow-up Strategy	Page 4-50	
5	Economic Effects Assessment	The Application will include an assessment of economic VCs identified in the AAIR. The assessment will be conducted in accordance with the methodology specified in Section 3.0, Assessment Methodology, of this AAIR template and reported using the organizational structure demonstrated in the Section 4.0, Environmental Effects Assessment.	5	Economic Effects Assessment	Page 5-1	
5.1	Economy	The Application will identify the VCs selected for assessment according to the methodology specified in Section 3.1 Issues Scoping and Selection of VCs. The Application will also include the rationale for any differences in the list of VCs presented in the Application from those listed in the final AAIR.	5.1	Economy	Page 5-1 Table 5.1-1	
		The Economy VC includes the following subcomponents:				
		• Resource-based economy				
		• Barter economy				
		• Employment				
		The KIs that will be used to measure the potential adverse effects of the proposed Project on the Economy VC include:				
		• Economic activity levels in the LAA and RAA				
		• Employment levels				
5.1.1	Context and Boundaries	The Application will identify the spatial, temporal, administrative, and technical study area boundaries, as applicable of the VC, including maps, in a manner consistent with Section 3.2, Assessment Boundaries, of the AAIR template. The following assessment boundaries have been defined for the Economy VC.	5.1.1	Assessment Boundaries	Page 5-1	
5.1.1.1	Spatial Boundaries	The spatial boundaries for the Economy VC are shown on Figures 3.2-3 and 3.2-4 of this EA and include the Project Footprint as well as:	5.1.1.1	Spatial Boundaries	Page 5-1	
		• LAA – Includes municipalities and communities, including First Nations communities, where it can be reasonably expected that direct economic activities will be conducted; these communities include Blueberry First Nations, Doig River First Nation, the Community of Buick, and the City of Fort St. John				
		• RAA – The area within Electoral Area B of the Peace River Regional District

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
5.1.1.2	Temporal Boundaries	The temporal boundaries identified for the Economy VC include:	5.1.1.2	Temporal Boundaries	Page 5-2	
		• Construction phase (approximately 6 months at the initiation of the proposed Project)				
		• Operations phase, including ongoing landfill clearing and construction activities, and progressive closure (approximately 25 years – Years 1 to 25)				
		• Operations phase, including ongoing landfill clearing and construction activities, and progressive closure (approximately 25 years – Years 1 to 25				
		• Post-closure phase (approximately 25 years – Years 26 to 51)				
5.1.1.3	Administrative Boundaries	Administrative boundaries refer to the effects of political, economic or social boundaries on an EA. No administrative boundaries have been identified for the Economy VC at this time.	5.1.1.3	Administrative Boundaries	Page 5-2	
5.1.1.4	Technical Boundaries	Technical boundaries refer to a proponent's ability to predict the effects of a Project. No technical boundaries have been identified for the Economy VC at this time.	5.1.1.4	Technical Boundaries	Page 5-2	
5.1.2	Existing Conditions	The Application will summarize existing conditions in a manner consistent with Section 3.3, Existing Conditions, of this AAIR template.	5.1.2 – 5.1.3	Existing Conditions	Pages 5-2 to 5-3 Subsections 5.1.2.1 to 5.1.2.3	
		The following methods of data collection will be used to inform the description of existing conditions for the Economy VC:				
		• Desktop review of economic activity in the LAA and RAA, using provincial, regional, and municipal information sources				
5.1.3	Potential Effects	The Application will identify potential adverse effects to the VC in a manner consistent with Section 3.4 Potential Effects of this AAIR template.	5.1.4	Economic Effects Assessment	Pages 5-3 to 5-6 Subsections 5.1.4.1 to 5.1.4.5 Tables 5.1-2 and 5.1-3	
		The proposed Project is anticipated to interact with the Economy VC during the following construction, operations, and closure and reclamation activities:				
		• Transportation and mobilization of equipment and workers to site				
		• Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure				
		• Waste acceptance, placement, and compaction				
		• Leachate management, storm water management, and ongoing monitoring				
		• Cell capping				
		• Post-closure maintenance and monitoring				
5.1.4	Mitigation Measures	The Application will identify measures to avoid, manage or otherwise mitigate potential adverse effects to the VC in a manner consistent with Section 3.5, Mitigation Measures, of this AAIR template. Relevant management plans will be referenced. Linkages to other sections in the Application must be identified.				
5.1.5	Residual Effects and Their Significance	Where an adverse residual effect is identified, the Application will characterize the residual effect based on the context, magnitude, extent, duration, reversibility, and frequency as described in Section 3.6, Characterization of Residual Effects, of this AAIR template.				
		Where an adverse residual effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template.

5.1.6	Cumulative Effects and Their Significance	If a residual effect is identified, unless stated otherwise by BC EAO, the Application will:	See above	See above	See above	
		• Determine whether any cumulative interactions between residual effects of the proposed Project and the potential residual effects of other developments, based on the preliminary list of past, present and reasonably foreseeable developments provided in the AAIR, are likely to occur, consistent with Section 3.10.1, Identifying Past, Present or Reasonably Foreseeable Projects and/or Activities, of this AAIR template				
		• Conduct a cumulative effects assessment consistent with Section 3.10.2, Conducting a Cumulative Effects Assessment, of this AAIR template				
		• Identify any additional mitigation measures, consistent with Section 3.5, Mitigation Measures, of this AAIR template				
		• Where an adverse residual cumulative effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Sections 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template				
5.1.7	Follow-up Strategy	Where a residual effect and/or cumulative effect have been identified, the Application will include a description of a follow-up strategy that is consistent with Section 3.11, Follow-up Strategy, of this AAIR template.	5.1.5	Follow-up Strategy	Page 5-6	
6	Social Effects Assessment	The Application will include an assessment of social VCs identified in the AAIR. The assessment will be conducted in accordance with the methodology specified in Section 3.0, Assessment Methodology, of this AAIR template and reported using the organizational structure demonstrated in the Section 4.0, Environmental Effects Assessment.	6	Social Effects Assessment	Page 6-1	
6.1	Land and Resource Use	The Application will identify the VCs selected for assessment according to the methodology specified in Section 3.1, Issues Scoping and Selection of VCs. The Application will also include the rationale for any differences in the list of VCs presented in the Application from those listed in the final AAIR.	6.1	Land and Resource Use	Page 6-1 Table 6.1-1	
		The Land and Resource Use VC includes the following subcomponents:				
		• Agriculture				
		• Oil and gas activity				
		• Trapping				
		• First Nation land and resource use including, but not limited to, hunting and trapping, as well as travel to First Nation land and resource use sites				
		• Logging/forestry				
		The KIs that will be used to measure the potential adverse effects of the proposed Project on the Land and Resource Use VC include:				
		• Area of grazing tenures and Agricultural Land Reserve affected				
		• Oil and gas infrastructure and pipeline tenures affected				
		• Viability of trapping tenures				
		• Viability of identified First Nation land and resource use sites				
6.1.1	Context and Boundaries	The Application will identify the spatial, temporal, administrative and technical study area boundaries, as applicable of the VC, including maps, in a manner consistent with Section 3.2, Assessment Boundaries, of the AAIR template. The following assessment boundaries have been defined for the Land and Resource Use VC.	6.1.1	Assessment Boundaries	Page 6-1	
6.1.1.1	Spatial Boundaries	The spatial boundaries for the Land and Resource Use VC are shown on Figure A 2 and Figure A 3 and include the Project Footprint as well as:	6.1.1.1	Spatial Boundaries	Page 6-1	
		• LAA – A 1-km radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities				
		• RAA – A 5-km radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities

6.2	Community Services	The Application will identify the VCs selected for assessment according to the methodology specified in Section 3.1, Issues Scoping and Selection of VCs. The Application will also include the rationale for any differences in the list of VCs presented in the Application from those listed in the final AAIR.	6.2	Community Services	Page 6-7 Table 6.2-1	
		The Community Services VC includes the following subcomponent: • Community utilities and services				
		The KIs that will be used to measure the potential adverse effects of the proposed Project on the Community Services VC include:				
		• Community and utility services capacity and demand				
		• Accommodation capacity and demand				
		• Health service impacts				
6.2.1	Context and Boundaries	The Application will identify the spatial, temporal, administrative and technical study area boundaries, as applicable of the VC, including maps, in a manner consistent with Section 3.2, Assessment Boundaries, of the AAIR template. The following assessment boundaries have been defined for the Community Services VC.	6.2.1	Assessment Boundaries	Page 6-7	
6.2.1.1	Spatial Boundaries	The spatial boundaries for the Community Services VC are shown on Figure A 4 and Figure A 5 and include the Project Footprint as well as:	6.2.1.1	Spatial Boundaries	Page 6-7	
		• LAA – The areas within the boundaries of the City of Fort St. John and the Community of Buick				
		• RAA – The area within Electoral Area B of the Peace River Regional District				
6.2.1.2	Temporal Boundaries	The temporal boundaries identified for the Community Services VC include:	6.2.1.2	Temporal Boundaries	Page 6-7	
		• Construction phase (approximately 6 months at the initiation of the proposed Project)				
		• Operations phase, including ongoing landfill clearing and construction activities, and progressive closure (approximately 25 years – Years 1 to 25)				
		• Closure and reclamation phase (approximately 1 year following operations – Year 26)				
		• Post-closure phase (approximately 25 years – Years 26 to 51)				
6.2.1.3	Administrative Boundaries	Administrative boundaries refer to the effects of political, economic, or social boundaries on an EA. No administrative boundaries have been identified for the Community Services VC at this time.	6.2.1.3	Administrative Boundaries	Page 6-8	
6.2.1.4	Technical Boundaries	Technical boundaries refer to a proponent's ability to predict the effects of a project. No technical boundaries have been identified for the Community Services VC at this time.	6.2.1.4	Technical Boundaries	Page 6-8

6.3.1.1	Spatial Boundaries	The spatial boundaries for the Community Infrastructure VC are shown on Figures A-4 and A-5 and include the Project Footprint as well as:	6.3.1.1	Spatial Boundaries	Page 6-11	
		• LAA – The areas within the boundaries of the City of Fort St. John and the Community of Buick				
		• RAA – The area within Electoral Area B of the Peace River Regional District				
6.3.1.2	Temporal Boundaries	The temporal boundaries identified for the Community Infrastructure VC include:	6.3.1.2	Temporal Boundaries	Page 6-11	
		• Construction phase (approximately 6 months at the initiation of the proposed Project)				
		• Operations phase, including ongoing landfill clearing and construction activities, and progressive closure (approximately 25 years – Years 1 to 25)				
		• Closure and reclamation phase (approximately 1 year following operations – Year 26)				
		• Post-closure phase (approximately 25 years – Years 26 to 51)				
6.3.1.3	Administrative Boundaries	Administrative boundaries refer to the effects of political, economic, or social boundaries on an EA. No administrative boundaries have been identified for the Community Infrastructure VC at this time.	6.3.1.3	Administrative Boundaries	Page 6-11	
6.3.1.4	Technical Boundaries	Technical boundaries refer to a proponent's ability to predict the effects of a Project. No technical boundaries have been identified for the Community Infrastructure VC at this time.	6.3.1.4	Technical Boundaries	Page 6-11	
6.3.2	Existing Conditions	The Application will summarize existing conditions in a manner consistent with Section 3.3 Existing Conditions of this AAIR template.	6.3.2 – 6.3.3	Existing Conditions	Page 6-12 Subsection 6.3.2.1	
		The following methods of data collection will be used to inform the description of existing conditions for the Community Infrastructure VC:				
		• Desktop review of provincial, regional, and municipal information sources.				
6.3.3	Potential Effects	The Application will identify potential adverse effects to the VC in a manner consistent with Section 3.4 Potential Effects of this AAIR template.	6.3.4	Community Infrastructure Effects Assessment	Page 6-12 to 6-14 Subsections 6.3.4.1 to 6.3.4.2 Table 6.3-2	
		The proposed Project is anticipated to interact with the Community Infrastructure VC during the following construction, operations, and closure and reclamation activities:				
		• Transportation/mobilization of equipment and workers to site				
		• Post-closure maintenance and monitoring				
6.3.4	Mitigation Measures	The Application will identify measures to avoid, manage or otherwise mitigate potential adverse effects to the VC in a manner consistent with Section 3.5, Mitigation Measures, of this AAIR template. Relevant management plans will be referenced. Linkages to other Sections in the Application must be identified.				
6.3.5	Residual Effects and their Significance	Where an adverse residual effect is identified, the Application will characterize the residual effect based on the context, magnitude, extent, duration, reversibility, and frequency as described in Section 3.6 Characterization of Residual Effects of this AAIR template.				
		Where an adverse residual effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template.

Table of Concordance - Application for Amendment of Project Approval Certificate WD02-01 (now known as Environmental Assessment Certificate) for Landfill Expansion

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
6.3.6	Cumulative Effects and their Significance	If a residual effect is identified, unless stated otherwise by BC EAO, the Application will:	See above	See above	See above	
		• Determine whether any cumulative interactions between residual effects of the proposed Project and the potential residual effects of other developments, based on the preliminary list of past, present and reasonably foreseeable developments provided in the AAIR, are likely to occur, consistent with Section 3.10.1, Identifying Past, Present or Reasonably Foreseeable Projects and/or Activities, of this AAIR template				
		• Conduct a cumulative effects assessment consistent with Section 3.10.2, Conducting a Cumulative Effects Assessment, of this AAIR template				
		• Identify any additional mitigation measures, consistent with Section 3.5, Mitigation Measures, of this AAIR template				
		• Where an adverse residual cumulative effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template				
6.3.7	Follow-up Strategy	Where a residual effect and/or cumulative effect have been identified, the Application will include a description of a follow-up strategy that is consistent with Section 3.11, Follow-up Strategy, of this AAIR template.	6.3.5	Follow-up Strategy	Page 6-14	
7	Cultural and Heritage Effects Assessment	The Application will include an assessment of heritage VCs identified in the AAIR. The assessment will be conducted in accordance with the methodology specified in Section 3.0, Assessment Methodology, of this AAIR template and reported using the organizational structure demonstrated in Section 4.0, Environmental Effects Assessment.	7	Cultural and Heritage Effects Assessment	Page 7-1	
7.1	Cultural and Heritage Resources	The Application will identify the VCs selected for assessment according to the methodology specified in Section 3.1, Issues Scoping and Selection of VCs. The Application will also include the rationale for any differences in the list of VCs presented in the Application from those listed in the final AAIR.	7.1	Culture and Heritage	Page 7-1 Table 7.1-1	
		The Cultural and Heritage Resources VC includes the following subcomponents: • Archaeological sites • Historic sites				
		The KI that will be used to measure the potential adverse effects of the proposed Project on the Cultural and Heritage Resources VC is:				
		• Characteristics, conditions, and location of archaeological and heritage sites, if any				
7.1.1	Context and Boundaries	The Application will identify the spatial, temporal, administrative, and technical study area boundaries, as applicable of the VC, including maps, in a manner consistent with Section 3.2, Assessment Boundaries, of the AAIR template. The following assessment boundaries have been defined for the Cultural and Heritage Resources VC.	7.1.1	Assessment Boundaries	Page 7-1	
7.1.1.1	Spatial Boundaries	The spatial boundaries for the Cultural and Heritage Resources VC are shown on Figure A 3 and include the Project Footprint as well as:	7.1.1.1	Spatial Boundaries	Page 7-1	
		• LAA - Same as Project Footprint				
		• RAA – The area within all Borden Blocks crossed by the proposed Project. A Borden Block measures 16 km x 16 km and is a terrestrial mapping system used to permanently name and register archaeological sites				
7.1.1.2	Temporal Boundaries	The temporal boundaries identified for the Cultural and Heritage Resources VC include:	7.1.1.2	Temporal Boundaries	Page 7-2	
		• Construction phase (approximately 6 months at the initiation of the proposed Project)				
		• Operations phase, including ongoing landfill clearing and construction activities, and progressive closure (approximately 25 years – Years 1 to 25)				
7.1.1.3	Administrative Boundaries	Administrative boundaries refer to the effects of political, economic or social boundaries on an EA. No administrative boundaries have been identified for the Cultural and Heritage Resources VC at this time.	7.1.1.3	Administrative Boundaries	Page 7-2	
7.1.1.4	Technical Boundaries	Technical boundaries refer to a proponent's ability to predict the effects of a Project. No technical boundaries have been identified for the Cultural and Heritage Resources VC at this time.	7.1.1.4	Technical Boundaries	Page 7-2	

Tervita Corporation Silverberry Secure Landfill Project

Table of Concordance - Application for Amendment of Project Approval Certificate WD02-01 (now known as Environmental Assessment Certificate) for Landfill Expansion

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
7.1.2	Existing Conditions	The Application will summarize existing conditions in a manner consistent with Section 3.3, Existing Conditions of this AAIR template.	7.1.2 – 7.1.3	Existing Conditions	Pages 7-2 to 7-3	
		The following methods of data collection will be used to inform the description of existing conditions for the Cultural and Heritage Resources VC:				
		• An initial desktop review to document previously recorded archaeological and historic sites in proximity to the proposed Project and to identify areas of potential for heritage resources				
		• Note: There are no changes to the Project Footprint as proposed in the original Project Approval Certificate Application and subsequently approved for development by the former Ministry of Sustainable Resource Management (Archaeological Planning and Assessment), therefore, an Archaeological Impact Assessment will not be required for the proposed Project				
7.1.3	Potential Effects	The Application will identify potential adverse effects to the VC in a manner consistent with Section 3.4 Potential Effects of this AAIR template.	7.1.4	Culture and Heritage Effects Assessment	Pages 7-3 to 7-4 Subsection 7.1.4.1 and 7.1.4.2 Table 7.1-2	
		The proposed Project is anticipated to interact with the Heritage Resources VC during the following activities:				
		• Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure				
7.1.4	Mitigation Measures	The Application will identify measures to avoid, manage or otherwise mitigate potential adverse effects to the VC in a manner consistent with Section 3.5 Mitigation Measures of this AAIR template. Relevant management plans will be referenced. Linkages to other sections in the Application must be identified.				
7.1.5	Residual Effects and their Significance	Where an adverse residual effect is identified, the Application will characterize the residual effect based on the context, magnitude, extent, duration, reversibility, and frequency as described in Section 3.6 Characterization of Residual Effects of this AAIR template.				
		Where an adverse residual effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template.				
7.1.6	Cumulative Effects and their Significance	If a residual effect is identified, unless stated otherwise by BC EAO, the Application will:				
		• Determine whether any cumulative interactions between residual effects of the proposed Project and the potential residual effects of other developments, based on the preliminary list of past, present and reasonably foreseeable developments provided in the AAIR, are likely to occur, consistent with Section 3.10.1, Identifying Past, Present or Reasonably Foreseeable Projects and/or Activities, of this AAIR template				
		• Conduct a cumulative effects assessment consistent with Section 3.10.2, Conducting a Cumulative Effects Assessment, of this AAIR template				
		• Identify any additional mitigation measures, consistent with Section 3.5, Mitigation Measures, of this AAIR template				
		• Where an adverse residual cumulative effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7 Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template				
7.1.7	Follow-up Strategy	Where a residual effect and/or cumulative effect have been identified, the Application will include a description of a follow-up strategy that is consistent with Section 3.11, Follow-up Strategy, of this AAIR template.	7.1.5	Follow-up Strategy	Page 7-4	
8	Health Effects Assessment	The Application will include an assessment of health VCs identified in the AAIR. The assessment will be conducted in accordance with the methodology specified in Section 3.0, Assessment Methodology, of this AAIR template and reported using the organizational structure demonstrated in Section 4.0, Environmental Effects Assessment.	8	Health Effects Assessment	Page 8-1	Appendix 9

Tervita Corporation Silverberry Secure Landfill Project

Table of Concordance - Application for Amendment of Project Approval Certificate WD02-01 (now known as Environmental Assessment Certificate) for Landfill Expansion

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
8.1	Human Health	The Application will identify the VCs selected for assessment according to the methodology specified in Section 3.1 Issues Scoping and Selection of VCs. The Application will also include the rationale for any differences in the list of VCs presented in the Application from those listed in the final AAIR.	8.1	Selection of VCs and KIs	Page 8-1 Table 8.1-1	
		The Human Health VC includes the following subcomponents:				
		• Soil quality				
		• Air quality				
		• Water quality				
		• Leachate quality				
		• Visual quality				
		• Noise				
		• NORM				
		• Quality of vegetation, fish, wildlife, and water consumed as country foods, including consumption of First Nation-specific foods				
		The KIs that will be used to measure the potential adverse effects of the proposed Project on the Human Health VC include:				
		• Indicators under the Terrain and Soils, Air Quality, Acoustic Environment, Vegetation, Fish and Fish Habitat, Wildlife and Wildlife Habitat and Surface Water VCs as applicable				
		• NORM levels				
		• Traffic-related injuries				
		• Radiological risk assessment				
		• Community health				
		• Other indicators if developed through SLHHRA and consultation on social/cultural determinants of health				
8.1.1	Context and Boundaries	The Application will identify the spatial, temporal, administrative and technical study area boundaries, as applicable of the VC, including maps, in a manner consistent with Section 3.2, Assessment Boundaries, of the AAIR template. The following assessment boundaries have been defined for the Human Health VC.	8.2	Assessment Boundaries	Page 8-2	
8.1.1.1	Spatial Boundaries	The spatial boundaries for the Human Health VC are shown on Figures A-2 and A-3 of the EA and include the Project Footprint as well as:	8.2.1	Spatial Boundaries	Pages 8-3 to 8-4 Table 8.2-1	
		• LAA – The maximum extent of the area encompassed by the Acoustic Environment LAA, the Surface Water LAA, and the Groundwater LAA				
		• RAA – The maximum extent of the area encompassed by the Acoustic Environment RAA, the Air Quality RAA, the Surface Water RAA, the Groundwater RAA, the Fish and Fish Habitat RAA, and the Wildlife and Wildlife Habitat RAA				
8.1.1.2	Temporal Boundaries	The temporal boundaries identified for the Human Health VC include:	8.2.2	Temporal Boundaries	Page 8-5	
		• Construction phase (approximately 6 months at the initiation of the proposed Project)				
		• Operations phase, including ongoing landfill clearing and construction activities, and progressive closure (approximately 25 years – Years 1 to 25)				
		• Closure/reclamation phase (approximately 1 year following operations – Year 26)				
		• Post-closure phase (approximately 25 years – Years 26 to 51)				
8.1.1.3	Administrative Boundaries	Administrative boundaries refer to the effects of political, economic or social boundaries on an EA. No administrative boundaries have been identified for the Human Health VC at this time.	8.3	Regulatory and Policy Setting	Pages 8-4 to 8-5 Subsections 8.3.1.1 to 8.3.1.5	
8.1.1.4	Technical Boundaries	Technical boundaries refer to a proponent's ability to predict the effects of a Project. No technical boundaries have been identified for the Human Health VC at this time.				

Tervita Corporation Silverberry Secure Landfill Project

Table of Concordance - Application for Amendment of Project Approval Certificate WD02-01 (now known as Environmental Assessment Certificate) for Landfill Expansion

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
8.1.2	Existing Conditions	The Application will summarize existing conditions in a manner consistent with Section 3.3 Existing Conditions of this AAIR template.	8.4	Existing Conditions and Context	Pages 8-7 to 8-12 Subsections 8.4.1 to 8.4.10	Appendix 11
		The following methods of data collection will be used to inform the description of existing conditions for the Human Health VC:				
		• Interpretation and analysis of results obtained by air quality, noise, and water quality specialists as they relate to human health				
		Desktop review of provincial and regional information sources, including the following Health Canada guidance documents:				
		• Evaluating the following Human Health Impacts in EA: Noise, Air Quality, Water Quality, and Radiological Impacts				
		• Radiological risk assessment				
		• Description potential receptors, nearby water sources and historic usage of land				
		SLHHRA Report – the SLHHRA for the proposed Project will be carried out using industry-accepted methods (that is,, Health Canada guidance and BC Protocol 13) and will be formatted as a stand-alone report that will be attached to the Amendment Application for the proposed Project. The SLHHRA will evaluate chemicals of potential concern in environmental media based on supporting studies for the Amendment Application, which include air quality, soil quality, water quality (groundwater), and sediment quality, as well as assessment of NORMs. For each environmental media, a conceptual site exposure model will be developed, identifying the pathway of exposure from the chemicals of potential concern in the source media, through release mechanism and exposure routes to human receptors. The results of the SLHHRA will be used to inform the description of existing conditions related to the Human Health VC, as well as inform the identification and characterization of potential adverse effects and proposed mitigation measures.				
		An SLHHRA report if deemed required after review of the SLHHRA.				
8.1.3	Potential Effects	The Application will identify potential adverse effects to the VC in a manner consistent with Section 3.4 Potential Effects of this AAIR template.	8.5	Human Health Effects Assessment	Pages 8-12 to 8-17 Subsections 8.5.1 to 8.5.3 Table 8.5-1	
		The proposed Project is anticipated to interact with the Human Health VC during the following construction, operations, and closure and reclamation activities:				
		• Transportation and mobilization of equipment and workers to site				
		• Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure				
		• Waste acceptance, placement, and compaction				
		• Leachate management, storm water management, and ongoing monitoring				
		• Cell capping				
		• Post-closure maintenance and monitoring				
8.1.4	Mitigation Measures	The Application will identify measures to avoid, manage or otherwise mitigate potential adverse effects to the VC in a manner consistent with Section 3.5, Mitigation Measures, of this AAIR template. Relevant management plans will be referenced. Linkages to other Sections in the Application must be identified.				
8.1.5	Residual Effects and their Significance	Where an adverse residual effect is identified, the Application will characterize the residual effect based on the context, magnitude, extent, duration, reversibility, and frequency as described in Section 3.6, Characterization of Residual Effects, of this AAIR template.				
		Where an adverse residual effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Sections 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template.				

Tervita Corporation Silverberry Secure Landfill Project

8.1.6	Cumulative Effects and their Significance	If a residual effect is identified, unless stated otherwise by BC EAO, the Application will:	See above	See above	See above	
		• Determine whether any cumulative interactions between residual effects of the proposed Project and the potential residual effects of other developments, based on the preliminary list of past, present and reasonably foreseeable developments provided in the AAIR, are likely to occur, consistent with Section 3.10.1 Identifying Past, Present or Reasonably Foreseeable Projects and/or Activities of this AAIR template				
		• Conduct a cumulative effects assessment consistent with Section 3.10.2, Conducting a Cumulative Effects Assessment, of this AAIR template				
		• Identify any additional mitigation measures, consistent with Section 3.5, Mitigation Measures, of this AAIR template				
		• Where an adverse residual cumulative effect is identified, the Application will also describe the likelihood, Proponent's significance determination and predictive confidence, in accordance with Section 3.7, Likelihood, Section 3.8, Proponent's Determination of Significance, and Section 3.9, Confidence and Risk, of this AAIR template				
8.1.7	Follow-up Strategy	Where a residual effect and/or cumulative effect have been identified, the Application will include a description of a follow-up strategy that is consistent with Section 3.11, Follow-up Strategy of this AAIR template.	8.5.4	Follow-up Strategy	Page 8-17	
9	Accidents and Malfunctions	The Application will include the following:	9	Accidents and Malfunctions	Pages 9-1 to 9-7 Tables 9.2-1, 9.2-2, and 9.2-3	
		• Identification of potential accidents and malfunctions:				
		– Traffic-related accidents				
		– Release or spill of contaminants such as hydrocarbons, hazardous materials, and NORM-containing materials (terrestrial, surface water, or groundwater)				
		– Structural failure of a landfill component during construction or operations				
		– Onsite fires				
		– Damage to existing Silverberry landfill infrastructure				
		• The overall methodology for assessing the potential risk of an event (likelihood and consequence):				
		– Definitions of each category of likelihood				
		– Definitions for each category of consequence				
		– An assessment of the likelihood of the event occurring, based on historical trends and predictive models				
		– Identification of proposed measures to reduce the likelihood of the event				
		– Assessment of consequence of the event, in a manner consistent with the direct effects assessment				
		– Identification of measures to mitigate the consequences to VCs				
		– Conclusions on the potential risk (likelihood multiplied by consequence) of the accident or malfunction

AAIR Section/ Subsection	AAIR Section Title	AAIR Section Language	Amendment Application Section/Subsection	Amendment Application Section Title	Amendment Application Volume, Section, Subsection, and Page Number	Relevant Appendix
10	Effects of the Environment of the Project	The Application will include:	10	Effects of the Environment of the Project	Page 10-1 to 10-5 Subsections 10.1.1 to 10.1.5.4 Tables 10.1-1 and 10.1-2	
		• The environmental factors deemed to have possible consequences on the proposed Project, including, but not necessarily limited to, consideration of natural hazards such as:				
		– Climate change, including temperature rise and precipitation				
		– Extreme weather and weather-related events (for example,, heavy precipitation, extreme temperatures, and wind)				
		– Seismic events				
		– Wildfire				
		• A description of any changes or effects on the proposed Project that may be caused by the above-mentioned environmental factors				
		• The likelihood and consequence of the changes or effects to relevant VCs				
		• Practical mitigation measures, including design strategies and environmental contingency plans, to avoid or minimize the likelihood and consequence of the effects of the environment on the proposed Project				
		• A conclusion about the potential risk of an effect of the environment on the proposed Project and to relevant VCs				
Part C	**Aboriginal Consultation**		**Part C**	**Aboriginal Consultation**		
11	Aboriginal Consultation		11	Aboriginal Consultation		
11.1	Aboriginal Interests	The Aboriginal Groups discussed in this Section will include:	11.1 to 11.3	Aboriginal Interests	Page 11-1 to 11-7 Subsections 11.2.1 to 11.3.7	
		• Blueberry River First Nations				
		• Doig River First Nation				
		For each Aboriginal Group, the Application will include:				
		• A summary of past and planned consultation activities				
		• A summary of proposed changes to the Aboriginal Consultation Plan resulting from the Aboriginal Groups' feedback, or experience from consultation to date, including any such changes which have been implemented				
		• A summary of the key issues and concerns raised by Aboriginal Groups relevant to the EA, the Proponent's responses to those issues and concerns, and the status of resolution				
		• A map that identifies Indian Reserves and Aboriginal communities, for the Aboriginal Groups and the proposed Project location, including proposed Project components in relation to Aboriginal Group's and/or Treaty Nation's traditional territories				
		• TEK and TLU information, as available, with a description of how TEK and TLU Studies information was gathered and incorporated into the assessment of impacts of the proposed Project on Aboriginal Interests				
		• A description of the Aboriginal Interests of each group identified through secondary research techniques or provided directly through consultation activities; the description will include background information on ethnography, language, governance, economy, and reserves				
		• A description of potential adverse effects of the proposed Project on Aboriginal Interests				
		• A description or summary of mitigation measures to avoid or reduce potential adverse effects on Aboriginal Interests consistent with Section 3.5, Mitigation Measures, of this AAIR template				
		• A characterization of the residual adverse effects on Aboriginal Interests after mitigation using the methodology described in Section 3.6, Characterization of Residual Effects, Section 3.7, Likelihood, and Section 3.9, Confidence and Risk, of this AAIR template and incorporating the findings of the VC chapters in the Application that are relevant to Aboriginal Interests				
		• A summary of any outstanding Aboriginal Interests issues identified by Aboriginal Groups

11.1 (cont'd)	See above	• A summary of publicly available arrangements or agreements reached between the proponent and Aboriginal Groups	See above	See above	See above	
		The description of potential effects and characterization of residual effects will be developed by assessing the potential effects pathways to Aboriginal Interests. The potential effects will include, but are not limited to, the following topics requested by First Nations to date:				
		• Effects to the exercise of traditional practices, including via perceived odor, noise, and light				
		• Effects to cultural practices and cultural sites, for example, cultural sites where transmission of traditional knowledge may take place				
11.2	Other Matters of Concern to Aboriginal Groups	The Application will include:	11.4	Other Matters of Interest to Aboriginal Groups	Page 11-7 To be prepared for final version	
		• A list of other matters of concern raised by Aboriginal Groups with respect to potential environmental, economic, social, heritage and health effects of the proposed Project, which have not already been considered in the discussion about Aboriginal Interests				
		• A description (or summary if described elsewhere in the Application) of the mitigation measures to address potential effects on other matters of concern to Aboriginal Groups				
		• A characterization of the residual adverse effects after mitigation, in a manner consistent with assessment methodology in this AAIR template				
		• A description of how these matters of concern have been addressed from the perspective of the Aboriginal Groups and the Proponent				
11.3	Issue Summary Table	The Application will include:	11.5	Issue Summary Table	Page 11-7 To be prepared for final version	
		• A Summary Table (see example below) that identifies Aboriginal Interests or other matters of concern to Aboriginal Groups that may be impacted by the proposed Project, and the measures to avoid, mitigate or otherwise manage the effects				
		• An Appendix, the Aboriginal Consultation Report, which contains comments received from Aboriginal Groups regarding this Section of the Application				
		Table 3: Summary table of the results of Aboriginal consultation related to Aboriginal interests and other matters of concern to Aboriginal groups				
Part D	**Public Consultation**		**Part D**	**Public Consultation**		
12	Public Consultation	The Application will include a report on the results of implementation of the approved Public Consultation Plan including:	12	Public Consultation	Page 12-1 to 12-3 Subsections 12.1 to 12.3 To be prepared for final version	
		• Background information:				
		– Identification of local governments, residents, property owners, and other rights holders who are potentially impacted by the proposed Project				
		– Maps of local government boundaries, private land, tenures/authorizations, or residences with respect to the proposed Project				
		– Background information about each potentially affected municipality and/or stakeholder group				
		• Public Consultation:				
		– A summary of the past and planned consultation activities				
		– A summary of any proposed changes to the approved Public Consultation Plan as a result of feedback from local governments, stakeholders, or individuals, or experience from consultation to date				
		– A description of the key issues raised by the public that are relevant to the EA, the responses to those issues, and the status of their resolution				
		• Summary Table:				
		– Identification of concerns raised by the public and the measures to avoid, reduce or mitigate those impacts; this information will be provided in the form of a table

Part A: Introduction

Part A of the Environmental Assessment Certificate (EAC) Amendment Application (the Application) includes an overview of the proposed Tervita Silverberry Landfill Amendment Application Project (the proposed Project expansion) (Section 1) and provides a description of the British Columbia (BC) Environmental Assessment Office (EAO) process through which the proposed Project expansion will be reviewed (Section 2).

The information provided in Part A follows the requirements set out in the Amendment Application Information Requirements (AAIR) for the proposed Project expansion issued on January 23, 2019 by the BC EAO.

1. Overview of Proposed Project Expansion

This section of the Application provides an overview of the proposed Project expansion, describing the proponent, the proposed Project expansion location and components, applicable authorizations, alternative means of undertaking the proposed Project expansion, and Project benefits. An overview map of the proposed Project expansion is provided on Figure 1.2-1, while a more detailed overview of the proposed Project expansion can be found on Figure 1.2-2.

1.1 Proponent Description

Tervita Corporation (Tervita) owns and operates the Silverberry Secure Landfill (the existing landfill), which is located approximately 50 kilometres (km) northwest of Fort St. John, BC. The existing landfill was originally constructed in 2003, and currently holds approval (PR 17150) from the BC Ministry of Environment and Climate Change Strategy (MECCS) and approval (EAC WD02-01) from the BC EAO.

Based in Calgary, Alberta, Tervita is a leading environmental and energy services company that provides the energy industry with a comprehensive suite of services that include waste management, drilling and coring, well servicing, and other environmental services. These services cover every stage of the production life cycle, from development to reclamation. Through innovation, science, knowledge, and experience, Tervita helps their clients, communities, and governments ensure responsible and sustainable development of our resources, while demanding safety, enhancing efficiency, and minimizing the environmental impact.

Operating under previous names such as Canadian Crude Separators Inc. (CCS), Hazco, Concord, Beck, HMI, Prodrill, and others, Tervita is the largest owner and operator of Class II landfills in Western Canada with stringent operating standards and procedures. Tervita currently operates 20 engineered landfills in Western Canada, with 2 in northeastern BC (Silverberry and Northern Rockies). In addition, Tervita operates 22 Treatment, Recovery, and Disposal (TRD) or wastewater disposal facilities and 2 Cavern facilities across Western Canada.

Tervita (then CCS) was incorporated in the Province of Alberta in November 2007, and is registered as an Extraprovincial Company in the Province of BC (Attachment 1). Prior to 2007, CCS operated as a publicly-traded common stock company. In 2012, CCS and 12 owned subsidiaries (including HAZCO, Prodrill, Concord, and others) came together under the new name of Tervita Corporation. On May 21, 2019, Tervita requested that the name on EAC WD02-01 be changed from CCS to Tervita Corporation (see Attachment 2). There were no ownership changes to the company. Tervita's website can be accessed at the following address: http://www.tervita.com. The proponent's contact information for the proposed Project expansion is provided in Table 1.1-1.

This Application was prepared by CH2M HILL Canada Limited (Jacobs) with the input of Tervita and the assistance of other professional consulting firms. Identified in Table 1.1-2 are the companies responsible for the various supporting studies and activities to support Tervita in developing the proposed Project expansion. Discipline leads are the individuals responsible for reviewing and, in some cases, writing effects assessments and technical reports to ensure consistency and accuracy.

Supporting technical reports are provided in Appendices 1 to 11. The technical reports provide topic-specific background information, the methodology and results of field surveys, and research conducted in support of the Application. These technical reports, surveys, and studies provide an information base for the assessment of the proposed Project expansion. The authors of the supporting technical reports participated in the identification of potential adverse effects, the development of mitigation measures, and the evaluation of the significance of the potential residual adverse effects within their respective disciplines. The technical reports contain information to demonstrate the expertise of the authors.

1.2 Description of Proposed Project Expansion

The existing landfill is located on privately owned land at 8-88-20 W6M, approximately 50 km northwest of Fort St. John, BC. A Project Approval Certificate (PAC) (now known as an EAC) Application was submitted to the BC EAO for the existing landfill in March 2002, and the Project was approved in July 2002, with the existing landfill being operational in 2003. The existing landfill consists of seven secure landfill cells, with one still to be developed under the existing approval, for a total of eight cells and an approved capacity of 3,933,000 cubic metres (m^3). Silverberry is approved to accept nonhazardous and select hazardous waste. The select hazardous waste that Silverberry is able to accept includes waste with leachable benzene, toluene, ethylbenzene, and xylenes levels, solids containing flammable liquid (UN3175 Class 4.1), and waste oil. No waste streams at the landfill are incinerated. All waste is primarily generated from the oil and gas industry. Just under 300,000 m^3 of waste was accepted by the existing landfill in 2018.

The purpose of the proposed Project expansion is to expand the depleted capacity of the existing landfill. The proposed Project expansion will be located on land owned by Tervita, immediately east of the existing landfill, and will be approximately the same size as the existing landfill footprint (roughly 25 hectares [ha]). Landfill cells are constructed in a staged manner dependent on fill rate, typically with only one cell operational at a time. Associated infrastructure and facilities located on the existing Tervita property include access roads, drainage ditches, and groundwater monitoring wells, as well as the office and weigh scales. Infrastructure and associated facilities are in operation for the existing landfill and will continue to be used for the proposed Project expansion. In addition, stormwater and leachate management and monitoring systems are in place at the existing landfill, and will be expanded or upgraded, where appropriate, to account for stormwater retention and leachate generation associated with the proposed Project expansion.

Similar to the existing landfill, the proposed Project expansion will be developed as a series of cells. The future landfill development area has been conceptually designed to accommodate six cells of varying sizes. As additional cells are developed, the liner and leachate collection systems will be tied together to provide a continuous liner system under the entire proposed Project expansion footprint. This will allow

final development of the area as one contiguous fill mass, rather than six individual pockets, as is standard landfill operating and construction practice. The additional cells will provide an additional 5,274,340 m^3 of capacity. The location of the proposed Project expansion provides for a 50-metre (m) wide secure buffer zone on the property owned by Tervita, surrounding the active area of the existing landfill, as required under Section 25 (10) of the *Hazardous Waste Regulation* (HWR).

The type of waste accepted is not expected to change as a result of the proposed Project expansion, as the purpose of this Application is to replace depleted capacity. The types of waste that are currently accepted at the existing landfill include hydrocarbon-contaminated soils and sands, sulphur-contaminated soil, salt-contaminated soils, and other wastes associated with the oil and gas industry. Examples of other waste that may be accepted include construction and demolition materials such as cement, absorbents and desiccants, drill cuttings, and other sources of industrial waste.

Waste is screened for naturally occurring radioactive materials (NORMs) prior to being accepted at the existing landfill, and materials containing NORMs are accepted in accordance with all provincial and federal regulatory requirements. This same procedure will apply to the proposed Project expansion.

Based on current knowledge of the types and volumes of oilfield waste in the northeast BC area, Tervita estimates that the proposed Project expansion will handle approximately 250,000 to 300,000 tonnes per year of solid waste, depending on economic conditions. There is potential for variability in annual waste quantities accepted by the proposed Project expansion. The capacity replacement is estimated to provide an estimated 25 years of operating capacity. There will be no new buildings or structures added as part of the proposed Project expansion. The proposed Project expansion is not associated with any broader public sector policies, plans, or programs.

1.2.1 Proposed Project Expansion Location

The existing landfill is located on privately owned land, approximately 50 km northwest of Fort St. John in Electoral Area B of the Peace River Regional District (PRRD), at 8 88-20 W6M (latitude: 56°37'21.49"N; longitude: 121°9'24.88"W). The landfill expansion area is located immediately east of the current landfill footprint in Block A of Section 8. The expansion footprint will be approximately 25 ha (roughly the same size as the existing landfill footprint) and will be designed to handle approximately 5,275,000 m^3 of material. The location of the expansion area provides for a 50- m)-wide secure buffer zone on the property, surrounding the active area of the landfill. Tervita estimates that the proposed Project expansion will handle approximately 600,000 tonnes per year of oilfield waste and will add approximately 20 years to the operating life of the existing landfill. Figure 1.2-1 shows the regional location of the proposed Project expansion, while Figure 1.2-2 provides a more detailed overview of the proposed Project expansion.

The proposed Project expansion is within Treaty 8 boundaries and the asserted traditional territories of several Aboriginal groups and Métis organizations. Per a letter from BC EAO dated August 6, 2015, Tervita is required to consult with the following Aboriginal groups with asserted traditional territories overlapping the proposed Project expansion:

- Blueberry River First Nations (BRFN)
- Doig River First Nation (DRFN)

The proposed Project expansion is also located in proximity to the following Indian Reserves (IRs):

- Approximately 5 km south of the Blueberry River IR No. 205
- Approximately 20 km southeast of the Beaton River IR No. 204 (South Half)
- Approximately 40 km west-southwest of the Doig River IR No. 206
- Approximately 40 km northwest of the Halfway River IR No. 168

The location of the proposed Project expansion in relation to the previously noted traditional territories and IRs is provided on Figures 1.2-1 and 1.2-2.

1.2.2 Phases of the Proposed Project Expansion

It is anticipated that the final cell of the existing landfill will be constructed and filled to capacity by 2020. Tervita estimates that all amendments will be in place by spring 2020, with construction of the proposed Project expansion to commence in summer 2021. A schedule for the entire proposed Project expansion is outlined in Table 1.2-1. The landfill operation will be progressive in nature, with each cell being constructed and capped independently. When all cells have been decommissioned, the entire site will be decommissioned and reclaimed.

Table 1.2-1. Proposed Project Expansion Schedule

Project Phase	Activities	Date
BC EAO and BC MECCS permits obtained	Permitting	Spring 2020
Equipment mobilized to site	Transportation	Spring 2021[a]
Construction of landfill expansion	Land clearing, excavating, grading, stockpiling of excavated material, compaction, and liner installation	Summer-fall 2021[a]
Demobilization of equipment	Transportation	Fall 2021[a]
Landfill operation	Excavating, grading, and compaction; capping used cells	2021-2050
Closure or future expansion	To be determined[b]	--

[a] Dates for equipment mobilization, construction, and demobilization are provided for development of the first cell. These activities will be repeated approximately every 2 to 3 years thereafter as more cells are developed.

[b] At the end of its operational life, the proposed Project expansion will be decommissioned and postclosure activities will commence. Any reclamation requirements will be determined at this time. Postclosure activities will be completed for a minimum of 25 years.

1.2.3 Proposed Project Expansion Components and Activities

Construction is scheduled to start as soon as practical following the receipt of Project approvals and seasonal limitations. The current estimate is for construction to start in summer 2021. The construction period will be approximately 6 months, starting with major earthworks, proceeding through liner installation, and finishing with the leachate collection system installation. The construction labour force will consist of project engineers, liner installation specialists, and contractors for general earthwork. The total labour force will vary from 5 to 20 persons at any time, depending on the stage of construction. There will be no construction camp onsite. Construction personnel will likely be accommodated in Fort St. John, BC.

During operation, waste will arrive at the site on trucks owned and operated by oilfield companies. There will be no increase in traffic volume as a result of the proposed Project expansion. Existing access roads to the landfill will be utilized. Internal access roads to the cells will be built within the Project footprint. Power transmission is only used to run the scale house, and no increase in power usage is expected. All other equipment runs on fuel.

Only solid, nonsecure (nonhazardous), and select secure (hazardous) oilfield and industrial wastes are accepted for disposal at the landfill. Municipal solid wastes are not permitted for disposal at the landfill. Gases resulting from the decomposition of landfilled wastes are not expected, due to the nature of the solid wastes accepted. The landfill utilizes specific waste acceptance procedures prior to accepting and processing all incoming waste to ensure that only approved wastes are accepted. Hydrocarbon odours may be present at times in the vicinity of the active landfilling area, but are not expected to be detectible at the property boundaries. Emissions are negligible and are only attributed to onsite heavy machinery. Landfill leachate will be collected and stored within engineered, lined ponds and trucked offsite for disposal in injection wells and other approved facilities. The water injection wells are permitted by the BC Oil and Gas Commission (OGC) and BC MECCS for disposal of nonhazardous waste. Leachate volumes are expected to remain consistent, as landfill cells are progressively capped in order to reduce the generation of leachate.

1.2.4 Land Use

The proposed Project expansion will be constructed on land that is owned by Tervita and is located within the existing fenced boundaries of the operating landfill. There is low natural vegetation diversity within the Project footprint, as vegetation has been disturbed by past agricultural activities. There is a small area (2.2 ha) of native vegetation along the east margin of the Project footprint that will be cleared to accommodate the expanded landfill; however, this area is not expected to be cleared for 10 to 15 years, once new landfill cells are required. The proposed Project expansion is surrounded by mainly Crown-owned, forested lands, which support oil and gas exploration and development, forestry, and agriculture. Other land use activities with the potential to take place in the area include hunting, trapping, fishing, gathering, and offroad recreation (for example, snowmobiling and all-terrain vehicle [ATV] use). The following subsections describe planned land use in the proposed Project expansion area. Additional details on surrounding land and resource use activities are provided in Section 6.1.

1.2.4.1 Zoning and Local Planning

The Tervita property was rezoned from “Public” to “Oil and Gas Production” under the PRRD Zoning By-law No. 1000 to accommodate the construction of the existing secure landfill in 2003. Lands at the proposed Project expansion site are therefore permitted to be used only for oil and gas production, land treatment facilities, and associated accessory buildings and structures (PRRD Zoning By-law No. 1000 [PRRD 1996]).

1.2.4.2 Tenures, Licenses, Permits, and Authorizations

A PAC (now known as an EAC) Application was submitted to the BC EAO for the existing landfill in March 2002, and the Project was approved and issued the PAC WD02-01 in July 2002, with the existing landfill being constructed in 2003. Tervita currently holds the following permits and approvals for the Project:

- BC MECCS – Permit 17150 (issued on October 18, 2002, under the *Environmental Management Act* [*EMA*])
- BC Ministry of Sustainable Resource Management – Water Licence No. C113545 (issued on February 18, 2002, under the *Water Act*)

Tervita also currently holds the following permit for the Landfarm facility to the north of the Project:

- BC Ministry of Water, Land and Air Protection – Permit 10758 (issued on October 7, 1994 under the *Waste Management Act*).

Applicable licenses, permits, and/or authorizations that are required for the proposed Project expansion are described in Section 1.3.

1.2.4.3 Provincial and Regional Land Use Plans

The proposed Project expansion is located in the Fort St. John Forest District on land designated for “Agriculture/Settlement” in the *Fort St. John Land and Resource Management Plan* (LRMP) (Fort St. John LRMP Working Group 1997). Although agriculture is a high priority in these areas, the Fort St. John LRMP encourages multiple land and resource uses as long as agricultural soil productivity is maintained (Fort St. John LRMP Working Group 1997). The proposed Project expansion is compatible with LRMP objectives for the area given that final cover upon closure of the landfill will meet agricultural standards, as provided in the *Contaminated Sites Regulation* (CSR), and Tervita will work with BC MECCS to consider future land uses upon closure.

In July 2018, a new Regional Strategic Environmental Assessment Interim Measures Agreement (the Agreement) signed by BRFN, the BC Ministry of Energy, Mines and Petroleum Resources, the BC OGC, and the BC Ministry of Forests, Lands, Natural Resource Operations and Rural Development (MFLNRORD) will apply to defined areas within the BRFN traditional territory. The Agreement is designed to address immediate concerns with respect to oil and gas development activities in BRFN’s critical areas

while supporting the access and development of resources in specific areas identified by the parties. There are critical areas where new surface disturbance will not be permitted or will be restricted and other areas where development activities will be managed. The proposed Project expansion is located within Region 3, where the management objective is “no new surface disturbance”. The Agreement is specifically for oil and gas applications under the BC OGC. The proposed Project expansion will take place on private, previously disturbed land and, therefore, is not inconsistent with the Agreement.

1.2.4.4 Provincial Land Use Designations

The proposed Project expansion is located on lands zoned as Agricultural Land Reserve (ALR) by BC’s Agricultural Land Commission (ALC). The purpose of the ALR is to protect land with agricultural potential in BC (PRRD 2014). ALR lands are considered to have the greatest agricultural capability in the province with agriculture recognized as the priority land use. Although agriculture and farming are prioritized in the ALR, other compatible land uses are permitted. Nonagricultural uses must be approved by the ALC (ALC 2014a). The land in the Project footprint was approved for nonfarm use by the ALC (see Figure 1.2-3 and Section 4.1.2 for additional details).

The proposed Project expansion is also located in the Fort St. John Timber Supply Area (TSA) with a current allowable annual cut (AAC) of 2,115,000 m^3 (Province of BC 2018d) (see Figure 1.2-3 and Section 3.9.1.2 for more details on the TSA).

1.2.4.5 Wildlife Management Areas

The proposed Project expansion is located within the Peace Region Management Unit 7-33 (Region 7B) (GBC 2019b). The proposed Project expansion is not located within any provincially identified wildlife management areas (for example, Ungulate Winter Ranges [UWRs] or Wildlife Habitat Areas [WHAs]) (GBC 2019b). The proposed Project expansion is not located within any Parks and Protected Areas (BC MFLNRORD 2018a), Important Bird Areas (Bird Studies Canada and Nature Canada 2004-2010), Migratory Bird Sanctuaries (ECCC 2017), National Wildlife Areas (ECCC 2018), Western Hemisphere Shorebird Reserves (WHSRN 2018), or Ramsar wetlands (Bureau of the Convention on Wetlands 2016).

1.2.5 Economic Benefits

Construction expenditures are estimated to total approximately $43.5 million for all proposed cells. Of this amount, approximately $4 million will be spent on engineering and design and $9 million will be spent to construct the first cell (Cell 9). The operations phase expenditures are estimated to total approximately $3 million per year, and include regular maintenance and material expenditures, labour, and contracting. Costs associated with initial decommissioning and abandonment are estimated at approximately $7 to $8 million, and include activities such as soil and groundwater monitoring, leachate and stormwater testing, demolishing the office site, weigh scales, clay liners and berms, grading and contouring, erosion and dust control, topsoil replacement, seeding, and inspections. Annual costs associated with decommissioning and abandonment are estimated at $140,000, and include activities such as annual inspections and maintenance, soil and groundwater monitoring, laboratory testing of leachate and stormwater, dust control, mowing, and vegetation control. Reclamation requirements and associated costs will be determined during the decommissioning phase.

The proposed Project expansion will, over more than 25 years of life, contribute millions of dollars in construction-related expenditures, labour income and employment, and taxes to the municipal, regional, provincial, and federal governments. Capital cost of the proposed Project expansion is estimated at $43.5 million. Currently, Silverberry pays a royalty of $0.90 per tonne of waste accepted per the *Waste Discharge Regulation*, which amounted to $269,199.73 in royalties in 2018. This revenue is expected to be similar for the proposed Project expansion if rates remain the same. The operations of the proposed Project expansion will also generate revenue in the form of property taxes. The construction of the proposed Project expansion will generate a demand for goods, services, and workers, which will contribute to the local and regional economy. There will be direct and indirect business income, and direct and indirect employment income. There will also be increased tax revenues during construction and operations as a result of sales tax and fuel tax, for example.

The proposed Project expansion will generate employment and contracting opportunities for Aboriginal and non-Aboriginal community members and businesses. The construction phase will require a workforce of approximately 20 personnel for 4 to 5 months to construct each cell, which is the equivalent to a total of 36 person-years for construction of all 6 proposed cells. The proposed Project expansion construction will provide most employment opportunities for local businesses and community members. Types of job requirements for landfill cell construction include an Environment & Regulatory Advisor, a Landfill Project Manager, third-party landfill engineering firms, a construction crew, a liner crew, and an inspector. Although Tervita will endeavour to hire locally, all major construction is sent out to bid and awarded to companies with appropriate experience versus cost. Companies are, however, typically Western Canadian. Tervita currently employs seven full-time personnel (175 person-years for the operations phase) residing in Fort St. John for operations and no additional full-time employment is expected to be generated for the proposed Project expansion. Wages paid by Tervita will be aligned with the average wages in the region for technical and nontechnical work.

Predicted benefits include an influx of tax revenues that may be used by the government for services related to the environmental, economic, social, health, and heritage pillars of assessment. The predicted social benefits of the proposed Project expansion include training, education, and employment opportunities for unemployed or underemployed individuals.

A summary of economic benefits is provided in Table 1.2-2.

Table 1.2-2. Economic Benefits

Economic Benefit	Project Phases	Amount (approximate)
Expenditures	Construction	$43.5 million
	Operations	$3 million per year
	Decommissioning and abandonment	$7 to $8 million
Royalties	Operations	$0.90 per tonne of waste accepted
GST	Construction and operations	$150,000 to $500,000
Employment and contracting opportunities	Construction	36 person-years
	Operations	175 person-years

Note:
GST = goods and services tax

1.2.6 Assumptions

The following assumptions were made in relation to the information presented in Section 1.2:

- Tax rates and royalties are based on current market prices (that is, GST from $150,000 to $500,000 and a royalty of $0.90 per tonne).
- The proposed Project expansion will not be subject to any additional taxes or royalties other than the existing landfill.
- The majority of construction purchases will be made locally.
- Construction and operations of the proposed Project expansion are based on Tervita's current knowledge of the types and volumes of oilfield waste in the northeast BC area and Tervita's previous secure landfill experience.

1.3 Applicable Authorizations

Table 1.3-1 outlines the applicable licenses, permits, and/or approvals that are required for the phases of the proposed Project expansion.

Table 1.3-1. Applicable Authorizations

Statute and Authorizing Agency	Permit/Authorization	Description/Need for Authorization
BC MECCS *EMA*, HWR, and *Waste Discharge Regulation*	Amendment of BC MECCS Permit PR 17150	Required for discharge of nonhazardous and select hazardous waste
BC EAO *EMA* and *Reviewable Projects Regulation*	Amendment of PAC (now known as the EAC)	Required for construction and operations of the proposed Project expansion

1.4 Project Design and Alternative Means

Alternative means are the various technically and economically feasible ways to implement a project (CEA Agency 2015). Increased landfill capacity is required to meet potential future waste management needs in the region, and the existing landfill does not currently provide sufficient capacity. Alternative means were sought through a siting process. In order to determine the best option to meet the needs and

purpose of the proposed Project expansion, a multidisciplinary team used a balanced approach that emphasized public safety, protecting the environment, constructability, and cost.

The main alternative to the proposed Project expansion is the construction of a new landfill at a different location. Not constructing a landfill is not an option as there is a need for increased landfill capacity in the region to address the ongoing production of industrial waste. The proposed Project expansion will allow Tervita to continue to provide timely, orderly, environmentally sound, and economical options for the disposal of oilfield waste in northeastern BC.

If Tervita were to construct the proposed Project expansion at a new location, most of the existing infrastructure and safety systems would need to be re-established, increasing costs and the overall risk to people and the environment. New land and access requirements would result in increased native vegetation disturbance and risks to wildlife and wildlife habitat. In addition, a new site would result in a cumulative decrease to the aesthetic value of the landscape and increased nuisance to land users, for example, as a new source of noise and traffic.

Site selection is one of the primary mitigation options for minimizing conflict between a proposed Project expansion and biophysical, socio-economic, and cultural resources. Co-locating the proposed Project expansion at Tervita's existing landfill instead of constructing and operating a landfill at a new site allows for a lower impact for the following reasons:

- Reduces impacts on other land owners and land users since Tervita holds the disposition rights to the proposed Project expansion area, leveraging existing data regarding the Project Area given the ongoing monitoring of the existing landfill, and minimizing visual and land use impacts.
- Minimizes potential adverse effects by limiting the overall physical disturbance necessary to construct and operate the proposed Project expansion to locations where Tervita holds the disposition rights to that land.
- Incorporates operational activities associated with new infrastructure into existing activities.
- Leverages existing data to understand potential interactions of the existing landfill and the environment, with over a decade of results through routine monitoring of surface and groundwater quality, air quality, and soil quality.
- Keeps the proposed Project expansion away from residential areas
- Avoids the creation of new access corridors, which may result in adverse and unintended consequences on wildlife and wildlife habitat, and interfere with surrounding land uses.
- Minimizes potential adverse effects on aesthetic value of the landscape, since the proposed Project expansion will be co-located with an existing landfill that has already altered the viewshed in the area.
- Reduces the likelihood that the proposed Project expansion will interact with previously unidentified heritage resources, since the land is previously disturbed and has low potential for heritage resources.
- Reduces costs consistent with prudent company management and long-term sustainability; expanding the existing landfill site is substantially more cost-effective than constructing and operating a landfill at a new site.

1.5 Alternatives to the Proposed Project Expansion

No technically and economically feasible alternative locations were identified to meet the needs of the proposed Project expansion. Consequently, a qualitative assessment associated with building the capacity replacement for the landfill at an alternate location was not considered in this assessment.

2. Environmental Assessment Process

2.1 Provincial Environmental Assessment Process

This subsection outlines the stages of the BC EAO process including the Pre-Application stage and the Application Review stage for amendments to EAC. The BC EAO established a Working Group consisting of representatives from provincial and federal government agencies, local and regional governments, and Aboriginal groups to assist the EAO with the Application process. The EAO Working Group identified for the proposed Project expansion are as follows:

Provincial government agencies:

- BC EAO
- BC Ministry of Agriculture
- BC MECCS
- BC MFLNRORD
- BC Ministry of Health
- BC Ministry of Natural Gas Development
- Northern Health

Municipal and Regional Agencies:

- PRRD
- City of Fort St. John

Aboriginal Groups:

- BRFN
- DRFN

2.1.1 Pre-Application Stage

After reviewing materials that Tervita provided February 24, 2014, and based on subsequent meetings and discussions, in a letter dated August 6, 2015, the EAO determined that Tevita's amendment request to the existing PAC (WD02-01; now known as the EAC) for the proposed Project expansion is deemed to require an Application pursuant to Section 19 of the BC *Environmental Assessment Act* (*EA Act*). An amendment of the PAC WD02-01 (now known as the EAC) is required because Tervita (as holder of the EAC) proposes a change or changes to the design, location, construction, operation or decommissioning of Silverberry. An approval from BC MECCS for amendment of Permit PR 17150 is also required for the proposed Project expansion pursuant to Section 19 of the *EA Act*. This Application has been developed pursuant to the BC EAO-approved AAIR. The Pre-Application stage has concluded with the Tervita filing of the proposed Project expansion Application to the BC EAO.

During the Pre-Application stage of the proposed Project expansion, Tervita conducted consultation activities with the Working Group for their inputs on the selection of appropriated Valued Components (VCs) and on details of the AAIR. Details of issues raised by the Working Group during these consultation activities are provided in Parts C and D, and Appendix 12 and 13 of this Application. A summary of key issues raised by the EAO Working Group's government agencies and status of resolution is provided in Table 2.1-1. Summaries of key issues raised by the EAO Working Group's Aboriginal groups and status of resolution are provided in Tables 11.2-1 and 11.3-1. These issues have been addressed prior to the finalization of the AAIR or are addressed in this Application.

Tervita initiated public consultation on July 1, 2015. Residences, occupants, and landowners within 3,200 m of the Project were consulted in-person and by phone on September 9 and 10, 2015. Residences, occupants, and landowners within 5,000 m of the Project were notified by registered mail on September 10, 2015. An open house was held in the Community of Buick on February 16, 2016. An

"Invitation to Comment" by the BC EAO was posted on the May 11, 2017 issue of the *Alaska Highway News*, seeking public comments on the draft VCs. No public concerns have been expressed about the proposed Project at this time.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Terrain and soils	BC MECCS asked what soil sampling will be collected to support the assessment of soils, where soil chemistry will be sampled and analyzed, and what is the soil quality at the existing effluent discharge location and in soils that are downwind of the facility. BC MECCS requested soil chemistry sampling downgradient to determine if stormwater effluent discharge has impacted soil quality and downwind of the landfill to evaluate the efficacy of current dust suppression mitigation for preventing contamination of regional soils. BC MECCS is also concerned about impacts to soils and biota on lands and surface waters downwind of the prevailing winds from the transport of contaminated or radioactive dust.	There was a siting investigation done before the original landfill was built (Appendix 5). The original geology of the area will not have changed. However, Tervita is supplementing the original siting investigation with some further analysis of the expansion area. Soil chemistry and quality have been assessed in the field (Appendix 1) and are discussed in the Application (Section 4.1). Tervita performs NORM air monitoring bi-annually (Appendix 11) to ensure that onsite mitigation measures are sufficient to prevent the spread of naturally occurring radiation outside the landfill.	Addressed in Section 4.1 and Appendices 1, 5, and 11 of the Application.
	BC MECCS raised a concern that “Potential atmospheric impacts associated with a proposed secure landfill site include: fugitive dust from equipment activities that may adversely affect vegetation and increase the intake of particles on wildlife and human receptors;”	Fugitive dust emissions are addressed under the Dust subcomponent in Section 4.2 of the Application.	Addressed in Section 4.2 of the Application.
	BC MECCS noted this reference: Integrated Approach for the Analysis of Ecosystems at Risk: A Case Study in a Waste Landfill. R. Mazzeo et al. 2013. Environmental Engineering and Management Journal 12: 165-168. “Quantification of heavy elements levels in soil and air cannot generate sufficient information on impact because the absolute metal concentration alone does not reflect the degree to which these compounds affect the environment (Cheung et al., 1993). Data on the bioaccumulation and effects of leachate on wild populations are essential to assess the environmental impact of these disposal sites.”	Tervita reviewed the extended abstract of the article referenced. The landfill referenced in the abstract is a municipal solid waste landfill. No details of landfill design, siting, or geology are given; therefore, a correlation between the environmental effects of Ginestreto and Tervita Silverberry cannot be made.	Addressed in the response.
	PRRD requested for clarification regarding soil sampling, while they have a sample regimen stated in one of their documents, it is unclear how often they would be sampling (that is, whether it is monthly, annually, case-by-case, etc.).	The soil sampling program is planned to be a one-time-only study to determine if existing operations have impacted the surrounding soils.	Addressed in the response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Terrain and soils (cont'd)	Northern Health suggested that the LAA for soils should be expanded to capture potential effects from potential offsite soil contamination associated with surface water discharge and dust deposition.	There are no proposed changes to the spatial boundaries for assessment at this time. Section 3.2.1 in the AAIR stated that "if information is produced that indicates assessment boundaries should be adjusted to better reflect ecosystem boundaries and divides, study area boundaries will be revised". Tervita has reviewed the information collected for the Application and determined that there are no findings that warrant a revision of the LAAs and RAAs.	Addressed in the response.
	Northern Health noted that the soil data would be compared to the BC CSR Schedule 4 Standards, and asked for other applicable CSR Schedules (for example, Schedule 5) to be included in the assessment. BC MECCS noted that where CCME soil quality guidelines do not exist for a particular parameter, the BC CSR numerical standards should be used in the evaluation of soil analysis results. Alternatively, other applicable guidelines or standards can be used, if available, such as guidelines or standards from the U.S. EPA.	Considerations suggested by Northern Health and BC MECCS have been addressed in Section 4.1 and Appendix 1 of the Application.	Addressed in Section 4.1 and Appendix 1 of the Application.
Soil study method	Northern Health noted that screening criteria based on CCME's human health-based soil quality guidelines and/or BC CSR standards are only acceptable for assessing risk from direct contact. Northern Health suggested that tissue modelling and/or sampling would be required to assess the risk to human health if there is a potential for the bioaccumulation of contaminants into the food chain.	In order to determine effects of emissions on vegetation, the potential emissions from Silverberry first have to be understood. If vegetation sampling or monitoring is required, this should be discussed in the *EMA* Permit amendment. Tervita has committed to completing soil sampling at the surface water discharge location and in the Project Area adjacent to the existing landfill to determine if contamination is present. If contamination is discovered, mitigation will be implemented to reduce the risk of contaminants reaching receptors. In addition, Tervita has committed to conducting air quality monitoring to determine if emissions are being produced by the landfill, and NORMs are monitored twice a year to determine if atmospheric levels are within regulatory standards. Since the possible pathways for contamination are being studied, it would be duplicative to sample vegetation tissue to determine if contamination is being spread through air, water, or soil; therefore, Tervita is not proposing a tissue sampling program at this time.	Addressed in the response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Soil study method (cont'd)	BC Ministry of Natural Gas Development noted that it does not appear that any samples were taken to the northwest; the samples were only taken to the north.	When surface water is discharged, it is discharged directly north from the stormwater pond. If there is no sign of contamination directly north where water is discharged, it can be assumed that no/minimal contamination is reaching the ephemeral drainage that drains northwest.	Addressed in the response.
	BC Ministry of Natural Gas Development asked why no sample was collected southwest of the work area (that is, south/southeast of the leachate frac/water ponds or west of Cell 6 given prevalent conditions.	Land by the leachate ponds is on the footprint of an oilfield waste management facility and water injection facility. Any sampling taken in this area would make it difficult to differentiate between contamination caused by the landfill and oilfield waste management facility. Land directly west of Cell 6 is going to be developed into new landfill cells. The study work plan was circulated to the Working Group prior to initiation and the sampling locations were deemed satisfactory.	Addressed in the response.
	BC Ministry of Natural Gas Development noted that barium results from onsite locations are consistently higher than offsite locations. Are we seeing a possible impact from operations here (even though they are still below regional background levels)?	Further investigation will have to be performed to draw a more substantial correlation between operations and a possible barium impact. Tervita will take into consideration further investigation on the source of barite/barium.	Addressed in the response.
	BC MECCS suggested adding a separate chapter for GHGs.	GHGs were originally excluded in the VC document. After Working Group feedback, Tervita added GHGs under the air quality VC as a KI.	Addressed in Section 4.2.4 of the application.
Air study method	BC MECCS suggested that, when including the discrete data collected on August 24, 2016, ensure to compare the nature of this sampling program to the bullets detailed in Section 3.3 of the dAAIR. Specifically, consider these two samples relative to the first bullet: "A description of the quality and reliability of the existing (or baseline) data and its applicability for the purpose used, including any gaps, insufficiencies and uncertainties, particularly for the purpose of monitoring activities".	The data gathered on air quality and potential effectiveness regarding uncertainty and sufficiency have been expanded upon in Section 4.2 of the Application.	Addressed in Section 4.2 of the Application.
	BC MECCS noted that fugitive emissions (of coarse particles, VOCs and odourants) are missing from the list of potential effects. Fugitive emissions should be considered an activity of sorts.	Tervita added fugitive emissions to the list of potential effects in Section 4.2.4.	Addressed in Section 4.2.4 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Air study method (cont'd)	BC MECCS asked which data can be presented to support the assertion that the site does not produce uncontrolled releases of CH_4 and which information is gathered through ongoing monitoring and data collection efforts? Which ambient air quality monitoring occurs onsite?	Data regarding air monitoring and landfill gas generation have been discussed in Section 4.2.2 and Appendix 2 of the Application.	Addressed in Section 4.2.2 and Appendix 2 of the Application.
	BC MECCS noted that the potential impacts from landfill dust and emissions remains a key uncertainty that should be resolved prior to the submission of an application. BC MECCS suggested a limited sampling program, such as lichen sampling and tissue analysis for assessing the potential impact of emissions.	In order to determine effects of emissions on vegetation, the potential emissions from Silverberry first have to be understood. If vegetation sampling or monitoring is required, this should be discussed in the *EMA* Permit amendment. Tervita has committed to completing soil sampling at the surface water discharge location and in the Project Area adjacent to the existing landfill to determine if contamination is present. If contamination is discovered, mitigation will be implemented to reduce the risk that contaminants will reach receptors. In addition, Tervita has committed to conducting air quality monitoring to determine if emissions are being produced by the landfill, and NORMs are monitored twice a year to determine if atmospheric levels are within regulatory standards. Since the possible pathways for contamination are being studied, it would be duplicative to sample vegetation tissue to determine if contamination is being spread through air, water, or soil; therefore, Tervita is not proposing a tissue sampling program at this time.	Addressed in the response and Sections 4.4.5 and 4.2.5 of the Application.
	BC MECCS suggested an annual or other monitoring survey and indicated that the concerns with the need for long-term air emission monitoring and evaluation of potential contaminants of concern also apply to whether there will be effects to nearby water bodies and terrestrial ecosystems from the landfill gas emissions.	The HWR does not stipulate conditions or guidelines on air/ landfill gas monitoring at Secure Landfills. Ongoing monitoring requirements has been discussed in the Application. The VC Document was edited to include VOCs as an indicator of air quality, and VCs to assess effects to aquatic and terrestrial environments have been included in Section 4.2.5 of the Application.	Addressed in Section 4.2.5 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Air study method (cont'd)	Northern Health and PRRD noted that it was not clear how it was concluded that additional monitoring is not warranted based on one sampling event. BC MECCS also noted that monitoring of emissions for the air study appears to occur on a single day in July. Typically, monitoring involves more than one sampling event and should be a scheduled period of sampling to capture annual and seasonal variations that take into account temperature and precipitation changes.	Additional monitoring is not needed as the monitoring event provided an adequate snapshot to understand the chemical composition of landfill gas, collected during a warm summer day and at a location when/where emissions would be expected to be near maximum. Ongoing monitoring requirements has been discussed in the dAAIR and Section 4.2.5 of the Application.	Addressed in the response and Section 4.2.5 of the Application.
	Northern Health noted that insufficient rationale was provided for the air quality criteria that were used.	Tervita has provided rationale for the air quality criteria in Table 4.2-1 of the Application.	Addressed in Table 4.2-1 of the Application.
	Northern Health noted that it should be recognized that some contaminants can work cumulatively (for example, impacting the same target organ), and that there can be compounded effects from multiple exposure pathways. Why were additive effects not considered?	The results of the air study are intended to report on the findings of the field work; they are not intended to provide an effects assessment. The atmospheric environment, as well as human health, have been assessed in Sections 4.2.4 and 8.5 of the Application, which considered potential cumulative and additive impacts.	Addressed in Sections 4.2.4 and 8.5 of the Application.
	Northern Health asked that Tervita include VOCs as a KI for Air Quality and Human Health, or at least that VOCs are included in the AAIR.	The VC Document has been edited to include VOCs as an indicator of air quality.	Addressed in Table 4.2-1 of the Application.
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Surface water	BC MECCS asked whether analysis of discharge of stormwater and contaminated water would need to be developed - a plan on disposal of water and emergency overflow (flood event).	Due to the existing landfill in operation, Tervita has developed plans to analyze, control, and discharge stormwater. Details of surface water controls have been provided in Section 4.4.5 of the Application.	Addressed in Section 4.4.5 of the Application.
	BC MECCS noted that although a stream is found on private land, the water and stream/bed channel is vested property to the Crown; therefore, if a stream does not appear on a desktop exercise, a drainage having stream characteristics, whether flowing or not, at any time of the year can be a regulated stream under water legislation. The proponent should ensure that surface water surveys address stream classification in the field to meet legislative standards.	Tervita has reviewed applicable legislation to ensure that surface water is classified properly.	Addressed in the response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Surface water (cont'd)	BC MECCS asked for inclusion of a brief description of the proposed leachate treatment system, the locations of discharge, and the parameters of concern in the discharged effluent, including radioactivity.	Leachate characteristics, disposal, etc. have been discussed in Section 4.4.2 of the Application.	Addressed in Section 4.4.2 of the Application.
	BC MECCS asked how the Important Features in the Project Area were identified, how priorities of local, provincial, or federal governments, First Nations, or the public were determined, and why the creek to the west of the Project Area was omitted as an Important Feature. BC MECCS also noted that the surface water streams to the north and west of the Tervita property should be included in the assessment of potential impacts to surface water.	Through the comment periods of the Application process, Tervita has been able to determine the priorities of local, provincial, and federal government, First Nations, and the public. Nearby creeks that may be impacted are an Important Feature. Surface water is a proposed VC. Surface water streams to the north and west will be included in the assessment of potential impacts to surface waters.	Addressed in the response and Sections 4.4.1 and 4.4.2 of the Application.
	BC MECCS is concerned about surface water contamination from leachate leakage, or from contaminated stormwater discharge.	Surface water contamination is a VC, and it is noted that surface water may come into contact with waste (leachate). Tervita has discussed mitigation in Section 4.4.4 of the Application. Based on Tervita's experience constructing and operating the existing landfill, the potential adverse effects of the proposed Project expansion on Surface Water VC are generally well-understood. Evidence at the existing landfill (refer to Appendix 3) indicates that Tervita's mitigation measures and construction practices are effective in preventing or reducing potential residual effects on Surface Water VC. Section 9 of the Application assesses the likelihood of accidents and malfunctions occurring, which ranges from may to unlikely, while consequence ranges from minor to severe. Confidence ranges from high to moderate and is based on Tervita's extensive experience operating hazardous waste landfills throughout Western Canada, including the safe and successful operational history of the existing Silverberry landfill, as well as the effectiveness of mitigation, including Tervita's Operations Plan.	Addressed in Sections 4.4.4 and 9 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Surface water (cont'd)	BC MECCS asked for more definition of water quality parameters, how the sampling of water quality would be evaluated, and against which standards it would be evaluated. BC MECCS noted that enough data are needed to determine the potential effects. An understanding is also needed as to whether water quality is better by dilution from snow melt in the spring or whether the spring runoff picks up more contaminants and reduces water quality. The same understanding is needed for the late summer period, when the main contributor to runoff is from groundwater. BC MECCS asked if there are enough data collected to answer these questions.	Currently, the surface water at site is tested for Schedule 1.2 of the HWR. As described in Section 4.4.2 of the Application, surface water within the property (which includes the proposed Project expansion and the existing landfill) is controlled by a water management system consisting of a network of onsite ditches, runon and runoff systems, and a surface water (stormwater) pond. Surface water generally flows from the southeast side of the property to the northwest side of the property, and a ditch constructed around the perimeter will direct runoff towards the stormwater pond on the northwest side of the existing landfill; therefore, the existing conditions related to surface water at the proposed Project expansion are based on analytical results of sampling events for the stormwater pond conducted by Nichols Environmental (Canada) Ltd. in spring and summer, yearly, from 2014 to 2019 at the existing landfill. Data reported in the surface water sampling report (Appendix 3) identify that analytical results of surface water samples collected in 2018 were less than the applicable standards for petroleum hydrocarbons, organics, and metals. Data from desktop review of provincial and regional information sources, information from site investigations, ongoing surface water discharge analytical data at the existing facility and data collection efforts, as well as comparison of the surface water quality data to the BC HWR provide an appropriate baseline for assessing the effects of the proposed Project expansion on surface water.	Addressed in the response and Section 4.4.2 of the Application.
	BC MECCS noted that it appeared that only a few years of data containing three samples are currently available, despite discharging from the sediment pond occurring throughout the season. Sampling needs to match the discharging. Considering the evaluation of effects of the Project, additional sampling may be needed to properly determine the effects for this amendment.	Tervita keeps records of analytical, dates, and volumes of surface water discharged. Tervita analyzes the water prior to discharge against Schedule 1.2 of the HWR. Discharge is intermittent, depending on precipitation, and is only typically done in spring and fall.	Addressed in the response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Surface water (cont'd)	BC MECCS noted that there are only three samples for water quality for the discharge from the sediment pond over a 2-year period. It is not appropriate to evaluate the predictions for impacts to the environment from three sample points. BC MECCS suggested that during the Environmental Assessment process, the proponent should collect some additional data to validate the predictions.	Tervita performed a soil sampling program as requested by Working Group members to help determine impacts of the surface water discharge. Tervita can resupply this report to BC MECCS.	Addressed in the response.
	BC MECCS suggested that Tervita should include any monitoring surface water data collected during operation of the existing landfill, developing the water quality predictions for the expansion. This information would not only strengthen their predictions, but would also provide more certainty to the surface water quality assessment portion of the Application.	Tervita has included existing monitoring data in Sections 4.4.2 and 4.4.4 of the Application when developing the water quality predictions for the expansion.	Addressed in Sections 4.4.2 and 4.4.4 of the Application.
	BC MECCS noted that the spatial boundaries of the RAA include a number of creeks and rivers. How will those be monitored to ensure no deleterious effects to surface water from the discharge and from groundwater infiltration? Sites will need to be established for long-term monitoring.	Tervita can work with BC MECCS on potentially developing a Surface Water Monitoring Plan during the *EMA* permit amendment. Due to the development of oil and gas infrastructure in the area, potential contamination found in rivers and creeks may be inadvertently and incorrectly tied to Silverberry Landfill operations. Tervita follows the HWR developed by BC MECCS to ensure surface water discharge has limited impacts on the surrounding environment.	Addressed in the response.
	BC MECCS asked if the surface water retention pond is sized adequately to accommodate potential increased loading from seasonal runoff emitted from the new footprint and to prevent risk of overflow, and whether a KI for a retention volume should be included.	Tervita will meet the requirements of the HWR for Secure Landfills. Stormwater management and monitoring systems are already in place at the existing facility, and will be adjusted accordingly to account for stormwater retention associated with the proposed Project expansion. As described in Section 4.4.2.2 of the Application, surface water must regularly be removed from the system to maintain operating levels, as per Section 26(6) of the HWR. As per Section 26(1)(b)(i) of the HWR, the surface water collection system will be inspected weekly and/or immediately after a major storm or a catastrophic event. Surface water monitoring includes inspections of the surface water controls, and analytical and volume disposed/discharged/sent for alternate reuse. Water volume and movement were included as a KI in the Application.	Addressed in the response and in Section 4.4.2.2 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Surface water (cont'd)	BC MECCS asked for inclusion of baseline water quality data (including hydrocarbons and radiation) for surface waters and groundwater, capturing seasonal variation in streams to the north and west of the landfill facility.	Relevant information has been provided in Sections 4.4.2 and 4.5.2 of the Application. Tervita's groundwater consultant has reported seasonal groundwater elevations and concentrations. Based on the results presented in the report in Appendix 4, seasonality in groundwater concentrations is not evident.	Addressed in Sections 4.4.2 and 4.5.2 of the Application.
	Northern Health noted that the LAAs for surface and groundwater are limited to a 500-m radius from the site. This area may represent the area with the highest COPC concentrations. However, drinking water intakes may be outside that area and may represent the locations where receptors are at a greater risk of exposure.	Tervita has reviewed the information collected for the Application and determined that there are no findings that warrant a revision of the LAAs and RAAs. The locations of sensitive receptors will be considered on a case-by-case basis depending on the potential for, and the severity of, Project interactions with that receptor. Section 3.2.1 in the AAIR stated that "if information is produced that indicates assessment boundaries should be adjusted to better reflect ecosystem boundaries and divides, study area boundaries will be revised".	Addressed in the response.
	Northern Health noted that, similar to the potential for surface water NORM contamination, it should be recognized that surface water could be contaminated by metals contained in dust, which also could "settle into surface water".	Considerations suggested by Northern Health have been addressed in the Application. Metals have been identified as COPCs in surface water, soil, and groundwater VCs. As described in Section 4.2.4 of the Application, dust from construction material (rock and/or gravel) handling and earth grading may contain contaminants, which could be transported away from the proposed Project expansion. As part of the current landfill operations, roadways are wetted on an as-needed basis to reduce dust generation by vehicular traffic. Operational restrictions will take place if visible dust clouds are noted by onsite operators. These restrictions could include curtailment or cessation of work under high wind conditions, minimizing drop distances, covering or watering of open stockpiles, rehabilitating completed sections of the landfill as soon as practical, and adhering to posted speed limits onsite.	Addressed in Section 4.4.2 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Groundwater	BC MFLNRORD noted that new water legislation requires groundwater works to be authorized by BC MFLNRORD. Groundwater wells and monitoring may require water authorizations under the *Water Sustainability Act*. Groundwater Monitoring - Contact Yin Jun at the Omnica Region - Groundwater Specialist.	Tervita will review the *Water Sustainability Act* and contact Yin Jun to determine if the existing groundwater monitoring network requires authorization. Tervita would like to note that BC MECCS will review the groundwater monitoring network during the Waste Discharge Permit Amendment for Silverberry Landfill.	Addressed in the response.
	BC MFLNRORD asked whether references to existing monitoring well information would be included in the methods of data collection and assessment, and the monitoring plan.	Existing well information will be provided in the monitoring plan, which has been detailed in Section 4.5.2 of the Application.	Addressed in Section 4.5.2 of the Application.
	BC MECCS noted that the list of groundwater quality parameters is incomplete and should be corrected. Furthermore, an analysis of risks posed by an exceptionally high or seasonally high water table should be completed. Details about the direction of flow and flow rate of the groundwater are recommended.	The water quality parameters provided for review at that time were an example of what may be analyzed. Full details of parameters and the groundwater monitoring program have been discussed in the Sections 4.5.1 and 4.5.2 of the Application.	Addressed in Sections 4.5.1 and 4.5.2 of the Application.
	BC MECCS asked which parameters are measured, where, and how frequently. The regional groundwater flows northwest. What is the rate? What is the predicted fate of leachate should a liner breach occur during high and low groundwater seasons?	Groundwater monitoring has been discussed in detail in Section 4.5.2.2 of the Application. A leak detection system is also in place to ensure that landfill integrity is maintained.	Addressed in Section 4.5.2.2 of the Application.
	BC MECCS asked what would be the fate of leachate in the event of a liner breach? What direction/path is the groundwater flow pattern and what is the rate of groundwater movement? How long would it take to reach the nearest receptors? BC MECCS requests that these concerns be addressed in the groundwater section of the Application.	In the event of a liner breach, the leachate is still contained by the compact clay liner and is driven towards the leachate collection. The shallow groundwater flows to the northwest. The horizontal groundwater velocity beneath the site is estimated to be less than 0.3 m per year in 2014. Potential receptors and potential accidents and malfunctions will be discussed in the Application.	Addressed in Sections 4.5.4 and 9.2 of the Application.
	BC MECCS was concerned about groundwater contamination from leachate leakage through ruptured cell liners or elevated groundwater events.	Groundwater contamination is a VC and it is noted that leachate may migrate into groundwater. Tervita has discussed mitigation in Section 4.5.4 of the Application.	Addressed in Section 4.5.4 of the Application.
	BC MECCS noted how groundwater sample results would be evaluated and whether the BC CSR numeric standards would be used, or the contaminated sites federal interim groundwater guidelines.	Tervita's groundwater consultant uses the BC CSR when interpreting monitoring results. For consistency, the Application also uses the BC CSR when comparing results.	Addressed in Section 4.5 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Groundwater (cont'd)	BC MECCS noted that the background well, BH-103, has had issues and periodic parameter levels higher than the monitoring wells. This should be discussed and the work should be completed to understand why the results are high and how it is assured to be background only. Has there been consideration of another background well?	Tervita has discussed BH-103 with BC MECCS staff. Tervita will properly decommission and replace background monitoring well BH-103, including the installation of a deeper nested monitoring well with landfill cell 8 construction in 2019.	Addressed in the response.
	BC MECCS asked for inclusion of baseline water quality data (including hydrocarbons and radiation) for surface waters and groundwater, capturing seasonal variation in streams to the north and west of the landfill facility.	Relevant information has been provided in Appendices 3 and 4 of the application.	Addressed in Appendices 3 and 4 of the Application.
	PRRD noted that groundwater is not marked off as a candidate VC, and asked for clarification whether the construction of the expansion goes below ground for the first cells, and if so, if it is deep enough to interact with groundwater.	Groundwater was included as a VC in the Application. The new cells will be built below grade and shallow groundwater is present at the site. In 2002, BC MECCS granted Tervita an exemption to the Special Waste Regulation because "…the natural geology and designs exceed the minimum requirements of the Special Waste Regulation with respect to groundwater protection." Leachate management and monitoring systems are already in place at the existing landfill and will be adjusted accordingly to account for leachate generation associated with the proposed Project expansion. Leachate at the existing landfill is monitored as part of the groundwater monitoring program. The proposed Project expansion will connect to the existing system. A review of the leak detection sample data suggests that the current landfill leachate collection and containment system is operating effectively (refer to Appendix 4).	Addressed in the response and in Section 4.5 of the Application.
	PRRD asked whether the BC CSR Technical Guidance Document #6 (2010) been taken into account for water well and water body searches in the BC Water Resources Atlas. This is specific to any aquifer that may be within 500 m of a site, such as the planned expansion area, and focuses on whether or not the water quality of the aquifer could be affected.	Tervita has included relevant technical baseline information and guidance documents in Appendix 4 of the Application.	Addressed in Appendix 4 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Groundwater (cont'd)	Northern Health noted that the LAAs for surface and groundwater are limited to a 500-m radius from the site. This area may represent the area with the highest COPC concentrations. However, drinking water intakes may be outside that area and may represent the locations where receptors are at a greater risk of exposure.	Tervita has reviewed the information collected for the Application and determined that there are no findings that warrant a revision of the LAAs and RAAs. The locations of sensitive receptors will be considered on a case-by-case basis depending on the potential for, and severity of, Project interactions with that receptor. Section 3.2.1 in the AAIR stated that "if information is produced that indicates assessment boundaries should be adjusted to better reflect ecosystem boundaries and divides, study area boundaries will be revised".	Addressed in the response.
	Northern Health asked that information be provided to justify that there are "no registered wells, aquifers or community watersheds near the proposed Project Area".	Potential groundwater or surface water intakes and receptors in the vicinity of the site are identified in Sections 4.4.2 and 4.5.2 of the Application.	Addressed in Sections 4.4.2 and 4.5.2 of the Application.
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Terrestrial vegetation, including plant species at risk, First Nation culturally important species, and invasive plant species	BC MFLNRORD noted that the Terrestrial Vegetation VC should address plant species at risk, First Nation culturally important species, and the potential for transplant of rare and important species found.	Plant species at risk and First Nation culturally important species have been considered in Sections 4.6.2.1, 4.6.3, and 4.6.4 of the Application. Mitigation procedures to rare and First Nation culturally important plant species have been addressed in the Application.	Addressed in Sections 4.6.2.1, 4.6.3, and 4.6.4 of the Application.
	BC MECCS asked what data collection has been completed to date to determine if the vegetation in the receiving environment has been exposed to contaminants during existing operations.	Surface water is tested before being released to the environment. Stressed vegetation around the landfill will be noted by operations staff and measures will be taken to investigate the source.	Addressed in the response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Terrestrial vegetation, including plant species at risk, First Nation culturally important species, and invasive plant species (cont'd)	BC MECCS noted that the AAIR needs to ensure that if air quality emissions and dust concentrations are over a predetermined threshold, then potential impacts to vegetation and other interrelated VCs are evaluated.	Tervita has taken BC MECCS's comment into consideration and revised the AAIR to address potential effects of dust on vegetation and wildlife. Section 4.2.4 (Air Quality Potential Effects), Section 4.6 (Terrestrial Vegetation Key Indicators), Section 4.6.4 (Terrestrial Vegetation Potential Effects), Section 4.8 (Wildlife and Wildlife Habitat Key Indicators), and Section 4.8.4 (Wildlife and Wildlife Habitat Potential Effects) have been edited accordingly. Tervita performed a soil sampling program as requested by the Working Group to address the PDMA. To mitigate dust impacts, Tervita progressively caps cells as they reach capacity and will actively water waste to prevent potential dispersion during dry periods. Tervita can work with BC MECCS on a potential Air Monitoring Plan during the *EMA* Permit amendment. Tervita would like to note that Silverberry Landfill is in an active oil and gas production area, and that it would be difficult to delineate contamination and contaminant migration between operations.	Addressed in Sections 4.2.4, 4.6, 4.6.4, 4.8, and 4.8.4 of the Application.
	BC MECCS noted the Landfill Criteria for Municipal Solid Waste. BC MOE 1993. Section 7.15. Monitoring. "Monitoring of other environmental media such as vegetation and soils should be assessed and a program developed as the site-specific situation warrants".	There may be some applicable information from the Landfill Criteria for Municipal Solid Waste, 1993, that can be applied to Secure Landfills; however, it should be noted that the HWR should be used as the regulation for operations of Secure Landfills. There is a substantial difference in which wastes are landfilled at a Secure Landfill and a Municipal Solid Waste Landfill. There is no direction in the HWR that directs vegetation sampling for Secure Landfills.	Addressed in the response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Terrestrial vegetation, including plant species at risk, First Nation culturally important species, and invasive plant species (cont'd)	BC MECCS noted that dust from construction and operation needs to be added to potential effects and requested vegetation tissue sampling downwind from the landfill to evaluate the efficacy of existing mitigation for preventing the contamination of vegetation offsite.	Potential effects of dust have been expanded in the Environmental Affects Assessment, Section 4.2 Air Quality of the Application. Tervita has committed to completing soil sampling at the surface water discharge location and in the Project Area adjacent to the existing landfill to determine if contamination is present. If contamination is discovered, mitigation will be implemented to reduce the risk that contaminants will reach receptors. In addition, Tervita has committed to conducting air quality monitoring to determine if emissions are being produced by the landfill, and NORMs are monitored twice a year to determine if atmospheric levels are within regulatory standards. Since the possible pathways for contamination are being studied, it would be duplicative to sample vegetation tissue to determine if contamination is being spread through air, water or soil; therefore, Tervita is not proposing a tissue sampling program at this time.	Addressed in Section 4.2 of the Application.
	PRRD expressed concerns about occurrence and spread of Noxious weeds in disturbed construction soil and possible impacts with the washing of equipment.	Tervita reseeds all soil stockpiles and new berms to prevent Noxious weeds, erosion, and soil loss after construction. The Peace Forage Association website and seeding tool will be passed onto Tervita's construction contractor as part of contractor requirements. Currently, construction equipment has to be steamed/washed prior to mobilizing and demobilizing from the site to control the spread of Noxious weeds. This practice will continue. After soil stockpiles are seeded they will be monitored and Noxious weeds will be controlled, as needed. Mitigation measures to prevent and manage the spread of Noxious weed are described in Section 4.6.4 of the Application.	Addressed in Section 4.6.4 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Fish and fish habitat	BC MFLNRORD noted that drainages may be regulated under the *Water Act* and the *Water Sustainability Act* if they meet the definition of a stream, regardless of fish presence or value; therefore, the proponent needs to ensure that drainages are not streams, as defined under water legislation.	Tervita has reviewed the *Water Sustainability Act* and the *Water Act*, and has addressed applicable mitigation measures in Section 4.7.4 of the Application.	Addressed in Section 4.7.4 of the Application.
	In addition to Aboriginal interests, BC MECCS wanted to see health of the aquatic ecosystem considered rather than just a few key food fish species. Smaller and more localized species, such as sculpin, are better sentinels for contaminants than many food fish. A few species should be considered when looking at effects to the habitat.	Tervita has worked with its consultant and BC MECCS on potential indicator species to be used in Sections 4.7.2 and 4.7.4 of the Application.	Addressed in Sections 4.7.2 and 4.7.4 of the Application.
	BC MECCS noted that it is important that the change in habitat incorporates water quality, as well as the physical changes, such as loss of habitat types or invertebrates.	Tervita recognizes the interrelated nature of certain VCs and has conducted a comprehensive assessment of each VC with this in mind.	Addressed in the response.
	BC MECCS noted that the immediate receiving environment is an ephemeral creek. BC MECCS asked whether the creek gets used during the season by fish and if there are times that are critical to the fish lifecycle, such as spawning or rearing.	The creek has not been identified as suitable for fish habitat. As per the Fisheries Habitat Assessment completed during the original EAC application, "A nonfish-bearing, ephemeral tributary along the northwest corner of the existing facility offers seasonal connectivity to the downstream fish habitat from an area immediately adjacent to the north property boundary".	Addressed in the response.
	BC MECCS suggested that a Water Quality Management Plan should be included. This should identify both the ongoing groundwater sampling and a surface water sampling plan, including some basic biological sampling to confirm that the receiving environment is fine.	Tervita's Operations Plan will include the following management plans for monitoring and protection of water quality: • Groundwater Monitoring Plan • Leachate Management Plan • Stormwater Management Plan • Landfill Leak Detection Monitoring Plan	Addressed in the response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Community infrastructure	PRRD noted that surrounding municipalities are being consulted and asked whether there will be additional notices, signage posted, radio ads etc. during the construction to make those traveling back and forth on Beatton River Airport Road aware.	As part of the consultation process of this Application, Tervita has been consulting local residents, posting ads, open houses etc. Depending on resident concern and feedback, Tervita will consider posting a notice during construction. Mitigation has been addressed in the Application (Table 6.1-2)	Addressed in Table 6.1-2 of the Application.
	PRRD would like to echo the concerns raised by BRFN regarding the status of the road in front of the facility. The PRRD sees that there are issues not only with rock damage to windshields, but also dirt tracked from the site onto the Beatton River Airport Road. The PRRD asked Tervita to provide more clarity around how they perform road maintenance to prevent the tracking of the dirt/foreign material onto the public road.	All trucks leaving the landfill site must try to clear tires and tire wells of as much mud as possible. Tervita checks the roadway daily for the tracking of dirt onto Beatton River Airport Road. During wet conditions, a skid steer is used to blade off any mud on the public roadway and brings it back to the landfill. When it is dry out, the skid steer has a sweeper bucket attachment to sweep any gravel and mud from the roadway. There is also an exit grid in place at Silverberry Landfill that trucks must drive over to remove excess mud from tires. Swamp/rig mats are also used in the landfill cells during wet conditions.	Addressed in the response.
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Human health	BC MECCS noted that the statement, "NORM waste has a low potential to affect human health", should not be made in advance of a radiological risk assessment. NORMs are recognized by the Canadian Association of Petroleum Producers as having both long-term and short-term human health effects. Exposure to NORMs is one of the key risks associated with this Project and a thorough radiological risk assessment that includes appropriate public and First Nations consultation will be necessary.	NORM has been assessed under the Health pillar and details on NORM monitoring and health and safety programs have been discussed in Section 8.4.8 and Appendix 11 (SLHHRA) of the Application. The SLHHRA indicates that possible receptors to NORMs include construction workers and facility operators. Concentrations of NORMs will diminish rapidly with increasing distance from the proposed Project; therefore, land use receptors, including First Nations, are not likely to experience exposure. BMPs, such as the use of personal dosimeters for onsite staff and air monitoring for NORMs in dust, will mitigate receptor exposure.	Addressed in Section 8.4.8 and Appendix 11 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Human health (cont'd)	BC MECCS is concerned about impacts to workers, the public, and biota from elevated radiation due to the exposure of NORMs. BC MECCS noted that a radiological risk assessment on human and environmental health, including a summary of the current monitoring program with methods and data representing worker and fence-line exposures (comparisons should be made to the relevant national and international standards and guidelines).	As discussed in the January 27 2016 Working Group meeting, Tervita has shared information regarding their RPP at Silverberry. BC MECCS was going to review applicable material and propose a scope for a Radiological Risk Assessment.	Addressed in the response.
	BC MECCS suggested a BACT review for leachate minimization and full treatment with a surface discharge.	Leachate disposal has been discussed in the Application. Tervita will continue to work with MECCS to address concerns around stormwater, surface water discharge, leachate treatment, and other potential discharges to the environment.	Addressed in the response and in Section 4.5.2.3 and Table 8.5-1 of the Application.
	BC MECCS requested a review of secure landfill facilities operated by Tervita and/or others with full landfill leachate treatment and surface discharge. The BACT review should explain why full leachate treatment is, or is not, appropriate for the Silverberry Landfill.	Leachate disposal has been discussed in the Application. Tervita will continue to work with MECCS to address concerns around stormwater, surface water discharge, leachate treatment, and other potential discharges to the environment.	Addressed in the response and in Section 4.5.2.3 and Table 8.5-1 of the Application.
	BC MECCS asked how much leachate is discharged and whether there are ways to minimize leachate volumes, including the implementation of the free liquid test rather than the paint filter test and containing or covering the leachate storage facilities to prevent dilution by rain.	Relevant information regarding leachate characterization, volumes, and minimization has been provided in the Application (Section 4.4 and 4.5).	Addressed in Sections 4.4 and 4.5 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Human health (cont'd)	Northern Health asked which section traffic-related injuries will be captured in. The potential for traffic-related injuries should be also considered as part of the assessment and should encompass the traffic corridors associated with the Project.	Traffic-related injuries has been captured via the Accidents and Malfunctions section and via the Health Pillar under Human Health.	Addressed in Sections 8.5 and 9 of the Application.
	Northern Health asked Tervita to provide justification for exclusion of landfill gas generation and potential for the volatilization of chemicals from contaminated groundwater, surface water, and soils, and to consider inhalation exposures from assessment.	Rationale for exclusion was elaborated on in Table 3 of Section 4.2 of the VC Document. Silverberry does not accept municipal solid waste; therefore, landfill gas generation is minimal. Hydrocarbons associated with the waste tend to be heavier end and do not rapidly volatilize.	Addressed in the response and the Application.
	Northern Health asked Tervita if other indicators for the HHRA should include pathways for human consumption of contaminated foods, hazard quotients, and incremental lifetime cancer risk.	Health risks have not changed since the original application, except a permit amendment to accept NORM material. Health risks will be addressed under the Health Pillar of the VCs. Regulatory guidance has been reviewed and considered when drafting the Application.	Addressed in Section 8.5 of the Application.
	KIs listed are ambient air. Northern Health asked Tervita to provide a rational on how concentrations of PM and NO_x were selected as KIs. Northern Health expects the HHRA to be completed in accordance with Health Canada's guidelines.	Emissions from the site will largely be from internal (diesel) combustion engines. According to BC Air Quality - pollutant vehicles emit, NO_x and fine PM ($PM_{2.5}$) are found in larger amounts in emissions from diesel engines than gasoline engines. Most of the combustion at the site will be associated with the diesel engines of Silverberry's heavy equipment.	Addressed in the response.
	Northern Health asked that Tervita to consider health service impacts under the community services VC.	Tervita has incorporated health service impacts under the community services VC.	Addressed in Section 6.2 of the Application.
	Northern Health asked Tervita to provide rationale for spatial boundaries of Human Health VC subcomponents.	Rationale for spatial boundaries for assessment has been provided in the Application.	Addressed in Section 8.2.1 of the Application.
	Northern Health asked Tervita to provide justification that "ongoing management measures" would be sufficient to "ensure potential waterborne contaminants do not enter the environment" (into groundwater), or consider extending the groundwater LSA.	Tervita has provided justification in Section 8.5 of the Application that mitigation measures prevent waterborne contaminants from entering the environment.	Addressed in Section 8.5 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Rationale for selection of draft VC and VC indicators and details in the AAIR for: • Human health (cont'd)	Northern Health recommended that indicators of potential health affects related to noise should include noise complaints and long-term high annoyance.	Tervita has reviewed the Health Canada guidance document provided by Northern Health and applied applicable criteria. Appropriate indicators for noise impacts on human health have been used in assessment.	Addressed in Section 8.4.7 of the Application.
	Northern Health asked Tervita to consider that drinking water intakes might be outside of the surface and groundwater LSAs (500-m radius), and may be the point where receptors are at the greatest risk of exposure.	Considerations suggested by Northern Health have been addressed in the Application (Section 4.2).	Addressed in Section 4.2 of the Application.
	Northern Health suggested that data collection methods to characterize existing conditions also include data collection to characterize potential receptors, nearby water sources, and historic usage of land.	Tervita has added these methods of data collection to the AAIR and Section 8.4 of the Application.	Addressed in Section 8.4 of the Application.
	Northern Health noted that a detailed quantitative HHRA may be necessary to understand health effects associated with the Project. This should be clearly indicated in the AAIR.	Once the results of the SLHHRA are shared with the Working Group and feedback is received, Tervita will work with Northern Health to address concerns on the SLHHRA before determining whether a detailed quantitative HHRA will be completed.	Addressed in the response.
	Northern Health asked that the potential for the uptake of contaminants into the food chain (from soil, air, and water) be further discussed based upon the findings of the surface water and soil quality assessments (as well as other relevant assessments).	Considerations suggested by Northern Health have been addressed in Sections 8.4 and 8.5 of the Application.	Addressed in Sections 8.4 and 8.5 of the Application.
	Northern Health asked that the Screening Level Risk Assessment in the Application includes the potential for wildlife to enter the Project vicinity (such as, floating on ponds or grazing). We ask for information to also be provided in the Application on the controls that will be implemented to prevent wildlife, birds, and people from entering the waste storage areas (to prevent direct contaminant exposures or uptake into the food chain).	Considerations suggested by Northern Health have been addressed in Table 4.8-2 of the Application.	Addressed in Table 4.8-2 of the Application.
	Northern Health asked how potential dust impacts will be captured in the air quality study, considering that the Site may be a source of contaminant laden dust. Would soil sampling methodology be able to capture dust impacts or would this require specific sampling methodology?	Dust is not captured in the air quality study. The air quality study focuses on landfill gas emissions. However, PM is captured under the Air Quality VC and has been looked at in the Application as having the potential to impact air quality.	Addressed in Sections 4.2 and 8.4.6 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Inclusion of economic benefit information in the Application	BC MECCS suggested including Financial Security Requirements, *EMA* Section 14(1)(b).	Economic benefit information has been incorporated in the Application.	Addressed in Sections 1.2.5 and 5.1 of the Application.
Inclusion of existing landfill in cumulative effects assessment	BC MECCS asked if existing landfill would be considered in cumulative effects assessment.	The existing landfill was considered in the CEA as an existing development.	Addressed in Section 3.9.1 of the Application.
Consultation	BC MECCS noted that it is not clear whether recent (within the last 2 years) and relevant First Nations, public, and agency input was solicited to inform the list of candidate VCs for the Application. Tervita's extensive experience operating Secure Landfills is a benefit in refining VCs, but it does not replace independent review by individuals and organizations that may have more extensive knowledge and understanding of regional sensitivities.	Tervita has had an ongoing relationship with many First Nations and government agencies throughout the operation of Silverberry Landfill. Through the comment period on the draft VCs and the amendment process, Tervita has been working with First Nations, agencies, and the public to understand and address regional sensitivities (refer to Appendix 13 of the Application).	Addressed in the response and Appendix 13 of the Application.
Alternative Means	The PRRD noted that Section 1.5 indicates that no feasible alternative locations were identified, therefore qualitative assessment was not considered. While there is no assessment, 1.4 provides a rationale. The PRRD does not see this as a deterrent to the Application process, as good landfill practices include maximizing capacity on an existing site prior to siting on a new greenfield. If this were not possible, then an assessment should be undertaken and documented.	Tervita thanks PRRD for their input. Tervita's goal is to maximize current capacity on our privately-owned land at Silverberry before pursuing alternate locations.	Addressed in the response.
Terrain and Soils	BC MECCS states that in Appendix 1 and Section 4.1, the samples collected, parameters analyzed and information documented in the report are reasonable as a “reference” data set to which potential future soil sampling and field testing can be compared.	Tervita can work with BC MECCS to develop any future soil monitoring plans that may be required, during the *EMA* Amendment process.	Addressed in the response.
Terrain and Soils Cumulative Effects	BC MECCS suggested that the long-term monitoring program include annual sampling of surface stormwater (prior to discharge to the environment) for analysis of the same analytical parameters as the soil and groundwater samples (Section 4.1.4). The near surface materials would be expected to have low permeability based on geological descriptions (Section 2.2.3), which was also evidenced by lack of groundwater at two of the monitoring wells following purging (monitoring wells 03-4 and BH-104(R)). Site data presented in the report suggests relatively low aquifer vulnerability to releases of contaminants at the ground surface, subject to spill response and remedial efforts.	Tervita can work on amending the Surface Water Monitoring Plan during the *EMA* application process.	Addressed in the response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Terrain and Soils Follow up Strategy	BC MECCS indicated that the proponent must provide a rationale for this statement.	Tervita referred to sections where no residual effect is discussed in Section 4.1.5.	Addressed in the response and in Section 4.1.5 of the Application.
Air Quality	BC MECCS noted that KIs should be quantitative in nature. "Visible" is qualitative and subject to interpretation by different people. BC MECCS recommended an alternate measure to ensure that this KI is adequately addressed. For example, air quality instruments can quantify the concentration of particles in the coarse fraction. Other instruments can provide a measure of visual range.	Tervita recognizes the subjectivity of visible dust and has proposed quantitative KIs, such as ambient air concentrations of PM, NO_x, VOCs, and GHG emissions. These quantitative KIs are expanded upon in Section 4.2 of the Application.	Addressed in Section 4.2 of the Application.
	BC MECCS noted that if monitoring data were collected as specified in the second bullet in 4.2.2 these should be presented in the Application, along with analysis. There are references to biannual monitoring data but there are no data in this section. Some data and analysis are required for this bullet, or at the very least, a reference to a different section in the report where these data are presented and analyzed.	Tervita will append the most recent monitoring information to the Application in Appendix 2.	Addressed in Appendix 2 of the Application.
	BC MECCS noted that there is reference to the VOC sampling that was conducted but no data is presented (only a reference to an appendix). Data should be presented in this section of the report, accompanied with analysis if warranted.	To keep the document readable to the general public, Tervita summarized findings of the report in the Application, but the whole report and corresponding information is provided in Appendix 2.	Addressed in the response and in Appendix 2 of the Application.
	Northern Health notes that comments from BC MECCS regarding the dAAIR made reference to other data that can be used to inform a baseline (ambient air quality monitoring at Blueberry River from July 2016 - November 2017, and at Buick Creek from February 2015 to July 2016.)(In addition to ambient concentrations at BC monitoring stations, the desktop review should look for ambient CAC measurements on/at/near other landfills.) A discussion regarding these other data sources is not included and there is not enough information regarding current air quality conditions. Page 4-12 "The ambient air quality in the region, as measured at the Key Learning Center monitoring station, is well below provincial criteria for all contaminants measured." This statement is not representative of local conditions, which change throughout the season. Fort St. John often experiences dust advisories in the spring. The PM_{10} values are not well below provincial criteria.	Tervita acknowledges that conditions change throughout the season. During the dryer times of year, Tervita through its mitigation measures such as watering the roads, is able to minimize dust impacts. Language has been added to Section 4.2.4.	Addressed in the response and in Section 4.2.4 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Air Quality (cont'd)	BC MECCS notes that in Table 4.2-2 there is a column titled $PM_{10}/PM_{2.5}$. and asks if this denotes the ratio of these two pollutants? If yes, it would have no units (that is, would not be t/y). If it is not a ratio and only intended to represent a quantity of emissions for both pollutants, please change this for the final submission.	Both $PM_{2.5}$ and PM_{10} have values of 0.4. Tervita has edited Table 4.2-2 in the Application to clarify the data presented.	Addressed in Table 4.2-2 of the Application.
	Ministry of the Environment notes that the VOC sampling was insufficient to be called a baseline monitoring program and should not be referenced as though it has adequately characterized existing conditions. This sampling program consisted of two discrete samples and is of insufficient quantity to be relied on for using in conclusions of an Environmental Assessment. Either more monitoring is required to adequately achieve stated objectives or this sampling should be recharacterized accordingly.	If an air monitoring program is required Tervita will work with BC MECCS during the *EMA* Application process to develop one.	Addressed in the response.
	Northern Health states that The VOC air sampling activities are very limited. The air study report stated: "*The sampling program provides a snapshot of the VOCs at the time the measurements were recorded. It does not provide a method to estimate the quantity or rate of landfill gas emissions*." This study does not provide sufficient data to justify the exclusion of VOCs from further assessment. An important conclusion of the study was that a number of VOCs were identified at detectable levels at the site.	Tervita acknowledges the presence of VOCs at the landfill, but through mitigation measures such as progressive capping, Tervita is able to minimize landfill surface area and the interactions with VOCs.	Addressed in the response.
	BC MECCS noted that different CACs in Table 4.2-3 have different achievement metrics and reporting the 98th percentile of 24-hour averages is without meaning for all pollutants but $PM_{2.5}$ and requested that Tervita reanalyze accordingly for final submission. Refer to footnotes in: https://www2.gov.bc.ca/assets/gov/environment/air-land-water/air/reports-pub/aqotable.pdf for appropriate statistics. For PM_{10} please report # of hours and days which exceed the 24-hour objective.	Tervita has reviewed the reference provided and updated the numbers in Table 4.2-3.	Addressed in Table 4.2-3 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Air Quality (cont'd)	Northern Health noted that despite there being documented concern regarding odour from a nearby community (page 4-12, section 4.2.3 Traditional Knowledge Shared), odour conditions have not been explained. Unpleasant or annoying environmental odours may result in negative mood, 'environmental worry', or 'environmental stress' (i.e., perceiving the odour as a health risk), which in turn, may result in stress-related illnesses (Alberta Health, Odours and Human Health, 2017 - https://open.alberta.ca/publications/9781460131534). Please provide more information regarding odour conditions and proposed mitigations.	The Air Quality Monitoring Plan and the Dust and Odour Control Plan identified in Section 4.2.4 include mitigation measures to address odour effects.	Addressed in Section 4.2.4 of the Application.
	Northern Health noted that the recommendations for ongoing monitoring are sparse. Please provide more information regarding the rationale for the scope and frequency of ongoing air quality monitoring.	An Air Quality Monitoring Plan and Dust and Odour Control Plan are included as part of the proposed Project's Operating Plan that will be submitted to BC MECCS for approval, during the *EMA* Application process.	Addressed in the response.
	Northern Health requested that Tervita provide more information regarding how the increase in Project-related traffic (to and from the site) will influence local and nearby dust conditions (both PM_{10} and $PM_{2.5}$). Even short-term increases in PM can cause acute health effects such as asthma exacerbations (for workers and nearby residents).	During the dryer times of year and times of increased traffic (construction), Tervita is able to minimize dust impacts through mitigation measures such as watering the roads.	Addressed in the response.
	Northern Health noted that there is not a lot of detail provided regarding the air quality management plans and how they will be used to verify existing and proposed conditions or how air quality complaints will be follow-up. Measures to reduce emissions to as low as reasonably achievable and the use of best available technologies should be explained. Compliance with the BC AAQOs should not be the sole purpose of the management plans - health effects can occur below provincial air quality objectives. Please explain the monitoring frequencies identified (for example, bi-annually) in the management plans.	The effects of the proposed Project on air quality are assessed qualitatively as emission estimation and modelling of fugitive emissions from sources associated with landfills are very uncertain. An Air Quality Monitoring Plan and Dust and Odour Control Plan are included as part of the proposed Project's Operating Plan that will be submitted to BC MECCS for approval.	Addressed in the response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Surface Water	BC MECCS provided comments on items listed in Table 4.4-1: • There is no information discussing why there is no expected change to the volume of treated stormwater runoff. This Environmental Assessment covers all phases and information about the current volumes. Rationale for why this is not expected to increase needs to be provided as required by the AAIR. There is no comparison to BC WQGs or CCME WQGs. The use of BC CSR and HWR standards in Appendix 3 is for a different purpose and results need to be compared to the BC WQGs as required by the AAIR to properly assess the potential for adverse effects to Fish and Fish Habitat, which includes aquatic organisms living in an ephemeral stream.	Table 4.4-1 was reviewed, and surface water quantity should be expected to increase as the capped portion of the landfill increases. Information will be revised accordingly. Tervita's current approved Surface Water Monitoring Plan does not require analysis for comparison to WQG. Tervita can work with a new surface water monitoring program during the *EMA* Application process.	Addressed in the response and in Table 4.4-1 and Section 4.4.2 of the Application
Surface Water Temporal Boundaries	BC MECCS indicated that the wording is basically the same as what is in the AAIR. No new information is provided on these boundaries	The temporal boundaries used for the assessment are consistent for all VCs and include Project stages from construction to postclosure.	Addressed in the response
Surface Water Technical Boundaries	BC MECCS stated that there were no technical boundaries as "Information on existing conditions was based on a desktop review, site investigations, and field data collection, including results of surface water sampling activities for the existing landfill". Other than six sampling events for stormwater runoff over a one-year period under existing permit requirements, no other information on a desktop review, site investigation or field data was provided. There is no discussion about how often leachate might be discharged to land and no assessment of its potential to effect surface water quality.	Tervita's current approved Surface Water Monitoring Plan does not require analysis for comparison to WQG. If any of our current analyses can be compared to drinking water guidelines, they will be and the Application updated. Tervita can work with a new surface water monitoring program during the *EMA* Application process. Tervita does not intentionally discharge leachate to land. Any spills are immediately contained and cleaned up.	Addressed in the response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Surface Water Existing Conditions	BC MECCS states that under Section 3.3 it says "To gather pertinent background data for each VC, the assessment team used relevant legal frameworks (for example, *EMA*) and information gathered from a literature review" which included maps, scientific papers, information letters, factsheets. Typically, this type of review on background information gathers data from other sources such as nearby sampling sites as a starting point for a database and then identifies gaps where more field work is needed. It can include water quality results from nearby sites and from reports of other projects in the area. Although reports were one source of information in the literature review, the types of reports were not specified. There also needs to be a summary of their findings on the information specific to water quality and a list of references identifying exactly what the sources were to develop this information. There is no information describing the pathway and location of any releases to the environment, for both leachate and stormwater runoff. Therefore, it is not possible to evaluate the assessment on potential adverse effects to the environment.	Tervita's current approved Surface Water Monitoring Plan does not require analysis for comparison to WQG. Tervita can work with a new surface water monitoring program during the *EMA* Application process. Tervita will update the Application with surface water quantity (volumes). Tervita added water quality parameters measured by Stantec in August 2017 for the nearby Westcoast Spruce Ridge Program. Pathways are described in Section 4.4.4.1. The potential effects to water quality are addressed through the effective operations of the existing surface water and leachate management systems. In the unlikely event of spills or system failures, potential effects to water quality are assessed in Section 9, Accidents and Malfunctions. Location of/options for release to the environment: added details in Section 4.4.2.2 based on information in the draft Operations Plan. Tervita added current runoff volumes in 2016, 2017, and 2018, and reworded the rationale in Table 4.4-1.	Addressed in the response and in Table 4.4-1 and Section 4.4.2 of the Application.
	There is limited information on water quality to evaluate the assessment of potential adverse effects to the environment. Receiving water bodies have not been sampled and the existing conditions repeats the wording of the AAIR but adds no new information under Section 4.4.2.	See above	See above
	BC MECCS mentioned that information was not provided about what was researched and what the results were. There may have been some confusion about the intention of this review, which was to glean information from other projects, either by government agencies such as water quality monitoring in the area or by other proponents for projects nearby who have published reports. There needs to be a list of references cited for any information that was used to support the assessment of impacts and a summary of the information from those references.	Tervita identified local information and incorporated it and referenced it in Section 4.4.2.	Addressed in Section 4.4.2 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Surface Water Existing Conditions (cont'd)	BC MECCS stated that the use of HWR and CSR standards is not appropriate and the AAIR specified the use of the BC WQGs. Appendix 3 is a 2018 Annual Report developed for compliance with the permit and does not meet the AAIR language without some additional interpretation, which has not been provided.	If any of our current analyses can be compared to drinking water guidelines they will be, and the Application updated. Tervita added a reference to the Water Quality Criteria (from the Nichols report) in Section 4.4.2.	Addressed in the response.
Potential Effects to Surface Water	BC MECCS stated that information has been provided for the stormwater runoff only. However, the Application says in Section 4.4.4.1: The proposed Project expansion is anticipated to interact with the Surface Water VC during the following construction, operations, and closure/reclamation, and postclosure activities: • Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure • Leachate management • Stormwater management • Cell capping • Postclosure maintenance and monitoring No mitigation or discussion of adverse effects has been given for the other bullets.	Information regarding mitigation measures and adverse effects regarding the bullets was incorporated into Section 4.4.4.	Addressed in Section 4.4.4 of the Application.
Surface Water Mitigation Measures	BC MECCS stated that mitigation measures provided are only for stormwater runoff. See previous comment on Potential Effects to Surface Water	If Tervita needs to remove sediment from out of the surface water pond, it will be dredged and the sediment dewatered in an appropriate containment. The dewatered sediment will be tested and the appropriate disposal location found.	Addressed in the response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Groundwater Existing Conditions	BC MECCS stated that bedrock groundwater at the proposed expansion area has not been characterized. This is a key groundwater deficiency. Vertical hydraulic gradients at the landfill are much larger than horizontal, which means that the dominant groundwater flow direction is downward towards the bedrock. BC MECCS and Tervita discussed this deficiency in 2018, although the focus at that time was on the routine groundwater monitoring program at the Silverberry Landfill. In the end, Tervita committed to install bedrock monitoring wells in summer of 2019. This remaining deficiency now also relates to the adequacy of the baseline characterization for the proposed expansion. Finally, excluding the compromised monitoring well (BH-103) that was installed in 2001, no baseline hydrogeological information was collected within the proposed expansion area.	The current expansion area was characterized by Clifton Associates Ltd. in 2002. Tervita reviewed and incorporated information from this response in Section 4.5.2 of the Application. Once the groundwater network is upgraded this summer, Tervita will be able to share the changes with the Working Group.	Addressed in the response and in Section 4.5.2 of the Application.
Groundwater Residual Effects and Followup Strategy	BC MECCS stated that despite the landfill siting and design, there is still potential for the landfill to impact groundwater and surface water quality. This potential residual effect is acknowledged in the Application under the SLHHRA. Therefore, Section 4.5.4.2 of the Application should be updated to evaluate the significance of potential for leachate migration from the landfill to groundwater and surface water during operation and/or closure.	Tervita updated Section 4.5.4 of the Application.	Addressed in Section 4.5.4 of the Application.
Terrestrial Vegetation	BC MECCS stated that the highlighted subcomponent regarding vegetation uptake of contaminants from air quality and dust dispersion and deposition is not about the loss of vegetation. The loss of vegetation is captured with other subcomponents. This is about assessing the effect of plant uptake of contaminants on wildlife consumption and human use. Similar to soil effects, this has the potential to cause an adverse effect if there is plant collection for country foods or wildlife browsing within the dust or air impact zone. If the predictions for dust and air quality impacts are low outside the fenced area, then this subcomponent should not see adverse effects.	Vegetation uptake of contaminants from air quality and dust dispersion and deposition was considered as an effect in Section 4.6.4 of the Application.	Addressed in the response and in Section 4.6.4 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Terrestrial Vegetation Existing Conditions	BC MECCS stated that under Section 4.6.2 it says "The following methods of data collection have been used to inform the description of existing conditions for the Terrestrial Vegetation VC: • Desktop review of provincial and regional information sources • Information from site investigations and data collection efforts • Noxious weed information received from PRRD • Soil sampling program for the PDMA A summary of the soil sampling findings is not provided in this section and there is nothing directing the reader to another section for this information.	Tervita added a summary of soil sampling results to Section 4.6.2 and referred the reader to Section 4.1.2 for a fulsome discussion of the soil sampling program.	Addressed in Section 4.6.2 of the Application.
Terrestrial Vegetation Potential Effects	BC MECCS stated that the potential effect is loss or alteration of native vegetation, but this does not describe any changes in the chemical content of plants.	Tervita will not address the chemical composition of plants in the Application; although, the pathway of contaminant uptake has been considered in the Application.	Addressed in the response.
Terrestrial Vegetation Residual Effects	BC MECCS stated that there is no explanation of what the air and dust deposition section found and why it is expected to be negligible. The statement on Page 4-37 under Table 4.6-3 is a conclusion, but there is no support provided for this assessment other than a reference to another section.	Tervita considered air and dust deposition in Section 4.2 of the Application and did not repeat this information in this section. This section refers to Section 4.2 for more information.	Addressed in the response.
Health Effects Assessment	Northern Health indicated that as per the Proponent's response to NH-72a, we understood that a statement of qualifications indicating the risk assessor's qualifications and experience in conducting HHRAs relevant to the purposes of supporting an Environmental Assessment would be included in the SLHHRA. This does not appear to have been included.	The Application will be updated to include the assessor's qualifications in Appendix 11.	Addressed in Appendix 11 of the Application.
Health Effects Assessment Temporal Boundaries	Health risks during closure and postclosure have not been assessed. What will health effects be in the long-term due to disintegration of the liner system, particularly with regards to persistent contaminants?	Disintegration of the liner is beyond the scope of this assessment.	Addressed in the response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Health Effects Assessment Existing Conditions	Northern Health has provided all of the following comments: On Page 8-9, Section 8.4.6, the discussion regarding the health effects of air contaminants focuses on respiratory conditions and neglects other health effects such as cardiovascular effects, etc. Please include an explanation of other potential health effects. See joint ERS/ATS policy statement: what constitutes an adverse health effect of air pollution? An analytical framework: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5751718/	The article referred to by Northern Health was reviewed and a brief description of other health effects from air contaminants was added to Section 8.4.6 of the Application.	Addressed in Section 8.4.6 of the Application.
	The BC OGC noise guidelines are not indicators of health effects. For the purposes of assessing health effects associated with noise, health-based indicators and guidelines need to be used (such as, change in percent highly annoyed, sleep disturbance, interference with speech comprehension, etc.). This includes those summarized in Health Canada's *Guidance for Evaluating Human Health Impacts in Environmental Assessment: Noise*. As per Health Canada guidance, noise related effects to temporary receptors should be assessed, including harvesting and ceremonial sites, recreational areas, etc.	The Application will be edited to incorporate Health Canada's guidelines when assessing noise effects.	Addressed in Section 8.5.3 and Appendix 11 of the Application.
	On Page 8-9, Section 8.4.6 - "Tervita conducts air monitoring for NORM activity levels bi-annually to determine if dust being carried in the air has NORM activity levels above regulatory restrictions." Please explain how the frequency (bi-annually) is arrived at? Justification is required that this frequency is sufficient to understand effects.	The RPP was developed with BC MECCS. When the new one is developed with BC MECCS, Tervita can also share it with Northern Health for input.	Addressed in the response.
	Insufficient characterization has been included about nearby receptors/susceptible populations. This should include identification of potential temporary receptors in the area (such as, harvesting and ceremonial sites, work sites) as well as potential future receptors. Where is the closest location to the site that a residence could be established?	Temporary receptors have been added to the discussion in Section 8.4.7.	Addressed in Section 8.4.7 of the Application.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Health Effects Assessment Existing Conditions (cont'd)	The following exposure pathways have been excluded without a detailed rationale: Air: The lack of adequate landfill gas sampling and assessment, without sufficient justification for exclusion of this pathway is a significant gap (see previous comments on the air pathway). Groundwater: Insufficient rationale has been provided for the exclusion of the groundwater pathway from the assessment. Does affected groundwater have a potential to daylight and become surface water (especially when considering persistent COPCs)? Also, if future groundwater wells could be constructed in the area, it should be ensured that these potential receptors will be protected from health effects. Please identify the closest aquifers to the site. Groundwater should be assessed regardless of existing or proposed operating permits or 'remoteness' if a viable aquifer could supply one household with drinking water. According to CSR Protocol 21 (Section 3.2), "Future drinking water use applies to all drinking water aquifers below a site whether or not current drinking water use applies." The Application should indicate how hydraulic conductivities compare to those identified in Section 3.2.1 of Protocol 21 considered capable of supporting a single-family domestic water supply. Table 3-5 of the SLHHRA, groundwater data shows detectable levels of petroleum hydrocarbons. An explanation for this finding is needed, given that the health assessment is based on the assumption that the liner and leachate collection system prevents Project emissions to groundwater. Soil: Insufficient justification has been provided for the exclusion of the soil exposure pathway.	Tervita is able to mitigate exposure pathways to landfill gas, therefore no further sampling or characterization is required at this time. There were no hydrocarbons present during the 2018 monitoring cycle and showing pathways to groundwater are limited. Due to the larger number of industrial emitters in the region, Tervita is unable to differentiate or delineate any potential public areas and related exposure to dust caused from landfill operations. There has been limited soil sampling outside of the landfills fence line. Tervita would be unable to delineate impacts from other industrial users. Further investigation is required to determine the Barium impacts.	Addressed in the response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Health Effects Assessment Existing Conditions (cont'd)	Table 4-6 identifies soil COPCs above applicable guidelines. While public receptors will not have access to the site, it is not clear how soil in neighbouring areas that are publicly accessible may be affected through dust deposition. As per previous comments, is background soil data available for areas outside the Project footprint (for example, from the original EAC Application)? If so, this should be included to understand whether incremental/cumulative changes in COPCs in soil are occurring due to Project activities in areas that are accessible to the public, and therefore understand potential effects in the future. As per comments provided previously by Northern Health, the detection of barium concentrations greater than guidelines in the PDMA study indicates potential concern about dust migration beyond the Project footprint.	See above	See above
Health Potential Effects	Northern Health noted that the assessment of potential Project effects focuses on baseline information, based on an assumption that future effects associated with the Project will be similar to those currently occurring. A scientifically based rationale has not been provided to support this assumption, which has a significant effect on the assessment of health effects across all pathways. For certain pathways, could effects be additive (for example, effects to soil quality as a result of dust deposition)?	Tervita will explore the possibility of additive effects and update the Application as necessary.	Addressed in the response and in Section 8.5.1 of the Application.
	Northern Health noted that an assessment and discussion of the risks associated with exposures to Project-related road dust should be included.	Road dust was added to the sources of dust in Section 8.5.1. Mitigation measures for road dust are effective, thus limiting exposure.	Addressed in the response.
Health Effects Assessment Mitigation Measures	Northern Health noted that the health effects of the range of potential air contaminants associated with this Project may extend well beyond respiratory health.	The article referred to by Northern Health was reviewed and a brief description of other health effects from air contaminants was added to Section 8.4.6 of the Application. Based on the air sampling study conducted, no COCs (VOCs which would have other health effects aside from cardiovascular and vascular) were identified based on ambient air quality criteria. The other contaminants are not present at levels that would cause an effect. See 3.1.5 of the HHRA.	Addressed in Section 8.4.6 of the Application and in response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Accidents and Malfunctions	Northern Health noted that the potential health effects associated with failure of the liner system have not been adequately characterized. Table 3-6b of the SLHHRA identifies numerous COPC concentrations in leachate that are many magnitudes higher than guidelines, including for highly persistent contaminants. Further assessment is required of what a potential leak would mean for human health, in a manner consistent with the direct effects assessment: • How would groundwater be impacted? • What would the geographic scope be? • What would the migration time of contaminants be? • How would this be mitigated? • How long would it take for this leak to be identified? • Would it be possible to completely remediate contaminated soil and groundwater or would irreversible effects occur? • What communication strategy would be used to notify water users? This is of particular concern given the persistence and toxicity of several identified COPCs, even at trace concentrations.	A Leachate Monitoring Plan will be part of the Operations Plan approved by BC MECCS during the *EMA* permitting process. This will include action measures if a leak is identified.	Addressed in the response.
Effects of the Environment on the Project	PRRD noted a typo in the last sentence of the 2nd paragraph of Section 10.1.3. In the description of the wildfire effect from May 2016, the proponent notes "operations recommencing after the 'wildlife' was contained and extinguished". The proponent likely meant 'wildfire,' but should confirm.	Tervita changed the wording in Section 10.1.3 to "wildfire".	Addressed in Section 10.1.3 of the Application.
Public Consultation	PRRD noted that an open house planned by Tervita for the community of Buick will be forthcoming.	An open house is planned in the Community of Buick in November 2019.	Addressed in the response
Appendices - 2018 Groundwater Monitoring Program - Silverberry Secure Landfill, Block A-18-088-20 W6M	BC MECCS noted that the Application and the referenced Groundwater Monitoring Plan do not propose to expand the existing groundwater monitoring network. The existing network, which is already considered deficient as outline under AAIR Section/Sub-Section 4.5.5, is inadequate for monitoring the proposed expansion.	Tervita will work with BC MECCS on an expanded monitoring network during the *EMA* permitting process.	Addressed in the response.

Table 2.1-1. Summary of Key Issues raised by Government Agency Working Group and Tervita Responses

Key Issue	Specific Issues Raised by Government Agency Working Group	Tervita Response	Status of Resolution
Appendices - Hydrogeological Siting Suitability Investigation	BC MECCS noted that the referenced investigation report does not consider whether the HWR siting requirement (Section 28) of waste separation from groundwater is met. That requirement states that there must be a minimum separation depth of 3 m of unsaturated soil material with low permeability (10-8 m/s) above a seasonally high water table. The Application reports that shallow groundwater (i.e. water table) at the landfill is found between 1.8 to 3.8 mbgs and the depth to water table at the expansion area is unknown.	Tervita has a Section 51 under the HWR from BC MECCS for depth to groundwater. Tervita can supply this to BC MECCS as required.	Addressed in the response.

Notes:

AAQO = Ambient Air Quality Objective
BMP = best management practice
CAC = criteria air contaminant
CEA = Canadian Environmental Assessment
CH_4 = methane
COPC = contaminants of potential concern
BACT = Best Available Control Technology
dAAIR = draft Amendment Application Information Requirements
GHG = greenhouse gas
HHRA = Human Health Risk Assessment
KI = Key Indicator
LAA = Local Assessment Area
LSA = Local Study Area
m/s = metre(s) per second
mbgs = metre(s) below ground surface
NO_x = nitrogen oxide
PDMA = Potential Dust Migration Area
PM = particulate matter
PM_{10} = particulate matter less than 10 micrometres in aerodynamic diameter
$PM_{2.5}$ = particulate matter less than 2.5 micrometres in aerodynamic diameter
RAA = Regional Assessment Area
RPP = Radiation Protection Plan
SLHHRA = Screening Level Human Health Risk Assessment
Stantec = Stantec Consulting Ltd.
U.S. EPA = United States Environmental Protection Agency
VOC = volatile organic compound

Westcoast = Westcoast Energy Inc., doing business as Spectra Energy Transmission

2.1.1.1 Application Review Stage

Upon submission of this Application to the BC EAO, the Application will be reviewed against the information requirements specified in the AAIR for completeness. If the Application does not include all of the required information, the BC EAO may return the Application or request that the missing information be provided.

Once the Application is deemed complete and is accepted, the BC EAO will determine if the amendment is simple, typical or complex. Review period timing varies depending on the complexity of the amendment, and ranges from less than 3 months for simple, 3 to 6 months for typical, and 6 months or more for complex amendments. The BC EAO will also determine the need for and extent of consultation and engagement with the public, Working Group members, and Aboriginal groups. Tervita may be required to take an active role in public and Aboriginal consultation and Working Group meetings to resolve outstanding issues.

The BC EAO will then prepare an Assessment Report of the Application, including revised or new conditions as necessary. For typical and complex amendments, the report will also be reviewed by Tervita, relevant Working Group members and Aboriginal groups. Upon completion of the review of the Assessment Report, documents will be finalized and referred to the BC EAO's Executive Director for a decision whether to issue the amendment.

2.1.1.2 Overview of Amendment Application Process

An overview of key milestones during the pre-application and Application Review stages is provided in Table 2.1-2.

Table 2.1-2. Key Milestones during the Provincial Environmental Assessment Process

Key Milestones	Dates	Action	Document Link on BC EAO e-PIC Website
Project Description	February 24, 2014	Tervita submitted a Project Description for the proposed Project expansion to the BC EAO for review.	https://projects.eao.gov.bc.ca/api/document/5886ea9eeed3c0016f856f6c/fetch/Project_Description_for_the_proposed_Silverberry_Secure_Landfill_Amendment_dated_Feb_24_14
Section 19 Order	August 6, 2015	Tervita received letter from BC EAO that an amendment to EAC WD02-01 is required pursuant to Section 19 of the act.	https://projects.eao.gov.bc.ca/api/document/5886eac9eed3c0016f856f6e/fetch
Working group meeting No. 1	January 27, 2016	A Working Group meeting for the proposed Project expansion was held to review and comment on the draft VCs.	Not available
Public Consultation Plan	February 10, 2016	Tervita submitted the Public Consultation Plan for the proposed Project expansion to the BC EAO.	https://projects.eao.gov.bc.ca/api/document/5886ead0eed3c0016f856f6f/fetch/Public_Consultation_Plan
First Nations Consultation Plan	March 10, 2016	Tervita submitted the First Nations Consultation Plan for the proposed Project expansion to the BC EAO. proposed Project expansion	https://projects.eao.gov.bc.ca/api/document/5886eae1eed3c0016f856f71/fetch
Working group meeting No. 2	March 22, 2018	A Working Group meeting for the proposed Project expansion was held to review and comment on the draft AAIR.	Not available

Table 2.1-2. Key Milestones during the Provincial Environmental Assessment Process

Key Milestones	Dates	Action	Document Link on BC EAO e-PIC Website
Selection of VCs	April 20, 2017	Tervita submitted the draft Selection of VCs document to the BC EAO. The comment period began on May 18, 2017 and ended on June 7, 2017.	https://projects.eao.gov.bc.ca/api/document/58f9456e759d1b001983a8d0/fetch
Final Selection of VCs	July 31, 2018	Tervita submitted the final Selection of VCs document to the BC EAO.	https://projects.eao.gov.bc.ca/api/document/5b61d6fc6952ca0024cf674f/fetch
Final AAIR	January 23, 2019	BC EAO issued the approved AAIR.	https://projects.eao.gov.bc.ca/api/document/5c48b0a12da7200024c8c9ea/fetch
Application for an EAC filed	To be determined	Tervita files the Application for an EAC with the BC EAO.	To be determined
Application evaluation for completeness	To be determined	BC EAO evaluates the Application for completeness.	To be determined
Application for an EAC accepted	To be determined	BC EAO accepts the Application for an EAC.	To be determined
Application Review period	To be determined	BC EAO will start the Application Review period, typically between 3-6 months (depending on complexity of the amendment).	N/A
Public comment period for Application	To be determined	Public comment period will be held on the Application during the review period.	To be determined
Working Group meeting No. 3	To be determined	A Working Group meeting will be held to review the Application during the review period.	N/A
Draft Assessment Report	To be determined	The BC EAO will prepare and distribute the draft Assessment Report during the review period and distribute to Tervita, the Working Group and Aboriginal groups for input.	To be determined
Assessment Report	To be determined	The BC EAO will submit the final Assessment Report to the BC EAO Executive Director.	To be determined
Executive Director referral to Ministers	To be determined	The BC EAO Executive Director will submit the EAC package to the Minister of Environment and Climate Change Strategy.	To be determined
Issuance of Conditional Certificate	To be determined	Once approved, a conditional certificate will be issued and the proposed Project expansion will be authorized to proceed to the permitting stage.	To be determined

Table 2.1-2. Key Milestones during the Provincial Environmental Assessment Process

Key Milestones	Dates	Action	Document Link on BC EAO e-PIC Website
Ministers' decision posted on e-PIC	To be determined	The BC EAO will post the responsible Ministers' decision, Assessment Report, the Executive Director's reasons and recommendations, and the EAC on e-PIC.	To be determined

[a] This table describes the key milestones that have occurred during the Pre-Application stage and those expected to occur during the Application Review and Project Decision stages, and is not inclusive of all consultation activities conducted during the Pre-Application stage. Detailed summaries of consultation activities with the public and Aboriginal groups are provided in Parts C and D.

Note:

e-PIC = electronic Project Information Centre

2.2 Federal Environmental Assessment Process

On April 4, 2016, the CEA Agency determined that a federal Environmental Assessment is not required for the proposed Project expansion pursuant to the *CEA Act, 2012*. In making this determination, the CEA Agency considered the following factors as indicated in section 10 of *CEA Act, 2012*:

- The Project Description provided by the proponent on February 8, 2016
- The possibility that the carrying out of the proposed Project expansion may cause adverse environmental effects
- Comments received within the 20-day comment period

The CEA Agency was satisfied that the environmental effects of the proposed Project expansion are well-understood and adequately characterized in the Project Description, and that there is little potential for the proposed Project expansion to cause adverse environmental effects on areas of federal jurisdiction as defined in *CEA Act, 2012*.

Part B: Assessment of Environmental, Economic, Social, Heritage, and Health Effects

Part B of the Application provides information on the assessment methodology (Section 3) used to identify and characterize residual adverse effects and cumulative adverse effects related to the various environmental, economic, social, health, and heritage-related VCs for the proposed Project expansion. Sections 4 to 8 provide the effects assessments for each VC identified in Sections 4 to 8 of the AAIR. Sections 9 and 10 provide an assessment of Accidents and Malfunctions and Effects of the Environment on the Project, respectively.

The information provided in Part B follows the requirements set out in the AAIR for the proposed Project expansion issued January 23, 2019 by the BC EAO.

3. Assessment Methodology

This section provides information on how environmental, economic, social, heritage, and health effects of construction, operations, closure/reclamation, and postclosure have been assessed for the proposed Project expansion. In addition, information on the determination of assessment boundaries, identification of environmental, economic, social, heritage, and health pillars, as well as associated potential adverse effects has been provided. Technically and economically practical mitigation measures have been developed leading to the identification of potential residual adverse effects. Any residual adverse effects have been characterized and then evaluated for significance. In circumstances where potential residual adverse effects of the proposed Project expansion may interact with other reasonably foreseeable developments, these residual adverse effects have been considered in the cumulative effects assessment and evaluated for significance.

This effects assessment methodology has been developed based on:

- AAIR for the proposed Project expansion (BC EAO 2019a)
- *Guideline for the Selection of Valued Components and Assessment of Potential Effects* (BC EAO 2013)
- BC *EAO User Guide* (BC EAO 2018b)
- CEA Agency's *Cumulative Effects Assessment Practitioners Guide* (Hegmann et al. 1999)
- CEA Agency's *Incorporating Climate Change Considerations in Environmental Assessment: General Guidance for Practitioners* (CEA Agency 2003)
- CEA Agency's *Operational Policy Statement: Assessing Cumulative Environmental Effects under the Canadian Environmental Assessment Act, 2012* (CEA Agency 2015)

3.1 Issues Scoping and Selection of Valued Components

VCs refer to specific attributes of environment, economy, social, heritage and health that may be affected by the proposed Project expansion. The value of a component not only relates to its role in the ecosystem, but, also to the value placed on it by people and communities. In early 2017, Tervita prepared a preliminary VC selection document outlining the rationale and methods used for the selection of VCs for review by the BC EAO and members of the Working Group. The VC selection document was posted to the BC EAO e-PIC website on April 20, 2017, and is available at the following address: https://projects.eao.gov.bc.ca/api/document/58f9456e759d1b001983a8d0/fetch.

The Project team considered the original EAC Application (CCS 2002), information collected during the operation of the existing landfill and the BC EAO *Guideline for the Selection of Valued Components and Assessment of Potential Effects* (BC EAO 2013) in selecting VCs. In addition, the BC EAO *Secure Landfills Common Issues and Commitments Report* (BC EAO 2009) was used to identify potential VCs and pathways of potential effects. The original EAC Application included a literature review, desktop studies, and field studies done for the assessment of VCs selected at that time. The original EAC Application filed in 2002 included information gathered for climate, soils, terrain, vegetation, wildlife, surface water, fisheries, hydrogeology, air, noise, archaeology, socio-economics (including land and resource use), and health.

The VCs considered in this Application were selected based on the known interactions of landfill activities, and were refined through input from Aboriginal groups, the public, and government agencies. Tervita's understanding of VCs is founded on the legacy of having owned and operated 19 engineered landfills in Western Canada, including the existing landfill. Potential VCs were refined in consideration of the following factors (as stated in BC EAO 2013):

- Relevance to the five pillars (environmental, economic, social, heritage and health) and the proposed Project expansion

- Engagement with Aboriginal groups and the public through implementation of Tervita's First Nations Consultation Plan and Public Consultation Plan, as well as BC EAO Working Group meetings
- Representation of Important Features in the proposed Project expansion area
- Responsiveness to potential effects that may result from the proposed Project expansion
- Conciseness to clearly show Project-VC interaction while avoiding the redundancy of analyzing effects accounted for under other VCs
- Comprehensiveness when considering all of the VCs combined to identify important potential effects of the proposed Project expansion

The Project team followed a three-step process to identify the VCs for the proposed Project expansion by scoping the anticipated issues and effects pathways:

Step 1 - Compiling a list of potential issues and potential effect pathways. The list was developed through a preliminary assessment of the proposed Project expansion location, current condition data collection, and environmental information previously collected for the existing landfill (such as the approved PAC Application).

Step 2 - Determining whether the potential issues and effect pathways identified in Step 1 had the potential to interact with the proposed Project expansion, and, if so, whether the interaction could result in an adverse effect. If the candidate VC had no clear interaction or effect pathway, it was not carried forward for the purpose of the Environmental Assessment. If the candidate VC was expected to have a clear interaction with the proposed Project expansion that could result in an adverse effect on the environment, it was carried forward to Step 3.

Step 3 - Evaluating the candidate VCs in closer detail. Candidate VCs were considered against the factors presented above as identified by the BC EAO. The following questions are examples of some of the topics that were considered.

- Is there a strong, clear, and measurable effect pathway between the candidate VC and the proposed Project expansion?
- Is the VC present in the proposed Project expansion area and does it have the potential to interact with the proposed Project expansion?
- Is the VC a priority of local, provincial or federal governments, Aboriginal groups, or the public?

Whether or not the candidate VC was selected was generally based on:

- Experience from operating the existing landfill and previous data collection efforts
- Legislation and guidance documents
- Professional experience and judgment

KIs are used to measure the potential adverse effects of the proposed Project expansion on the VCs. KIs have been identified for each VC based on: regulatory guidelines; experience gained during previous projects with similar conditions or potential issues; feedback from regulatory agencies, Aboriginal groups and public stakeholders; public issues; and professional judgment of the assessment team.

Each assessment of potential environment, economic, social, health and heritage effects (Part B, Sections 4 to 8) describes how the VCs and KIs were selected for the Application. A quantitative or qualitative threshold of significance was established for each VC assessed.

Table 3.1-1 provides a list of the KIs for each VC that are identified in Part B, Sections 4 to 8, under each pillar related to environmental, economic, social, health and heritage topics.

Table 3.1-1. Valued Components and Key Indicators

VC	Subcomponents	KI(s)
Environment Pillar		
Terrain and Soils	• Terrain • Soils	• Soil quality • Erosion
Air Quality	• Dust • Odours • Emissions from combustion • Emissions from other sources, (for example, volatilization)	• Visible dust • Detectable odour at sensitive receptor • Ambient air concentrations of PM, NO_x, and other landfill gases • VOCs • GHG emissions
Acoustic Environment	• Wildlife • Land and resource use	• Noise levels
Surface Water	• Water quality • Water quantity	• Water quality parameters (for example, sediment, metals, and hydrocarbons, perceived taste and smell) • Water volume and movement
Groundwater	• Water quality • Water quantity	• Water quality parameters (for example, inorganic parameters, ions, dissolved metals, perceived taste and smell and other contaminants) • Water volume and movement
Terrestrial Vegetation	• Plant species of concern, including rare plant species and plant species used for traditional purposes • Vegetation communities of concern • Invasive plant species	• Loss of plant species of concern, including rare plant species and plant species used for traditional purposes • Loss of vegetation communities of concern • Introduction or spread of Noxious weeds
Fish and Fish Habitat	• Fish species of management interest and their habitat, including fish species of concern to Aboriginal groups	• Change in habitat (including possible effects to the food chain, such as effects to invertebrates through contamination or loss of habitat that have an effect on fish species of management interest and fish species of concern to Aboriginal groups) • Change in mortality risk
Wildlife and Wildlife Habitat	• Moose • Other ungulates • Black bear • Furbearers (including species of importance to Aboriginal groups such as porcupines and beavers) • Mature and old-forest birds • Early seral forest birds • Western toad	• Change in habitat (for example, including usage of mineral licks and changes to diet) • Change in movement and distribution • Change in mortality risk

Table 3.1-1. Valued Components and Key Indicators

VC	Subcomponents	KI(s)
Social Pillar		
Land and Resource Use	• Agriculture • Oil and gas activity • Trapping • Aboriginal land and resource use including, but not limited to, hunting and trapping, as well as travel to Aboriginal land and resource use sites • Logging/forestry	• Area of grazing tenures and ALR affected • Oil and gas infrastructure and pipeline tenures affected • Viability of trapping tenures • Viability of identified Aboriginal land and resource use sites
Community Services	• Community utilities and services	• Community and utility services capacity and demand • Accommodation capacity and demand • Health service impacts
Community Infrastructure	• Traffic and transportation infrastructure	• Traffic volumes • Transportation infrastructure disturbance
Heritage Pillar		
Cultural and Heritage Resources	• Archaeological sites • Historic sites	• Characteristics, conditions, and location of archaeological and heritage sites, if any
Health Pillar		
Human Health	• Soil quality • Air quality • Water quality • Leachate quality • Visual quality • Noise • NORM • Quality of vegetation, fish, wildlife, and water consumed as country foods, including consumption of Aboriginal-specific foods	• See indicators under the Air Quality, Terrain and Soils, Acoustic Environment, Terrestrial Vegetation, Fish and Fish Habitat, Wildlife and Wildlife Habitat, and Surface Water VCs, as applicable • NORM levels • Traffic-related injuries • Radiological risk assessment • Community Health • Indicators to be further developed through HHRA and consultation on social/cultural determinants of health
Economy Pillar		
Economy	• Resource-based economy • Barter economy • Employment	• Economic activity levels in the LAA and RAA • Employment levels

3.2 Assessment Boundaries

The Application considers the potential effects of the proposed Project expansion on the VCs in the context of defined spatial and temporal boundaries and for some VCs, administrative and technical boundaries. These boundaries vary by VC and reflect:

- The construction, operations and decommissioning phases of the proposed physical works and activities
- The natural variation of a VC

- The timing of sensitive lifecycle phases in relation to the scheduling of the proposed physical works and activities
- The time required for a VC to recover from an effect and return to a natural condition
- The area directly affected by proposed physical works and activities
- The area in which a VC functions and within which a proposed Project expansion effect may be felt

3.2.1 Spatial Boundaries

Spatial boundaries were determined by the distribution, movement patterns and potential geographic area within which there is some interaction between a VC and the proposed Project expansion. The spatial boundary of a VC may be limited to the footprint of the work conducted or extend beyond the physical boundaries of the area of the proposed Project expansion component, since the distribution or movement of a VC can be local, regional, provincial or national in extent.

The spatial boundaries are considered as follows:

- Project footprint: The land area directly disturbed by proposed Project expansion construction and cleanup activities, including associated physical works and activities.
- LAA: The LAA varies with the VC being considered. The LAA includes the Project footprint and extends beyond it to incorporate the area within which the VC is most likely to be affected by the proposed Project expansion.
- RAA: The RAA varies with the VC being considered and includes the Project footprint and LAA, and the area extending beyond the LAA where there is potential for the proposed Project expansion to have regional effects on the VC.
- Provincial: The area extending beyond regional or administrative boundaries but confined to BC.
- National: The area extending beyond BC, but confined to Canada.
- International: The area extending beyond Canada.

Each VC has specific definitions and rationale for spatial and temporal boundaries described in Sections 4 to 8. The spatial boundaries of the various VCs are provided in Figures 3.2-1 to 3.2-4.

3.2.2 Temporal Boundaries

The temporal boundaries identified for the proposed Project expansion include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading and compaction. As each cell reaches capacity it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).
- Closure/reclamation phase. When the capacity of all cells is reached the landfill will be capped with an impermeable cap and top soil and seeding will occur (approximately 1 year following operations – Year 26).
- Postclosure phase is when the entire landfill has been capped and reclaimed and monitoring will occur (approximately 25 years – Years 26 to 51).

3.2.3 Administrative Boundaries

Administrative boundaries refer to effects of political, economic or social boundaries influencing an Environmental Assessment. These may include existing datasets collected on the basis of regional or provincial boundaries that are not the same as the spatial boundaries of the selected VCs, and could influence the assessment of the potential effects. Where administrative boundaries may affect the identification or assessment of potential effects on a VC, the nature of the administrative boundaries and their influence on the assessment have been included in this Application under the appropriate assessment in Part B, Sections 4 to 8.

3.2.4 Technical Boundaries

Technical boundaries refer to potential limitations in the Proponent's ability to predict effects of the proposed Project expansion. Where technical boundaries may affect the identification or assessment of potential adverse effects on a VC, the nature of the technical boundaries and their influence on the assessment has been described in this Application under the appropriate assessment in Part B, Sections 4 to 8.

3.3 Existing Conditions

Information on existing conditions is necessary to facilitate an effective assessment. The assessment team carried out baseline studies to establish the conditions of the VCs for the proposed Project expansion. Baseline data collection includes information on current environmental, economic, social, health and heritage conditions as well as existing disturbances and land uses. To gather pertinent background data for each VC, the assessment team used relevant legal frameworks (for example, *EMA*) and information gathered from a literature review including: topographic maps; aerial photography; scientific papers; reference books; municipal, provincial and federal government maps and registries; reports; interactive websites; guides; information letters; fact sheets; databases; previous similar projects; and Aboriginal, public, stakeholder and regulatory feedback, and expert opinion.

The assessment team drew on the support of consultants and subcontractors in the compilation of desktop research and field study data for Part B of the Application.

For each VC, the following information is provided on existing conditions in Part B, Sections 4 to 10:

- A description of the quality and reliability of the existing (or baseline) data and its applicability for the purpose used, including any gaps, insufficiencies and uncertainties, particularly for the purpose of monitoring activities

- Reference to natural and/or human-caused trends that may alter the environmental, economic, social, heritage and health setting, irrespective of the changes that may occur as a result of the proposed Project expansion or other Project and/or activities in the area
- An explanation of if and how other past and present projects and activities in the study area have affected or are affecting each VC
- Documentation of the methods and data sources used to compile information on existing (or baseline) conditions, including any standards or guidelines followed
- Where additional Project and VC-specific field studies are conducted, the scope and methods to be used will follow published documents pertaining to data collection and analysis methods, where available. Where methods used for the assessment deviate from applicable published guidance, the rationale for the variance will be provided in the Application
- Description of what Aboriginal Traditional Knowledge was used in the VC assessment

Gathering of baseline information and identification of potential issues relied on an understanding of known interactions identified through operation of the existing landfill, and were refined through input from Aboriginal groups, the public, and the government agencies, as well as Project-specific field surveys. The following technical reports contain baseline information for the proposed Project expansion and are provided in Appendices 1 to 11:

- Soil Sampling Report (Appendix 1)
- Volatile Organic Compound Air Sampling Report (Appendix 2)
- 2018 Surface Water Discharge Report (Appendix 3)
- 2018 Groundwater Monitoring Program (Appendix 4)
- Hydrogeological Siting Suitability Investigation (Appendix 5)
- Vegetation Survey Report (Appendix 6)
- Early Summer Wildlife Survey Report (Appendix 7)
- Early-mid Winter Snow Tracking Survey Report (Appendix 8)
- Late-Winter Snow Tracking Survey Report (Appendix 9)
- Spring Breeding Bird and Amphibian Survey Report (Appendix 10)
- Screening Level Human Health Risk Assessment (Appendix 11)

Tervita conducts quarterly groundwater monitoring and annual surface water discharge monitoring and NORM surveys for existing operations**.** These annual reports are referenced where applicable to inform the assessment of the proposed Project expansion.

3.4 Potential Effects

The Application includes an assessment of the potential environmental, economic, social, health and heritage effects of the proposed Project expansion on the VCs identified in the AAIR. The potential adverse effects of the proposed Project expansion on a particular VC were identified through: engagement with Aboriginal groups, the Working Group, the public, and government and regulatory agencies; experience gained during operations of the existing landfill; and the professional judgement of the assessment team.

The assessment methods followed in Part B, Sections 4 to 10 include:

- Identification of the potential interactions of the proposed Project expansion and the selected VCs
- Identification and description of the potential adverse effects resulting from the proposed Project expansion, using existing knowledge of potential effects identified through the literature review, knowledge gained from ongoing operations of the existing landfill, and field studies
- Identification of mitigation measures that avoid, reduce or otherwise address potential adverse effects using the tiered approach described in the BC Ministry of Environment (MOE) Environmental Mitigation Procedures (2014a)
- Determination of potential residual adverse effects (that is, effects after mitigation)

- Characterization of the potential residual adverse effects
- Determination of significance of potential residual adverse effects
- Evaluation of the potential for residual adverse effects associated with the proposed Project expansion to interact with similar effects of other past, present or reasonably foreseeable projects or activities
- Identification of any cumulative effects
- Identification of mitigation measures that avoid, reduce or otherwise address potential cumulative effects (if any)
- Identification of residual cumulative adverse effects
- Characterization and determination of significance of residual cumulative adverse effects
- Feedback from Aboriginal groups, the public, stakeholders and government agencies, as appropriate

3.5 Mitigation Measures

Mitigation measures are implemented to avoid, reduce, or control a project's adverse environmental, economic, social, heritage or health effects. Mitigation is developed on a project-specific basis for identified potential effects. A proponent or third party must accept responsibility for implementation of the mitigation and there must be certainty that the mitigation will be carried out (BC MOE 2014a). Mitigation measures are implemented to reduce the impact of any residual adverse effects which may occur including the reduction of the magnitude of the effect, the limitation of the extent of the effect and the shortening of the reversibility of the effect (that is, time to alleviate the residual effect). For some VCs (such as, Economy), the potential effects of the Project are considered positive; therefore, mitigation measures identified for positive effects are enhancement measures.

The BC MOE *Policy for Mitigating Impacts on Environmental Values (Environmental Mitigation Policy)* must be considered in BC EAO assessments. The Environmental Mitigation Policy (BC MOE 2014b) enables the Province to meet its goals for economic prosperity and environmental sustainability and requires consideration of environmental, social, and economic values. The Environmental Mitigation Policy is intended to support the environmental portion of informed, integrated, transparent decision-making in the Province's natural resource sector. It is supported by the Procedures for Mitigating Impacts on Environmental Values (Environmental Mitigation Procedures) (BC MOE 2014a) which are intended to improve the quality, transparency and consistency of information to support existing decision-making processes for mitigating impacts on environmental values and associated components in four areas:

- Identification of environmental values and associated components
- Assessment of impacts on environmental values and associated components
- Application of the mitigation hierarchy to develop mitigation measures
- Preparation of mitigation plans

3.5.1 Mitigation Hierarchy

The types of mitigation measures outlined below are applied in a tiered approach consistent with the Environmental Mitigation Procedures published by the BC MOE (2014a).

- Avoidance: Measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: Measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): Measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.

Offset or compensation: measures taken to offset or compensate for (a) any residual adverse effect that cannot be avoided, reduced or restored, and (b) any residual adverse effects where there is a time-lag between the residual adverse effects and the effectiveness of the mitigation. One step should be considered before moving to the next, and a rationale should be provided for the approach that is taken. The general principle is that the higher the risk to the VC, the more protective the mitigation measures should be and the more likely that offset or compensation measures will also need consideration for any residual adverse effects remaining after restoration (onsite) (BC MOE 2014a). Considerations for rationale to move through the mitigation hierarchy include:

- Avoidance: Rationale for avoidance mitigation would address the question of to what degree or extent has the preliminary design of the proposed Project avoided potential effects, to what degree or extent can the impacts of the proposed Project or activity be avoided and whether the impacts on the environmental values and associated components can be fully avoided (“avoid”) or only partially avoided (“minimized”). Procedures to avoid impacts would consider location, means, timing and not proceeding with a particular activity.

  Part A, Section 1.4 provides information on the site selection criteria which helped frame the initial mitigation approach for the proposed Project expansion design.

- Minimization: Measures to minimize should consider the scope, scale, and duration of the impacts on environmental values and associated components within the footprint and area of influence. Although avoid and minimize are two distinct steps within the mitigation hierarchy, they are often considered at the same time. These same considerations generally apply when considering ways to minimize (i.e., partially avoid impacts). Guidance may be available in the form of land-use plans and other higher-level plans, park plans, strategic restoration plans, or BMPs. Same procedures and considerations as outlined for avoid (location, means, and timing) generally apply when considering ways to minimize impacts (that is, partially avoid impacts).

- Restoration (onsite): Rationale for restoration mitigation would address the question of why it was deemed not practicable to minimize impacts on environmental values and associated components to a greater extent.

- Offset or Compensation: Rationale for offset or compensation as mitigation would address the question of why it was deemed not practicable to restore environmental values and associated components on the site of the impacts to a greater extent.

  No offset or compensation measures are considered warranted as the proposed Project expansion is located adjacent to the existing landfill and on previously cleared land that is on private land owned by Tervita.

3.5.2 Mitigation Effectiveness

Effectiveness of mitigation measures to reduce or eliminate potential adverse effects are characterized using the following criteria:

- High effectiveness: The mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.

- Moderate effectiveness: The mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

- Low effectiveness: The mitigation measure may result in no or little change in the effect on a VC, the effectiveness of the mitigation measure is unknown or unproven, or no improvement to the condition of the VC.

Mitigation measures are implemented prior to, during or following Project activities and are expected to be effective immediately in alleviating or reducing potential Project effects on the VC. Some mitigation measures may not be effective immediately and require time before they function as intended or predicted such as implementation of seeding for erosion control.

To ensure that the severity of potential adverse effects is reduced during all phases of the proposed Project expansion, general and site-specific mitigation measures are recommended based upon current industry-accepted standards, professional judgement, engagement with regulatory agencies, interested groups and individuals including Aboriginal groups, as well as lessons learned during operations of the existing landfill. If in the future, regulatory changes occur, Tervita will adhere to these changes.

A summary of the mitigation measures for potential adverse effects of the proposed Project expansion by phase and any mitigation measures that will be in management plans is provided in Part B, Sections 4 to 10. The proposed mitigation measures take into consideration the technical and economic feasibility of the measures and their suitability for the Project, general and site-specific application as well as the degree to which the proposed mitigation measures have been considered effective in the same or similar applications elsewhere.

Experienced and qualified environmental professionals will be retained by Tervita, as required, to help ensure that the mitigation measures within this Application are understood and properly implemented. In addition, it is expected that through the Aboriginal and public engagement program, additional issues related to the proposed Project expansion may be identified and further mitigation measures determined. These measures will be incorporated in the management plans and the Silverberry Operations Plan, where appropriate.

3.6 Characterization of Residual Effects

Residual adverse effects are characterized in order to inform the determination of significance (Section 3.7). The criteria used to characterize the residual effects are identified below and their definitions are presented in Table 3.6-1:

- Context (that is, the extent to which the area in which a residual adverse effect may occur has already been adversely affected by existing conditions, as well as ecological thresholds and levels of existing disturbance, providing an indication of the sensitivity and resilience of the VC to effects)
- Spatial boundary (that is, Project footprint, LAA, RAA, Provincial, National, International)
- Temporal context (that is, duration and frequency of the event causing the residual effect, reversibility of the residual effect)
- Magnitude (that is, severity of the residual adverse effect in relation to environmental, social or regulatory standards)
- Level of confidence or uncertainty (that is, availability of data to substantiate the assessment conclusion, previous success of mitigative measures, etc.)
- Probability or likelihood of occurrence of the residual effect

All criteria (for example, temporal context, magnitude, etc.) were considered by the assessment team for each residual effect. Where appropriate, the key or most influential assessment criteria used to inform the determination of significance for each residual effect are noted.

A summary of the characterization of residual adverse effects arising from the construction and operations of the Project is identified in Part B, Sections 4 to 10.

Table 3.6-1. Characterization of Residual Effects for Evaluation of Significance

Assessment Criteria	Definition	
Spatial Boundary		
Footprint	The land area directly disturbed by proposed Project expansion construction and cleanup activities, including associated physical works and activities.	
LAA	The LAA varies with the VC being considered. The LAA includes the Project footprint and extends beyond it to incorporate the area within which the VC is most likely to be affected by the proposed Project expansion. The VC-specific LAAs are described in Sections 4 to 8 and are illustrated on Figures 3.2-1 and 3.2-3.	
RAA	The RAA varies with the VC being considered and includes the Project footprint and LAA, and the area extending beyond the LAA where there is potential for the proposed Project expansion to have regional effects on the VC. The VC-specific RAAs are described in Sections 4 to 8 and are illustrated on Figures 3.2-1 and 3.2-4.	
Provincial	The area extending beyond regional or administrative boundaries but confined to BC.	
National	The area extending beyond BC, but confined to Canada.	
International	The area extending beyond Canada.	
Temporal Context		
Duration – (period of the predicted residual effect)	Immediate	Residual effect is limited to less than or equal to 2 days.
	Short-term	Residual effect is limited to the initial construction phase, or any 1 year during the life of the proposed Project expansion.
	Medium-term	Residual effect extends into the operations phase for up to 10 years.
	Long-term	Residual effect extends into the operations phase for more than 10 years, but ceases during the operational life of the proposed Project expansion or upon closure/reclamation.
	Extended-term	Residual effect extends beyond the closure/reclamation phase.
Frequency (how often the predicted residual effect would occur)	Single/Rare	Residual effect occurs one time or rarely occurs.
	Infrequent	Residual effect occurs infrequently at multiple times.
	Frequent/Regular	Residual effect occurs frequently, at regular intervals.
	Continuous	Residual effect occurs continuously.
Reversibility	Reversible	Residual effect is reversible to pre-construction or equivalent conditions.
	Irreversible	Residual effect is permanent.
Magnitude - Residual Effects on the Environment, Social, Economic, and Health Pillars		
Negligible	There is no detectable change from baseline conditions.	
Low	The effect results in conditions that differ from the average value for baseline conditions but remain within the range of natural variation and below a guideline or threshold value, where applicable.	
Medium	The effect results in conditions that differ measurably from the average value for baseline conditions and are equal to or slightly above the limits of natural variation, and/or are equal to or slightly above a guideline or threshold value, where applicable.	
High	The effect results in conditions that differ substantially from baseline conditions, resulting in a clearly detectable change beyond the range of natural variation, and/or are measurable beyond a guideline or threshold value or at a regional population level, where applicable.	

Table 3.6-1. Characterization of Residual Effects for Evaluation of Significance

Assessment Criteria	Definition
Magnitude - Residual Effects on the Heritage Pillar	
Negligible	No detectable changes to heritage or archaeology sites.
Low	There are detectable changes to heritage or archaeology sites, but limited to small portions of sites of low significance, or portions of sites of higher significance that are already substantially disturbed.
Medium	Changes to small, but intact portions of heritage or archaeological sites of moderate or high significance, or substantial and intact portions of sites of low significance.
High	Changes to substantial and intact heritage or archaeology sites of moderate or high significance.
Magnitude - Residual Effects on GHG Emissions	
Negligible	No measurable contribution to provincial or national emissions. Very little or no measurable change based on comparison with national and provincial inventories.
Low	Emissions represent a small contribution to provincial or national emissions.
Medium	Emissions represent a moderate contribution to provincial or national emissions but are within regulatory limits and objectives.
High	Emissions cause exceedances of provincial or national emissions objectives or standards.
Likelihood of Residual Effect Occurring	
Low	The effect is unlikely to occur (as in a malfunction or accident or other low probability event).
Medium	The effect may occur, depending on the effectiveness of mitigation measures.
High	The effect will occur should the Project proceed.

The assessment period for the effects assessment includes construction, operations, closure/reclamation, and postclosure phases for the proposed Project expansion. In addition to the phases included in the assessment period of the effects assessment, the assessment period for the cumulative effects assessment includes the planning, construction, and operations phases of activities or projects that have previously occurred and those that are planned (publicly disclosed).

3.7 Proponent's Determination of Significance

A determination of significance was completed for all identified potential residual adverse effects. Thresholds of significance have been defined to provide a transparent basis for the determination of whether a potential residual effect is expected to be significant. Where practical, a quantitative threshold was defined for the significance determination for VCs based on published data, as well as environmental standards and guidelines. Due to a lack of regulatory standards, guidelines or objectives, a significance determination based on qualitative thresholds was used for all other VCs. Definitions are provided when qualitative thresholds were used. For some subjects, the evaluation of significance benefited from an understanding of similar issues or interactions associated with operation of the existing landfill. A conclusion of significance of residual adverse effects was determined and is provided for each VC.

The extent to which professional judgement of the assessment team was used in the evaluation of significance of potential residual adverse effects is indicated for each VC. For the proposed Project expansion, the assessment team consisted of discipline experts, the Jacob's Project Management Team, experienced assessment practitioners and senior reviewers.

3.8 Confidence and Risk

Section 3.9 of the AAIR indicates that additional risk analysis may be required to fully characterize the potential risk associated with uncertain outcomes, where there is a high degree of uncertainty with the possibility of a significant adverse effect, and follow-up programs are not considered sufficient to manage the potential risk. In the assessment of potential adverse effects of the proposed Project expansion in Part B, Sections 4 to 8, no situations like this arose, and therefore, the assessments do not contain additional information on risk. An assessment of risk was completed in the assessment of potential adverse effects resulting from Accidents and Malfunctions (Part B, Section 9).

Level of confidence in the determination of significance of potential residual adverse effects was determined by the availability of data, precedents, and degree of scientific uncertainty or other factors beyond the control of the assessment team. A conclusion will be based on either a low, moderate or high level of confidence for each residual adverse effect. These determinations will be made on the basis of the following factors.

- Low – prediction is based on incomplete understanding of cause-effect relationships and incomplete data pertinent to the proposed Project expansion area.
- Moderate – prediction is based on good understanding of cause-effect relationships using data from outside the proposed Project expansion area or incompletely understood cause-effect relationships using data pertinent to the proposed Project expansion area.
- High – assessment is based on good understanding of cause-effect relationships and data pertinent to the proposed Project expansion area.
- Where uncertainty exists in the significance determination, the Application provides recommended follow-up and monitoring programs (Part B, Sections 4 to 10).

3.9 Cumulative Effects Assessment

Cumulative effects are changes to the environment that are caused by an action in combination with other past, present and reasonably foreseeable human actions (Hegmann et al. 1999). The scope of the cumulative effects assessment is a Project-specific cumulative effects assessment as required under the BC *EA Act*. Hegmann et al. (1999) states an assessment must determine that a project is incrementally responsible for adversely affecting a given VC. Therefore, the total cumulative adverse effect on a given VC due to many actions must be identified, and the cumulative effects assessment specifies to what degree the proposed Project expansion under review is contributing to that total effect.

The cumulative effects assessment was conducted in accordance with the AAIR for the proposed Project expansion and BC EAO guidance, which states that the assessment of cumulative adverse effects is to be completed for VCs where potential residual adverse effects are evaluated as likely to occur and will interact with other past, present, or reasonably foreseeable projects (BC EAO 2013, 2018b).

Section 3.9.3 outlines the methodology for conducting the cumulative effects assessment.

3.9.1 Identification of Past, Present, and Reasonably Foreseeable Projects or Activities

Past, present or reasonably foreseeable projects and activities that were considered to have potential interaction with the proposed Project expansion met the following criteria:

- The project or activity may result in a residual adverse effect on a selected VC.
- The project-specific residual adverse effect on a VC is likely to act in a cumulative fashion with the residual adverse effects of other past, present or reasonably foreseeable developments in the area.

The following development categories of projects and activities were identified:

- Projects or activities that have already been built or conducted for which the environmental effects overlap with those of the proposed Project expansion (that is certain).
- Projects that are either proposed (public disclosure) or have been approved to be built, but are not yet built, for which the environmental effects overlap the proposed Project expansion (that is reasonably foreseeable).

Existing activities and disturbances or reasonably foreseeable developments that are likely to interact with the predicted residual effects of the proposed Project expansion vary depending upon the spatial boundaries identified for the specific environmental or socio-economic element, and temporal overlap with proposed Project expansion activities. Future projects considered in the assessment do not include proposed or hypothetical projects where formal plans have not been disclosed.

For each cumulative effects assessment, information will be provided on the adequacy of existing data in conducting the assessment.

Reasonably foreseeable developments included in the assessment were identified prior to June 1, 2019, and are summarized in Section 3.9.1.3. Only those reasonably foreseeable developments with identified footprints outside of urban disturbed areas are mapped and included in Figure 3.9-2.

Sources reviewed to identify any projects or activities that could have cumulative interactions with the proposed Project expansion include: CEA Agency Environmental Assessment Registry, Major Projects Management Office, National Energy Board (NEB), BC OGC, BC EAO Project Information and Collaboration System (EPIC), BC Major Projects Inventory, BC Ministry of Transportation and Infrastructure, BC Utilities Commission, and local government agencies.

The projects identified in Table 3.9-1 and shown on Figure 3.9-2 were identified as reasonably foreseeable in the AAIR and include some projects which are now complete and/or in operation (and, therefore, are now a part of existing activities identified in Section 3.9.1.2). Table 3.9-1 also includes additional reasonably foreseeable projects identified after the AAIR was finalized.

Table 3.9-1. Projects Identified for the Proposed Project Expansion Cumulative Effects Assessment

Proponent	Project Name	Type of Development	Status/Schedule (as of June 2019)	Relevant Project Spatial Boundaries[a]	Existing or Reasonably Foreseeable
Aeolis Wind Power Corporation	Hackney Hills Wind Park	Wind Energy	Proposed	Community Services RAA Community Infrastructure RAA Economy RAA	Reasonably Foreseeable
Aley Corporation Limited, a subsidiary of Taseko	Aley Niobium Project	Niobium Mine	Proposed	Community Services RAA Community Infrastructure RAA Economy RAA	Reasonably Foreseeable
AuRico Metals Inc.	Kemess Underground Copper-Gold Mine	Copper/ Gold Mine	Under construction Expected to be operating by 2022	Community Services RAA Community Infrastructure RAA Economy RAA	Reasonably Foreseeable
Secure Energy Services Inc.	Wonowon Landfill	Hazardous Waste Facility	Proposed Provincial Environmental Assessment process started in January 2019	Community Services RAA Community Infrastructure RAA Economy RAA	Reasonably Foreseeable

Table 3.9-1. Projects Identified for the Proposed Project Expansion Cumulative Effects Assessment

Proponent	Project Name	Type of Development	Status/Schedule (as of June 2019)	Relevant Project Spatial Boundaries[a]	Existing or Reasonably Foreseeable
Enbridge Inc. (formerly Westcoast Energy Inc.)	Spruce Ridge Program	Pipeline Expansion	Approved by NEB in December 2018 Construction schedule not yet determined	Community Services RAA Community Infrastructure RAA Economy RAA	Reasonably Foreseeable
NGTL	North Montney Mainline Pipeline	Natural Gas Transmission Pipeline	Construction began in August 2018, and facilities will be phased into service over a 2-year period, beginning September 2019	Community Services RAA Community Infrastructure RAA Economy RAA	Reasonably Foreseeable
The Station at Fort St. John	Station 44 Town Centre	Urban Residential/ Retail Development	Under construction Project completion forecasted for Q4 2023	Community Services LAA Community Infrastructure LAA Economy LAA	Reasonably Foreseeable
Enbridge Inc. (formerly Spectra Energy)	Westcoast Connector Gas Transmission Project	LNG Pipeline	EAC issued in 2014 – EAC extension granted in December 2018	Community Services RAA Community Infrastructure RAA Economy RAA	Reasonably Foreseeable
Blue Fuel Energy Corp.	Sundance Low Carbon Gasoline Refinery	Petrochemical Manufacturing	Current status unknown – construction completion was forecasted for early 2019	None - Outside Assessment Area Boundaries	Existing
Canadian Methanol Corp.	Sundance Clean Methanol Refinery	Petrochemical Manufacturing	Permitting stage – construction planned to start in late 2017, and production planned to begin in 2020	None - Outside Assessment Area Boundaries	Existing
Wartenbe Wind Project Limited Partnership	Wartenbe Wind Energy Project	Wind Energy	Current status unknown	None - Outside Assessment Area Boundaries	Not Existing or Reasonably Foreseeable
Canadian Dehua International Mines Group Incorporated	Gething Coal Project	Coal Mine	Proposed – BC EAO Pre-Application Phase	None - Outside Assessment Area Boundaries	Reasonably Foreseeable
Taylor Wind Project Limited Partnership, a subsidiary of EDF EN Canada Inc.	Taylor Wind Project	Wind Energy	Proposed – BC EAO Pre-Application Phase No activity on BC EAO EPIC since 2015	None - Outside Assessment Area Boundaries	Not Existing or Reasonably Foreseeable
Zero Emission Energy Developments Inc.	Septimus Creek Wind Power Project	Wind Energy	Under Construction (latest information available is from 2018)	None - Outside Assessment Area Boundaries	Existing
BC Hydro	Site C Clean Energy Project	Hydro-Electric	Construction of the project started in summer 2015, and will be completed in 2024	None - Outside Assessment Area Boundaries	Existing

Table 3.9-1. Projects Identified for the Proposed Project Expansion Cumulative Effects Assessment

Proponent	Project Name	Type of Development	Status/Schedule (as of June 2019)	Relevant Project Spatial Boundaries[a]	Existing or Reasonably Foreseeable
Cardero Coal Ltd.	Carbon Creek Mine	Coal Mine	Withdrawn from BC EAO process in 2016, due to inactivity on application	None - Outside Assessment Area Boundaries	Not Existing or Reasonably Foreseeable
Air Liquide Canada Inc.	Air Liquide Liquid Nitrogen Plant	Industrial	Operating	None - Outside Assessment Area Boundaries	Existing
Bear Mountain Wind Limited Partnership	Bear Mountain Wind Park	Wind Energy	Operating	None - Outside Assessment Area Boundaries	Existing
Conuma Coal Resources Limited	Brule Mine	Coal Mine	Postoperation – project is in care and maintenance phase	None - Outside Assessment Area Boundaries	Existing
Keyspan Energy Canada Company (now Keyera Corp.)	Caribou Gas Processing Plant	Natural Gas Processing Facility	On hold	Community Services RAA Community Infrastructure RAA Economy RAA	Not Existing or Reasonably Foreseeable
Ferus Incorporated	Dawson Creek Liquid Nitrogen Plant	Industrial	Operating	None - Outside Assessment Area Boundaries	Existing
Spectra Energy Midstream Corporation	Dawson Liquids Extraction Project	Natural Gas Liquids Extraction	Operating	None - Outside Assessment Area Boundaries	Existing
Encana Corporation	Debolt Saline Water	Groundwater Extraction	Operating	None - Outside Assessment Area Boundaries	Existing
Encana Corporation	Encana 4-26 Refrigeration	Natural Gas Processing Facility	Current status unknown	None - Outside Assessment Area Boundaries	Not Existing or Reasonably Foreseeable
Encana Corporation	Encana 8-21 Refrigeration	Natural Gas Processing Facility	Current status unknown	None - Outside Assessment Area Boundaries	Not Existing or Reasonably Foreseeable
Slocan Forest Products Limited	Fibreco Pulp Mill Expansion	Pulp Mill	Operating	None - Outside Assessment Area Boundaries	Existing
BC Hydro	GM Shrum Generating Station Upgrade	Power Plant	Completed	None - Outside Assessment Area Boundaries	Existing
BC Hydro	GM Shrum Units 1 to 5 Turbine Rehabilitation Project	Power Plant	Completed	None - Outside Assessment Area Boundaries	Existing
City of Prince George	Hart Water Supply Improvements Fishtrap Island Collector Well	Groundwater Extraction	Completed	None - Outside Assessment Area Boundaries	Existing
Conuma Coal Resources Limited	Hermann Mine	Coal Mine	Under construction – production targeted for end of 2019	None - Outside Assessment Area Boundaries	Existing

Table 3.9-1. Projects Identified for the Proposed Project Expansion Cumulative Effects Assessment

Proponent	Project Name	Type of Development	Status/Schedule (as of June 2019)	Relevant Project Spatial Boundaries[a]	Existing or Reasonably Foreseeable
Westcoast Gas Services Incorporated	Highway Gas and Liquids Plant and Pipeline	Natural Gas Processing Facility & Pipeline	EAC issued in 1997 Current status unknown – assumed to be in operation	Community Services RAA Community Infrastructure RAA Economy RAA	Existing

Prince Rupert Gas Transmission Ltd.	Prince Rupert Gas Transmission Pipeline	Natural Gas Transmission Pipeline	On hold	None - Outside Assessment Area Boundaries	Not Existing or Reasonably Foreseeable

[a] Definitions and rationale for proposed Project expansion spatial boundaries are provided for each VC in Sections 4 to 8.

Notes:

NGTL = NOVA Gas Transmission Ltd.
Taseko = Taseko Mines Ltd.

3.9.1.1 Historical Conditions

Approximately 10,000 years ago, the last glacial ice sheets retreated from the northern parts of the Canadian prairies, leaving behind fertile soils, thick deposits of gravel, boulders, innumerable shallow lakes and large areas of swamp and muskeg. For thousands of years nomadic hunters struggled to adapt to the rigors of a harsh northern climate and an uncertain food supply. Over time, distinctive groups developed their own cultures and tool kits to make survival possible, passing knowledge and wisdom over generations to present day (Clare 1998).

The understanding of existing activities and disturbances on the landscape is based on disturbance since settlers began to arrive to the northeastern BC area in the early 1900s using the Athabasca, Edson and Hinton trails. After 1912, large areas of bushland in the Peace area were turned into cropland (Clare 1998). The Northern Alberta Railway reached the village of Dawson Creek in 1931 (Lord and Green 1986). In the early 1940s, the BC, Canadian and American governments developed a plan to secure land transportation between the continental states to Alaska by building the Alaska Highway. In 1942, Dawson Creek was developed at the confluence of Highway 97 from southern and western BC, Highway 2 from Alberta and the start of the Alaska Highway. After World War II ended in 1945, the area was left with better connections by land and by air. Exploration for oil and natural gas brought new interest, prosperity and transportation links to the region. Energy extraction in the region began in the

1960s. Since then, lands have been cleared for further settlement, agriculture, forestry, recreation, transportation infrastructure, and oil and gas activities (Clare 1998).

The surrounding land of the proposed Project expansion is generally undeveloped forest, but a number of oil and gas facilities operate within the immediate vicinity of the site, and oil and gas production is generally the predominant commercial activity within the area. Based on historical areal imagery the landfill site has been subject to a history of natural and man-made disturbances including wildfire scarring in the 1950s and oil and gas activity in the 1970s. Most of the landfill site was cleared of trees in the 1980s for agricultural use prior to being developed as a secure landfill.

3.9.1.2 Existing Activities

Existing activities and disturbances in the proposed Project expansion assessment areas include the following:

- Forestry (for example, TSAs and Tree Farm Licenses [TFLs])
- Oil and gas developments (for example, wells, pipelines, and oil or gas facilities)
- Agriculture (for example, crop and pasture lands)
- Mineral resources (for example, exploration activities)
- Energy transmission (for example, electricity transmission lines and electric power substations)
- Recreation and tourism (for example, canoeing, cross-country skiing, hiking, horseback riding, hunting, fishing, and snowmobiling)
- Settlement and rural and urban development (for example, cities, towns, counties, population growth/decline, residential and commercial development, utilities [distribution lines, sewer/water], landfills, museums, and hospitals)
- Transportation and infrastructure (for example, traffic, highways, roads, railways, and airports)

Natural disturbances within the proposed Project expansion assessment areas, such as wildfires, are discussed in Section 10 Effects of the Environment on the Project.

Existing activities are further described in the following subsections. Locations of specific projects are shown on Figure 3.9-1. (Note: only select projects are mapped).

Forestry

The proposed Project expansion is located in the Fort St. John TSA, which is the sixth largest TSA in BC. The volume of timber harvested in the TSA provides an indication of current forestry activity in the proposed Project expansion assessment areas. Effective May 10, 2018, the current AAC in the TSA is 2,115,000 m^3, consisting of 1.2 million m^3 coniferous and 915,000 m^3 deciduous (Province of BC 2018d). The AAC has largely remained unchanged over the last 15 years and is expected to remain at current rates over the next decade (BC MFLNRORD 2018b).

Along with oil and gas and agriculture, forestry (that is, timber harvesting) is the dominant land use activity in the proposed Project expansion assessment areas. Current and ongoing forestry activities in the proposed Project expansion assessment areas include forest harvesting in TSAs, as well as TFLs. A vegetation field survey conducted in June 2015, and a site visit in 2017 for the proposed Project expansion observed patches of forest harvesting (logging) in the northeast portions of the Terrestrial Vegetation RAA and the Land and Resource Use LAA (that is, 1-km radius extending outwards from the proposed Project expansion footprint boundary).

Oil and Gas Developments

Oil and gas activity in the proposed Project expansion assessment areas has been ongoing since the 1960s. Numerous oil and gas exploration and development companies are currently active in northeast BC and are considered vital to the economy. With the recent discovery of the Montney Shale field in the region, expansion in the natural gas industry is growing quickly. Over 5 years, from 2011 to 2016, annual production has increased 24 percent. Recently, however, exploration and development have declined, with only 353 gas wells drilled in northeast BC in 2016, compared to 531 in 2015 (BC OGC 2017).

The proposed Project expansion is located in the oil and gas development area of the Montney basin, which remains the major place for drilling activity, production and reserves growth in northeast BC (BC OGC 2017). Oil and gas companies currently operating and with proposed oil and gas activities in the RAA of various VCs include, but are not limited to, AltaGas Holdings Inc., ARC Resources Ltd., Baytex Energy Ltd., Bonavista Energy Corp., Canadian Natural Resources Ltd., Kelt Exploration Ltd., Pembina Pipeline Corp., NGTL, and Westcoast (IHS 2019a, 2019b, 2019c).

In October 2017, Plateau Pipe Line Ltd., a subsidiary of Pembina Pipeline Corp., completed and put into operation the Northeast BC Expansion Project. The project included the construction of 147 km of pipeline to transport natural gas liquids, running from northwest of Wonowon, BC, to an existing terminal near Taylor, BC (see Figure 3.9-1). It has a transmission capacity of approximately 75,000 barrels per day and is expected to be in operation for a minimum of 25 years (BC EAO 2016; Pembina Pipeline Corp. 2019).

In January 2018, AltaGas Ltd. completed construction of the North Pine Natural Gas Liquids Facility project, located approximately 5 km south of the proposed Project expansion (see Figure 3.9-1). The 10,000 barrels per day facility is connected to existing AltaGas Ltd. infrastructure. Natural gas liquids such as butane, propane and natural gas condensate will be delivered to the facility by truck and by pipeline, and will then be separated, processed to meet sales specifications for each of the components and then shipped to sales destinations by rail, with some product being trucked to local markets. The facility will also receive condensate that has been processed at upstream gas plants. This condensate will flow into storage at the facility then be transported by rail or trucks to sales destinations (AltaGas Ltd. 2018).

Existing oil and gas activities expected to take place in the proposed Project expansion assessment areas include operations and maintenance activities for wells, pipelines, and facilities (for example, gas plants, pump stations, compressor stations, and meter stations).

Agriculture

The Peace River region is a crucial agricultural production area of BC. The PRRD contains approximately 1.4 million ha of land within the ALR, comprising approximately 27 percent of ALR lands in BC. Approximately 825,000 ha of land are currently farmed in the region, producing forage seed, grain (that is, barley, oats and wheat), alfalfa, canola and honey. Cattle ranching and game farm production are also common agricultural activities in the region (PRRD 2013, 2014). Most of the land in the proposed Project expansion assessment areas is designated as ALR (Province of BC 2018a). Current and ongoing agricultural activities in the proposed Project expansion assessment areas predominantly consist of field crop production, managed and unmanaged pasture, and other livestock and associated activities (PRRD 2014).

Utilities and Energy Transmission

Current and ongoing utility activities in the proposed Project expansion assessment areas include maintenance on transmission lines, fibre optic line and gas distribution rights-of-way (for example, BC Hydro, Telus Communications Corp., Spectra Energy Corp.). There are currently no independent power projects identified as operating within the proposed Project expansion assessment areas (BC Hydro 2018a).

Other ongoing and current utility activities in the proposed Project expansion assessment areas include operation and maintenance activities associated with public utilities and services (for example, water and

sewer lines, landfills) and electrical infrastructure (for example, substations, power lines) serving local communities and rural residences, as well as the oil and gas industry.

In addition, BC Hydro recently completed two projects associated with one of its largest generating facilities (that is, Gordon M. Shrum) as part of their plan to invest approximately $2 billion a year over the next decade in BC's electric system (BC Hydro 2018b). These projects, while identified in the AAIR as reasonably foreseeable, are now considered a part of existing activities and are located outside of the proposed Project expansion assessment area boundaries (see Table 3.9-1).

Mineral Resources

At present, there are no operating mines or other mineral resource developments identified in any of the proposed Project expansion assessment areas (Clarke et al. 2019). However, given the importance of mineral resources for BC, it is expected that ongoing exploration activities may overlap with the proposed Project expansion assessment areas.

Recreation and Tourism

Current and ongoing recreational use of lands in the proposed Project expansion assessment areas may include camping, hiking, canoeing/kayaking, fishing, hunting, boating, snowmobiling and ATV use. However, the remote setting of the proposed Project expansion may limit the number of recreational users. The closest designated park, recreation area, or natural area is Beatton Provincial Park, located approximately 34 km south of the proposed Project expansion.

Settlement and Rural and Urban Development

The proposed Project expansion is located in a remote, predominantly forested, Crown land setting. No residences are located within 1.5 km of the Project footprint.

There are a number of existing landfill and waste treatment facilities in the Community Services RAA, Community Infrastructure RAA, and Economy RAA including the Tervita Silverberry Secure Landfill, Tervita Babkirk Secure Landfill, Tervita Babkirk Special Waste Treatment Facility, and the Petrowest GP Ltd. Peejay Secure Landfill (see Figure 3.9-1).

In 2016, PRRD Electoral Area B had a population of 5,628, an increase of 1.4 percent from 2011 (Statistics Canada 2018). The nearest communities with services to the proposed Project expansion are the City of Fort St. John (approximately 50 km southeast), the District Municipality of Taylor (approximately 60 km south), and the Community of Wonowon (approximately 40 km northwest), which provide accommodation, restaurants, groceries, gas, and diesel. The Community of Buick, which consists of several houses, a community hall and a small store, is located approximately 16 km north.

In 2016, the City of Fort St. John had a population of 20,155, an increase of 8.3 percent from 2011. In 2016, the District Municipality of Taylor had a population of 1,469, an increase of 7.0 percent from 2011 (Statistics Canada 2018).

Transportation and Infrastructure

Current and ongoing transportation activities in the proposed Project expansion assessment areas may include regular and commercial vehicle traffic, as well as maintenance activities on roads, bridges, highways, railways and airports. Access to the proposed Project expansion is via local highways (for example, Highway 97) and Beatton River Road (also referred to as the Buick Creek Road, Highway #151, or the Beatton River Airport Road). The nearest major airport is the North Peace Regional Airport (YXJ) located in Fort St. John, where the Canadian National Railway Company has the nearest railway stop.

3.9.1.3 Reasonably Foreseeable Projects

Reasonably foreseeable projects considered in the cumulative effects assessment will vary depending on the spatial boundaries identified for specific VCs. Refer to Table 3.9-1 and on Figure 3.9-2.

In general, reasonably foreseeable activities in the proposed Project expansion assessment areas may include: forestry, oil and gas development, agriculture, utilities and energy transmission projects, mineral resource exploration/extraction, settlement and rural and urban development, and transportation and infrastructure projects.

Forestry

As described in Section 3.9.1.2, the proposed Project expansion is located in the Fort St. John TSA. Reasonably foreseeable forestry activities within the TSA are expected to continue at a harvest rate consistent with the current AAC of 2,115,000 m^3, effective May 10, 2018 (Province of BC 2018d). Although spatial disturbance data for future cutblocks was not available, the Application considers that forest harvesting is expected to continue into the foreseeable future and incorporates this foreseeable development qualitatively in the assessment of cumulative effects.

Oil and Gas Development

In May 2018, the NEB approved NGTL's request for variances to Condition 4 of their existing NEB Certificate and Condition 4 of their existing NEB Order to enable the company to proceed with construction of specific components of the approved North Montney Mainline Project. In the original and previously approved NEB application, the North Montney Project was a proposal to build and operate approximately 301 km of pipeline in the PRRD, along with associated metering facilities, valve sites and possible compression facilities. The proposed natural gas pipeline would connect with the existing Groundbirch Mainline (Saturn Section), located approximately 35 km southwest of Fort St. John, and would continue approximately 187 km northwest of Fort St. John. Among other changes associated with the variances, the originally proposed 301 km pipeline has since been shortened to 206 km. The pipeline will be located approximately 40 km northwest of the Project footprint, within the Community Services RAA, Community Infrastructure RAA, and Economy RAA (see Figure 3.9-2). The anticipated 1,400 to 1,800 workers are planned to be housed in local accommodations and two work camps. Construction of the North Montney Mainline Project is expected to overlap with construction of the proposed Project expansion and is expected to be completed by spring 2020 (EnergeticCity.ca 2018; NEB 2018a).

Enbridge Inc. (formerly Westcoast Energy Inc.) received NEB approval in December 2018, to construct and operate the Spruce Ridge Program to expand its existing natural gas transmission system in the PRRD (NEB 2018b). The Spruce Ridge Program comprises two new pipeline loops, expansions at two compressor stations and modifications at a third compressor station. There are two components of the program within the assessment boundaries of the proposed Project expansion (specifically the Community Services RAA, Community Infrastructure RAA, and Economy RAA; see Figure 3.9-2): the Aitken Creek Loop and the Compressor Station N5 Expansion. Located approximately 60 km northwest of the proposed Project expansion, the Aitken Creek Loop is an approximately 13 km nominal pipe size (NPS) 24 pipeline looping of Westcoast's Aitken Creek Pipeline northwest of Wonowon, BC. Located approximately 70 km southwest of the proposed Project expansion, the Compressor Station N5 Expansion involves increasing compression capacity at Westcoast's existing compressor station. The Compressor Station N5 Expansion will include the necessary utilities to support a new 30,000-horsepower unit, as well as piping tie-ins to connect the compressor unit to the mainline pipeline entering and exiting the station. The Compressor Station N5 Expansion will be located on forested and previously cleared Westcoast-owned lands situated immediately south of the existing compressor station facilities. The project is currently in the preconstruction phase, and the proponent is evaluating when to start construction (Enbridge Inc. 2019).

Westcoast Connector Gas Transmission Ltd. (on behalf of Spectra Energy Corp. and BG International Ltd.) applied to the BC EAO in May 2014, to construct and operate the Westcoast Connector Gas Transmission Project from northeast BC to the Prince Rupert area. The project would involve the

construction of a pipeline system, consisting of up to two 914-1,219-millimetre (mm) (NPS 36-48) pipelines approximately 854-862 km in length, three metering stations, and five compressor stations. The project is expected to provide in the range of 3,000 to 3,600-person years of employment during construction, and approximately 50 to 60 permanent jobs for the life of the project. The capital cost of the project is estimated between $6 and $8 billion. Although the EAC for the project was issued by the BC EAO in November 2014, construction has not yet started on the proposed pipeline, which received certificate extension in December 2018 (BC OGC 2018b; Province of BC 2018c). For the purposes of this Application, construction of the proposed pipeline is assumed to overlap with construction of the proposed Project expansion. At its nearest point to the proposed Project expansion, the proposed pipeline would be located approximately 50 km west of the Project footprint, within the Community Services RAA, Community Infrastructure RAA, and Economy RAA (see Figure 3.9-2).

In addition, several reasonably foreseeable oil and gas developments, specifically facilities, are identified within the proposed Project expansion assessment areas (see Table 3.9-2 and Figure 3.9-2). No other reasonably foreseeable oil and gas developments, such as pipelines and wells, were identified within the assessment boundaries for the proposed Project expansion (IHS 2019a, 2019b, 2019c).

The oil and gas companies listed in Section 3.9.1.2 with currently operating activities are expected to continue operations and maintenance activities, which will potentially interact temporally with the construction and operations phases of the proposed Project expansion. Some of these companies also have proposed oil and gas activities within the spatial boundaries of the proposed Project expansion. Although the development schedules for these projects are unknown, many are of limited scope and short anticipated construction times and, therefore, for the purposes of the cumulative effects assessment, it was assumed that most would be constructed prior to construction of the proposed Project expansion but ongoing operations and maintenance activities could interact with those of the proposed Project expansion. Other reasonably foreseeable activities in the proposed Project expansion assessment areas that are not listed in Table 3.9-2 may include ongoing oil and gas exploration, as well as upgrades and maintenance activities.

Table 3.9-2. Number of Reasonably Foreseeable Oil and Gas Pipelines, Wells, and Facilities Identified Within the Spatial Boundaries of the Proposed Project Expansion

Source: IHS 2019a, 2019b, 2019c.

[a] Definitions and rationale for proposed Project expansion spatial boundaries are provided for each VC in Sections 4 to 8.

Agriculture

A Regional Agricultural Plan is currently being prepared by the PRRD. The purpose of the plan is to provide guidance to the District for encouraging and supporting agricultural activity both within and outside of the ALR. Guiding principles identified for the Regional Agricultural Plan are to:

- Contain a vision for the future of agriculture that will include a permanent role for agriculture as an essential component of the physical, ecological, social and economic well-being of the PRRD
- Identify changes in farm business management, which could be implemented by farmers or farm organizations
- Identify strategies to enhance agriculture in the context of competition with other land uses such as oil and gas, and forestry and mining (PRRD 2013)

As an increasingly valued resource, agriculture and related activities within the proposed Project expansion assessment areas (as discussed in Section 3.9.1.2) are expected to continue into the future and will act cumulatively with the proposed Project expansion. No specific future developments such as feedlots, meat processing facilities, or agriculture facilities have been identified.

Utilities and Energy Transmission

The BC Hydro Site C Clean Energy project is located approximately 7 km southwest of Fort St. John. The Environmental Impact Statement for the proposed hydroelectric development was submitted to the BC EAO in January 2013, and was approved in December 2014 under a joint provincial-federal panel review. Construction of the project started in summer 2015 and will be completed in 2024. The project consists of the construction and operations of a dam and a 1,100-megawatt (MW) hydroelectric generating station on the Peace River in northeast BC. The project would be the third in a series of dams on the Peace River. Components include an earthfill dam (1,050 m long and 60 m high), up to 1,100-MW generating station and associated structures, an 83-km long reservoir, realignment of four sections of Highway 29 and two 77-km long transmission lines along existing transmission line rights-of-way connecting Site C to Peace Canyon. Approximately 10,200 direct jobs will be created during construction, with 1,600 of those located in northeast BC. Most workers are accommodated at the dam site, with other workers housed offsite and in the region. Approximately 58 direct jobs will be created during operation. The capital cost of the project is estimated at $7.9 billion and construction is anticipated to take 7 to 8 years (BC Hydro, 2018c; Province of BC 2018c). The project was identified in the AAIR; however, it is located outside of the proposed Project expansion assessment area boundaries (see Table 3.9-1 and Figure 3.9-2).

No other reasonably foreseeable utility or energy transmission developments with the potential to interact with the proposed Project expansion were identified within the proposed Project expansion assessment areas. For all proposed Project expansion assessment areas, it is expected that the existing utility and energy transmission activities described in Section 3.9.1.2 will continue into the foreseeable future.

Wind Energy

Aeolis Wind Power Corporation is proposing to construct and operate the Hackney Hills Wind Park, located approximately 100 km west of Fort St. John within the Community Services RAA, Community Infrastructure RAA, and Economy RAA (see Figure 3.9-2). The proposed 380-MW wind energy project is currently in the pre-application stage with the BC EAO (approved Terms of References submitted to the BC EAO in November 2008). Additional information on the project status is limited and the construction schedule could not be determined. Based on a review of available information including the BC EAO EPIC and proponent website (http://aeoliswind.ca/chapter-links/hackney-hills/), the wind project appears to be progressing over a longer regulatory timeline than the proposed Project expansion, where construction is assumed to take place well after proposed Project expansion construction is complete (Aeolis Wind Power Corporation 2018; Province of BC 2018c).

No other reasonably foreseeable wind energy projects were identified within the proposed Project expansion assessment areas.

Mineral Resources

Taseko is proposing to develop the Aley Niobium Project located in northern BC, 140 km north of Mackenzie (see Figure 3.9-2). Niobium is primarily used in the manufacturing of high strength, light-weight, and corrosion resistant steel found in turbines, aerospace and automobile machinery, and oil and gas pipelines, among other end-products. The site covers approximately 433 square km and consists of 104 mineral claims. With a capital cost of $870 million, the mine is expected to produce 9 million kg of niobium per year over a 24-year mine life. The project is currently in the pre-application stage with the BC EAO (Project Description accepted in September 2014). In November 2014, the Federal Minister of the Environment approved Substitution under the *CEA Act, 2012* to the Province of BC. Additional information on the project status is limited and the construction schedule could not be determined. Based on a review of available information including the BC EAO EPIC and proponent website (https://www.tasekomines.com/properties/aley), the mining project appears to be progressing over a longer regulatory timeline than the proposed Project expansion, where construction is assumed to take place well after proposed Project expansion construction is complete (Taseko 2018; Province of BC 2018c).

In March 2017 AuRico Metals Inc. (AuRico) was issued an EAC (#M17-01) to construct and operate the Kemess Underground Project, an underground copper-gold mine with an average production of approximately 24,650 tonnes of ore per day over a 13-year mine life. Kemess Underground is located approximately 250 km north of Smithers, and 430 km northwest of Prince George in the PRRD, and is approximately 6 km north of the existing infrastructure from the past-producing Kemess South mine (BC EAO 2018a). It is approximately 340 km from the Project footprint and is within the Community Services RAA, Community Infrastructure RAA, and Economy RAA (see Figure 3.9-2). Construction on the AuRico Kemess Underground Project began in 2018, and the mine is expected to be operational by 2022 (Clarke et al. 2019).

No other reasonably foreseeable mineral resource developments were identified within the proposed Project expansion assessment areas.

Recreation and Tourism

No reasonably foreseeable recreation and tourism developments with the potential to interact with the proposed Project expansion were identified within the proposed Project expansion assessment areas. For all proposed Project expansion assessment areas, it is expected that the existing recreation and tourism activities described in Section 3.9.1.2 will continue into the foreseeable future.

Settlement and Rural and Urban Development

The Station 44 Town Centre is a proposed $500 million (phase I only) mixed development project that comprises 220 acres located on the Alaska Highway near Fort St. John. The project includes a power centre with big box stores over 80 acres. A hotel, truck centre and mixed density residential units will comprise the remainder of the development. Estimated completion of the entire project is forecasted for Q4 2023 (Province of BC 2018b).

Secure Energy Services Inc. submitted a project description to the BC EAO for the proposed Wonowon Landfill in December 2018, and the BC EAO issued an order under Section 10(1)(c) of the *EA Act* on January 18, 2019, stating the project requires an EAC and may not proceed without an assessment (BC EAO 2019b). The proposed landfill would be located on Crown land approximately 9 km southeast of the community of Wonowon in the PRRD, approximately 32 km from the Project footprint and within the Community Services RAA, Community Infrastructure RAA, and Economy RAA (see Figure 3.9-2). The proposed landfill is being developed to meet existing and increasing industry demand from oilfield and industrial waste generators in northeast BC. The proposed landfill would be designed to accept contaminated soils from spill clean-ups and site remediation, drilling waste from oil and gas exploration

and production, industrial waste, and forestry waste (Secure Energy Services Inc. 2018). Since the Wonowon Landfill project is only in the early stages of the Environmental Assessment process, it is not anticipated that proposed Project expansion construction will overlap with the construction of the Wonowon Landfill, however, it can be expected that future operational activities at both the proposed Project expansion and the Wonowon Landfill will temporally overlap.

No other reasonably foreseeable settlements and rural/urban developments with the potential to interact with the proposed Project expansion were identified within the proposed Project expansion assessment areas. For all proposed Project expansion assessment areas, it is expected that the existing settlement and rural and urban development activities described in Section 3.9.1.2 will continue into the foreseeable future.

Transportation and Infrastructure

Current and reasonably foreseeable transportation activities within the proposed Project expansion assessment areas include regular and commercial vehicle traffic and rail traffic, as well as maintenance and upgrade activity on roads, bridges, and highways. No other reasonably foreseeable transportation projects with potential to interact with the proposed Project expansion were identified within the proposed Project expansion assessment areas.

\\amr.ch2m.com\common\Shares\CNR\gis_proj2\VECA\661198\MAP_FILES\REPORT\EAC\661198_Report_EAC_Figure3_9_2_Reasonably_Foreseeable_Developments_Rev0.mxd

3.9.2 Determining the Need for a Cumulative Effects Assessment

The cumulative effects assessment was conducted in accordance with the AAIR for the proposed Project expansion and with BC EAO guidance which is consistent with evolving best practice and the federal approach under the *CEA Act, 2012* (BC EAO 2013). The guidance provided by the BC EAO states that the assessment of cumulative adverse effects is to be completed for VCs where potential residual adverse effects are evaluated as likely to occur and will interact with effects of past, present or reasonably foreseeable projects or activities.

According to BC EAO (2013) guidance, only those VCs that will be directly affected by the proposed Project expansion, as well as other projects or activities, need to be included in the Project-specific cumulative effects assessment.

The cumulative effects assessment evaluates the potential residual adverse effects predicted to result from the proposed Project expansion (as identified in Part B, Sections 4 to 8) in combination with the likely residual adverse effects arising from other projects and activities that have been or will be carried out in the VC-specific LAA or RAA. Reasonably foreseeable projects considered in the assessment do not include proposed or hypothetical projects where formal plans have not been disclosed.

For potential residual adverse effects that do not have an interaction with effects of past, present and reasonably foreseeable activities, an evaluation of significance was not conducted in the cumulative effects section.

3.9.3 Cumulative Effects Assessment Methodology

The cumulative effects assessment of the proposed Project expansion entailed the following steps:

- Determination of spatial and temporal boundaries for each VC where potential residual adverse effects have been identified for the proposed Project expansion.
- Identification of potential residual adverse effects of the proposed Project expansion that may interact with effects of past, present and reasonably foreseeable activities.
- Identification of past, present and reasonably foreseeable projects and activities with potential residual adverse effects that may act in combination with the potential residual adverse effects of the proposed Project expansion.
- Identification of potential cumulative adverse effects.
- Development, if warranted, of additional technically and economically practical mitigation measures.
- Identification of any potential residual adverse cumulative effects.
- Determination of the significance of the proposed Project expansion’s contribution to the potential residual cumulative adverse effects.

If an environmental, social, economic, heritage or health VC evaluated in the effects assessment had no residual adverse effects predicted, then no further analysis of that VC is required in the cumulative effects assessment. The potential residual adverse effects that were not considered to be likely in the Project-specific effects assessment did not form a part of the cumulative effects assessment.

3.9.4 Identification of Residual Effects of the Proposed Project Expansion

Potential residual adverse effects identified in Part B, Sections 4 to 8 that were considered likely to occur and were determined to have the potential to interact with past, present and reasonably foreseeable projects or activities have been evaluated for potential cumulative adverse effects. A rationale will be provided for likely potential residual adverse effects that were determined not to interact with reasonably foreseeable projects or activities and, therefore, did not form a part of the cumulative effects assessment.

3.9.5 Spatial and Temporal Boundaries

3.9.5.1 Spatial Boundaries

The spatial boundaries used in the cumulative effects assessment for the proposed Project expansion were determined to be the areas where potential cumulative adverse effects have been identified. The spatial boundaries for each VC as well as the rationale for the boundaries are presented in the respective subsection for each VC in Part B, Sections 4 to 8.

Spatial boundaries were designed to include the largest RAA for all VCs in order to determine whether existing activities and projects were to be included in the cumulative effects assessment. The following outlines the criteria for screening projects and activities for the cumulative effects assessment:

- A project or activity was included if it is within the RAA for the VC
- A project or activity was excluded if it was outside the RAA for the VC

3.9.5.2 Temporal Boundary

A project or activity was included if it was in the provincial or federal Environmental Assessment regulatory process or otherwise reasonably expected to proceed (for example, logging).

A project or activity was excluded from the inclusion list of reasonably foreseeable projects or activities and included as existing disturbance if it was known that it will be in development or operation prior to construction of the proposed Project expansion.

3.9.6 Identification of Cumulative Effects Mitigation Measures

Section 3.5 provides information on mitigation that is implemented to reduce the impact of any residual effects which may occur including the reduction of the magnitude of the effect, the limitation of the extent of the effect and the shortening of the reversibility of the effect (that is, time to alleviate the residual effect).

In order to ensure that potential cumulative adverse effects are reduced during construction and operations of the proposed Project expansion, additional mitigation measures are provided, where warranted.

3.9.7 Characterization of Residual Cumulative Effects

The characterization of residual cumulative adverse effects is determined in a manner similar to that employed in the characterization of potential residual adverse effects as previously outlined in Section 3.6.

3.9.8 Significance of Cumulative Effects

The significance of the proposed Project expansion's contribution to cumulative adverse effects is determined in the manner used to determine the significance of residual adverse effects as previously outlined in Section 3.7 and summarized in Table 3.6-1, with the exception of spatial and temporal boundaries, which are discussed in Section 3.9.5.

3.10 Follow-up Strategy

Where a residual adverse effect and/or cumulative effect has been identified for a specific VC, the Application will include a description of a follow-up strategy, where appropriate, that:

- Identifies the measures to evaluate the accuracy of the original effects prediction
- Identifies the measures to evaluate the effectiveness of proposed mitigation measures
- Proposes an appropriate strategy to apply in the event that original predictions of effects and mitigation effectiveness are not as expected. This includes reference to further mitigation, involvement of key stakeholders, Aboriginal groups, government agencies and any other measures deemed necessary to manage the issue

4. Environmental Effects Assessment

This section of the Application presents the assessment of the potential adverse effects of the proposed Project expansion on the environmental VCs during the construction, operations, closure/reclamation, and postclosure phases of the proposed Project expansion.

The following subsections explain the selection process for each of the environmental VCs, the associated subcomponents, and the KIs. The assessment boundaries for each VC are described and existing conditions are summarized, including the results of field studies, where applicable. The potential adverse effects of the proposed Project expansion on each of the VCs have been identified, as measured with reference to the KIs. Proposed measures to mitigate the potential adverse effects on the VCs are also identified. Any residual adverse effects on the VCs have been characterized using the criteria set out in Section 3 of the AAIR and a determination of significance has been made. Any cumulative adverse effects likely to result from the residual adverse effects of the proposed Project expansion interacting with the residual adverse effects of past, present, and reasonably foreseeable developments have also been assessed.

4.1 Terrain and Soils

Table 4.1-1 shows the subcomponents and KIs for the Terrain and Soils VC as approved by the BC EAO in the VC Rationale Document for the proposed Project expansion (CH2M 2016b).

Table 4.1-1. Terrain and Soils Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Terrain • Soils	• Soil quality • Erosion	• *Guideline for the Selection of Valued Components and Assessment of Potential Effects* (BC EAO 2013), *Secure Landfills Common Issues and Commitments Report* (BC EAO 2009), and the original Silverberry Secure Landfill PAC Application (CCS 2002). • Leaching of materials from the waste collected into salvaged soil can impact soil quality which affects health and water quality, as well as soil productivity and reclamation suitability of the salvaged material. • Potential impacts to soils include loss or mixing of topsoil and subsoil during construction and closure activities, loss of stockpiled soil through wind and/or water erosion, and contamination during construction and operations. • Accelerated erosion from precipitation and surface water runoff can reduce soil productivity impacting vegetation growth and hydrologic characteristics.

4.1.1 Assessment Boundaries

The following assessment boundaries have been defined for the Terrain and Soils VC.

4.1.1.1 Spatial Boundaries

The spatial boundaries for the Terrain and Soils VC are shown on Figures 3.2-1 and 3.2-2 and include the Project footprint, as well as the following:

- LAA (same as Project footprint): As potential proposed Project expansion effects are expected to take place on the Project footprint and not extend past it, the area of direct proposed Project expansion effects (that is, the LAA) is the Project footprint.
- RAA: A 1-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities: The RAA is the area in which cumulative effects to soils or terrain could occur (that is, proposed Project expansion effects in combination with the effects of existing or reasonably foreseeable future projects). As the proposed Project expansion site is

located in relatively flat terrain, potential cumulative effects to soil quality or erosion would not travel past 1 km.

4.1.1.2 Temporal Boundaries

The temporal boundaries identified for the Terrain and Soils VC include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading and compaction. As each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).
- Closure/reclamation phase. When the capacity of all cells is reached, the landfill will be capped with an impermeable cap and top soil and seeding will occur (approximately 1 year following operations – Year 26).
- Postclosure phase is when the entire landfill has been capped and reclaimed and monitoring will occur (approximately 25 years – Years 26 to 51).

4.1.1.3 Administrative Boundaries

Administrative boundaries refer to the effects of political, economic, or social boundaries on an Environmental Assessment. No administrative boundaries have been identified for the Terrain and Soils VC.

4.1.1.4 Technical Boundaries

Technical boundaries refer to a proponent's ability to predict the effects of a project. No technical boundaries have been identified for the Terrain and Soils VC. Information on existing conditions was based on a desktop review, site investigations, and field data collection, including results of soil sampling activities conducted for the proposed Project. The potential adverse effects of landfill construction, operations, closure/reclamation, and postclosure on terrain and soils are generally well-understood and have predictable effects. This understanding, in conjunction with the results of the desktop review and available field data, meant that there was a complete technical understanding for conducting the assessment.

4.1.2 Existing Conditions

The following methods of data collection were used to describe the existing conditions for the Terrain and Soils VC:

- Desktop review of provincial and regional information sources
- Hydrogeologic Siting Suitability Investigation (Clifton 2002) (Appendix 5)
- Site investigations and field data collection efforts, including results of soil sampling activities (Appendix 1)
- *Field Manual for Describing Terrestrial Ecosystems*, 2nd Edition (BC MOFR and BC MOE 2010)
- CCME's Environmental Quality Guidelines (CCME 2014) and BC's CSR

Data from these sources provide an appropriate baseline for assessing the effects of the Project on terrain and soils. The Hydrogeological Siting Suitability Investigation (Clifton 2002) provides information on existing soil and topography conditions for the footprint. Although conducted in 2002, it is not anticipated that soil and topography conditions will have changed since the surface of the Project footprint has not been disturbed by the development of the existing landfill. Site investigations, including soil sampling conducted and analysed in 2016 (Appendix 1), provide updated information about soil quality in

the Surface Water Drainage Area (SWDA) and the PDMA of the existing landfill. While not specific to the Project footprint, this data provides information regarding soil conditions for a landfill facility similar to the Project.

4.1.2.1 Environmental Context

The proposed Project expansion is located within the Halfway Plateau Ecosection of the Central Alberta Upland Ecoregion of Canada (Ecological Stratification Working Group 1995) and is not in an area that is subject to permafrost formation (NRCan 1995).

The proposed Project expansion is located in the Boreal White and Black Spruce (BWBS) Biogeoclimatic (BGC) Zone of BC, within the moist, warm subzone (BWBSmw). The BWBS BGC Zone generally experiences long, very cold winters and short growing seasons. The regional climate in the BWBSmw subzone is relatively moist and warm, with a comparatively longer growing season than the dry cool (dk) and wet cool (wk) subzone variants. The forests in the BWBSmw subzone are dominated by white spruce or aspen, and soils are primarily fine-textured Gray Luvisols with some Brunisols (DeLong et al. 1991).

The proposed Project expansion is underlain by flat-lying sedimentary rock of the Upper Cretaceous Dunvegan Formation (BC Geological Survey 2018; Church and Ryder 2010). The Dunvegan Formation is composed of light grey to yellow-grey sandstone interbedded with laminated siltstone and dark grey shale (Prior et al. 2013). The primary soil parent material is glacial till and fine-textured Gray Luvisols are the dominant soil group (Church and Ryder 2010).

4.1.2.2 Agricultural Land Reserve

The proposed Project expansion is located within the ALR in Zone 2 (ALC 2014b). The agricultural capability of the land in the Terrain and Soils RAA (that is, a 1-km radius from the Project footprint) is rated predominantly as Class 6, with some inclusions of land rated as Class 4 and Class 5 (BC MECCS 2018). Lands rated as Class 6 are considered nonarable but are capable of producing native and/or uncultivated perennial forage crops; lands rated as Class 5 have limitations that restrict their capability to producing perennial forage crops or other specially adapted crops; and, lands rated as Class 4 have limitations that require special management practices or severely restrict the range of crops, or both. Limitations on soil capability for agriculture in this area include adverse climate and cumulative, minor adverse conditions (ALC 2013).

The proposed Project expansion will be constructed within Tervita's existing property boundaries on land that is zoned for "Oil and Gas Production" under the PRRD Zoning By-law No. 1000. The land in the Project footprint was approved by the ALC for nonfarm use under the *Agricultural Land Reserve Use, Subdivision, and Procedure Regulation* (BC Reg. 171/2002) on June 3, 2016. The operational permit for the existing landfill requires that postclosure, the end land use be returned to agriculture.

4.1.2.3 Soil Quality

The BC *EMA* (S.B.C. 2003, c. 53) is the primary statute regulating contaminated sites in the Province. According to the *Act*, a site is contaminated if "*the concentration of any substance in soil, groundwater or surface water at the site is greater than or equal to the lowest value of the applicable numerical standard corresponding to the site's use*". Standards for contaminated sites are found in the schedules attached to the CSR. Soil standard values are calculated for five generically defined land uses: agricultural (AL), wildland (WL), urban park (PL), residential (RL), commercial (CL), and industrial (IL). The standard applicable to a particular site will vary according to the site's primary land and water uses. The existing landfill has an industrial use (IL) designation and is surrounded by areas of undeveloped forest supporting natural ecosystems. As the landfill is located within the ALR, the existing operational permit requires that postclosure, the end land use be returned to agriculture (AL).

A soil study (see Appendix 1) was completed to determine how soil quality has been affected by the existing landfill and identify the existing conditions for the proposed Project expansion. There were two areas that were subject to soil sampling investigations. A SWDA located in the northwest corner of the

existing landfill site and a PDMA encompassing areas to the south and southwest of the existing landfill, based on prevailing winds and estimates of area of potential distribution. Figure 4.1-1 provides an overview of the SWDA and PDMA in relation to the Project footprint.

The SWDA drains northwest towards an ephemeral stream located approximately 100 m north of the existing landfill's stormwater retention pond. The SWDA soil sampling investigation assessed the concentration and distribution of potential impact in surficial soils resulting from surface water discharge pumped offsite and overland flow onsite draining towards the ephemeral stream. Ten soil sampling locations were selected in the field, with eight sampling locations located within the fence line of the existing landfill, and two located within undisturbed native areas offsite.

The PDMA soil sampling investigation assessed the concentration and distribution of potential impact in surficial soils resulting from airborne PM originating from site-related activities. Six sample locations were selected within 200 m upwind and downwind from the existing landfill. Four sample locations were within the fence line of the existing landfill and two were located offsite in undisturbed native areas.

The results of the laboratory analysis of the soil samples were compared to both agricultural (AL) and industrial (IL) use standards under the CSR, in consideration of both the current and end land use. A detailed description of the sampling methodology, soil parameters, and laboratory analytical results is provided in the Soil Sampling Report (Appendix 1). The CSR soils standards have changed from what they were when the soil sampling and analysis was completed in 2016. As such, these results were re-evaluated.

The updated analysis for the soil samples taken within the SWDA indicates that concentrations of all metals parameters in all submitted samples were found to be less than applicable CSR IL or AL standards or BC MECCS Protocol 4 background concentrations at all locations with the exception of:

- **Arsenic**: All samples collected at onsite locations contained concentrations greater than current (IL) and future (AL) land use CSR standards. At offsite locations, one sample contained concentrations greater than AL land use CSR standards and one sample contained concentrations less than applicable CSR standards.
- **Barium**: With the exception of three samples, all onsite samples contained concentrations greater than current (IL) and future (AL) land use CSR standards. All offsite concentrations were less than applicable CSR standards.
- **Beryllium**: All samples collected onsite contain concentrations less than applicable CSR standards, with the exception of five samples, all of which exceeded both current (IL) and future (AL) land use CSR standards. At offsite locations, only one sample exceeded AL land use CSR standards.
- **Mercury**: All samples collected onsite, with the exception of one sample, contained concentrations greater than BC MECCS Protocol 4 Background concentrations, but less than applicable current (IL) and future (AL) future land use CSR standards. All offsite samples contained concentrations less than applicable AL land use CSR standards.
- **Molybdenum**: All samples collected at both onsite and offsite locations contained concentrations greater than BC MECCS Protocol 4 Background concentrations, but less than all other applicable current (IL) and future (AL) land use CSR standards.
- **Selenium**: Four samples at onsite locations contained concentrations greater than current (IL) and future (AL) land use standards. All other onsite samples, as well as offsite samples were less than current (IL) and future (AL) land use standards.

The updated analysis for the soil samples taken within the PDMA indicates that concentrations of all metals parameters in all submitted samples were found to be less than applicable CSR IL or AL standards or BC MECCS Protocol 4 background concentrations at all locations with the exception of:

- **Arsenic**: All samples collected onsite contained concentrations greater than current (IL) land use standards, as well as future (AL) land use standards. Of the samples collected offsite, three samples exceeded AL land use standards.

- **Barium**: All samples collected at onsite locations contained concentrations greater than current (IL) and future (AL) land use standards. Two samples also exceeded BC MECCS Protocol 4 Background concentrations. All samples collected offsite contained concentrations less than applicable AL land use standards.
- **Mercury**: All samples collected on and offsite contained concentrations greater than BC MECCS Protocol 4 Background concentrations, but less than applicable current (IL) and future (AL) land use CSR standards.
- **Molybdenum**: All samples collected at both onsite and offsite locations contained concentrations greater than BC MECCS Protocol 4 Background concentrations, but less than all other applicable current (IL) and future (AL) land use CSR standards.

The results presented above indicate there are exceedances of metal parameters both onsite (within the fenceline) and offsite (outside the fenceline) associated with the SWDA and PDMA. Further investigation of the sources of the exceedances will occur and additional mitigation measures will be developed, if warranted. Tervita will share the results of the investigation with DRFN, and plans for additional mitigation, as warranted. Further soil sampling and analysis would be required at the time of closure/reclamation in order to identify areas requiring remediation.

4.1.2.4 Erosion

Coarse-textured soils are less resilient than medium or fine-textured soils to wind erosion, the loosely consolidated particles make them susceptible to the influence of the wind, especially in dry conditions, whereas finer textured soils are more cohesive (Manitoba Agriculture 2018). Conversely, medium to fine-textured soils are less resilient than coarse-textured soils to water erosion since the smaller pore size between particles does not allow as much water infiltration (that is, water running over finer-textured soils is more likely to cause erosion than in coarse-textured soils that more readily take in water). However, with water erosion, slope is an important consideration, as soils on slopes are more readily eroded than soils on level terrain (Manitoba Agriculture 2018).

The existing landfill and proposed Project expansion are located on relatively flat terrain. The lithology of the soil samples from the SWDA and PDMA show that the soils within the Project footprint and Terrain and Soils RAA are generally composed of a topsoil horizon underlain by a clay and silty clay layer with trace amounts of fine sand and gravel. The fine texture of the soils means they are more resilient to wind erosion, but more susceptible to water erosion, than coarse-textured soils.

4.1.3 Traditional Knowledge Shared

In their review during the screening of the Application, DRFN expressed concerns about exceedances in soil concentrations for arsenic, barium, molybdenum, and mercury that were recorded outside the fence line, and requested that the sources of exceedances be investigated and that additional mitigation measures be included to address these effects. To date, although opportunities were provided to share traditional knowledge both directly and through the Working Group, no traditional knowledge related to terrain and soils has been shared by BRFN.

4.1.4 Terrain and Soils Effects Assessment

4.1.4.1 Identification of Potential Effects, Mitigation Measures, and Potential Residual Effects

The identification of the potential effects of the proposed Project expansion on the Terrain and Soils VC is based on the results of the soils assessment performed for the proposed Project expansion. The soils assessment included a desktop review and field studies (see Appendix 1, Soil Sampling Report).

The proposed Project expansion is anticipated to interact with the Terrain and Soils VC during the following construction, operations, closure/reclamation, and postclosure activities:

- Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure
- Leachate management, stormwater management, and ongoing monitoring
- Cell capping
- Postclosure maintenance and monitoring

Table 4.1-2 identifies the potential effects of the proposed Project expansion on the Terrain and Soils VC, as well as mitigation measures and potential residual effects. Mitigation measures have been identified in a manner consistent with Section 3.5 of this Application. These mitigation measures focus on minimization, except for restoration measures that would be implemented if erosion occurs. As the majority of these mitigation measures would be implemented prior to the initiation of, or during, activities associated with the construction, operations, closure/reclamation, and postclosure phases of the proposed Project expansion, they are expected to be effective immediately in reducing potential adverse effects on the Terrain and Soils VC. The seeding measures, as well as those mitigation measures involving inspections, require a time lag before they function effectively in preventing erosion.

Mitigation measures for potential adverse effects on terrain and soils are generally described as having high effectiveness with BMPs and technologies that are widely used in various industries and that are considered to be effective at reducing erosion and reclaiming the landscape. These mitigation measures are also observed to be highly effective at the existing landfill.

In addition to the summary of mitigation provided below, further measures are provided in the management planning documents (see Section 13) and the Silverberry Operations Plan.

The landfill is designed to eliminate the pathway to effects on soil quality. The impermeable liner prevents waste from interacting with soil and thus avoids soil contamination directly through contact with waste. Pathways to changes in soil quality as a result of transportation of contaminants via air and surface water are discussed in Section 4.2 and Section 4.4, respectively. While soil sampling results indicate that there are elevated levels of metal parameters in soils both onsite and offsite that are associated with the SWDA and PDMA of the existing facility, it is not clear whether these exceedances are due to the existing landfill, naturally occurring elevated levels of these elements, or the historic presence of other activities in that location. Further investigation of the sources of the exceedances will occur and additional mitigation measures to prevent effects on soil quality will be developed, if warranted. Since the landfill is designed to eliminate the pathway to effects on soil quality, soil quality is not expected to be affected, unless there is an accidental release or spill of contaminants during proposed Project expansion activities. Potential effects from accidental release or spill of contaminants are assessed in the Accidents and Malfunctions Section (Section 9). If soil sampling is required during closure or reclamation and postclosure phases, Tervita will conduct sampling accordingly.

Table 4.1-2. Terrain and Soils – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction, Operations, and Closure/Reclamation	Loss of surface soil material through wind or water erosion	Project footprint	• Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized.	Minimization	Immediate	High	Potential residual effects are expected to be avoided through the implementation of mitigation measures.
			• Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion.	Minimization	During all Project phases	High	
			• Topsoil and subsoil salvage will be immediately suspended for the preservation of topsoil and subsoil under the following conditions: – Wet or frozen field conditions will result in the admixing, degradation or compaction of topsoil or subsoil – High wind velocities create the potential for the loss of topsoil or subsoil – Any other field conditions will result in the admixing, degradation or loss of topsoil or subsoil	Minimization	Immediate	High	
			• Surface water control works will be inspected weekly and/or immediately after a major storm or catastrophic event.	Minimization	During all Project phases	High	
			• Erosion occurring on surface water control works will be repaired and mitigated as soon as possible.	Restoration	Immediate	High	
			• Mitigation measures to prevent surface water erosion may include swales, hay bales, rock rip-rap, and/or coconut matting. High erosion areas in ditches may be armored with LLPDE.	Restoration	Immediate	High	
			• The final slopes of the landfill cap will not exceed 33% and will be seeded as soon as possible to provide vegetation cover to minimize erosion.	Minimization	During all Project phases	High	
			• The landfill cap will be inspected weekly and if erosion on the cap is noted it will be repaired and mitigated as soon as possible.	Restoration	During all Project phases	High	
			• An Erosion and Sediment Control Plan will be implemented to prevent erosion (see Section 13.1 for summary).	Minimization	During all Project phases	High	
			• A Soil Conservation Plan will be implemented to avoid or reduce potential loss of surface soil material through wind or water erosion (see Section 13.2 for summary).	Minimization	During all Project phases	High	
			• A Dust and Odour Control Plan will be implemented to prevent conditions conductive to dust generation and to suppress dust (see Section 13.9 for summary).	Minimization	Immediate	High	
	Reduction in soil productivity due to loss or mixing of topsoil and subsoil		• Topsoil and subsoil will be stockpiled and re-used for site reclamation. Topsoil and subsoil salvage will be immediately suspended for the preservation of topsoil and subsoil under wet or frozen field conditions which can result in the admixing, degradation or compaction of topsoil or subsoil.	Minimization	Construction	High	Potential residual effects are expected to be avoided through the implementation of mitigation measures.
			• Implement two-lift soil handling for topsoil salvage. In this process, the topsoil material is stripped in the first lift and stored onsite for replacement after the life of the Project. The second lift includes all of the remaining subsoil material.	Minimization	Construction	High	
			• Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion.	Minimization	During all Project phases	High	
			• Maintain an adequate separation between topsoil and subsoil piles.	Minimization	Immediate	High	
			• Replace the topsoil and subsoil in the same manner as it was excavated, avoiding admixing of soils.	Minimization	Immediate	High	

Table 4.1-2. Terrain and Soils – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction, Operations, and Closure/Reclamation (cont'd)	See above	See above	• A Soil Conservation Plan will be implemented to avoid or reduce potential reduction in soil productivity (see Section 13.2 for summary).	Minimization	During all Project phases	High	See above

[a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (On-site): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC. Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

Note:

LLPDE = Low Density Polyethylene

4.1.4.2 Characterization and Significance of Potential Residual Effects

Construction, operations, closure, and postclosure activities have the potential to effect soil erosion through the loss of surface soil material through wind or water erosion. The construction of the landfill using a phased approach will minimize the disturbed and potentially exposed areas at any given time. Topsoil stockpiles will be contoured, stabilized, and seeded to prevent soil loss by wind and water erosion, and if necessary, stockpiles will be wetted to prevent wind erosion. Surface water works will be inspected weekly and, if necessary, additional mitigation measures such as swale, hay bales, rock, riprap, or coconut matting will be utilized to ensure that soil erosion does not occur. During closure, the final slopes of the landfill cap will not exceed 33 percent and will be seeded as soon as possible to reduce soil erosion. With the implementation of these mitigation measures and the other mitigation measures identified in Table 4.1-2, no residual effects on soil erosion are anticipated; therefore, a characterization of significance of residual effects is not warranted.

Construction, operations, closure, and postclosure activities have the potential to effect soil erosion through a reduction in soil productivity due to loss or mixing of topsoil and subsoil. Tervita will stockpile topsoil and subsoil and re-use these stockpiles for site reclamation. Topsoil and subsoil salvage will be immediately suspended for the preservation of topsoil and subsoil under wet or frozen field conditions, which can result in the admixing, degradation, or compaction of topsoil or subsoil. Topsoil stockpiles will be contoured, stabilized, and seeded to prevent soil loss by wind and water erosion, and if necessary, stockpiles will be wetted to prevent wind erosion. During reclamation activities, topsoil and subsoil will be replaced in the same manner as it was excavated avoiding admixing of soils. With the implementation of the mitigation measures identified in Table 4.1-2, no residual effects on soil erosion are anticipated; therefore, a characterization of significance of residual effects is not warranted.

4.1.4.3 Cumulative Effects Assessment

No residual effects have been identified for the Terrain and Soils VC, therefore, a cumulative effects assessment is not required.

4.1.5 Follow-up Strategy

A follow-up strategy should be considered where a residual effect and/or cumulative effect has been identified. As discussed in Section 4.1.4.1 and 4.1.4.3, there are no residual or cumulative effects identified for the Terrain and Soils VC, therefore, a follow-up strategy is not required.

4.2 Air Quality

Table 4.2-1 shows the subcomponents and KIs for the Air Quality VC as approved by the BC EAO in the VC Rationale Document for the proposed Project expansion (CH2M 2016b).

Table 4.2-1. Air Quality Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Dust • Odours • Emissions from combustion • Fugitive emissions • Emissions from other sources, (for example, volatilization)	• Visible dust • Detectable odour at sensitive receptors • Ambient air concentrations of PM, SO_2, NO_x, and other landfill gases • VOCs • GHG emissions	• BC EAO Guidelines and original EAC Application. • Criteria contaminant (PM, SO_2, and NO_x) emissions from emissions of construction, operation and closure, equipment tailpipes, and roadway travel can affect health and wildlife. • Vehicle traffic from the proposed Project expansion will produce small amounts of GHGs, which can cumulatively lead to complex environmental effects.

Table 4.2-1. Air Quality Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
See above	See above	• Perception of odour and dust from construction equipment and wind erosion can affect the ability to use the surrounding environment, such as for traditional purposes. Due to the nature of the landfill materials, landfill gas generation is expected to be minimal. Roads are watered during construction to control dust emissions. • Dust from construction material handling and earth grading can affect terrestrial vegetation and human health. NORM may be contained in dust. Construction material is wetted during handling to suppress dust.

Note:

SO_2 = sulphur dioxide

4.2.1 Assessment Boundaries

The following assessment boundaries have been defined for the Air Quality VC.

4.2.1.1 Spatial Boundaries

The spatial boundaries for the Air Quality VC are shown on Figure 3.2-2 and include the Project footprint as well as:

- RAA – A 10-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities.

This spatial boundary includes the area in which air emissions associated with the proposed Project expansion are likely to be detectable. The RAA includes consideration of impacts of Project emissions in proximity to the sources (that is, “local” effects) and possible impacts further downwind due to transport and dispersion. Also, the RAA includes the area where direct and indirect influences from other activities could overlap with Project-specific effects from construction and operations and cause cumulative effects on air quality. The expected contaminants of concern for the proposed Project expansion are primarily fugitive dust emissions (PM), and (to a lesser extent) various minor combustion tailpipe emissions. The Air Quality RAA is expected to be sufficient to capture the area of such low lying releases and potential cumulative interactions with other activities not related to the proposed Project expansion. Although no air modeling is planned for the proposed Project expansion, the extent of the study area is consistent with current BC Air Dispersion Modelling Guidance (BC MOE 2015). Traffic corridors that are potentially affected by dust within the 10-km radius will be captured in the assessment of effects.

The effects of GHG emissions are global in scale and, therefore, no separate study area was defined for GHG emissions.

4.2.1.2 Temporal Boundaries

The temporal boundaries identified for the Air Quality VC include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading, and compaction; as each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).

- Closure/reclamation phase. When the capacity of all cells is reached, the landfill will be capped with an impermeable cap and top soil and seeding will occur (approximately 1 year following operations – Year 26).
- Postclosure phase is when the entire landfill has been capped and reclaimed and monitoring will occur (approximately 25 years – Years 26 to 51).

4.2.1.3 Administrative Boundaries

Administrative boundaries refer to the effects of political, economic or social boundaries on an Environmental Assessment. No administrative boundaries have been identified for the Air Quality VC.

4.2.1.4 Technical Boundaries

Technical boundaries refer to a proponent's ability to predict the effects of a project. No technical boundaries have been identified for the Air Quality VC.

4.2.2 Existing Conditions

The following methods of data collection were used to describe the existing conditions for the Air Quality VC:

- Desktop review of BC MECCS and BC Air Monitoring Station data
- Bi-annual monitoring to determine the effect of NORM waste on air quality at the site (Appendix 2)
- Information from data collection efforts for VOCs at the existing landfill (Appendix 2)
- A review of the nature and number of equipment to be used, and review of the nature of landfill waste and likely construction equipment emissions and odours

Data from these sources provide an appropriate baseline for assessing the effects of the proposed Project on air quality. The desktop review of BC MECCS and BC Air Monitoring Station data provides ambient air quality data to inform the assessment. This station is 46 km southeast of the proposed Project and was chosen because it is the nearest station to the proposed Project that measures a comprehensive list of CACs. The concentration data from this monitoring station may be somewhat different than the data expected onsite or near the site due to differences in nearby air emission sources. However, the station is located in the same air zone as the Project site and in a rural community; as such, the concentration data are regarded as being generally representative of the northeast BC area, including the Project Area. Data from NORM monitoring programs and VOC data collection efforts at the existing landfill were used to identify the potential effects pathways with respect to air quality. These data were intended to provide a short-term "snap-shot" or characterization of the possible species of VOCs emitted from the current landfill, and if possible, to measure the concentrations of those species. For this purpose, and aligned with the precautionary principle, the monitoring was completed at a time and location when worst-case emissions were expected. A portable handheld landfill gas analyzer was used to potentially identify areas in the active cell where emissions may be greater than other areas ("hotspots") to help identify possible locations where summa canister samples were subsequently taken (refer to Appendix 2). The samples taken were not intended to be a comprehensive VOC monitoring program, as this was beyond the scope of the study. The data should be considered as representative of the conditions at the site on that particular day and time.

Industrial emission sources (for example, well sites, flare stacks, and gas plants) are present in the region surrounding the existing landfill. With the exception of Tervita's adjacent TRD facility, none are located within 1 km of the existing landfill (CCS 2002; Tervita 2014).

As part of existing operations, onsite air emissions are generated by heavy machinery and one diesel generator, which supplies power to the existing landfill (CCS 2002; Tervita 2014). The Tervita TRD facility has combustion units (one boiler, one treater, and a flare) that emit small amounts of combustion

products. Table 4.2-2 shows the total maximum annual CAC emissions for the TRD combustion equipment at 100-percent load and utilization (Altus Environmental Engineering 2015).

Table 4.2-2. Total Maximum Criteria Air Contaminant Emissions from Treatment, Recovery, and Disposal Facility

NO_x (t/y)	CO (t/y)	PM_{10} and $PM_{2.5}$ (t/y)	VOC (t/y)
5.3	5.1	0.4	0.4

Notes:

CO = carbon monoxide
t/y = tonne(s) per year

Dust from construction material handling and earth grading may contain potential contaminants of concern that could affect human health. As part of the current landfill operations, roadways are wetted on an as-needed basis to reduce dust generation by vehicular traffic (Tervita 2014). NORM may be present in dust and could be released in the air when moving vehicles and other equipment over the proposed Project expansion footprint. Tervita conducts air monitoring for NORM activity levels bi-annually to determine if dust being carried in the air has NORM activity levels above regulatory restrictions. The results of air monitoring at the existing landfill, indicate no loose NORM contaminants or evidence of NORM-contaminated dust leaving the property and worker exposure is anticipated to fall within the allowable regulatory guideline limits (see the SLHHRA in Appendix 11).

Due to the waste types present at the landfill (that is, waste materials from the oil and gas industry), minimal landfill gas is generated; however, this material can produce odours and vapours from volatile petroleum hydrocarbons (VPH) present in the waste (CCS 2002; Tervita 2014).

4.2.2.1 Contaminants of Potential Concern

Jacobs investigated the nature of emissions of hydrocarbon-related VOC vapours from landfill wastes at the existing landfill (CH2M 2016a). The intent of the study was to measure the chemical composition of landfill gas emissions at the existing landfill cells. Bitumen or low-density polyurethane caps are in place on closed landfill cells, which limit the release of landfill gases. Therefore, the VOC sampling was conducted on Cell 7, which was active and not capped at the time of sampling. This report is provided in Appendix 2.

The sampling activities were conducted in two phases: the first phase was a survey to identify “worst-case” sampling locations, while the second phase involved sampling using Summa canisters. The preliminary survey was conducted over a grid using a hand-held landfill gas analyser, measuring CH_4, carbon dioxide (CO_2), hydrogen sulphide (H_2S), and CO to potentially identify “hotspots” where emissions may be greatest. No detectable concentrations of CH_4, CO_2, H_2S, or CO were detected during this survey. As a result, the locations for the second phase of sampling were based on the terrain of the landfill cell. Two sampling points at higher elevations were selected for the Summa canister sampling. The results were compared to ambient air guidelines from Alberta and Ontario, as BC MECCS does not have ambient air criteria applicable to the VOCs analysed. Concentrations of VOCs were less than the selected ambient air criteria, except benzene. The concentration of benzene in one sample was equal to the Alberta 1-hour ambient air criterion. The report concludes that considering dispersion and dilution, VOC emissions from the landfill are unlikely to be greater than ambient air criteria at an offsite location.

As part of the existing operations, air emissions are also generated by heavy machinery and one diesel generator which supplies power to the existing landfill (CCS 2002; Tervita 2014). CACs that may be emitted during current operations include NO_x, sulphur oxide gases, and airborne PM, along with minor amounts of VOCs, as discussed previously. Minor quantities of GHGs are also expected to be emitted during all phases of the proposed Project expansion.

4.2.2.2 Ambient Air Quality in the Region

Ambient air quality monitoring data were obtained from the Province of BC Northeast Air Zone dataset to define existing air quality in the RAA. Specifically, data from the Fort St. John – Key Learning Center, Monitor Station ID# E299830 for the year 2016 were downloaded from BC MECCS (BC MECCS 2016a). The station is located at latitude 56.244722, and longitude -120.856111, approximately 46 km southeast of the proposed Project expansion. This station was chosen because it is the nearest station to the proposed Project expansion that measures a comprehensive list of CACs and in relatively close proximity to the proposed Project expansion footprint. Table 4.2-3 summarizes the air quality data.

Table 4.2-3. Summary of Ambient Air Quality in the Project Region – 2016 Data

NO_2	SO_2	O_3	$PM_{2.5}$	PM_{10}	Comments
43.5 ppb[a]	4.9 ppb[b]	57.4 ppb[c]	15.4 µg/m^3 [d]	66.9 µg/m^3 [e]	See footnotes
5.7 ppb	0.32 ppb	NA	5.6 µg/m^3	NA	Average of 24-hour averages (annual)

[a] 98th percentile of maximum daily 1-hour concentrations.

[b] 99th percentile of maximum daily 1-hour concentrations.

[c] 99th percentile of maximum daily 8-hour concentrations.

[d] 98th percentile of daily average concentrations.

[e] Second highest daily average concentration, 7 days of the year 2016 exceeded 50 µg/m^3.

Notes:

µg/m^3 = micrograms per cubic metre
NA = no applicable air quality objective or standard
NO_2 = nitrogen dioxide
O3 = ozone
ppb = part(s) per billion

A summary of BC AAQOs is shown in Table 4.2-4 (BC MECCS 2016b).

Table 4.2-4. Summary of British Columbia Ambient Air Quality Objectives

Contaminant	Averaging Period	Air Quality Objective	
		µg/m^3	ppb
NO_2	1-hour	188	100
	Annual	60	32
O_3	1-hour	160	82
	8-hour	123	63
$PM_{2.5}$	24-hour	25	-
	Annual	8	-
PM_{10}	24-hour	50	-
SO_2	1-hr	183	70
	Annual	13	5
TSP	24-hour	120	-
	Annual	60	-

The ambient air quality in the region, as measured at the Key Learning Center monitoring station, is well below provincial criteria for all contaminants measured. This monitoring station is in central Fort St. John and is likely a conservative estimate of actual air quality concentrations at the proposed Project expansion footprint, which is more remote with fewer nearby emission sources.

4.2.3 Traditional Knowledge Shared

In their comments on the VCs used, BRFN shared that odour from the existing landfill has a profound affect on the experience of the land for community members and leads to avoidance and alienation from lands. To date, although opportunities were provided to share traditional knowledge both directly and through the Working Group, DRFN has not provided any traditional knowledge related to air quality.

4.2.4 Air Quality Effects Assessment

4.2.4.1 Identification of Potential Effects, Mitigation Measures, and Potential Residual Effects

The proposed Project expansion is anticipated to interact with the Air Quality VC during the following construction, operations, and closure/reclamation activities:

- Transportation/mobilization of equipment and workers to the site
- Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure
- Waste acceptance, placement, and compaction
- Air quality and dust dispersion and deposition of contaminants
- Cell capping

Dust from construction material (rock and/or gravel) handling and earth grading may contain contaminants, which could be transported away from the proposed Project expansion. As part of the current landfill operations, roadways are wetted on an as-needed basis to reduce dust generation by vehicular traffic (Tervita 2014). Operational restrictions will take place if visible dust clouds are noted by onsite operators. These restrictions could include curtailment or cessation of work under high wind conditions, minimizing drop distances, covering or watering of open stockpiles, rehabilitating completed sections of the landfill as soon as practical, and adhering to posted speed limits onsite. Typically, fugitive dust particles are larger particles that will redeposit to the ground within a few hundred meters of the fugitive dust source. Therefore, total PM concentrations will approach background levels within a localized area. In addition, there is a significant distance to any potentially affected receptors, meaning that there is little potential for offsite dust nuisance. Emissions from construction equipment are expected to be localized and temporary in nature. In addition, Project-related traffic on roads to and from the site may contribute to dust levels. During times when roads are dry and traffic could mobilize dust, mitigation measures such as watering of roads will be implemented in order to minimize dust impacts.

Table 4.2-5 summarizes the details of typical equipment to be used during cell construction. All equipment will adhere to low-emission Tier 4 engine specifications.

Table 4.2-5. Description of Cell Construction Equipment

Equipment Type	Number	Engine Model	Engine Size	Comments
CAT D6T dozers	2	C9.3 ACERT	161-kW net	U.S. EPA Tier 4
CAT 330F L excavators	2	C7.1 ACERT	175-kW net	U.S. EPA Tier 4
CAT 735 C trucks	6	C15 ACERT	329-kW net	U.S. EPA Tier 4
CAT 815K compactors	2	C7.1 ACERT	185-kW net	U.S. EPA Tier 4

Note:

kW = kilowatt(s)

Due to the waste types present at the existing landfill (that is, waste materials from the oil and gas industry), minimal landfill gas is expected to be generated during operations of the proposed Project expansion; however, this material can produce odours and vapours from VPH present in the waste (CCS 2002; Tervita 2014). As discussed above, a preliminary study of landfill emissions was done in 2016 to quantify the nature and concentration of emissions of VOC vapours from the existing landfill (CH2M 2016a). The results show that minor amounts of VOCs are emitted from the existing landfill cells under typical operating conditions. Similar wastes will be accepted at the proposed Project expansion, and VOC emissions are expected to be similar in nature and quantity. Progressive capping of the waste with LLDPE to minimize the open landfill area will reduce odour emissions. Additional mitigation measures outlined in the Dust and Odour Control Plan will be implemented to reduce odour effects of the Project.

The effects of the proposed Project expansion on air quality are assessed qualitatively as emission estimation and modelling of fugitive emissions from sources associated with landfills are very uncertain. Ambient air monitoring will be implemented for postconstruction as warranted to verify or confirm compliance for possible effects to air quality. An Air Quality Monitoring Plan is included as part of the proposed Project expansion's Operations Plan that will be submitted to BC EAO for approval.

Table 4.2-6 summarizes the potential effects related to proposed Project expansion activities, along with mitigation measures, and any potential residual effects. Mitigation measures have been identified in a manner consistent with Section 3.5 of this Application. Given the nature of equipment and activities associated with the proposed Project expansion with regards to air emissions, avoidance and restoration are not directly applicable; therefore, mitigation measures have focused on minimization. As these mitigation measures would be implemented prior to the initiation of, or during, activities associated with the construction, operations, and closure/reclamation phases of the proposed Project expansion, they are expected to be effective immediately in reducing potential adverse effects on air quality.

Moderate effectiveness is expected for measures to reduce idling of equipment and for equipment to use low-sulphur diesel because these measures can practicably be applied to only certain types of equipment (for example, idling is necessary for some equipment to function properly under extreme cold weather). Other mitigation measures described in Table 4.2-6 have high effectiveness as observed at the existing landfill.

Table 4.2-6. Air Quality – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction, Operations, Closure/Reclamation	Increase in air emissions including dust	RAA	• Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events.	Minimization	Immediate	High	Increase in air emissions during all phases of the Project
			• Contractor will ensure equipment is well-maintained	Minimization	Immediate	High	
			• Reduce idling of equipment, where possible.	Minimization	Immediate	Moderate	
			• Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized.	Minimization	Immediate	High	
			• Equipment to use low sulphur diesel, as appropriate.	Minimization	Immediate	Moderate	
			• Progressive capping of the waste with LLDPE to minimize the open landfill area	Minimization	Immediate	High	
			• Implement additional measures provided in the Dust and Odour Control Plan and Air Quality Monitoring Plan.	Minimization	Immediate	High	
Construction, Operations, Closure/Reclamation	Project contribution to GHG emission levels	International	• The Contractor will ensure equipment is well-maintained.	Minimization	Immediate	High	Increase in GHG emissions during all phases of the Project
			• Reduce idling of equipment, where possible.	Minimization	Immediate	Moderate	

[a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.
- Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

4.2.4.2 Characterization and Significance of Potential Residual Effects

Residual adverse effects on the Air Quality VC identified in Table 4.2-6 include an increase in air and GHG emissions during construction, operations and closure/reclamation.

Table 4.2-7 provides a summary of the significance evaluation of the residual adverse effects associated with the Air Quality VC during proposed Project expansion activities and considers the probability for significance in the evaluation as outlined in Section 3.

Table 4.2-7. Residual Effects Significance Evaluation for Air Quality Valued Component

Predicted Residual Effects	Spatial Boundary	Temporal Context			Magnitude	Probability	Confidence	Significance
		Duration	Frequency	Reversibility				
a) Increase in air emissions during all phases of the Project	RAA	Short-term	Frequent/ Regular	Reversible	Negligible to medium	High	High	Not significant
b) Increase in GHG emissions during all phases of the Project	RAA	Extended-term	Continuous	Irreversible	Low	High	High	Not significant

4.2.4.3 Increased Air Emissions

Construction activities will involve the operation of fossil fuel-based vehicles, heavy equipment (for example, excavators, trucks and dozers) and auxiliary equipment (for example, power generators) which will emit CACs. CACs associated with the use of gasoline and diesel-based vehicles and equipment consist of NO_x, CO, $PM_{2.5}$ with a trace amount of VOCs and SO_2. Construction activities such as topsoil movement, grading and transportation on unpaved roads are expected to result in dust emissions.

Based on the professional experience of the assessment team, emissions of CO and NO_x are expected to result in short-term elevated concentrations relative to background but are likely to be well within long-term (for example, 8-hour and annual) air quality objectives since most of the construction activities will occur during the day allowing more time for dispersion during the night. Brief episodes of high ambient concentrations of PM will likely occur in close vicinity to proposed Project expansion construction activities during these occasional activities, which are common to typical construction projects. All construction activities are considered intermittent and isolated events (that is, activities will cease once proposed Project expansion construction is finished). The increase in CAC emissions during construction is expected to raise existing background CAC concentrations, but not to reach BC AAQO or Canadian Ambient Air Quality Standard limits; the increases are expected to be reversible since emissions will cease once construction activities are completed. During the operational phase, equipment number and nature will be similar to what is currently being used; therefore, the increase in air contaminant concentrations compared to baseline conditions may be detectible but within normal variability of existing landfill operations.

The mitigation in Table 4.2-6 and the Air Quality Monitoring Plan and Dust and Odour Control Plan will reduce the severity of Project-related air emissions, which are short-term in duration and of medium magnitude during construction, since long-term average concentrations will stay below AAQO, and negligible magnitude during operation and closure/reclamation. Consequently, an increase in Project-related air emissions during all Project phases is considered not significant (Table 4.2-7, point [a]).

4.2.4.4 Increased Greenhouse Gas Emissions

GHG emissions are expected to be released as a result of proposed Project expansion activities. These emissions are expected to be primarily from combustion sources such as construction equipment tailpipe emissions and generator use. Emissions from the Tervita TRD Facility are expected to continue in similar quantity as they currently are, and there will not be a notable increase in the emissions as presented in Table 4.2-2. All construction equipment will adhere to low-emission Tier 4 engine specifications. Due to the nature of the waste accepted at the landfill, generation of CH_4 is not expected to be substantial, although some biodegradation of hydrocarbon materials will contribute to CO_2 emissions. The proposed Project expansion's contribution to GHG emissions will be minor compared to provincial or national emissions totals and the residual effect is considered not significant (Table 4.2-7, point [b]).

4.2.4.5 Cumulative Effects Assessment

The proposed Project expansion will act cumulatively with existing activities and reasonably foreseeable developments in the Air Quality RAA to increase air emissions during construction and operations. Existing sources of increased air emissions in the Air Quality RAA include oil and gas development (including ongoing pipeline and facility maintenance activities), agricultural activities, utility activities (for example, maintenance on transmission lines), transportation activities and forestry activities involving equipment use (that is, timber harvesting). Smoke from burning may also be generated during clearing and land management activities associated with agricultural, forestry, and oil and gas developments. The construction of the proposed Project expansion, and to a lesser extent, the operations, will increase air emissions and interact with construction and operations of certain reasonably foreseeable developments.

Reasonably foreseeable proposed air emission sources in the Air Quality RAA include the construction of five oil and gas developments (see Table 3.9-2 and Figure 3.9-2). Although the construction schedule of these reasonably foreseeable oil and gas facilities is unknown, it was assumed that these developments would be constructed prior to construction of the proposed Project expansion, as they are relatively minor in scale (Section 8.2.3). No other reasonably foreseeable developments were identified within the Air Quality RAA, however, existing developments and activities identified in Section 3.9.1.2 are expected to continue into the future.

Given the short duration of construction activities and limited sources of proposed Project expansion-related emissions during operation, it was assumed that the proposed Project expansion would contribute less to increased air emissions compared to the total emissions from the existing and reasonably foreseeable developments in the Air Quality RAA. Nevertheless, during construction, the total cumulative effect may approach medium magnitude levels as a result of brief, localized increases in air emissions associated with proposed Project expansion construction activities.

The total cumulative effect of increased air emissions in the Air Quality RAA during operations is considered to be of low magnitude since the emissions arising from existing activities, the proposed Project expansion and reasonably foreseeable developments are expected to low. During operation, air emissions may be detectable, but are within applicable environmental and regulatory standards and will occur at substantial distances from any potential receptors.

The mitigation in Table 4.2-6 and the Air Quality Monitoring Plan and Dust and Odour Control Plan will reduce the severity of Project-related air emissions. It is expected that operators of existing and reasonably foreseeable developments will also implement mitigation developed in accordance with industry standards for air emissions. With implementation of the proposed mitigation measures, the proposed Project expansion's contribution to potential cumulative effects on air emissions are of short-term duration, low magnitude and are considered to be reversible. Consequently, the proposed Project expansion's contribution to cumulative effects on air emissions will be not significant.

4.2.5 Follow-up Strategy

A follow-up strategy should be considered where a residual effect and/or cumulative effect has been identified. The implementation of the Air Quality Monitoring Plan and the Dust and Odour Control Plan will reduce the severity of Project-related air emissions. These plans will include a mitigation strategy to mitigate air quality effects and dust deposition.

4.3 Acoustic Environment

Table 4.3-1 shows the subcomponents and KIs for the Acoustic Environment VC as approved by the BC EAO in the VC Rationale Document for the proposed Project expansion (CH2M 2016b).

Table 4.3-1. Acoustic Environment Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Wildlife • Land and resource use	• Noise levels • Level of annoyance	• Project activities may generate noise, potentially impacting wildlife, and use of the surrounding environment

4.3.1 Assessment Boundaries

The following assessment boundaries have been defined for the Acoustic Environment VC.

4.3.1.1 Spatial Boundaries

The spatial boundaries for the Acoustic Environment VC are shown on Figures 3.2-1 and 3.2-2 and include the Project footprint as well as the following:

- LAA – A 1-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities.
- RAA – A 5-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities.

As disruption of the acoustic environment may potentially affect wildlife and land users, the Acoustic Environment LAA and RAA are the same as those of the Wildlife and Wildlife Habitat VC and Land and Resource Use VC.

4.3.1.2 Temporal Boundaries

The temporal boundaries identified for the Acoustic Environment VC include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading and compaction. As each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).
- Closure/reclamation phase. When the capacity of all cells is reached, the landfill will be capped with an impermeable cap and top soil and seeding will occur (approximately 1 year following operations – Year 26).
- Postclosure phase is when the entire landfill has been capped and reclaimed and monitoring will occur (approximately 25 years – Years 26 to 51).

4.3.1.3 Administrative Boundaries

Administrative boundaries refer to the effects of political, economic or social boundaries on an Environmental Assessment. No administrative boundaries have been identified for the Acoustic Environment VC.

4.3.1.4 Technical Boundaries

Technical boundaries refer to a proponent's ability to predict the effects of a project. No technical boundaries have been identified for the Acoustic Environment VC.

4.3.2 Existing Conditions

The following methods of data collection were used to describe the existing conditions for the Acoustic Environment VC:

- Desktop review of provincial and regional information sources
- A review of the nature and number of equipment to be used during construction
- A description of noise sources and estimated noise levels at offsite sensitive receptors in the Acoustic Environment RAA

Data from these sources provide an appropriate baseline for assessing the effects of the Project on the acoustic environment. Tervita has a good understanding of the nature and the number of equipment required for activities relating to the proposed Project, and the potential receptors. The noise levels associated from this equipment were obtained from recognized databases and overall noise impacts at sensitive receptors were determined using conservative assumptions.

Health Canada does not regulate noise levels, but does provide recommendations for the assessment of noise impacts (Health Canada 2010, 2017), including:

- Identification and mapping of noise-sensitive receptors such as residences, schools, nursing homes and First Nations communities, relative to a project location
- Estimation of baseline sound levels for a project be estimated at both day and night
- Identification of all potential Project noise during all Project phases
- Comparison of baseline noise levels with predicted noise levels at sensitive receptor locations
- Evaluation of severity of predicted changes and prediction of health impacts
- Implementation of mitigation measures, noise management and complaint resolution planning

The BC OGC *British Columbia Noise Control Best Practices Guideline* (BC OGC 2018a) was developed to outline requirements for noise control for activities under BC OGC jurisdiction and has also been applied to assess noise levels that may disturb local residents. The Guideline compares predicted noise levels to permissible sound levels (PSLs) for day and night. BC noise guidelines for temporary activities (that is, activities lasting less than 60 days) state that noise impacts should be less than 55 decibels (dBA).The guideline set PSLs of 40 decibels absolute energy level equivalent (dBA Leq) during night-time hours (the period between 22:00 and 07:00) and 50 dBA Leq during day-time hours (the period between 07:00 and 22:00) at 1.5 km from any dwellings or landfill fenceline, whichever is the lesser distance (BC OGC 2018a). The average ambient sound level in rural areas is approximately 35 dBA Leq at night and daytime ambient sound levels are commonly 10 dBA Leq higher than nighttime levels (BC OGC 2018a). Although the guideline was established for noise control associated with operations of oil and gas wells/facilities, its recommended best practices are commonly adopted for management of noise for construction and operations of various project types in BC.

The major source of noise contributing to existing sound levels in the Acoustic Environment RAA are road and train traffic. Beatton River Road (also referred to as the Buick Creek Road) is present to the west of

the Project footprint with railway lines beyond. Frequent daily rail traffic is present; however, the noise from the road and rail traffic is considered “variable and intermittent” (Tervita 2014). Average car traffic along the Beatton River Road during the summer is estimated to be 735 vehicles per day (CCS 2002). Natural sounds, such as wind rustling through vegetation and birds, are also expected to contribute to ambient noise levels when vehicle traffic is absent.

At the existing landfill, noise is primarily generated from the waste-handling machinery and trucks hauling the waste (CCS 2002). The noise from normal daytime landfill operations includes truck traffic, heavy equipment, back-up beepers, speaker systems and radios (Tervita 2014). Noise sources associated with the proposed Project expansion will be similar to noise sources at the existing landfill.

The nearest human resident receptor is a seasonal occupant of a residence located at a distance of 2.5-km northeast from the existing landfill (Tervita 2014). The existing landfill is also surrounded by forest, which helps to dampen noise generated from operations (CCS 2002). Project-related noise levels at the nearest resident receptor or at 1.5 km from the property fence-line are expected to be within the BC noise guidelines. There have been no sensory effects or noise annoyance complaints due to operations of the existing landfill identified for wildlife, use of land, and use of resources in the Acoustic Environment RAA.

4.3.3 Traditional Knowledge Shared

In their comments on the VCs chosen for the proposed Project expansion, BRFN reported that an increase in noise could have a devastating effect on wildlife and in turn on BRFN interests since wildlife is sensitive to noise and other vibrations. To account for this, BRFN requested that the spatial boundaries be adjusted and that a percent annoyance parameter be added to the assessment of the proposed Project expansion. Noise was considered in the effects pathways as potential effects to wildlife and land users. The spatial boundaries for noise effects assessment (that is, Acoustic Environment LAA and RAA) are the same as those of the Wildlife and Wildlife Habitat VC and Land and Resource Use VC.

To date, although opportunities were provided to share traditional knowledge both directly and through the Working Group, DRFN has not provided any traditional knowledge related to the acoustic environment.

4.3.4 Acoustic Environment Effects Assessment

4.3.4.1 Identification of Potential Effects, Mitigation Measures, and Potential Residual Effects

The proposed Project expansion is anticipated to interact with the Acoustic Environment VC during the following construction, operations, closure/reclamation, and postclosure activities:

- Transportation/mobilization of equipment and workers to the site
- Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure
- Waste acceptance, placement, and compaction
- Cell capping
- Postclosure maintenance and monitoring

Construction Phase

During construction of the proposed Project expansion, it is expected that the following equipment (or similar) will be used:

- Two CAT D6T dozers
- Two CAT 330F excavators
- Six 30-ton CAT 735C rock trucks
- Two CAT 815K compactors

It is unlikely that all equipment will be used simultaneously, and construction is only anticipated during the daylight hours. According to the U.S. Department of Transportation, Federal Highway Administration, *Construction Noise Handbook* (2017), the previously noted equipment have measured and averaged sound pressure level measurements at 15 m as follows: compactor (83 dBA), dozer (82 dBA), dump truck (76 dBA), and excavator (81 dBA).

To screen the potential for adverse noise impacts during the construction stage, noise levels have been estimated from the equipment list provided above and compared to PSLs.

If it is conservatively assumed that the dozers, excavators, compactors, and rock trucks will be onsite, with two of all these categories of equipment working in the same general area simultaneously (the remaining rock trucks will likely be travelling to and from other areas at the construction site), then the predicted total sound level at 15 m would be 90 dBA. This noise level will attenuate to less than 55 dBA (the BC OGC PSL for daytime operations with less than 60 days or operations [Class B] adjustment) at a distance of less than 1 km. This estimate conservatively assumes only distance attenuation and no other attenuation due to foliage, terrain, solid barriers, etc. Therefore, based on the noise screening, these temporary construction noise levels will not substantially affect offsite sensitive receptors in the area.

Construction noise levels were estimated based on simultaneous operation of several pieces of equipment expected to be used during cell preparation. This equipment is only expected to be used during daytime hours. The noise levels are conservatively expected to attenuate to less than 55 dBA within 1 km of the Project footprint and will not affect sensitive receptors to levels greater than BC noise guidelines. The noise effects of construction are expected to be temporary, localized, and reversible.

Operations Phase

The operations phase of the proposed Project expansion will require the use of similar equipment in the same quantities as what is currently being used at the existing landfill. During operations of the proposed Project expansion, it is expected that the following equipment (or similar) will be used:

- Two John Deere 850k dozers
- One John Deere 210 GLC excavator

According to the U.S. Department of Transportation, Federal Highway Administration, *Construction Noise Handbook* (2017), the previously noted equipment have measured and averaged sound pressure level measurements at 15 m as follows: dozer (82 dBA) and excavator (81 dBA). This equipment is only expected to be used during daytime hours. The noise levels produced by this equipment are conservatively expected to attenuate to less than 55 dBA within 1 km of the Project footprint and will not affect sensitive receptors to levels greater than BC noise guidelines.

Noise levels during the operations phase are predicted to be the same as existing conditions since the proposed Project expansion will use similar equipment in the same quantities as what is currently being used. The existing cells at the landfill will no longer be used once the proposed Project expansion is in operation and minimal noise is expected from periodic maintenance vehicles and equipment. Therefore, it is not expected that there will be a noticeable increase in noise at off-property receptors associated with the use of equipment and vehicles during the operations phase of the proposed Project expansion.

Closure/Reclamation Phase

The closure/reclamation phase of the proposed Project expansion will occur during daytime hours and will require the use of a smaller number of similar equipment that will be used for construction. Similar to predicting noise effects of construction and operations, the increase in noise levels during closure/reclamation activities are conservatively expected to attenuate to less than 55 dBA within 1 km of the Project footprint and will not affect sensitive receptors to levels greater than BC noise guidelines. The noise effects of closure/reclamation phase are expected to be temporary, localized, and reversible.

Postclosure Phase

Postclosure activities are expected to be intermittent and involve the use of vehicles for monitoring and inspection site visits. Therefore, it is not expected that there will be a noticeable increase in noise at off-property receptors associated with the use of vehicles during the postclosure phase of the proposed Project expansion.

Table 4.3-2 summarizes the potential effects, mitigation measures, and potential residual effects of proposed Project expansion noise emissions on the Acoustic Environment VC. Vibration has not been included as a potential effect as vibration due to equipment used during construction and operations is not expected to cause any noticeable vibrations.

Mitigation measures have been identified in a manner consistent with Section 3.5 of this Application. Given the nature of equipment and activities associated with the proposed Project expansion with regards to noise emissions, avoidance and restoration are not directly applicable; therefore, mitigation measures have focused on minimization. As these mitigation measures would be implemented prior to the initiation of, or during, activities associated with the construction, operations, and closure/reclamation phases of the proposed Project expansion, they are expected to be effective immediately in reducing potential adverse effects on the Acoustic Environment VC. Mitigation measures described in Table 4.3-2 have been implemented at the existing landfill and are considered to have high effectiveness.

Table 4.3-2. Acoustic Environment – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction, Operations, Closure/Reclamation, and Postclosure	Increase in noise levels	LAA and RAA	• Construction work will be done in daylight hours and operational work will be done between the hours of 7 a.m. and 7 p.m.	Minimization	Immediate	High	Increased noise emissions during all phases of the Project
			• Equipment will be well maintained with properly functioning mufflers. Operators will take reasonable measures to control construction-related noise.	Minimization	Immediate	High	

[a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.
- Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

4.3.4.2 Characterization and Significance of Potential Residual Effects

Residual adverse effects on the Acoustic Environment VC identified in Table 4.3-2 include increased noise emissions during construction, operations and closure/reclamation.

Table 4.3-3 provides a summary of the significance evaluation of the residual effects associated with the Acoustic Environment VC during proposed Project expansion activities and considers the probability for significance in the evaluation as outlined in Section 3.

Table 4.3-3. Residual Effects Significance Evaluation for Acoustic Environment Valued Component

Predicted Residual Effects	Spatial Boundary	Temporal Context			Magnitude	Probability	Confidence	Significance
		Duration	Frequency	Reversibility				
a) Increased noise emissions during all phases of the Project	LAA and RAA	Short-term	Frequent/ Regular	Reversible	Low	High	High	Not significant

4.3.4.3 Increased Noise

The most influential assessment criteria for the acoustic environment are magnitude, duration and reversibility, although many of the criteria ratings are inherently related. The determination of significance on the acoustic environment is strongly influenced by the context for the residual effect, which is reflected in the criteria ratings for magnitude.

Increases in sound levels arising from proposed Project expansion construction are expected. There may be some elevated and localized noise emissions occurring above background levels due to heavy equipment use associated with the construction phase; however, the emissions are short-term, localized, low in magnitude, and reversible. During the operations phase, equipment number and nature will be similar to what is currently being used and; therefore, increase in overall noise emissions will be negligible compared to baseline conditions.

It is not anticipated that there will be a significant increase in noise levels within 1 km of the proposed Project expansion or at the nearest sensitive receptors approximately 2.5 km away.

The residual effect of increased noise emissions on the Acoustic Environment VC is considered to be not significant (Table 4.3-3, point [a]).

4.3.4.4 Cumulative Effects Assessment

Ambient noise in the Acoustic Environment RAA is primarily caused by existing activities (that is, local and industrial vehicle traffic, existing facilities and industrial maintenance activities). Although forestry activities may occur in the Acoustic Environment RAA, no activities related to forestry are anticipated to occur during construction of the proposed Project expansion. Some other activities, such as maintenance and operations activities, that may contribute noise emissions, are of a very short-term nature and occur as isolated events. There are no other reasonably foreseeable developments identified within the Acoustic Environment RAA (see Tables 3.9-1 and 3.9-2 and Figure 3.9-2); however, existing developments and activities identified in Section 3.9.1.2 are expected to continue into the future.

While the nuisance noise in the Acoustic Environment RAA will increase during proposed Project expansion activities, the increase is anticipated to be greater during construction than during operations,

closure/reclamation, and postclosure activities given the use of heavy construction equipment and the longer duration of construction compared to other activities.

The total cumulative effect on the Acoustic Environment VC resulting from the proposed Project expansion in combination with existing and reasonably foreseeable developments within the Acoustic Environment RAA is considered to be of low magnitude due to the remote location and lack of permanent receptors and given that the proposed Project expansion will be within the PSLs outlined by the BC OGC.

The mitigation in Table 4.3-2 will reduce the severity of proposed Project expansion contributions to cumulative noise emissions. It is expected that operators of reasonably foreseeable developments will also implement mitigation developed in accordance with industry standards for noise emissions. No mitigation beyond the Project-specific mitigation already proposed is deemed to be warranted.

The Project-specific contributions of effects on a cumulative increase in nuisance noise within the Acoustic Environment RAA are considered reversible, and short to long-term in duration since the cumulative increase in nuisance noise will be alleviated upon completion of construction, maintenance or operation activities (that is, the lifetime of the proposed Project expansion). Considering the remote location and lack of permanent receptors, adherence within the PSLs outlined by the BC OGC, and mitigation in Table 4.3-2, the Project-specific contribution of effects to a cumulative increase in nuisance noise is low in magnitude.

With implementation of the proposed mitigation measures, the proposed Project expansion's contribution to potential cumulative effects on the acoustic environment are of short-term duration, low magnitude and are considered to be reversible. The proposed Project expansion's contribution to cumulative effects on the Acoustic Environment VC will be not significant.

4.3.5 Follow-up Strategy

A follow-up strategy should be considered where a residual effect and/or cumulative effect has been identified. No specific follow-up strategies have been identified for the Acoustic Environment VC. Construction work will be done in daylight hours and operational work will be done between the hours of 7 a.m. and 7 p.m. Equipment will be well maintained with properly functioning mufflers. Operators will take reasonable measures to control construction-related noise. If noise concerns are raised during Project activities, Tervita will evaluate all reasonable measures to address the specific concerns identified.

4.4 Surface Water

Table 4.4-1 shows the subcomponents and KIs for the Surface Water VC as approved by the BC EAO in the VC Rationale Document for the proposed Project expansion (CH2M 2016b).

Table 4.4-1. Surface Water Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Water quality • Water quantity	• Water quality indicators (for example, sediment, concentrations of metals and hydrocarbons, perceived taste and smell) • Water volume and movement	• BC EAO Guidelines and original EAC Application. • There is potential for contamination of surface water by the proposed Project expansion due to stormwater runoff during construction, operations, and closure. Runoff may come in contact with waste (including NORM material) or spills. Runoff that has come into contact with waste will be handled as leachate. Surface water quality will be assessed using provincial and federal guidelines, such as the Canadian WQG and the BC WQG. • Seasonal surface drainage from the south portion of the existing site (that is, snow melt and rainfall) is presently controlled by ditches and berms and is directed towards the stormwater retention pond on the west side of the site.

Table 4.4-1. Surface Water Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Water quality • Water quantity (cont'd)	See above	• Surface water quantity is not expected to be a concern as no changes to surface water quantity have been observed at the existing landfill. Stormwater management and monitoring systems are already in place at the existing facility, and will be adjusted accordingly to account for stormwater retention associated with the proposed Project expansion. Surface water must regularly be removed from the system to maintain operating levels, as per Section 26(6) of the HWR. As per Section 26(1)(b)(i) of the HWR, the surface water collection system will be inspected weekly and/or immediately after a major storm or a catastrophic event. Surface water monitoring includes: inspections of the surface water controls and analytical and volume disposed/discharged/sent for alternate reuse.

4.4.1 Assessment Boundaries

The following assessment boundaries have been defined for the Surface Water VC.

4.4.1.1 Spatial Boundaries

The spatial boundaries for the Surface Water VC are shown on Figures 3.2-1 and 3.2-2 and include the Project footprint as well as the following:

- LAA: A 500-m radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities: The LAA is considered to be the extent in which direct potential effects could occur (that is, the geographic area in which direct interaction of the proposed Project expansion with surface water may occur in the unlikely event of discharge from the proposed Project expansion site to the environment). No guidance is available for BC to determine the potential area of effects to surface water from a landfill; however, the 500 m distance includes the area with the greatest potential for effect from the landfill and is based on Ontario Ministry of the Environment, Conservation and Parks (MECP) Guideline D-4, which states that the most significant contaminant discharges are normally within 500 m of the perimeter of a fill area (Ontario MECP 2016).
- RAA: The proposed Project expansion is located on a watershed divide between the Blueberry River and Monnery Creek, and therefore includes portions of both of these watersheds. The RAA is limited to a portion of these watersheds only, to allow for a reasonable assessment of cumulative effects. In determining an appropriate scale for the RAA and the cumulative effects assessment, two primary factors were considered:
  - If the spatial extent was too large, effects of the Project appear relatively small (Hegmann et al. 1999; Antoniuk 2000, 2002).
  - If the spatial scale was too small, it may exclude potentially significant development (Hegmann et al. 1999; Finley and Revel 2002).

  To find an appropriate balance, the RAA for this Project includes the watershed of Monnery Creek from the headwaters of its main branch, including the watersheds of all tributaries, downstream from the headwater of Monnery Creek for a distance of 15 km, and the watershed of the Blueberry River and its tributaries for a distance of 15 km upstream and downstream of the confluence with the Blueberry River, of the unnamed creek located immediately west of the proposed Project expansion site.

4.4.1.2 Temporal Boundaries

The temporal boundaries identified for the Surface Water VC include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading and compaction. As each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).
- Closure/reclamation phase. When the capacity of all cells is reached, the landfill will be capped with an impermeable cap and top soil and seeding will occur (approximately 1 year following operations – Year 26).
- Postclosure phase is when the entire landfill has been capped and reclaimed and monitoring will occur (approximately 25 years – Years 26 to 51).

4.4.1.3 Administrative Boundaries

Administrative boundaries refer to the effects of political, economic, or social boundaries on an Environmental Assessment. No administrative boundaries have been identified for the Surface Water VC.

4.4.1.4 Technical Boundaries

Technical boundaries refer to a proponent's ability to predict the effects of a project. The potential adverse effects of the landfill construction, operations, closure/reclamation, and postclosure on surface water are generally well-understood and have predictable effects. Tervita operates an existing landfill adjacent to the proposed expansion and as such has baseline data gathered from construction and operation experience. Information on existing conditions was based on a desktop review, site investigations, and field data collection, including results of surface water sampling activities for the existing landfill. Much of the baseline characterisation presented in this section was based on the available data for the existing landfill and an understanding of Tervita's surface water management system. This understanding, in conjunction with the results of the desktop review and available field data, meant that there was a complete technical understanding for conducting the assessment.

4.4.2 Existing Conditions

The following methods of data collection, as outlined in the AAIR, have been used to inform the description of existing conditions for the Surface Water VC:

- Desktop review of provincial and regional information sources
- Information from site investigations, ongoing surface water discharge analytical data at the existing facility and data collection efforts
- Comparison of the surface water quality data to the BC WQG

In addition, information from the Hydrogeologic Siting Suitability Investigation (Clifton 2002, Appendix 5) conducted for the existing landfill was also reviewed for context related to the Surface Water VC.

Data from these sources provide an appropriate baseline for assessing the effects of the proposed Project expansion on surface water. Surface water within the property (which includes the proposed Project expansion and the existing landfill) is controlled by a water management system consisting of a network of onsite ditches, runon and runoff systems, and a surface water (stormwater) pond. Surface water generally flows from the southeast side of the property to the northwest side of the property, and a ditch constructed around the perimeter will direct runoff towards the stormwater pond on the northwest side of the existing landfill; therefore, the existing conditions related to surface water at the proposed Project expansion are based on analytical results of sampling events for the stormwater pond conducted

by Nichols Environmental (Canada) Ltd. in spring and summer, yearly, from 2014 to 2019 at the existing landfill.

Tervita's current approved Surface Water Monitoring Plan for the existing landfill does not require analysis for comparison to the BC WQG and Tervita's surface water consultant uses the BC CSR when interpreting the monitoring results; therefore, for consistency, the Application also uses the BC CSR when discussing existing conditions for the Surface Water VC.The following subsections summarize available information on existing conditions of surface water within the spatial boundaries defined for the Surface Water VC in Section 4.4.1.1.

4.4.2.1 Environmental Context

The proposed Project expansion is situated at an elevation of approximately 755 m above sea level (asl). Several permanent creeks and lakes were identified within a 10-km radius of the existing landfill during a hydrogeological study (Clifton 2002) completed prior to the construction of the existing landfill in 2003. Surface topography near the proposed Project expansion footprint slopes at 1 to 2 percent to the northwest towards an ephemeral stream located approximately 100 m north of the existing landfill's stormwater retention pond. Upset Creek, St. John Creek, an unnamed creek, and two unnamed lakes or sloughs are also listed as being present within 5 km of the existing landfill (Clifton 2002). The nearest major surface water body is the Blueberry River, located approximately 7 km to the north, at an elevation approximately 100 m lower than the elevation of the existing landfill and proposed Project expansion (CH2M 2017; Matrix 2017). Most recent and available surface water quality data (temperature, hydrogen [ion] concentration [pH], conductivity, dissolved oxygen, and turbidity) at the Blueberry River and its tributaries were measured in August 2017 by Stantec (Stantec 2017) for the Westcoast's Spruce Ridge Program which is an expansion of Westcoast's existing natural gas transmission system in the PRRD. The Spruce Ridge Program is located approximately 40 km northwest and within the Community Services, Community Infrastructure, and Economy RAAs of the proposed Project expansion. Water temperatures measured at the Blueberry River and its tributaries for the Spruce Ridge Program ranged from 10 degrees Celsius (°C) to 13.4°C. Values of pH ranged from 6.0 to 8.0. Conductivity measurements ranged from 101.2 to 340.9 microSiemens per centimetre. Dissolved oxygen levels ranged from 0.7 to 8.6 milligrams per litre (mg/L). Water temperature was within optimum levels for fish species present (BC MOE 2006) at the watercourses with water present at the time of sampling. Dissolved oxygen concentrations were below the *Canadian Water Quality Guidelines for the Protection of Aquatic Life* (greater than 5 mg/L; CCME 2007) and the *British Columbia Approved Water Quality Guidelines* (greater than 5.0 mg/L; BC MOE 2006) at one of the tributaries. Turbidity measurements ranged from 2.6 to 101 Nephelometric Turbidity Unit.

4.4.2.2 Stormwater Management

Stormwater management and monitoring systems are already in place at the existing facility and will be adjusted accordingly to account for stormwater retention associated with the proposed Project expansion. Surface water generally flows from the southeast side of the property to the northwest side of the property. Seasonal surface drainage from the south portion of the existing landfill (that is, snow melt and rainfall) is presently controlled by ditches and berms and is directed towards the stormwater retention pond on the northwest side of the existing landfill. The total volumes of surface water runoff from the existing facility were 17,440 m^3 in 2018, 15,680 m^3 in 2017, and 18,189 m^3 in 2016. Surface water must regularly be removed from the system to maintain operating levels, as per Section 26(6) of the HWR. As per Section 26(1)(b)(i) of the HWR, the surface water collection system will be inspected weekly and/or immediately after a major storm or a catastrophic event. Surface water monitoring includes: inspections of the surface water controls and analytical and volume disposed/discharged/sent for alternate reuse.

Prior to release, water is tested as required against Schedule 1.2 of the HWR. Once analytical data is received, the results are reviewed and compared against water quality parameters, water volume and date of discharge are recorded, then water is discharged/released in the following ways:

- Discharge to the environment: Tervita will conduct testing of water quality parameters prior to release. If the surface water meets the standard for discharges, the water will be released to land. Surface water is pumped out to Tervita land directly north and northwest of the surface water pond. If the

surface water fails discharge criteria, treatment may be considered depending on the economics and feasibility.

- Deepwell disposal: If the surface water fails discharge to the environment criteria, Tervita will send the water to an approved disposal facility. Tervita's Oilfield Waste Management Facilities also process waste and have quality assurance/quality control (QA/QC) programs in place to ensure fluids meet criteria prior to injection.
- Site use for construction and dust control: Surface water may be used at the Project site for construction and/or dust suppression.
- Reuse for hydraulic fracturing in the oil and gas industry: If the surface water meets the criteria, the surface water may be reused as makeup water for oilfield fracturing operations and/or other industrial uses where the surface water can be used to offset freshwater. Tervita will work with the user(s) of the surface water to ensure the proper regulatory requirements are in place before withdrawal(s) occur.

Precipitation falling on the active landfill cell is contained within the lined area and, either will be dealt with as leachate (see Section 4.4.1.3) or discharged to surface if it meets relevant criteria for water quality. Water quality in the stormwater pond is measured multiple times a year for metals, nutrients, water quality, petroleum hydrocarbons, polychlorinated biphenyls, organic halides, and oil and grease. In 2018, there was one exceedance for chlorine during one sampling event. All other analyzed parameters were less than the CSR and HWR for all water use pathways including drinking water, irrigation, livestock and freshwater aquatic life (Nichols Environmental [Canada] Ltd., 2019; Appendix 3). Details of stormwater sampling results from 2018 and comparison to BC CSR and HWR water quality standards are provided in Tables 1 to 4 of the Nichols Environmental (Canada) Ltd. Report in Appendix 3.

During the *EMA* permit application for the proposed Project expansion, the Stormwater Management Plan currently in place for the existing facility will be amended for annual sampling of surface stormwater (prior to discharge to the environment) to include analysis of the same analytical parameters as the soil and groundwater samples, and compared to the relevant surface water guidelines.

4.4.2.3 Leachate Management

Leachate management and monitoring systems are already in place at the existing landfill and will be adjusted accordingly to account for leachate generation associated with the proposed Project expansion. The *Special Waste Regulation* stipulates that a secure landfill must have, as a minimum, a dual liner with a leak detection system between the two liners. Each of the two liners can be either soil or synthetic in construction. The proposed design incorporates a primary (top) composite liner consisting of both a 1.5-mm thick synthetic high-density polyethylene liner and 0.6-m thick compacted clay liner (CCL) as the secondary liner. The existing landfill is equipped with a leachate collection and a leak detection system (CCS 2002). The proposed Project expansion will connect to the existing system. The collected leachate is pumped into leachate vault, which is subsequently pumped out and disposed of in an offsite licenced disposal well (Golder 2008). Leachate at the existing landfill is monitored as part of the groundwater monitoring program.

Leachate generation has been conservatively estimated based on BC MECCS Normals (1961-1990) for Fort St. John, and assume all precipitation falling on the active landfill area will become leachate (that is, neglecting any reduction through evapotranspiration). This estimates an average maximum flow rate of 0.23 litres per second. A review of the leak detection sample data suggests that the current landfill leachate collection and containment system is operating effectively (Matrix 2019; Appendix 4).

Leachate collected in the leachate drainage network will be managed in the following ways:

- Discharge to the environment: If the leachate meets the standard for discharges to the environment and there are no other contaminants of concern, the leachate will be released to land. If the leachate fails discharge criteria, treatment or a deepwell disposal method will be considered depending on the economics and feasibility.

- Deepwell disposal: Leachate will be tested for Class Ib disposal criteria stated in Section 3.5.2.2 of the *Procedure for Authorizing Deepwell Disposal of Wastes* and select contaminants of concern from Schedule 4, Table 1 of the HWR. Tervita's Oilfield Waste Management Facilities also process waste and ensure QA/QC programs are established to ensure fluids meet criteria prior to injection.
- Reuse for hydraulic fracturing in the oil and gas industry: If the leachate meets the standard for discharges to the environment, the leachate may be reused as makeup water for oilfield fracturing operations and/or other industrial uses where the leachate can be used to offset the use of regional fresh water. Tervita will work with the end user of the leachate to ensure the proper regulatory requirements are in place before withdrawals occur.
- Recirculation: Leachate generated from the landfill may be recirculated back into the waste fill or may be utilized for dust control.

4.4.3 Traditional Knowledge Shared

DRFN shared knowledge about the connectivity between waterways identified in the LAA for the proposed Project expansion and noted the importance of ensuring the water contamination did not occur. BRFN shared that the perceived safety value and quality of water, including taste and smell, is important to aboriginal values and requested that assessment of these qualities of water be conducted.

4.4.4 Surface Water Effects Assessment

4.4.4.1 Identification of Potential Effects, Mitigation Measures, and Potential Residual Effects

The identification and assessment of the potential effects of the proposed Project expansion on the Surface Water VC is based on the results of surface water monitoring at the existing site, results of previous studies, and desktop review performed for the proposed Project expansion.

The proposed Project expansion is anticipated to interact with the Surface Water VC during the following construction, operations, and closure/reclamation, and postclosure activities:

- Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure
- Leachate management
- Stormwater management
- Cell capping
- Postclosure maintenance and monitoring

Activities associated with construction, operations, closure/reclamation, and postclosure of the proposed Project expansion have the following potential effects on surface water:

- Increased sediment in stormwater runoff
- Contamination of surface water due to accidental release of chemicals, oil, or other fuels from stormwater or leachate

Table 4.4-2 identifies the potential effect of increased sediment in stormwater runoff due to the proposed Project expansion on the Surface Water VC, as well as mitigation measures and potential residual effects. Accidental release or spills of contaminants during proposed Project expansion activities that may cause contamination of surface water are assessed in Accidents and Malfunctions Section (Section 9).

Mitigation measures for the potential effect of increase sediment in stormwater runoff have been identified in a manner consistent with Section 3.5 of this Application. These mitigation measures focus on minimization, except for restoration measures that would be implemented if erosion occurs. As the majority of these mitigation measures would be implemented prior to the initiation of, or during, activities associated with the construction, operations, closure/reclamation, and postclosure phases of the proposed Project expansion, they are expected to be effective immediately in reducing potential adverse

effects on the Surface Water VC. The seeding measure, as well as those mitigation measures involving inspections, require a time lag before they function effectively in preventing erosion.

Mitigation measures for potential adverse effects on surface water are generally described as having high effectiveness with BMPs and technologies that are widely used in various industries, and that are considered to be effective at reducing erosion. These mitigation measures are also observed to be highly effective at the existing landfill.

In addition to the summary of mitigation provided below, further measures are provided in the management planning documents (see Section 13) and the Silverberry Operations Plan.

Table 4.4-2. Surface Water – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction, Operations, Closure/Reclamation, and Postclosure	Increased sediment in stormwater runoff	Project footprint and LAA	• Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized.	Minimization	Immediate	High	Potential residual effects are expected to be avoided through the implementation of mitigation measures
			• Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion.	Minimization	Construction	High	
			• Surface water control works will be inspected weekly and/or immediately after a major storm or catastrophic event.	Minimization	During all Project phases	High	
			• Erosion occurring on surface water control works will be repaired and mitigated as soon as possible.	Restoration	Immediate	High	
			• Mitigation measures to prevent surface water erosion may include swales, hay bales, rock rip-rap, and/or coconut matting.	Restoration	Immediate	High	
			• The final slopes of the landfill cap will not exceed 33% and will be seeded as soon as possible to ensure vegetation growth and minimize erosion.	Minimization	During all Project phases	High	
			• The landfill cap will be inspected weekly and if erosion on the cap is noted it will be repaired and mitigated as soon as possible.	Restoration	During all Project phases	High	
			• A ditch constructed around the perimeter will direct run off and run on water to the runoff pond which has a capacity of 15,000 m^3.	Minimization	Immediate	High	
			• All surface water runs to a pond on the northwest portion of the existing landfill. Sediments will settle in the pond, and the water will be released as required. On-site erosion control will be utilized if extreme conditions warrant.	Minimization	Immediate	High	
			• Throughout the operation period, prior to final capping, waste is placed a minimum of 1.0 m below the top of berm (top of liner) elevation. Interior grading is maintained such that surface water runoff from the waste is contained within the cell(s).	Minimization	Immediate	High	
			• Implement additional measures provided in the Erosion and Sediment Control Plan, the Leachate Management Plan, and the Stormwater Management Plan.	Minimization	During all Project phases	High	
			• Any additional requirements for reclamation will be discussed with BC MECCS pending final site assessment.	Minimization	During all Project phases	High	

[a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.
- Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

4.4.4.2 Characterization and Significance of Potential Residual Effects

No potential residual effects have been identified for the Surface Water VC. Based on Tervita's experience constructing and operating the existing landfill, the potential adverse effects of the proposed Project expansion on Surface Water VC are generally well-understood. Evidence at the existing landfill (refer to Appendix 3) indicates that Tervita's mitigation measures and construction practices are effective in preventing or reducing potential residual effects on Surface Water VC. The landfill design along with the implementation of mitigation measures are expected to sufficiently avoid and/or prevent residual adverse effects to surface water quality. With the implementation of appropriate mitigation and remedial measures, there are no potential residual effects predicted for the Surface Water VC.

Given that there are no identified residual effects, a characterization and evaluation of significance of residual effects is not warranted.

4.4.4.3 Cumulative Effects Assessment

No residual effects have been identified for the Surface Water VC, therefore, a cumulative effects assessment is not required.

4.4.5 Follow-up Strategy

A follow-up strategy should be considered where a residual effect and/or cumulative effect has been identified. There are no residual or cumulative effects identified for the Surface Water VC, and no specific follow-up strategies have been identified. Monitoring of surface water quality postconstruction will be integrated with current operations and incorporated with other routine operational monitoring activities that will be expanded for the proposed Project expansion. Operation monitoring activities include but are not limited to the implementation of mitigation measures as summarized in the Erosion and Sediment Control Plan (Section 13.1), the Emergency Preparedness and Response Plan (Section 13.4), the Leachate Management Plan (Section 13.12), the Stormwater Management Plan (Section 13.13), and the Landfill Leak Detection Monitoring Plan (Section 13.14), and Tervita will adhere to additional construction or postconstruction monitoring (PCM), follow-up and reporting requirements required under Certificate Conditions.

4.5 Groundwater

Table 4.5-1 shows the subcomponents and KIs for the Groundwater VC as approved by the BC EAO in the VC Rationale Document for the proposed Project expansion (CH2M 2016b).

Table 4.5-1. Groundwater Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Water quality • Water quantity	• Water quality indicators such as concentrations of inorganic ions (such as calcium, magnesium, sodium, potassium, chloride, sulphate, fluoride), dissolved metals (such as aluminum, antimony, arsenic, barium, boron, iron, lead), perceived taste and smell and other contaminants (such as petroleum hydrocarbons, VPHs, PAHs) • Water volume and movement	• BC EAO Guidelines, BC Ministry of Water, Land and Air Protection's sampling methodology (BC WLAP 2013), and original EAC Application. • Construction and operations may introduce groundwater contamination and changes in groundwater quantity during pumping of a high water table. • Potential impacts to groundwater at the proposed Project expansion site and the surrounding area is contamination from landfill materials. Groundwater contamination may affect downstream surface water, aquatic habitat, or drinking water through migration of leachate through the soil to groundwater or aquifers during operation and post closure. • At the existing landfill site, Tervita maintains a Groundwater Monitoring Program and is in compliance with BC MECCS permit requirements for long-term groundwater monitoring. Tervita's hydrogeologist reviews groundwater monitoring information to review potential impacts to the environment.

Table 4.5-1. Groundwater Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale

Note:
PAH = polycyclic aromatic hydrocarbon

4.5.1 Assessment Boundaries

The following assessment boundaries have been defined for the Groundwater VC.

4.5.1.1 Spatial Boundaries

The spatial boundaries for the Groundwater VC are shown on Figures 3.2-1 and 3.2-2 and include the Project footprint as well as the following:

- LAA – A 500-m radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities: The LAA is considered to be the extent in which direct potential effects could occur (that is, the geographic area in which direct interaction of the proposed Project expansion with groundwater may occur in the unlikely event of discharge from the proposed Project expansion site to the environment). No guidance is available for BC to determine the potential area of effects to groundwater from a landfill; however, the 500 m distance includes the area with the greatest potential for effect from the landfill and is based on Ontario MECP Guideline D-4, which states that the most significant contaminant discharges are normally within 500 m of the perimeter of a fill area (Ontario MECP 2016).
- RAA – The proposed Project expansion site is located on a watershed divide between the Blueberry River and Monnery Creek, and therefore includes portions of both of these watersheds. The RAA is limited to a portion of these watersheds only, to allow for a reasonable assessment of cumulative effects. In determining an appropriate scale for the RAA and the cumulative effects assessment, two primary factors were considered:
  - If the spatial extent was too large, effects of the Project appear relatively small (Hegmann et al. 1999; Antoniuk 2000, 2002).
  - If the spatial scale was too small, it may exclude potentially significant development (Hegmann et al. 1999; Finley and Revel 2002).

  To find an appropriate balance, the RAA for this Project includes the watershed of Monnery Creek from the headwaters of its main branch, including the watersheds of all tributaries, downstream from the headwater of Monnery Creek for a distance of 15 km, and the watershed of the Blueberry River and its tributaries for a distance of 15 km upstream and downstream of the confluence with the Blueberry River, of the unnamed creek located immediately west of the proposed Project expansion site.

4.5.1.2 Temporal Boundaries

The temporal boundaries identified for the Groundwater VC include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading and compaction. As each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).
- Closure/reclamation phase. When the capacity of all cells is reached, the landfill will be capped with an impermeable cap and top soil and seeding will occur (approximately 1 year following operations – Year 26).

- Postclosure phase is when the entire landfill has been capped and reclaimed and monitoring will occur (approximately 25 years – Years 26 to 51).

4.5.1.3 Administrative Boundaries

Administrative boundaries refer to the effects of political, economic, or social boundaries on an Environmental Assessment. No administrative boundaries have been identified for the Groundwater VC.

4.5.1.4 Technical Boundaries

Technical boundaries refer to a proponent's ability to predict the effects of a project. No technical boundaries have been identified for the Groundwater VC. Information on existing conditions was based on a desktop review, site investigations, and field data collection, including results of groundwater monitoring activities for the existing landfill. The potential adverse effects of landfill construction, operations, closure/reclamation, and postclosure on groundwater are generally well-understood and have predictable effects. This understanding, in conjunction with the results of the desktop review and available field data, meant that there was a complete technical understanding for conducting the assessment.

4.5.2 Existing Conditions

The following methods of data collection, as outlined in the AAIR, have been used to inform the description of exiting conditions for the Groundwater VC:

- Desktop review of provincial and regional information sources
- Information from site investigations and data collection efforts, including:
  - Annual groundwater monitoring program (Matrix 2019, Appendix 4)
  - Hydrogeologic Siting Suitability Investigation (Clifton 2002, Appendix 5)

Data from these sources provide an appropriate baseline for assessing the effects of the proposed Project on groundwater. The groundwater monitoring network of 14 active wells includes a quarterly groundwater monitoring and sampling program, which would identify potential effects of seasonality. The groundwater monitoring well locations were chosen based on groundwater flow directions and the potential for impact to groundwater quality associated with onsite facilities. Pre-2012 data from monitoring well BH-103, located upgradient near the southeast corner of the proposed Project expansion area, were used to determine background conditions for the property. Leachate and leak detection system samples have been collected in conjunction with the groundwater monitoring sampling events (Matrix 2019, Appendix 4). An evaluation of the effectiveness of the leachate collection and containment system typically involves comparing the results of the leachate samples to that of the groundwater samples to determine if groundwater has been impacted by leachate.

The following subsections summarize available information on existing conditions of groundwater within the spatial boundaries defined for the Groundwater VC in Section 4.5.1.1.

4.5.2.1 Environmental Context

The proposed Project expansion is underlain by flat-lying sedimentary rock of the Upper Cretaceous Dunvegan Formation (BC Geological Survey 2018; Church and Ryder 2010). The Dunvegan Formation is composed of light grey to yellow-grey sandstone interbedded with laminated siltstone and dark grey shale (Prior et al., 2013). The local surficial geology is composed of a thin clay unit that overlies a thick clay till unit (Matrix 2019). The primary soil parent material is glacial till and fine-textured Gray Luvisols are the dominant soil group with till and stony, silty clay being predominant (Church and Ryder 2010). A thin, patchy cover of lacustrine material may also be present (referenced in Metrix 2019). The overlying clay typically has a thickness between 1.5 and 3 m. The underlying clay till unit may extend to the maximum depth drilled of 20.7 mbgs (Matrix 2019, Appendix 4). Locally, shallow groundwater flow is likely directed to the northwest toward the Blueberry River under a hydraulic gradient of 0.03 mm (shallow) and 0.04 mm (deep) (Clifton 2002, Appendix 5); however, regional groundwater may flow south toward the Peace River. Groundwater monitoring results indicate the presence of a shallow groundwater depth ranging from

1.3 m to 8.5 m below surface at the property (Matrix 2019). Field response tests at the site indicate an estimated hydraulic conductivity of the clay till unit to range from 3 x 10^{-7} to 8 x 10^{-7} m/s (Clifton 2002, Appendix 5). Based on the results of the Hydrogeologic Siting Suitability Investigation (Clifton 2002, Appendix 5), near surface soils have low hydraulic conductivity and no aquifers identified as a groundwater resource are located below or within several kilometers of the existing landfill and proposed Project expansion (Clifton 2002; Appendix 5).

The property is considered suitable for the proposed Project expansion based on the following results of the Hydrogeologic Siting Suitability Investigation (Clifton 2002, Appendix 5):

- The site meets all siting requirements in the BC HWR with an engineered design of a liner and leachate collection system to mitigate potential seepage issues
- No major drainage courses are present in the vicinity of the site; there is an ephemeral stream 100 m northwest of the storm retention pond of the existing landfill
- The near surface soils (0 m to 20 m below surface) have a low hydraulic conductivity
- No appreciable groundwater resource has been identified below the site (within 20 m of surface) or within several kilometres of the site

As part of a hydrogeological study conducted for the property (Clifton 2002, Appendix 5), groundwater was sampled and analyzed for general chemistry, metals, hydrocarbons, phenols, and PAHs. The groundwater was characterized as a “sulphate type water with no dominant cation”. Total dissolved solids concentrations ranged between 1,160 mg/L to 7,060 mg/L and is considered “brackish”. Hydrocarbons, phenols, and PAHs were absent (nondetect) in the samples collected, while metals analytes were generally detected. Clifton (2002) indicates that the concentrations measured in groundwater are indicative of natural background conditions, and that the groundwater would not be suitable for potable use because of high sulphate, sulphide, and total dissolved solids concentrations (Appendix 5).

Matrix (2019) conducted a water well search through the BC Water Resources Atlas. Four water wells were identified within 5 km of the proposed Project expansion. One well is located 0.3 km south-southeast of the existing landfill and is used for nondomestic purposes and owned by Tervita. Two wells are located 2.5 km to the east, owned by Leucrotta Exploration Inc., and used for monitoring. The fourth well is a domestic well owned by the BC Railway Company, and is located 4 km to the northwest.

4.5.2.2 Groundwater Monitoring

The existing groundwater monitoring well network was evaluated for its continued suitability for identifying impact on groundwater quality for the proposed Project expansion. Regular groundwater monitoring has been conducted at the existing landfill before and after site commissioning. The current groundwater monitoring well network consists of 14 active monitoring wells located in the landfill area, including a background monitoring well, which is located hydraulically upgradient of the landfill and onsite facilities. Refer to Appendix 4 for locations and detailed descriptions of these monitoring wells. All monitoring wells were designed to evaluate the characteristics of shallow and, in some areas, deep groundwater in the unconsolidated surficial deposits. Well data identify two stratigraphic units at the landfill site: Unit A comprises a thin layer of clay and overlays Unit B, which comprises primarily clay till.

The groundwater monitoring network has been divided based on the potential for impact to groundwater quality associated with onsite facilities and groundwater flow directions, and to establish background groundwater conditions hydraulically upgradient of the landfill area. Well data collected over the operational phase of the existing landfill indicates groundwater levels have remained relatively consistent throughout the monitoring periods, though there have been marginal increases and decreases recorded. For example, the hydrogeological study completed in 2002 encountered a shallow water table ranging from 1.8 to 3.8 mbgs, which is generally consistent with annual groundwater monitoring reports completed during operations (for example, EBA 2009, 2010; Matrix 2015; NLR/AE 2012, 2013).

The horizontal groundwater velocity beneath the landfill is estimated to be less than 0.3 to 0.4 m per year and is consistent with historical calculations. Well data also indicate shallow groundwater flow direction is

to the northwest (Clifton 2002; Matrix 2017). In 2018, shallow groundwater beneath the site was interpreted to flow toward the northwest with an estimated horizontal groundwater velocity of less than 1 m per year. Groundwater beneath the landfill generally shows recharge conditions (Matrix 2019). In 2018, there was one exceedance for fluoride during one sampling event. All other analyzed parameters were less than CSR standards for all nonbackground monitoring wells (Matrix 2019).

4.5.2.3 Leachate Management

To prevent impacts to groundwater from operations, the existing landfill is lined and equipped with a leachate collection and leak detection system. The proposed Project expansion landfill cells will be lined and connected to the existing leachate collection and leak detection systems. Testing of the leachate collection and leak detection systems is conducted concurrently with the groundwater monitoring program. Leachate samples from both systems are compared to the BC CSR, which has the most conservative water standards that are protective of freshwater aquatic life, livestock, irrigation watering, and drinking water use (Matrix 2019), and Protocol 21 for Contaminated Sites: Water Use Determination (Matrix 2019).

An evaluation of the effectiveness of the leachate collection and containment system typically involves comparing the results of the leachate samples to that of the groundwater samples to determine if groundwater has been impacted by leachate.

Per the existing landfill's BC MECCS permit, a groundwater monitoring program is conducted, and a summary report of the groundwater monitoring program is prepared annually (EBA 2009, 2010; Golder 2007, 2008; Matrix 2004, 2015, 2017, 2019; NLR/AE 2012, 2013). The annual reports assess whether groundwater shows evidence of impacts from the landfill or if the groundwater quality is indicative of natural conditions. The reports also confirm that the leachate collection and leak detection systems are functioning as designed.

In 2018, results of monitoring and sampling program for groundwater and leachate collection and leak detection system of the existing landfill suggest that the current landfill leachate collection and containment system is operating effectively (Matrix 2019).

The proposed Project expansion will be incorporated into the existing groundwater monitoring program which provides an annual summary report and will be accommodated in accordance with any revised permit requirements. Additional background information on leachate management is provided under the Surface Water VC (Section 4.4.1.3).

4.5.3 Traditional Knowledge Shared

DRFN shared knowledge about the connectivity between waterways identified in the LAA for the proposed Project expansion and noted the importance of ensuring the water contamination did not occur. BRFN shared that the perceived safety value and quality of water, including taste and smell, is important to aboriginal values and requested that assessment of these qualities of water be conducted.

4.5.4 Groundwater Effects Assessment

4.5.4.1 Identification of Potential Effects, Mitigation Measures, and Potential Residual Effects

The identification and assessment of the potential effects of the proposed Project expansion on the Groundwater VC is based on the results of groundwater monitoring at the existing site, results of previous studies, and desktop review performed for the proposed Project expansion.

The proposed Project expansion is anticipated to interact with the Groundwater VC during the following construction, operations, closure/reclamation, and postclosure activities:

- Excavation, construction of cells
- Leachate management, stormwater management, and ongoing monitoring

- Cell capping
- Postclosure maintenance and monitoring

Activities associated with construction, operations, closure/reclamation, and postclosure of the proposed Project expansion have the following potential effects on groundwater:

- Alteration of groundwater hydrogeology

- Contamination of groundwater due to accidental release of leachate

Table 4.5-2 identifies the potential effect of alteration of groundwater hydrogeology due to the proposed Project expansion on the Groundwater VC, as well as mitigation measures and potential residual effects. Accidental release of leachate during proposed Project expansion activities that may cause contamination of groundwater are assessed in the Accidents and Malfunctions Section (Section 9).

Mitigation measures have been identified in a manner consistent with Section 3.5 of this Application. As these mitigation measures would be implemented prior to the initiation of, or during, activities associated with the construction, operations, and closure/reclamation phases of the proposed Project expansion, they are expected to be effective immediately in reducing or avoiding potential adverse effects on Groundwater VC (by using a phase approach in construction of landfill cells and by not using groundwater from the monitoring wells, respectively). These mitigation measures have been implemented at the existing landfill and are considered to have high effectiveness.

In addition to the summary of mitigation provided below, further measures are provided in the management planning documents (see Section 13) and the Silverberry Operations Plan.

Table 4.5-2. Groundwater – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction, Operations, and Closure/Reclamation	Alteration of groundwater hydrogeology	Project footprint and LAA	• Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized.	Minimization	Immediate	High	Potential residual effects are expected to be avoided through the implementation of mitigation measures
			• Groundwater from monitoring wells will not be used during construction, operation or reclamation\closure.	Avoidance	Immediate	High	

[a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.
- Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

4.5.4.2 Characterization and Significance of Potential Residual Effects

No potential residual effects have been identified for the Groundwater VC. Based on Tervita's experience constructing and operating the existing landfill, the potential adverse effects of the proposed Project expansion on the Groundwater VC are generally well-understood. Evidence at the existing landfill (refer to Appendix 4) indicates that Tervita's mitigation measures and construction practices are effective in preventing or reducing potential residual effects on the Groundwater VC. The existing landfill has mitigation measures in place that will be applied to the proposed Project expansion and the landfill design to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system). With the implementation of appropriate mitigation and remedial measures, there are no potential residual effects predicted for the Groundwater VC.

Given that there are no identified residual effects, a characterization and evaluation of significance of residual effects is not warranted.

4.5.4.3 Cumulative Effects Assessment

No residual effects have been identified for the Groundwater VC, therefore, a cumulative effects assessment is not required.

4.5.5 Follow-up Strategy

A follow-up strategy should be considered where a residual effect and/or cumulative effect has been identified. There are no residual or cumulative effects identified for the Groundwater VC, and no specific follow-up strategies have been identified. Monitoring of groundwater quality postconstruction will be integrated with current operations and incorporated with other routine operational monitoring activities that will be expanded for the proposed Project expansion. Operation monitoring activities include but are not limited to the implementation of mitigation measures provided in the Groundwater Monitoring Plan, the Leachate Management Plan, the Landfill Leak Detection Monitoring Plan, and the Emergency Preparedness and Response Plan. Tervita will adhere to additional construction or PCM, follow-up and reporting requirements required under Certificate Conditions.

4.6 Terrestrial Vegetation

Table 4.6-1 shows the subcomponents and KIs for the Terrestrial Vegetation VC as approved by the BC EAO in the VC Rationale Document for the proposed Project expansion (CH2M 2016b).

Table 4.6-1. Terrestrial Vegetation Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Plant species of concern, including rare plant species and plant species used for traditional purposes • Vegetation communities of concern • Invasive plant species	• Loss of plant species of concern, including rare plant species and plant species used for traditional purposes • Loss of vegetation communities of concern • Vegetation uptake of contaminants from air quality and dust dispersion and deposition • Introduction or spread of Noxious weeds	• BC EAO Guidelines and original EAC Application. • Construction and operations are expected to have a minimal effect on terrestrial vegetation within the Project footprint as well as the surrounding areas. The proposed Project expansion site is previously disturbed from agricultural activity. • There is low natural vegetation diversity at the proposed Project expansion site and there is low potential for loss of plant species or ecological communities of conservation concern during construction activities. • Introduction or spread of Noxious weeds may occur during construction, operation, or closure activities. To minimize the spread of Noxious weeds, equipment is inspected and washed prior to mobilization and demobilization.

4.6.1 Assessment Boundaries

The following assessment boundaries have been defined for the Terrestrial Vegetation VC.

4.6.1.1 Spatial Boundaries

The spatial boundaries for the Terrestrial Vegetation VC are shown on Figures 3.2-1 and 3.2-2 and include the Project footprint as well as:

- LAA: A 100-m radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities.

  Key considerations used to establish the spatial boundaries of the Terrestrial Vegetation LAA for the proposed Project expansion include the distance that edge effects to plant species and communities are expected to extend from a disturbed area. The spatial extent of changes in terrestrial vegetation composition may be affected by a number of factors. In one study, increased light was shown to allow the invasion of shade-intolerant vegetation up to 30 m (Ranney et al. 1981). Some tree species exhibit increased growth and regeneration within 30 to 60 m of clear-cut edges; however, depending on the species, tree mortality can also increase (Bannerman 1998). Within an old-growth Douglas-fir forest, air temperature and humidity were generally found to be influenced to a distance of 120 to 180 m in areas adjacent to a clear-cut edge, while soil temperature and moisture were influenced from 60 to 120 m from the edge (Chen et al. 1990). Forman et al. (2003) found that the greatest changes to microclimate and dust levels occurred within the first 30 to 50 m from road edges, while the greatest changes in hydrological function, salinity and nitrogen levels could extend 100 m from the disturbed area. Based on the above concepts, a 100-m-wide LAA, from the outside boundary of the landfill footprint was established to assess Project-related effects to terrestrial vegetation resources.

- RAA: A 1-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities.

  Key considerations used to establish the spatial boundaries of the Terrestrial Vegetation RAA for the proposed Project expansion included the following:

  – The separation distance typically used to distinguish one rare plant population from another

  – The dispersal of non-native, invasive species to or from the footprint

  – Provision of baseline data and mapping sufficient to support accurate assessment of wildlife habitat resources within the respective LAA of that biophysical component

  – The footprint of the proposed Project expansion within a regional landscape context

  An Element Occurrence (EO) is the area of land or water in which a rare species or rare ecological community of conservation interest is or was present (BC MOE 2011, NatureServe 2002). EOs generally refer to a local population or metapopulation (NatureServe 2002). Although there are many factors which may be taken into account in determining individual EOs, the default minimum separation distance for plant species EOs is 1 km (NatureServe 2002, 2004). Although dispersal distances depend on a number of factors, many weed species produce large numbers of seeds that are wind dispersed (Forman et al. 2003). Forman et al. (2003) found that the spread of non-native, invasive species could extend up to 1 km from the disturbed area. A 1-km-wide Terrestrial Vegetation RAA corresponds with the Wildlife and Wildlife Habitat LAA for the proposed Project expansion, which will facilitate accurate mapping, modeling and assessment of wildlife habitat at a scale where it is most likely to be affected by proposed Project expansion construction and operations. The 1-km-wide Terrestrial Vegetation RAA will allow for a meaningful assessment of potential effects to plant species and vegetation communities of concern, as well as for the potential introduction or spread of Noxious weeds within a regional landscape context.

4.6.1.2 Temporal Boundaries

The temporal boundaries identified for the Terrestrial Vegetation VC include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading and compaction. As each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).
- Closure/reclamation phase. When the capacity of all cells is reached, the landfill will be capped with an impermeable cap and top soil and seeding will occur (approximately 1 year following operations – Year 26).
- Postclosure phase is when the entire landfill has been capped and reclaimed and monitoring will occur (approximately 25 years – Years 26 to 51).

4.6.1.3 Administrative Boundaries

Administrative boundaries refer to the effects of political, economic, or social boundaries on an Environmental Assessment. No administrative boundaries have been identified for the Terrestrial Vegetation VC.

4.6.1.4 Technical Boundaries

Technical boundaries refer to a proponent's ability to predict the effects of a project. No technical boundaries have been identified for the Terrestrial Vegetation VC. Information on existing conditions was based on a desktop review and field surveys. The potential adverse effects of landfill construction, operations, closure/reclamation, and postclosure on vegetation are generally well-understood and have predictable effects. This understanding, in conjunction with the results of the desktop review, meant that there was a complete technical understanding for conducting the assessment.

4.6.2 Existing Conditions

The following methods of data collection have been used to inform the description of existing conditions for the Terrestrial Vegetation VC:

- Desktop review of provincial and regional information sources
- Information from site investigations and data collection efforts (Appendix 6)
- Noxious weed information received from PRRD
- Soil sampling program for the PDMA (see Section 4.1.2.3 and Appendix 1 for the results of the soil sampling program)

Data from these sources provide an appropriate baseline for assessing the effects of the Project on terrestrial vegetation. Field surveys in June 2015 and June 2017 identified the vegetation present on the proposed Project footprint. No Noxious weeds were identified. While the primary effects on terrestrial vegetation will be confined to the proposed Project footprint, the pathways to potential vegetation uptake of contaminants from air quality and dust dispersion and deposition off the proposed Project footprint were considered in the soils, air quality, surface water, and groundwater sections. The proposed Project expansion is located within the Halfway Plateau Ecosection of the Central Alberta Upland Ecoregion of Canada (Ecological Stratification Working Group 1995) and is located in the BWBS BGC Zone of BC, within the moist, warm subzone (BWBSmw) (DeLong et al. 1991).

The proposed Project expansion will be constructed on land that is owned by Tervita and is located within the existing fenced boundaries of the operating landfill. There is low natural vegetation diversity within the Project footprint, as vegetation has been disturbed by past agricultural activities.

A vegetation field survey was conducted for the proposed Project expansion on June 24, 2015 (see the Vegetation Survey Report in Appendix 6). The majority of the Project footprint is located within a hayfield, with a young aspen-rose-creamy peavine forest at the eastern edge. The hayfield is dominated by common timothy grass (*Phleum pratense*) and clover (white clover [*Trifolium repens*] and alsike clover [*Trifolium hybridum*]). The young aspen-rose-creamy peavine forest at the eastern edge of the Project footprint is characterized as a zonal ecosystem in the BWBSmw (101$4B) in a pole/sapling structural stage. The forests to the south of the Project footprint (greater than 100 m from the Project footprint boundary) are also dominated by young aspen-rose-creamy peavine forests (BWBSmw/101$5B) with remnant patches of white spruce-trailing raspberry-step moss forests (BWBSmw/1015M) ranging between 60 and 80 years old.

A moist, shrubby area was observed at the eastern side of the Project footprint, composed of willows (*Salix* spp.), alder (*Alnus incana*), and bluejoint reedgrass (*Calamagrostis canadensis*). Wet swales were evident; however, they were dry during the time of the field survey.

The Project footprint was visited again in June 2017 for wildlife surveys and the same vegetation communities and composition were observed at that time (that is, no plant species/vegetation communities of conservation concern or Noxious weeds); however, patches of forest harvesting (logging) and wildfires had occurred since 2015 in the northeast portions of the LAA and RAA.

4.6.2.1 Plant Species and Vegetation Communities of Concern

There is low potential for plant species and/or vegetation communities of concern to occur within the Project footprint, since the land has been previously disturbed for agricultural activities. Plants used for traditional purposes are assessed in Section 6.1. No occurrences of plant species or vegetation communities of concern were observed in the Project footprint or the LAA during the field surveys conducted for the proposed Project expansion. Therefore, plant species and vegetation communities of concern are not considered further in the assessment.

4.6.2.2 Invasive Plant Species

No occurrences of Noxious weeds or invasive plants were observed in the Project footprint or LAA during the field surveys conducted for the proposed Project expansion. The hayfield is mainly composed of agronomic species, with a mix of non-native and native plants.

4.6.3 Traditional Knowledge Shared

DRFN reported that they actively pick and harvest berries, medicinal plants, and other plants and fungi throughout their traditional territory. Culturally important species include lily pads, spruce gum, devils club, Labrador tea and yarrow. BRFN requested that spatial distribution of vegetation losses, and landscape changes be included as KIs of changes in terrestrial vegetation,

4.6.4 Terrestrial Vegetation Effects Assessment

4.6.4.1 Identification of Potential Effects, Mitigation Measures, and Potential Residual Effects

The identification of the potential effects of the proposed Project expansion on the Terrestrial Vegetation VC is based on the results of the desktop assessment for the proposed Project expansion, as well as information from field surveys.

The proposed Project expansion is anticipated to interact with the Terrestrial Vegetation VC during the following construction, operations, closure/reclamation, and postclosure activities:

- Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure
- Waste acceptance, placement, and compaction
- Cell capping
- Postclosure maintenance and monitoring

Table 4.6-2 identifies the potential effects of the proposed Project expansion on the Terrestrial Vegetation VC, as well as mitigation measures and potential residual effects. Mitigation measures have been identified in a manner consistent with Section 3.5 of this Application. Given the nature of activities associated with the proposed Project expansion with regards to potential adverse effects to terrestrial vegetation, avoidance and restoration are not directly applicable; therefore, mitigation measures have focused on minimization. As the majority of these mitigation measures would be implemented prior to the initiation of, or during, activities associated with the construction, operations, closure/reclamation, and postclosure phases of the proposed Project expansion, they are expected to be effective immediately in reducing potential adverse effects on the Terrestrial Vegetation VC. Seeding and weed control measures, as well as those mitigation measures involving inspections, require a time lag before they function effectively in reducing potential adverse effects on the Terrestrial Vegetation VC.

Moderate effectiveness is expected for measures to reduce idling of equipment and for equipment to use low-sulphur diesel because these measures can practicably be applied to only certain types of equipment (for example, idling is necessary for some equipment to function properly under extreme cold weather). Using a cover crop to assist in weed and erosion control, where warranted, is expected to have a moderate effectiveness as establishment of cover crop would depend on site conditions. Other mitigation measures described in Table 4.6-2 have high effectiveness as observed at the existing landfill.

In addition to the summary of mitigation provided herein, further measures are provided in the management planning documents (see Section 13) and the Silverberry Operations Plan.

Table 4.6-2. Terrestrial Vegetation – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction, Operations, Closure/Reclamation, and Postclosure	Introduction or spread of Noxious weeds	Project footprint	• Areas of Noxious weeds/invasive plants (as designated on Schedule A of the *Weed Control Regulation*) will be noted during weekly inspections, especially during times of high vegetation growth (May-August).	Minimization	During all Project phases	High	Potential residual effects are expected to be avoided through the implementation of mitigation measures.
			• To supplement the list of Noxious and invasive plants, the PRRD's Invasive Plant Program Strategic Plan and Profile will be reviewed annually to determine regionally important Noxious and invasive plants.	Minimization	During all Project phases	High	
			• If areas of Noxious or invasive weeds are noted, a certified pesticide applicator will be brought in on an as-needed basis. If there is an infestation of Noxious/invasive plants, Tervita will document the infestation on the Provincial IAPP to help with future weed control programs.	Minimization	Immediate	High	
			• To prevent the spread of Noxious and invasive weeds, Tervita vehicles and equipment will be cleaned as best as reasonably possible (before entering/exiting the landfill). Prior to mobilization and demobilization, construction equipment will be cleaned. Any equipment leaving site will utilize the following tools to remove soil prior to exiting: – Track shovels – Brooms – Air Compressor (if available).	Minimization	Immediate	High	
			• When seed is being used for re-vegetation at site, best efforts will be made to source local seed in consultation with local First Nations to reduce the risk of introducing invasive plant species from another region. The Certificate of Seed Analysis will be kept on file and analyzed to ensure Noxious species and regional species of concern are not present in the seed lot.	Minimization	Immediate	High	
Construction, Operations, Closure/Reclamation, and Postclosure	Vegetation uptake of contaminants from air quality and dust dispersion and deposition	Air Quality RAA	• Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events.	Minimization	Immediate	High	Loss or alteration of native vegetation
			• Contractor will confirm that equipment is well-maintained	Minimization	Immediate	High	
			• Reduce idling of equipment, where possible.	Minimization	Immediate	Moderate	
			• Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized.	Minimization	Immediate	High	
			• Equipment to use low sulphur diesel, as appropriate.	Minimization	Immediate	Moderate	
			• Implement additional measures provided in the Dust and Odour Control Plan and the Air Quality Monitoring Plan.	Minimization	Immediate	High	
	Loss or alteration of native vegetation	Project footprint	• Tervita will seek to reduce disturbance to native vegetation to the extent possible.	Minimization	Immediate	High	Loss or alteration of native vegetation
			• Use a cover crop to assist in weed and erosion control where warranted.	Minimization	During all Project phases	Moderate	
			• Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized.	Minimization	Immediate	High	

[a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.
- Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

Note:
IAPP = Invasive Alien Plant Program

4.6.4.2 Characterization and Significance of Potential Residual Effects

Construction, operations, closure, and postclosure activities have the potential to contribute to the introduction or spread of Noxious weeds. No occurrences of Noxious weeds or invasive plants were observed in the Project footprint or LAA during the field surveys conducted for the proposed Project expansion. As identified in Table 4.6-2, if areas of Noxious or invasive weeds are noted, a certified pesticide applicator will be brought in on an as-needed basis. If there is an infestation of Noxious/invasive plants, Tervita will document the infestation on the Provincial IAPP to help with future weed control programs. In addition, to prevent the spread of Noxious weeds, Tervita vehicles and equipment will be cleaned as best as possible (before entering/exiting the landfill). Prior to mobilization and demobilization, construction equipment will be cleaned. Any equipment leaving the site will utilize various tools to remove soil prior to existing. Since no occurrences of Noxious weeds or invasive plants were observed during the field surveys with the implementation of the mitigation measures identified in Table 4.6-2, no residual effects on the introduction and spread of Noxious weeds are anticipated; therefore, a characterization of significance of residual effects is not warranted.

Residual adverse effects on the Terrestrial Vegetation VC identified in Table 4.6-2 include loss or alteration of native vegetation.

Table 4.6-3 provides a summary of the significance evaluation of the residual effect associated with the Terrestrial Vegetation VC during proposed Project expansion activities and considers the probability for significance in the evaluation as outlined in Section 3.

Table 4.6-3. Residual Effects Significance Evaluation for the Terrestrial Vegetation Valued Component

Predicted Residual Effects	Spatial Boundary	Temporal Context			Magnitude	Probability	Confidence	Significance
		Duration	Frequency	Reversibility				
a) Loss or alteration of native vegetation	Project footprint	Short to extended-term	Infrequent to Continuous	Reversible	Low	High	High	Not significant

A minor loss or alteration of native vegetation on the eastern edge of the Project footprint will result from construction and operations of the proposed Project expansion. Approximately 2.2 ha of a young aspen forest habitat located along the eastern edge of the Project footprint may be directly disturbed by proposed Project expansion construction and operations. In addition, there is potential for construction, operations, and closure activities to lead to vegetation uptake of contaminants from air quality and dust dispersion and deposition. Since pathways to contamination are considered in the soils, air quality, surface water, and groundwater sections, it would be duplicative to also assess this pathway in the vegetation section. As discussed in Section 4.2, the mitigation measures outlined in the Air Quality Monitoring and Dust and Odour Control Plan are expected to reduce the severity of Project-related air emissions such that it is predicted that there will be insignificant additional loading of dust and contaminants in the Air Quality RAA. With the implementation of mitigation measures, vegetation uptake of contaminants from air quality and dust dispersion and deposition is expected to be negligible. Construction and operations are expected to have a minimal effect on terrestrial vegetation within the Project footprint as well as the surrounding areas. Areas prone to erosion will be seeded with an appropriate native seed mix or cover crop.

The residual effect of construction and operations of the proposed Project expansion on the loss or alteration of native vegetation is reduced by limiting the area of disturbance (by expanding an existing operating landfill, overlapping existing disturbances, and using existing access). With implementation of the mitigation to reduce effects on soil, air quality, low-lying wet habitats and wildlife (Sections 4.1, 4.2, 4.4, and 4.8), the residual effect of construction and operations of the proposed Project expansion on the loss or alteration of native vegetation is predicted to be low magnitude. Effects on native vegetation associated during construction or specific operations activities are short-term in duration and infrequent.

Effects on native vegetation resulting from ongoing operations are extended term duration and continuous frequency. Consequently, with a high level of confidence, the proposed Project expansion's residual effect of loss or alteration of native vegetation is not significant (Table 4.6-3, point [a]).

4.6.4.3 Cumulative Effects Assessment

The predicted adverse residual effect of loss or alteration of native vegetation was considered in the cumulative effects assessment for the Terrestrial Vegetation VC. However, it should be noted that the potential for cumulative effects is limited as there are no reasonably foreseeable projects identified within the Terrestrial Vegetation RAA (see Tables 3.9-1 and 3.9-2 and Figure 3.9-2). Cumulative effects on the Terrestrial Vegetation VC would be caused mainly by ongoing operational activities at the existing landfill and nearby forestry operations.

4.6.4.4 Loss or Alteration of Native Vegetation

The proposed Project expansion will act in combination with the existing landfill and nearby forestry operations to result in the cumulative loss or alteration of native vegetation within the Terrestrial Vegetation RAA.

Existing activities and developments in the Terrestrial Vegetation RAA that have contributed to cumulative changes in native vegetation composition include forestry cutblocks, existing rights-of-way and associated facilities (for energy transmission, and oil and gas), and roads for industrial use. The proposed Project expansion will contribute to cumulative alteration of natural vegetation by disturbing approximately 2.2 ha during operation when cells are constructed along the east margins of the Project footprint. In the Terrestrial Vegetation RAA, forestry activities are the currently accepted and desired land use for these regions, by the TSA, where the current AAC is 2,115,000 m^3 (see Section 6.1.2 for details). A site visit in 2017 confirmed recent logging and wildfire activity had occurred in the northeast portion of the Terrestrial Vegetation LAA. It is assumed that forestry activities and associated traffic will occur concurrently with the proposed Project expansion within the Terrestrial Vegetation RAA to result in the potential loss or alteration of native vegetation.

Tervita will implement mitigation in Table 4.6-2 to reduce the proposed Project expansion's contribution to cumulative loss or alteration of native vegetation. It is expected that other industries such as forestry in the Terrestrial Vegetation RAA will implement industry standard mitigation to reduce or avoid loss or alteration of native vegetation.

The predicted cumulative effect on native vegetation resulting from existing activities in combination with the proposed Project expansion and reasonably foreseeable developments is low magnitude and not significant, and is likely to persist with or without the proposed Project expansion. With a high degree of confidence, the proposed Project expansion's contribution to the cumulative effect is negligible in magnitude at the regional scale. No mitigation beyond the Project-specific mitigation already recommended in Table 4.6-2 is warranted.

4.6.5 Follow-up Strategy

A follow-up strategy should be considered where a residual effect and/or cumulative effect has been identified. The implementation of the Noxious Weeds Plan and the Vegetation Management Plan will reduce the potential loss or alteration of native vegetation.

4.7 Fish and Fish Habitat

Table 4.7-1 shows the subcomponents and KIs for the Fish and Fish Habitat VC as approved by the BC EAO in the VC Rationale Document for the proposed Project expansion (CH2M 2016b).

Table 4.7-1. Fish and Fish Habitat Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Fish species of management interest and their habitat, including fish species of concern to Aboriginal groups	• Change in habitat (including possible effects to the food chain, such as effects to invertebrates through contamination or loss of habitat that have an effect on fish species of management interest and fish species of concern to Aboriginal groups)	• Fish species of management interest and their habitat was identified as a subcomponent to include species of fish that contribute to commercial, recreational or Aboriginal fisheries as defined in the *Fisheries Act*, as well as fish species of conservation concern that are listed by the COSEWIC or under the *SARA* as Endangered, Threatened, or Special Concern, or Red or Blue-listed provincially.
• Fish species of management interest and their habitat, including fish species of concern to Aboriginal groups (cont'd)	• Change in mortality risk	• There is potential for contamination of surface water by the proposed Project expansion due to stormwater runoff during construction, operations and closure. Contaminated surface water has the potential to impact fish, if contaminated water reaches watercourses or drainages that support fish. • There is an ephemeral drainage near the Project site, however, no fish have been documented in this drainage and the nearest documented fish presence is approximately 6 km downstream of the Project site.

Notes:

COSEWIC = Committee on the Status of Endangered Wildlife in Canada
SARA = *Species at Risk Act*

4.7.1 Assessment Boundaries

The following assessment boundaries have been defined for the Fish and Fish Habitat VC.

4.7.1.1 Spatial Boundaries

The spatial boundaries for the Fish and Fish Habitat VC are shown on Figures 3.2-1 and 3.2-2 and include the Project footprint as well as:

- LAA: A 500-m radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities.

  Fish habitat is not expected to be physically affected by the proposed Project expansion, since there are no watercourses or drainages located where they will be physically affected by the proposed Project expansion construction and operations.

  Fish and fish habitat could be affected if contaminated water leaves the proposed Project expansion site. The Fish and Fish Habitat LAA is, therefore, based on the Surface Water LAA, which includes the area within 500 m of the proposed Project expansion site. The Fish and Fish Habitat LAA includes those portions of drainages or watercourses that lie within the Surface Water LAA. The Fish and Fish Habitat LAA does not extend downstream of the area encompassed by the Surface Water LAA, since all drainages in the vicinity of the proposed Project expansion site are first order drainages and likely to be dry or contain little water most of the year. In addition, monitoring of surface and groundwater movement at and around the proposed Project expansion site will allow early detection of potentially contaminated water leaving the site and allow its retention and treatment within boundary of the LAA.

- RAA: The watershed of Monnery Creek from the headwaters of its main branch, including the watersheds of all tributaries, downstream from the headwater of Monnery Creek for a distance of 15 km, and the watershed of the Blueberry River and its tributaries for a distance of 15 km upstream and downstream of the confluence with the Blueberry River, of the unnamed creek located immediately west of the proposed Project expansion site.

  The Fish and Fish Habitat RAA is the same as the Surface Water RAA as potential cumulative effects to fish and fish habitat will occur by the same mechanisms, and in the same potential area as cumulative effects to surface water.

4.7.1.2 Temporal Boundaries

The temporal boundaries identified for the Fish and Fish Habitat VC include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading and compaction. As each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).
- Closure/reclamation phase. When the capacity of all cells is reached, the landfill will be capped with an impermeable cap and top soil and seeding will occur (approximately 1 year following operations – Year 26).
- Postclosure phase is when the entire landfill has been capped and reclaimed and monitoring will occur (approximately 25 years – Years 26 to 51).

4.7.1.3 Administrative Boundaries

Administrative boundaries refer to the effects of political, economic, or social boundaries on an Environmental Assessment. No administrative boundaries have been identified for the Fish and Fish Habitat VC.

4.7.1.4 Technical Boundaries

Technical boundaries refer to a proponent's ability to predict the effects of a project. No technical boundaries have been identified for the Fish and Fish Habitat VC. Information on existing conditions was based on a desktop review and field surveys. The potential adverse effects of landfill construction, operations, closure/reclamation, and postclosure on vegetation are generally well-understood and have predictable effects. This understanding, in conjunction with the results of the desktop review, meant that there was a complete technical understanding for conducting the assessment.

4.7.2 Existing Conditions

The following methods of data collection have been used to inform the description of existing conditions for the Fish and Fish Habitat VC:

- Desktop review of provincial and regional information sources.
- Information from site investigations, ongoing surface water discharge analytical data at the existing facility and data collection efforts.
- Drainage patterns within the Fish and Fish Habitat RAA are primarily dendritic. The proposed Project expansion is located in the Blueberry River Watershed, a sub-basin of the Beatton River system. The Blueberry River and its tributaries originate on the plateau uplands within the Halfway Plateau ecosection of northeastern BC. Aquatic habitats are typically characterized by low to moderate gradient riffle/pool structures and gravel/cobble substrates with a high proportion of fines (DES 2002).

Data from these sources provide an appropriate baseline for assessing the effects of the Project on fish and fish habitat. As identified in the Hydrogeologic Siting Suitability Investigation (CCS 2002), drainage patterns within the Fish and Fish Habitat RAA are primarily dendritic. There is no direct discharge of surface water to water bodies, and no known channel connections exist between the proposed Project expansion and nearby fish-bearing water bodies (CCS 2002).

The proposed Project expansion is located in the Blueberry River Watershed, a sub-basin of the Beatton River system. The Blueberry River and its tributaries originate on the plateau uplands within the Halfway Plateau ecosection of northeastern BC. Aquatic habitats are typically characterized by low to moderate gradient riffle/pool structures and gravel/cobble substrates with a high proportion of fines (DES 2002).

The Blueberry River and its tributaries support a variety of nonsportfish species including lake chub, longnose dace, white sucker, longnose sucker, redside shiner, slimy sculpin, spoonhead sculpin, troutperch, and flathead chub. Low seasonal flow rates, high summer temperatures, and high turbidity limit suitability for sportfish species. Only northern pike and Arctic grayling have been previously recorded in the watershed (DES 2002; GBC 2019a). Northern pike appear to exist at very low densities in the Blueberry River mainstem and the lower reach of larger tributaries. Arctic grayling distribution is restricted to isolated upper reach habitats, where reduced suspended sediment levels provide improved spawning and seasonal rearing potential (DES 2002).

The proposed Project expansion is located within the catchment area of a tributary to an unnamed tributary to the Blueberry River. This unnamed tributary is the nearest potentially fish-bearing watercourse, and is located approximately 1.5 km downstream of an ephemeral tributary at the northwest boundary of the proposed Project expansion site. In October 1994, Diversified Environmental Services conducted fish salvage sampling in the unnamed tributary and in its unnamed parent tributary nearby. White sucker, longnose sucker, lake chub, redside shiner and a single sub-adult norther pike were captured. Low to moderate seasonal rearing habitat is present for these species, however, over-wintering potential is severely limited by negligible winter flow (DES 2002; BC MECCS 2018b).

4.7.3 Traditional Knowledge Shared

DRFN reported that they fish for rainbow trout, speckled trout, grayling, whitefish, pickerel, salmon and jackfish in watercourses within their traditional territory.

BRFN requested that they be given an opportunity to provide traditional knowledge with respect to species presence, abundance and distribution. However, to date, BRFN has not provided traditional knowledge specific to fish and fish habitat.

4.7.4 Fish and Fish Habitat Effects Assessment

4.7.4.1 Identification of Potential Effects, Mitigation Measures, and Potential Residual Effects

As per the Fisheries Habitat Assessment done during the original EAC application, the ephemeral tributary at the northwest corner of the existing landfill is nonfish-bearing, offering only seasonal connectivity to the unnamed tributary located approximately 1.5 km downstream (DES 2002). Consequently, there is no direct discharge of surface water to water bodies, and no known channel connections exist between the proposed Project expansion and nearby fish-bearing water bodies (CCS 2002).

As previously discussed under the Surface Water VC in Section 4.4., no deleterious effects to the environment from stormwater discharge or leachate contamination have been documented to date, and the proposed Project expansion will be incorporated into Tervita's existing annual surface water monitoring sampling and monitoring program. In consideration of the fish and fish habitat characteristics discussed, scope of proposed Project expansion operation and design, results of the previous habitat assessment (DES 2002) as well as results of the assessment on surface water in Section 4.4, the proposed Project expansion is not expected to result in a change in habitat or mortality risk and no potential impacts to the Fish and Fish Habitat VC are predicted. Consequently, no mitigation measures are required, and further assessment of the Fish and Fish Habitat VC is not warranted.

4.7.4.2 Cumulative Effects Assessment

No residual effects have been identified for the Fish and Fish Habitat VC; therefore, a cumulative effects assessment is not required.

4.7.5 Follow-up Strategy

A follow-up strategy should be considered where a residual effect and/or cumulative effect has been identified. There are no residual or cumulative effects identified for the Fish and Fish Habitat VC; therefore, a follow-up strategy is not required.

4.8 Wildlife and Wildlife Habitat

Table 4.8-1 shows the subcomponents and KIs for the Wildlife and Wildlife Habitat VC as approved by the BC EAO in the VC Rationale Document for the proposed Project expansion (CH2M 2016b).

Table 4.8-1. Wildlife and Wildlife Habitat Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Moose • Other ungulates • Black bear • Furbearers (including species of importance to Aboriginal groups such as porcupine and beaver) • Mature and old-forest birds • Early seral forest birds • Western toad	• Change in habitat (including usage of mineral licks and changes to diet) • Change in movement and distribution • Change in mortality risk	• BC EAO Guidelines and original EAC Application. • Construction and operations may affect mammal, bird and amphibian wildlife species, including species at risk, through changes in habitat (for example, the removal or alteration of habitat), movement (for example, sensory disturbance that produces a barrier or filter to movement, or wildlife attraction to the Project Area), mortality risk (for example, vehicle collisions or increased human-wildlife conflict), and their interactions. Potential impacts may occur during construction, operation, or closure activities. The landfill will be fenced to help prevent wildlife interaction with operations. • The changes in habitat resulting from the proposed Project expansion may affect usage of nearby mineral licks. • The proposed Project expansion site will occur adjacent to the existing landfill footprint on land that was previously used for agriculture, therefore, potential for direct alteration of wildlife habitat is limited. Indirect habitat alteration may arise from noise, artificial light, dust, or surface water moving beyond the Project footprint. • With the increase in traffic volumes during construction phases, the potential risk of road kills for a number of species – particularly ungulates, small mammals and birds – is increased. However, Tervita has strict controls in place on speed limits to reduce the potential risk of road kills.

4.8.1 Assessment Boundaries

The following assessment boundaries have been defined for the Wildlife and Wildlife Habitat VC.

4.8.1.1 Spatial Boundaries

The spatial boundaries for the Wildlife and Wildlife Habitat VC are shown on Figures 3.2-1 and 3.2-2 and include the Project footprint as well as:

- LAA: A 1-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities.

  Key considerations used to establish the spatial boundaries of the Wildlife and Wildlife Habitat LAA for the proposed Project expansion include the effects pathways, and available information on wildlife sensitivity to disturbance (for example, zones of influence, setback distances).
- RAA: A 5-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities.

  Key considerations used to establish the spatial boundaries of the Wildlife and Wildlife Habitat RAA for the proposed Project expansion included the following:

  – Biologically relevant spatial scale at which management of wildlife species occurs.

  – Home range and dispersal distance of wildlife species.

– The species likely to occur within the proposed Project expansion area with the largest home ranges and territories are black bear, moose and elk. The home ranges of each of these species vary between individuals and seasons; however, the Wildlife and Wildlife Habitat RAA encompasses the average movements for each of these species (moose: Doerr 1983; Gillingham and Parker 2008; elk: Gillingham and Parker 2008; black bear: Blood 2001), and therefore, is likely to allow for a meaningful assessment of potential effects to wildlife species and wildlife habitat within a regional landscape context.

4.8.1.2 Temporal Boundaries

The temporal boundaries identified for the Wildlife and Wildlife Habitat VC include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading and compaction. As each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).
- Closure/reclamation phase. When the capacity of all cells is reached, the landfill will be capped with an impermeable cap and top soil and seeding will occur (approximately 1 year following operations – Year 26).
- Postclosure phase is when the entire landfill has been capped and reclaimed and monitoring will occur (approximately 25 years – Years 26 to 51).

4.8.1.3 Administrative Boundaries

Administrative boundaries refer to the effects of political, economic, or social boundaries on an Environmental Assessment. No administrative boundaries have been identified for the Wildlife and Wildlife Habitat VC.

4.8.1.4 Technical Boundaries

Technical boundaries refer to a proponent's ability to predict the effects of a project. No technical boundaries have been identified for the Wildlife and Wildlife Habitat VC. Information on existing conditions was based on a desktop review and field surveys. The potential adverse effects of landfill construction, operations, closure/reclamation, and postclosure on vegetation are generally well-understood and have predictable effects. This understanding, in conjunction with the results of the desktop review, meant that there was a complete technical understanding for conducting the assessment.

4.8.2 Existing Conditions

The following methods of data collection have been used to inform the description of existing conditions for the Wildlife and Wildlife Habitat VC:

- Desktop review of provincial and regional information sources
- Site investigations and data collection efforts (Appendices 7, 8, 9, and 10)
- Soil sampling program for the PDMA
- Traditional Knowledge information

Data from these sources provide an appropriate baseline for assessing the effects of the Project on wildlife and wildlife habitat. Field surveys were conducted using standard protocols during summer, late winter, early winter and spring, providing data on the presence of wildlife in different seasons. The results of the desktop review combined with the field surveys have gathered enough data to provide a thorough understanding of the existing conditions to inform the assessment.

The proposed Project expansion is located in the BWBS BGC Zone (Meidinger and Pojar 1991) within the PRRD. The proposed Project expansion will be constructed on land that is owned by Tervita and is located within the existing fenced boundaries of the operating landfill. There is low natural vegetation diversity within the Project footprint, as vegetation has been disturbed by past agricultural activities. Land uses in the area include agriculture and oil and gas activity.

The proposed Project expansion is not located within any provincially identified wildlife areas (for example, UWR or WHA) (GBC 2019b; BC MFLNRORD 2018c). The proposed Project expansion is not located within any Parks and Protected Areas (GBC 2019b), Important Bird Areas (Bird Studies Canada and Nature Canada 2004-2010), Migratory Bird Sanctuaries (ECCC, 2017), National Wildlife Areas (ECCC 2018), Western Hemisphere Shorebird Reserves (WHSRN 2018), or Ramsar wetlands (Bureau of the Convention on Wetlands 2016).

The following wildlife surveys were completed for the proposed Project expansion:

- An Early Summer Wildlife Survey on June 24, 2015 (Appendix 7)
- An Early-mid Winter Snow Tracking Survey on January 24 and 25, 2017 (Appendix 8)
- A Late-winter Snow Tracking Survey on March 13 and 14, 2017 (Appendix 9)
- A Spring Breeding Bird and Amphibian Survey on June 9, 13, and 30, 2017 (Appendix 10)

4.8.2.1 Winter Track Surveys

Winter track surveys were used to collect information on the presence, distribution, relative abundance, and habitat associations of mammals and upland bird species in the Project footprint and adjacent areas. A total of 13 wildlife species (that is, deer, elk, moose, coyote, lynx, black bear, marten/fisher, weasel/ermine, snowshoe hare, red squirrel, mouse/vole, grouse *sp.* and raptor/owl *sp*.) or their sign were observed during the early-mid and late-winter wildlife surveys. No species of conservation concern were conclusively observed during the surveys (that is, marten/fisher tracks were observed, but it is not possible to confirm which species). Notably, fewer tracks were observed overall during the late-winter survey than during the early to mid-winter survey in January 2017. Mammal tracks that were observed during the surveys included moose, deer, coyote, lynx, marten/fisher, weasel/ermine, snowshoe hare, red squirrel, and mouse/vole. The most abundant tracks observed were snowshoe hare. Photos of selected tracks are provided in Appendix A of the winter reports (Appendices 8 and 9).

4.8.2.2 Spring/Summer Surveys

The wildlife surveys conducted in June 2015 (Appendix 7) and 2017 (Appendix 10) were completed in the proposed Project expansion footprint and adjacent areas to document wildlife and wildlife sign (for example, scat, browse, tracks, cavity nests, stick nests, etc.). In addition, areas of potential interest beyond the Project footprint were investigated (for example, game trails, riparian areas). The areas surveyed were reviewed for their potential to support species with special conservation status, as well as to provide comment on the proposed Project expansion footprint from a wildlife and wildlife habitat perspective.

Breeding bird point count surveys were conducted during both surveys to collect information on the presence of breeding bird species and information on habitat use. A total of 36 and 23 bird species were observed during the June 2015 and 2017 surveys, respectively. Most commonly observed bird species were black-and-white warblers (observed primarily in forested areas), Wilson's warblers and white-throated sparrows (observed in both forest and shrubby habitats), and savannah sparrows (observed primarily in the hayfield). A Canada warbler, listed as Threatened under Schedule 1 of *SARA* and by COSEWIC, was heard during the 2015 survey; and one raptor was visually observed, a northern harrier foraging over a hayfield. One nightjar species, the common nighthawk, was observed taking off from the ground in the hayfield when flushed by the northern harrier. A red-tailed hawk was also observed during the 2017 survey.

Four mammal species or their sign were observed during wildlife fieldwork in 2015 (Appendix 7). Moose, elk, and deer scat were observed in several locations, primarily in the shrubby margin between the forest

and the hayfield. One set of elk tracks were observed. Several red squirrel middens were observed in the forested area of the Project footprint.

Amphibian surveys were targeted at low-lying wet areas adjacent to the expansion area to expand the survey coverage beyond the areas checked in 2015. Juvenile western toads were observed in 2015 at the east edge of the Project footprint (Appendix 7). One of the goals of these spring surveys was to identify potential breeding habitat near the proposed Project expansion, including the possible habitat in a small shrubby low-lying area at the east edge of the Project footprint. A total of 22 amphibian surveys were conducted in June 2017 (Appendix 10). Amphibian surveys were conducted at eleven low-lying wet areas during the course of the June surveys, one location inside the Project footprint and nine outside the Project footprint. Two amphibian species were observed during the June 2017 site visits, including numerous wood frog tadpoles, juveniles and adults; and only one western toad juvenile observation. Wood frog tadpoles and adults were observed in all but low-lying locations during the site visits. The western toad was observed at the east edge of the Project footprint in the same low-lying ditch where the other toad was observed in 2015. No western toad breeding habitat was observed during the site visits in June 2015 or 2017.

4.8.2.3 Wildlife Species of Conservation Concern

No species of conservation concern were conclusively observed during the winter tracking surveys (that is, marten/fisher tracks were observed, but it is not possible to confirm which species).

Three species of conservation concern were observed during the wildlife field survey on June 24, 2015:

- Canada warbler (Blue-listed in BC, Threatened under Schedule 1 of *SARA* and by COSEWIC)
- Common nighthawk (Threatened under Schedule 1 of *SARA* and designated as Special Concern by COSEWIC)
- Western toad (Blue-listed in BC, Special Concern under Schedule 1 of *SARA* and by COSEWIC)

During the 2017 wildlife survey, one auditory, incidental observation of an olive-sided flycatcher (Blue-listed in BC, Threatened under Schedule 1 of *SARA* and designated as Special Concern by COSEWIC) was recorded on June 30 in the southeast corner approximately 100 m from the Project footprint.

4.8.3 Traditional Knowledge Shared

DRFN reported that hunting is an important activity throughout their traditional territory. Culturally important species include moose, caribou, elk, deer, sheep, goats, black and grizzly bear, furbearers, porcupine and grouse. In particular, caribou and moose are important species to DRFN. DRFN have observed declines in numbers of caribou and moose within their traditional territory and have also observed changes in the quality of the meat due to pollution, disease and an increase in parasites. DRFN reported that community members require access to healthy ecosystems that support the wildlife used for hunting and trapping.

DRFN recommended that Tervita assist in the reforestation of forested lands within the Local Effects Area to provide habitat for wildlife species and, also, requested that DRFN be included in the decisions about the vegetation that is planted during restoration to ensure that it benefits local wildlife. For example, specific species of berries, lichen and other plants are known to be grazed by caribou in different seasons. DRFN also recommended protection of areas of high habitat quality and best practices to avoid animal disturbance. In addition, DRFN provided mitigation measures for caribou including a rest period of 10 years for development in one third of the caribou range, a ban of industrial activity in caribou calving habitat, fencing of man-made licks and industrial sites like landfill sites, and establishing a monitoring program.

DRFN reported that based on the wildlife studies conducted that birds and amphibian species appear to be the most likely at highest direct risk of disturbance from the proposed Project expansion. DRFN

supports the recommendations of the study to conduct an amphibian salvage of frogs or toads within the Project footprint prior to construction and to conduct nest sweeps of the shrubby low-lying area in the southeastern corner before construction starts if vegetation clearing starts within the breeding bird window.

BRFN understands that the area is important for birds including the eared grebe. BRFN is concerned that additional lighting at dawn and dusk which are critical periods for migratory birds, may have effects on bird navigation and way-finding.

BRFN shared that the area is used by ungulates including moose, deer and elk. BRFN are concerned that animals browsing shrubs and using lick sites or getting water from areas immediately downstream and downgradient from the proposed Project expansion may become contaminated if the site is expanded. To capture wildlife activity in the area, BRFN recommended a minimum of four wildlife cameras to determine how moose and other ungulates are using these areas. These cameras were added by Tervita in September 2016.

BRFN expressed concerns that the wildlife and wildlife habitat VC is not disaggregated enough to identify those species of importance to BRFN such as moose. BRFN expressed concern that traditional knowledge has not been used to understand behaviours and movement patterns of wildlife of importance to BRFN, although BRFN did not share traditional knowledge related to this.

4.8.4 Wildlife and Wildlife Habitat Effects Assessment

4.8.4.1 Identification of Potential Effects, Mitigation Measures, and Potential Residual Effects

The identification of the potential effects of the proposed Project expansion on the Wildlife and Wildlife Habitat VC is based on the results of the desktop assessment for the proposed Project expansion, as well as information from field surveys.

The proposed Project expansion is anticipated to interact with the Wildlife and Wildlife Habitat VC during the following construction, operations, closure/reclamation, and postclosure activities:

- Transportation/mobilization of equipment and workers to the site
- Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure
- Waste acceptance, placement, and compaction
- Leachate management, stormwater management, and ongoing monitoring
- Cell capping
- Postclosure maintenance and monitoring
- Air quality and dust dispersion, deposition and vegetation uptake of contaminants

Table 4.6-2 identifies the potential effects of the proposed Project expansion on the Wildlife and Wildlife Habitat VC, as well as mitigation measures and potential residual effects. The potential effects include changes in wildlife habitat from direct and indirect effect pathways, changes in wildlife movement, and changes in wildlife mortality risk. Potential effects associated with water and air quality, including dust dispersion, deposition, and vegetation uptake of contaminants is considered in the assessment of indirect effects on wildlife habitat. Potential effects associated with wildlife health from contaminant exposure are further evaluated in Section 8 and the SLHHRA for the Project (refer to Section 4.2.4 in Appendix 11), which found the risk from soil, groundwater, and surface water pathways to be low or unlikely.

Mitigation measures have been identified in a manner consistent with Section 3.5 of this Application. Mitigation measures to avoid potential adverse effects on the Wildlife and Wildlife Habitat VC include measures for avoiding interactions with wildlife. For example: Tervita will schedule construction activities outside of the migratory bird nesting period; an active landfill area will be fenced; all food and wastes will be stored and secured appropriately; feeding or harassment of livestock or wildlife will be prohibited; no firearms or pets are allowed on the Project site; and measures in the Erosion and Sediment Control Plan, the Leachate Management Plan, and the Stormwater Management Plan to prevent sediment, contaminants, waste materials, or leachate from being released to surface or subsurface water outside of

the Project footprint will be applied. Other proposed mitigation measures, as described in Table 4.8-2, focus on minimizing potential adverse effects on the Wildlife and Wildlife Habitat VC, such as minimization of noise through proper maintenance of equipment onsite, and dust suppression.

As the majority of these mitigation measures would be implemented prior to the initiation of, or during, activities associated with the construction, operations, closure/reclamation, and postclosure phases of the proposed Project expansion, they are expected to be effective immediately in reducing potential adverse effects on the Wildlife and Wildlife Habitat VC. Using a cover crop to assist in weed and erosion control, where warranted, is expected to have a time lag and a moderate effectiveness as establishment of cover crop would require time and depend on site conditions. Other mitigation measures described in Table 4.8-2 are consistent with BMPs for reducing adverse effects to wildlife and wildlife habitat and are generally described as having high effectiveness.

In addition to the summary of mitigation provided below, further measures are provided in the management planning documents (see Section 13) and the Silverberry Operations Plan.

Table 4.8-2. Wildlife and Wildlife Habitat – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction, Operations, Closure/Reclamation, and Postclosure	Loss or alteration of wildlife habitat	LAA	• Schedule construction activities outside the migratory bird nesting period of May 1 to July 31. Conduct a nonintrusive pre-construction nest survey in the event any clearing activities are scheduled within the migratory bird nesting period.	Minimization	Immediate	High	Loss or alteration of wildlife habitat
			• Use a cover crop to assist in weed and erosion control, where warranted.	Minimization	During all Project phases	Moderate	
			• If previously unidentified wildlife species with special conservation status or their site-specific habitat (for example, dens and nests) are identified during construction, suspend activities and notify the Environment & Regulatory Advisor, who will determine the appropriate mitigation measure to be implemented in consultation with a Wildlife Resource Specialist and the appropriate government authority, if applicable.	Minimization	Immediate	High	
			• Existing mitigation measures, such as dust suppression at the landfill, will be implemented for the proposed Project expansion, including the following: – Current mitigation measures will continue, such as occasional watering of roadways and curtailment of activity during high wind events. – Contractor will confirm that equipment is well-maintained. – Reduce idling of equipment, where possible. – Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. – Equipment to use low-sulphur diesel, as appropriate. – Implement additional measures provided in the Dust and Odour Control Plan and the Air Quality Monitoring Plan.	Minimization	Immediate	High	
			• Implement measures in the Erosion and Sediment Control Plan, the Leachate Management Plan, and the Stormwater Management Plan to prevent sediment, contaminants, waste materials, or leachate from being released to surface or subsurface water outside of the Project footprint.	Avoidance	Immediate	High	
	Changes to wildlife movement	LAA	• The active landfill area will be surrounded by a fence, as required by Section 8(a)(i) of the HWR, limiting wildlife interactions	Avoidance	Immediate	High	Changes to wildlife movement
			• All food and wastes will be stored and secured in vehicles or appropriate facilities.	Avoidance	Immediate	High	
			• Limit light and noise effects on wildlife by actively accepting waste on a prebooked basis from 7 a.m. to 7 p.m.	Minimization	Immediate	High	

Table 4.8-2. Wildlife and Wildlife Habitat – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction, Operations, Closure/Reclamation, and Postclosure	Increased wildlife mortality risk	LAA to RAA	• The feeding or harassment of livestock or wildlife will be prohibited. Construction and operations personnel will not be permitted to have firearms or pets on the Project site.	Avoidance	Immediate	High	Increased wildlife mortality risk
			• Schedule construction activities outside the migratory bird nesting period of May 1 to July 31. Conduct a nonintrusive pre-construction nest survey in the event any clearing activities are scheduled within the migratory bird nesting period	Avoidance and minimization	Construction	High	
			• If amphibians are found, Tervita will seek an amphibian salvage permit from BC MFLNRORD to salvage any amphibians from the Project footprint prior to construction activities.	Minimization	Construction	High	
			• Tervita personnel and contractors will be required to abide by all speed limits on the Project site and on transit to the site.	Minimization	Immediate	High	
			• All collisions (including wildlife) along the Project access road or within the Project site must be immediately reported to the Facility Manager. The root causes of the collision will be recorded and reasonably corrective measures will be put in place to try and prevent future collisions.	Restoration	Immediate	High	
			• Tervita will ensure compliance with safe operating practices so that wildlife will not come in contact with any spills, leaks, or other releases from Project facilities and equipment.	Minimization	Immediate	High	
			• Any wildlife mortalities or injuries at the Project site will be documented.	Restoration	Immediate	High	

[a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.
- Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

4.8.4.2 Characterization and Significance of Potential Residual Effects

Residual adverse effects on the Wildlife and Wildlife Habitat VC identified in Table 4.8-2 include loss or alteration of wildlife habitat, changes to wildlife movement, and increased wildlife mortality risk during construction and operations.

Table 4.8-3 provides a summary of the significance evaluation of the residual effects associated with the Wildlife and Wildlife Habitat VC during proposed Project expansion activities and considers the probability for significance in the evaluation as outlined in Section 3.

Table 4.8-3. Residual Effects Significance Evaluation for Wildlife and Wildlife Habitat Valued Component

Predicted Residual Effects	Spatial Boundary	Temporal Context			Magnitude	Probability	Confidence	Significance
		Duration	Frequency	Reversibility				
a) Loss or alteration of wildlife habitat	LAA	Short to extended-term	Infrequent to Continuous	Reversible	Low	High	High	Not significant
b) Changes to wildlife movement	LAA	Short to extended-term	Infrequent to Continuous	Reversible	Low	High	High	Not significant
c) Increased wildlife mortality risk	RAA	Short to extended-term	Singe/ Rare	Reversible	Low	Low	Moderate	Not significant

4.8.4.3 Loss or Alteration of Wildlife Habitat

A minor loss or alteration of wildlife habitat will result from construction and operations of the proposed Project expansion. The Project footprint is predominantly located on previously disturbed land, mostly hayfield. Approximately 2.2 ha of a young aspen forest habitat located along the eastern edge of the Project footprint may be directly disturbed by proposed Project expansion construction and operations. Within the forested area, there is also a small, shrubby low-lying wet area located in the southeast corner of the Project footprint. Surrounding forest habitat is dominated by young aspen forest and remnant patches of mature spruce dominated forest. If vegetation clearing occurs in the breeding bird window of May 1 to July 31 (BC MFLNRORD 2014), Tervita will engage a qualified environmental professional(s) to conduct nonintrusive nest surveys prior to construction. The highest likelihood of amphibians occurring in the Project footprint is in the southeast quadrant where a small, shrubby low-lying wet area is present. Prior to any construction in this area, Tervita will seek an amphibian salvage permit from BC MFLNRORD to salvage any amphibians from the Project footprint, if activities will occur during the amphibian breeding period.

Indirect habitat alteration occurs when habitat is available; however, the quality or effectiveness of the habitat is changed such that wildlife avoid the habitat or reduce their use of it. Habitat effectiveness may be affected by noise, light and activity associated with proposed Project expansion construction and operations (for example, traffic and machinery use). Sensory effects on wildlife can potentially include habitat loss or reduced habitat effectiveness through avoidance, increased energy expenditure, changes in normal behaviours (for example, feeding) and impaired communication between individuals. Bayne et al. (2005) determined that the abundance of passerines is up to 1.5 times greater near noiseless energy facilities than areas in the vicinity of noise-producing facilities. However, different species and even individuals of a given species are expected to respond differently to sensory disturbances. Various factors affect an animal's response to sensory disturbances, such as noise level and frequency distribution, duration, number of events, rate of onset, level of existing ambient noise, time of year or day, animal activity and location, animal age, life stage and gender. Completing site preparation activities outside

sensitive nesting, breeding and rearing periods for wildlife, will reduce potential effects associated with sensory disturbance and reduced habitat effectiveness. Where construction activities will occur during the summer, pre-construction surveys will be conducted in areas of suitable habitat for active nests of migratory birds and other important wildlife habitat features (such as, amphibian breeding sites), and appropriate buffers will be implemented to avoid disturbance of active habitat features.

Reduced habitat effectiveness can occur as a result of fragmentation, creation of edges, or sensory disturbance (for example, noise, artificial light, proximity to facilities and infrastructure, human activity, and traffic). Habitat fragmentation can cause habitat to become unsuitable for species with large territories or home ranges (that is, patch sizes become too small), alter predator-prey dynamics (Gehring and Swihart 2003) and allow for increased invasive or parasitic species abundance (for example, cowbird parasitism of songbird nests near forest edges). By constructing the landfill directly adjacent to the existing, operating landfill on an area of existing disturbance, the proposed Project expansion's potential effects on habitat fragmentation and isolation of habitat patches will be avoided.

Indirect alteration of habitat may also result from changes in vegetation communities. For example, vegetation uptake of contaminants from air quality and dust dispersion and deposition (refer to Section 4.6.4) can affect the quality of wildlife forage or cover habitat. Change in water quality is another effect pathway that could cause indirect effects on habitat quality outside of the Project footprint. Amphibians are particularly sensitive to changes in water quality or increased siltation that may result from construction adjacent to low-lying wet areas. The highest likelihood of amphibians occurring in the Project footprint is in the southeast quadrant where a small, shrubby low-lying wet area is present. As previously described, an amphibian salvage permit will be obtained to salvage any potential frogs or toads from the Project footprint prior to construction. In addition, implementing the Erosion and Sediment Control Plan, the Leachate Management Plan, and the Stormwater Management Plan to prevent sediment, contaminants, waste materials, or leachate from being released to surface or subsurface water outside the Project footprint is expected to avoid or reduce potential effects from changes in water quality on wildlife habitat during construction and operations. While there is lighting at the existing facility, there is no anticipated change in indirect effects on wildlife habitat from artificial lighting, as the proposed expansion does not require additional lighting.

The residual effect of construction and operations of the proposed Project expansion on wildlife habitat is reduced by limiting the area of disturbance (by expanding an existing operating landfill, overlapping existing disturbances, and using existing access). With implementation of the mitigation to reduce effects on water quality, vegetation, and low-lying wet habitats (Sections 4.4, 4.6, and 4.8), the residual effect of construction and operations of the proposed Project expansion on wildlife habitat is predicted to be low magnitude. Effects on wildlife habitat associated with temporary reduction in habitat effectiveness during construction activities are short-term in duration and infrequent. Effects on habitat resulting from ongoing operations are extended term duration and continuous frequency. Consequently, with a high level of confidence, the proposed Project expansion's residual effect of wildlife habitat loss or alteration is not significant (Table 4.8-3, point [a]).

4.8.4.4 Changes to Wildlife Movement

By constructing the proposed Project expansion on predominantly disturbed land within Tervita's existing, operational landfill, changes to wildlife movement from increased access or fragmentation will be avoided. Habitat effectiveness can be reduced when factors such as sensory disturbance reduce the use of habitat that would otherwise occur in the absence of such factors. Species such as the Connecticut warbler, Canada warbler, LeConte's sparrow and Nelson's sharp tailed sparrow, which may find suitable nesting and foraging habitat in the vicinity of the proposed Project expansion site, may experience reduced habitat effectiveness through the construction and operations phases of the landfill. However, construction for the active landfill cells will be localized within Tervita's existing operational site and is scheduled to occur during the summer and fall period. Therefore, sensory disturbance to breeding birds in the proposed Project expansion vicinity is expected to be negligible. The only increase in sensory disturbance will be localized (that is, restricted to the activity of the active cell) and occur from landfill operations, however, the predicted increase in sensory disturbance is expected to be negligible when compared to existing operations.

With the Application of the recommended mitigation such as fencing and preventing attraction of wildlife to the construction site, limiting noise from the Project and avoiding increased lighting at the site, the predicted residual effect of proposed Project expansion construction on wildlife movement patterns will be low magnitude. Effects on wildlife movement associated with construction activities are short-term in duration and infrequent. Effects on wildlife movement resulting from ongoing operations are extended term duration and continuous frequency. There is a good understanding of cause-effect relationships and sufficient information pertinent to the proposed Project expansion area to conclude with a high degree of confidence that the predicted residual effect of wildlife movement is not significant (Table 4.8-3, point [b]).

4.8.4.5 Increased Wildlife Mortality Risk

The level of mortality risk that will occur due to proposed Project expansion construction activities will depend on the species guild. Clearing can create risk of mortality for wildlife that nest or den in trees and understory vegetation. Vegetation clearing and soil handling activities may affect mammals and amphibians that inhabit woody debris, litter and soil. With the slight increase in traffic volume attributed to the proposed Project expansion, the potential risk of road kills for a number of species, particularly ungulates, small mammals and birds, is increased.

Wildlife mortality risk caused by the proposed Project expansion will be mitigated in part by scheduling (for example, initiating clearing and constructing outside the migratory bird nesting period to prevent mortality of nesting birds and young). For any construction activities that will be completed during seasons when wildlife may be breeding or rearing in habitats within or adjacent to the Project footprint, mitigation includes conducting pre-construction surveys for evidence of occupied habitat, such as migratory bird nesting sites, and implementing an amphibian salvage in the event amphibians are observed on the Project footprint. Risk of wildlife mortality will be further mitigated by using multi-passenger vehicles to transport crews, limiting and enforcing vehicle speed limits, relocating wildlife observed on the Project footprint, properly managing waste storage and disposal, and fencing the operational area to avoid access by wildlife. Furthermore, Tervita will enforce a no firearms/no hunting policy for all Project personnel and contractors on the proposed Project expansion site.

The potential increase in wildlife mortality risk as a result of construction activities is low magnitude and of low probability. There is a good understanding of cause-effect relationships and sufficient information pertinent to the proposed Project expansion area to conclude with a high degree of confidence that the predicted residual effect of increased wildlife mortality risk is not significant (Table 4.8-3, point [c]).

4.8.4.6 Cumulative Effects Assessment

The predicted adverse residual effects of the proposed Project expansion on Wildlife and Wildlife Habitat that will potentially interact with existing and reasonably foreseeable developments and activities to have cumulative effects within the Wildlife and Wildlife Habitat RAA include:

- Changes to wildlife habitat
- Changes to wildlife movement

Since increased wildlife mortality risk was assessed as having a low probability of occurrence (see Table 4.8-3, point[c]), it is not considered likely to interact spatially or temporally with the proposed Project expansion to have a cumulative effect.

4.8.4.7 Cumulative Loss or Alteration of Wildlife Habitat

It is expected that the proposed Project expansion and existing and reasonably foreseeable developments described in Section 3.9 have the potential to act cumulatively to result in the loss or alteration of wildlife habitat within the Wildlife and Wildlife Habitat RAA.

Existing activities that have resulted in the loss or alteration of wildlife habitat in the Wildlife and Wildlife Habitat RAA include agriculture, forestry, oil and gas, energy transmission, and infrastructure such as roads and railways. These activities typically alter wildlife habitat by creating openings, early seral forests

and fragmenting habitat patches. The proposed Project expansion will contribute to cumulative alteration of natural vegetation by disturbing approximately 2.2 ha during operation when cells are constructed along the east margins of the Project footprint. There are no other reasonably foreseeable developments identified within the Wildlife and Wildlife Habitat RAA (see Tables 3.9-1 and 3.9-2 and Figure 3.9-2); however, existing developments and activities identified in Section 3.9.1.2 are expected to continue into the future. It is assumed that agriculture and forestry activities, existing and proposed oil and gas projects (such as, construction of wells and pipelines as well as ongoing operations and maintenance activities), and associated traffic will occur concurrently with the proposed Project expansion within the Wildlife and Wildlife Habitat RAA to result in the potential loss or alteration of wildlife habitat.

Tervita will implement mitigation in Table 4.8-2 to reduce the proposed Project expansion's contribution to cumulative loss or alteration of wildlife habitat. It is expected that other industries such as oil and gas operators in the Wildlife and Wildlife Habitat RAA will implement industry standard mitigation (such as, the *Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area* [BC MFLNRORD 2014]) to reduce or avoid loss or alteration of wildlife habitat.

The predicted cumulative effect on wildlife habitat resulting from existing activities in combination with the proposed Project expansion and reasonably foreseeable developments is low magnitude and not significant, and is likely to persist with or without the proposed Project expansion. With a high degree of confidence, the proposed Project expansion's contribution to the cumulative effect is negligible in magnitude at the regional scale. No mitigation beyond the Project-specific mitigation already recommended in Table 4.8-2 is warranted.

4.8.4.8 Cumulative Changes in Wildlife Movement

Displacement and sensory disturbance of wildlife resulting from proposed Project expansion construction and operations activities may act cumulatively with existing sources of auditory and visual disturbances, including agriculture, forestry, oil and gas, energy transmission, and infrastructure such as roads and railways in the Wildlife and Wildlife Habitat RAA, to cause wildlife to alter their movement patterns (that is, avoidance). There are no other reasonably foreseeable developments identified within the Wildlife and Wildlife Habitat RAA (see Tables 3.9-1 and 3.9-2 and Figure 3.9-2); however, existing developments and activities identified in Section 3.9.1.2 are expected to continue into the future. It is assumed that agriculture and forestry activities, existing and proposed oil and gas projects (such as, construction of wells and pipelines as well as ongoing operations and maintenance activities), and associated traffic will occur concurrently with the proposed Project expansion within the Wildlife and Wildlife Habitat RAA resulting in a cumulative interaction causing changes in wildlife movement.

The magnitude of the cumulative effect on wildlife movement patterns is considered low to moderate in the Wildlife and Wildlife Habitat RAA, where roads, a railway, cutblocks in various stages of regeneration, oil and gas exploration (seismic lines), agriculture, transmission lines, and pipeline rights-of-way are expected to influence movement patterns throughout the RAA. The proposed Project expansion is predicted to have a minor incremental contribution of the cumulative effects on wildlife movement patterns in the Wildlife and Wildlife Habitat RAA, given the proposed Project expansion is situated at Tervita's existing, operating landfill, the use of existing access, and mitigation provided in Table 4.8-2. Cumulative effects on wildlife movement from existing and reasonably foreseeable developments are expected to be managed through the implementation of best practices and mitigation (such as, the *Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area* [BC MFLNRORD 2014]).

The predicted cumulative effect causing changes in wildlife movement in the Wildlife and Wildlife Habitat RAA is low to medium magnitude and is not significant, and is likely to persist with or without the proposed Project expansion. With a high degree of confidence, the proposed Project expansion's contribution to the cumulative effect is negligible to low magnitude at the regional scale. No mitigation beyond the Project-specific mitigation already recommended in Table 4.8-2 is warranted.

4.8.5 Follow-up Strategy

A follow-up strategy should be considered where a residual effect and/or cumulative effect has been identified. The implementation of the Traffic Management Plan, Wildlife Management Plan, and the Night Time Light Management Plan will reduce the potential effect to wildlife.

5. Economic Effects Assessment

This section of the Application presents the assessment of the potential effects of the proposed Project expansion on the Economy VC during the construction, operations, closure/reclamation, and postclosure phases of the proposed Project expansion.

The following subsection explains the selection process for the Economy VC, the associated subcomponents, and the KIs. The assessment boundaries for the Economy VC are described and existing conditions are summarized. The potential effects of the proposed Project expansion on the Economy VC has been identified, as measured with reference to the KIs. Proposed measures to mitigate or enhance the potential effects on the VC are also identified. Any residual effects on the VC have been characterized using the criteria set out in Section 3 of the AAIR and a determination of significance has been made. Any cumulative adverse effects likely to result from the residual adverse effects of the proposed Project expansion interacting with the residual adverse effects of past, present, and reasonably foreseeable developments have also been assessed.

5.1 Economy

Table 5.1-1 shows the subcomponents and KIs for the Economy VC as approved by the BC EAO in the VC Rationale Document for the proposed Project expansion (CH2M 2016b).

Table 5.1-1. Economy Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Resource-based economy • Barter economy • Employment	• Economic activity levels in the LAA and RAA • Employment levels	• The Project is expected to benefit the economy in some ways, which will be discussed in the Application. • The proposed Project expansion has the potential to affect resource economic activities (for example, hunting, trapping). The landfill helps support the oil and gas industry by providing an economic and secure disposal option. First Nations and resource users in the area are being actively consulted to determine potential effects. • The closure of the landfill in the future has the potential to adversely affect employment levels. • Each subcomponent will consider effects to First Nations communities and the public.

5.1.1 Assessment Boundaries

The following assessment boundaries have been defined for the Economy VC.

5.1.1.1 Spatial Boundaries

The spatial boundaries for the Economy VC are shown on Figures 3.2-3 and 3.2-4 and include the Project footprint as well as:

- LAA – Includes municipalities and communities, including First Nations communities, where it can be reasonably expected that direct economic activities will be undertaken. These communities include BRFN, DRFN, the Community of Buick, and the City of Fort St. John.

  The spatial boundaries of the Economy LAA include communities where it was considered that economic and employment activities directly related to the proposed Project expansion will occur.

- RAA – The area within Electoral Area B of the PRRD.

  The spatial boundaries of the Economy RAA include the area where direct and indirect economic influences could overlap with the proposed Project expansion and cause cumulative effects on the KI.

5.1.1.2 Temporal Boundaries

The temporal boundaries identified for the Economy VC include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading and compaction. As each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).
- Closure/reclamation phase. When the capacity of all cells is reached, the landfill will be capped with an impermeable cap and top soil and seeding will occur (approximately 1 year following operations – Year 26).
- Postclosure phase is when the entire landfill has been capped and reclaimed and monitoring will occur (approximately 25 years – Years 26 to 51).

5.1.1.3 Administrative Boundaries

Administrative boundaries refer to the effects of political, economic, or social boundaries on an Environmental Assessment. No administrative boundaries have been identified for the Economy VC.

5.1.1.4 Technical Boundaries

Technical boundaries refer to a proponent's ability to predict the effects of a project. No technical boundaries have been identified for the Economy VC. Information on existing conditions was based on a desktop review and Tervita's experience constructing and operating the existing landfill. The potential adverse effects of landfill construction, operations, closure/reclamation, and postclosure on the economy are generally well-understood and have predictable effects. This understanding, in conjunction with the results of the desktop review and available data, meant that there was a complete technical understanding for conducting the assessment.

5.1.2 Existing Conditions

The following methods of data collection have been used to inform the description of existing conditions for the Economy VC:

- Desktop review of economic activity in the LAA and RAA using provincial, regional, and municipal information sources

Data from these sources provide an appropriate baseline for assessing the effects of the Project on the economy. A desktop review of the economic activity in the LAA and RAA using provincial, regional, and municipal information sources provides appropriate data to inform the assessment of the effects of the proposed Project on the economy as it provides a snapshot of existing conditions. The economic benefits of the proposed Project are also well-understood.

5.1.2.1 Economic Context

Key industrial sectors in the Economy RAA primarily consist of oil and gas production, agricultural production and forestry. The proposed Project expansion is expected to contribute to the economic well-being of families and communities in the Economy RAA, and the type of proposed Project expansion activities described in Section 1.2 are compatible with employment and procurement activities and the local economies in the Economy RAA. The proposed Project expansion is expected to result in a positive interaction on the Economy VC.

The proposed Project expansion will, over more than 25 years of life, contribute millions of dollars in construction-related expenditures, labour income and employment, and taxes to the municipal, regional,

provincial, and federal governments. Construction expenditures are estimated to total approximately $43.5 million for all proposed cells. The operations phase expenditures are estimated to total approximately $3 million per year, and include regular maintenance and material expenditures, labour, and contracting. Costs associated with initial decommissioning and abandonment are estimated at approximately $7 to 8 million, and include activities such as soil and groundwater monitoring, leachate and stormwater testing, demolishing the office site, weigh scales, clay liners and berms, grading and contouring, erosion and dust control, topsoil replacement, seeding, and inspections. Annual costs associated with decommissioning and abandonment are estimated at $140,000, and include activities such as annual inspections and maintenance, soil and groundwater monitoring, laboratory testing of leachate and stormwater, dust control, mowing, and vegetation control. Reclamation requirements and associated costs will be determined during the decommissioning phase.

Currently, Silverberry pays a royalty of $0.90 per tonne of waste accepted per the *Waste Discharge Regulation*, which amounted to $269,199.73 in royalties in 2018. This revenue is expected to be similar for the proposed Project expansion if rates remain the same. The operations of the proposed Project expansion will also generate revenue in the form of property taxes. The construction of the proposed Project expansion will generate a demand for goods, services, and workers, which will contribute to the local and regional economy. There will be direct and indirect business income, and direct and indirect employment income. There will also be increased tax revenues during construction and operations as a result of sales tax and fuel tax, for example.

The proposed Project expansion will generate employment and contracting opportunities for Aboriginal and non-Aboriginal community members and businesses. The construction phase will require a workforce of approximately 20 personnel for 4 to 5 months to construct each cell, which is the equivalent to a total of 36 person-years for construction of all 6 proposed cells. The proposed Project expansion construction will provide most employment opportunities for local businesses and community members. Types of job requirements for landfill cell construction include an environmental and regulatory advisor, a landfill project manager, third-party landfill engineering firms, a construction crew, a liner crew, and an inspector. Although Tervita will make best efforts to hire locally, all major construction is sent out to bid and awarded to companies with appropriate experience versus cost. Companies are, however, typically Western Canadian. Tervita currently employs seven full-time personnel (175 person-years for the operations phase) residing in Fort St. John for operations and no additional full-time employment is expected to be generated for the proposed Project expansion.

5.1.2.2 Peace River Regional District

In 2016, the population of PRRD Electoral Area B was 5,628, an increase of 1.2 percent from 2011. In 2015, the number of total income recipients aged 15 years and over in private households was an estimated 3,505, with a median individual income of $36,036 and a median household income of $93,397. Approximately 70 percent of the total population in the PRRD Electoral Area B aged 15 years and over by labour force status, participated in the labour force and approximately 10.3 percent of the participating labour force was unemployed. In comparison, BC's employment provincial unemployment rate was 6.7 percent during the same year. Most common occupations by labour force are trades, transport and equipment operators and related occupations; management occupations; business, finance and administration occupations; followed by natural resources, agriculture and related production occupations. Most common industries by labour force are agriculture, forestry, fishing and hunting; mining, quarrying, and oil and gas extraction; followed by construction, retail trade and transportation and warehousing (Statistics Canada 2018).

Major employers in the PRRD include the school districts, Northern Health Authority, BC Hydro, energy, mining and forestry companies (PRRD 2018). While the PRRD has experienced strong economic growth, the residents recognize the importance of a balanced community, economy and environment. By expanding the existing landfill, Tervita will be able to continue providing a service to oil and gas operators in the region for the disposal of nonrecyclable wastes in a safe, environmentally responsible manner. In this way, and by constructing and operating the new landfill cells at Tervita's existing landfill site; the proposed Project expansion supports the economic goal established in the *North Peace Fringe Area Official Community Plan* of achieving a working balance that protects the well being, health and safety of

area residents, while ensuring a sustainable level of resource development (PRRD 2017). Refer to Section 1.2.5 for details of the proposed Project expansion's expected economic benefits.

5.1.2.3 City of Fort St. John

In 2016, the population of the City of Fort St. John was 20,155, an increase of 8.3 percent from 2011. In 2015, the number of total income recipients aged 15 years and over in private households was an estimated 15,055, with a median individual income of $48,851 and a median household income of $102,903. Approximately 79 percent of the total population in the City of Fort St. John aged 15 years and over by labour force status, participated in the labour force and approximately 10.8 percent of the participating labour force was unemployed. Most common occupations by labour force are sales and service occupations; trades, transport and equipment operators and related occupations; occupations in education, law and social, community and government services; business, finance and administration occupations; followed by natural and applied sciences and related occupations. Most common industries by labour force are construction; mining, quarrying, and oil and gas extraction; retail trade; accommodation and food services; health care and social assistance; followed by professional, scientific and technical services (Statistics Canada 2018).

Known as the "Energy Capital of BC", the City of Fort St. John is a major centre for the oil and gas industry in the region. Showing steady growth, Fort St. John is planning for further growth, working with industry to create a community that supports new energy projects and other resource projects (City of Fort St. John 2018a, 2018b). Guiding principles identified in the Official Community Plan include supporting a prosperous economy with a diverse cross-section of employment sectors, included oil and gas, while proactively ensuring development is delivered in a manner that has the least possible impact on areas of high natural value within and around the city (City of Fort St. John 2018b). By expanding the existing operating landfill on Tervita's existing, previously disturbed lands, Tervita will be able to continue providing a service to oil and gas operators in the region for the disposal of nonrecyclable wastes in a safe, environmentally responsible manner that aligns with guiding principles identified in the Official Community Plan. Refer to Section 1.2.5 for details of the proposed Project expansion's expected economic benefits.

5.1.3 Traditional Knowledge Shared

To date, although opportunities were provided to share traditional knowledge both directly and through the Working Group, no traditional knowledge has been shared by BRFN or DRFN in relation to economic effects.

5.1.4 Economic Effects Assessment

5.1.4.1 Identification of Potential Effects, Mitigation Measures, and Potential Residual Effects

The identification and assessment of the potential effects of the proposed Project expansion on the Economy VC is based on the results of results of previous studies and experience from the existing landfill, consultation and engagement, and professional judgement.

The proposed Project expansion is anticipated to interact with the Economy VC during the following construction, operations, closure/reclamation, and postclosure activities:

- Transportation/mobilization of equipment and workers to the site
- Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure
- Waste acceptance, placement, and compaction
- Leachate management, stormwater management, and ongoing monitoring
- Cell capping
- Postclosure maintenance and monitoring

Table 5.1-2 identifies the potential effects of the proposed Project expansion on the Economy VC, as well as mitigation measures and potential residual effects. Mitigation measures have been identified in a

manner consistent with Section 3.5 of this Application. The proposed Project expansion is anticipated to provide economic benefits. Mitigation measures described in Table 5.1-2 are enhancement measures that are considered to have high effectiveness in increasing local employment and local, provincial, and federal revenue. Except for the notification measure, which has an immediate effect, there will be a time lag for other enhancement measures described in Table 5.1-2 before their benefits are realized for local, provincial, and federal economy.

Table 5.1-2. Economy – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction, Operations, and Closure/Reclamation	Increased contract procurement and employment opportunities	RAA	• Inform appropriate municipalities, Aboriginal groups and economic development agencies of the Project developments and workforce details, as warranted.	Enhancement	Immediate	High	Increased contract procurement and employment opportunities.
			• Engage with the local and regional business community to notify businesses of project contracting, subcontracting, and employment opportunities and requirements.	Enhancement	During all Project phases	High	
	Increased local, provincial and federal revenue	RAA	• Increase government revenue by promoting local labour income and expenditure.	Enhancement	During all Project phases	High	Increased revenue for local, regional, provincial and federal governments.

[a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.
- Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC

5.1.4.2 Characterization and Significance of Potential Residual Effects

Residual effects on the economy identified in Table 5.1-2 include Increased contract procurement and employment opportunities, and increased revenue for local, regional, provincial and federal governments.

Table 5.1-3 provides a summary of the significance evaluation of the residual effects associated with the Economy VC during proposed Project expansion activities and considers the probability for significance in the evaluation as outlined in Section 3.

Table 5.1-3. Residual Effects Significance Evaluation for Economy VC

Predicted Residual Effects	Spatial Boundary	Temporal Context			Magnitude	Probability	Confidence	Significance
		Duration	Frequency	Reversibility				
a) Increased contract procurement and employment opportunities	RAA	Short to long-term	Continuous	Reversible	Low	High	High	Not significant
b) Increased revenue for local, regional, provincial and federal governments	RAA	Short to long-term	Continuous	Reversible	Low	High	High	Not significant

5.1.4.3 Contracting and Employment Opportunities

The proposed Project expansion will result in direct (employment directly related to proposed Project expansion construction and operations) and indirect (employment that supplies goods and services to the proposed Project expansion) employment opportunities, as well as direct and indirect income, and employment effects.

The capital cost of the proposed Project expansion is estimated at $43.5 million to be spent during the entire expansion. Approximately $9 million will be spent to expand the landfill every 3 to 4 years. The operations phase expenditures are estimated to total approximately $3 million per year, and include regular maintenance and material expenditures, labour, and contracting. Costs associated with initial decommissioning and abandonment are estimated at approximately $7 to 8 million. Annual costs associated with decommissioning and abandonment are estimated at $140,000.

Proposed Project expansion construction is expected to provide direct employment for approximately 20 workers during the 4 to 5 month construction period for each cell, which is the equivalent of total 36 person-years for construction of all 6 proposed cells. Types of job requirements for landfill cell construction include an environmental and regulatory advisor, a landfill project manager, third-party landfill engineering firms, a construction crew, a liner crew, and an inspector. Most skills required for the proposed Project expansion exist within the local Fort St. John area, Tervita intends to hire locally, where possible. Tervita currently employs seven full-time personnel (175 person-years for the operations phase) residing in Fort St. John for operations and no additional full-time employment is expected to be generated for the proposed Project expansion.

In addition to the direct economic benefits described above, purchases of supplies and services for Project development will generate indirect economic benefits. Construction purchases will include materials such as the geomembrane liner, gravel, leachate piping and sumps. Approximately 35 percent of the estimated $43.5 million construction costs will be allocated to cover these costs. It was assumed that the majority of construction purchases will be made locally. The geomembrane liner and filter fabric may, however, be purchased from outside the province. Furthermore, local businesses including lodging

accommodations, restaurants, and local service stations may also benefit economically during construction of the proposed Project expansion.

This positive predicted residual effect of increased contracting and employment opportunities is short to long-term in duration, reversible, and of low magnitude, and is, therefore, not significant (Table 5.1-3, point [a]).

5.1.4.4 Increased Revenue for Local, Regional, Provincial and Federal Governments

The construction of the proposed Project expansion will generate a demand for goods, services and workers, which will contribute to the local and regional economy. Currently, Silverberry pays a royalty of $0.90 per tonne of waste accepted per the *Waste Discharge Regulation*, which amounted to $269,199.73 in royalties in 2018. This revenue is expected to be similar for the proposed Project expansion if rates remain the same. There will be direct and indirect business income, and direct and indirect employment income. There will also be increased tax revenues during construction and operations as a result of sales tax and fuel tax, for example. The operations of the proposed Project expansion will also generate revenue in the form of property taxes.

This positive residual effect of increased revenue for local, regional, provincial, and federal governments is short to long-term in duration, reversible, and of low magnitude, and is, therefore, not significant (Table 5.1-3, point [b]).

5.1.4.5 Cumulative Effects Assessment

The cumulative effects assessment is to be completed for VCs where potential residual adverse effects are evaluated as likely to occur and will interact with other past, present, or reasonably foreseeable projects (BC EAO 2013, 2018). The predicted residual effects for the Economy VC are positive, and therefore, do not warrant a cumulative effects assessment.

5.1.5 Follow-up Strategy

A follow-up strategy should be considered where a residual effect and/or cumulative effect has been identified. No specific follow-up strategies have been identified for the Economy VC.

6. Social Effects Assessment

This section of the Application presents the assessment of the potential effects of the proposed Project expansion on the Land and Resource Use, Community Services and Community Infrastructure VCs during the construction, operations, closure/reclamation, and postclosure phases of the proposed Project expansion.

The following subsection explains the selection process for the Land and Resource Use, Community Services and Community Infrastructure VCs, the associated subcomponents, and the KIs. The assessment boundaries for the Land and Resource Use, Community Services and Community Infrastructure VCs are described and existing conditions are summarized. The potential effects of the proposed Project expansion on the Land and Resource Use, Community Services and Community Infrastructure VCs have been identified, as measured with reference to the KIs. Proposed measures to mitigate or enhance the potential effects on the VCs are also identified. Any residual effects on the VCs have been characterized using the criteria set out in Section 3 of the AAIR and a determination of significance has been made. Any cumulative adverse effects likely to result from the residual adverse effects of the proposed Project expansion interacting with the residual adverse effects of past, present, and reasonably foreseeable developments have also been assessed.

6.1 Land and Resource Use

Table 6.1-1 shows the subcomponents and KIs for the Land and Resource Use VC as approved by the BC EAO in the VC Rationale Document for the proposed Project expansion (CH2M 2016b).

Table 6.1-1. Land and Resource Use Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Agriculture • Oil and gas activity • Trapping • First Nation land and resource use including, but not limited to, hunting and trapping, as well as travel to First Nation land and resource use sites • Logging/forestry	• Area of grazing tenures and ALR affected • Oil and gas infrastructure and pipeline tenures affected • Viability of trapping tenures • Viability of identified First Nation land and resource use sites	• BC EAO Guidelines and original EAC Application. • The main land and resource use activities within a 5-km radius of the proposed Project expansion site include agriculture, oil and gas activities, trapping, and forestry. Project activities may disrupt land use activities on ALR, grazing tenures, trapping tenures, and pipeline tenures through potential physical disruption and potential access disruption during construction, operation, and closure. • First Nations land and resource use occurs within 5-km radius of the proposed Project expansion. • Cattle and forage production are the primary agricultural activities in the area.

6.1.1 Assessment Boundaries

The following assessment boundaries have been defined for the Land and Resource Use VC.

6.1.1.1 Spatial Boundaries

The spatial boundaries for the Land and Resource Use VC are shown on Figures 3.2-2 and 3.2-3 and include the Project footprint as well as:

- LAA: A 1-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities.

The Land and Resource Use LAA includes the areas where direct disturbance could occur to land and resource users (including, but not limited to, visual, physical and acoustic disturbance and changes to resources such as vegetation and wildlife).

- RAA: A 5-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities.

  The Land and Resource Use RAA includes the area where direct and indirect influences on land and resource use could overlap with the proposed Project expansion and cause cumulative effects on the KI.

6.1.1.2 Temporal Boundaries

The temporal boundaries identified for the proposed Land and Resource Use VC include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading and compaction. As each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).
- Closure/reclamation phase. When the capacity of all cells is reached, the landfill will be capped with an impermeable cap and top soil and seeding will occur (approximately 1 year following operations – Year 26).
- Postclosure phase is when the entire landfill has been capped and reclaimed and monitoring will occur (approximately 25 years – Years 26 to 51).

6.1.1.3 Administrative Boundaries

Administrative boundaries refer to the effects of political, economic, or social boundaries on an environmental assessment. No administrative boundaries have been identified for the Land and Resource Use VC.

6.1.1.4 Technical Boundaries

Technical boundaries refer to a proponent's ability to predict the effects of a project. No technical boundaries have been identified for the Land and Resource Use VC.

6.1.2 Existing Conditions

The following methods of data collection have been used to inform the description of existing conditions for the Land and Resource Use VC:

- Desktop review of provincial and regional information sources
- Discussion with local land users, including First Nations
- Review of available First Nations Traditional Use Studies

Data from these sources provide an appropriate baseline for assessing the effects of the Project on land and resource use. Provincial and regional information sources provide a general overview of land use activities in the Land and Resource LAA and RAA and discussion with local land users supplements this understanding. At the time of the Application BRFN had not provided a traditional use study to inform the proposed Project; however through other Project communications BRFN identified the Land and Resource LAA and RAA as areas where traditional land use activities occur and that resources harvested in traditional land use activities such as wildlife also use the Land and Resource Use LAA and RAA.

6.1.2.1 Agriculture

The proposed Project expansion is located on land designated for "Agriculture/Settlement" in the Fort St. John LRMP (Fort St. John LRMP Working Group 1997), and on ALR lands regulated by the *Agricultural Land Commission Act*. ALR lands constitute 11 percent of the land in the PRRD. Within the PRRD, the primary field crops that dominate agriculture production include barley, alfalfa, wheat, oats, canola, forage seed and other tame hay and fodder crops (PRRD 2014). The land in the Project footprint was approved for nonfarm use by the ALC on June 3, 2019 (see Section 4.1.2.2 for additional details).

A Regional Agricultural Plan is currently being prepared by the PRRD. The plan is intended to provide guidance to the PRRD for encouraging and supporting agricultural activity in the region (PRRD 2014). The plan will also identify strategies to enhance agriculture production in the context of competition with other land uses including oil and gas infrastructure (PRRD 2014).

As described in Section 4.6.2, most vegetation within the Project footprint has been disturbed by previous agricultural activities. See Section 4.1.2.2 for additional details on agricultural productivity.

6.1.2.2 Forestry/Logging

Other than agriculture and oil and gas related activities, forestry (that is, timber harvesting) is the dominant land use activity in the Land and Resource Use RAA. The proposed Project expansion is located in the Fort St. John TSA, where the current AAC is 2,115,000 m^3, consisting of 1.2 million m^3 from coniferous-leading stands and 915,000 m^3 from deciduous-leading stands (Province of BC 2018d). Leading tree species in the TSA include white spruce, lodgepole pine, aspen and black spruce while minor amounts of birch, balsam poplar and larch are also present (BC MFLNRORD 2018b). A site visit in 2017 confirmed recent logging and wildfire activity had occurred in the northeast portion of the LAA (refer to Section 4.6.2 for more details).

6.1.2.3 Trapping

BC is divided into registered traplines. Traplines are provincial management areas in which registration is granted to one or more licensed trappers for the trapping of furbearing animals under the BC *Wildlife Act*. Traplines are designated by a regional manager of the recreational fisheries and wildlife programs. The *Wildlife Act* regulates who may set a trap for, hunt, kill, take or capture a furbearing animal within a trapline (BC MFLNRORD 2018c).

There are 71 registered traplines (or portions of) within the Fort St. John LRMP area and commercially harvested furbearers in the area include marten, lynx, beaver, coyote and fox (Fort St. John LRMP Working Group 1997). One of the management objectives of the Fort St. John LRMP is to maintain trapping opportunities through honoring existing tenures and managing furbearer habitats and populations. The proposed Project expansion footprint overlaps with one registered trapping area (TR0745T007), though the existing level of activity associated with the trapline was not available at the time of this assessment (BC MFLNRORD 2018b).

6.1.2.4 Oil and Gas

Energy is the largest economic sector in the Fort St. John LRMP area, followed by the public sector and agriculture, forestry, and mining. The Land and Resource Use LAA and RAA are located in the oil and gas development area of the Montney basin, which is the largest contributor to natural gas production volumes in the province. Gas production has increased by 24 percent in the last 5 years in northeast BC (BC OGC 2017) (see Section 3.9.1.2 for additional details). The proposed Project expansion will be constructed within Tervita's existing property boundaries on land that is zoned for "Oil and Gas Production" under the PRRD Zoning By-law No. 1000.

6.1.2.5 First Nation Land and Resource Use

First Nations have identified land and resource use activities including a travel route and hunting, trapping, fishing and plant gathering in the proposed Project expansion LAA and RAA.

Doig River First Nation

DRFN identified hunting and trapping activities within the LAA and RAA and noted that caribou and moose are culturally important species. They also identified fishing sites within the LAA and RAA and noted the importance of waterways for fishing, drinking water, and as travel routes throughout their traditional territory. DRFN identified plant gathering throughout the LAA and RAA and indicated that plant gathering was an important cultural activity for intergenerational transfer of knowledge. They also identified two travel routes and an archaeological site within the LAA.

DRFN did not identify any land and resource use sites within the Project footprint (Urban Systems 2017). DRFN expressed concerns about access to Traditional Land Use (TLU) areas and to a healthy ecosystem that supports hunting, trapping, fishing and peaceful enjoyment of the land (Urban Systems 2017).

Blueberry River First Nations

BRFN have identified patterns of economic activity, land use and occupation within their traditional territory including hunting, fishing, trapping, camping and gathering resources (Macdonald 2016; Traditions Consulting Services, Inc. 2013). The traditional territory of BRFN is defined as extending from approximately Tumbler Ridge in the south, to the Sikanni Chief River in the north, west to the Rocky Mountains, and east to the Alberta border (BRFN 2012). This area lies within the PRRD and is where BRFN members traditionally carried out activities central to their way of life. There are many historical trails in the region that were used for travel and hunting, many of which were documented in a 1915 map of the Peace River Block and later used by a BC Land Surveyor in 1930 (BRFN 2012).

Today, BRFN members hunt moose, elk, dear, bear, mountain sheep and caribou (Traditions Consulting Services, Inc. 2013). Members also harvest medicinal plants, berries and root vegetables, and up to 15 different species of fish have been known to be caught by members in the region (Traditions Consulting Services, Inc. 2013; BRFN 2012). BRFN has expressed concerns about cumulative effects in the region, impacting their access to lands and resources that sustain their traditional way of life (Macdonald 2016).

6.1.3 Land and Resource Use Effects Assessment

6.1.3.1 Identification of Potential Effects, Mitigation Measures, and Potential Residual Effects

The identification of the potential effects of the proposed Project expansion on the Land and Resource Use VC is based on the results of desktop review of provincial and regional information sources; discussions with local land users, including First Nations; and review of available First Nations Traditional Use Studies.

The proposed Project expansion is anticipated to interact with the Land and Resource Use VC during the following construction, operations, closure/reclamation, and postclosure activities:

- Transportation/mobilization of equipment and workers to the site
- Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure
- Waste acceptance, placement, and compaction
- Cell capping
- Postclosure maintenance and monitoring

Table 6.1-2 identifies the potential effects of the proposed Project expansion on the Land and Resource Use VC, as well as mitigation measures, and potential residual effects. Mitigation measures have been identified in a manner consistent with Section 3.5 of this Application. As the proposed Project expansion

area is currently fenced, interactions with agricultural or recreational users, or with First Nations in terms of land use, are avoided. Mitigation measures described in Table 6.1-2 are consistent with BMPs for reducing adverse effects to land and resource use and are generally described as having high effectiveness. As these mitigation measures would be implemented prior to the initiation of, or during, activities associated with the construction, operations, and closure/reclamation phases of the proposed Project expansion, they are expected to be effective immediately in reducing potential adverse effects on land and resource use. Refer to Sections 4.4, 4.5, 4.6, and 4.8 for descriptions of other mitigation measures for land and resource use related to Surface Water, Groundwater, Terrestrial Vegetation, and Wildlife and Wildlife Habitat VCs, respectively.

In addition to the summary of mitigation provided herein, further measures are provided in the management planning documents (see Section 13) and the Silverberry Operations Plan.

Table 6.1-2. Land and Resource Use – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction, Operations, Closure/Reclamation, and Postclosure	Potential disruption of resource use activities including agriculture, timber harvesting, industrial use and trapping activities	RAA	• The proposed Project expansion footprint is currently fenced and not being used by agricultural or recreational users.	Avoidance	Immediate	High	Potential residual effects are expected to be avoided through the implementation of mitigation measures.
			• Provide forest tenure holders and trappers with information and protocols regarding the timeframe for construction.	Minimization	Immediate	High	
			• Consult with forest tenure holders and trappers and consider specific requests for mitigation.	Minimization	Immediate	High	
			• Inform and consult with interested federal and provincial agencies with the potential to be impacted by the Project, as warranted.	Minimization	Immediate	High	
	Potential disruption of First Nation land and resource use including access to lands	LAA	• The proposed Project expansion footprint is currently fenced and not being used by First Nations.	Avoidance	Immediate	High	Potential residual effects are expected to be reduced to negligible levels through the implementation of mitigation measures.
			• Provide First Nations with information and protocols regarding the timeframe for construction.	Minimization	Immediate	High	
			• Consult with First Nations and consider specific requests for mitigation.	Minimization	Immediate	High	
			• Refer to Section 4.8 for mitigation measures relating to Wildlife and Wildlife Habitat.	Refer to Section 4.8			
			• Refer to Section 4.6 for mitigation measures relating to Terrestrial Vegetation.	Refer to Section 4.6			
			• Refer to Section 4.5 and Section 4.4 for mitigation measures relating to Groundwater and Surface Water.	Refer to Sections 4.4 and 4.5			
			• As no effects have been identified for fish and fish habitat (Section 4.7), no mitigation measures are required.	N/A	N/A	N/A	

[a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.
- Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

6.1.3.2 Characterization and Significance of Potential Residual Effects

Potential effects on the Land and Resource use VC will be reduced to negligible levels by constructing the proposed Project expansion on Tervita's existing fenced, operational landfill, by providing advanced notification of the construction schedule, and through consultation with land users and First Nations in the proposed Project expansion area. No additional land will be taken from First Nations or recreational users in the RAA (for example, trappers and/or forestry companies) and operational activities are not expected to affect First Nations land and resource use, trapping or forestry activities beyond any impacts that already exist as a result of the existing landfill.

The proposed Project expansion is compatible with the strategies identified in the Fort St. John LRMP and has been granted permission for nonfarm use by the ALC. The management strategy with respect to the agriculture/settlement zone within the Fort St. John LRMP (for which the proposed Project expansion is located) encourages multiple land and resource uses where appropriate and achievable (Fort St. John LRMP Working Group 1997). Final cover upon closure will meet agricultural standards as provided in the CSR, and Tervita will work with BC MECCS to consider future land uses upon closure.

With the implementation of appropriate mitigation measures, including mitigation measures for the VCs that support First Nation land and resource use, potential residual effects are predicted to be negligible for the Land and Resource Use VC and a characterization and evaluation of significance of residual effects is not warranted.

6.1.3.3 Cumulative Effects Assessment

No residual effects have been identified for the Land and Resource Use VC, therefore, a cumulative effects assessment is not required.

6.1.4 Follow-up Strategy

A follow-up strategy should be considered where a residual effect and/or cumulative effect has been identified. There are no residual or cumulative effects identified for the Land and Resource Use VC, therefore, a follow-up strategy is not required.

6.2 Community Services

Table 6.2-1 shows the subcomponents and KIs for the Community Services VC as approved by the BC EAO in the VC Rationale Document for the proposed Project expansion (CH2M 2016b).

Table 6.2-1. Community Services Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Community utilities and services	• Community and utility services capacity and demand • Accommodation capacity and demand • Health service impacts	• BC EAO Guidelines and original EAC Application. • Community utilities and services may be required by the proposed Project expansion workforce, and therefore may increase the demand on community services, utilities, and accommodation during transport of workers in construction, operation, and closure activities. The surrounding municipality is being consulted and any concerns will be addressed.

6.2.1 Assessment Boundaries

The following assessment boundaries have been defined for the Community Services VC.

6.2.1.1 Spatial Boundaries

The spatial boundaries for the Community Services VC are shown on Figure 3.2-3 and 3.2-4 and include the Project footprint as well as the following:

- LAA: The areas within the boundaries of the City of Fort St. John and the Community of Buick.

  The Community services LAA is defined by the boundaries of communities where direct effects on community services could occur, and where a community could offer goods or services.

- RAA: The area within Electoral Area B of the PRRD.

  The Community Services RAA is the regional district, to characterize and assess the cumulative effects of the proposed Project expansion on regional services.

6.2.1.2 Temporal Boundaries

The temporal boundaries identified for the Community Services include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading and compaction. As each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).
- Closure/reclamation phase. When the capacity of all cells is reached, the landfill will be capped with an impermeable cap and top soil and seeding will occur (approximately 1 year following operations – Year 26).
- Postclosure phase is when the entire landfill has been capped and reclaimed and monitoring will occur (approximately 25 years – Years 26 to 51).

6.2.1.3 Administrative Boundaries

Administrative boundaries refer to the effects of political, economic, or social boundaries on an environmental assessment. No administrative boundaries have been identified for the Community Services VC.

6.2.1.4 Technical Boundaries

Technical boundaries refer to a proponent's ability to predict the effects of a project. No technical boundaries have been identified for the Community Services VC. The potential adverse effects of landfill construction, operations, closure/reclamation, and postclosure on community services are generally well understood and have predictable effects. This understanding, in conjunction with the results of the desktop review and available data, meant that there was a complete technical understanding for conducting the assessment.

6.2.2 Existing Conditions

Information on existing conditions of community services in the Electoral Area B (that is, Community Services RAA) was based on a desktop review of online information, primarily from Statistics Canada, the PRRD, and the City of Fort St. John and based on Tervita's experience constructing and operating the existing landfill. Data from these sources provide an appropriate baseline for assessing the effects of the Project on community services.

6.2.2.1 Community Service Context

The nearest communities with services to the proposed Project expansion are the City of Fort St. John (approximately 50 km southeast), the District Municipality of Taylor (approximately 60 km south), and the

Community of Wonowon (approximately 40 km northwest), which provide accommodation, restaurants, groceries, gas, and diesel. The Community of Buick, which consists of several houses, a community hall and a small store, is located approximately 16 km north.

In 2016, PRRD Electoral Area B had a population of 5,628, an increase of 1.4 percent from 2011 (Statistics Canada 2018). In 2016, the City of Fort St. John had a population of 20,155, an increase of 8.3 percent from 2011. In 2016, the District Municipality of Taylor had a population of 1,469, an increase of 7.0 percent from 2011 (Statistics Canada 2018).

6.2.2.2 Traditional Knowledge Shared

To date, although opportunities were provided to share traditional knowledge both directly and through the Working Group, BRFN and DRFN have not provided any traditional knowledge in relation to community services.

6.2.3 Community Services Effects Assessment

6.2.3.1 Identification of Potential Effects, Mitigation Measures, and Potential Residual Effects

The identification and assessment of the potential effects of the proposed Project expansion on the Community Services VC is based on the results of results of previous studies and experience from the existing landfill, consultation and engagement, and professional judgement.

The proposed Project expansion is anticipated to interact with the Community Services VC during the following construction, operations, closure/reclamation, and postclosure activities:

- Transportation/mobilization of equipment and workers to the site
- Postclosure maintenance and monitoring

Table 6.2-2 identifies the potential effects of the proposed Project expansion on the Community Services VC, as well as mitigation measures, and potential residual effects. Mitigation measures have been identified in a manner consistent with Section 3.5 of this Application. As the proposed Project expansion will rely on certain community utilities and services, avoidance and restoration are not directly applicable; therefore, mitigation measures have focused on minimization. As these mitigation measures would be implemented prior to the initiation of, or during, activities associated with the construction, operations, closure/reclamation, and postclosure phases of the proposed Project expansion, they are expected to be effective immediately in reducing potential adverse effects of disruption of community life by temporary workers. Mitigation measures described in Table 6.2-2 have high effectiveness, as observed at the existing landfill. Refer to Sections 5.1 (Economy), 6.1 (Land and Resource Use), 6.3 (Community Infrastructure), and 8 (Human Health) for descriptions of other mitigation or enhancement measures related to the Community Services VC.

Table 6.2-2. Community Services – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction, Operations, Closure/Reclamation, and Postclosure	Disruption of community life by temporary workers	RAA	• Inform all responsible federal and provincial resource agencies and interested municipal officials of the Project developments, as warranted.	Minimization	Immediate	High	Potential residual effects are expected to be avoided through the implementation of mitigation measures.
			• Provide potentially affected Aboriginal groups with the proposed Project expansion construction schedule and maps.	Minimization	Immediate	High	
			• Adhere to Tervita's Alcohol and Drug Policy.	Minimization	Immediate	High	
			• Adhere to Tervita's HSE Program.	Minimization	Immediate	High	
			• See mitigation to address potential effects related to Land and Resource Use in Section 6.1.	Refer to Section 6.1.			
			• See mitigation to address the potential effects on Community Infrastructure in Section 6.3.	Refer to Section 6.3			
			• See mitigation to address potential effects related to Human Health in Section 8.	Refer to Section 8			
			• See enhancement measures related to Economy in Section 5.1.	Refer to Section 5.1			

[a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.
- Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

Note:

HSE = Health, Safety, and the Environment

6.2.3.2 Characterization and Significance of Potential Residual Effects

The City of Fort St. John contains numerous hotels and motels, gas stations, restaurants and other services that may be utilized by the temporary proposed Project expansion workforce consisting of 20 personnel. The City of Fort St. John also contains emergency, health and social services including the Fort St. John Hospital. It is anticipated that the capacity of local community services and facilities can handle the demands of the proposed Project expansion workforce without overburdening them or displacing local resident use. Due to the limited size of the proposed Project expansion workforce and sufficient availability of services in the City of Fort St. John, construction and operations of the proposed Project expansion is expected to have a negligible adverse impact on the Community Services VC and, consequently, with implementation of mitigation provided in Table 6.2-2, no residual effects were identified for the Community Services VC.

6.2.3.3 Cumulative Effects Assessment

No residual effects have been identified for the Community Services VC; therefore, a cumulative effects assessment is not required.

6.2.4 Follow-up Strategy

A follow-up strategy should be considered where a residual effect and/or cumulative effect has been identified. There are no residual or cumulative effects identified for the Community Services VC, therefore, a follow-up strategy is not required.

6.3 Community Infrastructure

Table 6.3-1 shows the subcomponents and KIs for the Community Infrastructure VC as approved by the BC EAO in the VC Rationale Document for the proposed Project expansion (CH2M 2016b).

Table 6.3-1. Community Infrastructure Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Traffic and transportation infrastructure	• Traffic volumes • Transportation infrastructure disturbance	• BC EAO Guidelines and original EAC Application. • Traffic volumes will be slightly increased during construction activities, and transportation infrastructure may be disturbed during construction, operation, and closure activities. During operation, vehicular traffic volumes will be the same as for the currently approved landfill. Vehicular traffic can track mud from the landfill onto public roads. The surrounding municipality is being consulted and any concerns will be addressed.

6.3.1 Assessment Boundaries

The following assessment boundaries have been defined for the Community Infrastructure VC.

6.3.1.1 Spatial Boundaries

The spatial boundaries for the Community Infrastructure VC are shown on Figure 3.2-3 and 3.2-4 and include the Project footprint as well as the following:

- LAA: The areas within the boundaries of the City of Fort St. John and the Community of Buick.

  The Community Infrastructure LAA is defined as the boundaries of communities where direct effects on community infrastructure could occur, and where a community could offer goods or services.

- RAA: The area within Electoral Area B of the PRRD.

  The Community Infrastructure RAA is the regional district, to characterize and assess the cumulative effects of the proposed Project expansion on regional infrastructure (for example, roads).

6.3.1.2 Temporal Boundaries

The temporal boundaries identified for the Community Infrastructure VC include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading and compaction. As each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).
- Closure/reclamation phase. When the capacity of all cells is reached, the landfill will be capped with an impermeable cap and top soil and seeding will occur (approximately 1 year following operations – Year 26).
- Postclosure phase is when the entire landfill has been capped and reclaimed and monitoring will occur (approximately 25 years – Years 26 to 51).

6.3.1.3 Administrative Boundaries

Administrative boundaries refer to the effects of political, economic, or social boundaries on an environmental assessment. No administrative boundaries have been identified for the Community Infrastructure VC.

6.3.1.4 Technical Boundaries

Technical boundaries refer to a proponent's ability to predict the effects of a project. No technical boundaries have been identified for the Community Infrastructure VC. The potential adverse effects of landfill construction, operations, closure/reclamation, and postclosure on community infrastructure are generally well understood and have predictable effects. This understanding, in conjunction with the results of the desktop review and available data, meant that there was a complete technical understanding for conducting the assessment.

6.3.2 Existing Conditions

Information on existing conditions of community infrastructure in the Electoral Area B (that is, Community Infrastructure RAA) was based on a desktop review and Tervita's experience constructing and operating the existing landfill. Data from these sources provide an appropriate baseline for assessing the effects of the Project on community infrastructure.

6.3.2.1 Community Infrastructure Context

The nearest communities with services to the proposed Project expansion are the City of Fort St. John (approximately 50 km southeast), the District Municipality of Taylor (approximately 60 km south), the Community of Wonowon (approximately 40 km northwest), and the Community of Buick (approximately 16 km north).

Access to the proposed Project expansion is via local highways (for example, Highway 97) and Beatton River Road, which is paved. Average car traffic along the Beatton River Road (also referred to as the Buick Creek Road) during the summer is estimated to be 735 vehicles per day (CCS 2002). The Canadian National Railway crosses Beatton River Road approximately 500 m southwest of the landfill site turn-off. No new access is required to accommodate the expanded landfill.

6.3.3 Traditional Knowledge Shared

To date, although opportunities were provided to share traditional knowledge both directly and through the Working Group, no information has been shared in relation to community infrastructure by BRFN and/or DRFN.

6.3.4 Community Infrastructure Effects Assessment

6.3.4.1 Identification of Potential Effects, Mitigation Measures, and Potential Residual Effects

The identification and assessment of the potential effects of the proposed Project expansion on the Community Infrastructure VC is based on the results of results of previous studies and experience from the existing landfill, consultation and engagement, and professional judgement.

The proposed Project expansion is anticipated to interact with the Community Infrastructure VC during the following construction, operations, closure/reclamation, and postclosure activities:

- Transportation/mobilization of equipment and workers to the site
- Postclosure maintenance and monitoring

During cell construction, which will occur at the beginning for 4 to 5 months and periodically throughout operations (each time, 4 to 5 months), crew trucks will transport workers to and from site each day and there will be 15 to 20 truckloads of construction supplies. Onsite construction varies but generally requires 2 rock trucks, 2 bulldozers, 1 excavator and 1 compactor. All of these will be stored on site during the construction phase for each cell. Construction crews will car pool resulting in a peak of 10 personal trucks per day in and out of the proposed Project expansion site.

During operations, 20 to 30 end-dump trucks will transport waste to the proposed Project expansion site each day.

Table 6.3-2 identifies the potential effects of the proposed Project expansion on the Community Infrastructure VC, as well as mitigation measures, and potential residual effects. Mitigation measures have been identified in a manner consistent with Section 3.5 of this Application. Given the nature of activities associated with the proposed Project expansion with regards to potential adverse effects of increased traffic volumes and use of transportation infrastructure, avoidance and restoration are not directly applicable; therefore, mitigation measures have focused on minimization. As these mitigation measures would be implemented prior to the initiation of, or during, activities associated with the construction, operations, and closure/reclamation phases of the proposed Project expansion, they are expected to be effective immediately in reducing potential adverse effects on the Community Infrastructure VC. Mitigation measures described in Table 6.3-2 have high effectiveness, as observed at the existing landfill. Refer to Sections 6.1 (Land and Resource Use) and 8 (Human Health) for descriptions of other mitigation measures related to the Community Infrastructure VC.

Table 6.3-2. Community Infrastructure – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction, Operations, and Closure or Reclamation	Increased traffic volumes as a result of transporting workers, supplies, equipment and incoming waste for disposal	RAA	• Restrict all construction and operations activities to the approved designated survey area. All Project-related traffic will adhere to safety and traffic regulations.	Minimization	Immediate	High	Potential residual effects are expected to be avoided through the implementation of mitigation measures.
			• Inform all responsible federal and provincial resource agencies and interested municipal officials of the Project developments, as warranted.	Minimization	Immediate	High	
			• Provide potentially affected Aboriginal groups with the proposed Project expansion construction schedule and maps.	Minimization	Immediate	High	
			• All incoming waste will be prebooked before arrival at the landfill site and will be received during daylight hours unless it's an emergency situation.	Minimization	Immediate	High	
			• Implement traffic management measures outlined in the Operations Plan.	Minimization	Immediate	High	
			• Adhere to Tervita's Alcohol and Drug Policy.	Minimization	Immediate	High	
			• Adhere to Tervita's HSE Program.	Minimization	Immediate	High	
			• See mitigation to address potential effects related to Land and Resource Use in Section 6.1.	Refer to Section 6.1.			
			• See mitigation to address potential effects related to Human Health in Section 8.	Refer to Section 8.			

[a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.
- Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

6.3.4.2 Characterization and Significance of Potential Residual Effects

Although the proposed Project expansion may interact with current and ongoing transportation activities in the proposed Project expansion Community Infrastructure RAA, the expected increase of traffic from Project-related personnel, supplies and equipment during construction is expected to be negligible. Access routes to the existing landfill (Highway 97 and Beatton River Road) are well-established and maintained, and frequently utilized by local traffic and industrial traffic serving the agricultural and oil and gas industries in the RAA. During operation, the expanding landfill will experience regular traffic from operating personnel as well as waste transport trucks. However, the expanded landfill is not expected to result in any increase in traffic that the existing operating landfill already experiences during day to day operations.

It is anticipated that the capacity of community infrastructure can handle the incremental demands of Project-related traffic without overburdening it. Consequently, construction and operations of the proposed Project expansion is expected to have a negligible adverse impact on the Community Infrastructure VC and, with implementation of mitigation provided in Table 6.3-2, no residual effects were identified for the Community Infrastructure VC.

6.3.4.3 Cumulative Effects Assessment

No residual effects have been identified for the Community Infrastructure VC; therefore, a cumulative effects assessment is not required.

6.3.5 Follow-up Strategy

A follow-up strategy should be considered where a residual effect and/or cumulative effect has been identified. There are no residual or cumulative effects identified for the Community Infrastructure VC, therefore, a follow-up strategy is not required.

7. Cultural and Heritage Effects Assessment

This section of the Application presents the assessment of the potential effects of the proposed Project expansion on the Cultural and Heritage VC during the construction, operations, closure/reclamation, and postclosure phases of the proposed Project expansion.

The following subsection explains the selection process for the Cultural and Heritage VC, the associated subcomponents, and the KIs. The assessment boundaries for the Cultural and Heritage VC are described and existing conditions are summarized. The potential effects of the proposed Project expansion on the Cultural and Heritage VC have been identified, as measured with reference to the KIs. Proposed measures to mitigate or enhance the potential effects on the VC are also identified. Any residual effects on the VC have been characterized using the criteria set out in Section 3 of the AAIR and a determination of significance has been made. Any cumulative adverse effects likely to result from the residual adverse effects of the proposed Project expansion interacting with the residual adverse effects of past, present, and reasonably foreseeable developments have also been assessed.

7.1 Culture and Heritage

Table 7.1-1 shows the subcomponents and KIs for the Land and Resource Use VC as approved by the BC EAO in the VC Rationale Document for the proposed Project expansion (CH2M 2016b).

Table 7.1-1. Culture and Heritage Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Archaeological sites • Historic sites	• Characteristics, conditions, and location of archaeological and heritage sites, if any	• BC EAO Guidelines and original EAC Application. • Regulatory requirement of the Archaeology Branch of the BC MFLNRORD under the *Heritage Conservation Act*. • The proposed Project expansion has a low probability of affecting archaeological sites and historic sites through direct disturbance. An Archaeological Impact Assessment has been completed and determined no archaeological resources have been found on the Project footprint to date. Therefore, there is low potential to encounter previously undiscovered heritage resources during construction.

7.1.1 Assessment Boundaries

The following assessment boundaries have been defined for the Culture and Heritage VC.

7.1.1.1 Spatial Boundaries

The spatial boundaries for the Culture and Heritage VC are shown on Figure 3.2-2 and include the Project footprint as well as the following:

- LAA: (same as Project footprint): The zone of influence in which heritage resources are most likely to be affected during construction and operations is the Project footprint. The potential for impacting archaeological, palaeontological or historical resources is limited to areas of potential clearing or ground disturbance (that is, the Project footprint). Consequently, the Heritage LAA is the same land area as the Project footprint.

- RAA: The area within all Borden Blocks crossed by the proposed Project expansion. A Borden Block measures 16 km by 16 km and is a terrestrial mapping system used to permanently name and register archaeological sites.

  The spatial boundaries of the Heritage RAA for the proposed Project expansion comprise an area extending beyond the Project footprint and are defined as the area within all Borden Blocks crossed by the proposed Project expansion (Borden 1952). A Borden Block measures 10 minutes of latitude by 10 minutes of longitude, and is the accepted standard division of land used by archaeologists across Canada to index individual archaeological sites. For the proposed Project expansion, the Borden Blocks intersected measure approximately 10 km east-west by 18 km north-south.

7.1.1.2 Temporal Boundaries

The temporal boundaries identified for the Culture and Heritage VC include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading and compaction. As each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).

7.1.1.3 Administrative Boundaries

Administrative boundaries refer to the effects of political, economic, or social boundaries on an environmental assessment. No administrative boundaries have been identified for the Culture and Heritage VC.

7.1.1.4 Technical Boundaries

Technical boundaries refer to a proponent's ability to predict the effects of a project. No technical boundaries have been identified for the Culture and Heritage VC.

7.1.2 Existing Conditions

Information on existing conditions of heritage resources in the Heritage LAA and RAA was based on a desktop review to document previously recorded archaeological and historic sites and to identify areas of potential for heritage resources.

The following methods of data collection will be used to inform the description of existing conditions for the Cultural and Heritage Resources VC:

- An initial desktop review to identify previously recorded archaeological and historic sites in proximity to the proposed Project and to identify areas with potential for unrecorded heritage resources.

Data from a desktop review provides an appropriate baseline for assessing the effects of the Project on heritage resources. An Archaeological Impact Assessment, submitted as part of the EAC Application for the existing landfill, was completed under a *Heritage Conservation Act* Section 14 Inspection Permit and no archaeological resources were found on the Project footprint; therefore, there is a low potential of encountering previously undiscovered heritage resources during proposed Project expansion construction. Since heritage resources occupy specific spatial locations that do not change (for example, subsurface lithic scatters and historic homesteads), the proposed Project expansion can only interact with those heritage resource sites located within the Project footprint. There are no changes to the Project footprint as proposed in the original PAC Application and subsequently approved for development by the former Ministry of Sustainable Resource Management (Archaeological Planning and Assessment).

Heritage resources provide a window into past human experiences and the geological record, and by their very nature, are nonrenewable. Once disturbed, the resource may be altered or even lost. Consequently, the primary mitigation measure in protecting heritage resources is avoidance, and secondarily, site-specific mitigation developed in consultation with appropriate provincial regulatory authorities and approved by these authorities in fulfillment of permit obligations. In order to better understand heritage resources and the historical information associated with these materials, disturbing the resource through controlled, scientific excavation is an acceptable practice and, in many cases, the only method to collect in situ information to add to the archaeological record. Regardless of whether the excavation of the site is for academic or development purposes, the loss of heritage resource sites is offset by the recovery of knowledge about the site gained through meticulously identifying, cataloguing, and preserving artifacts and features in compliance with provincial guidelines.

The BC *Heritage Conservation Act* protects archaeological resources located on both public and private land throughout the province and is administered by the BC MFLNRORD Archaeology Branch. Sites and objects are protected under Section 13 of the *Heritage Conservation Act* by virtue of their antiquity (pre-1846) or under Section 9 as Provincial Heritage Sites, if designated as such by an order-in-council. The *Heritage Conservation Act* necessitates that a Permit issued by the Minister or designate must be in place prior to the altering of any protected archaeological sites.

An initial desktop review to document previously recorded archaeological and historic sites in proximity to the proposed Project expansion and to identify areas with potential for unrecorded heritage resources.

The proposed Project expansion is located in Borden Block HdRg. There are currently three sites listed within the Borden Block. The closest known archaeological site to the landfill site is HdRg-2, located approximately 7.2 km to the south-southeast, along St. John Creek. An Archaeological Impact Assessment, submitted as part of the PAC Application for the existing landfill, was completed under a *Heritage Conservation Act* Section 14 Inspection Permit and no archaeological resources were found on the Project footprint. Therefore, there is low potential to encounter previously undiscovered heritage resources during proposed Project expansion construction.

Since heritage resources occupy specific spatial locations that do not change (for example, subsurface lithic scatters and historic homesteads), the proposed Project expansion can only interact with those heritage resource sites located within the Project footprint. There are no changes to the Project footprint as proposed in the original PAC Application and subsequently approved for development by the former Ministry of Sustainable Resource Management (Archaeological Planning and Assessment); therefore, an Archaeological Impact Assessment will not be required for the proposed Project expansion.

7.1.3 Traditional Knowledge Shared

To date, although opportunities were provided to share traditional knowledge both directly and through the Working Group, BRFN and DRFN have not provided any traditional knowledge related to cultural and heritage resources.

7.1.4 Culture and Heritage Effects Assessment

7.1.4.1 Identification of Potential Effects, Mitigation Measures, and Potential Residual Effects

The identification of the potential effects of the proposed Project expansion on the Culture and Heritage VC is based on the results of desktop review of provincial and regional information sources; discussions with local land users, including First Nations; and results of the Archaeological Impact Assessment.

The proposed Project expansion is anticipated to interact with the Culture and Heritage VC during the following construction and operations activities:

- Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure.

Table 7.1-2 identifies the potential effects of the proposed Project expansion on the Culture and Heritage VC, as well as mitigation measures, and potential residual effects. Mitigation measures have been identified in a manner consistent with Section 3.5 of this Application. The primary mitigation measure in protecting heritage resources is avoidance, and secondarily, site-specific mitigation developed in consultation with appropriate provincial regulatory authorities and approved by these authorities in fulfillment of permit obligations. As the proposed mitigation measures described in Table 7.1-2 would be implemented prior to the initiation of, or during, activities associated with the construction, operations, and closure/reclamation phases of the proposed Project expansion, they are expected to be effective immediately in alleviate potential adverse effects on the Cultural and Heritage VC. These mitigation measures have high effectiveness as they align with regulatory requirements under the BC *Heritage Conservation Act*.

Table 7.1-2. Culture and Heritage – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction and Operations	Disturbance of previously unidentified cultural or heritage resources during construction or operations	LAA	• If historical features (for example, arrow heads, modified bone, pottery fragments, and fossils) not previously identified are found on the construction footprint, implement the following: – Immediately notify the BC Archaeology Branch – Immediately stop work within the site – Implement any other measures identified by the BC Archaeology Branch – Implement measures in the BC Archaeological Chance Find Procedure (GBC 2014)	Avoidance	Immediate	High	Potential residual effects are expected to be avoided through the implementation of mitigation measures.
			• Prohibit the collection of historical resources by Project personnel.	Avoidance	Immediate	High	

[a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.
- Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

7.1.4.2 Characterization and Significance of Potential Residual Effects

The Archaeological Impact Assessment for the proposed Project expansion concluded that no archaeological resources were found on the Project footprint. In the unlikely event that any historical resources are discovered during construction, work will be stopped at the site and the BC Archaeology Branch will be notified immediately. Given that disturbances to heritage resources by the proposed Project expansion are effectively offset by knowledge gained through the mitigation approved by the provincial regulatory authorities, no residual effects on the Culture and Heritage VC have been predicted and, consequently, no further assessment of the Culture and Heritage VC is warranted.

7.1.4.3 Cumulative Effects Assessment

No residual effects have been identified for the Culture and Heritage VC; therefore, a cumulative effects assessment is not required.

7.1.5 Follow-up Strategy

A follow-up strategy should be considered where a residual effect and/or cumulative effect has been identified. There are no residual or cumulative effects identified for the Culture and Heritage VC; therefore, a follow-up strategy is not required.

8. Health Effects Assessment

This section of the Application presents the assessment of the potential adverse effects of the proposed Project expansion on the Human Health VC during construction, operations and decommissioning or abandonment of the proposed Project expansion.

The following subsections explain the selection process of the Human Health VC and the associated KIs: noise, air quality, drinking water quality, leachate, soil quality, NORMs, or country foods quality. Spatial and temporal boundaries and the regulatory framework that apply to the assessment of the Human Health VC is discussed. The potential adverse effects of the proposed Project expansion on the Human Health VC have been identified and analyzed, as measured with reference to the KIs. Consideration of occupational health and safety requirements and existing measures to mitigate the potential adverse effects on the VCs are also identified. Any residual effects on the Human Health VC (after consideration of occupational health and safety requirements and mitigation measures currently in place) have been characterized using the criteria set out in Section 3.6 of the AAIR, and a determination of significance has been made.

The result of the assessment is a determination that any residual adverse effects of the proposed Project expansion on the Human Health VC is not significant.

8.1 Selection of Valued Components and Key Indicators

The BC EAO defines VCs as components of the natural and human environment that are considered by the proponent, the public, Aboriginal groups, scientists and other technical specialists, and government agencies involved in the assessment process to have scientific, ecological, economic, social, cultural, archaeological, historical or other importance (BC EAO 2013). KIs are metrics used to measure and report on the condition and trend of a VC, and are identified to further focus and facilitate the analysis of the effects of a proposed Project expansion on selected VCs.

To assess potential health concerns, Human Health was selected as a VC and is defined in the AAIR. Human Health was selected as a VC because the proposed Project expansion could result in changes to noise levels, air quality, drinking water quality, or soil quality. Changes to country foods quality may occur if there is a change to water or soil quality.

The selection of Human Health as a VC was based on: experience gained during previous projects with similar conditions and potential issues; feedback from regulatory authorities; input from Aboriginal groups and public stakeholders; relevant scientific studies; and professional judgment of the assessment team. Table 8.1-1 provides a summary of the KIs, rationale and measurable parameters used in the assessment of potential effects of the proposed Project expansion on the Human Health VC.

Table 8.1-1. Human Health Subcomponents, Key Indicators, and Rationale

Subcomponent(s)	KI(s)	Rationale
• Soil quality • Air quality • Water quality • Leachate quality • Visual quality • Noise • NORM • Quality of vegetation, fish, wildlife and water consumed as country foods, including consumption of First Nation-specific foods	• See indicators under the Air Quality (Section 4.2), Terrain and Soils (Section 4.1), Acoustic Environment (Section 4.3), Terrestrial Vegetation (Section 4.6), Fish and Fish Habitat (Section 4.7), Wildlife and Wildlife Habitat (Section 4.8), Surface Water (Section 4.4), and Groundwater (Section 4.5) VCs, as applicable. The overall study areas reflect the biophysical study areas of the atmospheric environment (acoustic environment and air quality) and water (surface water and groundwater), and includes measurable parameters such as: – Sound levels – Changes in air quality – Changes in water quality – Changes in soil quality – Changes in country foods quality • NORM levels • Traffic-related injuries • Radiological risk assessment • Community Health	• Human Health was selected as a VC to represent the interactions of the proposed Project expansion with the health of workers, land users, and First Nations. • Potential effects related to construction of the proposed Project expansion include: – Increased sound levels – Reduced air quality – Reduced drinking water quality – Contaminated soil quality – Quality of country foods • For these reasons, the KIs noise, respiratory health, drinking water quality and soil quality were chosen. Potential effects related to operations and maintenance of the proposed Project expansion include: – Increased sound levels at proposed Project expansion – Reduced air quality at proposed Project expansion – Dust generation by vehicular traffic

8.2 Assessment Boundaries

Assessment boundaries are used to set a frame of reference for the assessment. The following outlines the assessment boundaries used for the assessment of potential adverse effects of the proposed Project expansion on the Human Health VCs.

8.2.1 Spatial Boundaries

The spatial boundaries for the assessment were chosen in order to characterize local and regional effects of the proposed Project expansion on the Human Health VC. Proposed Project expansion activities have the potential to generate noise and may adversely affect air and water quality, which are indicators for the Human Health VC.

The spatial boundaries for Human Health include the Project footprint, the LAA and the RAA. The LAA boundaries includes the area in which all or most of the potential adverse health effects would be expected to occur. The LAA is the maximum extent of the area encompassed by the Acoustic Environment LAA, the Surface Water LAA, and the Groundwater LAA, and also the LAA of the Land and Resource Use VC (Figure 3.2-1) to account for potential adverse health effects from country foods.

A larger RAA can be used to provide additional context in the assessment of potential adverse effects, including cumulative effects. The RAA is the maximum extent of the area encompassed by the Acoustic Environment RAA, the Air Quality RAA, the Surface Water RAA, the Groundwater RAA, the Fish and Fish Habitat RAA, and the Wildlife and Wildlife Habitat RAA which also includes the RAA of the Land and Resource Use VC (Figure 3.2-2) to account for potential adverse health effects from country foods.

Mapped features and other spatial data used to inform the effects assessment were considered in the context of the largest LAA and RAA of those listed above, which are referred to as the Human Health LAA and RAA. Table 8.2-1 describes the spatial boundaries and rationale for the Human Health VCs.

Table 8.2-1. Health Study Area Boundaries

VC	Spatial Boundary	Rationale
Human Health	• Project footprint: the land area that will be directly disturbed by the proposed Project expansion construction and clean-up activities, including associated physical works and activities (for example, permanent right-of-way and temporary workspace for construction). • Health LAA encompasses the following: – Terrain and Soil LAA: Same as Project footprint. – Surface Water LAA: A 500-m radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities. – Groundwater LAA: A 500-m radius extending outwards form the proposed Project expansion footprint boundary, including associated physical works and activities. – Noise LAA: A 1-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities. – NORMs LAA: Maximum extent of the Terrain and Soil, Air, Surface Water and Groundwater LAA. – Country Foods LAA: A 1-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities. • Health RAA encompasses the following: – Terrain and Soil RAA: A 1-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities – Air Quality RAA: A 10-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities – Surface Water RAA: The watershed of Monnery Creek from the headwaters of its main branch, including the watersheds of all tributaries, downstream from the headwater of Monnery Creek for a distance of 15 km, and the watershed of the Blueberry River and its tributaries for a distance of 15 km upstream and downstream of the confluence with the Blueberry River, of the unnamed creek located immediately west of the Project site. – Groundwater RAA: The watershed of Monnery Creek from the headwaters of its main branch, including the watersheds of all tributaries, downstream from the headwater of Monnery Creek for a distance of 15 km, and the watershed of the Blueberry River and its tributaries for a distance of 15 km upstream and downstream of the confluence with the Blueberry River, of the unnamed creek located immediately west of the Project site. – Fish and Fish Habitat RAA: Same as the Surface Water RAA – Wildlife and Wildlife Habitat RAA: A 5-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities. – Noise RAA: A 5-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities. – NORMs RAA: Maximum extent of the Terrain and Soil, Air, Surface Water and Groundwater RAA. – Country Foods RAA: A 5-km radius extending outwards from the proposed Project expansion footprint boundary, including associated physical works and activities.	• The water quality subcomponent is encompassed by the assessment boundaries for the Surface Water and Groundwater VCs. • The Terrain and Soils LAA (that is, the Project footprint) is the only assessment boundary for the leachate quality subcomponent. • The LAA and RAA for the NORMs subcomponent is the maximum extent of the area encompassed by the Terrain and Soils, Air Quality, Surface Water, and Groundwater LAAs and RAAs. • The LAA and RAA for the country foods subcomponent is equivalent to the assessment boundaries for the Land and Resource Use VC.

Note:

[a] RAA/LAA = Health RAA/LAA

8.2.2 Temporal Boundaries

The temporal boundaries identified for the Human Health VC include the following:

- Construction phase (approximately 4 to 5 months for each cell from the initiation of the proposed Project expansion and periodically (for example, every 2 or 3 years) during the length of the proposed Project expansion as new cells are developed).
- Operations phase, accepting and disposing of hazardous waste and maintenance of the site. May include activities such as excavation, grading and compaction. As each cell reaches capacity, it will be closed with an impermeable cap (approximately 25 years – Years 1 to 25).
- Closure/reclamation phase. When the capacity of all cells is reached, the landfill will be capped with an impermeable cap and top soil and seeding will occur (approximately 1 year following operations – Year 26).
- Postclosure phase is when the entire landfill has been capped and reclaimed and monitoring will occur (approximately 25 years – Years 26 to 51).

8.2.3 Administrative Boundaries

Administrative boundaries refer to the effects of political, economic, or social boundaries on an environmental assessment. No administrative boundaries have been identified for the Human Health VC. However, the human health effects assessment is guided by the regulatory and policy setting described in Section 8.3.

8.2.4 Technical Boundaries

Technical boundaries refer to a proponent's ability to predict the effects of a project. No technical boundaries have been identified for the Human Health VC. The potential adverse effects of landfill construction, operations, closure/reclamation, and postclosure on human health are generally well understood and have predictable effects.

8.3 Regulatory and Policy Setting

The proposed Project expansion will be constructed and operated in compliance with all applicable federal and provincial legislation. This subsection provides a summary of the regulatory framework of legislation, regulations, policies and guidelines which pertain to each KI for the Human Health VC.

Public health in BC is the responsibility of the BC Ministry of Health in accordance with the *Public Health Act*. The *Act* addresses current and emerging health issues, health protection and health promotion, amongst other objectives. Also addressed in the *Act* are provisions designed to address the potential adverse health effects associated with exposure to environmental contaminants.

Health Canada assumes an advisory role with respect to federal and provincial environmental assessments. Health Canada has expertise in HHRA and in biophysical areas related to human health, including noise and air quality effects, drinking water quality, soil quality guidelines and contamination of country foods (Health Canada 2010).

8.3.1 Surface Water

The *Canada Water Act* provides for the management, conservation, development and use of the water resources of Canada in co-operation with provincial and territorial governments.

The BC *Water Act* is administered by BC MECCS and regulates the allocation and management of surface water in BC, in addition to establishing protection for groundwater and wells. The *Act* also regulates diversion and short-term use of watercourses. The *Water Regulation*, pursuant to the *Act* ensures that water quality and water user rights are not compromised by any instream activities.

The BC *Drinking Water Protection Act* and the *Drinking Water Protection Regulation* provide the regulatory framework for safe, reliable and accessible drinking water in BC. The *Act* and associated regulation are administered by the BC Ministry of Health. Health officers monitor drinking water systems for potential health and safety hazards (BC Ministry of Health 2013).

The BC CSR derived water standards in the former Schedule 6 (Generic Numerical Water Standards) and Schedule 10 (Generic Numerical Soil and Water Standards) tables for the following water uses: Drinking Water (DW), Irrigation Water (IW), Livestock Water (LW), and Aquatic Life (AW) (freshwater). These standards were used in the identification of COPCs in surface water and groundwater. The guidelines are used to screen against potential chemical health risks to people consuming local stream water or well water.

8.3.2 Soil Quality

The BC *EMA* regulates contaminated sites in the province. The CSR under the *Act* provides standards for contaminated sites, which may depend on the primary uses of the site. Soil quality guidelines from the CCME, BC MECCS, the CSR and U.S. EPA are used to screen potential health risks to people following direct contact or ingestion of soil contaminants. The BC CSR derived soil standards (agricultural land [AL] and industrial land [IL] use or Protocol 4 background) for soil were used in the identification of COPCs in soil.

8.3.3 Noise

Health Canada does not regulate noise levels, but does provide recommendations for the assessment of noise effects, including:

- Identification and mapping of noise-sensitive receptors such as residences, schools, nursing homes and First Nations communities, relative to a project location
- Estimation of baseline sound levels for a project be estimated at both day and night
- Identification of all potential project noise during all project phases
- Comparison of baseline noise levels with predicted noise levels at sensitive receptor locations
- Evaluation of severity of predicted changes and prediction of health effects
- Implementation of mitigation measures, noise management and complaint resolution planning (Health Canada 2010, 2017)

Further details on the regulatory framework for the acoustic assessment are provided in Section 4.3.3 Atmospheric Environment Effects Assessment.

8.3.4 Respiratory Health

The *Canadian Environmental Protection Act* requires that air pollutants are reported to the National Pollutant Release Inventory. Such air releases are used to help characterize air quality in Section 5, Atmospheric Environment Effects Assessment of the Application. Ambient air quality in BC is managed through provincial acts and regulations, with input from federal, regional and municipal governments. The *BC EMA* is the main provincial legislation for air quality and other environmental issues, and the *Waste Discharge Regulation* under the *Act* regulates the release and disposal of wastes to land, water and air in BC.

AAQOs are pollutant concentration thresholds that are set to protect human and environmental health across Canada. These limits provide regulatory benchmarks against which pollutant concentrations of CACs can be measured and assessed. The ambient air data were compared to ambient air guidelines from Alberta and Ontario, as BC MECCS does not have ambient air criteria applicable to the VOCs analyzed (BC MOE 2016).

Further details on the regulatory framework for the air quality assessment are provided in Section 4.2.3 Atmospheric Environment Effects Assessment.

8.3.5 Country Food Quality

Country foods are those that can be harvested through hunting, fishing or gathering activities, or grown in a noncommercial agricultural setting (Health Canada 2012). Harvesting activities may occur on or near contaminated sites or aquatic organisms may be consumed from water bodies affected by a contaminated site, therefore this exposure pathway for human health risk is considered for the assessment of the Country Foods Quality KI under the Human Health VC.

Health Canada provides expertise on the potential toxicological health effects of consuming contaminated country foods and is responsible for establishing the health standards for country foods. The quantity of country foods consumed and the predicted levels of contaminants in these foods vary, and expertise on contaminant pathways is limited (Health Canada 2010).

The US Environmental Protection Agency provides some guidance on the consumption of country foods, but there is little guidance overall with respect to sampling, analysis and consumption of country foods (Health Canada 2012). Health Canada provides guidance on when to consider a country foods study (that is, where there is a source of contamination, a mechanism for the contamination to move from the source into country foods and a subsequent route to the receptor via ingestion) (Health Canada 2012).

8.4 Existing Conditions and Context

This subsection provides information on existing environmental conditions in the Health RAA. Existing conditions for the Human Health VC refer to current surface water quality, groundwater quality, soil quality, quality of country foods, air quality, noise, and NORMs. The baseline information collected on environmental conditions is used to describe the potential effects of the proposed Project expansion on the Human Health VCs.

The information on environmental conditions in the following subsections was compiled from a variety of sources, including:

- The biophysical sections of the Application: Section 4.1 Terrain and Soils Effect Assessment; Section 4.2 Atmospheric Environment Effects Assessment; Section 4.3 Acoustic Environment Effects Assessment; Section 4.4 Surface Water Effects Assessment; and Section 4.5 Groundwater Effects Assessment
- A desktop SLHHRA (Appendix 11)
- Radiological risk assessment
- Description potential receptors, nearby water sources and historic usage of land
- Desktop review of publicly available information such as provincial and regional information sources, including the following Health Canada guidance documents:
  - Evaluating Human Health Impacts in Environmental Assessment: Noise
  - Evaluating Human Health Impacts in Environmental Assessment: Air Quality
  - Evaluating Human Health Impacts in Environmental Assessment: Water Quality
  - Evaluating Human Health Impacts in Environmental Assessment: Radiological Impacts
- Interviews with regional and municipal governments, health authorities and community organizations

Baseline information collected on environmental elements such as surface water, groundwater, soils, air quality, and the acoustic environment established the existing conditions for the potential pathways for effects on human health. Environmental media samples (soil, groundwater, surface water, and air sample) were collected and analyzed for parameters related to site activities and operations. These samples were considered applicable to characterize baseline conditions. Appropriate QA/QC measures were taken as part of sampling programs to confirm the quality of data collected from the Project site,

including field duplicates and trip blanks, where appropriate,. Samples were transported to qualified laboratories with rigorous laboratory QA/QC programs.

As with any environmental characterization activities, it is generally accepted that a number of uncertainties are inherent in collecting and analyzing environmental media. For example, heterogeneity of environmental media (such as soil), or sampling in space and time, can increase uncertainties. Sampling plans can reduce uncertainties by employing methods such as judgement sampling (identifying locations of previous releases or the location of known activities), or understanding the effect of exposure pathways on contaminant transport (selecting locations that are considered preferential pathways). Uncertainties in data are also addressed by employing multiple conservative assumptions that will overestimate actual risks (for example, reducing the effects of uncertainty by use of maximum observed concentrations or upper limits instead of a measure of central tendency, and/or assuming that environmental media is homogenously contaminated at maximum concentrations). In addition, potential receptors were selected based on current and historic use of the land. Health Canada guidance documents were reviewed and while some potential gaps may exist (for example, seasonal sampling), data considered in this risk assessment are considered sufficient to meet the objectives of the SLHHRA.

The proposed Project expansion is situated in the Boreal Plains Ecoprovince and the BWBS BGC Zone (CCS 2002). This zone is characterized by long and cold winters, with a warm and short growing season. Approximately 35 to 55 percent of precipitation falls as snow (BC MOF 1991). The topography ranges from 650 m asl to 850 m asl (Clifton 2002). The Blueberry River is located approximately 6.5 km to the north of the proposed Project expansion.

8.4.1 Human Health Risk Assessment Methodology

The SLHHRA evaluated the human health risk of exposure to potential stressors in the environment. Potential stressors considered in the SLHHRA included noise and environmental contaminants. Potential contaminants are chemicals released into air or water as a result of proposed Project expansion activities. The SLHHRA was carried out using guidance from regulatory authorities such as BC MECCS and Health Canada.

Potential risks to human health were evaluated using a conceptual model consisting of three components: a stressor; an exposure pathway; and a receptor. For a health risk to be plausible, all three components must be present, however, the health risk is also dependent on the magnitude and duration of the exposure to a stressor.

Further detail on the methodology and results of the SLHHRA is provided in Appendix 11.

8.4.2 Surface Water Quality

Surface water quality is included as a KI for the Human Health VC to identify any potential health effects resulting from reduced water quality.

Clifton (2002) identified several permanent creeks and lakes within a 10-km radius of the proposed Project expansion. The nearest surface water bodies include two unnamed creeks (tributaries to the Blueberry River), that are located approximately 1.4 km both to the west and north of the proposed Project expansion. Upset Creek, St. John Creek, an unnamed creek, and two unnamed lakes or sloughs are also listed as being present within 5 km of the proposed Project expansion (Clifton 2002). The nearest major surface water body is the Blueberry River, located approximately 7 km to the north, at an elevation approximately 100 m lower than the elevation of the proposed Project expansion. An ephemeral stream is located adjacent to the proposed Project expansion, to the north (CH2M 2017; Matrix 2017).

At the existing landfill, precipitation and runoff that does not contact waste drains offsite to the northwest following the topography. Precipitation that falls on the landfill is directed west using berms and ditches towards a stormwater retention pond (Tervita 2014). Surface water is sampled and analyzed prior to being pumped offsite to a forested area to the north of the existing landfill for re-infiltration (CH2M 2017).

There are no known channel connections between the proposed Project expansion and nearby fish-bearing water bodies (CCS 2002).

8.4.3 Groundwater Quality

Groundwater quality is included as a KI for the Human Health VC to identify any potential health effects resulting from reduced water quality.

A hydrogeological study (Clifton 2002) was completed prior to the construction of the existing landfill. This study encountered a shallow water table ranging from 1.8 to 3.8 mbgs. No aquifers identified as a groundwater resource are located below or within several km of the existing landfill. Groundwater flow was found to be to the northwest. The hydraulic conductivity of the clay till was found to be low, ranging from 3 by 10^{-7} cm per second (cm/s) to 8 by 10^{-7} cm/s. Horizontal groundwater migration rates were estimated in the range of centimetres per year (cm/y).

Recent investigations (Matrix 2017, 2019) have encountered the water table ranging from 0.65 to 9.54 mbgs, with flow to the northwest. Horizontal groundwater velocity was estimated at approximately 40 cm/y.

As part of the Clifton (2002) study, groundwater was sampled and analyzed for general chemistry, metals, hydrocarbons, phenols, and PAHs. The groundwater was characterized as a “sulphate type water with no dominant cation”. Total dissolved solids concentrations ranged between 1,160 mg/L to 7,060 mg/L and is considered “brackish”. Hydrocarbons, phenols, and PAHs were absent (nondetect) in the samples collected, while metals analytes were generally detected. Clifton (2002) indicates that the concentrations measured in groundwater are indicative of natural background conditions, and that the groundwater would not be suitable for potable use because of high sulphate, sulphide, and TDS concentrations.

Matrix (2017, 2019) conducted a water well search through the BC Water Resources Atlas. Within 5 km of the proposed Project expansion, three water wells were identified. Two wells are located 2.5 km to the east, owned by Leucrotta Exploration Inc., and used for monitoring; the third well is a domestic well owned by the BC Railway Company, and located 4 km to the northwest.

Potable water is trucked to the existing landfill, where it is stored in a cistern for general water use. A septic tank captures and stores wastewater until it is pumped out for offsite disposal (CCS 2002).

To prevent impacts to groundwater from the operations at the existing landfill, the cells are lined and equipped with a leachate collection and leak detection system (Tervita 2014). The proposed landfill expansion will be lined and connected to the existing leachate collection and leak detection systems.

Per the existing landfill’s BC MECCS permit, a groundwater monitoring program is conducted (Tervita 2014). A summary report of the groundwater monitoring program is prepared annually. The annual reports assess whether groundwater shows evidence of impacts from the landfill or if the groundwater quality is indicative of natural conditions. The reports also comment on whether the leachate collection and leak detection systems are functioning as designed.

8.4.4 Soil Quality

Soil quality is included as a KI for the Human Health VC to identify any potential health effects resulting from reduced soil quality.

The proposed Project expansion footprint is underlain by bedrock of middle Cenomanian age known as the Dunvegan Formation. The formation is characterized as grey sandstone, interbedded with grey to dark siltstone, shale, and carbonaceous shale (CCS 2002; Matrix 2017). This formation ranges from 50 to 250 m in thickness and is located at depths of approximately 6 to 18 mbgs in the vicinity of the existing landfill (Clifton 2002). Surficial deposits are characterized as glaciolacustrine deposits (clay) overlying clay till (CCS 2002; Clifton 2002; Matrix 2017). This information is consistent with Jacobs’ observations during

shallow soil sampling at the proposed Project expansion footprint (CH2M 2017), where topsoil underlain by clay and silty clay with trace fine sand and gravel was encountered.

The proposed Project expansion will extend the existing double-liner system already in place to the new landfill cells. The liner is in place to protect existing soil and groundwater from impacts from the landfill activities (Tervita 2014).

During construction and operations of the landfill, topsoil and subsoil is salvaged, stockpiled, and maintained with the purpose of using the salvaged soil as the final cover for the landfill cells (Tervita 2014). Measures taken to maintain these soils can include: “seeding, hydroseeding, erosion mitigation, cutting, weeding, or contouring to maintain efficient drainage” (Tervita 2014).

The types of waste that are currently accepted at the existing landfill include hydrocarbon-contaminated soils and sands, sulphur-contaminated soil, and salt-contaminated soils. These soils generate leachate. The existing landfill is equipped with a leachate collection and a leak detection system (CCS 2002). The proposed Project expansion will connect to the existing system. The collected leachate is pumped into leachate vault, which is subsequently pumped out and disposed of in an offsite licenced disposal well (Golder 2008). Leachate at the existing landfill is monitored as part of the groundwater monitoring program.

8.4.5 Country Foods Quality

Country foods are defined as foods which are trapped, fished, hunted, harvested or grown for subsistence or medicinal purposes, or obtained from recreational activities such as sport fishing or game hunting. Country foods do not include foods produced in commercial operations, such as large farms or greenhouses (Health Canada 2012).

Traditional foods and consumption rates can vary widely depending upon location. For example, the traditional diet of inland First Nations groups likely includes greater proportions of wild game, whereas coastal First Nations groups likely harvest and consume more marine fish and shellfish. Guidance from Health Canada on HHRAs for country foods states that between 6 percent and 40 percent of total dietary energy consumed by Aboriginal people is from country foods. A low of 6 percent occurs close to urban centres and communities, to a high of 40 percent in more remote areas (Health Canada 2012).

BRFN has indicated that they gather, hunt, fish, and trap in the vicinity of the proposed Project expansion. COPCs for country foods will be based on the COPCs identified in soil, groundwater, and surface water. Vegetation, fish, and wildlife may uptake COPCs in these media.

8.4.6 Air Quality

Ambient air quality is assessed by way of monitoring stations for various CACs, including the following:

- **NO_x**, which are the main component of industrial and vehicle emissions, and can transform into acidic nitrate particles in the presence of sunlight
- **SO_2**, which occurs naturally at low levels, but is primarily produced by industrial processes and fuel combustion
- **CO**, which is produced by vehicle emissions and interferes with the body’s ability to use oxygen
- **PM**, which are airborne particles characterized as coarse, with a diameter between 2.5 µm and 10 µm ($PM_{2.5-10}$) or fine, with a diameter of less than 2.5 µm ($PM_{2.5}$), are produced by industrial and natural processes, and are a major component of smog
- **VOCs,** which are carbon-containing compounds (for example, benzene and formaldehyde) that can react with sunlight and NO_x to form ground-level ozone (Health Canada 2010)

Increased levels of CACs are linked to a range of health effects, including reduction of lung function, pain and difficulty breathing, coughing and wheezing, especially in people already suffering from asthma or

bronchitis (Health Canada 2010), and effects on the cardiovascular system, such as cardiovascular disease, myocardial infarction, stroke, high blood pressure, and arrhythmias (Thurston et al. 2017). $PM_{2.5}$ can be inhaled deep into the lungs and damage the alveoli (Health Canada 2010). VOCs are not generally monitored in the ambient air; however, VOCs and other contaminants such as ammonia and NO_x can react to increase levels of ground-level ozone, which is linked to a broad array of human health effects such as decreased lung function (Health Canada 2013) and cardiovascular disease (Thurston et al. 2017).

Industrial emission sources (for example, well sites, flare stacks, and gas plants) are present in the region surrounding the proposed Project expansion, and with the exception of Tervita's adjacent TRD landfill, none are located within 1 km of the proposed Project expansion (CCS 2002; Tervita 2014).

Onsite, as part of the existing landfill operations, air emissions are generated by heavy machinery and one diesel generator, which supplies power to the existing landfill (CCS 2002; Tervita 2014).

Dust from construction material handling and earth grading, and traffic on the roads to and from the landfill, may generate dust. The dust from construction material handling and earth grading may contain potential contaminants of concern that could affect human health. As part of the current landfill operations, roadways are wetted on an as-needed basis to reduce dust generation by vehicular traffic (Tervita 2014). NORMs may be present in dust and could be released in the air when moving vehicles and other equipment over the proposed Project expansion area. Tervita conducts air monitoring for NORM activity levels bi-annually to determine if dust being carried in the air has NORM activity levels above regulatory restrictions.

Due to the waste types present at the landfill (that is, waste materials from the oil and gas industry), minimal landfill gas is generated; however, this material can produce odours and vapours from VPH present in the waste (CCS 2002; Tervita 2014).

The Respiratory Health KI was selected to identify and mitigate potential effects on the Human Health VC of reduced air quality due to the proposed Project expansion. proposed Project expansion emissions of air contaminants are equipment and vehicular emissions during construction and operations.

8.4.7 Noise

Noise was included as a KI under the Human Health VC in order to identify and mitigate potential effects from elevated noise levels associated with the proposed Project expansion on the Human Health VC. Noise is defined as any unwanted sound that has a sound level and duration sufficient to cause adverse effects on physical, mental or social well-being (Health Canada 2012). Noise-induced endpoints that are recognized as health effects include hearing loss, sleep disturbance, interference with speech comprehension, public complaints and change in percent of the population identified as "highly annoyed" (Health Canada 2010). Potential health effects of noise also include increased stress that may contribute to development of stress-related illnesses (Health Canada 2012).

The major source of noise contributing to existing sound levels around the proposed Project expansion area are road and train traffic. Buick Creek Road is present to the west of the site with railway lines beyond. Frequent daily rail traffic is present; however, the noise from the road and rail traffic is considered "variable and intermittent" (Tervita 2014). Average car traffic along Buick Creek Road during the summer is estimated to be 735 vehicles per day (CCS 2002). Natural sounds, such as wind rustling through vegetation and birds, are also expected to contribute to ambient noise levels when vehicle traffic is absent.

At the existing landfill, noise is generated from the waste-handling machinery and trucks hauling the waste (CCS 2002). The noise from normal daytime landfill operations includes "truck traffic, heavy equipment, backup beepers, speaker systems and radios" (Tervita 2014a). These noise sources are also associated with cell construction activities.

The nearest neighbour to the proposed Project expansion is seasonal and is located at a distance of 2.5 km from the proposed Project expansion footprint (Tervita 2014a). BRFN has indicated that they gather, hunt, and trap in the vicinity of the proposed Project expansion. The proposed Project expansion is also

surrounded by forest, which will dampen noise generated from operations (CCS 2002). The construction phase of the Project is expected to last approximately 4 to 5 months; therefore, the mitigation noise levels presented in Section 6.4.2 Table 6.2 of Health Canada's *Guidance for Evaluating Human Health Impacts in Environmental Assessments: Noise* are applicable and were used as a screening comparison to worst-case noise levels during construction. If it is conservatively assumed that two of each of the equipment types presented in Section 4.3.3.1 of the Environmental Assessment are being used simultaneously at the work site, the noise level at a distance of 2.5 km is expected to attenuate to 46 dBA. These construction activities are only expected to occur during daytime hours; therefore, the construction day-night sound level (Ldn) would be 44 dBA. If baseline Ldn is conservatively assumed to be 45 dBA for a quiet rural setting (per Table 6.1 of the guidance), the sum of construction and baseline Ldn is then 47 dBA, which is equal to the suggested mitigation noise level of 47 dBA Ldn. The estimate of 47 dBA for noise levels from construction considers only distance attenuation and is therefore a conservative estimate. In reality, ground attenuation, vegetation, and foliage between the work site and the receptor would further reduce this noise impact. Furthermore, simultaneous usage of all the equipment stated in Section 4.3.3.1 of the Environmental Assessment for 15 hours per day during construction is unlikely. During the operations phase of the Project, it is expected that the same number and nature of equipment that is currently being used at the landfill will continue to be used; therefore no significant increase in noise will occur. For closure and reclamation, similar equipment to the construction phase, albeit fewer of them, will be used; therefore, noise impacts are expected to be lower than the construction phase. Based on this screening analysis, it is not expected that there will be any health impacts to human receptors during the short construction period, nor any subsequent phase of the Project.

These noise sources represent the baseline noise levels in the vicinity of the proposed Project expansion.

8.4.8 Naturally Occurring Radioactive Materials

NORMs can accumulate in waste streams from the oil and gas industry at levels greater than background. Within the subsurface formations from which oil and gas are extracted, the source of NORMs are primarily naturally occurring uranium-238 (U-238) and thorium-232 (Th-232) (Smith 1992). Of most concern is the radium-226 (Ra-226) isotope, which is a decay product of U-238. Radon-222 (Rn-222) (a decay product of Ra-226) and lead-210 (Pb-210) (a decay product of Rn-222) may also be present (Smith 1992). Depending on the geographic source, the original concentrations of U-238 and Th-232 in the formation, and the waste stream, levels of NORMs can vary widely (Smith 1992). All waste loads are screened for NORMs prior to acceptance at the landfill and known NORM waste loads must have proof of analysis prior to acceptance. NORMs may occur in the oil and gas waste streams accepted at the proposed Project expansion, including decommissioned infrastructure materials, such as spent catalyst and refractory brick. As per Silverberry's *EMA* Permit, 17150, the maximum acceptable radioactive concentration for NORMs is 70 becquerels per gram (Bq/g), with a maximum radioactive concentration due to Ra-226 of 5 Bq/g.

8.4.9 Community Health

Community health is linked to aspects of the proposed Project expansion that have potential to affect quality of life such as air quality, surface and groundwater quality, noise, visual quality, traffic, employment and training opportunities, housing and commercial accommodation, accidents and malfunctions, and human health. An environmental stressor, such as construction and operations of a landfill, can affect an individual's physical, mental and social well-being. Even though this particular stressor may not pose an immediate threat to an individual, constant worry about the potential adverse effects from construction and operations can affect one's perception of the environment and overall quality of life. Not all individuals or communities perceive development in the same way, and concerns or issues can be unique to each community or Aboriginal group. An important consideration in limiting effects on community health is that the proposed Project expansion will be confined within the existing fence line of the existing operating landfill and will require a limited construction workforce of up to 20 personnel. Overall, in the context of Tervita's existing operating landfill, the increased potential or perceived effects on community health from the proposed Project expansion are anticipated to be negligible.

Aspects of community health are, nevertheless, incorporated throughout this assessment under VCs including Air Quality (Section 4.2), Acoustic Environment (Section 4.3), Surface Water (Section 4.4), Groundwater (Section 4.5), Community Services (Section 6.2), and Community Infrastructure (Section 6.3), in addition to other KIs assessed under the Human Health VC.

8.4.10 Traditional Knowledge Shared

BRFN expressed concerns that the landfill will affect water, air and collected, gathered or harvestable consumables that in turn will affect BRFN member health. BRFN indicated that whether or not levels are below standard levels is one KI, but another KI is the extent to which perception leads to avoidance of country foods leading to adverse health impacts. To date, although opportunities were provided to share traditional knowledge both directly and through the Working Group, DRFN have not provided any traditional knowledge related to human health effects.

8.5 Human Health Effects Assessment

This subsection describes potential effects, mitigation measures, residual effects and their significance, reference to the associated KIs: drinking water quality; soil quality; leachate; country foods quality; respiratory health; noise; and NORMs. Information on existing economic conditions in the Health RAA which provides context for the Environmental Assessment is located in the Appendix 11.

8.5.1 Identification of Potential Effects, Mitigation Measures and Residual Effects

Table 8.5-1 identifies the potential adverse effects of the proposed Project expansion on the Human Health VC, mitigation measures, and potential residual effects.

The identification of potential adverse effects of the proposed Project expansion on the Human Health VC is based on the results of the applicable biophysical sections of the Application:

- Soil Quality: Section 4.1 Terrain and Soil Effects Assessment
- Air Quality: Section 4.2 Air Quality Effects Assessment
- Noise: Section 4.3 Acoustic Environment Effects Assessment
- Surface Water: Section 4.4 Surface Water Effects Assessment
- Groundwater: Section 4.5 Groundwater Effects Assessment

Additional sources used to inform the assessment of the Human Health VC include the following:

- A desktop SLHHRA (Appendix 11)
- Desktop review of publicly available information
- Interviews with regional and municipal government, health authorities and community organizations

The health assessment methodology was developed through a literature review as well as consultation and engagement with government agencies and the professional experience of the assessment team.

The proposed Project expansion is anticipated to interact with the Human Health VC during the following construction, operations and closure/reclamation activities:

- Transportation/mobilization of equipment and workers to the site
- Clearing of vegetation, excavation, construction of cells and construction of associated infrastructure
- Waste acceptance, placement, and compaction
- Leachate management, stormwater management and ongoing monitoring
- Cell capping
- Postclosure maintenance and monitoring

The summary of recommended mitigation measures provided in Table 8.5-1 was developed in accordance with industry and provincial regulatory guidelines and in a manner consistent with Section 3.5 of this Application. Through the implementation of these measures, it is expected that the proposed

Project expansion will meet the objectives relating to drinking water quality, soil quality, leachate, country foods quality, respiratory health, noise, and NORMs. The description of mitigation measures provided in Table 8.5-1 is based on proposed mitigation measures to avoid or reduce potential adverse effects on the Surface Water VC (refer to Section 4.4), the Groundwater VC (refer to Section 4.5), the Terrain and Soils VC (refer to Section 4.1), the Air Quality VC (refer to Section 4.2), and the Acoustic Environment VC (refer to Section 4.3).

Table 8.5-1. Potential Effects, Mitigation Measures and Residual Effects of the Proposed Project Expansion on Human Health

Project Phase	Potential Effect	Spatial Boundary	Key Recommendation/ Mitigation Measures	Mitigation Tier [a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect(s)
Surface Water							
Construction, Operations and Closure/Reclamation	Change in drinking water quality	Surface Water LAA and RAA	• Proposed Project expansion will be tied into the existing stormwater management system where surface water is discharged to the land (not an existing surface water body) following sampling, analysis, and evaluation against regulatory criteria	Minimization	During all Project phases	High	No residual effects have been identified.
Groundwater							
Construction, Operations and Closure/Reclamation	Change in drinking water quality	Groundwater LAA and RAA	• Existing mitigation measures to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system)	Minimization	During all Project phases	High	No residual effects have been identified.
			• Existing quarterly groundwater monitoring program will be applied to the proposed Project expansion to detect any potential impacts to groundwater (and potential migration, if applicable)	Minimization	During all Project phases	High	
Soil							
Construction, Operations and Closure/Reclamation	Potential adverse human health effects due to the disturbance of contaminated soil	Terrain and Soil LAA and RAA	• Existing mitigation measures to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system)	Minimization	During all Project phases	High	No residual effects have been identified.
			• Existing mitigation measures such as dust suppression at the Project will be implemented for the proposed Project expansion	Minimization	Immediate	High	
			• Workers must comply with occupational health and safety requirements (for example, use of PPE)	Avoidance	Immediate	High	
Leachate							
Construction, Operations and Closure/Reclamation	Leachate effects on surface water, groundwater, or soil quality	Surface Water LAA and RAA, Surface Water LAA and RAA. Terrain and Soil LAA and RAA	• Existing mitigation measures to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system)	Minimization	During all Project phases	High	No residual effects have been identified.
			• Workers must comply with occupational health and safety requirements (for example, use of PPE)	Avoidance	Immediate	High	
Country Foods							
Construction, Operations and Closure or Reclamation	Decreased quality of country foods in plant gathering areas, hunting sites and fishing areas	Terrain and Soil LAA and RAA	• Existing mitigation measures such as dust suppression at the landfill will be implemented for the proposed Project expansion	Minimization	Immediate	High	No residual effects have been identified.
		Groundwater LAA and RAA	• Existing mitigation measures to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system)	Minimization	During all Project phases	High	No residual effects have been identified.
			• Existing quarterly groundwater monitoring program will be applied to the proposed Project expansion to detect any potential impacts to groundwater (and potential migration, if applicable)	Minimization	During all Project phases	High	
		Surface Water LAA and RAA	• Proposed Project expansion will be tied into the existing stormwater management system where surface water is discharged to the land (not an existing surface water body) following sampling, analysis, and evaluation against regulatory criteria	Minimization	During all Project phases	High	No residual effects have been identified.
Respiratory Health							
Construction, Operations and Closure/Reclamation	Air quality effects on respiratory and cardiovascular health	Air Quality RAA	• All construction equipment will adhere to low-emission Tier 4 engine specifications	Minimization	Immediate	High	No residual effects have been identified.

Table 8.5-1. Potential Effects, Mitigation Measures and Residual Effects of the Proposed Project Expansion on Human Health

Project Phase	Potential Effect	Spatial Boundary	Key Recommendation/ Mitigation Measures	Mitigation Tier [a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect(s)
Noise							
Construction, Operations and Closure/Reclamation	Noise disturbance to nearby Land Users/First Nations	Noise LAA and RAA	• Construction work will be done in daylight hours only and operational work will be done between 7 a.m. and 7 p.m.	Avoidance	Immediate	High	No residual effects have been identified.
			• Equipment will be well-maintained with properly functioning mufflers; operators will take reasonable measures to control construction-related noise	Minimization	Immediate	High	
NORMs							
Construction, Operations and Closure/Reclamation	Potential adverse human health effects due to the disturbance of contaminated soil	Maximum extent of the Terrain and Soil, Air, Surface Water and Groundwater LAA and RAA	• Dust suppression measures to minimize dust generated from vehicular traffic	Minimization	Immediate	High	No residual effects have been identified.
			• Air filter monitoring at the property boundary	Minimization	Immediate	High	
			• Workers must comply with occupational health and safety requirements (for example, use of PPE)	Avoidance	Immediate	High	

[a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.
- Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

Note:
PPE = personal protective equipment

8.5.2 Residual Effects and Their Significance

No potential residual effects were identified for drinking water quality, soil quality, country foods quality, and respiratory health. Potential risks associated with the construction and operation of the proposed Project expansion are generally low or unlikely. Furthermore, occupational health and safety requirements and risk mitigation measures currently in place at the existing landfill will be implemented for the proposed Project. With the implementation of the proposed mitigation described in Table 8.5-1, no potential residual effects on the Human Health VC due to the decommissioning or abandonment of the proposed Project expansion have been identified.

Construction noise levels were estimated based on simultaneous operation of several pieces of equipment expected to be used during cell preparation:

- Two CAT D6T dozers
- Two CAT 330F excavators
- Six 30-ton CAT 735C rock trucks
- Two CAT 815K compactors

The operations stage of the proposed Project expansion will require the use of similar equipment in the same quantities as what is currently being used at the existing landfill.

According to the U.S. Department of Transportation, Federal Highway Administration, *Construction Noise Handbook* (2017), the equipment listed above have measured and averaged sound pressure level measurements at 15 m as follows: compactor (83 dBA), dozer (82 dBA), dump truck (76 dBA), and excavator (81 dBA). It is highly unlikely that all equipment will be used simultaneously, and construction is only anticipated during the daylight hours. The noise levels are conservatively expected to attenuate to less than 55 dBA within 1 km of the Project footprint and will not affect sensitive receptors to levels greater than BC noise guidelines. The noise effects of construction are expected to be temporary, localized, and reversible. There may be land users, including First Nations, within the Acoustic Environment LAA on an intermittent basis and a limited number of users within the Acoustic Environment RAA (that is, a 5-km radius extending outwards from the Project footprint boundary). The noise levels within the Acoustic Environment LAA during the construction stage are expected to be within BC noise guideline acceptable levels; therefore, the levels within the RAA will also be acceptable.

8.5.2.1 Risk Analysis

On the basis of the known risks associated with construction and operation of the proposed Project expansion, the potential environmental effects and associated risks to the Human Health VC, along with consideration of occupational health and safety requirements and risk mitigation measures currently in place at the existing landfill, the potential adverse effects of the proposed Project expansion on Human Health do not require additional risk analysis.

The SLHHRA was conducted to provide a conservative evaluation of potential risks to human health associated with the proposed Project. The SLHHRA evaluated chemical concentrations in applicable environmental media (that is, soil, groundwater, leachate, and surface water) and compared analytical data against the applicable BC CSR Standards (BC MOE 1996). The BC CSR Standards are derived using conservative exposure assumptions to be sufficiently protective of the general public within each land use category. Air, noise, and NORMs have also been evaluated in the SLHHRA using applicable BC and Health Canada criteria. To identify COPCs, the SLHHRA compared the maximum measured concentration or highest detection limit (if greater than the maximum measured value) of chemical parameters against the most stringent BC CSR Standard for each environmental media to provide the most conservative approach to characterize onsite conditions.

8.5.3 Summary of Assessment of Potential Effects on the Human Health VC

Based on the CSMs and data and information available, this qualitative SLHHRA predicts that there are not significant risks of adverse health effects to human receptors from the proposed Project expansion. All pathways are predicted to have risks that are low or unlikely.

The risk assessment paradigm specifies that for a risk of adverse effects to human health to be plausible, three components are required to be present: a stressor (for example, COPC in environmental media) at a concentration or magnitude that can present a hazard; an exposure pathway for the stressor to contact the receptor; and, a human receptor. The SLHHRA qualitatively evaluated the level of risk by considering potential receptor of concern (that is, workers, land users, First Nations), the potential hazard of COPCs in an environmental media and the level of exposure. Finally, the SLHHRA considered occupational health and safety requirements and risk management measures currently in place at the existing landfill that will mitigate risks of adverse effects to human health. The conclusions of the SLHHRA are likely to be consistent with the conclusions of a quantitative human health risk assessment. Therefore, a quantitative human health risk assessment is not warranted at this time.

8.5.3.1 Cumulative Effects Assessment

No residual effects have been identified for the Human Health VC; therefore, a cumulative effects assessment is not required.

8.5.4 Follow-up Strategy

A follow-up strategy should be considered where a residual effect and/or cumulative effect has been identified. There are no residual or cumulative effects identified for the Human Health VC; therefore, a follow-up strategy is not required.

9. Accidents and Malfunctions

Accidents or malfunctions are unplanned events that can result in adverse environmental, economic, social, heritage or health effects. While the proposed Project expansion has rigorous standards and practices in place to make accidents or malfunctions unlikely, the potential consequences of an accident or malfunction are evaluated so that emergency response and contingency planning can be identified to reduce risk. Tervita is committed to designing, constructing and operating the proposed Project expansion in a safe and environmentally responsible manner that respects land users and the landscape within which it operates.

9.1 Context

Potential accidents and malfunctions that may occur during proposed Project expansion activities include traffic-related accidents; release or spill of contaminants such as hydrocarbons, hazardous materials and NORM-containing materials (terrestrial, surface water or groundwater); structural failure of a landfill component during construction or operations; onsite fires; and damage to existing Silverberry landfill infrastructure. Consequences of these events potentially include effects on human health, and contamination of onsite surface water, soil and groundwater and release of contaminants to air, adversely affecting nearby terrestrial and aquatic habitats.

9.1.1 Traditional Knowledge Shared

Through the Working Group, BRFN has not identified any concerns or provided any traditional knowledge specific to accidents and malfunctions, but has identified concerns with respect to soils, surface water, groundwater, vegetation, and wildlife, should accidents and malfunctions occur. DRFN has expressed concerns about elevated barium levels in soils outside the footprint of the existing landfill and requested that further studies be conducted to determine the sources of these exceedances.

9.2 Risk Evaluation

Table 9.2-1 describes the definitions for each category of likelihood and consequence used in the risk evaluation for each accident or malfunction. The definitions for likelihood and consequence were adapted from the University of New South Wales Environmental Risk Rating Procedure and were revised to align with the assessment criteria definitions for characterizing potential residual adverse effects (University of New South Wales 2010).

Table 9.2-1. Definitions for each Category of Likelihood and Consequence

	Category	Description
Likelihood	Almost Certain	Is expected to occur in most circumstances and has a history of occurrence. Occurrence can be expected once or more per year.
	Likely	Will probably occur in most circumstances. Occurrence is expected once in 1 to 3 years.
	May	Could occur at some point. Occurrence is expected once in every 3 to 5 years.
	Unlikely	Not likely to occur in normal circumstances. Occurrence is expected only once during the life of the proposed Project expansion.
	Rare	Could occur only in exceptional circumstances. Occurrence is not expected during the life of the proposed Project expansion.
Consequence	Severe	Resulting adverse environmental, social, economic, heritage and health effects are considered severe and will take more than 10 years to reverse.
	Major	Resulting adverse environmental, social, economic, heritage and health effects are considered major and can be reversed in less than 10 years.
	Moderate	Resulting adverse environmental, social, economic, heritage and health effects are detectable and can be reversed in less than or equal to 1 year.
	Minor	Resulting adverse environmental, social, economic, heritage and health effects are barely detectable and can be reversed in less than or equal to 1 month.

Table 9.2-1. Definitions for each Category of Likelihood and Consequence

	Category	Description
Consequence (cont'd)	Negligible	Resulting adverse environmental, social, economic, heritage and health effects are barely to not detectable and can be reversed in 2 days or less.

The methodology used to assess the potential risk of an accident or malfunction will involve the use of a risk evaluation matrix (Table 9.2-2).

Table 9.2-2. Risk Evaluation Matrix

		Consequence				
Likelihood		***Severe***	***Major***	***Moderate***	***Minor***	***Negligible***
	Almost Certain	Very High	Very High	High	Medium	Low
	Likely	Very High	High	High	Medium	Low
	May	High	High	Medium	Low	Low
	Unlikely	Medium	Medium	Medium	Low	Low
	Rare	Medium	Low	Low	Low	Low

The risk evaluation matrix was adapted from the Risk Management Guideline for the BC Public Sector document and was revised to consider the consequence of an accident or malfunction associated with the proposed Project expansion (Province of BC Risk Management Branch and Government Security Office 2012).

Level of confidence was determined by the availability of data, precedents and degree of scientific uncertainty or other factors beyond the control of the assessment team. Conclusion will be based on either a low, moderate or high level of confidence for each potential adverse effect. These determinations will be made on the basis of the following factors:

- Low: Prediction is based on incomplete understanding of cause-effect relationships and incomplete data pertinent to the proposed Project expansion area.
- Moderate: Prediction is based on good understanding of cause-effect relationships using data from outside the proposed Project expansion area or incompletely understood cause-effect relationships using data pertinent to the proposed Project expansion area.
- High: Assessment is based on good understanding of cause-effect relationships and data pertinent to the proposed Project expansion area.

Where uncertainty exists in the conclusion of risk, appropriate follow up and monitoring programs are provided.

Table 9.2-3 represents the potential risk that could result from accidents and malfunctions and conservatively outlines the unmitigated likelihood and consequence of such an event, level of confidence, and the mitigation that addresses the risk and the potential residual adverse effects that remain after mitigation. Since waste is screened for NORMs prior to being accepted at the existing landfill and materials containing NORM are accepted in accordance with all provincial and federal regulatory requirements, no accidents or malfunctions related to NORMs are anticipated. The potential effects of NORMs on human health are assessed in Section 8.5 Human Health.

Mitigation measures have been identified in a manner consistent with Section 3.5 of this Application and have been incorporated into Project design and the Operations Plan based on regulatory requirements, standard industry practice, and Project-specific requirements. The proposed mitigation measures are predicted to have high effectiveness as they reflected Tervita's experience in operating Secure Landfills in

northeast BC region. As these mitigation measures would be implemented prior to the initiation of, or during, activities associated with the construction, operations, and closure/reclamation phases of the proposed Project expansion, they are expected to be effective immediately in avoiding or reducing potential adverse effects of accidents and malfunctions.

Table 9.2-3. Potential Effects, Mitigation Measures and Risk Evaluation of the Proposed Project expansion on Accidents and Malfunctions

Project Phase	Potential Effect	Potentially Affected VC	Likelihood	Consequence	Confidence	Key Recommendation/ Mitigation Measures	Mitigation Tier [a]	Mitigation Timeline	Effectiveness[b]	Potenti
Construction and Operations	Traffic-related accidents	Community Infrastructure	Unlikely	Minor to severe	High	• Implement measures to reduce traffic-related accidents provided under Community Infrastructure Table 6.3-2.	Minimization	Immediate	High	Low to mediu
Construction, Operations, Closure or Reclamation, and Postclosure	Accidental release or spill of contaminants such as hydrocarbons or hazardous materials to the terrestrial environment	Terrain and Soils Air Quality Terrestrial Vegetation Wildlife and Wildlife Habitat Human Health	May to unlikely	Minor to moderate	High	• Design standards for the liner and leachate system will be in accordance with regulatory requirements.	Avoidance	Immediate	High	Low to mediu
						• A leak detection program for the liner system will be installed and monitored.	Restoration	Immediate	High	
						• Design failures will be monitored and tracked through the following: – Leak detection monitoring. – Inspection and monitoring of surface water and leachate controls. – Weekly inspection of cover controls to monitor erosion, vegetation growth, and other integrity issues. Any integrity issues will be documented in inspections and rectified as soon as possible.	Restoration	Immediate	High	
						• Tervita will adhere to applicable BC spill regulations during all phases of the Project.	Avoidance	Immediate	High	
						• Wastes transported to the Project site will be covered to minimize loss during transit.	Minimization	Immediate	High	
						• Waste resulting from clean-up of spilled and released material shall be collected, stored and characterized appropriately.	Avoidance	Immediate	High	
						• Fuel tanks brought to site will be double walled or must be in secondary containment that is 110% of the volume of the tank. Fuel tanks onsite will follow the provincial guidelines in *A Field Guide to Fuel Handling, Transportation and Storage*.	Avoidance	Immediate	High	
						• A spill prevention program will be implemented, where any spills that occur are cleaned up using absorbent materials, and with the use of any other required remedial actions.	Avoidance	Immediate	High	
						• Spill and release equipment and supplies will be available onsite, such as PPE, first aid kit(s), a fire extinguisher, a tool box (with tools), a commercial spill kit (absorbent sheets/pillows, absorbent socks, disposal bags, disposal bags, splash goggles, nitrile gloves), absorbent booms, and a shovel.	Restoration	Immediate	High	
						• Employees and contractors will be trained and made aware of their roles and responsibilities in the event of a spill or release.	Minimization	Immediate	High	
						• Soil sampling will be conducted at the closure/reclamation phase in order to identify contaminated soils requiring remediation.	Restoration	Immediate	High	
						• Waste resulting from cleanup of spilled and released material shall be collected, stored, and characterized appropriately.	Minimization	Immediate		
						• Fuel tanks brought to site will be double walled or must be in secondary containment that is 110% of the volume of the tank.	Avoidance	Immediate		
						• A spill prevention program will be implemented, where any spills that occur are cleaned up using absorbent materials, and with the use of any other required remedial actions.	Restoration	Immediate		
						• Spill and release equipment and supplies will be available onsite, such as PPE, first aid kit(s), a fire extinguisher, a tool box (with tools), a commercial spill kit (absorbent sheets/pillows, absorbent socks, disposal bags, disposal bags, splash goggles, and nitrile gloves), absorbent booms, and a shovel. Table 9.2-3. Potential Effects, Mitigation Measures and Risk Evaluation of the Proposed Project expansion on Accidents and Malfunctions

Project Phase	Potential Effect	Potentially Affected VC	Likelihood	Consequence	Confidence	Key Recommendation/ Mitigation Measures	Mitigation Tier [a]	Mitigation Timeline	Effectiveness[b]	Potenti
Construction, Operations, Closure or Reclamation, and Postclosure (cont'd)	See above	See above	See above	See above	See above	• Employees and contractors will be trained and made aware of their roles and responsibilities in the event of a spill or release.	Minimization	Immediate	High	See a
						• Chemical and fuel storage during the construction phase will be limited to small volumes in temporary areas (for example, truck mounted fuel tanks for excavating equipment, cases of lube oil stored in equipment storage locker).As a precaution to deal with the potential for a significant release, Tervita will require the construction contractor to maintain a spill response plan to manage the surface assessment, mitigation and remediation, including notification to the appropriate regulatory authority (BC MECCS).	Minimization	Immediate	High	
						• A leak detection program for the liner system will be installed and monitored. The leak detection system between the primary composite liner and secondary CCL will consist of high flow geonet synthetic drainage media connected to a drain system and collection sump.	Restoration	Immediate	High	
						• The leachate collection and removal system will consist of a permeable granular layer across the entire base of the landfill cell. Leachate filtering through the waste will drain laterally through the granular drainage layer to the collection trenches and from there to a collection sump where automatic pumping systems will extract the leachate and direct it to the leachate ponds for storage. At less frequent intervals, the leachate will be removed from storage and trucked or moved via pipeline to an approved facility for treatment or disposal.	Avoidance	Immediate	High	
						• Design standards for the liner and leachate system will be in accordance with regulatory requirements.	Avoidance	Immediate	High	
						• The landfill cell final cover has been designed to prevent surface water from coming into contact with waste soils. The surface water run-off will instead flow to the surrounding environment, minimizing continued leachate production.	Avoidance	Immediate	High	
						• Water within the cell will be treated as leachate prior to release of water.	Avoidance	Immediate	High	
						• Implement additional measures provided in the Leachate Management Plan, the Landfill Leak Detection Monitoring Plan and the Emergency Preparedness and Response Plan.	Minimization	Immediate	High	
Construction, Operations, Closure/Reclamation, and Postclosure	Accidental release or spill of contaminants such as hydrocarbons or hazardous materials to the groundwater environment	Groundwater Human Health	Rare to unlikely	Minor to severe	Moderate	• As a precaution to deal with the potential for a significant release, Tervita will require the construction contractor to maintain a spill response plan to manage the surface assessment, mitigation and remediation, including notification to the appropriate regulatory authority (BC MECCS). [a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.
- Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

The BC HWR governs approval and development of Secure Landfills in the province of BC. As with other existing Tervita landfills in Canada, the existing landfill design is intended to exceed minimum prevailing regulatory requirements with respect to overall objectives for secure long-term containment of wastes within the landfill.

In order to ensure ongoing compliance with the BC HWR and minimize the likelihood and magnitude of any accidents or malfunctions, Tervita personnel and third-party contractors are required to adhere to specific operating procedures, policies and information provided in Tervita's Operations Plan for the existing Silverberry Landfill. The Operations Plan covers construction, operations and closure/reclamation phases of the existing landfill and will be updated to accommodate the landfill expansion. Materials provided within the Operations Plan that will be reviewed and updated to accommodate the expansion activities include:

- **Main design elements** including detailed descriptions, specifications and drawings of the liner system and liner material, leachate management system and disposal, stormwater management, final cover system, and monitoring of groundwater, surface water, leachate and any liquids accumulating in the leak detection system.
- **Construction Quality Assurance Plan** implemented for construction of each landfill cell to ensure the final outcome fully meets the design intent and outlines the roles, responsibilities and qualification requirements of contract personnel as well as the requirements for as-built surveys and construction summary reports for each cell.
- **Operational Report – Landfill Policy** that provide detailed operating procedures and policy including an Organization Structure Plan, waste acceptance protocol, waste documentation and tracking, fire control, occupational health and safety program, Emergency Response Plan, onsite communication and awareness procedures, operating regulatory requirements, staff training requirements and general housekeeping requirements.
- **Recordkeeping** including documentation of all visitors and vehicles to the site, a waste stream filing system, detailed waste records, landfill operator diaries updated daily, regulatory and permitting records, audits and internal inspection reports, construction summary reports and annual waste management reports.
- **Leachate collection and removal** including detailed descriptions, specifications and procedures related to leachate management and monitoring, leachate removal and disposal, and leak detection.
- **Spill response program** including provisions of a spill kit, regular site and general waste containment measures and machinery inspection, and response procedures, including appropriate contacts and reporting.
- **Risk Management Plan** that comprises a Due Diligence/Liability Plan, Compliance Response Plan, and Remediation Contingency Plan.

The Operations Plan will be updated to reflect the expanded landfill, and as frequently as necessary during operation to maintain up to date information and to accurately reflect current policy. All Tervita staff involved in landfill operations are encouraged to provide comments and input which can then be considered in preparing future Operations Plan iterations.

9.3 Summary of Risk Evaluation of Accidents and Malfunctions

As identified in Table 9.2-3, the likelihood of any accidents and malfunctions occurring ranges from may to unlikely, while consequence ranges from minor to severe. Confidence ranges from high to moderate and is based on Tervita's extensive experience operating hazardous waste landfills throughout western Canada, including the safe and successful operational history of the existing Silverberry landfill, as well as the effectiveness of mitigation including Tervita's Operations Plan, as well as professional judgment. For all potential effects assessed, the risk rating was determined to range from low to medium after implementation of mitigation. There are no situations where likelihood and consequence would result in a very high risk or high risk accident or malfunction taking place.

10. Effects of the Environment on the Project

10.1 Context

Tervita operates the largest number of Class II and Secure Landfills in Western Canada. Tervita has been operating Secure Landfills in northeast BC since 2003, and the existing landfill since 2003, and is aware of the normal environmental conditions experienced at the site. This knowledge is reflected in the engineering design and mitigation proposed to address these environmental conditions.

10.1.1 Changing Climate Trends

Depending upon the nature and extent of changing climatic trends, certain operational activities could be delayed and stormwater management systems may need modification. For example, warmer temperatures during the spring and higher levels of rainfall may result in localized flooding, altering hydrologic regimes (Section 10.1.2), while changes in summer temperatures and reduced summer rainfall could lead to an increase in wildfires (Section 10.1.3).

10.1.2 Extreme Weather Events

Extreme weather events such as heavy or persistent precipitation could lead to hydrotechnical hazards such as localized flooding (that is, ponding), scour and erosion. Other forms of extreme weather events such as high winds and lightning have the potential to affect the proposed Project expansion power supply and damage above ground infrastructure (that is, office buildings and other construction or operational infrastructure), and ignite wildfires (see Section 10.1.3).

The risk of a major flood occurring is low since the proposed Project expansion is not located on a floodplain, however, localized flooding (that is, ponding) has the potential to occur as a result heavy snow melt and/or intense rainfall. High winds could result in the suspension of some construction or operational activities such as soil handling. Heavy or persistent precipitation could also delay cell construction if soil salvage activities have not been completed, or if wet soil conditions create safety or traffic-related problems. Extremely cold temperatures and lightning create safety hazards for workers, and also have the potential to delay construction or operational activities over a short-term duration. Unexpected snowfall or snowfall early in the season may also affect operational activities, while frost and freezing temperatures can potentially cause damage to equipment and facilities.

10.1.3 Wildfire

Wildfires result either from anthropogenic causes such as campfires or from natural causes such as lightning. On average, approximately 7,600 forest wildfires occur annually in Canada. Of these, just over half are started by people, most by accident, and just under half by lightning (Canadian Encyclopedia 2015). The total number of wildfires and total hectares burned vary annually. In 2017, 1,353 wildfires occurred in BC, burning a total of 1.2 million ha, well above the 10-year average of 151,041 ha. On average, approximately 43 percent of fires of the last years were human-caused (Province of BC 2018e).

The proposed Project expansion is located in forested region where wildfires caused by lightning strikes or anthropogenic sources are frequent, with several historical wildfires documented in close proximity to the existing landfill. More recently, in May 2016, an approximately 15,700 ha human-caused wildlife fire burned much of the surrounding area to the south of the existing landfill (Province of BC 2018a). During the fire, the existing landfill was secured and closed and personnel were evacuated. The wildfire did not spread onto the landfill, with operations recommencing after the wildfire was contained and extinguished.

In addition to the combustion of woody and plant materials, wildfires may also cause soil to burn. In extreme cases, this could result in ignition of flammable landfill waste. Factors that influence the probability and magnitude of wildfires include vegetation type, ignition source and weather conditions, relative humidity, air temperature, forest moisture, precipitation, wind speed, and wind direction. Conditions in BC change continuously according to these factors.

10.1.4 Environmental Conditions Not Considered

The following environmental conditions were not considered to have the potential to adversely affect the proposed Project expansion either during construction or operation or both:

- Flooding
- Landslides and Slumping
- Seismic activity

10.1.4.1 Flooding

Although there is a possibility for localized flooding (that is, ponding) from snow melt and/or heavy rainfall, extensive flooding from nearby water bodies is not anticipated since the proposed Project expansion is not located on a floodplain, nor is it located near any water bodies susceptible to major flood events.

10.1.4.2 Landslides and Slumping

The proposed Project expansion is located on level terrain and there are no nearby slope hazards with the potential to result in landslides affecting the proposed Project expansion. The potential for slope instability is considered extremely low due to the stable soil stratigraphy and minimal average slopes. Engineering and design of the proposed Project expansion has taken into consideration the potential for slumping at the site. During construction and operation, stormwater management and erosion control systems will be installed to control subsurface and surface water flow. These measures are designed to direct water off the site, thereby reducing the potential for erosion and sudden mass movements of soil. Other mitigation will be implemented where the potential for localized terrain instability exists (Section 4.1). In the event areas of potential terrain instability are identified, the site(s) will be monitored through regular inspections construction or operation and remedial action will be promptly undertaken, where warranted. To date, no terrain instability has been documented at the existing landfill.

10.1.4.3 Seismic Activity

The seismic hazard at the existing landfill is low (NRCan 2015) and no adverse effects on the proposed Project expansion are anticipated to result from seismic activity.

10.1.5 Effects of the Environment on the Project Effects Assessment

10.1.5.1 Identification of Potential Effects, Mitigation Measures, and Potential Residual Effects

The identification and assessment of the potential effects of the environment on the proposed Project expansion are based on the results of results of previous studies and experience from the existing landfill, consultation and engagement, and professional judgement.

Effects of the environment on the Project have the potential to interact with any phases and activities related to proposed Project expansion construction, operations, closure/reclamation, and postclosure.

Table 10.1-1 identifies the potential effects of the environment on the proposed, as well as mitigation measures, and potential residual effects. Mitigation measures have been identified in a manner consistent with Section 3.5 of this Application. The proposed mitigation measures focus on avoidance and minimization and are predicted to have high effectiveness as they reflected Tervita's experience in operating Secure Landfills in northeast BC region and its knowledge of the normal environmental conditions experienced at the adjacent existing landfill. As these mitigation measures would be implemented prior to the initiation of, or during, activities associated with the construction, operations, and closure/reclamation phases of the proposed Project expansion, they are expected to be effective immediately in avoiding or reducing potential adverse effects of changing climatic trends, extreme weather events, and wildfires on the proposed Project expansion.

Table 10.1-1. Effects of the Environment on the Project – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Phase	Potential Effect	Spatial Boundary	Mitigation Measures	Mitigation Tier[a]	Mitigation Timeline	Effectiveness[b]	Potential Residual Effect
Construction, Operations, and Closure/ Reclamation	Changing climate trends	International	• In the event of a wildfire, flood or other natural hazard, implement measures in the Tervita Silverberry Site Emergency Response Plan	Minimization	Immediate	High	Extreme weather events could delay Project activities, or damage or impair operating infrastructure Depending upon the severity, a wildfire has the potential to delay Project activities, or damage or impair operating infrastructure
	Extreme weather events	Soil and Terrain RAA and Surface Water RAA	• Implement measures for erosion control and stormwater management identified in Sections 4.1 and 4.4.	Refer to Sections 4.1 and 4.4.			Extreme weather events could delay Project activities, or damage or impair operating infrastructure
			• Precipitation falling on the uncovered portions of the active landfill cells, therefore coming into contact with the waste soils, will be managed as leachate. The leachate management system will be designed to handle at minimum, a 1 in 25 year storm event, as required by the HWR. However, the actual design will exceed this minimum requirement.	Avoidance	Immediate	High	
			• Buildings (and other Site structures, including tanks), will be built to comply with local building codes and other regulatory requirements in order to minimize the potential for snow damage.	Minimization	Immediate	High	
			• Equipment onsite will be stored or winterised to prevent damage, including draining fluids that might freeze and cause spills or damage. When the site begins operation again, exposed liners, berms and general site facilities will be inspected for signs of damage due to frost heaves.	Avoidance	Immediate	High	
	Wildfire	Vegetation RAA	• There will be no open fires allowed on the site.	Avoidance	Immediate	High	Depending upon the severity, a wildfire has the potential to delay Project activities, or damage or impair operating infrastructure
			• In the event of a wildfire, implement measures in the Emergency Response Plan.	Minimization	Immediate	High	
			• As part of the Emergency Response Plan, there will be fire suppression equipment onsite, and personnel will have undergone training in the use of the equipment.	Avoidance	Immediate	High	
			• All fires detected will be extinguished immediately upon detection. Complete procedures for dealing with fires during operation are specified in the Fire Control section of the Operations Plan. Portable fire equipment will be available at the site and marked appropriately.	Minimization	Immediate	High	
			• There will also be annual drills conducted to test and train personnel, which will be recorded and reported.	Minimization	Immediate	High	
			• Provision of firebreaks shall be carried out to the satisfaction of the Director.	Avoidance	Immediate	High	

[a] Mitigation tiers:

- Avoidance: measures taken to avoid creating potential effects from the outset, such as considering spatial or temporal factors in Project design. These measures are taken in order to avoid potential effects on certain VCs.
- Minimization: measures taken to reduce the duration, intensity or extent of potential effects that cannot be completely avoided, as far as is practically feasible.
- Restoration (onsite): measures taken in response to potential residual adverse effects where these effects cannot be completely avoided or reduced.
- Enhancement: an enhancement measure is defined as a recommendation that aims to promote the likelihood of potential positive environmental or socio-economic residual effects.

[b] Mitigation effectiveness:

- High effectiveness: the mitigation measure is expected to noticeably reduce or alleviate the effect or noticeably improve the condition of the VC.
- Moderate effectiveness: the mitigation measure is expected to moderately reduce the effect or moderately improve the condition of the VC.

10.1.5.2 Characterization and Significance of Potential Residual Effects

Residual effects identified in Table 10.1-1 are a delay of proposed Project expansion activities, or damage or impair operating infrastructure as a result of extreme weather events or wildfires.

Table 10.1-2 provides a summary of the significance evaluation of the residual effects associated with effects of the environment on the Project and considers the probability for significance in the evaluation as outlined in Section 3.

Table 10.1-2. Residual Effects Significance Evaluation for Effects of the Environment on the Project

Predicted Residual Effects	Spatial Boundary	Temporal Context			Magnitude	Probability	Confidence	Significance
		Duration	Frequency	Reversibility				
a) Extreme weather events could delay Project activities, or damage or impair operating infrastructure	Soil and Terrain RAA and Surface Water RAA	Immediate to short-term	Occasional to rare	Reversible	Low to medium	Low	Moderate	Not significant
b) Depending upon the severity, a wildfire has the potential to delay Project activities, or damage or impair operating infrastructure	Vegetation RAA	Short-term	Rare	Reversible	Low to high	Low	Moderate	Not significant

10.1.5.3 Extreme Weather Events

Infrastructure will be built in accordance with the HWR to reduce the risk of damage due to extreme weather events such as excess precipitation, snow melt, high winds and lightning. Construction materials, equipment, and instruments used for proposed Project expansion construction and operations will be suitable for the climate conditions, including unusually extreme temperatures and precipitation, to ensure system integrity.

As part of Tervita's operational monitoring and maintenance procedures, Tervita will routinely monitor the condition of runoff and erosion control systems after any extreme weather events to look for potential damage and, where warranted, remediate any damage to protect the integrity of the proposed Project expansion.

The potential effects vary depending upon the timing, location and magnitude of the event. However, given the implementation of the proposed mitigation, the probability of potential adverse effects such as these is low. The magnitude of damage to the proposed Project expansion is considered to be low to medium given the variability of residual effects but immediate to short-term in duration and reversible. As a result, the predicted residual effect is not significant (Table 10.1-2, point [a]).

10.1.5.4 Wildfires

Factors that influence the probability and magnitude of wildfires include vegetation type, ignition source and weather conditions, relative humidity, air temperature, forest moisture, precipitation, wind speed, and wind direction. Conditions in northeast BC change continuously according to these factors. Tervita's emergency response program will be implemented in the event of a wildfire potentially affecting the proposed Project expansion. Tervita will maintain portable fire suppression equipment on site and ensure personnel will have undergone training in the use of the equipment. Regular operational monitoring and maintenance procedures including regular site inspections and vegetation control will help reduce potential risk and severity of any damage to the site resulting from nearby wildfires.

In the event of a wildfire, Tervita will report wildfires and relevant information to the BC Wildfire Service, the PRRD and applicable local fire departments. Efforts of fire control will be limited, if warranted, due to safety issues and will take into consideration fire conditions, safety, fitness of personnel, and equipment availability. Construction or operational activities and related traffic would be suspended if conditions were considered to be unsafe by Tervita or if requested by the appropriate authority.

The probability of a wildfire affecting proposed Project expansion activities is low, and potential delays in the construction or operation schedule caused by a wildfire can likely be recuperated over the course of the proposed Project expansion. As a result, the predicted effect is not significant (Table 10.1-2, point [b]).

Part C: Aboriginal Consultation

Part C of the Application provides a summary of Aboriginal consultation activities undertaken in support of the EAC and their outcomes for the proposed Project expansion. Details on the methodology and approach to Aboriginal consultation activities are provided in Tervita's Aboriginal Consultation Plan as approved by the BC EAO.

The information provided in Part C follows the requirements set out in the AAIR for the proposed Project expansion issued January 23, 2019 by the BC EAO.

11. Aboriginal Consultation

11.1 Overview of Aboriginal Interests

This section provides an overview of the Aboriginal engagement activities for the Project as outlined in the Project's First Nations Consultation Plan (the Plan). The section provides a summary of past and planned consultation activities conducted by Tervita since July 2014 and ongoing engagement activities with First Nations.

The BC EAO directed Tervita to consult with the BRFN and the DRFN. In addition, Tervita identified the following Treaty 8 First Nations for engagement in the Plan:

- Halfway River First Nations (HRFN)
- West Moberly First Nations
- Saulteau First Nations (SFN)
- Prophet River First Nations (PRFN)
- McLeod Lake Indian Band
- Fort Nelson First Nation

On July 14, 2014, Tervita attended a Chiefs Gathering at the Treaty 8 Tribal Association Office to informally notify the Chiefs of Tervita's intention to expand the facility. Since that time, Tervita has met with BRFN, DRFN, HRFN, SFN, and PRFN. DRFN and SFN chose to conduct site visits on October 2 and 7, 2014, respectively. Tervita continues to provide all First Nation groups with updates to Amendment information and processes as outlined in the Plan.

In accordance with the AAIR, Tervita has conducted further consultation with BRFN and DRFN. Consultation activities involved meetings to:

- Review documents and technical information
- Attending community meetings and public open houses
- Participation in Working Group meetings
- Responding to written submissions, including comments or information requests pertaining to the Application

No changes have been made to the Plan. Follow-up consultation involved addressing issues of concern through Working Group meetings (see issue summary table in Appendix 13). A summary of BRFN consultation is provided in Section 11.2 and a summary of DRFN consultation is provided in Section 11.3. A map with First Nations territories located near the proposed Project is provided in Figure 1.2-1

11.2 Blueberry River First Nations

11.2.1 Summary of Past and Planned Consultation

Tervita initiated discussions with BRFN Chief and Council on April 14, 2015. At this meeting Tervita provided general information about the Silverberry expansion. Since then, the following engagement activities have occurred with BRFN.

- May 4, 2015: Meeting between Tervita's Chief Executive Officer and BRFN.
- May 20, 2015: Meeting between Tervita and Blueberry River Enterprises GP Ltd. (Blueberry River Enterprises) to discuss opportunities to work together during Project construction and possible future expansion.
- June 30, 2015: Tervita notified BRFN about the Application in an in-person meeting with BRFN Council.

- August 27, 2015: Tervita circulated the draft Consultation Plan. No feedback has been received to date.
- October 2015: Tervita committed to work with BRFN to mitigate concerns, assist with community initiatives, provide capacity development, and enhance awareness about Tervita operations as stated in the First Nations Consultation Plan for the Proposed Silverberry PAC Amendment WD02-01.
- January 13, 2016: BRFN provided Tervita comments on the draft VCs and Tervita responded on January 23, 2016.
- January 27, 2016: BRFN attended the Working Group meeting for the draft VCs. Tervita responded to BRFN concerns raised during the Working Group meeting on February 23, 2016.
- May 16, 2016: Meeting between Tervita and BRFN to discuss the environmental assessment (EA) Application. Action items from this meeting included the following:
  - Tervita circulated the air study work plan to BRFN for comment (June 22, 2016)
  - Tervita circulated the soil sampling work plan to BRFN for comment (June 22, 2016)
  - Tervita addressed potential changes in the surface water discharge point
  - Tervita circulated enhanced wildlife survey plan.
  - Tervita discussed and provided comments on BRFN's proposed TLU and socio-economic survey (June 17, 2016)
  - Tervita sent the revised draft VCs (June 8, 2017)
- September 8, 2016: Tervita contacted BRFN to provide an opportunity for BRFN participation in wildlife studies.
- BRFN participated in January 24 to 25, 2017 early-mid winter snow tracking (Appendix 6) and March 14, 2017: late-winter snow tracking wildlife studies (Appendix 7).
- June 7, 2017: BRFN provided comments on the draft VCs. Tervita responded to BRFN's comments on August 3, 2017.
- January 31, 2018: Meeting between Tervita's leadership (Chief Operating Officer, Vice President of Health, Safety and Environment, BC Area Manager, Silverberry Facility Manager and Community and Aboriginal Advisor) and BRFN's Chief and Council. Tervita introduced themselves to new council members and discussed the Silverberry Project and related Traditional Use Study (TUS) and socio-economic studies.
- September 12, 2018, October 31, 2018, November 14, 2018, and December 6, 2018: BRFN provided comments on the dAAIRs. Tervita provided responses on September 18, November 1 and 22, 2018, and January 4, 2019, respectively.
- November 9, 2018: Meeting between Tervita, the EAO and BRFN to discuss concerns regarding the dAAIR. Tervita committed to giving BRFN the opportunity to comment first on the draft Application.
- March 29, 2019: Tervita circulated the draft Application to BRFN for comment.
- April 23, 2019: BRFN confidentially provided Tervita with comments on the draft Application.
- July 8, 2019: Tervita provided a response to BRFN outlining where and how comments received from BRFN on the draft Application had been incorporated into the Application, or where comments were not incorporated, an explanation of why comments were not incorporated.

11.2.2 Summary of Key Issues Raised

Key issues that have been raised by BRFN to date are identified in Table 11.2-1.

Table 11.2-1. Summary of Key issues raised by BRFN and Tervita Responses

Key Issue	Specific Issues Raised by BRFN	Tervita Response	Status of Resolution
Potential effects of the Project on Aboriginal rights	BRFN expressed concern that the original VC selection did not contemplate Project impacts on Aboriginal peoples or their treaty rights practices.	Tervita and EAO will engage with BRFN to address applicable impacts to BRFN treaty rights.	Addressed in response.
Potential effects of the Project on TLU activities	BRFN expressed concerns about desirability/ accessibility to plant species used for traditional purposes.	Tervita remains willing to work with BRFN on a Traditional Knowledge and Use Study. To date no Traditional Knowledge and Use Study has been provided by BRFN.	Addressed in response.
	BRFN expressed concern that Tervita has a narrow understanding of TLU that is restricted to extractive uses or travel patterns associated with extractive uses. A full suite of nonextractive uses exist that may be affected by the Project including: • Experience of the land/sense of place associated with food and water taste, quality and abundance, • Sense of cultural identity associated with place, place quality and ability to exercise traditional practices • Intergenerational cultural transmission • Spirituality and stewardship		
Potential effects on culturally important wildlife, including noise, potential contamination and loss of habitat.	BRFN expressed concerns that the wildlife species selected for the assessment were not reflective of species important to BRFN such as furbearers and ungulates, and particularly moose.	Tervita will engage BRFN to identify wildlife valued by BRFN. To date, BRFN has not provided Tervita with traditional knowledge information.	Addressed in response.
	BRFN expressed concerns about the field program for collecting information on wildlife and requested additional cameras be installed, and requested additional information about fall, winter and spring surveys and that BRFN community members be involved in wildlife field studies.	Tervita installed two additional wildlife cameras, provided additional information about the fall, winter and spring surveys and provided opportunities to engage BRFN as monitors during field surveys.	Addressed with follow-up actions.
	BRFN requested clarification as to how information obtained in field surveys would be used to develop mitigation measures.	Wildlife mitigation measures will be developed following the supplemental field surveys and informed by survey results.	Addressed with follow-up actions and in Section 4.8.4 of the Application.
	BRFN expressed concerns regarding the use of the Project Area by ungulates including moose, deer and elk. BRFN is concerned about animals browsing shrubs and using lick sites or getting water from areas immediately downstream and down gradient.	Tervita conducted wildlife surveys and installed cameras to determine wildlife activity in the area and used the results of the field program to develop mitigation measures to address effects on wildlife.	Addressed with follow-up actions and in Section 4.8.4 of the Application.
Potential effects on fish and fish habitat	BRFN expressed concerns that fish and fish habitat could be affected by the Project and asked for a more fulsome justification for the exclusion of fish and fish habitat as a VC.	Tervita added fish and fish habitat as a VC.	Addressed in Section 4.7 of the Application.

Table 11.2-1. Summary of Key issues raised by BRFN and Tervita Responses

Key Issue	Specific Issues Raised by BRFN	Tervita Response	Status of Resolution
Potential effects on air quality including contamination and odour effects	BRFN expressed concerns that the Project may result in the release of particulates which may contain NORMs. Specifically, BRFN expressed concern that atmospheric transport will lead to deposition of these materials beyond the selected LSA for this VC with consequent effects on soil quality, surface and groundwater quality, vegetation quality, wildlife health and traditional use of resources.	Tervita provided BRFN with justification for the spatial boundaries chosen for the air quality VC.	Addressed in response.
	BRFN expressed concern about odour from the existing facility because it has an effect on the experience of the land and can lead to avoidance/alienation.	Tervita assessed the effects of the Project on air quality including odour in Section 4.2.	Addressed in Section 4.2 of the Application.
Potential effects of noise and light pollution	BRFN expressed concern that noise was not originally included as a VC since noise could have an impact on wildlife. BRFN also requested that % Annoyance be added to the indicators for assessing the effects of Project noise.	Tervita added noise as a VC and assessed the effects of the Project on noise in Section 4.3. Tervita added level of annoyance to Section 4.3.	Addressed in Section 4.3 of the Application.
	BRFN expressed concern that artificial night lighting can affect night sky viewing by BRFN community members and can have a disruptive effect on birds and wildlife.	The existing conditions adjacent to the Project is an operational facility, including visual disturbance and light emissions. There are no expected changes to visual quality or light emissions for the Project.	Addressed in response.
Potential effects on groundwater and surface water	BRFN expressed concern about the spatial boundaries for groundwater and surface water quality.	Tervita provided BRFN with justification for the spatial boundaries chosen for the groundwater and surface water VCs.	Addressed in response.
	BRFN requested that “taste and smell” be added to the indicators for groundwater and surface water since the perceived value and safety of water, as experienced through water taste and smell, is central to Aboriginal values.	Tervita altered the water quality parameters in Section 4.4 to include perceived taste and smell.	Addressed in Section 4.4 of the Application.
Human Health	BRFN expressed concerns that the landfill is, or will, affect water, air, and collected, gathered or harvested consumables that in turn will affect BRFN member health. Whether or not contaminants are below regulated levels is one important KI, a second KI is the extent to which perception leads to avoidance of country foods, leading to adverse health and economic effects of reliance on store bought foods.	The human health effects assessment is based on pathways of potential effects from air quality, terrain and soils, noise and surface water and groundwater VCs. Effects on human health are assessed in Section 8.5.	Addressed in Section 8.5 of the Application.
Potential cumulative effects.	BRFN expressed concern about the cumulative effects of development and reported that BRFN’s territory is already heavily impacted and efforts to reduce further impact should underpin all future activities.	Tervita conducted a cumulative effects assessment for VCs where residual effects were identified.	Addressed in various sections of the Application.

Details of these key issues and Tervita's response to these issues are provided in a summary table in Appendix 13. Tervita approached BRFN about providing TLU early in 2017, and discussed funding for a TLU and socio-economic studies. An agreement was signed on April 11, 2017. To date, BRFN has not provided Tervita with Project-specific TLU information, but has provided comments on how BRFN defines TLU and appropriate spatial boundaries for assessing the effects of the Project on TLU. Tervita incorporated BRFN's understanding of TLU into the assessment, but does not have site-specific information from BRFN. Tervita continues to work with BRFN to address differences in definition of spatial boundaries and to allow BRFN to provide Project-specific information.

11.2.3 Background Information

BRFN is located in northeastern BC, 80 km northwest of Fort St. John, in the PRRD (Province of BC 2019a; PRRD 2019). The Nation has two reserves, Blueberry River (IR No. 205) which is approximately 5 km north of the Project and the South Parcel of Beatton River (IR No. 204) which is located approximately 20 km northwest of the Project, covering a total of 1,505.8 ha (Indigenous and Northern Affairs Canada 2019a). The total registered population as of June 2019, is 506, of which 195 are reported to reside predominantly on the Blueberry River reserve (Indigenous and Northern Affairs Canada 2019a).

BRFN belongs to the Dane-zaa language group and is one of four communities of the Peace River region who speak Dane-zaa (also known as the Beaver Language), which is classified as a Northern Athapaskan language (BC EAO 2016; BRFN 2012). The Athapaskan people have been associated with the Peace River region and referred to as the "Beaver People" since the earliest historical documents relating to the area (BRFN 2012).

BRFN is a signatory of Treaty 8, which was signed in 1899, and were part of the Fort St. John Band until 1977 when the band was split into BRFN and DRFN (Province of BC 2019a).

BRFN followed a 2-year election cycle in accordance with the *Indian Act* from 1978 until 2017 (Canada Gazette 2017). In 2017 BRFN adopted a resolution requesting that the Minister of Indian Affairs and Northern Development terminate the election provisions of the *Indian Act* and replace it with a custom electoral process developed and ratified by the community (Canada Gazette 2017). On September 13, 2017 the Minister approved the *Order Amending the Indian Bands Council Elections Order* for BRFN (Canada Gazette 2017). The custom electoral system divided the band into five main family groups, with each group electing a family councillor to serve as their representative on Band Council (Chipesia v. BRFN [Vancouver. 2019[1]]). The family councillors select a Chief by way of majority vote among them (Chipesia v. BRFN [Vancouver. 2019]). The election code does not include a process for the placement of individual band members into a family group (Chipesia v. BRFN [Vancouver. 2019]). Subsequently, a group of members filed a Notice of Application seeking judicial review of the BRFN Election Code in 2017, however on January 11, 2019 the Court dismissed the Application because the applicants neither challenged the section 74(1) Order, nor named the Minister as the respondent (Chipesia v. BRFN [Vancouver. 2019]).

According to the most recent census data available, 160 BRFN members were 15 years of age or older in 2016 (Indigenous and Northern Affairs Canada 2019a). Educational attainment rates in 2016 were as follows: 10 individuals (6 percent) possessed a university certificate; 10 individuals (6 percent) completed a trade, apprenticeship or other non-university certificate; 35 individuals (22 percent) completed high school, and 110 (69 percent) individuals had not completed high school (Indigenous and Northern Affairs Canada 2019a). The labour force participation rate in 2016 was 43.8 percent, with an employment rate of 28.1 percent and an unemployment rate of 35.7 percent (Indigenous and Northern Affairs Canada 2019a). The top industries were business services, manufacturing, construction, health, education, agriculture and other (Indigenous and Northern Affairs Canada 2019a). The most common occupations were sales and service, followed by management, social services, and trades (Indigenous and Northern Affairs Canada 2019a).

[1] Chipesia v. BRFN, 2019 FC 41, T-1681-17 (Vancouver. 2019). https://decisions.fct-cf.gc.ca/fc-cf/decisions/en/item/361486/index.do

BRFN owns and operates Blueberry River Enterprises, which specializes in the construction, alteration, repair and development of any type of earthwork (BC Assembly of First Nations 2019a). Blueberry River Enterprises was created with the goal of competing in the oil and gas, construction, maintenance and logging industries by developing projects in a safe, environmentally friendly and regulatory compliant manner (Blueberry River Enterprises 2019). The business develops well sites, plant sites, roads, clean-ups, right of way, and seismic clearing (BC Assembly of First Nations 2019a).

BRFN is also a partner in Six Nation Ventures, a limited partnership between six Treaty 8 communities that operates the log yard at Peace Valley Orientated Strand Board plant (TransCanada 2014). However, the plant is scheduled to shut down in 2019 due to poor market conditions (Alaska Highway News 2019). Other BRFN-owned businesses include a convenience store and gas station and an electrical company to service oil patch operations (TransCanada 2014).

11.2.4 Traditional Ecological Knowledge and Traditional Land Use

To date, BRFN has not provided Project-specific Traditional Ecological Knowledge (TEK) and TLU information. The results of a review of publicly available literature are included herein. The information in this section was used to identify culturally important resources, key issues and potential effects of the Project on BRFN rights and interests.

The traditional territory of BRFN includes a broad area in northeastern BC, identified by BRFN as the area in which members traditionally carried out activities central to their way of life (Macdonald 2016). The territory is defined as extending approximately from south of Tumbler Ridge, to south of the Sikanni Chief River in the north, west to the height of land in the Rocky Mountains, and east to the Alberta border (BRFN 2012). This area is also shared and relied upon by other First Nations under Treaty 8 (Macdonald 2016). Dane-zaa oral history describes events and people in the area prior to the arrival of European explorers and there is archaeological evidence from the Charlie Lake caves showing that people occupied the area from 10,500 years ago (Olsen 2017).

Historically, BRFN's economic activities and social organization were closely tied to the resources and conditions of their environment (BRFN 2012). There are many historical trails in the region that were used for travel and hunting, many of which were documented in a 1915 map of the Peace River Block and later used by a BC Land Surveyor in 1930 (BRFN 2012).

BRFN traditionally viewed hunting as a complex pattern of connection between the trails of people, animals, and spiritual guidance (BRFN 2012). TEK extends to the identification, management, and monitoring of game, using animal tracks, trails, the numbers of animals observed, the thickness of a beaver lodge, the slope of a moose's neck, and the colour of its innards, as indicators of the state of the environment (BRFN 2012). Such knowledge about the health of the environment was a matter of life and death, both individually and culturally (BRFN 2012).

Harsh winters, regular movement of herds and the uncertainty of hunting dictated a seasonal cycle of aggregation and dispersal related to the availability of resources (BRFN 2012). In his 1979 research of the Dane-zaa, Martin Weinstein identified consistent movement patterns based on five seasons, rather than four (BRFN 2012). These consisted of the following.

1) Fall: Larger bands divided into smaller hunting groups to hunt game, primarily moose, and deer, for dry meat and grease during the winter.
2) Early Winter: Family groups dispersed to winter hunting and trapping areas for fur-bearing mammals.
3) Late Winter: Hunting and trapping would shift toward predatory species.
4) Early Spring: Winter furs were traded and hunting would shift to beaver.
5) Summer: Larger groups would congregate at summer camps and travel to summer hunting, fishing, and berry-picking areas.

This research also recognized a diverse economy, which included 8 species of ungulates, 2 bear, 4 small game animals, 4 grouse, 13 types of fur-bearing mammals, 13 ducks, 2 geese, 1 swan, and 15 species of

fish (BRFN 2012). Bison was a key staple prior to the 1900s, however, overhunting by trappers and traders caused a sharp decline in their numbers (Olsen 2017). Subsequently, the Dane-zaa people replaced bison with moose and caribou as a dietary and cultural staple (Olsen 2017). Similarly, caribou was an important species, but as populations have also been declining, BRFN members have self-imposed a harvesting moratorium (Olsen 2017).

During the 19th century, trade increased for food products such as flour, sugar, tea, rice, and potatoes (Olsen 2017). Today, BRFN members still hunt moose, elk, deer, bear and mountain sheep (Traditions Consulting Services, Inc. 2013). Moose is the preferred species for meat, with the hide being used for making moccasins and other leather work (Traditions Consulting Services, Inc. 2013). Fish caught by BRFN members include dolly varden, rainbow trout, bull trout, kokanee, jackfish, pickerel, suckers, whitefish, lingcod, and grayling (Traditions Consulting Services, Inc. 2013). Small game, including rabbit and beaver, is hunted for food and pelts (Traditions Consulting Services, Inc. 2013).

BRFN community members harvest plants and berries throughout the Peace River valley (Traditions Consulting Services, Inc. 2013). These include blackberries, Saskatoon berries, chokecherries, cloud berries, white berries, huckleberries, blueberries, strawberries, and cranberries (BRFN 2012; Traditions Consulting Services, Inc. 2013). Other plant foods harvested include wild rhubarb, wild carrot, wild potatoes, and cow parsnip (BRFN 2012). The banks of Halfway River are important for harvesting mint and Labrador tea, both commonly used for brewing beverages (BRFN 2012; Traditions Consulting Services, Inc. 2013). Many areas traditionally used for harvesting plants and medicines have been impacted by development and are no longer productive (BRFN 2012). Today, BRFN members have difficulty maintaining access to lands and resources that are uncontaminated and capable of sustaining the patterns of economic activity, land use, and occupation essential to their livelihood (Macdonald 2016). Despite these changes to their traditional territory and reductions in subsistence resources, BRFN members continue to actively pursue hunting, trapping, fishing, gathering, learning on the land, and having cultural gatherings to the extent possible (Olsen 2017). However, they often have to travel to other regions of their traditional territory to do so (Traditions Consulting Services, Inc. 2013).

11.2.5 Potential Effects on Blueberry River First Nations Aboriginal Interests

This section describes the potential Project-related effects identified by BRFN on Aboriginal interests.

The identification of the potential effects of the proposed Project expansion on BRFN Aboriginal interests is based on the results of the desktop review of provincial and regional information sources outlined above; to date, BRFN have not provided Project-specific TLU information to inform the assessment.

The proposed Project expansion is anticipated to interact with the Aboriginal interests of BRFN during the following construction, operations, closure/reclamation, and postclosure activities:

- Transportation/mobilization of equipment and workers to the site
- Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure
- Waste acceptance, placement, and compaction
- Cell capping
- Postclosure maintenance and monitoring

Mitigation measures have been identified in a manner consistent with Section 3.5 of this Application. The mitigation measures to address the effects on BRFN's Aboriginal interests have been outlined and discussed in the following VC sections: Land and Resource Use VC, Acoustic Environment VC, Wildlife and Wildlife Habitat VC, Air Quality VC, Terrestrial Vegetation VC, Surface Water VC, Groundwater VC, and Human Health VC. These mitigation measures are designed to reduce the effects of the Project on the resources and environment that are used by BRFN in support of their traditional activities. The efficacy of these mitigation measures is discussed and outlined in the respective VC sections and is not repeated in this section.

Table 11.2-2 identifies the potential effects of the proposed Project expansion on Aboriginal interests identified by BRFN, as well as mitigation measures and potential residual effects. In addition to the summary of mitigation provided herein, further measures are provided in the management planning documents (see Section 13) and the Silverberry Operations Plan.

Table 11.2-2. Aboriginal Interests Effects Assessment – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Concern and Impact	Mitigation[a]	Potential Residual Effect
Effects on TLU activities. Specific effects outlined are sensory disturbance (noise, odour, light and visual effects) and effects on sense of place, cultural identity and intergenerational transfer of knowledge	Mitigation measures for the Land and Resource Use VC include: • The proposed Project expansion footprint is currently fenced and not being used by agricultural, recreational users or First Nations. • Provide First Nations with information and protocols regarding the timeframe for construction. • Consult with First Nations, forest tenure holders and trappers and consider specific requests for mitigation. • Place signage on access roads in the vicinity of the construction activities notifying road users that construction activities are taking place. • Inform and consult with interested federal and provincial agencies with the potential to be impacted by the Project, as warranted. Mitigation measures for the Acoustic Environment VC include: • Construction work will be done in daylight hours only and operational work will be done between 7 a.m. and 7 p.m. • Equipment will be well maintained with properly functioning mufflers. Operators will take reasonable measures to control construction-related noise. Mitigation measures for the Air Quality VC include: • Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Contractor will ensure equipment is well-maintained. • Reduce idling of equipment, where possible. • Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. • Equipment to use low-sulphur diesel, as appropriate. • Implement additional measures provided in the Dust and Odour Control Plan and Air Quality Monitoring Plan. • The Contractor will ensure equipment is well-maintained. • Reduce idling of equipment, where possible. Mitigation measures for potential effects of Light Pollution include: • Provide potentially affected Aboriginal groups with the proposed Project expansion construction schedule and maps. • All incoming waste will be prebooked before arrival at the landfill site and will be received during daylight hours unless it's an emergency situation. • Construction work will be done in daylight hours only and operational work will be done between 7 a.m. and 7 p.m.	Sensory disturbance of traditional land and resource users.

Table 11.2-2. Aboriginal Interests Effects Assessment – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Concern and Impact	Mitigation[a]	Potential Residual Effect
Effects on TLU activities. Specific effects outlined are sensory disturbance (noise, odour, light and visual effects) and effects on sense of place, cultural identity and intergenerational transfer of knowledge (cont'd)	Tervita will continue to work with BRFN to develop mitigation measures for the intangible aspects of TLU activities if any are identified.	See above
Effects on resources used for TLU activities including water, culturally important vegetation, fish, and wildlife	Mitigation measures for the Wildlife and Wildlife Habitat VC include: • Schedule construction activities outside the migratory bird nesting period. • Conduct a nonintrusive preconstruction nest survey in the event any clearing activities are scheduled within the migratory bird nesting period. • Use a cover crop to assist in weed and erosion control, where warranted. • If previously unidentified wildlife species with special conservation status or their site-specific habitat are identified during construction, suspend activities and notify the Environment & Regulatory Advisor, who will determine the appropriate mitigation measure to be implemented. • Tervita will seek an amphibian salvage permit from BC MFLNRORD to salvage any amphibians from the Project footprint prior to construction activities. • The active landfill area will be surrounded by a fence as required by Section 8(a)(i) of the HWR, limiting wildlife interactions. • All food and wastes will be stored and secured in vehicles or appropriate facilities. • Limit light and noise effects on wildlife by actively accepting waste on a prebooked basis during daylight hours. • The feeding or harassment of livestock or wildlife will be prohibited. • Construction and operations personnel will not be permitted to have firearms or pets on the Project site. • Tervita personnel and contractors will be required to abide by all speed limits on the Project site and on transit to the site. • All collisions (including wildlife) along the Project access road or within the Project site will be reported and reasonable corrective measures will be put in place prevent future collisions. • Tervita will ensure compliance with safe operating practices so that wildlife will not come in contact with any spills, leaks or other releases from Project facilities and equipment. • Any wildlife mortalities or injuries at the Project site will be documented. Mitigation measures for the Terrestrial Vegetation VC include: • Tervita will seek to reduce disturbance to native vegetation to the extent possible.	Effect on culturally important resources such as wildlife.

Table 11.2-2. Aboriginal Interests Effects Assessment – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Concern and Impact	Mitigation[a]	Potential Residual Effect
Effects on resources used for TLU activities including water, culturally important vegetation, fish, and wildlife (cont'd)	• Areas of Noxious weeds/invasive plants will be noted during weekly inspections, especially during times of high vegetation growth. • The PRRD's Invasive Plant Program Strategic Plan and Profile will be reviewed annually to determine regionally important Noxious and invasive plants. • If areas of Noxious or invasive weeds are noted, a certified pesticide applicator will be brought in on an as-needed basis. • If there is an infestation of Noxious/invasive plants, Tervita will document the infestation on the Provincial IAPP to help with future weed control programs. • To prevent the spread of Noxious and invasive weeds, Tervita vehicles and equipment will be cleaned as best as reasonably possible (before entering/exiting the landfill). • Prior to mobilization and demobilization, construction equipment will be cleaned. • When seed is being used for revegetation at site, best efforts will be made to source local seed to reduce the risk of introducing invasive plant species from another region. The Certificate of Seed Analysis will be kept on file and analyzed to ensure Noxious species and regional species of concern are not present in the seed lot. • Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. • Use a cover crop to assist in weed and erosion control, where warranted. • Equipment to use low-sulphur diesel. • Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Implement additional measures provided in the Dust and Odour Control Plan and the Air Quality Monitoring Plan. Mitigation measures for the Surface Water VC include: • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion. • Surface water control works will be inspected weekly and/or immediately after a major storm or a catastrophic event. • Erosion occurring on surface water control works will be repaired and mitigated as soon as possible. • Mitigation measures to prevent surface water erosion may include swales, hay bales, rock riprap, and/or coconut matting.	See above

Table 11.2-2. Aboriginal Interests Effects Assessment – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Concern and Impact	Mitigation[a]	Potential Residual Effect
Effects on resources used for TLU activities including water, culturally important vegetation, fish, and wildlife (cont'd)	• The final slopes of the landfill cap will not exceed 33% and will be seeded as soon as possible to ensure vegetation growth and minimize erosion. • The landfill cap will be inspected weekly and if erosion on the cap is noted it will be repaired and mitigated as soon as possible. • A ditch constructed around the perimeter will direct run off and run on water to the runoff pond which has a capacity of 15,000 m^3. • Onsite erosion control will be utilized if extreme conditions warrant. • Implement additional measures provided in the Erosion and Sediment Control Plan and the Stormwater Management Plan. • Any additional requirements for reclamation will be discussed with BC MECCS pending final site assessment. Mitigation measures for the Groundwater VC include: • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Groundwater from monitoring wells will not be used during construction, operation or reclamation\closure. The assessment determined that the proposed Project expansion is not expected to result in a change in habitat or mortality risk and no potential impacts to the Fish and Fish Habitat VC are predicted. Consequently, no mitigation measures are required, and further assessment of the Fish and Fish Habitat VC is not warranted.	See above
Effects on traditional economy	The following are mitigation measures designed to reduce the effects of the Project on TLU activities and the resources used for TLU activities, which in turn will reduce the effects on traditional economy. Mitigation measures for the Land and Resource Use VC include: • The proposed Project expansion footprint is currently fenced and not being used by agricultural, recreational users or First Nations. • Provide First Nations with information and protocols regarding the timeframe for construction. • Consult with First Nations, forest tenure holders and trappers and consider specific requests for mitigation. • Place signage on access roads in the vicinity of the construction activities notifying road users that construction activities are taking place. • Inform and consult with interested federal and provincial agencies with the potential to be impacted by the Project, as warranted. Mitigation measures for the Wildlife and Wildlife Habitat VC include: • Schedule construction activities outside the migratory bird nesting period.	The effects on traditional economy are captured in effects on TLU activities and resources, and no effect is anticipated on the ability to barter and trade resources; therefore, no residual effect is anticipated.

Table 11.2-2. Aboriginal Interests Effects Assessment – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Concern and Impact	Mitigation[a]	Potential Residual Effect
Effects on traditional economy (cont'd)	• Conduct a nonintrusive preconstruction nest survey in the event any clearing activities are scheduled within the migratory bird nesting period. • Use a cover crop to assist in weed and erosion control, where warranted. • If previously unidentified wildlife species with special conservation status or their site-specific habitat are identified during construction, suspend activities and notify the Environment & Regulatory Advisor, who will determine the appropriate mitigation measure to be implemented. • Tervita will seek an amphibian salvage permit from BC MFLNRORD to salvage any amphibians from the Project footprint prior to construction activities. • The active landfill area will be surrounded by a fence as required by Section 8(a)(i) of the HWR, limiting wildlife interactions. • All food and wastes will be stored and secured in vehicles or appropriate facilities. • Limit light and noise effects on wildlife by actively accepting waste on a prebooked basis during daylight hours. • The feeding or harassment of livestock or wildlife will be prohibited. • Construction and operations personnel will not be permitted to have firearms or pets on the Project site. • Tervita personnel and contractors will be required to abide by all speed limits on the Project site and on transit to the site. • All collisions (including wildlife) along the Project access road or within the Project site will be reported and reasonable corrective measures will be put in place prevent future collisions. • Tervita will ensure compliance with safe operating practices so that wildlife will not come in contact with any spills, leaks or other releases from Project facilities and equipment. • Any wildlife mortalities or injuries at the Project site will be documented. Mitigation measures for the Terrestrial Vegetation VC include: • Tervita will seek to reduce disturbance to native vegetation to the extent possible. • Areas of Noxious weeds/invasive plants will be noted during weekly inspections, especially during times of high vegetation growth. • The PRRD's Invasive Plant Program Strategic Plan and Profile will be reviewed annually to determine regionally important Noxious and invasive plants. • If areas of Noxious or invasive weeds are noted, a certified pesticide applicator will be brought in on an as-needed basis. • If there is an infestation of Noxious/invasive plants, Tervita will document the infestation on the Provincial IAPP to help with future weed control programs.	See above

Table 11.2-2. Aboriginal Interests Effects Assessment – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Concern and Impact	Mitigation[a]	Potential Residual Effect
Effects on traditional economy (cont'd)	• To prevent the spread of Noxious and invasive weeds, Tervita vehicles and equipment will be cleaned as best as reasonably possible (before entering/exiting the landfill). • Prior to mobilization and demobilization, construction equipment will be cleaned. • When seed is being used for revegetation at site, best efforts will be made to source local seed to reduce the risk of introducing invasive plant species from another region. The Certificate of Seed Analysis will be kept on file and analyzed to ensure Noxious species and regional species of concern are not present in the seed lot. • Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. • Use a cover crop to assist in weed and erosion control, where warranted. • Equipment to use low-sulphur diesel. • Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Implement additional measures provided in the Dust and Odour Control Plan and the Air Quality Monitoring Plan. See above

Table 11.2-2. Aboriginal Interests Effects Assessment – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Concern and Impact	Mitigation[a]	Potential Residual Effect
Effects on traditional economy (cont'd)	• Implement additional measures provided in the Erosion and Sediment Control Plan and the Stormwater Management Plan. • Any additional requirements for reclamation will be discussed with BC MECCS pending final site assessment. Mitigation measures for the Groundwater VC include: • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Groundwater from monitoring wells will not be used during construction, operation or reclamation\closure. The assessment determined that the proposed Project expansion is not expected to result in a change in habitat or mortality risk and no potential impacts to the Fish and Fish Habitat VC are predicted. Consequently, no mitigation measures are required, and further assessment of the Fish and Fish Habitat VC is not warranted. Mitigation measures for the Culture and Heritage VC include: • If historical features (for example, arrow heads, modified bone, pottery fragments, and fossils) not previously identified are found on the construction footprint, implement the following: – Immediately notify the BC Archaeology Branch – Immediately stop work within the site – Implement any other measures identified by the BC Archaeology Branch – Implement measures in the BC Archaeological Chance Find Procedure (GBC 2014) – Prohibit the collection of historical resources by Project personnel.	See above

[a] Referenced sections refer to the draft EA.

Project activities, such as transportation and mobilization of equipment and workers to the site, clearing of vegetation, excavation, construction of cells and associated infrastructure and waste acceptance, placement, and compaction, have the potential to affect BRFN TLU activities, including a sense of place, cultural identity, and intergenerational transfer of knowledge. Noise, odour, lighting, and visual disturbance could potentially alter the experience of the land for BRFN community members. Potential effects on TLU activities through sensory disturbance and effects on sense of place, cultural identify, and intergenerational transfer of knowledge will be reduced by constructing the proposed Project expansion footprint on Tervita-owned, fenced land adjacent to the existing landfill. Since the land is Tervita-owned, private land, BRFN is not currently using the footprint for TLU activities. However, the Project will extend the life of the landfill; therefore, the effects on BRFN TLU activities will continue beyond the life of the existing facility. Tervita will provide BRFN with advanced notification of the construction schedule and continue consultation with BRFN regarding mitigation measures, as required. No additional land will be taken from use by First Nations and operational activities are not expected to change the magnitude of the effects on BRFN's TLU activities from the levels that already exist as a result of the existing landfill. With the use of private land and the implementation of the mitigation measures identified in Table 11.2-2, the effects of the Project on TLU are expected to be not significant.

Project activities, such as transportation and mobilization of equipment and workers to the site, clearing of vegetation, excavation, construction of cells and associated infrastructure and waste acceptance, placement, and compaction, have the potential to affect the resources traditionally harvested by BRFN. Tervita has developed a suite of mitigation measures for the resources used by BRFN in conducting TLU activities. A summary of mitigation measures is provided in Table 11.2-2 with additional details provided in Section 4.8 for Wildlife and Wildlife Habitat, Section 4.6 for Terrestrial Vegetation, and Sections 4.5 and 4.4 for Groundwater and Surface Water, respectively, which include the resources identified by BRFN in conducting TLU activities. As outlined in Sections 4.6 Terrestrial Vegetation, Section 4.7 Fish and Fish Habitat, and Section 4.8 Wildlife and Wildlife Habitat, the Project is not anticipated to significantly affect the resources available for TLU activities. The Project will extend the life of the landfill; however, Project activities are not expected to change the magnitude of effects on resources harvested by BRFN beyond the levels that already exist as a result of the existing landfill; therefore, with the implementation of the mitigation measures identified in Table 11.2-2 for the resources traditionally harvested by BRFN, the effects of the Project on TLU are expected to be not significant.

Project activities have the potential to affect BRFN's traditional economy indirectly through effects on traditional harvesting areas and resources harvested by BRFN. As previously stated, mitigation measures designed to reduce the effects of the Project on TLU activities and the resources used in TLU activities will in turn reduce the effects of the Project on the traditional economy, and harvest levels should not be affected. Tervita does not anticipate that the Project will affect BRFN's ability to share and barter resources as part of the traditional or barter economy; therefore, with the implementation of the mitigation measures identified in Table 11.2-2 for the traditional economy of BRFN, the effects of the Project on the traditional economy are expected to be not significant.

11.2.6 Outstanding Aboriginal Interests

BRFN have currently not provided a TLU report but have identified interests in their comments on the VCs for the Project.

To date BRFN has identified concerns with the assessment methodology including the VCs to be assessed, spatial boundaries used in the assessment and cumulative effects assessment but has not identified specific traditional land and resource sites and activities that will be affected by the Project. Tervita has been in discussions with BRFN to resolve these issues. When BRFN provides Tervita with Project-specific traditional land and resource information, Tervita will incorporate this information into Project planning. Tervita has mitigation measures in place to reduce the effects of the Project on the resources used by BRFN for conducting TLU activities and the sensory disturbance of TLU users and will work with BRFN to resolve outstanding concerns.

11.2.7 Commitments and Arrangements

No commitments or arrangements have currently been made with BRFN concerning TLU.

11.3 Doig River First Nation

11.3.1 Summary of Past and Planned Consultation

Tervita initiated discussions with DRFN on July 14, 2014. Since then, the following engagement activities have occurred with DRFN.

- October 2, 2014: DRFN Elders, land staff and youth toured the operating facility.
- April 16, 2015: Meeting between Tervita and DRFN Chief and Council for preliminary discussions.
- June 3, 2015: Tervita notified DRFN of the Application in an in-person meeting with DRFN Chief and Council.
- August 27, 2015: Tervita circulated the draft Consultation Plan. No feedback has been received to date.
- October 2015: Tervita committed to continue working with DRFN to mitigate concerns, assist with community initiatives, provide capacity development and enhance awareness about Tervita operations as stated in the First Nations Consultation Plan for the Proposed Silverberry PAC Amendment WD02-01.
- DRFN participated in January 24 to 25, 2017 early-mid winter snow tracking (Appendix 6) and March 14, 2017 late-winter snow tracking wildlife studies (Appendix 7).
- December 18, 2017: DRFN submitted a TUS to Tervita.
- January 15, 2018: Meeting between Tervita, Jacobs, UrbanSystems, and DRFN to discuss the TUS and its incorporation into the Application. Tervita and DRFN discussed working with Doig when placing final cover, to ensure the proper vegetation is planted to help support local wildlife populations. Tervita will work with local First Nations on the appropriate seed mix for revegetation and capping. DRFN also expressed concern of the deforestation around Silverberry affecting Caribou populations. Tervita and DRFN discussed the potential of restoration at a later date. Lastly, DRFN expressed concern about the amphibians found at site. Tervita will perform amphibian surveys prior to expansions construction.
- March 29, 2019: Tervita provided the draft Application to DRFN for comment.
- May 28, 2019: DRFN provided Tervita with comments on the draft Application.
- July 8, 2019: Tervita provided a response to DRFN outlining where and how comments received from DRFN on the draft Application had been incorporated into the Application, or where comments were not incorporated, an explanation of why comments were not incorporated.

11.3.2 Summary of Key Issues Raised

Key issues that have been raised to date are provided in a summary table in Appendix 13. A summary of concerns that have been identified by DRFN is provided in Table 11.3-1.:

Table 11.3-1. Key Issues Raised by DRFN and Tervita Response

Key Issue	Specific Issues Raised by BRFN	Tervita Response	Status of Resolution
Methodology – Confidence and Risk	DRFN noted that Section 3.9 states that additional risk analyses were not required. However, in Section 4.1 Terrain and Soils, there is a potential risk to environmental receptors outside the fence line associated with metal concentrations that exceed guidelines for barium, molybdenum, mercury, and arsenic.	Tervita acknowledges the potential risk to environmental receptors outside the fenceline. Through the mitigation measures described in the Application, Tervita will minimize impacts to environmental receptors. With implementation of effective mitigation and Tervita's experience in operating the existing landfill, potential effects of the proposed expansion are alleviated or reduced. As stated, potential adverse effects resulting from accidents or malfunctions are assessed in Section 9. Further investigation of the sources of the exceedances for soils will occur and additional mitigation measures will be developed if warranted. Potential health risk on receptors are assessed in Section 8. Pathways of potential health effects are predicted to have risks that are low or unlikely based on results of the qualitative SLHHRA.	Addressed in Section 4.1.2 of the Application.
Terrain and Soils – Spatial Boundaries	DRFN noted that no LAA has been identified for soils. This is potentially a significant omission given potential effects outside the fence line. Without an LAA, residual effects are discussed in a regional context, which may be misleading.	The RAA captures any effects that would be captured in the LAA.	Addressed in response.
Terrain and Soils – Potential Effects	DRFN indicated that there were exceedances in soil concentrations for Arsenic, Barium, Molybdenum, and Mercury recorded outside the fence line and included the following observations: • Only 1 area outside the fence line was sampled. Exceedances in other areas around the fence line are possible and remain uncertain. • Additional investigation for the source of these metals has not been conducted. • Additional mitigation to prevent ongoing deposition to areas outside the fence line is likely required, but not identified in the Application.	Tervita acknowledges the sources of the exceedances require further investigation. Tervita will describe in detail the mitigation measures being implemented to minimize environmental impacts.	Addressed in Section 4.1 of the Application.

Table 11.3-1. Key Issues Raised by DRFN and Tervita Response

Key Issue	Specific Issues Raised by BRFN	Tervita Response	Status of Resolution
Terrain and Soils – Potential Effects (cont'd)	• With the expansion of the Project, ongoing deposition is likely and the ongoing implementation of current mitigations are ineffective, potentially resulting in higher metal concentrations over time. • A discussion of potential environmental receptors outside the fence line has not been conducted. For example, there are 11 wetlands adjacent to the property, and associated biota that may rely on those wetlands are unknown. • It is unclear whether water quality has been impacted similarly to soils. • Tervita is proposing extensive soil sampling to guide remediation efforts, but not until closure, which delays addressing the issue for 25 years and allows deposition to continue. This poses an unnecessary risk to the surrounding environment. • As a result, the characterization of residual effects may be inaccurate. • Given the above, a risk assessment should be done to evaluate exposure to these metals, sources identified, and adaptive management and mitigations implemented to prevent further deposition associated from the existing project and the expansion.	See above	See above
Terrain and Soils – Follow-up Strategy	DRFN noted that an appropriate follow-up strategy has not been developed to deal with exceedances in soil metal concentrations outside the fence line.	Further investigation is required to determine whether the exceedances are a result of Tervita's landfill operations.	Addressed in response.
Air quality	DRFN expressed concern about benzene surpassing applicable guidelines.	Tervita assessed the effects of the Project on air quality in Section 4.2.	Addressed in Section 4.2 of the Application.

Table 11.3-1. Key Issues Raised by DRFN and Tervita Response

Key Issue	Specific Issues Raised by BRFN	Tervita Response	Status of Resolution
Air Quality – Spatial Boundaries	DRFN noted that an LAA has not been identified for the Air Quality VC. The discussion on dust attenuation and uncertainties around deposition outside the fence line require an assessment at the LAA scale.	The RAA captures any effects that would be captured in the LAA. The expected contaminants of concern for the proposed Project are primarily fugitive dust emissions (PM), and to a lesser extent various minor combustion tailpipe emissions. The Air Quality RAA is expected to be sufficient to capture the area of such low-lying releases and potential cumulative interactions with other activities not related to the proposed Project.	Addressed in response.
Air Quality – Residual Effects	DRFN stated that significance determination based on RAA is not appropriate for the following reasons: • The RAA is 10 km, but the Application states there are no industrial activities within 1 km of the site; it's not clear whether industrial air emissions sources within the RAA were considered. • The regional reference site is 46 km away, well outside the RAA boundary. • There is only 1 reference site, which may be inadequate to characterize current conditions. • The absence of an LAA is potentially misleading, particularly considering soil metal concentrations outside the fence line. • PM_{10} will attenuate within a local area, necessitating an LAA. • Composition of PM_{10} dust is unknown. • Distance that $PM_{2.5}$ is traveling is unknown. • Composition of $PM_{2.5}$ dust is unknown. • The assessment relies on the absence of receptors; however, vegetation, wetlands, soils, wildlife are adjacent to the property. • It's not clear whether traditional use sites are in close proximity to the property and may be exposed to dust.	Tervita is able to minimize potential residual effects through effective mitigation measures. The RAA captures any effects that would be captured in the LAA. The expected contaminants of concern for the proposed Project are primarily fugitive dust emissions (PM), and to a lesser extent various minor combustion tailpipe emissions. The Air Quality RAA is expected to be sufficient to capture the area of such low-lying releases and potential cumulative interactions with other activities not related to the proposed Project.	Addressed in response.

Table 11.3-1. Key Issues Raised by DRFN and Tervita Response

Key Issue	Specific Issues Raised by BRFN	Tervita Response	Status of Resolution
Air Quality – Cumulative Effects	DRFN noted that the characterization of residual effects may be inaccurate, in the absence of an LAA and given the uncertainties expressed above. The cumulative effects assessment may need to be revisited once these uncertainties have been addressed.	Tervita is able to minimize potential residual effects through effective mitigation measures. The RAA captures any effects that would be captured in the LAA. The expected contaminants of concern for the proposed Project are primarily fugitive dust emissions (PM), and to a lesser extent various minor combustion tailpipe emissions. The Air Quality RAA is expected to be sufficient to capture the area of such low-lying releases and potential cumulative interactions with other activities not related to the proposed Project.	Addressed in response.
Air Quality – Follow-up Strategy	DRFN noted that a follow-up strategy is required to mitigate air quality effects and dust deposition.	Tervita will include a mitigation strategy to mitigate air quality effects and dust deposition in the Application.	Addressed in Section 4.2.5 of the Application.
Acoustic Environment – Residual Effects	DRFN noted that quantitative modeling of noise attenuation was not conducted, which may lead to some uncertainty over potential receptors in the area as noise attenuation is unknown. Section 4.3.5 only discusses a residential receptor at 2.5 km away. Wildlife and land and resource users mentioned as sub-components but not considered in the assessment. Noise data from existing landfill would inform the assessment of the expansion, as it is reasonable to assume that noise would be similar.	A study to measure noise levels specific to operations is planned for later in 2019 and results can be shared with DRFN upon request. Sources of noise are described in Section 4.4.3.1 and include trucks and heavy equipment.	Addressed in the response and in Section 4.4.3.1 of the Application.
Acoustic Environment – Cumulative Effects	DRFN stated that Section 4.3.6 may need to be revisited based on discussions related to the characterization of Project residual effects and a clearer understanding of noise sources in the RAA.	Tervita will be able to minimize potential residual effects through our effective mitigation measures.	Addressed in Table 4.3-2 and Section 4.3.4.4 the Application.
Acoustic Environment – Follow-up Strategy	DRFN stated that a follow-up strategy may be required pending the resolution of the above comments.	If a follow-up strategy is required Tervita will engage DRFN to ensure adequacy.	Addressed in response.
Surface Water – Mitigation Measures	DRFN asked what mitigation is planned for sediment pond sludge.	If Tervita needs to remove sediment from out surface water pond, it will be dredged and the sediment dewatered in appropriate containment. The dewatered sediment will be tested and the appropriate disposal location found.	Addressed in response.

Table 11.3-1. Key Issues Raised by DRFN and Tervita Response

Key Issue	Specific Issues Raised by BRFN	Tervita Response	Status of Resolution
Groundwater – Mitigation Measures	DRFN asked how leachate will be treated.	Currently any recoverable oil is skimmed from leachate. Tervita is exploring thermal evaporation of leachate and is running trials in Alberta.	Addressed in response.
Terrestrial Vegetation – Spatial Boundaries	DRFN stated that the LAA may be too small and should be related to potential dust deposition. See additional comments on dust and air quality regarding dust and potential effects to environmental receptors.	The expected contaminants of concern for the proposed Project are primarily fugitive dust emissions (PM), and to a lesser extent various minor combustion tailpipe emissions. The Air Quality RAA is expected to be sufficient to capture the area of such low-lying releases and potential cumulative interactions with other activities not related to the proposed Project.	Addressed in response.
Terrestrial Vegetation – Existing Conditions	DRFN asked what the results of previous invasive plant monitoring were.	Tervita will update the Application to contain a summary of the results.	Addressed in Section 4.6 of the Application.
Terrestrial Vegetation – Mitigation Measures	DRFN noted that Section 4.6.4 refers to mitigations for wetlands, but effects to wetlands are not addressed in the assessment despite their location adjacent to the property. Wetlands are first mentioned in the wildlife section.	Wetlands were excluded as a VC. Effects will be addressed under Terrestrial Vegetation and Surface Water VCs.	Addressed in Section 4.6 of the Application.
Terrestrial Vegetation – Residual Effects	DRFN noted that Section 4.6.5 may need to be revisited based on resolution of spatial boundaries and uncertainties associated with dust deposition and composition.	Tervita will review the dust deposition information and supplement the Application if necessary.	Addressed in Section 4.6 of the Application.
Terrestrial Vegetation – Cumulative Effects	DRFN stated that Section 4.6.6 may need to be revisited based on updated characterization of residual effects.	Tervita will adequately describe residual effects and follow up with DRFN as required.	Addressed in Section 4.6 of the Application.
Terrestrial Vegetation – Follow-up Strategy	DRFN stated that a follow-up strategy may be required pending the resolution of the above comments.	If follow-up is required Tervita will engage DRFN to ensure adequacy.	Addressed in response.
Wildlife – Existing Conditions	DRFN stated that there are 11 wetlands near the Project, but they are first mentioned in the wildlife section. Given soil metal concentrations, it seems possible that wetlands (and the wildlife that rely on those wetlands) may be at risk of exposure. This is not considered in the EA. Wildlife use of the wetlands is not discussed and wildlife surveys of the wetlands were not undertaken. The class and function of the wetlands are not described in the EA. Wildlife surveys appear to be at a reconnaissance level and may be inadequate to document wildlife activity in the vicinity of the Project.	No permanent wetlands are currently present within 250 m of the Project footprint. Therefore, any potential Project effects will be addressed under Terrestrial Vegetation and Surface Water VCs. There is no potential surface water or groundwater connectivity from the Project footprint to wetlands, based on the separation distance and Tervita's commitment to groundwater and surface water control. Surface water will be tested for contamination prior to discharge and discharged into a well-vegetated upland area.	Addressed in the response and in Section 4.8 of the Application.

Table 11.3-1. Key Issues Raised by DRFN and Tervita Response

Key Issue	Specific Issues Raised by BRFN	Tervita Response	Status of Resolution
Wildlife – Existing Conditions (cont'd)	The identification of a juvenile western toad indicates the potential for breeding in the area, but follow-up surveys were not undertaken. It is not clear whether potential interaction with bears were considered. It is not clear what trails and riparian areas were investigated and the results.	See above	See above
Wildlife – Potential Effects and Mitigation Measures	DRFN noted that in the absence of a wetland delineation, it is not clear where amphibians would be salvaged to if the need arose. Is there evidence of nesting in the Project site? Construction is scheduled for summer and fall, but mitigations table suggests that construction will be avoided from May 1 to July 31.	Tervita will perform bird surveys and amphibian surveys prior to construction of new cells in the expansion area.	Addressed in response.
Wildlife – Residual Effects	DRFN indicated that it's not clear whether the correct effects pathways were considered. The expansion is within the fence line so presumably habitat loss, movement, and mortality risk was evaluated in the original assessment. There is unlikely to be a substantive change. However, effects outside of the fence line may not be completely captured, (that is, wildlife health associated with dust and metals). Additionally, it is not clear how habitat alteration was measured, particularly if noise and dust attenuation was not quantified or modelled.	Through effective mitigation measures Tervita is able to minimize dust impacts, thus minimal habitat alterations.	Addressed in response.
Wildlife – Cumulative Effects	DRFN indicated that Section 4.8.6 may need to be revisited based on updated characterization of residual effects.	Tervita will adequately describe residual effects and follow up with DRFN as required.	Addressed in Section 4.8.4 of the Application.
Wildlife – Follow-up Strategy	A follow-up strategy may be required pending the resolution of the above comments.	If follow-up is required Tervita will engage DRFN to ensure adequacy.	Addressed in response.
Effects on TLU activities	DRFN identified the Project Area as a location of value for continued practice of DRFN Aboriginal rights and was concerned about potential effects on accessibility to TLU sites.	Tervita assessed the effects of the Project on DRFN TLU activities.	Addressed in Section 11.3.5 of the Application.
Healthy watersheds	DRFN stated that access to a healthy ecosystem that supports hunting, trapping, and peaceful enjoyment of the land is integral to DRFN culture.	Tervita assessed the effects of the Project on DRFN TLU activities.	Addressed in Section 11.3.5 of the Application.

Table 11.3-1. Key Issues Raised by DRFN and Tervita Response

Key Issue	Specific Issues Raised by BRFN	Tervita Response	Status of Resolution
Culturally important wildlife, fish, and plants	DRFN identified culturally important wildlife, such as moose, elk, and deer, and plants, such as berries and medicinal plants, in their Traditional Use Study.	Tervita assessed the effects of the Project on DRFN TLU activities.	Addressed in Section 11.3.5 of the Application.
Groundwater and surface water quality	DRFN expressed concern about elevated levels of boron and barium in groundwater.	Tervita will conduct quarterly groundwater monitoring.	Addressed in response.

Source: DRFN screening comments and the Tervita Silverberry Non-Confidential Desktop Traditional Use Study.

- Details of these key issues and Tervita's response to these issues are provided in a summary table in Appendix 13. Tervita continues to work with DRFN to resolve outstanding issues such as effects on Aboriginal rights and TLU activities.

Details of these key issues and Tervita's response to these issues are provided in a summary table in Appendix 13. Tervita continues to work with DRFN to resolve outstanding issues such as effects on Aboriginal rights and TLU activities.

11.3.3 Background Information

DRFN is located 30 km northeast of Fort St. John, in electoral area B of the PRRD (Province of BC 2019b; PRRD 2019). The Nation has two reserves, Doig River (IR No. 206) and Beaton River (IR No. 204) (Indigenous and Northern Affairs Canada 2019b). Doig River is located 40 km east of the Project site and Beaton River is located 24 km northeast of the Project site. The total registered population as of June 2019 is 548 individuals, of which 133 are reported to reside predominantly on the Doig River reserve (Indigenous and Northern Affairs Canada 2019b).

DRFN is part of the Dane-Zaa language group, which is an Athapaskin language, also known as the Beaver language (BC Assembly of First Nations 2019a; The Firelight Group 2015). The word Dane-zaa means "Real People" in Dane-zaa Záágé (The Firelight Group 2015).

DRFN is a signatory of Treaty 8, signed in 1900 as part of the Fort St. John Band (The Firelight Group 2015). DRFN is governed by a Chief and three Councillors, who are selected through the electoral system outlined in the *Indian Act* (Indigenous and Northern Affairs Canada 2019b). Chief and Council are elected every two years and the current election cycle ends on November 23, 2019 (Indigenous and Northern Affairs Canada 2019b).

According to the most recent census data available, 100 DRFN members were 15 years of age or older in 2016 (Indigenous and Northern Affairs Canada 2019b). Educational attainment rates for 2016 were as follows: 35 individuals (35 percent) had completed a trades, apprenticeship or other non-university certificate; 10 individuals (10 percent) completed high school, and 55 individuals (55 percent) had no degree, certificate or diploma (Indigenous and Northern Affairs Canada 2019b). The labour force participation rate in 2016 was 60 percent, with an employment rate of 45 percent and an unemployment rate of 33 percent (Indigenous and Northern Affairs Canada 2019b). The top industries were agriculture, health, and education, while the most common occupations were management, trades, other, social services, and sales (Indigenous and Northern Affairs Canada 2019b).

DRFN has identified subsistence harvesting and hunting as an important way of life and culture. Historically fur trade has been an important source of income and still accounts for a portion of income today. Currently, DRFN works to achieve sustainable economic development that allows its membership to prosper while not detracting from their ability to use their land and exercise their treaty rights. In recent years, DRFN has entered into a number of agreements, alongside other neighboring Treaty 8 First

Nations, centering around natural gas development as well as the BC Hydro Site C hydroelectric project (BC Assembly of First Nations 2019b).

11.3.4 Traditional Ecological Knowledge and Traditional Land Use

A review of the desktop TUS provided by DRFN has given an overview of their traditional knowledge, land use, occupancy and resources in the context of the Project. The information in this section was used to identify culturally important resources, key issues and potential effects of the Project on DRFN rights and interests.

DRFN has traditionally used the area for travel routes; habitation sites; harvesting berries, plants, and medicines, as well as hunting, trapping and fishing (Urban Systems 2017). Having access to healthy ecosystems that support TLU is integral to the DRFN way of life, particularly with respect to knowledge transfer and cultural continuity (Urban Systems 2017).

The Project Area provides habitat for a variety of wildlife including caribou, moose, elk, deer, black and grizzly bears, fox, beaver, porcupine, and migratory birds (Urban Systems 2017).

The DRFN territory is home to a large population of caribou, which were traditionally harvested for food and cultural uses. The region, known as the Chinchanga range, is occupied by a herd of caribou that members of DRFN have been familiar with through generations of tracking and hunting (Urban Systems 2017). The boreal caribou is listed under the Species at Risk Public Registry as threatened, due to increased predation and habitat loss (Government of Canada 2019). As a result, DRFN has self-imposed a ban on caribou hunting and developed a list of management recommendations to address cumulative effects in the region (Urban Systems 2017).

Moose are also culturally significant species to DRFN. Moose has been a dietary staple with historical records of 10 moose per family being hunted annually (Urban Systems 2017). Moose is used for the meat and hides, the processing of which plays a significant cultural role in intergenerational knowledge transfer (Urban Systems 2017). Much like the caribou, DRFN has noticed a decline in moose populations and have self-regulated hunting as a result (Urban Systems 2017).

Many waterways in the area are used for fishing. Members often fish for rainbow trout, speckled trout, grayling, whitefish, pickerel, salmon, and jackfish (Urban Systems 2017). The Peace River was used for generations to travel between the mountains and the plains and is still used by members today (Urban Systems 2017). Many camping sites and pack trails are located along the river and much of the oral history takes place along the river's shores (Urban Systems 2017).

11.3.5 Potential Effects on Aboriginal Interests

This section describes the potential Project-related effects identified by DRFN on TLU.

The identification of the potential effects of the proposed Project expansion on DRFN TLU is based on the results of the TLU report received from DRFN, and discussions with DRFN.

The proposed Project expansion is anticipated to interact with the TLU for DRFN during the following construction, operations, closure/reclamation, and postclosure activities:

- Transportation/mobilization of equipment and workers to the site
- Clearing of vegetation, excavation, construction of cells, and construction of associated infrastructure
- Waste acceptance, placement, and compaction
- Cell capping
- Postclosure maintenance and monitoring

Mitigation measures have been identified in a manner consistent with Section 3.5 of this Application. The mitigation measures to address the effects on DRFN's Aboriginal interests have been outlined and discussed in the following VC sections: Land and Resource Use VC, Acoustic Environment VC, Wildlife and Wildlife Habitat VC, Air Quality VC, Terrestrial Vegetation VC, Surface Water VC, and Groundwater

VC. These mitigation measures are designed to reduce the effects of the Project on the resources and environment that are used by DRFN in support of their traditional activities. The efficacy of these mitigation measures is discussed and outlined in the respective VC sections and is not repeated in this section.

Table 11.3-2 identifies the potential effects of the proposed Project expansion on Aboriginal interests, as well as mitigation measures and potential residual effects. In addition to the summary of mitigation provided herein, further measures are provided in the management planning documents (see Section 13) and the Silverberry Operations Plan.

Table 11.3-2. Aboriginal Interests Effects Assessment – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Concern and Impact	Mitigation[a]	Potential Residual Effect
Effects on TLU activities specifically sensory disturbance (noise and dust)	Mitigation measures for the Land and Resource Use VC include: • The proposed Project expansion footprint is currently fenced and not being used by agricultural, recreational users or First Nations. • Provide First Nations with information and protocols regarding the timeframe for construction. • Consult with First Nations, forest tenure holders and trappers and consider specific requests for mitigation. • Place signage on access roads in the vicinity of the construction activities notifying road users that construction activities are taking place. • Inform and consult with interested federal and provincial agencies with the potential to be impacted by the Project, as warranted. Mitigation measures for the Acoustic Environment VC include: • Construction work will be done in daylight hours only and operational work will be done between 7 a.m. and 7 p.m. • Equipment will be well maintained with properly functioning mufflers. Operators will take reasonable measures to control construction-related noise. Mitigation measures for the Air Quality VC include: • Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Contractor will ensure equipment is well-maintained. • Reduce idling of equipment, where possible. • Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. • Equipment to use low-sulphur diesel, as appropriate. • Implement additional measures provided in the Dust and Odour Control Plan and Air Quality Monitoring Plan. • The Contractor will ensure equipment is well-maintained. • Reduce idling of equipment, where possible. Additional mitigation will be developed in consultation with DRFN, if required.	Sensory disturbance of traditional land and resource users
Effects on resources used for TLU activities including water, culturally important vegetation, trees, and wildlife	Mitigation measures for the Surface Water VC include: • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion. • Surface water control works will be inspected weekly and/or immediately after a major storm or catastrophic event. • Erosion occurring on surface water control works will be repaired and mitigated as soon as possible.	Effects on culturally important resources such as wildlife

Table 11.3-2. Aboriginal Interests Effects Assessment – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Concern and Impact	Mitigation[a]	Potential Residual Effect
Effects on resources used for TLU activities including water, culturally important vegetation, trees, and wildlife (cont'd)	• Mitigation measures to prevent surface water erosion may include swales, hay bales, rock riprap, and/or coconut matting. • The final slopes of the landfill cap will not exceed 33% and will be seeded as soon as possible to ensure vegetation growth and minimize erosion. • The landfill cap will be inspected weekly and if erosion on the cap is noted it will be repaired and mitigated as soon as possible. • A ditch constructed around the perimeter will direct run off and run on water to the runoff pond which has a capacity of 15,000 m^3. • Onsite erosion control will be utilized if extreme conditions warrant. • Implement additional measures provided in the Erosion and Sediment Control Plan and the Stormwater Management Plan. • Any additional requirements for reclamation will be discussed with BC MECCS pending final site assessment. Mitigation measures for the Groundwater VC include: • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Groundwater from monitoring wells will not be used during construction, operation or reclamation\closure. Mitigation measures for the Wildlife and Wildlife Habitat VC include: • Schedule construction activities outside the migratory bird nesting period. • Conduct a nonintrusive preconstruction nest survey in the event any clearing activities are scheduled within the migratory bird nesting period. • Use a cover crop to assist in weed and erosion control, where warranted. • If previously unidentified wildlife species with special conservation status or their site-specific habitat are identified during construction, suspend activities and notify the Environment & Regulatory Advisor, who will determine the appropriate mitigation measure to be implemented. • Tervita will seek an amphibian salvage permit from BC MFLNRORD to salvage any amphibians from the Project footprint prior to construction activities. • The active landfill area will be surrounded by a fence as required by Section 8(a)(i) of the HWR, limiting wildlife interactions. • All food and wastes will be stored and secured in vehicles or appropriate facilities. • Limit light and noise effects on wildlife by actively accepting waste on a prebooked basis during daylight hours. • The feeding or harassment of livestock or wildlife will be prohibited. • Construction and operations personnel will not be permitted to have firearms or pets on the Project site.	See above

Table 11.3-2. Aboriginal Interests Effects Assessment – Potential Effects, Mitigation Measures, and Potential Residual Effects

Project Concern and Impact	Mitigation[a]	Potential Residual Effect
Effects on resources used for TLU activities including water, culturally important vegetation, trees, and wildlife (cont'd)	• Tervita personnel and contractors will be required to abide by all speed limits on the Project site and on transit to the site. • All collisions (including wildlife) along the Project access road or within the Project site will be reported and reasonable corrective measures will be put in place prevent future collisions. • Tervita will ensure compliance with safe operating practices so that wildlife will not come in contact with any spills, leaks or other releases from Project facilities and equipment. • Any wildlife mortalities or injuries at the Project site will be documented. Mitigation measures for the Terrestrial Vegetation VC include: • Tervita will seek to reduce disturbance to native vegetation to the extent possible. • Areas of Noxious weeds/invasive plants will be noted during weekly inspections, especially during times of high vegetation growth. • The PRRD's Invasive Plant Program Strategic Plan and Profile will be reviewed annually to determine regionally important Noxious and invasive plants. • If areas of Noxious or invasive weeds are noted, a certified pesticide applicator will be brought in on an as-needed basis. • If there is an infestation of Noxious/invasive plants, Tervita will document the infestation on the Provincial IAPP to help with future weed control programs. • To prevent the spread of Noxious and invasive weeds, Tervita vehicles and equipment will be cleaned as best as reasonably possible (before entering/exiting the landfill). • Prior to mobilization and demobilization, construction equipment will be cleaned. • When seed is being used for revegetation at site, best efforts will be made to source local seed to reduce the risk of introducing invasive plant species from another region. The Certificate of Seed Analysis will be kept on file and analyzed to ensure Noxious species and regional species of concern are not present in the seed lot. • Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. • Use a cover crop to assist in weed and erosion control, where warranted. • Equipment to use low-sulphur diesel. • Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Implement additional measures provided in the Dust and Odour Control Plan and the Air Quality Monitoring Plan. The assessment determined that the proposed Project expansion is not expected to result in a change in habitat or mortality risk and no potential impacts to the Fish and Fish Habitat VC are predicted. Consequently, no mitigation measures are required, and further assessment of the Fish and Fish Habitat VC is not warranted.	See above

[a] Referenced sections refer to the draft EA.

Project activities, such as transportation and mobilization of equipment and workers to the site, clearing of vegetation, excavation, construction of cells and associated infrastructure and waste acceptance, placement, and compaction, have the potential to affect DRFN TLU activities through sensory disturbance. Noise, odour, lighting, and visual disturbance could potentially alter the experience of the land for DRFN community members while conducting TLU activities. Potential effects on TLU activities through sensory disturbance will be reduced by constructing the proposed Project expansion footprint on Tervita-owned, fenced land adjacent to the existing landfill. Since the land is Tervita-owned, private land, DRFN is not currently using the footprint for TLU activities. However, the Project will extend the life of the landfill; therefore, the effects on DRFN TLU activities will continue beyond the life of the existing facility. Tervita will provide DRFN with advanced notification of the construction schedule and will continue consultation with DRFN regarding mitigation measures, as required. No additional land will be taken from use by First Nations, and operational activities are not expected to change the magnitude of the effects on DRFN's TLU activities from the levels that already exist as a result of the existing landfill. With the use of private land and the implementation of the mitigation measures identified in Table 11.2-2, the effects of the Project on TLU are expected to be not significant.

Project activities, such as transportation and mobilization of equipment and workers to the site, clearing of vegetation, excavation, construction of cells and associated infrastructure and waste acceptance, placement, and compaction, have the potential to affect the resources traditionally harvested by DRFN. Tervita has developed a suite of mitigation measures for the resources used by DRFN in conducting TLU activities. A summary of mitigation measures is provided in Table 11.2-2 with additional details provided in Section 4.8 for Wildlife and Wildlife Habitat, Section 4.6 for Terrestrial Vegetation, and Sections 4.5 and 4.4 for Groundwater and Surface Water, respectively, which include the resources identified by DRFN in conducting TLU activities. As outlined in Sections 4.6 Terrestrial Vegetation, Section 4.7 Fish and Fish Habitat, and Section 4.8 Wildlife and Wildlife Habitat, the Project is not anticipated to significantly affect the resources available for TLU activities. The Project will extend the life of the landfill; however, Project activities are not expected to change the magnitude of effects on resources harvested by DRFN beyond the levels that already exist as a result of the existing landfill; therefore, with the implementation of the mitigation measures identified in Table 11.2-2 for the resources traditionally harvested by DRFN, the effects of the Project on TLU are expected to be not significant.

11.3.6 Outstanding Aboriginal Interests

On January 19, 2018, Tervita and DRFN met to discuss issues raised by DRFN in their TLU report. Tervita will continue to work with DRFN to resolve outstanding concerns. Tervita and DRFN discussed working with DRFN when placing final cover, to ensure the proper vegetation is planted to help support local wildlife populations. Tervita will work with local First Nations on the appropriate seed mix for revegetation and capping. DRFN also expressed concern of the deforestation around Silverberry affecting Caribou populations. Tervita and DRFN discussed the potential off restoration at a later date. Lastly, DRFN expressed concern about the amphibians found at site. Tervita will perform amphibian surveys prior to expansions construction.

11.3.7 Commitments and Arrangements

No commitments or arrangements have currently been made with DRFN concerning TLU.

11.4 Other Matters of Concern to Aboriginal Groups

BRFN raised concerns with respect to the selection of VCs, spatial boundaries for elements, field programs to establish a baseline and assessment methodologies particularly with respect to cumulative effects assessment. These issues have been captured in the previously noted key issues table and Tervita's responses to these requests are captured in Table 11.2-1. No other matters of concern have been raised by BRFN, other than those outlined in the Aboriginal interests section.

DRFN raised concerns with respect to potential effects on soil, air quality, vegetation, wildlife, and TLRU, as well as noise effects. These issues have been captured in the previously noted key issues table and

Tervita's responses to these requests are captured in Table 11.3-1. No other matters of concern have been raised by DRFN, other than those outlined in the Aboriginal interests section.

11.5 Issue Summary Table

Table 11.5-1 identifies the Aboriginal interests identified by participating Aboriginal groups and the mitigation measures to avoid, mitigate or manage the effects of the Project.

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN	Review of draft VCs; Wildlife Survey; and draft AAIR.	Potential effects on Aboriginal rights	In selecting the VCs, the Project team considered the original EAC Application, information collected during the operation of the existing landfill, and the BC EAO Guideline for the Selection of Valued Components. The VCs considered in this Application were selected based on the known interactions of landfill activities, and were refined through input from Aboriginal groups, the public, and government agencies. See Section 3.1 for more details on the VC selection process. • The Wildlife and Wildlife Habitat effects assessment included moose and other ungulates, black bear and other fur-bearers, mature forest birds, early seral forest birds and the western toad. The assessment identified activities in all phases of the Project that could interact with the Wildlife and Wildlife Habitat VC and provided a description of existing conditions, including winter track surveys, spring and summer surveys, and wildlife species of conservation concern. Traditional Knowledge shared included wildlife species of cultural importance, observations of changes to wildlife and wildlife habitat, and suggested best practices and mitigation measures. It was determined that postmitigation residual effects include loss or alteration of wildlife habitat, changes to wildlife movement, and increased wildlife mortality risk. See Section 4.8 for more details on the assessment of effects to the Wildlife and Wildlife Habitat VC.	Mitigation measures for the Wildlife and Wildlife Habitat VC include: • Schedule construction activities outside the migratory bird nesting period. • Conduct a nonintrusive preconstruction nest survey in the event any clearing activities are scheduled within the migratory bird nesting period. • Use a cover crop to assist in weed and erosion control, where warranted. • If previously unidentified wildlife species with special conservation status or their site-specific habitat are identified during construction, suspend activities and notify the Environment & Regulatory Advisor, who will determine the appropriate mitigation measure to be implemented. • Tervita will seek an amphibian salvage permit from BC MFLNRORD to salvage any amphibians from the Project footprint prior to construction activities. • The active landfill area will be surrounded by a fence as required by Section 8(a)(i) of the HWR, limiting wildlife interactions. • All food and wastes will be stored and secured in vehicles or appropriate facilities. • Limit light and noise effects on wildlife by actively accepting waste on a prebooked basis during daylight hours. • The feeding or harassment of livestock or wildlife will be prohibited. • Construction and operations personnel will not be permitted to have firearms or pets on the Project site.	Addressed

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	See above	See above	See above	• Tervita personnel and contractors will be required to abide by all speed limits on the Project site and on transit to the site. • All collisions (including wildlife) along the Project access road or within the Project site will be reported and reasonable corrective measures will be put in place prevent future collisions. • Tervita will ensure compliance with safe operating practices so that wildlife will not come in contact with any spills, leaks or other releases from Project facilities and equipment. • Any wildlife mortalities or injuries at the Project site will be documented.	See above
			• The Land and Resource Use effects assessment included First Nation land and resource use, including but not limited to, hunting and trapping, as well as travel to First Nation land and resource use sites. The assessment included a description of BRFN and DRFN current land use, identified the activities in all phases of the Project that could interact with the Land and Resource Use VC, and determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 6.1 for more details on the assessment of effects to the Land and Resource Use VC.	Mitigation measures for the Land and Resource Use VC include: • The proposed Project expansion footprint is currently fenced and not being used by agricultural, recreational users or First Nations. • Provide First Nations with information and protocols regarding the timeframe for construction. • Consult with First Nations, forest tenure holders and trappers and consider specific requests for mitigation. • Place signage on access roads in the vicinity of the construction activities notifying road users that construction activities are taking place. • Inform and consult with interested federal and provincial agencies with the potential to be impacted by the Project, as warranted.	

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	See above	See above	• The Culture and Heritage effects assessment included an assessment of archaeological and historical sites. The closest known archaeological site to the landfill is HdRg-2, located approximately 7.2 km to the south-southeast, along St. John Creek. An Archaeological Impact Assessment, submitted as part of the PAC Application for the existing landfill, was completed under a *Heritage Conservation Act* Section 14 Inspection Permit and no archaeological resources were found on the Project footprint. Therefore, there is low potential to encounter previously undiscovered heritage resources during proposed Project expansion construction. The assessment determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 7 for more details on the assessment of effects to the Heritage and Culture VC.	Mitigation measures for the Culture and Heritage VC include: • If historical features (for example, arrow heads, modified bone, pottery fragments, and fossils) not previously identified are found on the construction footprint, implement the following: – Immediately notify the BC Archaeology Branch. – Immediately stop work within the site. – Implement any other measures identified by the BC Archaeology Branch. – Implement measures in the BC Archaeological Chance Find Procedure (GBC 2014). – Prohibit the collection of historical resources by Project personnel. • Additional mitigation will be developed in consultation with BRFN, if required.	See above
	Review of draft AAIR	Potential effects on TLU activities including the intangible values associated with these activities	• The Land and Resource Use effects assessment included First Nation land and resource use, including but not limited to, hunting and trapping, as well as travel to First Nation land and resource use sites. The assessment included a description of BRFN and DRFN current land use, identified the activities in all phases of the Project that could interact with the Land and Resource Use VC, and determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 6.1 for more details on the assessment of effects to the Land and Resource Use VC.	Mitigation measures for the Land and Resource Use VC include: • The proposed Project expansion footprint is currently fenced and not being used by agricultural, recreational users or First Nations. • Provide First Nations with information and protocols regarding the timeframe for construction. • Consult with First Nations, forest tenure holders and trappers and consider specific requests for mitigation.. • Place signage on access roads in the vicinity of the construction activities notifying road users that construction activities are taking place	Addressed

BRFN (cont'd)	See above	See above	See above	• Construction and operations personnel will not be permitted to have firearms or pets on the Project site. • Tervita personnel and contractors will be required to abide by all speed limits on the Project site and on transit to the site. • All collisions (including wildlife) along the Project access road or within the Project site will be reported and reasonable corrective measures will be put in place prevent future collisions. • Tervita will ensure compliance with safe operating practices so that wildlife will not come in contact with any spills, leaks or other releases from Project facilities and equipment. • Any wildlife mortalities or injuries at the Project site will be documented.	See above
			• The Terrestrial Vegetation effects assessment included an assessment of plants species of concern, including rare plant species and plant species used for traditional purposes, vegetation communities of concern, and invasive plant species. Shared Traditional Knowledge identified that DRFN actively picks and harvests berries, medicinal plants, and other plants and fungi throughout their traditional territory. Culturally important species include lily pads, spruce gum, devils club, Labrador tea and yarrow. The assessment identified the activities in all phases of the Project that could interact with the Terrestrial Vegetation VC, and determined that postmitigation residual effects include loss or alteration of native vegetation. See Section 4.6 for more details on the assessment of effects to the Terrestrial Vegetation VC.	Mitigation measures for the Terrestrial Vegetation VC include: • Tervita will seek to reduce disturbance to native vegetation to the extent possible. • Areas of Noxious weeds/invasive plants will be noted during weekly inspections, especially during times of high vegetation growth. • The PRRD's Invasive Plant Program Strategic Plan and Profile will be reviewed annually to determine regionally important Noxious and invasive plants. • If areas of Noxious or invasive weeds are noted, a certified pesticide applicator will be brought in on an as-needed basis. • If there is an infestation of Noxious/invasive plants, Tervita will document the infestation on the Provincial IAPP to help with future weed control programs.

BRFN (cont'd)	See above	See above	• The Groundwater effects assessment included water quality and quantity as well as concentrations of inorganic ions, dissolved metals, other contaminants, perceived taste and smell, volume and movement. The assessment included a description of existing conditions including environmental context, groundwater monitoring, leachate management and identified the activities in all phases of the Project that could interact with the Groundwater VC. Traditional Knowledge shared included the connectivity between waterways identified in the LAA for the proposed Project expansion and the importance of mitigation water contamination, as well as the perceived safety value and quality of water, including taste and smell. The effects assessment determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 4.5 for more details on the assessment of effects to the Groundwater VC.	Mitigation measures for the Groundwater VC include: • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Groundwater from monitoring wells will not be used during construction, operation or reclamation\closure.	See above

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	See above	See above	• The Fish and Fish Habitat effects assessment included fish species of management interest and their habitat, including fish species of concern to Aboriginal groups. The assessment characterized the existing conditions for the Fish and Fish Habitat VC, considering Traditional Knowledge shared, including the species fished by DRFN in their traditional territory and further knowledge to be provided by BRFN with respect to species presence, abundance and distribution. However, to date, BRFN has not provided Traditional Knowledge specific to fish and fish habitat. The assessment determined that the proposed Project expansion is not expected to result in a change in habitat or mortality risk and no potential impacts to the Fish and Fish Habitat VC are predicted. Consequently, no mitigation measures are required, and further assessment of the Fish and Fish Habitat VC is not warranted. See Section 4.7 for more details on the assessment of effects to the Fish and Fish Habitat VC.	The assessment determined that the proposed Project expansion is not expected to result in a change in habitat or mortality risk and no potential impacts to the Fish and Fish Habitat VC are predicted. Consequently, no mitigation measures are required, and further assessment of the Fish and Fish Habitat VC is not warranted.	See above

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	See above	See above	• The Culture and Heritage effects assessment included an assessment of archaeological and historical sites. The closest known archaeological site to the landfill is HdRg-2, located approximately 7.2 km to the south-southeast, along St. John Creek. An Archaeological Impact Assessment, submitted as part of the PAC Application for the existing landfill, was completed under a *Heritage Conservation Act* Section 14 Inspection Permit and no archaeological resources were found on the Project footprint. Therefore, there is low potential to encounter previously undiscovered heritage resources during proposed Project expansion construction. The assessment determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 7 for more details on the assessment of effects to the Heritage and Culture VC.	Mitigation measures for the Culture and Heritage VC include: • If historical features (for example, arrow heads, modified bone, pottery fragments, and fossils) not previously identified are found on the construction footprint, implement the following: – Immediately notify the BC Archaeology Branch. – Immediately stop work within the site. – Implement any other measures identified by the BC Archaeology Branch. – Implement measures in the BC Archaeological Chance Find Procedure (GBC 2014). – Prohibit the collection of historical resources by Project personnel.	See above

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	Review of wildlife survey	Potential effects on culturally important wildlife, including noise, potential contamination and loss of habitat	• The Wildlife and Wildlife Habitat effects assessment included moose and other ungulates, black bear and other fur-bearers, mature forest birds, early seral forest birds and the western toad. The assessment identified activities in all phases of the Project that could interact with the Wildlife and Wildlife Habitat VC and provided a description of existing conditions, including winter track surveys, spring and summer surveys, and wildlife species of conservation concern. Traditional Knowledge shared included wildlife species of cultural importance, observations of changes to wildlife and wildlife habitat, and suggested best practices and mitigation measures. It was determined that postmitigation residual effects include loss or alteration of wildlife habitat, changes to wildlife movement, and increased wildlife mortality risk. See Section 4.8 for more details on the assessment of effects to the Wildlife and Wildlife Habitat VC.	Mitigation measures for the Wildlife and Wildlife Habitat VC include: • Schedule construction activities outside the migratory bird nesting period. • Conduct a nonintrusive preconstruction nest survey in the event any clearing activities are scheduled within the migratory bird nesting period. • Use a cover crop to assist in weed and erosion control, where warranted. • If previously unidentified wildlife species with special conservation status or their site-specific habitat are identified during construction, suspend activities and notify the Environment & Regulatory Advisor, who will determine the appropriate mitigation measure to be implemented. • Tervita will seek an amphibian salvage permit from BC MFLNRORD to salvage any amphibians from the Project footprint prior to construction activities. • The active landfill area will be surrounded by a fence as required by Section 8(a)(i) of the HWR, limiting wildlife interactions. • All food and wastes will be stored and secured in vehicles or appropriate facilities. • Limit light and noise effects on wildlife by actively accepting waste on a prebooked basis during daylight hours. • The feeding or harassment of livestock or wildlife will be prohibited. • Construction and operations personnel will not be permitted to have firearms or pets on the Project site.	Addressed

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	See above	See above	See above	• Tervita personnel and contractors will be required to abide by all speed limits on the Project site and on transit to the site. • All collisions (including wildlife) along the Project access road or within the Project site will be reported and reasonable corrective measures will be put in place prevent future collisions. • Tervita will ensure compliance with safe operating practices so that wildlife will not come in contact with any spills, leaks or other releases from Project facilities and equipment. • Any wildlife mortalities or injuries at the Project site will be documented.	See above
			• The Acoustic Environment effects assessment included noise levels and levels of annoyance with respect to wildlife and land and resource use. The assessment provided a description of the major sources of noise contributing to existing sound levels, the nearest noise-sensitive receptors, and identified the activities in all phases of the Project that could interact with the Acoustic Environment VC. Traditional Knowledge shared included effects of noise levels to wildlife and traditional land and resource use. The spatial boundaries for the noise effects assessment are the same as those for the Wildlife and Wildlife Habitat and Land and Resource Use VCs. It was determined that the postmitigation residual effects are increased noise emissions during all phases of the Project. See Section 4.3 for more details on the assessment of effects to the Acoustic Environment VC.	Mitigation measures for the Acoustic Environment VC include: • Construction work will be done in daylight hours only and operational work will be done between 7 a.m. and 7 p.m. • Equipment will be well maintained with properly functioning mufflers. Operators will take reasonable measures to control construction-related noise.	

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	See above	See above	• The Terrain and Soils effects assessment included terrain, soils, soil quality and erosion. The assessment provided a description of the existing conditions including environmental context, the ALR, soil quality, erosion, and identified the activities in all phases of the Project that could interact with the Terrain and Soils VC. No Traditional Knowledge was shared regarding terrain and soils. It was determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 4.1 for more details on the assessment of effects to the Terrain and Soils VC.	Mitigation measures for the Terrain and Soils VC include: • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion. • Topsoil and subsoil salvage will be immediately suspended for the preservation of topsoil and subsoil under the following conditions: – Wet or frozen field conditions which can result in the loss, admixing, degradation or compaction of topsoil or subsoil – High wind velocities which can create the potential for the loss of topsoil or subsoil – Any other field conditions which could result in the admixing, degradation or loss of topsoil or subsoil • Surface water control works will be inspected weekly and/or immediately after a major storm or catastrophic event. • Erosion occurring on surface water control works will be repaired and mitigated as soon as possible. • Mitigation measures to prevent surface water erosion may include swales, hay bales, rock riprap, and/or coconut matting. • The final slopes of the landfill cap will not exceed 33% and will be seeded as soon as possible to provide vegetation cover to minimize erosion. • The landfill cap will be inspected weekly and if erosion on the cap is noted it will be repaired and mitigated as soon as possible.	See above

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	See above	See above	See above	• Topsoil and subsoil will be stockpiled and re-used for site reclamation. Topsoil and subsoil salvage will be immediately suspended for the preservation of topsoil and subsoil under wet or frozen field conditions which can result in the admixing, degradation or compaction of topsoil or subsoil. • Implement two-lift soil handling for topsoil salvage. In this process, the topsoil material is stripped in the first lift and stored onsite for replacement after the life of the Project. The second lift includes all of the remaining subsoil material. • Maintain an adequate separation between topsoil and subsoil piles. • Replace the topsoil and subsoil in the same manner as it was excavated, avoiding admixing of soils. • An Erosion and Sediment Control Plan will be implemented to prevent erosion (see Section 13.1 for summary). • A Soil Conservation Plan will be implemented to avoid or reduce potential loss of surface soil material through wind or water erosion (see Section 13.2 for summary). • A Dust and Odour Control Plan will be implemented to prevent conditions conductive to dust generation and to suppress dust (see Section 13.9 for summary).	See above

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	See above	See above	• The Groundwater effects assessment included water quality and quantity as well as concentrations of inorganic ions, dissolved metals, other contaminants, perceived taste and smell, volume and movement. The assessment included a description of existing conditions including environmental context, groundwater monitoring, leachate management and identified the activities in all phases of the Project that could interact with the Groundwater VC. Traditional Knowledge shared included the connectivity between waterways identified in the LAA for the proposed Project expansion and the importance of mitigation water contamination, as well as the perceived safety value and quality of water, including taste and smell. The effects assessment determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 4.5 for more details on the assessment of effects to the Groundwater VC.	Mitigation measures for the Groundwater VC include: • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Groundwater from monitoring wells will not be used during construction, operation or reclamation\closure.	See above

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	Review of draft VC's and draft AAIR	Potential effects on fish and fish habitat	• The Surface Water effects assessment included water quality and quantity as well as sediment, concentrations of metals and hydrocarbons, perceived taste and smell and volume and movement. The assessment included a description of existing conditions including environmental context, stormwater management, leachate management and identified the activities in all phases of the Project that could interact with the Surface Water VC. Traditional Knowledge shared included the connectivity between waterways identified in the LAA for the proposed Project expansion and the importance of mitigation water contamination, as well as the perceived safety value and quality of water, including taste and smell. The effects assessment determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 4.4 for more details on the assessment of effects to the Surface Water VC.	Mitigation measures for the Surface Water VC include: • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion. • Surface water control works will be inspected weekly and/or immediately after a major storm or catastrophic event. • Erosion occurring on surface water control works will be repaired and mitigated as soon as possible. • Mitigation measures to prevent surface water erosion may include swales, hay bales, rock riprap, and/or coconut matting. • The final slopes of the landfill cap will not exceed 33% and will be seeded as soon as possible to ensure vegetation growth and minimize erosion. • The landfill cap will be inspected weekly and if erosion on the cap is noted it will be repaired and mitigated as soon as possible. • A ditch constructed around the perimeter will direct run off and run on water to the runoff pond which has a capacity of 15,000 m^3. • Onsite erosion control will be utilized if extreme conditions warrant. • Implement additional measures provided in the Erosion and Sediment Control Plan and the Stormwater Management Plan. • Any additional requirements for reclamation will be discussed with BC MECCS pending final site assessment.	Resolved

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	See above	See above	• The Fish and Fish Habitat effects assessment included fish species of management interest and their habitat, including fish species of concern to Aboriginal groups. The assessment characterized the existing conditions for the Fish and Fish Habitat VC and considered Traditional Knowledge shared, including the species fished by DRFN in their traditional territory and further knowledge to be provided by BRFN with respect to species presence, abundance and distribution. However, to date, BRFN has not provided Traditional Knowledge specific to fish and fish habitat. The assessment determined that the proposed Project expansion is not expected to result in a change in habitat or mortality risk and no potential impacts to the Fish and Fish Habitat VC are predicted. Consequently, no mitigation measures are required, and further assessment of the Fish and Fish Habitat VC is not warranted. See Section 4.7 for more details on the assessment of effects to the Fish and Fish Habitat VC.	• Assessment of the Fish and Fish Habitat VC is not warranted. • The assessment determined that the proposed Project expansion is not expected to result in a change in habitat or mortality risk and no potential impacts to the Fish and Fish Habitat VC are predicted. Consequently, no mitigation measures are required, and further.	See above

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	Review of draft VC's and AAIR	Potential effects on air quality including contamination and odour effects	• The Air quality effects assessment included dust, odours, emissions from combustion, fugitive emissions, and emissions from other sources. The assessment provided a description of existing conditions including COPC, ambient air quality in the region, and identified the activities in all phases of the Project that could interact with the Air Quality VC. Traditional Knowledge shared identified that odour from the existing landfill has a profound affect on the experience of the land for community members and leads to avoidance and alienation from lands. To date, although opportunities were provided to share Traditional Knowledge both directly and through the Working Group, DRFN has not provided any Traditional Knowledge related to air quality. It was determined that postmitigation residual effects are an increase in air emissions during all phases of the Project. See Section 4.2 for more details on the assessment of effects to the Air Quality VC.	Mitigation measures for the Air Quality VC include: • Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Contractor will ensure equipment is well-maintained. • Reduce idling of equipment, where possible. • Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. • Equipment to use low-sulphur diesel, as appropriate. • Implement additional measures provided in the Dust and Odour Control Plan and Air Quality Monitoring Plan. • The Contractor will ensure equipment is well-maintained. • Reduce idling of equipment, where possible.	Addressed

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	Review of draft AAIR	Potential effects of noise and light pollution	• The Acoustic Environment effects assessment included noise levels and levels of annoyance with respect to wildlife and land and resource use. The assessment provided a description of the major sources of noise contributing to existing sound levels, the nearest noise-sensitive receptors, and identified the activities in all phases of the Project that could interact with the Acoustic Environment VC. Traditional Knowledge shared included effects of noise levels to wildlife and traditional land and resource use. The spatial boundaries for the noise effects assessment are the same as those for the Wildlife and Wildlife Habitat and Land and Resource Use VCs. It was determined that the postmitigation residual effects are increased noise emissions during all phases of the Project. See Section 4.3 for more details on the assessment of effects to the Acoustic Environment VC. • The Night Time Light Management Plan includes measures to minimize potential light nuisance from the proposed Project expansion activities, including those relevant mitigation measures for effects on public health and wildlife. These mitigation measures include restricting most Project activities to daylight hours.	Mitigation measures for the Acoustic Environment VC include: • Construction and operational work will be done in daylight hours only. • Equipment will be well maintained with properly functioning mufflers. Operators will take reasonable measures to control construction-related noise. Mitigation measures for potential effects of Light Pollution include: • Provide potentially affected Aboriginal groups with the proposed Project expansion construction schedule and maps. • All incoming waste will be prebooked before arrival at the landfill site and will be received during daylight hours unless it's an emergency situation. • Construction work will be done in daylight hours only and operational work will be done between 7 a.m. and 7 p.m.	Addressed

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	Review of draft AAIR	Potential cumulative effects	Cumulative effects assessments were conducted for VC's determined to have residual effects that may interact with past, present and reasonably foreseeable projects in the RAA. These include Air Quality, Acoustic Environment, Terrestrial Vegetation and Wildlife and Wildlife Habitat. • The Air quality effects assessment included dust, odours, emissions from combustion, fugitive emissions, and emissions from other sources. The assessment provided a description of existing conditions including COPC, ambient air quality in the region, and identified the activities in all phases of the Project that could interact with the Air Quality VC. Traditional Knowledge shared identified that odour from the existing landfill has a profound affect on the experience of the land for community members and leads to avoidance and alienation from lands. To date, although opportunities were provided to share Traditional Knowledge both directly and through the Working Group, DRFN has not provided any Traditional Knowledge related to air quality. It was determined that postmitigation residual effects are an increase in air emissions during all phases of the Project. See Section 4.2 for more details on the assessment of effects to the Air Quality VC.	Mitigation measures for the Air Quality VC include: • Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Contractor will ensure equipment is well-maintained. • Reduce idling of equipment, where possible. • Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. • Equipment to use low-sulphur diesel, as appropriate. • Implement additional measures provided in the Dust and Odour Control Plan and Air Quality Monitoring Plan. • The Contractor will ensure equipment is well-maintained. • Reduce idling of equipment, where possible. BRFN (cont'd)	See above	See above	• The Acoustic Environment effects assessment included noise levels and levels of annoyance with respect to wildlife and land and resource use. The assessment provided a description of the major sources of noise contributing to existing sound levels, the nearest noise-sensitive receptors, and identified the activities in all phases of the Project that could interact with the Acoustic Environment VC. Traditional Knowledge shared included effects of noise levels to wildlife and traditional land and resource use. The spatial boundaries for the noise effects assessment are the same as those for the Wildlife and Wildlife Habitat and Land and Resource Use VCs. It was determined that the postmitigation residual effects are increased noise emissions during all phases of the Project. See Section 4.3 for more details on the assessment of effects to the Acoustic Environment VC.	Mitigation measures for the Acoustic Environment VC include: • Construction work will be done in daylight hours only and operational work will be done between 7 a.m. and 7 p.m. • Equipment will be well maintained with properly functioning mufflers. Operators will take reasonable measures to control construction-related noise.	See above

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	See above	See above	• The Terrestrial Vegetation effects assessment included an assessment of plants species of concern, including rare plant species and plant species used for traditional purposes, vegetation communities of concern, and invasive plant species. Shared Traditional Knowledge identified that DRFN actively picks and harvests berries, medicinal plants, and other plants and fungi throughout their traditional territory. Culturally important species include lily pads, spruce gum, devils club, Labrador tea and yarrow. The assessment identified the activities in all phases of the Project that could interact with the Terrestrial Vegetation VC, and determined that postmitigation residual effects include loss or alteration of native vegetation. See Section 4.6 for more details on the assessment of effects to the Terrestrial Vegetation VC.	Mitigation measures for the Terrestrial Vegetation VC include: • Tervita will seek to reduce disturbance to native vegetation to the extent possible. • Areas of Noxious weeds/invasive plants will be noted during weekly inspections, especially during times of high vegetation growth. • The PRRD's Invasive Plant Program Strategic Plan and Profile will be reviewed annually to determine regionally important Noxious and invasive plants. • If areas of Noxious or invasive weeds are noted, a certified pesticide applicator will be brought in on an as-needed basis. • If there is an infestation of Noxious/invasive plants, Tervita will document the infestation on the Provincial IAPP to help with future weed control programs. • To prevent the spread of Noxious and invasive weeds, Tervita vehicles and equipment will be cleaned as best as reasonably possible (before entering/exiting the landfill). • Prior to mobilization and demobilization, construction equipment will be cleaned. • When seed is being used for revegetation at site, best efforts will be made to source local seed to reduce the risk of introducing invasive plant species from another region. The Certificate of Seed Analysis will be kept on file and analyzed to ensure Noxious species and regional species of concern are not present in the seed lot. • Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized.	See above

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

BRFN (cont'd)	See above	See above	See above	• Use a cover crop to assist in weed and erosion control, where warranted. • Equipment to use low-sulphur diesel. • Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Implement additional measures provided in the Dust and Odour Control Plan and the Air Quality Monitoring Plan.	See above
			• The Wildlife and Wildlife Habitat effects assessment included moose and other ungulates, black bear and other fur-bearers, mature forest birds, early seral forest birds and the western toad. The assessment identified activities in all phases of the Project that could interact with the Wildlife and Wildlife Habitat VC and provided a description of existing conditions, including winter track surveys, spring and summer surveys, and wildlife species of conservation concern. Traditional Knowledge shared included wildlife species of cultural importance, observations of changes to wildlife and wildlife habitat, and suggested best practices and mitigation measures. It was determined that postmitigation residual effects include loss or alteration of wildlife habitat, changes to wildlife movement, and increased wildlife mortality risk. See Section 4.8 for more details on the assessment of effects to the Wildlife and Wildlife Habitat VC.	Mitigation measures for the Wildlife and Wildlife Habitat VC include: • Schedule construction activities outside the migratory bird nesting period. • Conduct a nonintrusive preconstruction nest survey in the event any clearing activities are scheduled within the migratory bird nesting period. • Use a cover crop to assist in weed and erosion control, where warranted. • If previously unidentified wildlife species with special conservation status or their site-specific habitat are identified during construction, suspend activities and notify the Environment & Regulatory Advisor, who will determine the appropriate mitigation measure to be implemented. • Tervita will seek an amphibian salvage permit from BC MFLNRORD to salvage any amphibians from the Project footprint prior to construction activities. • The active landfill area will be surrounded by a fence as required by Section 8(a)(i) of the HWR, limiting wildlife interactions. • All food and wastes will be stored and secured in vehicles or appropriate facilities.	

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
BRFN (cont'd)	See above	See above	See above	• Limit light and noise effects on wildlife by actively accepting waste on a prebooked basis during daylight hours. • The feeding or harassment of livestock or wildlife will be prohibited. • Construction and operations personnel will not be permitted to have firearms or pets on the Project site. • Tervita personnel and contractors will be required to abide by all speed limits on the Project site and on transit to the site. • All collisions (including wildlife) along the Project access road or within the Project site will be reported and reasonable corrective measures will be put in place prevent future collisions. • Tervita will ensure compliance with safe operating practices so that wildlife will not come in contact with any spills, leaks or other releases from Project facilities and equipment. • Any wildlife mortalities or injuries at the Project site will be documented.	See above
			• To avoid and reduce the potential adverse effects associated with the proposed Project expansion, Tervita has a number of management plans in place that describe environmental protection measures, instructions for carrying out proposed Project expansion activities, environmental permit and approval conditions and other environmental commitments, as well as applicable environmental laws and regulations that will be implemented by Tervita and their contractors during construction, operations and closure/reclamation.	The following Management Plans have been developed to addressed potential adverse effects of the Project: • Erosion and Sediment Control Plan • Soil Conservation Plan • Traffic Management Plan • Emergency Preparedness and Response Plan • Noxious Weeds Plan • Vegetation Management Plan • Wildlife Management Plan • Air quality Monitoring Plan	

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

BRFN (cont'd)	See above	See above	See above	• Dust and Odour Control Plan • RPP • Groundwater Monitoring Plan • Leachate Management Plan • Stormwater Management Plan • Landfill Leak Detection Monitoring Plan • Night time Light Management Plan • Monitoring and Follow-up Programs	See above
DRFN	Review of draft Application	Potential effects on TLU activities	• The Land and Resource Use effects assessment included First Nation land and resource use, including but not limited to, hunting and trapping, as well as travel to First Nation land and resource use sites. The assessment included a description of BRFN and DRFN current land use, identified the activities in all phases of the Project that could interact with the Land and Resource Use VC, and determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 6.1 for more details on the assessment of effects to the Land and Resource Use VC.	Mitigation measures for the Land and Resource Use VC include: • The proposed Project expansion footprint is currently fenced and not being used by agricultural, recreational users or First Nations. • Provide First Nations with information and protocols regarding the timeframe for construction. • Consult with First Nations, forest tenure holders and trappers and consider specific requests for mitigation. • Place signage on access roads in the vicinity of the construction activities notifying road users that construction activities are taking place. • Inform and consult with interested federal and provincial agencies with the potential to be impacted by the Project, as warranted.	Addressed

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
DRFN (cont'd)	See above	See above	• The Wildlife and Wildlife Habitat effects assessment included moose and other ungulates, black bear and other fur-bearers, mature forest birds, early seral forest birds and the western toad. The assessment identified activities in all phases of the Project that could interact with the Wildlife and Wildlife Habitat VC and provided a description of existing conditions, including winter track surveys, spring and summer surveys, and wildlife species of conservation concern. Traditional Knowledge shared included wildlife species of cultural importance, observations of changes to wildlife and wildlife habitat, and suggested best practices and mitigation measures. It was determined that postmitigation residual effects include loss or alteration of wildlife habitat, changes to wildlife movement, and increased wildlife mortality risk. See Section 4.8 for more details on the assessment of effects to the Wildlife and Wildlife Habitat VC.	Mitigation measures for the Wildlife and Wildlife Habitat VC include: • Schedule construction activities outside the migratory bird nesting period. • Conduct a nonintrusive preconstruction nest survey in the event any clearing activities are scheduled within the migratory bird nesting period. • Use a cover crop to assist in weed and erosion control, where warranted. • If previously unidentified wildlife species with special conservation status or their site-specific habitat are identified during construction, suspend activities and notify the Environment & Regulatory Advisor, who will determine the appropriate mitigation measure to be implemented. • Tervita will seek an amphibian salvage permit from BC MFLNRORD to salvage any amphibians from the Project footprint prior to construction activities. • The active landfill area will be surrounded by a fence as required by Section 8(a)(i) of the HWR, limiting wildlife interactions. • All food and wastes will be stored and secured in vehicles or appropriate facilities. • Limit light and noise effects on wildlife by actively accepting waste on a prebooked basis during daylight hours. • The feeding or harassment of livestock or wildlife will be prohibited. • Construction and operations personnel will not be permitted to have firearms or pets on the Project site.	See above

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
DRFN (cont'd)	See above	See above	See above	• Tervita personnel and contractors will be required to abide by all speed limits on the Project site and on transit to the site. • All collisions (including wildlife) along the Project access road or within the Project site will be reported and reasonable corrective measures will be put in place prevent future collisions. • Tervita will ensure compliance with safe operating practices so that wildlife will not come in contact with any spills, leaks or other releases from Project facilities and equipment. • Any wildlife mortalities or injuries at the Project site will be documented.	See above
			• The Terrestrial Vegetation effects assessment included an assessment of plants species of concern, including rare plant species and plant species used for traditional purposes, vegetation communities of concern, and invasive plant species. Shared Traditional Knowledge identified that DRFN actively picks and harvests berries, medicinal plants, and other plants and fungi throughout their traditional territory. Culturally important species include lily pads, spruce gum, devils club, Labrador tea and yarrow. The assessment identified the activities in all phases of the Project that could interact with the Terrestrial Vegetation VC, and determined that postmitigation residual effects include loss or alteration of native vegetation. See Section 4.6 for more details on the assessment of effects to the Terrestrial Vegetation VC.	Mitigation measures for the Terrestrial Vegetation VC include: • Tervita will seek to reduce disturbance to native vegetation to the extent possible. • Areas of Noxious weeds/invasive plants will be noted during weekly inspections, especially during times of high vegetation growth. • The PRRD's Invasive Plant Program Strategic Plan and Profile will be reviewed annually to determine regionally important Noxious and invasive plants. • If areas of Noxious or invasive weeds are noted, a certified pesticide applicator will be brought in on an as-needed basis. • If there is an infestation of Noxious/invasive plants, Tervita will document the infestation on the Provincial IAPP to help with future weed control programs. • To prevent the spread of Noxious and invasive weeds, Tervita vehicles and equipment will be cleaned as best as reasonably possible (before entering/exiting the landfill).	

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
DRFN (cont'd)	See above	See above	See above	• Prior to mobilization and demobilization, construction equipment will be cleaned. • When seed is being used for revegetation at site, best efforts will be made to source local seed to reduce the risk of introducing invasive plant species from another region. The Certificate of Seed Analysis will be kept on file and analyzed to ensure Noxious species and regional species of concern are not present in the seed lot. • Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. • Use a cover crop to assist in weed and erosion control, where warranted. • Equipment to use low-sulphur diesel. • Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Implement additional measures provided in the Dust and Odour Control Plan and the Air Quality Monitoring Plan.	See above

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
DRFN (cont'd)	See above	See above	• The Surface Water effects assessment included water quality and quantity as well as sediment, concentrations of metals and hydrocarbons, perceived taste and smell and volume and movement. The assessment included a description of existing conditions including environmental context, stormwater management, leachate management and identified the activities in all phases of the Project that could interact with the Surface Water VC. Traditional Knowledge shared included the connectivity between waterways identified in the LAA for the proposed Project expansion and the importance of mitigation water contamination, as well as the perceived safety value and quality of water, including taste and smell. The effects assessment determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 4.4 for more details on the assessment of effects to the Surface Water VC.	Mitigation measures for the Surface Water VC include: • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion. • Surface water control works will be inspected weekly and/or immediately after a major storm or catastrophic event. • Erosion occurring on surface water control works will be repaired and mitigated as soon as possible. • Mitigation measures to prevent surface water erosion may include swales, hay bales, rock riprap, and/or coconut matting. • The final slopes of the landfill cap will not exceed 33% and will be seeded as soon as possible to ensure vegetation growth and minimize erosion. • The landfill cap will be inspected weekly and if erosion on the cap is noted it will be repaired and mitigated as soon as possible. • A ditch constructed around the perimeter will direct run off and run on water to the runoff pond which has a capacity of 15,000 m^3. • Onsite erosion control will be utilized if extreme conditions warrant. • Implement additional measures provided in the Erosion and Sediment Control Plan and the Stormwater Management Plan. • Any additional requirements for reclamation will be discussed with BC MECCS pending final site assessment.	See above

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
DRFN (cont'd)	See above	See above	• The Groundwater effects assessment included water quality and quantity as well as concentrations of inorganic ions, dissolved metals, other contaminants, perceived taste and smell, volume and movement. The assessment included a description of existing conditions including environmental context, groundwater monitoring, leachate management and identified the activities in all phases of the Project that could interact with the Groundwater VC. Traditional Knowledge shared included the connectivity between waterways identified in the LAA for the proposed Project expansion and the importance of mitigation water contamination, as well as the perceived safety value and quality of water, including taste and smell. The effects assessment determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 4.5 for more details on the assessment of effects to the Groundwater VC.	Mitigation measures for the Groundwater VC include: • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Groundwater from monitoring wells will not be used during construction, operation or reclamation\closure.	See above

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
DRFN (cont'd)	See above	See above	• The Fish and Fish Habitat effects assessment included fish species of management interest and their habitat, including fish species of concern to Aboriginal groups. The assessment characterized the existing conditions for the Fish and Fish Habitat VC and considered Traditional Knowledge shared, including the species fished by DRFN in their traditional territory and further knowledge to be provided by BRFN with respect to species presence, abundance and distribution. However, to date, BRFN has not provided Traditional Knowledge specific to fish and fish habitat. The assessment determined that the proposed Project expansion is not expected to result in a change in habitat or mortality risk and no potential impacts to the Fish and Fish Habitat VC are predicted. Consequently, no mitigation measures are required, and further assessment of the Fish and Fish Habitat VC is not warranted. See Section 4.7 for more details on the assessment of effects to the Fish and Fish Habitat VC.	The assessment determined that the proposed Project expansion is not expected to result in a change in habitat or mortality risk and no potential impacts to the Fish and Fish Habitat VC are predicted. Consequently, no mitigation measures are required, and further assessment of the Fish and Fish Habitat VC is not warranted.	See above

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
DRFN (cont'd)	See above	See above	• The Culture and Heritage effects assessment included an assessment of archaeological and historical sites. The closest known archaeological site to the landfill is HdRg-2, located approximately 7.2 km to the south-southeast, along St. John Creek. An Archaeological Impact Assessment, submitted as part of the PAC Application for the existing landfill, was completed under a Heritage Conservation Act Section 14 Inspection Permit and no archaeological resources were found on the Project footprint. Therefore, there is low potential to encounter previously undiscovered heritage resources during proposed Project expansion construction. The assessment determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 7 for more details on the assessment of effects to the Heritage and Culture VC.	Mitigation measures for the Culture and Heritage VC include: • If historical features (for example, arrow heads, modified bone, pottery fragments, and fossils) not previously identified are found on the construction footprint, implement the following: – Immediately notify the BC Archaeology Branch – Immediately stop work within the site – Implement any other measures identified by the BC Archaeology Branch – Implement measures in the BC Archaeological Chance Find Procedure (GBC 2014) • Prohibit the collection of historical resources by Project personnel.	See above

DRFN (cont'd)	Review of draft Application	Potential effects on culturally important wildlife, fish and plants	• The Wildlife and Wildlife Habitat effects assessment included moose and other ungulates, black bear and other fur-bearers, mature forest birds, early seral forest birds and the western toad. The assessment identified activities in all phases of the Project that could interact with the Wildlife and Wildlife Habitat VC and provided a description of existing conditions, including winter track surveys, spring and summer surveys, and wildlife species of conservation concern. Traditional Knowledge shared included wildlife species of cultural importance, observations of changes to wildlife and wildlife habitat, and suggested best practices and mitigation measures. It was determined that postmitigation residual effects include loss or alteration of wildlife habitat, changes to wildlife movement, and increased wildlife mortality risk. See Section 4.8 for more details on the assessment of effects to the Wildlife and Wildlife Habitat VC.	Mitigation measures for the Wildlife and Wildlife Habitat VC include: • Schedule construction activities outside the migratory bird nesting period. • Conduct a nonintrusive preconstruction nest survey in the event any clearing activities are scheduled within the migratory bird nesting period. • Use a cover crop to assist in weed and erosion control, where warranted. • If previously unidentified wildlife species with special conservation status or their site-specific habitat are identified during construction, suspend activities and notify the Environment & Regulatory Advisor, who will determine the appropriate mitigation measure to be implemented. • Tervita will seek an amphibian salvage permit from BC MFLNRORD to salvage any amphibians from the Project footprint prior to construction activities. • The active landfill area will be surrounded by a fence as required by Section 8(a)(i) of the HWR, limiting wildlife interactions. • All food and wastes will be stored and secured in vehicles or appropriate facilities. • Limit light and noise effects on wildlife by actively accepting waste on a prebooked basis during daylight hours. • The feeding or harassment of livestock or wildlife will be prohibited. • Construction and operations personnel will not be permitted to have firearms or pets on the Project site. Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
DRFN (cont'd)	See above	See above	See above	• Use a cover crop to assist in weed and erosion control, where warranted. • Equipment to use low-sulphur diesel. • Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Implement additional measures provided in the Dust and Odour Control and the Air Quality Monitoring Plan.	See above
	Review of draft Application	Potential effects on air quality	• The Air quality effects assessment included dust, odours, emissions from combustion, fugitive emissions, and emissions from other sources. The assessment provided a description of existing conditions including COPC, ambient air quality in the region, and identified the activities in all phases of the Project that could interact with the Air Quality VC. Traditional Knowledge shared identified that odour from the existing landfill has a profound affect on the experience of the land for community members and leads to avoidance and alienation from lands. To date, although opportunities were provided to share Traditional Knowledge both directly and through the Working Group, DRFN has not provided any Traditional Knowledge related to air quality. It was determined that postmitigation residual effects are an increase in air emissions during all phases of the Project. See Section 4.2 for more details on the assessment of effects to the Air Quality VC.	Mitigation measures for the Air Quality VC include: • Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Contractor will ensure equipment is well-maintained. • Reduce idling of equipment, where possible. • Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. • Equipment to use low-sulphur diesel, as appropriate. • Implement additional measures provided in the Dust and Odour Control Plan and Air Quality Monitoring Plan. • The Contractor will ensure equipment is well-maintained. • Reduce idling of equipment, where possible.	Addressed

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
DRFN (cont'd)	Review of draft Application	Potential effects on soil quality	• The Terrain and Soils effects assessment included terrain, soils, soil quality and erosion. The assessment provided a description of the existing conditions including environmental context, the ALR, soil quality, erosion, and identified the activities in all phases of the Project that could interact with the Terrain and Soils VC. No Traditional Knowledge was shared regarding terrain and soils. It was determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 4.1 for more details on the assessment of effects to the Terrain and Soils VC.	Mitigation measures for the Terrain and Soils VC include: • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion. • Topsoil and subsoil salvage will be immediately suspended for the preservation of topsoil and subsoil under the following conditions: – Wet or frozen field conditions which can result in the loss, admixing, degradation or compaction of topsoil or subsoil – High wind velocities which can create the potential for the loss of topsoil or subsoil – Any other field conditions which could result in the admixing, degradation or loss of topsoil or subsoil • Surface water control works will be inspected weekly and/or immediately after a major storm or catastrophic event. • Erosion occurring on surface water control works will be repaired and mitigated as soon as possible. • Mitigation measures to prevent surface water erosion may include swales, hay bales, rock riprap, and/or coconut matting. • The final slopes of the landfill cap will not exceed 33% and will be seeded as soon as possible to provide vegetation cover to minimize erosion. • The landfill cap will be inspected weekly and if erosion on the cap is noted it will be repaired and mitigated as soon as possible.	Addressed

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
DRFN (cont'd)	See above	See above	See above	• Topsoil and subsoil will be stockpiled and re-used for site reclamation. Topsoil and subsoil salvage will be immediately suspended for the preservation of topsoil and subsoil under wet or frozen field conditions which can result in the admixing, degradation or compaction of topsoil or subsoil. • Implement two-lift soil handling for topsoil salvage. In this process, the topsoil material is stripped in the first lift and stored onsite for replacement after the life of the Project. The second lift includes all of the remaining subsoil material. • Maintain an adequate separation between topsoil and subsoil piles. • Replace the topsoil and subsoil in the same manner as it was excavated, avoiding admixing of soils. • An Erosion and Sediment Control Plan will be implemented to prevent erosion (see Section 13.1 for summary). • A Soil Conservation Plan will be implemented to avoid or reduce potential loss of surface soil material through wind or water erosion (see Section 13.2 for summary). • A Dust and Odour Control Plan will be implemented to prevent conditions conductive to dust generation and to suppress dust (see Section 13.9 for summary).	See above

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

Aboriginal Group	Consultation Stage/Information Source	Issue/Aboriginal Interest	Analysis of Potential Effect	Proposed Measures to Mitigate or Otherwise Manage Effects	Status of Issue
DRFN (cont'd)	Review of draft Application	Potential effects on groundwater and surface water quality	• The Surface Water effects assessment included water quality and quantity as well as sediment, concentrations of metals and hydrocarbons, perceived taste and smell and volume and movement. The assessment included a description of existing conditions including environmental context, stormwater management, leachate management and identified the activities in all phases of the Project that could interact with the Surface Water VC. Traditional Knowledge shared included the connectivity between waterways identified in the LAA for the proposed Project expansion and the importance of mitigation water contamination, as well as the perceived safety value and quality of water, including taste and smell. The effects assessment determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 4.4 for more details on the assessment of effects to the Surface Water VC.	Mitigation measures for the Surface Water VC include: • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion. • Surface water control works will be inspected weekly and/or immediately after a major storm or catastrophic event. • Erosion occurring on surface water control works will be repaired and mitigated as soon as possible. • Mitigation measures to prevent surface water erosion may include swales, hay bales, rock riprap, and/or coconut matting. • The final slopes of the landfill cap will not exceed 33% and will be seeded as soon as possible to ensure vegetation growth and minimize erosion. • The landfill cap will be inspected weekly and if erosion on the cap is noted it will be repaired and mitigated as soon as possible. • A ditch constructed around the perimeter will direct run off and run on water to the runoff pond which has a capacity of 15,000 m^3. • Onsite erosion control will be utilized if extreme conditions warrant. • Implement additional measures provided in the Erosion and Sediment Control Plan and the Stormwater Management Plan. • Any additional requirements for reclamation will be discussed with BC MECCS pending final site assessment.	Addressed

Table 11.5-1. Summary Table of the Results of Aboriginal Consultation Related to Aboriginal Interests/Other Matters of Concern to Aboriginal Groups

DRFN (cont'd)	See above	See above	• The Groundwater effects assessment included water quality and quantity as well as concentrations of inorganic ions, dissolved metals, other contaminants, perceived taste and smell, volume and movement. The assessment included a description of existing conditions including environmental context, groundwater monitoring, leachate management and identified the activities in all phases of the Project that could interact with the Groundwater VC. Traditional Knowledge shared included the connectivity between waterways identified in the LAA for the proposed Project expansion and the importance of mitigation water contamination, as well as the perceived safety value and quality of water, including taste and smell. The effects assessment determined that potential residual effects are expected to be avoided through the implementation of mitigation measures. See Section 4.5 for more details on the assessment of effects to the Groundwater VC.	• Mitigation measures for the Groundwater VC include: – Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. – Groundwater from monitoring wells will not be used during construction, operation or reclamation\closure.	See above

Part D: Public Consultation

Part D of the Application provides a summary of public consultation activities undertaken in support of the EAC and their outcomes for the proposed Project expansion. Details on the methodology and approach to public consultation activities are provided in Tervita's Public Consultation Plan as approved by the BC EAO.

The information provided in Part D follows the requirements set out in the AAIR for the proposed Project expansion issued January 23, 2019 by the BC EAO.

12. Public Consultation

12.1 Background

During the pre-application stage of the proposed Project expansion, Tervita developed a Public Consultation Plan (the Plan) for engaging with stakeholders and interested parties regarding the Application for the proposed Project expansion. The Plan was developed to meet the consultation requirements of the BC *EA Act* and Regulations for the Application. The Plan was designed to engage stakeholders and interested parties early in the development process and to provide them with an opportunity to participate and comment. It includes details on Tervita's consultation principles; planned consultation activities for the amendment; information delivery methods; estimated timelines; tracking and reporting procedures; and a list of identified stakeholders.

The plan utilized a 3,200-m consultation radius and 5,000-m notification radius (see Figure 12.1-1). Tervita reviewed BC OGC guidelines and Alberta Energy Regulator guidelines for similar projects and chose the larger consultation and notification radii from these guidelines to be more inclusive. Identified stakeholders consist of municipal governments (that is, City of Fort St. John, the PRRD, and the Community of Buick); provincial government agencies (that is, BC MECCS and the BC EAO); the CEA Agency; industry organizations; and residences, occupants, landowners and the general public. Methods of information sharing involved information sessions, existing landfill tours, in person meetings, information packages, status report newsletters, and a dedicated public feedback and information request email account. Details of public consultation activities occurred for the proposed Project expansion as well as key issues raised and their resolution are provided in Sections 12.2 and 12.3. Tervita is committed to maintain continued communication and stakeholder engagement throughout the Application process and during the course of the proposed Project expansion.

12.2 Summary of Public Consultation and Issues Raised

Tervita initiated public consultation on July 1, 2015. Residences, occupants and landowners within 3,200 m of the Project were consulted in-person and by phone on September 9 and 10, 2015. Residences, occupants and landowners within 5,000 m of the Project were notified by registered mail on September 10, 2015. An open house was held in the Community of Buick on February 16, 2016. The concerns raised during the open house held in the Community of Buick on February 16, 2016 include landfill material on public highway, dirt and mud on roadways, speed of trucks, general concerns for residential or private property impacts, and landfill reclamation. These raised concerns were responded to during the open house and are addressed in the Application. An "Invitation to Comment" by the BC EAO was posted on the May 11, 2017, Alaska Highway News seeking public comments on the draft VCs. Tervita hosted a second open house in November, to determine any outstanding community concerns. Tervita will maintain continued communication and stakeholder engagement throughout the Application process and during the course of the Project.

12.3 Planned Public Consultation Activities

Ongoing and planned public consultation activities for the proposed Project expansion include, but not are not limited to:

- An open house in Buick, BC planned by Tervita in the upcoming months
- Notices in the local media inviting public comment on the Application, and any further notifications as may be required by the BC EAO
- Distribution of copies of the Application documents necessary for review purposes
- Providing the BC EAO with electronic copies of all Application documentation to facilitate internet access to the Application
- Addressing any issues that are raised during and after the review period

- Ongoing communication and stakeholder engagement by Tervita throughout the Application process and during the course of the proposed Project expansion

Part E: Management Plans and Follow-up Programs

Part E of the Application provides information on the Environmental Management Plans (EMP) for the proposed Project expansion (Section 13), as well as follow-up programs and monitoring (Section 14).

The information provided in Part E follows the requirements set out in the AAIR for the proposed Project expansion issued January 23, 2019 by the BC EAO.

13. Management Plans

To avoid or reduce the potential adverse effects and risk of adverse effects on the proposed Project expansion, Tervita has a number of management plans in place that describe environmental protection measures, instructions for carrying out proposed Project expansion activities, environmental permit and approval conditions and other environmental commitments, as well as applicable environmental laws and regulations that will be implemented by Tervita and their contractors during construction, operations and closure/reclamation. A list and brief summary of management plans for all phases of the proposed Project expansion are provided herein. These management plans will be included in the Operations Plan for the proposed Project expansion.

13.1 Erosion and Sediment Control Plan

The Erosion and Sediment Control Plan includes measures to prevent soil stockpile erosion, landfill cap erosion and surface water erosion, including but not limited to the following:

- Suspending topsoil and subsoil salvage under excessive wet or frozen conditions and high winds
- Confirming that final slopes of landfill caps do not exceed 33 percent and are seeded as soon as possible, inspected weekly and covered as needed with matting to prevent water erosion
- Conducting weekly inspections of surface water control works and/or immediately after a major storm or catastrophic event, repairing as needed and implementation erosion control measures (for example, rock riprap, matting) as soon as possible

13.2 Soil Conservation Plan

The Soil Conservation Plan includes measures to avoid or reduce potential loss of surface soil material through wind or water erosion and potential reduction in soil productivity due to loss or mixing of topsoil and subsoil during the proposed Project expansion activities. Measures include but are not limited to the following:

- Where practical, topsoil and subsoil are salvaged and stockpiled separately. The stockpiles are located in a stable area unaffected by landfilling operations and are separated by a minimum of 3 m. All topsoil stockpiles are located on undisturbed topsoil and all subsoil stockpiles are located on undisturbed subsoil.
- Relocation of existing stockpiles may be required as part of landfill development and additional clearing activity may be required for stockpile relocation.
- The topsoil stockpiles are contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion.
- Topsoil and subsoil salvage are immediately suspended for the preservation of topsoil and subsoil as per the following examples:
  - Wet or frozen field conditions will result in the admixing, degradation or compaction of topsoil or subsoil
  - High wind velocities create the potential for the loss of topsoil or subsoil
  - Any other field conditions will result in the admixing, degradation or loss of topsoil or subsoil
- During the placement of final cover on cells, the stockpiled soil and subsoil will be used as part of the final cover system. Subsoil and topsoil will be placed in 400-mm and 100-mm-thick layers respectively before being revegetated.

13.3 Traffic Management Plan

The Traffic Management Plan includes measures to manage vehicles and equipment within the landfill, as well as those entering and exiting the landfill, to improve safety and reduce environmental impacts. Measures include but are not limited to the following:

- Prebooking all incoming waste and receiving during daylight hours to reduce noise, exhaust, and light impacts from traffic
- Constructing during daylight hours
- Assessing fugitive dust during dry conditions watering roads on an as-needed basis to reduce traffic related dust impacts
- Posting and enforcement of speed limits
- Reporting wildlife collisions and, if needed, implementing suitable measures to reduce the number of collisions, such as reduced speed limits

13.4 Emergency Preparedness and Response Plan

The Emergency Preparedness and Response Plan includes measures to avoid and respond to hazardous spills, including but not limited to the following:

- Measures for fueling and fuel storage procedures, including measures for parking and preparing for fueling, inspecting and using fuel equipment, and completing fueling and cleanup
- Measures for spills and release prevention, including identifying controls to prevent spills and releases, establishing spills and release prevention and response controls, implementing spill and release prevention and response controls, and processes for documentation, communication and review

13.5 Noxious Weeds Plan

The Noxious Weeds Plan includes measures to prevent and manage the spread of weeds, including but not limited to the following:

- Conducting weekly inspections, especially during times of high vegetation growth (May to August) for Noxious weeds listed under the provincial Weed Control Regulation and regional Noxious weeds and invasive species identified by the PRRD's Invasive Plant Program Strategic Plan and Profile
- Bringing in a certified pesticide applicator on an as need basis where weeds are identified
- Preventing the spread of Noxious and invasive weeds by cleaning vehicles and equipment as best as reasonably possible (before entering/exiting the landfill)
- Sourcing local seed to reduce the risk of introducing invasive plant species from other regions and retailing a Certificate of Seed Analysis

13.6 Vegetation Management Plan

The Vegetation Management Plan includes measures to restore and manage vegetation at the landfill, including but not limited to the following:

- Immediately stabilizing and seeding disturbed soils due to construction to prevent soil loss and Noxious weed spread
- Immediately cutting trees and shrubs growing on the final cover or treatment pad liners to maintain the long-term integrity of liner and cover systems

13.7 Wildlife Management Plan

The Wildlife Management Plan includes measures to prevent and avoid wildlife interactions, including but not limited to the following:

- Fencing and maintaining the fence line around the active landfill area as required by Section 8(a)(i) of the HWR, limiting wildlife interactions
- Maintaining good housekeeping to prevent and minimize food attractants at site
- Minimizing light and noise effects on wildlife by not actively accepting waste during night

13.8 Air Quality Monitoring Plan

The purpose of the Air Quality Monitoring Plan will be to verify that ambient air quality associated with emissions from the site complies with BC AAQOs. Air quality monitoring will only be implemented if it is determined that air quality is an issue at the site. In the event that dust (that is, particulate emissions) and/or odours are well controlled or are not identified to be an issue at the landfill, the air monitoring plan will not be implemented unless as directed by BC MECCS. If implemented, Tervita proposes that the monitoring be conducted for a period of 3 to 12 months, depending on the monitoring results, which will be reviewed by a qualified air quality specialist. The monitoring program would include the following:

- Wind speed and direction: continuous wind speed and wind direction data will be collected and hourly averages will be calculated. This information is very useful for determining the source(s) of elevated air contaminant concentrations and/or odours.
- PM: short-term monitoring will be conducted on an annual or semi-annual basis for PM less than PM_{10} to verify that the 24-hour BC limit of 50 µg/m^3 is not exceeded.
- H_2S: short-term H_2S concentrations will be monitored on an annual or semi-annual basis and will be compared to the Alberta AAQOs of 14 and 4 µg/m^3 as hourly and 24-hour averages, respectively, noting that BC MECCS does not have any objective for H_2S at this time.
- VOCs: VOCs will be monitored continuously if hydrocarbon odours are identified as a concern.

In the event that the air monitoring data indicate an air quality contravention, the following procedures will be undertaken:

- The contravention will be immediately reported to BC MECCS.
- An investigation will be undertaken in an attempt to determine the source of the unacceptable emission.
- Mitigative actions will be implemented as soon as possible to rectify the cause.
- Applicable Tervita personnel will be advised of the circumstances and discussions will be held to determine measures to prevent a reoccurrence, if applicable.

13.9 Dust and Odour Control Plan

The primary potential fugitive dust emission sources are associated with the following work areas and/or tasks: soil excavation and backfill activities, site grading and compacting activities, exposed excavation faces or disturbed areas where vegetation has been removed, soil and fill stockpiles, vehicular traffic on unpaved areas of the site, and loading and unloading operations.

Measure in the Dust and Odour Control Plan to prevent conditions conducive to dust generation and to suppress dust include, but are not limited to the following:

- When deemed necessary, exposed excavations, disturbed ground surfaces and unpaved traffic areas will be sprayed with water or chemical dust suppressant.
- Temporary cover and daily maintenance for soil or fill stockpiles will be used and/or these areas will be kept moist during construction. These areas will be inspected weekly and sprayed when

necessary once construction is complete until such time as the stockpiles/cover are seeded and vegetation growth is adequate for controlling dust.

- If high winds are evident at the close of a business day (or immediately prior to a weekend and/or holiday), site personnel will evaluate vulnerable areas and implement controls, as appropriate, to minimize off-hours emissions.

Potential odour sources include VOCs and/or H_2S emissions from contaminated soils, oilfield waste and leachate.

Measure in the Dust and Odour Control Plan to prevent conditions conducive to odour generation include, but are not limited to the following:

- Landfill personnel will perform inspections once per week around the perimeter of the property to determine if offsite odours are present.
- If a complaint is received during a typical workday, an investigation will be undertaken in an attempt to determine the source of the odour.
- Inert cover or soil will be used to cover sources that are identified to potentially be causing offsite odours and if necessary, these sources may also be sprayed with water and/or odour control neutralizer.
- Odour complaints will be logged to identify trends.

13.10 Radiation Protection Plan

The RPP is in place to confirm that all Tervita existing landfill employees and contractors engaged in any work activities where radiation hazards exist from NORM are fully knowledgeable of the correct procedures to be followed for worker protection. This is in compliance with the Silverberry BC MECCS Permit, BC Occupational Health and Safety Regulations and Health Canada's Guidelines for the Management of NORM. The radiation protection program includes the following elements:

- Management control over work practices including supervisory requirements to ensure adherence to the RPP
- Personnel qualifications and training
- Control of occupational and public exposure to radiation
- External gamma radiation monitoring and protection
- Contamination monitoring and controls
- Environmental monitoring and controls
- Waste management controls
- Recordkeeping

13.11 Groundwater Monitoring Plan

Tervita maintains a groundwater monitoring program at the Silverberry Landfill as required under the *EMA* Permit 17150 to provide long-term monitoring of groundwater conditions at the site, and to assess whether there are any effects on groundwater due to landfill activities. The program consists of collecting samples quarterly from 14 monitoring wells, as well as one leachate collection point and comparing the analytical results to background and/or historical results and regulatory criteria to determine if any changes in these conditions were the result of landfill activities onsite. The existing groundwater monitoring program will be expanded to accommodate the proposed Project expansion.

A Groundwater Monitoring Plan is in place with mitigation measures to protect groundwater quality at the proposed Project expansion site and includes details of the existing groundwater monitoring program such as the methodologies to be employed, the analyte list, the timing of monitoring activities, and procedures to be followed should performance indicators (including regulatory standards) be breached.

13.12 Leachate Management Plan

Leachate generated by the proposed Project expansion will be monitored as part of the groundwater monitoring program, similarly to the current operations at the existing landfill. A Leachate Management Plan is in place and includes mitigation measures to protect groundwater quality and to verify that leachate collection and leak detection systems are functioning as designed.

13.13 Stormwater Management Plan

The Stormwater Management Plan includes mitigation measures to protect surface water quality at the proposed Project expansion site and the surrounding area. These mitigation measures are to be implemented to control emissions to surface water associated with Project activities and a surface water quality monitoring program to guide further mitigation, if required. The Plan also includes details of the monitoring program, including the methodologies to be employed, the analyte list, the timing of monitoring activities, and procedures to be followed should performance indicators (including regulatory standards) be breached. The Stormwater Management Plan will be included in the Operations Plan for the proposed Project expansion.

13.14 Landfill Leak Detection Monitoring Plan

The Landfill Leak Detection Monitoring Plan includes procedures for inspection and maintenance of the containment and leak detection systems of the proposed Project expansion to verify that the systems are functioning as designed. The Plan specifies a methodology and schedule for inspection and maintenance of Project containment measures, including a process to be implemented should deficiencies in containment be identified. The Plan also includes a procedure for recordkeeping for inspection and maintenance activities. Landfill leak detection monitoring for the proposed Project expansion will be conducted as part of the groundwater monitoring program, similarly to the current operations at the existing landfill.

13.15 Night Time Light Management Plan

The Night Time Light Management Plan includes measures to minimize potential light nuisance from the proposed Project expansion activities, including those relevant mitigation measures for effects on public health and wildlife described in Section 4.8. These mitigation measures include restricting most Project activities to daylight hours.

14. Monitoring and Follow-up

Environmental monitoring refers to the procedures and activities that Tervita will implement as part of its environmental management systems to manage the environmental aspects of the proposed Project expansion. Environmental monitoring is a key component of Tervita's environmental compliance strategy and will be conducted by trained professionals including the Environmental & Regulatory Advisor, the Site Inspector and resource-specific specialists, as needed. Trained personnel will monitor, advise, and work with Tervita construction management, as necessary, throughout all phases of the proposed Project expansion, to ensure continuous and consistent compliance with the environmental protection and socio-economic commitments contained in the following:

- The Application
- The environmental management planning documents
- Permit and approval conditions
- Applicable environmental laws and regulations

The environmental monitors and trained personnel will be responsible for the following:

- Monitoring environmental and construction conditions and working with Tervita field management, when necessary, to ensure compliance with the proposed Project expansion's environmental commitments, approvals, permits and licenses
- Documenting the effectiveness of mitigation at reducing potential adverse environmental effects
- Recommending additional or alternative mitigation
- Identifying resource-specific issues
- Determining the status of environmental issues after construction

Reporting of environmental issues, associated mitigation and any follow-up will be incorporated in construction summary reports and submitted to BC MECCS per guidance contained in the Operations Plan.

Following construction activities, trained personnel will undertake PCM, including an assessment of reclamation, revegetation, erosion control and significant weed problems on the areas disturbed by construction of the proposed Project expansion. The objectives of PCM are as follows:

- Evaluate the effectiveness of environmental protection and mitigation during construction.
- Identify any new environmental issues that may have arisen after construction activities and during operation.
- Recommend, coordinate and implement any remedial measures that are warranted and any additional measures to address outstanding or new environmental issues.
- Compare the predicted effects and mitigation with actual documented effects.
- Document opportunities for procedural learnings and improvement.

PCM will be integrated with current operations and incorporated with other routine operational monitoring activities that will be expanded for the proposed Project expansion including monitoring of soil erosion and dust control, groundwater quality, surface water quality, leachate generation, and air monitoring for NORM activity. Any environmental issues, associated mitigation and follow-up will be incorporated into the annual operating reports and submitted to BC MECCS per guidance contained in the Operations Plan. Annual reclamation and closure reports will also be incorporated into the annual operating reports as needed, detailing reclamation activities such as drainage restoration, soil replacement, erosion control and revegetation, and associated follow-up, as needed.

While Tervita will integrate the proposed Project expansion into monitoring and reporting requirements currently in place for existing operations; Tervita will adhere to additional construction or PCM, follow-up and reporting requirements required under Certificate Conditions.

Part F: Conclusions

Part F of the Application for proposed Project expansion summarizes the Project design elements, residual adverse effects, cumulative adverse effects, and key mitigation measures for the proposed Project expansion.

The information provided in Part F follows the requirements set out in the AAIR for the proposed Project expansion issued January 23, 2019, by the BC EAO.

15. Conclusions

This Application has been prepared for Tervita to meet the assessment requirements specified in the AAIR issued by the EAO pursuant to Section 19 of the BC *EA Act* in order for Tervita to obtain an EAC Amendment for the proposed Project expansion. These requirements include identifying VCs and KIs for assessing potential proposed Project expansion effects, mitigation measures to eliminate, avoid or reduce these effects as well as characterizing and predicting the significance of potential residual effects and potential cumulative effects.

Based on the assessment results presented in this Application, Tervita concludes that the proposed Project expansion is not considered likely to result in significant residual adverse effects or cumulative effects. Furthermore, minor economic benefits are expected to be incurred by local businesses and by Project personnel employed from local communities. The proposed Project expansion is expected to continue to provide responsible waste management option for the oil and gas industry in northeastern BC, which is also considered a significant Project benefit. Therefore, Tervita requests that an EAC be issued for the proposed Project expansion.

Tervita will complete subsequent permitting/authorization processes where applicable prior to proceeding with proposed Project expansion construction, operation, and decommissioning.

15.1 Summary of Residual Effects

A summary of residual effects predicted for the proposed Project expansion is provided in Table 15.1-1.

15.2 Summary of Mitigation Measures

A summary of mitigation measures that are proposed to mitigate potential effects to VCs is provided in Table 15.2-1.

Table 15.1-1. Summary and Characterization of Residual Effects Predicted for the Proposed Project Expansion

VC	Potential Effects	Project Phase	Project Activity or Physical Work	Proposed Mitigation	Predicted Residual Effect	Significance of Residual Effect	Cumulative Effect
Terrain and Soils	Loss of surface soil material through wind or water erosion	Construction, Operations, Closure/Reclamation, and Postclosure	Activities such as clearing and grubbing, and Project preparation can result in wind and water erosion and soil cover loss.	• Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion. • Topsoil and subsoil salvage will be immediately suspended for the preservation of topsoil and subsoil under the following conditions: - Wet or frozen field conditions will result in the admixing, degradation or compaction of topsoil or subsoil - High wind velocities create the potential for the loss of topsoil or subsoil - Any other field conditions will result in the admixing, degradation or loss of topsoil or subsoil • Surface water control works will be inspected weekly and/or immediately after a major storm or catastrophic event. • Erosion occurring on surface water control works will be repaired and mitigated as soon as possible. • Mitigation measures to prevent surface water erosion may include swales, hay bales, rock riprap, and/or coconut matting. High erosion areas in ditches may be armored with LLPDE. • The final slopes of the landfill cap will not exceed 33% and will be seeded as soon as possible to ensure vegetation growth and minimize erosion. • The landfill cap will be inspected weekly and if erosion on the cap is noted it will be repaired and mitigated as soon as possible. • An Erosion and Sediment Control Plan will be implemented to prevent erosion (see Section 13.1 for summary). • A Soil Conservation Plan will be implemented to avoid or reduce potential loss of surface soil material through wind or water erosion (see Section 13.2 for summary). • A Dust and Odour Control Plan will be implemented to prevent conditions conductive to dust generation and to suppress dust (see Section 13.9 for summary).	No residual effect predicted	N/A	N/A
Terrain and Soils	Reduction in soil productivity due to loss or mixing of topsoil and subsoil	Construction, Operations, Closure/Reclamation, and Postclosure	Clearing and grading activities can lead to a reduction in soil productivity.	• Topsoil and subsoil will be stockpiled and re-used for site reclamation. • Implement two-lift soil handling for topsoil salvage. In this process, the topsoil material is stripped in the first lift and stored onsite for replacement after the life of the Project. The second lift includes all of the remaining subsoil material. • Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion. • Maintain an adequate separation between topsoil and subsoil piles. • Replace the topsoil and subsoil in the same manner as it was excavated, avoiding admixing of soils. • A Soil Conservation Plan will be implemented to avoid or reduce potential reduction in soil productivity (see Section 13.2 for summary).	No residual effect predicted	N/A	N/A
Air Quality	Increase in air emissions including dust	Construction, Operations, Closure/Reclamation	Fugitive dust from construction, and material unloading. Dust generated from traffic on roads.	• Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Contractor will ensure equipment is well-maintained • Reduce idling of equipment, where possible. • Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. • Equipment to use low-sulphur diesel, as appropriate. • Implement additional measures provided in the Dust and Odour Control and the Air Quality Monitoring Plan that will be submitted to BC MECCS for approval.	Increase in air emissions during all phases of the Project	Not significant	Not significant
Air Quality	Project contribution to GHG emission levels	Construction, Operations, Closure/Reclamation	Sources of air emissions include construction equipment and transportation of materials.	• The Contractor will ensure equipment is well-maintained. • Reduce idling of equipment, where possible	Increase in GHG emissions during all phases of the Project	Not significant	Not significant
Acoustic Environment	Increase in noise levels	Construction, Operations, Closure/Reclamation, and Postclosure	Sound generated by construction equipment and trucks that service the landfill site.	• Construction work will be done in daylight hours and operational work will be done between the hours of 7 a.m. and 7 p.m. • Equipment will be well maintained with properly functioning mufflers. Operators will take reasonable measures to control construction-related noise.	Increased noise emissions during all phases of the Project	Not significant	Not significant

Table 15.1-1. Summary and Characterization of Residual Effects Predicted for the Proposed Project Expansion

VC	Potential Effects	Project Phase	Project Activity or Physical Work	Proposed Mitigation	Predicted Residual Effect	Significance of Residual Effect	Cumulative Effect
Surface Water	Increased sediment in stormwater runoff	Construction, Operations, Closure/Reclamation, and Postclosure	Construction activities could increase sediment in stormwater runoff	• Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion. • Surface water control works will be inspected weekly and/or immediately after a major storm or catastrophic event. • Erosion occurring on surface water control works will be repaired and mitigated as soon as possible. • Mitigation measures to prevent surface water erosion may include swales, hay bales, rock riprap, and/or coconut matting. • The final slopes of the landfill cap will not exceed 33% and will be seeded as soon as possible to ensure vegetation growth and minimize erosion. • The landfill cap will be inspected weekly and if erosion on the cap is noted it will be repaired and mitigated as soon as possible. • A ditch constructed around the perimeter will direct run off and run on water to the runoff pond which has a capacity of 15,000 m^3. • All surface water runs to a pond on the northwest portion of the existing landfill. Sediments will settle in the pond, and the water will be released as required. Onsite erosion control will be utilized if extreme conditions warrant. • Throughout the operation period, prior to final capping, waste is placed a minimum of 1.0 m below the top of berm (top of liner) elevation. Interior grading is maintained such that surface water run-off from the waste is contained within the cell(s). • Implement additional measures provided in the Erosion and Sediment Control Plan, the Leachate Management Plan, and the Stormwater Management Plan. • Any additional requirements for reclamation will be discussed with BC MECCS pending final site assessment.	No residual effect expected	N/A	N/A
Groundwater	Alteration of Groundwater Hydrogeology	Construction, Operations, Closure/Reclamation		• Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Groundwater from monitoring wells will not be used during construction, operation or reclamation\closure.	No residual effects predicted	N/A	N/A
Terrestrial Vegetation	Introduction or spreads of Noxious weeds	Construction, Operations, Closure/Reclamation, and Postclosure	Clearing, grubbing and Project preparation activities can lead to introduction or spread of Noxious weeds	• Areas of Noxious weeds/invasive plants (as designated on Schedule A of the *Weed Control Regulation*) will be noted during weekly inspections, especially during times of high vegetation growth (May-August). • To supplement the list of Noxious and invasive plants, the PRRD's Invasive Plant Program Strategic Plan and Profile will be reviewed annually to determine regionally important Noxious and invasive plants. • If areas of Noxious or invasive weeds are noted, a certified pesticide applicator will be brought in on an as-needed basis. If there is an infestation of Noxious/invasive plants, Tervita will document the infestation on the Provincial IAPP to help with future weed control programs. • To prevent the spread of Noxious and invasive weeds, Tervita vehicles and equipment will be cleaned as best as reasonably possible (before entering/exiting the landfill). Prior to mobilization and demobilization, construction equipment will be cleaned. Any equipment leaving site will utilize the following tools to remove soil prior to exiting: – Track shovels – Brooms – Air Compressor (if available) • When seed is being used for revegetation at site, best efforts will be made to source local seed in consultation with local First Nations to reduce the risk of introducing invasive plant species from another region. The Certificate of Seed Analysis will be kept on file and analyzed to ensure Noxious species and regional species of concern are not present in the seed lot.	No residual effects predicted	N/A	N/A
Terrestrial Vegetation	Vegetation uptake of contaminants from air quality and dust dispersion and deposition	Construction, Operations, Closure/Reclamation, and Postclosure	Fugitive dust from construction, and material unloading. Dust generated from traffic on roads.	• Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Contractor will confirm that equipment is well-maintained. • Reduce idling of equipment, where possible. • Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. • Equipment to use low-sulphur diesel, as appropriate. • Implement additional measures provided in the Dust and Odour Control Plan and the Air Quality Monitoring Plan.	Loss or alteration of native vegetation	Not significant	Not significant
Terrestrial Vegetation	Loss or alteration of native vegetation	Construction, Operations, Closure/Reclamation, and Postclosure	Clearing, grubbing and Project preparation activities can lead to loss or alteration of native vegetation.	• Tervita will seek to reduce disturbance to native vegetation to the extent possible. • Use a cover crop to assist in weed and erosion control, where warranted. • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized.	Loss or alteration of native vegetation	Not significant	Not significant

Table 15.1-1. Summary and Characterization of Residual Effects Predicted for the Proposed Project Expansion

VC	Potential Effects	Project Phase	Project Activity or Physical Work	Proposed Mitigation	Predicted Residual Effect	Significance of Residual Effect	Cumulative Effect
Fish and Fish Habitat	Change in habitat and change in mortality risk	None	N/A	The Project expansion is not expected to result in a change in habitat or mortality risk and no potential impacts to the Fish and Fish Habitat VC are predicted. Consequently, no mitigation measures are required.	N/A	N/A	N/A
Wildlife and Wildlife Habitat	Loss or alteration of wildlife habitat	Construction, Operations, Closure/Reclamation and Postclosure.	Clearing, grubbing and Project preparation activities can alter wildlife habitat	• Schedule construction activities outside the migratory bird nesting period of May 1 to July 31. Conduct a nonintrusive preconstruction nest survey in the event any clearing activities are scheduled within the migratory bird nesting period. • Use a cover crop to assist in weed and erosion control, where warranted. • If previously unidentified wildlife species with special conservation status or their site-specific habitat (for example, dens and nests) are identified during construction, suspend activities and notify the Environment & Regulatory Advisor, who will determine the appropriate mitigation measure to be implemented in consultation with a Wildlife Resource Specialist and the appropriate government authority, if applicable. • Existing mitigation measures such as dust suppression at the landfill will be implemented for the proposed Project expansion, including: – Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. – Contractor will confirm that equipment is well-maintained – Reduce idling of equipment, where possible. – Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. – Equipment to use low-sulphur diesel, as appropriate. – Implement additional measures provided in the Dust and Odour Control Plan and the Air Quality Monitoring Plan. • Implement measures in the Erosion and Sediment Control Plan, the Leachate Management Plan, and the Stormwater Management Plan to prevent sediment, contaminants, waste materials or leachate from being released to surface or subsurface water outside the Project footprint.	Loss or alteration of wildlife habitat	Not significant	Not significant
Wildlife and Wildlife Habitat	Changes to wildlife movement	Construction, Operations, Closure/Reclamation, and Postclosure	Clearing, grubbing and Project preparation activities and operations traffic can lead to changes in wildlife movement.	• The active landfill area will be surrounded by a fence as required by Section 8(a)(i) of the HWR, limiting wildlife interactions. • All food and wastes will be stored and secured in vehicles or appropriate facilities. • Limit light and noise effects on wildlife by actively accepting waste on a prebooked basis from 7 a.m. to 7 p.m.	Changes to wildlife movement	Not significant	Not significant
Wildlife and Wildlife Habitat	Increased wildlife mortality risk	Construction, Operations, Closure/Reclamation, and Postclosure	Exposure to contaminants may occur and increased operations traffic could increase wildlife mortality risk.	• The feeding or harassment of livestock or wildlife will be prohibited. Construction and operations personnel will not be permitted to have firearms or pets on the Project site. • Schedule construction activities outside the migratory bird nesting period of May 1 to July 31. Conduct a nonintrusive preconstruction nest survey in the event any clearing activities are scheduled within the migratory bird nesting period. • If amphibians are found, Tervita will seek an amphibian salvage permit from BC MFLNRORD to salvage any amphibians from the Project footprint prior to construction activities. • Tervita personnel and contractors will be required to abide by all speed limits on the Project site and on transit to the site. • All collisions (including wildlife) along the Project access road or within the Project site must be immediately reported to the Facility Manager. The root causes of the collision will be recorded and reasonable corrective measures put in place to try and prevent future collisions. • Tervita will ensure compliance with safe operating practices so that wildlife will not come in contact with any spills, leaks or other releases from Project facilities and equipment. • Any wildlife mortalities or injuries at the Project site will be documented.	Increased wildlife mortality risk	Not significant	Not significant
Economy	Increased contract and procurement opportunities	Construction, Operations, and Closure/Reclamation	Construction and operation will require contract and procurement services	• Inform appropriate municipalities, Aboriginal groups and economic development agencies of the Project developments and workforce details, as warranted. • Engage with the local and regional business community to notify businesses of Project contracting, subcontracting and employment opportunities and requirements.	Increased contract procurement and employment opportunities	Not significant	N/A
Economy	Increased local, provincial and federal revenue	Construction, Operations, and Closure/Reclamation	Construction and operation may generate income	• Increase government revenue by promoting local labour income and expenditure	Increased revenue for local, regional, provincial and federal governments.	Not significant	N/A

Table 15.1-1. Summary and Characterization of Residual Effects Predicted for the Proposed Project Expansion

VC	Potential Effects	Project Phase	Project Activity or Physical Work	Proposed Mitigation	Predicted Residual Effect	Significance of Residual Effect	Cumulative Effect
Land and Resource Use	Potential disruption of resource use activities including agriculture, timber harvesting, industrial use and trapping activities	Construction, Operations, Closure/Reclamation, and Postclosure	Clearing, grubbing and Project preparation activities and heavy equipment use during construction can disrupt land and resource activities. During operations traffic and associated effects can disrupt land and resource users.	• The proposed Project expansion footprint is currently fenced and not being used by agricultural or recreational users. • Provide forest tenure holders and trappers with information and protocols regarding the timeframe for construction. • Consult with forest tenure holders and trappers and consider specific requests for mitigation. • Inform and consult with interested federal and provincial agencies with the potential to be impacted by the Project, as warranted	No residual effects predicted	N/A	N/A
Land and Resource Use	Potential disruption of First Nation land and resource use including access to lands	Construction, Operations, Closure/Reclamation, and Postclosure	Clearing, grubbing and Project preparation activities and heavy equipment use during construction can disrupt land and resource activities. During operations traffic and associated effects can create sensory disturbance for land and resource users.	• The proposed Project expansion footprint is currently fenced and not being used by First Nations. • Provide First Nations with information and protocols regarding the timeframe for construction. • Consult with First Nations and consider specific requests for mitigation. • Refer to Section 4.8 for mitigation measures relating to Wildlife and Wildlife Habitat. • Refer to Section 4.8 for mitigation measures relating to Wildlife and Wildlife Habitat. • Refer to Section 4.6 for mitigation measures relating to Terrestrial Vegetation. • Refer to Section 4.5 and Section 4.4 for mitigation measures relating to Groundwater and Surface Water. • As no effects have been identified for fish and fish habitat (Section 4.7), no mitigation measures are required.	No residual effects predicted	N/A	N/A
Community Services	Disruption of community life by temporary workers	Construction, Operations, Closure/Reclamation, and Postclosure	The presence of construction workforce in the community can disrupt community life.	• Inform all responsible federal and provincial resource agencies and interested municipal officials of the Project developments, as warranted. • Provide potentially affected Aboriginal groups with the proposed Project expansion construction schedule and maps. • Adhere to Tervita's Alcohol and Drug Policy. • Adhere to Tervita's HSE Program. • See mitigation to address potential effects related to Land and Resource Use in Section 6.1. • See mitigation to address the potential effects on Community Infrastructure in Section 6.3. • See mitigation to address potential effects related to Human Health in Section 8.1. • See enhancement measures relate to Economy in Section 5.1	No residual effects predicted	N/A	N/A
Community Infrastructure	Increased traffic volumes as a result of transporting workers, supplies, equipment and incoming waste for disposal	Construction, Operations, and Closure/Reclamation	Construction and operations traffic will increase demand on community infrastructure.	• Restrict all construction and operations activities to the approved designated survey area. All Project-related traffic will adhere to safety and traffic regulations. • Inform all responsible federal and provincial resource agencies and interested municipal officials of the Project developments, as warranted. • Provide potentially affected Aboriginal groups with the proposed Project expansion construction schedule and maps. • All incoming waste will be prebooked before arrival at the landfill site and will be received between 7 a.m. and 7 p.m. unless it's an emergency situation. • Implement traffic management measures outlined in the Operations Plan. • Adhere to Tervita's Alcohol and Drug Policy. • Adhere to Tervita's HSE Program. • See mitigation to address potential effects related to Land and Resource Use in Section 6.1. • See mitigation to address potential effects related to Human Health in Section 8.1.	No residual effects predicted	N/A	N/A
Culture and Heritage	Disturbance of previously unidentified cultural or heritage resources during construction or operations	Construction and Operations	Clearing, grubbing and Project preparation.	• If historical features (for example, arrow heads, modified bone, pottery fragments, and fossils) not previously identified are found on the construction footprint, implement the following: - Immediately notify the BC Archaeology Branch - Immediately stop work within the site - Implement any other measures identified by the BC Archaeology Branch - Implement measures in the BC Archaeological Chance Find Procedure (GBC 2014) • Prohibit the collection of historical resources by Project personnel.	No residual effect predicted.	N/A	N/A

Table 15.1-1. Summary and Characterization of Residual Effects Predicted for the Proposed Project Expansion

VC	Potential Effects	Project Phase	Project Activity or Physical Work	Proposed Mitigation	Predicted Residual Effect	Significance of Residual Effect	Cumulative Effect
Human Health	Change in drinking water quality.	Construction, Operations, and Closure/Reclamation	Construction, operations and closure/reclamation activities.	• Proposed Project expansion will be tied into the existing stormwater management system where surface water is discharged to the land (not an existing surface water body) following sampling, analysis, and evaluation against regulatory criteria. • Existing mitigation measures to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system). • Existing quarterly groundwater monitoring program will be applied to the proposed Project proposed Project expansion to detect any potential impacts to groundwater (and potential migration, if applicable).	No residual effect predicted	N/A	N/A
Human Health	Potential adverse human health effects due to the disturbance of contaminated soil	Construction, Operations, and Closure/Reclamation	Construction, operations and closure/reclamation activities	• Existing mitigation measures to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system). • Existing mitigation measures such as dust suppression at the Project will be implemented for the proposed Project expansion. • Workers must comply with occupational health and safety requirements (for example, use of PPE).	No residual effect is predicted	N/A	N/A
Human Health	Leachate effects on surface water, groundwater, or soil quality	Construction, Operations, and Closure/Reclamation	Construction, operations and closure/reclamation activities.	• Existing mitigation measures to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system). • Workers must comply with occupational health and safety requirements (for example, use of PPE).	No residual effect predicted	N/A	N/A
Human Health	Decreased quality of country foods in plant gathering areas, hunting sites and fishing areas	Construction, Operations, and Closure/Reclamation	Construction, operations and closure/reclamation activities.	• Existing mitigation measures such as dust suppression at the Project will be implemented for the proposed Project expansion. • Existing mitigation measures to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system). • Existing quarterly groundwater monitoring program will be applied to the proposed Project expansion to detect any potential impacts to groundwater (and potential migration, if applicable) • Proposed Project expansion will be tied into the existing stormwater management system where surface water is discharged to the land (not an existing surface water body) following sampling, analysis, and evaluation against regulatory criteria.	No residual effect predicted	N/A	N/A
Human Health	Air quality effects on respiratory health	Construction, Operations, and Closure/Reclamation	Construction traffic and releases during operations and closure/reclamation	• All construction equipment will adhere to low-emission Tier 4 engine specifications.	No residual effect predicted	N/A	N/A
Human Health	Noise disturbance to nearby Land Users/First Nations	Construction, Operations, and Closure/Reclamation	Traffic from construction, operations and closure/reclamation activities	• Construction work will be done in daylight hours only and operational work will be done between 7 a.m. and 7 p.m. • Equipment will be well maintained with properly functioning mufflers. Operators will take reasonable measures to control construction-related noise..	No residual effect predicted	N/A	N/A
Human Health	Potential adverse human health effects due to the disturbance of contaminated soil associated with NORMs	Construction, Operations, and Closure/Reclamation	Construction, operations and closure/reclamation activities	• Dust suppression measures to minimize dust generated from vehicular traffic. • Air filter monitoring at the property boundary. • Workers must comply with occupational health and safety requirements (for example, use of PPE).	No residual effect predicted	N/A	N/A
Accidents and Malfunctions	Traffic related accidents	Construction and Operations	Construction and operations traffic.	• Implement measures to reduce traffic-related accidents provided under Community Infrastructure Table 6.3-2.	Potential Risk: Low to medium	N/A	N/A

Table 15.1-1. Summary and Characterization of Residual Effects Predicted for the Proposed Project Expansion

VC	Potential Effects	Project Phase	Project Activity or Physical Work	Proposed Mitigation	Predicted Residual Effect	Significance of Residual Effect	Cumulative Effect
Accidents and Malfunctions	Accidental release or spill of contaminants such as hydrocarbons or hazardous materials to the terrestrial environment	Construction, Operations, Closure/Reclamation, and Postclosure	Construction, Operations, Closure/Reclamation, and Postclosure activities	• Design standards for the liner and leachate system will be in accordance with regulatory requirements. • A leak detection program for the liner system will be installed and monitored. • Design failures will be monitored and tracked through the following: – Leak detection monitoring. – Inspection and monitoring of surface water and leachate controls. – Weekly inspection of cover controls to monitor erosion, vegetation growth, and other integrity issues. Any integrity issues will be documented in inspections and rectified as soon as possible. • Tervita will adhere to applicable BC spill regulations during all phases of the Project. • Wastes transported to the Project site will be covered to minimize loss during transit. • Waste resulting from clean-up of spilled and released material shall be collected, stored and characterized appropriately. • Fuel tanks brought to site will be double walled or must be in secondary containment that is 110% of the volume of the tank. Fuel tanks onsite will follow the provincial guidelines in *A Field Guide to Fuel Handling, Transportation and Storage*. • A spill prevention program will be implemented, where any spills that occur are cleaned up using absorbent materials, and with the use of any other required remedial actions. • Spill and release equipment and supplies will be available onsite, such as PPE, first aid kit(s), fire extinguisher, tool box (with tools), commercial spill kit (absorbent sheets/pillows, absorbent socks, disposal bags, disposal bags, splash goggles, nitrile gloves), absorbent booms and shovel. • Employees and contractors will be trained and made aware of their roles and responsibilities in the event of a spill or release. • Soil sampling will be conducted at the closure/reclamation phase in order to identify contaminated soils requiring remediation.	Potential Risk: Low to medium	N/A	N/A
Accidents and Malfunctions	Accidental release or spill of contaminants such as hydrocarbons or hazardous materials to the surface water environment	Construction, Operations, Closure/Reclamation, and Postclosure	Construction, Operations, Closure/Reclamation, and Postclosure activities	• Wastes transported to the Project site will be covered to minimize loss during transit. • Waste resulting from clean-up of spilled and released material shall be collected, stored and characterized appropriately. • Fuel tanks brought to site will be double walled or must be in secondary containment that is 110% of the volume of the tank. • A spill prevention program will be implemented, where any spills that occur are cleaned up using absorbent materials, and with the use of any other required remedial actions. • Spill and release equipment and supplies will be available onsite, such as PPE, first aid kit(s), fire extinguisher, tool box (with tools), commercial spill kit (absorbent sheets/pillows, absorbent socks, disposal bags, disposal bags, splash goggles, nitrile gloves), absorbent booms and shovel. • Employees and contractors will be trained and made aware of their roles and responsibilities in the event of a spill or release. • Chemical and fuel storage during the construction phase will be limited to small volumes in temporary areas (for example, truck mounted fuel tanks for excavating equipment, cases of lube oil stored in equipment storage locker).As a precaution to deal with the potential for a significant release, Tervita will require the construction contractor to maintain a spill response plan to manage the surface assessment, mitigation and remediation, including notification to the appropriate regulatory authority (BC MECCS). • A leak detection program for the liner system will be installed and monitored. The leak detection system between the primary composite liner and secondary CCL will consist of high flow geonet synthetic drainage media connected to a drain system and collection sump. • The leachate collection and removal system will consist of a permeable granular layer across the entire base of the landfill cell. Leachate filtering through the waste will drain laterally through the granular drainage layer to the collection trenches and from there to a collection sump where automatic pumping systems will extract the leachate and direct it to the leachate ponds for storage. At less frequent intervals, the leachate will be removed from storage and trucked or moved via pipeline to an approved facility for treatment or disposal. • Design standards for the liner and leachate system will be in accordance with regulatory requirements. • The landfill cell final cover has been designed to prevent surface water from coming into contact with waste soils. The surface water run-off will instead flow to the surrounding environment, minimizing continued leachate production. • Water within the cell will be treated as leachate prior to release of water. • Implement additional measures provided in the Leachate Management Plan, the Landfill Leak Detection Monitoring Plan and the Accidents and Malfunctions Plan.	Potential Risk: Low to medium	N/A	N/A

Table 15.1-1. Summary and Characterization of Residual Effects Predicted for the Proposed Project Expansion

VC	Potential Effects	Project Phase	Project Activity or Physical Work	Proposed Mitigation	Predicted Residual Effect	Significance of Residual Effect	Cumulative Effect
Accidents and Malfunctions	Accidental release or spill of contaminants such as hydrocarbons or hazardous materials to the groundwater environment	Construction, Operations, Closure/Reclamation, and Postclosure	Construction, Operations, Closure/Reclamation, and Postclosure activities	• As a precaution to deal with the potential for a significant release, Tervita will require the construction contractor to maintain a spill response plan to manage the surface assessment, mitigation and remediation, including notification to the appropriate regulatory authority (BC MECCS). • Design standards for the liner and leachate system will be in accordance with regulatory requirements. • A leak detection program for the liner system will be installed and monitored. • Water within the cell will be treated as leachate prior to its release. • Install additional groundwater wells in accordance with the *Groundwater Protection Regulations*. • Incorporate the proposed Project expansion into the existing Groundwater Monitoring Program. • Implement additional measures provided in the Accidents and Malfunction Plan.	Potential Risk: Low to medium	N/A	N/A
Accidents and Malfunctions	Structural failure of a landfill component during construction or operations resulting in terrestrial contamination	Construction and Operations	Construction and Operations activities	• Adhere to construction and operational procedures and protocols provided in the Operations Plan to avoid structural failure of any landfill components.	Potential Risk: Low to medium	N/A	N/A
Accidents and Malfunctions	Structural failure of a landfill component during construction or operations resulting in surface water contamination	Construction and Operations	Construction and Operations activities	• Adhere to construction and operational procedures and protocols provided in the Operations Plan to avoid structural failure of any landfill components.	Potential Risk: Low to medium	N/A	N/A
Accidents and Malfunctions	Structural failure of a landfill component during construction or operations resulting in groundwater contamination	Construction and Operations	Construction and Operations activities	• Adhere to construction and operational procedures and protocols provided in the Operations Plan to avoid structural failure of any landfill components.	Potential Risk: Low to medium	N/A	N/A
Accidents and Malfunctions	Onsite fires	Construction and Operations	Construction and Operations activities	• There will be no open fires allowed on the site. • In the event of a wildfire, implement measures in the Emergency Response Plan • As part of the Emergency Response Plan, there will be fire suppression equipment onsite, and personnel will have undergone training in the use of the equipment. • All fires detected will be extinguished immediately upon detection, if possible. Complete procedures for dealing with fires during operation are specified in the Fire Control section of the Operations Plan. Portable fire equipment will be available at the site and marked appropriately. • There will also be annual drills conducted to test and train personnel, which will be recorded and reported.	Potential Risk: Low to medium	N/A	N/A
Accidents and Malfunctions	Damage to existing landfill infrastructure	Construction and Operations	Construction and Operations activities	• Adhere to construction and operational procedures and protocols provided in the Operations Plan to avoid damage to existing landfill infrastructure.	Potential Risk: Low to medium	N/A	N/A
Effects of the Environment on the Project	Changing climate trends	Construction, Operations, and Closure/Reclamation	Construction, Operations, and Closure/Reclamation activities	• In the event of a wildfire, flood or other natural hazard, implement measures in the Tervita Silverberry Site Emergency Response Plan.	Extreme weather events could delay Project activities, or damage or impair operating infrastructure Depending upon the severity, a wildfire has the potential to delay Project activities, or damage or impair operating infrastructure	Not significant	Not significant

Table 15.1-1. Summary and Characterization of Residual Effects Predicted for the Proposed Project Expansion

VC	Potential Effects	Project Phase	Project Activity or Physical Work	Proposed Mitigation	Predicted Residual Effect	Significance of Residual Effect	Cumulative Effect
Effects of the Environment on the Project	Extreme weather events	Construction, Operations, and Closure/Reclamation	Construction, Operations, and Closure/Reclamation activities	• Implement measures for erosion control and stormwater management identified in Sections 4.1 and 4.4. • Precipitation falling on the uncovered portions of the active landfill cells, therefore coming into contact with the waste soils, will be managed as leachate. The leachate management system will be designed to handle at minimum, a 1 in 25 year storm event, as required by the HWR. However, the actual design will exceed this minimum requirement. • Buildings (and other Site structures, including tanks), will be built to comply with local building codes and other regulatory requirements in order to minimize the potential for snow damage. • Equipment onsite will be stored or winterised to prevent damage, including draining fluids that might freeze and cause spills or damage. When the site begins operation again, exposed liners, berms and general site facilities will be inspected for signs of damage due to frost heaves.	Extreme weather events could delay Project activities, or damage or impair operating infrastructure	Not significant	Not significant
Effects of the Environment on the Project	Wildfire	Construction, Operations, and Closure/Reclamation	Construction, Operations, and Closure/Reclamation activities	• There will be no open fires allowed on the site. • In the event of a wildfire, implement measures in the Emergency Response Plan. • As part of the Emergency Response Plan, there will be fire suppression equipment onsite, and personnel will have undergone training in the use of the equipment. • All fires detected will be extinguished immediately upon detection. Complete procedures for dealing with fires during operation are specified in the Fire Control section of the Operations Plan. Portable fire equipment will be available at the site and marked appropriately. • There will also be annual drills conducted to test and train personnel, which will be recorded and reported. • Provision of firebreaks shall be carried out to the satisfaction of the Director.	Depending upon the severity, a wildfire has the potential to delay Project activities, or damage or impair operating infrastructure	Not significant	Not significant

Table 15.2-1. Summary of Proposed Mitigation Measures

No.	VC Potential Effects	Proposed Mitigation Measures	Timing	Legal Requirement?	Responsible Agency
Environmental					
1.1 Terrain and Soils	Terrain and Soils – Loss of surface soil material through wind and water erosion	• Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion. • Topsoil and subsoil salvage will be immediately suspended for the preservation of topsoil and subsoil under the following conditions: – Wet or frozen field conditions will result in the admixing, degradation or compaction of topsoil or subsoil – High wind velocities create the potential for the loss of topsoil or subsoil – Any other field conditions will result in the admixing, degradation or loss of topsoil or subsoil • Surface water control works will be inspected weekly and/or immediately after a major storm or catastrophic event. • Erosion occurring on surface water control works will be repaired and mitigated as soon as possible. • Mitigation measures to prevent surface water erosion may include swales, hay bales, rock riprap, and/or coconut matting. High erosion areas in ditches may be armored with LLPDE. • The final slopes of the landfill cap will not exceed 33% and will be seeded as soon as possible to ensure vegetation growth and minimize erosion. The landfill cap will be inspected weekly and if erosion on the cap is noted it will be repaired and mitigated as soon as possible. • The landfill cap will be inspected weekly and if erosion on the cap is noted it will be repaired and mitigated as soon as possible. • An Erosion and Sediment Control Plan will be implemented to prevent erosion (see Section 13.1 for summary). • A Soil Conservation Plan will be implemented to avoid or reduce potential loss of surface soil material through wind or water erosion (see Section 13.2 for summary). • A Dust and Odour Control Plan will be implemented to prevent conditions conductive to dust generation and to suppress dust (see Section 13.9 for summary).	Construction, Operations, Closure/Reclamation, and Postclosure	*EMA*, HWR, *and Waste Discharge Regulation*	BC MECCS, BC EAO
	Terrain and Soils – Reduction in soil productivity due to loss or mixing of topsoil and subsoil	• Topsoil and subsoil will be stockpiled and re-used for site reclamation. • Implement two-lift soil handling for topsoil salvage. In this process, the topsoil material is stripped in the first lift and stored onsite for replacement after the life of the Project. The second lift includes all of the remaining subsoil material. • Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion. • Maintain an adequate separation between topsoil and subsoil piles. • Replace the topsoil and subsoil in the same manner as it was excavated, avoiding admixing of soils. • A Soil Conservation Plan will be implemented to avoid or reduce potential reduction in soil productivity (see Section 13.2 for summary).	Construction, Operations, Closure/Reclamation, and Postclosure	*EMA*, HWR, *and Waste Discharge Regulation*	BC MECCS, BC EAO
1.2 Air Quality	Air Quality – Increase in air emissions including dust	• Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Contractor will ensure equipment is well-maintained. • Reduce idling of equipment, where possible. • Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. • Equipment to use low-sulphur diesel, as appropriate. • Implement additional measures provided in the Dust and Odour Control Plan and the Air Quality Monitoring Plan.	Construction, Operations, and Closure/Reclamation	*EMA*, HWR, *and Waste Discharge Regulation*	BC MECCS, BC EAO
	Air Quality – Project contribution to GHG emission levels	• The Contractor will ensure equipment is well-maintained. • Reduce idling of equipment, where possible.	Construction, Operations, and Closure/Reclamation	*EMA*, HWR, *and Waste Discharge Regulation*	BC MECCS, BC EAO
1.3 Acoustic	Acoustic Environment – Increase in noise levels	• Construction work will be done in daylight hours and operational work will be done between the hours of 7 a.m. and 7 p.m. • Equipment will be well maintained with properly functioning mufflers. Operators will take reasonable measures to control construction-related noise.	Construction, Operations, Closure/Reclamation, and Postclosure	*EMA*	BC EAO

Table 15.2-1. Summary of Proposed Mitigation Measures

No.	VC Potential Effects	Proposed Mitigation Measures	Timing	Legal Requirement?	Responsible Agency
1.4 Surface Water	Surface Water – Increased sediment in stormwater runoff	• Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. • Topsoil stockpiles will be contoured, stabilized and seeded to prevent soil loss by wind and water erosion. If necessary, stockpiles will be wetted to prevent wind erosion. • Surface water control works will be inspected weekly and/or immediately after a major storm or catastrophic event. • Erosion occurring on surface water control works will be repaired and mitigated as soon as possible. • Mitigation measures to prevent surface water erosion may include swales, hay bales, rock riprap, and/or coconut matting. • The final slopes of the landfill cap will not exceed 33% and will be seeded as soon as possible to ensure vegetation growth and minimize erosion. • The landfill cap will be inspected weekly and if erosion on the cap is noted it will be repaired and mitigated as soon as possible. • A ditch constructed around the perimeter will direct run off and run on water to the runoff pond which has a capacity of 15,000 m^3. • All surface water runs to a pond on the northwest portion of the existing landfill. Sediments will settle in the pond, and the water will be released as required. Onsite erosion control will be utilized if extreme conditions warrant. • Throughout the operation period, prior to final capping, waste is placed a minimum of 1.0 m below the top of berm (top of liner) elevation. Interior grading is maintained such that surface water run-off from the waste is contained within the cell(s). • Implement additional measures provided in the Erosion and Sediment Control Plan, the Leachate Management Plan, and the Stormwater Management Plan. • Any additional requirements for reclamation will be discussed with BC MECCS pending final site assessment.	Construction, Operations, Closure/Reclamation, and Postclosure	*EMA,* HWR, *and Waste Discharge Regulation*	BC MECCS, BC EAO
1.5 Groundwater	Groundwater – Alteration of groundwater hydrogeology	• Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized. Groundwater from monitoring wells will not be used during construction, operation or reclamation\closure.	Construction, Operations, and Closure/Reclamation	*EMA,* HWR, *and Waste Discharge Regulation*	BC MECCS, BC EAO
1.6 Terrestrial Vegetation	Terrestrial Vegetation – Introduction or spread of Noxious weeds	• Areas of Noxious weeds/invasive plants (as designated on Schedule A of the *Weed Control Regulation*) will be noted during weekly inspections, especially during times of high vegetation growth (May-August). • To supplement the list of Noxious and invasive plants, the PRRD's Invasive Plant Program Strategic Plan and Profile will be reviewed annually to determine regionally important Noxious and invasive plants. • If areas of Noxious or invasive weeds are noted, a certified pesticide applicator will be brought in on an as-needed basis. If there is an infestation of Noxious/invasive plants, Tervita will document the infestation on the Provincial IAPP to help with future weed control programs. • To prevent the spread of Noxious and invasive weeds, Tervita vehicles and equipment will be cleaned as best as reasonably possible (before entering/exiting the landfill). Prior to mobilization and demobilization, construction equipment will be cleaned. Any equipment leaving site will utilize the following tools to remove soil prior to exiting: – Track shovels – Brooms – Air Compressor (if available) • When seed is being used for revegetation at site, best efforts will be made to source local seed in consultation with local First Nations to reduce the risk of introducing invasive plant species from another region. The Certificate of Seed Analysis will be kept on file and analyzed to ensure Noxious species and regional species of concern are not present in the seed lot.	Construction, Operations, Closure/Reclamation, and Postclosure	*EMA*	BC MECCS, BC EAO
	Terrestrial Vegetation – Vegetation uptake of contaminants from air quality and dust dispersion and deposition	• Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. • Contractor will confirm that equipment is well-maintained. • Reduce idling of equipment, where possible. • Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. • Equipment to use low-sulphur diesel, as appropriate. • Implement additional measures provided in the Dust and Odour Control Plan and the Air Quality Monitoring Plan.	Construction, Operations, Closure/Reclamation, and Postclosure	*EMA*	BC MECCS, BC EAO
	Terrestrial Vegetation – Loss or alteration of native vegetation	• Tervita will seek to reduce disturbance to native vegetation to the extent possible. • Use a cover crop to assist in weed and erosion control, where warranted. • Construct the landfill using a phased approach so that the disturbed and potentially exposed areas will be minimized.	Construction, Operations, Closure/Reclamation, and Postclosure	*EMA*	BC MECCS, BC EAO
1.7 Fish	Fish and Fish Habitat	• The Project expansion is not expected to result in a change in habitat or mortality risk and no potential impacts to the Fish and Fish Habitat VC are predicted. Consequently, no mitigation measures are required.	N/A	N/A	N/A

Table 15.2-1. Summary of Proposed Mitigation Measures

No.	VC Potential Effects	Proposed Mitigation Measures	Timing	Legal Requirement?	Responsible Agency
1.8 Wildlife	Wildlife and Wildlife Habitat – Loss or alteration of wildlife habitat	• Schedule construction activities outside the migratory bird nesting period of May 1 to July 31. Conduct a nonintrusive preconstruction nest survey in the event any clearing activities are scheduled within the migratory bird nesting period. • Use a cover crop to assist in weed and erosion control, where warranted. • If previously unidentified wildlife species with special conservation status or their site-specific habitat (for example, dens and nests) are identified during construction, suspend activities and notify the Environment & Regulatory Advisor, who will determine the appropriate mitigation measure to be implemented in consultation with a Wildlife Resource Specialist and the appropriate government authority, if applicable. • Existing mitigation measures such as dust suppression at the landfill will be implemented for the proposed Project expansion, including: – Current mitigation measures will continue, such as occasional watering of roadways, and curtailment of activity during high wind events. – Contractor will confirm that equipment is well-maintained – Reduce idling of equipment, where possible. – Construct the landfill using a phased approach so that the disturbed soil available for wind erosion will be minimized. – Equipment to use low-sulphur diesel, as appropriate. – Implement additional measures provided in the Dust and Odour Control Plan and the Air Quality Monitoring Plan. • Implement measures in the Erosion and Sediment Control Plan, the Leachate Management Plan, and the Stormwater Management Plan to prevent sediment, contaminants, waste materials, or leachate from being released to surface or subsurface water outside the Project footprint.	Construction, Operations, Closure/Reclamation, and Postclosure	*EMA*	BC MECCS, BC EAO
	Wildlife and Wildlife Habitat – Changes to wildlife movement	• The active landfill area will be surrounded by a fence as required by Section 8(a)(i) of the HWR, limiting wildlife interactions. • All food and wastes will be stored and secured in vehicles or appropriate facilities. • Limit light and noise effects on wildlife by actively accepting waste on a prebooked basis from 7 a.m. to 7 p.m.	Construction, Operations, Closure/Reclamation, and Postclosure	*EMA*	BC MECCS, BC EAO
	Wildlife and Wildlife Movement – Increase wildlife mortality risk	• The feeding or harassment of livestock or wildlife will be prohibited. Construction and operations personnel will not be permitted to have firearms or pets on the Project site. • Schedule construction activities outside the migratory bird nesting period of May 1 to July 31. Conduct a nonintrusive preconstruction nest survey in the event any clearing activities are scheduled within the migratory bird nesting period. • If amphibians are found, Tervita will seek an amphibian salvage permit from BC MFLNRORD to salvage any amphibians from the Project footprint prior to construction activities. • Tervita personnel and contractors will be required to abide by all speed limits on the Project site and on transit to the site. • All collisions (including wildlife) along the Project access road or within the Project site must be immediately reported to the Facility Manager. The root causes of the collision will be recorded and reasonable corrective measures put in place to try and prevent future collisions. • Tervita will ensure compliance with safe operating practices so that wildlife will not come in contact with any spills, leaks or other releases from Project facilities and equipment. • Any wildlife mortalities or injuries at the Project site will be documented.	Construction, Operations, Closure/Reclamation, and Postclosure	*EMA,* HWR, *and Waste Discharge Regulation*	BC MECCS, BC EAO

Table 15.2-1. Summary of Proposed Mitigation Measures

No.	VC Potential Effects	Proposed Mitigation Measures	Timing	Legal Requirement?	Responsible Agency
Social					
2.1	Economy – Increased contract procurement and employment opportunities	• Inform appropriate municipalities, Aboriginal groups and economic development agencies of the Project developments and workforce details, as warranted. • Engage with the local and regional business community to notify businesses of Project contracting, subcontracting and employment opportunities and requirements.	Construction, Operations, and Closure/Reclamation	*EMA*	BC EAO
	Economy – Increased local, provincial and federal revenue	• Increase government revenue by promoting local labour income and expenditure.	Construction, Operations, and Closure/Reclamation	*EMA*	BC EAO
	Land and Resource Use – Potential disruption of resource use activities including agriculture, timber harvesting, industrial use and trapping activities	• The proposed Project expansion footprint is currently fenced and not being used by agricultural or recreational users. • Provide forest tenure holders and trappers with information and protocols regarding the timeframe for construction. • Consult with forest tenure holders and trappers and consider specific requests for mitigation. • Inform and consult with interested federal and provincial agencies with the potential to be impacted by the Project, as warranted.	Construction, Operations, Closure/Reclamation, and Postclosure	*EMA*	BC EAO
	Land and Resource Use – Potential disruption of First Nation land and resource use including access to lands	• The proposed Project expansion footprint is currently fenced and not being used by First Nations. • Provide First Nations with information and protocols regarding the timeframe for construction. • Consult with First Nations and consider specific requests for mitigation. • Refer to Section 4.8 for mitigation measures relating to Wildlife and Wildlife Habitat. • Refer to Section 4.8 for mitigation measures relating to Wildlife and Wildlife Habitat. • Refer to Section 4.6 for mitigation measures relating to Terrestrial Vegetation. • Refer to Section 4.5 and Section 4.4 for mitigation measures relating to Groundwater and Surface Water. • As no effects have been identified for fish and fish habitat (Section 4.7), no mitigation measures are required.	Construction, Operations, Closure/Reclamation, and Postclosure	*EMA*	BC EAO
	Community Services – Disruption of community life by temporary workers	• Inform all responsible federal and provincial resource agencies and interested municipal officials of the Project developments, as warranted. • Provide potentially affected Aboriginal groups with the proposed Project expansion construction schedule and maps. • Adhere to Tervita's Alcohol and Drug Policy. • Adhere to Tervita's HSE Program. • See mitigation to address potential effects related to Land and Resource Use in Section 6.1. • See mitigation to address the potential effects on Community Infrastructure in Section 6.3. • See mitigation to address potential effects related to Human Health in Section 8.1. • See enhancement measures relate to Economy in Section 5.1	Construction, Operations, Closure/Reclamation, and Postclosure	*EMA*	BC EAO
	Community Infrastructure – Increased traffic volumes as a result of transporting workers, supplies, equipment and incoming waste for disposal	• Restrict all construction and operations activities to the approved designated survey area. All Project-related traffic will adhere to safety and traffic regulations. • Inform all responsible federal and provincial resource agencies and interested municipal officials of the Project developments, as warranted. • Provide potentially affected Aboriginal groups with the proposed Project expansion construction schedule and maps. • All incoming waste will be prebooked before arrival at the landfill site and will be received between 7 a.m. to 7 p.m. unless it's an emergency situation. • Implement traffic management measures outlined in the Operations Plan. • Adhere to Tervita's Alcohol and Drug Policy. • Adhere to Tervita's HSE Program. • See mitigation to address potential effects related to Land and Resource Use in Section 6.1. • See mitigation to address potential effects related to Human Health in Section 8.1.	Construction, Operations, and Closure/Reclamation	*EMA*	BC EAO

Table 15.2-1. Summary of Proposed Mitigation Measures

No.	VC Potential Effects	Proposed Mitigation Measures	Timing	Legal Requirement?	Responsible Agency
2.1 (cont'd)	Culture and Heritage – Disturbance of previously unidentified cultural or heritage resources during construction or operations	• If historical features (for example, arrow heads, modified bone, pottery fragments, and fossils) not previously identified are found on the construction footprint, implement the following: – Immediately notify the BC Archaeology Branch – Immediately stop work within the site – Implement any other measures identified by the BC Archaeology Branch – Implement measures in the BC Archaeological Chance Find Procedure (GBC 2014) • Prohibit the collection of historical resources by Project personnel.	Construction and Operations	*EMA*, HWR, *and Waste Discharge Regulation*	BC MECCS, BC EAO
	Human Health – Change in drinking water quality	• Proposed Project expansion will be tied into the existing stormwater management system where surface water is discharged to the land (not an existing surface water body) following sampling, analysis, and evaluation against regulatory criteria. • Existing mitigation measures to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system). • Existing quarterly groundwater monitoring program will be applied to the proposed Project expansion to detect any potential impacts to groundwater (and potential migration, if applicable).	Construction, Operations, and Closure/Reclamation	*EMA*, HWR, *and Waste Discharge Regulation*	BC MECCS, BC EAO
	Human Health – Potential adverse human health effects due to the disturbance of contaminated soil	• Existing mitigation measures to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system). • Existing mitigation measures such as dust suppression at the landfill will be implemented for the proposed Project expansion. • Workers must comply with occupational health and safety requirements (for example, use of PPE).	Construction, Operations, and Closure/Reclamation	*EMA*, HWR, *and Waste Discharge Regulation*	BC MECCS, BC EAO
	Human Health – Leachate effects on surface water, groundwater or soil quality	• Existing mitigation measures to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system). • Workers must comply with occupational health and safety requirements (for example, use of PPE).	Construction, Operations, and Closure/Reclamation	*EMA*, HWR, *and Waste Discharge Regulation*	BC MECCS, BC EAO
	Human Health – Decreased quality of country foods in plant gathering areas, hunting sites and fishing areas	Existing mitigation measures such as dust suppression at the existing landfill will be implemented for the proposed Project expansion. • Existing mitigation measures to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system). • Existing quarterly groundwater monitoring program will be applied to the proposed Project expansion to detect any potential impacts to groundwater (and potential migration, if applicable). • Proposed Project expansion will be tied into the existing stormwater management system where surface water is discharged to the land (not an existing surface water body) following sampling, analysis, and evaluation against regulatory criteria.	Construction, Operations, and Closure/Reclamation	*EMA*, HWR, *and Waste Discharge Regulation*	BC MECCS, BC EAO
	Human Health – Air quality effects on respiratory health	• All construction equipment will adhere to low-emission Tier 4 engine specifications.	Construction, Operations, and Closure/Reclamation	*EMA*, HWR, *and Waste Discharge Regulation*	BC MECCS, BC EAO
	Human Health – Noise disturbance to nearby Land Users/ First Nations	• Construction work will be done in daylight hours only and operational work will be done in between 7 a.m. to 7 p.m. • Equipment will be well maintained with properly functioning mufflers. Operators will take reasonable measures to control construction-related noise.	Construction, Operations, and Closure/Reclamation	*EMA*	BC EAO
	Human Health – Potential adverse human health effects due to the disturbance of contaminated soil associated with NORMs	• Dust suppression measures to minimize dust generated from vehicular traffic. • Air filter monitoring at the property boundary. • Workers must comply with occupational health and safety requirements (for example, use of PPE).	Construction, Operations, and Closure/Reclamation	*EMA*, HWR, *and Waste Discharge Regulation*	BC MECCS, BC EAO

Subject: Results of Soil Sampling Activities
August 23 and 24, 2016
Tervita Silverberry Landfill

Dear Mr. Nelson,

1. Introduction

Based on comments from the Working Group to Tervita Corporation (Tervita) for the Silverberry Landfill Capacity Replacement Project, Tervita has retained CH2M HILL Energy Canada, Ltd. (CH2M) to conduct a soil study for the Silverberry landfill site (the Facility).

The Facility is located approximately 50 kilometers northwest of Fort St. John in northeastern British Columbia (BC). The landfill is used primarily for the disposal of waste associated with oil and gas exploration.

2. Objectives

The objective of the Surface Water Drainage Area (SWDA) soil sampling investigation is to assess concentration and distribution of potential impact in surficial soils resulting from surface water discharge pumped offsite and overland flow onsite draining towards the ephemeral stream, as show in Figure 2 of the SWDA area.

The objective of the Potential Dust Migration Area (PDMA) soil sampling investigation is to assess concentration and distribution of potential impact in surficial soils resulting from airborne particulate matter originating from site-related activities.

Details of the study and the results are provided in the following sections.

3. Scope of Work

The scope of work for the surficial soil quality assessment program included collection of soil samples from the proposed SWDA and PDMA as shown in Figure 1 of Attachment A. The scope of work is broken down as follows:

3.1 Surficial Soil Quality Assessment in the Surface Water Drainage Area (SWDA)

- Performed a review of the work area to determine borehole locations.
- Obtained safe work permit and adhered to all applicable health and safety plans and requirements of CH2M and Tervita.
- Located proposed boring locations in field using GPS coordinates. Boring locations may be slightly altered based on topography or accessibility.
- Hand augured ten boreholes and collected soil samples to delineate contaminants of potential concern (COPCs).
- Collected and submitted soil samples to an accredited laboratory for the analyses of:
  - **Benzene, toluene, ethylbenzene, and xylenes (BTEX)**
  - **Volatile petroleum hydrocarbons (VPHs)** – C6-C10
  - **Light extractable petroleum hydrocarbons (LEPHs)** – C10-C19
  - **Heavy extractable petroleum hydrocarbons (HEPHs)** – C19-C32
  - **Petroleum aromatic hydrocarbons (PAHs)** – naphthalene, anthracene, pyrene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, fluoranthene, fluorene, acenaphthene, phenanthrene, benzo(a)anthracene, acenaphthylene, indeno(1,2,3-c,d)pyrene, dibenzo(a,h)anthracene, benzo(g,h,i)perylene, 2-methylnaphthalene (soil), 1-methylnaphthalene (soil).
  - **Volatile organic compounds (VOCs)** – chloromethane, vinyl chloride, bromomethane, chloroethane, trichlorofluoromethane, acetone, 1,1-dichloroethene, dichloromethane, methyl tert-butyl ether, 2-butanone, trans-1,2-dichloroethylene, 1,1-dichloroethane, cis-1,2-dichloroethylene, chloroform, 1,2-dichloroethane, 1,1,1-trichloroethane, carbon tetrachloride, benzene, 1,2-dichloropropane, trichloroethene, bromodichloromethane, trans-1,3-dichloropropene, 4-methyl-2-pentanone, cis-1,3-dichloropropene, 1,1,2-trichloroethane, toluene, dibromochloromethane, ethylene dibromide, tetrachloroethene, 1,1,1,2-tetrachloroethane, chlorobenzene, ethylbenzene, m&p-xylenes, bromoform, styrene, 1,1,2,2-tetrachloroethane, o-xylene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, 1,2-dichlorobenzene, 1,2,4-trichlorobenzene.
  - **Polychlorinated biphenyls (PCBs)** – by Alocor
  - **Metals** – Sb, As, Ba, Be, B, Cd, Cr, Co, Cu, Pb, Hg, Mo, Ni, Se, Ag, Ti, Sn, V, and Zn
  - **Total phenols –** non-chlorinated phenols screening tool
  - **Extractable organic halides (EOXs)**
  - **Duplicate samples** for quality assurance and quality control (QA/QC) purposes
  - **General parameters** – pH, EC, and particle size analyses for selected samples
- Backfilled boreholes with cuttings.

3.2 Surficial Soil Quality Assessment in the PDMA

- Performed a review of the work area to determine borehole locations.
- Obtained safe work permit and adhered to all applicable health and safety plans and requirements of CH2M and Tervita.
- Located proposed boring locations in field using GPS coordinates. Boring locations may be slightly altered based on topography or accessibility.
- Hand augured six boreholes and collected soil samples to delineate COPCs.
- Collected and submitted soil samples to an accredited laboratory for the analyses of same parameters as outlined in Section 3.1.
- Backfilled boreholes with cuttings.

3.3 Deliverables

Prepare a letter report summarizing the scope of work, regulatory framework, field activities, analytical results, and conclusions of the soil assessment program.

4. Regulatory Framework

The Environmental Management Act, which includes the Contaminated Sites Regulation (CSR), including nine stages of amendments up to BC Reg. 184/2016, July 19, 2016, is the primary law governing contaminated sites in BC. The BC Ministry of Environment (BC MoE) provides two numerical standards for soil in CSR, namely, the generic standards (Schedule 4 and 10) and matrix standards (Schedule 5). Soil standards values are calculated for five generically defined land uses: agricultural (AL), wildland (WL), urban park (PL), residential (RL), commercial (CL), and industrial (IL). The applicable standards depend on the primary land use onsite. The Facility has an IL use and is surrounded by areas of undeveloped forest supporting natural ecosystems. Based on an iMapBC land search, the Facility and surrounding area are located within the Agricultural Land Reserve (ALR). Per the Facility permit, the end land use for the Facility would be AL.

To determine which Schedule 5 site specific factors applied at the Facility, an iMapBC water well search was completed. No water wells were found within 500 m of the Facility. Based on the CSR and the characteristics at the Facility and surrounding lands, the applicable site specific water factors for Schedule 5 matrix standards are human intake of contaminated soil and toxicity to soil invertebrates and plants (mandatory at all sites), the protection of Aquatic Life water use for freshwater (AWF) and Drinking Water use (DW). Although no water wells were identified within 500 m of the Facility, DW site-specific factors for consideration of future water use is mandatory at all sites.

As outlined in Protocol 4 for contaminated sites (BC MoE, 2010) BC MoE has background concentrations for inorganic substances for regions across the province. Data can also be compared to these background soil concentrations in Protocol 4 and can supersede the CSR standards, and therefore could be the applicable standard for the Silverberry Facility. Within Protocol 4, the Facility is located within the Omineca Peace Region. Protocol 4 metals background concentrations have been presented on Tables 3a and 3b, for on and off site, respectively, in Attachment B.

Based on the above, the applicable standards are as follows:

- **During operation at the Facility:** CSR IL use standards and Protocol 4 background concentrations;
- **Facility's end land use (post-operation):** CSR AL use standards and Protocol 4 background concentrations; and
- **Adjacent lands:** CSR AL use standards and Protocol 4 background concentrations.

Analytical data for the Facility has been compared to both AL and IL standards, in consideration of both current and end land use standards.

5. Methodology

5.1 Sample Locations for the SWDA

The SWDA, located in the northwest corner of the landfill site, drains northwest towards an ephemeral stream located approximately 100 m north of the storm water retention pond, as shown on Figure 1. The objective of the SWDA soil sampling investigation was to assess concentration and distribution of potential impact in surficial soils resulting from surface water discharge pumped offsite and overland flow onsite draining towards the ephemeral stream. Ten soil sampling locations were selected in the field based on professional judgement within a 100 m by 100 m area along an elevation gradient between discharge point of the storm water retention pond and the ephemeral stream. Particular consideration was given to areas that appeared to have a high probability of soil impact from surface water such as the surface water flow outlet, depressional areas where water appeared to pond, and areas of vegetation change (tree line). Any areas that had noticeable staining were to be sampled, although none were observed. Eight sampling locations (BH-1 to BH-8) were located within the Facility fenceline, and two (BH-9 and BH-10) were located within undisturbed native areas off-Site. Sampling locations are shown in Figure 2 of Attachment A and the GPS coordinates and sample depths are provided on the Borehole Logs in Attachment C.

5.2 Sample Locations for the PDMA

Initial estimates of the number and layout of PDMA sampling locations were determined from wind rose analysis of prevailing winds and estimates of area of potential distribution. Analysis of average monthly wind speed and primary wind direction at Fort St John, BC suggests a predictable monthly pattern of wind speed and direction (Exhibit 1).

Exhibit 1. Average Monthly Wind Speed and Wind Direction at Fort St. John A Weather Station (Government of-Canada 2016)

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Year
Speed (km/h)	13.3	13.5	14.1	14.4	14.1	13.1	12.2	11.8	13.2	14.8	13.9	13.2	13.5
Most Frequent Direction	SW	SW	SW	SW	SW	SW	SW	SW	SW	SW	SW	SW	SW

Samples were taken at locations upwind and downwind from the Facility. Distribution distances are influenced by particle size distributions, landforms, and lateral and horizontal wind characteristics (Countess, 2001). Although initial estimates suggested downwind samples would be taken at a distance up to 1 km from the site with the majority of samples taken within 200 m of the Facility, road, and access conditions (dense forested areas) limited access to sampling locations within 200 m of the Facility boundary. Six sampling locations were selected, of which four were within the Facility fenceline (BH-12, BH-13, BH-16 and BH-17) and two were located off-site in undisturbed native areas (BH-14 and BH-15). Their locations are shown in Figure 3 of Attachment A and the GPS coordinates and sample depths are provided on the Borehole Logs in Attachment C.

5.3 Soil Field Screening

All boreholes were visually inspected for any signs of impact. The soil sampled from each interval were field screened for headspace vapour concentrations using an RKI Eagle 2 combustible vapour analyzer with photoionization detector (PID) with methane elimination enabled.

5.4 Soil Sampling

Soils samples were collected from each of the borehole locations at intervals of approximately 15 cm depth. Lithology was logged continuously according to a modified Unified Soil Classification System, and were visually inspected for any signs of impact. Detailed stratigraphy is presented on the Borehole Logs in Attachment C.

All soil samples were collected using a hand held soil auger. Nitrile gloves were worn by CH2M field personnel, and replaced after each sampling interval, in order to mitigate the potential for cross contamination. All non-disposable equipment used in the collection of a soil sample was cleaned before use at each sample location and between sample collection at each location to avoid cross-contamination of samples. All soil samples were collected in appropriate laboratory supplied sampling containers for subsequent regular turn-around analysis to be completed by ALS Laboratories (ALS) in Calgary, Alberta.

5.5 Soil Laboratory Analytical Program

Based on soil field screening results and visual observations, the following soil samples were submitted to ALS for analyses:

- **From SWDA:** Ten soil samples and one duplicate sample for analyses of BTEX, VPH, LEPHs, HEPHs, PAHs, VOCs, PCBs, metals, total phenols, extractable organic halides; and two of the 11 samples were additionally analyzed for pH, EC, and particle size.
- **From PDMA:** Six soil samples and one duplicate sample for analyses of BTEX, VPH, LEPHs, HEPHs, PAHs, VOCs, PCBs, metals, total phenols, extractable organic halides; and four of the six samples were additionally analyzed for pH, EC, and particle size.

6. Results

6.1 Soil Lithology

The observed surface and subsurface stratigraphy encountered in 16 borehole locations varied across SWDA and PDMA vary consisting of top soil underlain by clay and silty clay layer with trace fine sand and gravel.

6.2 Soil Field Screening

Headspace vapour concentrations measured in soil samples collected from the boreholes ranged from 0 ppm to 2 ppm. The headspace vapour concentrations are presented in Table 1 of Attachment B and on the borehole logs in Attachment C**.**

6.3 Laboratory Analytical Results

6.3.1 SWDA

Ten boreholes (BH-1 to BH-10) were drilled within the SWDA. No visual evidence of petroleum hydrocarbon (PHC) contamination or elevated VOC headspace concentrations were observed in the field.

6.3.1.1 General Parameters

A total of eleven soil samples, consisting of ten samples and one duplicate sample, were submitted to the laboratory from ten borehole locations for analyses of EOX and PCB parameters. Concentrations of EOX and PCB parameters of all submitted samples were less than the method detection limits (MDLs).

Two samples from two borehole locations were submitted for pH, conductivity and particle size analysis. The pH values ranged on-site from 5.63 (BH-7A) to 6.94 (BH-3A), while for off-site borehole samples, it was 4.75 (BH10-A) and 5.14 (BH-9A). The on-site borehole soil conductivity values ranged from

0.272 dS/m (BH-5A) to 0.510 dS/m (BH-4A). The on-site borehole percentage of clay ranged from 50% (BH-5A) to 62.5% (BH-4A). Detailed results are presented in Tables 2a and 2b of Attachment B.

6.3.1.2 Metals Parameters

A total of eleven soil samples, consisting of ten samples and one duplicate sample, were submitted to the laboratory from ten borehole locations for analyses of metals parameters.

As shown in Tables 3a and 3b – Attachment B, concentrations of all metals parameters in all submitted samples were found to be less than applicable CSR AL or IL standards, or Protocol 4 background concentration at all locations with the exception of

- **Boron:** BH-1A to BH-8A (9.6 to 14.3 mg/kg), which were greater than the applicable future end land use at the Facility, the AL standard of 2 mg/kg, and in BH-9A and BH-10A (7.2 and 6.7 mg/kg) which were greater than the applicable AL standard for the off-site lands.

There is no boron standard for IL land use, nor is there a BC MoE Protocol 4 background soil concentration for boron. Further discussion on boron is provided in Section 8.1.

6.3.1.3 VOCs Parameters

A total of eleven soil samples, consisting of ten samples and one duplicate sample were submitted to the laboratory from ten borehole locations for analyses of VOCs parameters. Concentrations of all VOCs parameters in all submitted samples were less than applicable CSR AL and IL land use standards and were also less than the MDLs. Detailed results are presented in Tables 4a and 4b of Attachment B**.**

6.3.1.4 Hydrocarbon and Total Phenols

A total of eleven soil samples, consisting of ten samples and one duplicate sample were submitted to the laboratory from ten borehole locations for analyses of the following hydrocarbon parameters, BTEX, VPH, LEPH, HEPH and PAH parameters. Concentrations of all hydrocarbon parameters in all submitted samples were less than applicable CSR AL and IL land use standards and were also less than the MDLs. Detailed results are presented in Tables 5a to 6b of Attachment B**.**

Total phenols (non-chlorinated) were also tested as a screening tool for presence/absence in all ten sample and were found to be less than the MDL of 0.1 µg/g, with exception of sample BH-9A which had a concentration of 0.11 µg/g. There is no Total Phenol parameter standard in the CSR, however there are individual phenolic compound standards for the various land uses. Further discussion is provided in Section 8.1.

6.3.2 PDMA

Six boreholes (BH-12 to BH-17) were advanced within the PDMA. No visual evidence of PHC contamination or elevated headspace vapour concentrations were observed in the field.

6.3.2.1 General Parameters

A total of six soil samples, and one duplicate sample, were submitted to the laboratory from six borehole locations for analyses of EOX and PCB parameters. Concentrations of EOX and PCB parameters of all submitted samples were less than the MDLs.

Four samples from four borehole locations were submitted for pH, conductivity, and particle size analysis. The on-site borehole soil pH values ranged from 5.74 (BH-16A) to 7.18 (BH-13A) and for off-site boreholes in the PDMA it was 5.21 (BH15-A) and 5.73 (BH14-A). The on-site soil conductivity values ranged from 0.15 dS/m (BH-16A) to 0.85 dS/m (BH-13A) and off-site a value of 0.17 (BH14-A) was measured. The percentage of clay ranged from 31.8% (BH-14A off-site) to 53.5% (BH-16A – on-site). Detailed results are presented in Tables 2a and 2b of Attachment B.

6.3.2.2 Metals Parameters

A total of six soil samples, and one duplicate sample, were submitted to the laboratory from six borehole locations for analyses of metals parameters.

As shown in Tables 3a and 3b, Attachment B, concentrations of all metals parameters in all submitted samples were less than applicable CSR AL and IL land use standards, and Protocol 4 background concentrations in metals with following exceptions:

- **Barium:** On-Site BH-16A (830 mg/kg); BH-17A (664 mg/kg) which were greater than the applicable CSR AL/IL standard for drinking water use of 400 mg/kg and the BC MoE Protocol 4 background barium concentration for the Omineca Peace Region of 600 mg/kg; and
- **Boron:** BH-12A, BH-13A, BH-16A and BH-17A (6.8 to 13.4 µg/g), which were greater than the applicable future end land use at the Facility, CSR AL standard of 2 mg/kg and in BH-15A (9.7/10.2 mg/kg), which was greater than the applicable AL standard for the off-site lands. There is no boron standard for IL land use, nor is there a BC MoE Protocol 4 background soil concentration for boron.

Further discussion on barium is provided in Section 8.2.

6.3.2.3 VOCs Parameters

A total of six soil samples, and one duplicate sample, were submitted to the laboratory from six borehole locations for analyses of VOCs parameters. Concentrations of all VOCs parameters outlined in Schedules 4 and 5 in all submitted samples were less than the applicable CSR AL and IL standards and were also less than the MDLs. Detail results are presented in Tables 4a and 4b of Attachment B**.**

6.3.2.4 Hydrocarbon, PAHs and Total Phenols

A total of six soil samples, and one duplicate sample, were submitted to the laboratory from six borehole locations for analyses of the following hydrocarbon parameters, BTEX, VPH, LEPH, HEPH, PAH. Concentrations of all hydrocarbon parameters in all submitted samples were less than applicable CSR AL and IL land use standards and all were also less than MDLs, with the exception of PAHs concentrations in BH-12A and BH-13A samples, which were all detectable, but less than applicable standards. Detail results are presented in Tables 5a to 6b, Attachment B**.**

Total phenols screening was also completed in all six sample and the concentrations were less than or equal to the MDL of 0.10 µg/g.

7. Quality Assurance and Quality Control

CH2M prepared and implemented QA/QC procedures throughout this investigation. This included field measures and a data quality review of the analytical results.

7.1 Field Measures

QA/QC field measures conducted by CH2M included the following:

- Donning a clean pair of nitrile gloves to collect each sample.
- Decontamination of field tools and sampling equipment, as required.
- Following appropriate CH2M standard operating procedures (SOPs) for sampling and decontamination activities.
- Collecting and analyzing appropriate field QA/QC samples as proposed in the work plan.
- Using proper sampling containers, storage methods, and shipping container.
- Maintaining and documenting chain-of-custody of all samples throughout collection, storage, and shipment to the receiving laboratory.

Measures were also taken in the field to avoid cross contamination between samples, field tools, external contamination, and contamination from the samples to external sources.

7.2 Data Quality Review

The data quality review conducted by CH2M included the following:

- Verifying the chain-of-custody forms had been properly completed and signed.
- Verifying all of the requested analyses were performed and reported for the correct samples.
- Reviewing the results for all field QC samples.
- Verifying the applicable holding times and extraction times have been met by the laboratory.

7.3 Analytical Reports

The review included the following samples and analytical reports.

Soil samples collected August 23-24, 2016 were analyzed BTEX, VPHs, LEPHs, HEPHs, PAHs, VOCs, PCBs, metals, Total Phenols, Extractable Organic Halides, pH, EC, and particle size analyses. The final results were reported by ALS Calgary on August 25, 2016 as work order L1819102. (Attachment D).

7.4 Field Duplicate

Field duplicates were collected and analyzed in all sets of soil samples at a frequency of 10% (one duplicate for every ten field samples).

The field duplicate sample results are evaluated by calculating a relative percent difference (RPD), a measure of the reproducibility and variability of the data. CH2M assessed the analytical data precision in the soil field duplicate samples by calculating an RPD using the following formula:

$$\text{RPD\%} = \frac{|S - D|}{\frac{1}{2}(S + D)} \times 100\%$$

Where:

RPD = relative percent difference
S = parent sample result
D = duplicate sample result

The closer the calculated RPD result is to 0%, the better the precision and the smaller the variability of the represented data set. Depending on the parameter analyzed, RPD values below 50% are typically considered acceptable for most parameters in soil, while 30% is typical for most parameters in water. If the calculated RPD is above the applicable control limit, further assessment may be required to establish the cause and determine whether the elevated variability has an effect on the reported results investigation (that is, change the classification of a sample from “uncontaminated” to “contaminated” based on the applicable standards, guidelines or criteria). However, all RPD values found above the applicable control limit are evaluated in relation to other factors. These factors include the sample matrix, the specific analytical parameter, and the relative concentration. Since analytical accuracy decreases near the detection limit, results reported within five times the laboratory reportable detection limit (RDL) are not typically used for RPD calculations. For the purpose of this report, when one of the reported results was not greater than five times the RDL, the RPD was not calculated.

The RPDs calculated for each parameter in each set of samples during this investigation were below the appropriate control limits.

7.5 Laboratory Quality Control Results

Laboratory QC sample results consisted of laboratory duplicates, method blanks, matrix spikes, laboratory control samples, and reference materials. All results fell within the laboratory's QC limits, or met the laboratory's QC acceptance criteria. It is noticed that some Laboratory Control Sample recovery and Reference Material recovery were below ALS DQO (Data Quality Objectives). In accordance with ALS, Reference Material (or Laboratory Control Samples) and/or Matrix Spike were acceptable under that situation.

These results indicate acceptable precision and accuracy with minimal variability. The laboratory analytical systems appear to be producing reliable results.

7.6 Holding Times

The holding times experienced by all samples met the recommended limits for all parameters except phenols.

Due to laboratory error in sample tracking, the sample holding times for the phenol parameter were exceeded before analyses. The holding times for phenols ranged from 15 to 17 days which were longer than the recommended holding time of 14 days. The ALS Technical Director of Canada indicated that as the samples were stored appropriately, a very marginal hold time exceedance of 1 or 2 days on a 14-day hold time would have a very marginal impact on the results. Even a hold time exceedance of more than 50% of the recommended hold time would be considered a "marginal" impact exceedance. Based on this statement, it is not expected the holding times have a significant impact on the results. A copy of the correspondence with ALS is provided in Attachment D.

7.7 Chain of Custody

The chain-of-custody submitted for each work order appeared to be properly completed.

Sample temperatures upon receipt at the laboratory, all of the appropriate signatures, and all other necessary information were included on each chain-of-custody provided in the completed work orders.

The sample temperatures upon receipt at the laboratory were below the QC limit (10°C) when applicable, for all sets of samples. It is noticed the ALS subcontracted out EOX tests to SRC. However, the sample temperatures upon receipt at SRC were at 16.2°C which is above QC limit (10°C). ALS confirmed that the temperature does not affect the EOX measurement.

8. Summary

8.1 SWDA

Ten boreholes (BH-1 to BH-10) were advanced at the SWDA between August 23 and 24, 2016 using a hand auger. The objective of the SWDA soil sampling investigation was to assess concentration and distribution of potential contamination in surficial soils resulting from surface water discharge pumped offsite and overland flow onsite draining towards the ephemeral stream.

Field observations and field screening as well as the subsequent laboratory analysis indicated shallow soil concentrations were less than applicable BC CSR AL and IL standards and the BC MoE Protocol 4 background concentrations (available for metals only) for all hydrocarbon parameters, VOCs, PAHs, and metals, with following exceptions for boron:

- **On-site:** BH-1A to BH-8A (greater than the future end land use standard)
- **Off-Site:** BH-9A to BH-10A (greater than AL standard).

As there is no BC MoE background concentration for boron, it is unknown if the boron concentrations observed are from anthropogenic sources or not. However, based on the following lines of evidence, it is determined that the measured boron concentrations are resulting from naturally occurring sources:

- Given the observation of elevated boron greater than applicable standards across the Facility in both the PDMA and SWDA areas, as well as in undisturbed areas at BH-9A, BH-10A, BH-14A and BH-15A locations.
- The absence of other primary contaminants of concern for the facility (hydrocarbons) within the samples.

EOX, PCB, and total Phenols are all less than the detection limits except at off-site BH-9A sample location where the total phenol concentration of 0.11 mg/kg was marginally greater than the MDL of 0.1 mg/kg. Given total phenols were not detected in samples collected within the Facility and only in one sample in a non-disturbed area and was marginally greater than the MDL, the environmental risk is low for this parameter and is not a concern. This is supported in the 2014 surface water monitoring report, where all chlorinated and non-chlorinated phenolic compound concentrations were less than the detection limits, with the exception of phenol which was detectable but less than the applicable standard (Attachment E).

8.2 PDMA

Six boreholes (BH-12 to BH-17) were advanced at the PDMA between August 23 and 24, 2016, using a hand auger. The objective of the PDMA soil sampling investigation is to assess concentration and distribution of potential contamination in surficial soils resulting from airborne particulate matter originating from site-related activities. Field observations and field screening, as well as the subsequent laboratory analysis, detected less than applicable BC CSR AL and IL land use standards for hydrocarbon parameters, VOCs, PAHs, and metals, and the BC MoE Protocol 4 background metals concentrations, with following exception:

- **Barium:** BH-16A; BH-17A (830 and 664 mg/kg, greater than MoE Protocol 4 background concentrations); and
- **Boron:** BH-12A to BH-17A (greater than the CSR AL standard).

BHs 16A and 17A are located adjacent to Cell 7 and the “common stockpile’, as shown on Figure 3. Based on the barium results at the Facility exceeding the MoE Protocol 4 background concentrations at two locations, additional investigation may be warranted to confirm the source of the barium, whether it is from naturally occurring barium concentrations or the materials stored at the Facility. It is recommended that Tervita review the applicability of the BC MoE Protocol 14 *Determining a Barite Site* given the main source of the materials accepted at the Facility come from the oil and gas industry activities, where barite is a common mud additive.

As noted in Section 8.1, the boron concentrations measured were due to natural background soil quality for the area.

EOX, total phenols and PCB concentrations were all less than or equal to detection limits.

9. Conclusions

9.1 SDWA

Based on the surficial soil investigation and sampling that was completed in the SDWA, there was no EOX, hydrocarbon, phenols or metals contamination in surficial soils resulting from surface water discharge pumped offsite and overland flow onsite draining towards the adjacent ephemeral stream.

9.2 PDMA

Based on the soil investigation and sampling that was completed in the PDMA, there was no evidence of EOX, hydrocarbon, phenols or metals contamination in surficial soils resulting from assess from airborne particulate matter originating from site-related activities, with the exception of barium.

Barium concentrations at two borehole sample locations along the southern Facility limit (BH-16A and BH-17A) were greater than BC MoE Protocol 4 background concentrations for the area. To confirm whether these barium concentrations are a result of potential barite presence within the soils handled at the Facility or due to natural elevated background concentrations in the native soils, additional surficial soil samples should be collected and analyzed using the methodology prescribed in BC MoE Protocol 14, *Requirements for Determining a Barite Site*, to demonstrate that the Facility can be considered a barite site and that the elevated barium concentrations are a result of the presence of barite in the soil.

The results presented in this report are reflective of the conditions at the time of the sample collection, and at the locations where the samples were collected. CH2M does not attest to the conditions at the Facility or emissions therefrom at any other time or location.

Use of this Report or any information contained herein, if by any party other than Tervita, shall be at the sole risk of such party and shall constitute a release and agreement by such party to defend and indemnify CH2M and its affiliates, officers, employees and subcontractors from and against any liability for direct, indirect, incidental, consequential or special loss or damage or other liability of any nature arising from its use of the Report or reliance upon any of its content. To the maximum extent permitted by law, such release from and indemnification against liability shall apply in contract, tort (including negligence), strict liability, or any other theory of liability.

[1] Summary CSR Standard for most stringent site spec

\- = parameter not analyzed

< = parameter less than the laboratory analytical det

CSR = Contaminated Sites Regulation

ID = identification

m = metre

mg/kg = milligram per kilogram

NC = not calculated

ns = no standard specified

PAH = polycyclic aromatic hydrocarbons

PL = Urban Park Land

Shaded = Exceeds Protocol 4 and CSR standards

BOLD = Exceeds CSR AL standard

Underline = Exceeds CSR IL standard

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
LCS-L	Lab Control Sample recovery was below ALS DQO. Reference Material and/or Matrix Spike results were acceptable. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
PEHT	Parameter Exceeded Recommended Holding Time Prior to Analysis
RM-L	Reference Material recovery was below ALS DQO. Lab Control Sample and/or Matrix Spike results were acceptable. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.
RRR	Refer to Report Remarks for issues regarding this analysis

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
BTX,VPH-MEOH-CL	Soil	BTEX and VPHs	EPA 8260C/5021A and BCMELP

This analysis involves the extraction of a subsample of the sediment/soil with methanol added in the field at the time of subsampling. The soil methanol extract is added to water and reagents, then heated in a sealed vial to equilibrium. The headspace from the vial is transferred into a gas chromatograph. BTX Target compound concentrations are measured using mass spectrometry detection. Volatile Hydrocarbons (VH) are analyzed by capillary column gas chromatography with flame-ionization detection (GC/FID) in accordance with the British Columbia Ministry of Environment.

EC-1:2-CL	Soil	Conductivity (1:2)	CSSS ch.15

Soil and de-ionized water (by volume) are mixed in a defined ratio. The slurry is allowed to stand, shaken, and then allowed to stand again prior to taking measurements. After equilibration, the conductivity of the liquid portion of the extract is measured by a conductivity meter

EOX-SR	Misc.	Ext. Org. Halogen (EOX)	EPA 9022 and EPA 9023
HG-200.2-CVAA-CL	Soil	Mercury in Soil by CVAAS	EPA 200.2/1631E (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CVAAS.

LEPH/HEPH-CALC-CL	Soil	LEPHs and HEPHs	BC MELP; CSR-Analytical Method 3

: Light and Heavy Extractable Petroleum Hydrocarbons in Solids. These results are determined according to the British Columbia Ministry of Environment, Lands, and Parks Analytical Method for Contaminated Sites "Calculation of Light and Heavy Extractable Petroleum Hydrocarbons in Solids or Water". According to this method, LEPH and HEPH are calculated by subtracting selected Polycyclic Aromatic Hydrocarbon results from Extractable Petroleum Hydrocarbon results. To calculate LEPH, the individual results for Naphthalene and Phenanthrene are subtracted from EPH(C10-19). To calculate HEPH, the individual results for Benz(a)anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Dibenz(a,h)anthracene, Indeno(1,2,3-c,d)pyrene, and Pyrene are subtracted from EPH(C19-32). Analysis of Extractable Petroleum Hydrocarbons adheres to all prescribed elements of the BCMELP method "Extractable Petroleum Hydrocarbons in Solids by GC/FID" (Version 2.1, July 20, 1999).

LEPH/HEPH-CL	Soil	LEPHs and HEPHs	BC MELP; CSR-Analytical Method 3
MET-200.2-CCMS-CL	Soil	Metals in Soil by CRC ICPMS	EPA 200.2/6020A (mod)

Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CRC ICPMS.

Method Limitation: This method is not a total digestion technique. It is a very strong acid digestion that is intended to dissolve those metals that may be environmentally available. This method does not dissolve all silicate materials and may result in a partial extraction. depending on the sample matrix, for some metals, including, but not limited to Al, Ba, Be, Cr, Sr, Ti, Tl, and V.

MOISTURE-CL	Soil	% Moisture	CWS for PHC in Soil - Tier 1

This analysis is carried out gravimetrically by drying the sample at 105 C

MTBE-ADD-CL	Soil	MTBE - additional to BTEX	EPA 5030/8260B-P&T GC-MSD
PAH-BCCSR-CL	Soil	PAHs - BC CSR Regs	EPA 3570/8270-GC/MS

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3570 & 8270, published by the United States Environmental Protection Agency (EPA). The procedure uses a mechanical shaking technique to extract a subsample of the sediment/soil with a 1:1 mixture of Hexane and acetone. The extract is then solvent exchanged to toluene. The final extract is analyzed by capillary column gas chromatography with mass spectrometric detection (GC/MS). Surrogate recoveries may not be reported in cases where interferences from the sample matrix prevent accurate quantitation.

PCB-ED	Soil	PCBs	EPA 3570/8082-GC-ECD
PH-1:2-CL	Soil	pH in soil (1:2 Soil:Water Extraction)	CSSS Ch. 16

Soil and de-ionized water (by volume) are mixed in a defined ratio. The slurry is allowed to stand, shaken, and then allowed to stand again prior to taking measurements. After equilibration, the pH of the liquid portion of the extract is measured by a pH meter. Field Measurement is recommended where accurate pH measurements are required, due to the 15 minute recommended hold time.

PH-1:2-CL	Waste	pH (1:2 Soil:Water Extraction)	CSSS Ch. 16

Soil and de-ionized water (by volume) are mixed in a defined ratio. The slurry is allowed to stand, shaken, and then allowed to stand again prior to taking measurements. After equilibration, the pH of the liquid portion of the extract is measured by a pH meter. Field Measurement is recommended where accurate pH measurements are required, due to the 15 minute recommended hold time.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
PHENOLS-4AAP-WT	Soil	Phenol (4AAP)	EPA 9066

A manual method is used to distill the sample. The distillate is then buffered to pH 9.4 and reacts with 4AAP and alkaline ferricyanide to form a red complex which is measured colorimetrically.

PSA-1-CL	Soil	Particle Size	CSSS 55.3 - Hydrometer

Particle Size analysis in soil using a hydrometer

TEH-BC-CL	Soil	EPH (C10-C19) & EPH (C19-C32)	BC MOE EPH GCFID

Analysis is in accordance with BC MOE Lab Manual method "Extractable Petroleum Hydrocarbons in Solids by GC/FID", v2.1, July 1999. Soil samples are extracted with a 1:1 mixture of hexane and acetone using a rotary extraction technique modified from EPA 3570 prior to gas chromatography with flame ionization detection (GC-FID). EPH results include Polycyclic Aromatic Hydrocarbons (PAH) and are therefore not equivalent to Light and Heavy Extractable Petroleum Hydrocarbons (LEPH/HEPH).

VOC-EPA-ED	Soil	EPA Volatile Organics	SW 846 8260-GC-MS
VOC-MISC-CL	Soil	EPA 8260 Volatile Organics - single parm	SW 846 8260-GC-MS
VPH-CALC-CL	Soil	VPH Calculation	BC MOE LABORATORY MANUAL (2005)

These results are determined according to the British Columbia Ministry of Environment, Lands, and Parks Analytical Method for Contaminated Sites "Calculation of Volatile Petroleum Hydrocarbons in Solids or Water" (Version 2.1, July 20, 1999). According to this method, the concentrations of specific Monocyclic Aromatic Hydrocarbons (Benzene, Toluene, Ethylbenzene, Xylenes and Styrene) are subtracted from the collective concentration of Volatile Hydrocarbons (VH) that elute between n-hexane (nC6) and n-decane (nC10). Analysis of Volatile Hydrocarbons adheres to all prescribed elements of BCMELP method "Volatile Hydrocarbons in Solids by GC/FID" (Version 2.1, July 20, 1999).

XYLENES-SUM-CALC-CL	Soil	Sum of Xylene Isomer Concentrations	CALCULATED RESULT

Total xylenes represents the sum of o-xylene and m&p-xylene.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SR	Saskatchewan Research Council - Saskatoon, Saskatchewan, Can
ED	ALS ENVIRONMENTAL - EDMONTON, ALBERTA, CANADA
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Quality Control Report

Workorder: L1819102 Report Date: 21-SEP-16 Page 26 of 27

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
J	Duplicate results and limits are expressed in terms of absolute difference.
LCS-L	Lab Control Sample recovery was below ALS DQO. Reference Material and/or Matrix Spike results were acceptable. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
RM-L	Reference Material recovery was below ALS DQO. Lab Control Sample and/or Matrix Spike results were acceptable. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1819102 were received on 25-AUG-16 11:25.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Sep 21, 2016

ALS Laboratory Group
2559 29th St NE
Calgary, AB T1Y 7B5
Attn: Nelson Kwan

Date Samples Received: Sep-09-2016 Client P.O.: L1819102

This is a final report.

Lab Section 1 results have been authorized by Keith Gipman, Supervisor

Lab Section 2 results have been authorized by Melissa Tackaberry-Syed, Supervisor

Lab Section 3 results have been authorized by Pat Moser, Supervisor

Lab Sections 4 and 5 results have been authorized by Vicky Snook, Supervisor

Lab Section 6 results have been authorized by Marion McConnell, Supervisor

* Test methods and data are validated by the laboratory's Quality Assurance Program.

* Routine methods follow recognized procedures from sources such as

  * Standard Methods for the Examination of Water and Wastewater APHA AWWA WEF
  * Environment Canada
  * US EPA
  * CANMET

* The results reported relate only to the test samples as provided by the client.

* Samples will be kept for 30 days after the final report is sent. Please contact the lab if you have any special requirements.

* Additional information is available upon request.

Quality Control Report

Nelson Kwan
ALS Laboratory Group
2559 29th St NE
Calgary, AB T1Y 7B5

Reference Materials and Standards:

A reference material of known concentration is used whenever possible as either a control sample or control standard and analyzed with each batch of samples. These "QC" results are used to assess the performance of the method and must be within clearly defined limits; otherwise corrective action is required.

QC Analysis	Units	Target Value	Obtained Value
EOX	ug/g	24.8	21.4
EOX	ug/g	24.8	20.5

Duplicates:

Duplicates are used to assess problems with precision and help ensure that samples within a given batch were processed appropriately. The difference between duplicates must be within strict limits, otherwise corrective action is required. Please note, the duplicate(s) in this report are duplicates analyzed within a given batch of test samples and may not be from this specific group of samples.

Duplicate Analysis	Units	Sample ID	First Result	Second Result
EOX	ug/g Cl	28390	<1	<1
EOX	ug/g Cl	28399	<1	<1

Spikes and/or Surrogates:

Samples spiked with a known quantity of the analyte of interest or a surrogate which is a known quantity of a compound which behaves in a similar manner to the analyte of interest, are used to assess problems with the sample processing or sample matrix. The recovery must be within clearly defined limits when the quantity of spike is comparable to the sample concentration.

Spike Analysis	Percent Recovery
EOX	84

All quality control results were within the specified limits and considered acceptable.

Subject: RE: (CH2M) L1819102 --- phenols (soil) EHT [EXTERNAL]
Attachments: ALS Hold Time Information 24Sept2012.pdf

Hi Raymond,

I got in touch with our Technical Director of Canada and he has indicated that:

> *If the samples were stored appropriately, then I would definitely not expect a very marginal hold time exceedance of 1 or 2 days on a 14 day hold time to have a significant impact on the results. I typically use a 50% exceedance of the recommended hold time as my interpretation of a "marginal" exceedance. This is based on professional judgment of course, and the 14 day hold time is still recognized as the best practice guidance, which is why we need to qualify when this is exceeded.*

He also asked me to send you the attached HT info sheet for reference.

My understanding is that phenols results should not be impacted by much, if any at all.

Nelson Kwan
Account Manager, Environmental (Calgary)

Subject: RE: (CH2M) L1819102 --- phenols (soil) EHT [EXTERNAL]

Hi Raymond,

I did also notice the EHT issue with phenols in soil results, which was conducted by our ALS WT sister lab.

I emailed last night to inquire about whether or not the EHT was confirmed based on the date processed (in case there was a typo on analysis date). I am currently discussing this with ALS WT.

Stay tuned.

Hi,

Thanks for your quick response.

I also noticed in your quality control report, it indicated that the hold time for Phenol exceed the recommended hold time (see attached). Just wonder why, as we submitted on the August 25 while the processed date is on September 8. Please also tell me what is the impact to the result if it did not meet the recommended hold time.

Thanks
Raymond

Hi Nelson,
I have been told by our client services personnel that ALS has requested the cooler temperature to be reported on every group regardless of its relevance.
The temperature does not affect the EOX measurement.
The report will not be revised or reissued.
Thanks,

General Comments About Hold Times & Interpretation of Hold Time Exceedances

Under some circumstances, many test parameters can be altered between the time of sampling and the time of analysis due to bacterial action, chemical reaction, evaporative loss, or other processes.

A sample hold time is the recommended maximum time between sampling and analysis, and is often matched with a specified sample preservation practice (e.g. acidification or dechlorination). Maximum hold times are established in order to protect the integrity of test samples, and to reduce potential changes in the sample before analysis.

The hold time guidelines used by most laboratories in Canada are those established by organizations such as US EPA, Environment Canada, or the American Public Health Association (APHA). ALS adopted our recommended hold times after careful review of recent literature, including guidelines established by provincial jurisdictions (notably British Columbia and Ontario).

However, rigorous scientific studies are not always available to substantiate reliable hold time recommendations for all test methods. Because of this, published hold time guidelines may sometimes be overly conservative. This problem has been recognized by the US EPA, and was the impetus for a 2006 EPA study titled "Sample Holding Time Re-Evaluation". The EPA introduction to this project stated the following:

"While holding times may appear adequate to protect sample integrity and provide sufficient time for laboratory analysis, relevant data is sparse on individually defined holding times and, thus, some of the holding times appear to be arbitrary and/or politically driven. Holding times appear to be arbitrary when a single value is applied over a large general class of compounds (e.g., pesticides or polyaromatic hydrocarbons); when the holding time was originally "established" for aqueous media and then blindly applied to other media (e.g., sediments and tissues); or when a contaminant is known to be chemically highly stable and will still be present in the sample even if the sample is not extracted in the regulatory time frame. For example, if PCBs significantly degraded after 7 days, then there would not be an environmental problem with PCBs today."

Another reason for conservatism in hold time guidelines is that a single guideline will be applied to a vast majority of sample types and compositions. A hold time guideline that is appropriate for a wastewater with complex chemical and microbiological composition may be overly conservative for less complex samples. Thus, it is important to note that for many test parameters and for many sample types, no noticeable degradation or change to results will be observed long after the recommended hold time has passed.

Apart from microbiological test requirements pertaining to human health and drinking water, we are not aware of any Canadian regulatory agencies that normally reject or invalidate laboratory test results solely because of hold time exceedances, especially where the exceedance is marginal.

Because of the conservatism applied in the establishment of most hold time guidelines, one can generally assume that the integrity of samples tested *within* the recommended hold time will be reliable if the samples have been stored under appropriate conditions (for many tests, this means under refrigeration). Although analysis within the recommended hold time is of course advisable, and is always the objective of the laboratory, it is important to understand that sample integrity is not immediately compromised once the recommended hold time has elapsed.

When analytical hold times are exceeded, it is common practice to apply professional judgement in order to determine whether the results are useable and fit for purpose. Part of this assessment should include whether the sample was appropriately preserved, whether it was appropriately stored, and whether the magnitude of the hold time exceedance was substantial. In many cases, such results are simply flagged as "estimates" to indicate that their degree of uncertainty may be higher than usual. This is a common approach used under the US EPA Contract Laboratory Program.

Another factor that may help with the evaluation of the potential impact of hold time exceedances is a comparison against historical data or with other available analytical results from related or similar samples, if available (e.g. other samples collected from the same site).

ATTN: Mr. Trevor Befus
Manager, Operational Compliance

RE: 2014 Surface Water Monitoring Report
Silverberry Landfill
A-08-088-20-W6M, British Columbia

Dear Mr. Befus:

Nichols Environmental (Canada) Ltd. is pleased to present this summary report of the 2014 Surface Water Discharge for Tervita Corporation (Tervita) for the Silverberry Landfill. This facility is at a location legally described as 16-07-088-20-W6M, approximately 45 kilometres (km) northwest of Fort St. John, British Columbia (herein referred to as the 'Site'). Figure 1 (attached) shows the location of the Site relative to the surrounding area.

BACKGROUND

The facility is located within the Peace River Regional District, northwest of the City of Fort St. John, British Columbia. The Site consists of the Tervita Silverberry Landfill whose facilities are located to the north and east of the Tervita Silverberry Treatment, Recovery and Disposal (TRD) facility, with which it shares central access.

Tervita's Silverberry Landfill facility was granted an operating permit (No. 17150) on October 18, 2002, pursuant to the Waste Management Act which has since been appealed and is now the *Environmental Management Act*. The permit was last amended on February 21, 2012.

The Silverberry Landfill accepts solid hazardous wastes in accordance with the Hazardous Waste Regulation of the Environmental Management Act and the operating permit and approved operational plan. The Tervita Silverberry landfill is also the only facility in British Columbia licensed to accept naturally occurring radioactive material (NORM) that exceeds federal and provincial guidelines.

The surface drainage network on the Site is shared between the Landfill and TRD and collects surface waters from across the Site and directs flows to the Stormwater Pond located to the west of the TRD. All collected surface waters are retained in the

Stormwater Pond, which is sampled prior to discharge to the environment. The location of the Stormwater Pond in relation the Site is presented on Figure 2.

The adjoining TRD facility activities consist of the treatment, storage, and recovery of oilfield wastes such as sludges, wastewater, pigging waste, drilling sump material, contaminated debris, and crude oil. Onsite facilities which may pose as a potential source of environmental impact include the aboveground storage tank (AST) containment area, flare stack, and all processing, terminal, and treatment areas. Leachate collected from the landfill is also disposed of by the Silverberry TRD.

ASSESSMENT GUIDELINES

Regulatory Framework

The analytical results are presented in the context of the British Columbia Ministry of Environment's (BC MOE's) Contaminated Sites Regulations (BC CSR 1997). The most recent amendment (Stage 9) to the BC CSR was issued in January 2014, and is reflected in this assessment. The BC CSR was developed to provide a system to ensure that contaminated soil, surface water, sediments and groundwater are cleaned up to scientifically based standards for sites in British Columbia.

Under the BC CSR, there are two types of remediation standards for a particular site; Numerical Standards, and Risk-Based Standards. The Numerical Standards refer to concentrations of given substances in soil or groundwater for a particular land use or a particular land use and site-specific exposure pathway. Generic Numerical Standards for some substances are applied to a site based on the applicable land use of that site, while Matrix Numerical Standards are applied for some substances in soil, taking into account various site-specific factors such as proximity to receiving waters, likelihood of human ingestion, and use of land for livestock rearing. The second type of remediation standard is the site-specific risk-based standard, which involves the generation of a standard for a specific site based on a risk assessment protocol by BC MOE.

The above remediation criteria may be used as benchmarks to evaluate the need for further investigation, remediation or to guide in the establishment of land-use restrictions. The water use pathways required to be assessed for applicability to the Site include the Drinking Water (DW) pathway, the Marine/Estuarine Aquatic Life pathway (MW), the Irrigation pathway (IW), the Livestock pathway (LW), and the Freshwater Aquatic Life pathway (FW).

Water Use Assessment

The Property is situated within an area of predominately natural land use with some surrounding oil and gas and forestry related activities. The are no adjacent agricultural land uses, however, agricultural activities are present to the northeast of the Site and the Site is within the provincial Agriculture Land Reserve (ALR).

Several lakes were noted within a 10-km radius of the Site including two unnamed lakes (approximately 4.5 km east), as well as several oxbow lakes located to the north along the Blueberry River system. Two small unnamed creeks are located to the immediate north and west

of the Site that are tributary to the Blueberry River, which is located approximately 6.5 km to the north.

The topography of the Site is generally flat, with a local area slope generally to the northwest toward the Blueberry River system. A surface water collection ditch is present across the Site and to the east, south, and west of the TRD's processing infrastructure, through which storm and melt waters are directed to the Stormwater Pond located towards the west perimeter of the Site. Based on previous assessments groundwater flow direction is to the north by northwest.

Based on the current land uses, all drinking water use pathways would be operative with the exception of the marine/estuarine aquatic life (MW) pathway.

RESULTS

Nichols Environmental reviewed the laboratory analysis completed on samples collected from the Stormwater Pond by Tervita personnel. Samples were collected on May 12, 2014, and July 11, 2014.

Surface water samples collected from the Stormwater Pond on May 12, 2014, were submitted for laboratory analysis of metals, nutrients and water quality, phenols, and oil and grease. Surface water samples collected from the Stormwater Pond on July 11, 2014, were submitted for laboratory analysis of metals, nutrients and water quality, petroleum hydrocarbons and oil and grease. The results of these analyses are discussed below.

Surface Water Analysis - Metals

The results metals analyses reported concentrations for all analysed parameters that were below their respective standards, where applicable. The results of the metals analyses are presented in Table 1 (attached).

Surface Water Analysis - Nutrients and Water Quality

The results of the nutrients and water quality analyses reported concentrations for all analysed parameters that were below their respective standards, where applicable. The results of the nutrients and water quality analyses are presented in Table 2.

Surface Water Analysis - Petroleum Hydrocarbons

The results of the PHC analyses reported detectable concentrations of xylenes (1 parts per billion [ppb]) in the July 11, 2014, sample, which was below the applicable standard of 300 ppb. Concentrations of all other parameters were below their respective laboratory method detection limits (MDLs) and standards, where applicable. The results of the PHC analyses are presented in Table 3.

Surface Water Analysis - Phenols

The results of the May 12, 2014, reported detectable concentrations of phenols (5.1 ppb), which was below the most conservative applicable standard of 10 ppb. Concentrations of all other parameters were below their respective laboratory MDLs and standards, where applicable. The results of the May 12, 2014, phenols analyses are presented in Table 4.

A copy of the final signed groundwater laboratory reports is attached.

CONCLUSIONS

Nichols Environmental has completed the 2014 Surface Water Monitoring Report for the Silverberry Landfill at A-08-088-20-W6M, British Columbia. The field and analytical results are summarized as follows:

- Surface water samples were collected from the Storm Pond on May 12, 2014, and July 11, 2014, and submitted for laboratory analysis of select metals, nutrients and water quality, phenols, and PHC parameters;
- All analytical results were compared to the BC CSR standards for the DW, IW, LW, and FW pathways;
- All concentrations were reported below their respective laboratory MDLs and/or BC CSR standards, where applicable; and
- It is the opinion of Nichols Environmental that there were no deleterious effects on the environment due to surface water discharge from the Silverberry Landfill.

LIMITATIONS

In conducting the 2014 Surface Water Monitoring Report at the Property and in rendering our conclusions on the potential presence or level of contamination, Nichols Environmental (Canada) Ltd. gives the benefit of its best judgment based on its experience and in accordance with generally accepted professional standards for this type of investigation. Our conclusions are limited by the following:

- Nichols Environmental spent only a limited amount of time on the Property. Thus, any activities conducted on the Property following the site inspection that Nichols Environmental is not aware of may have an impact on the conclusions and recommendations presented;
- The sampling areas were limited to the sample locations outlined in Figure 2; and
- It was not possible to test for all forms of contamination at each and every location in the study areas. Although site-specific locations were used during testing, it is our opinion that the information obtained is representative of the conditions at the time the assessment was conducted.

This report is intended to provide information to reduce, but not necessarily eliminate, uncertainty regarding the potential for contamination of a property. This report has been prepared for the exclusive use of Tervita Corporation for the purpose of assessing the current environmental conditions that may be present at the Property. Any uses which a third party makes of this report, or any reliance on or decisions made based on it, are the responsibility of such third parties. Nichols Environmental (Canada) Ltd. accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

CLOSURE

We trust this meets your current requirements. If you have any questions, please contact our office at (780) 484-3377 at your convenience.

Yours truly,
NICHOLS ENVIRONMENTAL (CANADA) LTD.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
A	Method Blank exceeds ALS DQO. Refer to narrative comments for further information.
DLA	Detection Limit adjusted for required dilution
DLM	Detection Limit Adjusted due to sample matrix effects.
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
J,B	The analyte was detected below the calibrated range but above the EDL, and was detected in the Method Blank at >10% of the sample concentration.
J,R	The analyte was detected below the calibrated range but above the EDL, and the ion abundance ratio(s) did not meet the acceptance criteria. Value is an estimated maximum.
M,J	A peak has been manually integrated, and the analyte was detected below the calibrated range but above the EDL.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
[J]	The analyte was detected below the calibrated range but above the EDL.
[U]	The analyte was not detected above the EDL.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

BOD5-VA	Water	Biochemical Oxygen Demand- 5 day	APHA 5210 B- "BIOCHEMICAL OXYGEN DEMAND"

This analysis is carried out using procedures adapted from APHA Method 5210 B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

BOD5-VA	Water	Biochemical Oxygen Demand- 5 day	APHA 5210 B- BIOCHEMICAL OXYGEN DEMAND

This analysis is carried out using procedures adapted from APHA Method 5210 B - "Biochemical Oxygen Demand (BOD)". All forms of biochemical oxygen demand (BOD) are determined by diluting and incubating a sample for a specified time period, and measuring the oxygen depletion using a dissolved oxygen meter. Dissolved BOD (SOLUBLE) is determined by filtering the sample through a glass fibre filter prior to dilution. Carbonaceous BOD (CBOD) is determined by adding a nitrification inhibitor to the diluted sample prior to incubation.

CN-WAD-CFA-VA	Water	Weak Acid Diss. Cyanide in water by CFA	APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

CR6-D-IC-ED	Water	Chromium, Dissolved Hexavalent (Cr +6)	APHA 3500-Cr C (Ion Chromatography)

This analysis is carried out using procedures adapted from method 3500-Cr C in "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from Method 1636 published by the United States Environmental Protection Agency (EPA). The procedure involves analysis for chromium (VI) by ion chromatography using diphenylcarbazide in a sulphuric acid solution.
Results are based on a field-filtered, field-preserved sample.

DX-1613B-HRMS-BU	Water	Dioxins and Furans HR 1613B	USEPA 1613B

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-TOT-CVAFS-VA	Water	Total Mercury in Water by CVAFS	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).

MET-DIS-ICP-VA	Water	Dissolved Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-DIS-LOW-MS-VA	Water	Dissolved Metals in Water by ICPMS(Low)	EPA SW-846 3005A/6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures involves preliminary sample treatment by filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

OGG-SF-VA	Water	Oil & Grease by Gravimetric	BCMOE (2010), EPA1664A

The procedure involves an extraction of the entire water sample with hexane. This extract is then evaporated to dryness, and the residue weighed to determine Oil and Grease.

PCB-SF-ECD-VA	Water	PCB by Extraction with GCECD	EPA 3510/8082 Liq-Liq GCECD

This analysis is carried out using procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846, Methods 3510, 3620, 3660, 3665 & 8082, published by the United States Environmental Protection Agency (EPA). The procedure involves a liquid-liquid extraction of the entire water sample using dichloromethane. The extract is then solvent exchanged to hexane followed by one or more of the following clean-up procedures (if required): florisil clean-up, sulphur clean-up and/or sulphuric acid clean-up. The final extract is analysed by capillary column gas chromatography with electron capture detection (GC/ECD).

PCB-SUM-CALC-VA	Water	Total PCBs in water	CALCULATION

Calculation of Total PCB. Total PCB is the sum of the concentrations of PCB aroclors 1016, 1221, 1232, 1242, 1248, 1254, 1260, 1262, and 1268. Results below detection limit (DL) are treated as zero. The Total PCB detection limit is equal to the highest of the aroclor detection limits used in the sum.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PHENOLS-4AAP-ED	Water	Phenols (4AAP)	AB ENV.06537-COLORIMETRIC

This analysis is carried out using procedures adapted from ENVIRODAT VMV 06537 689, Method Code 154, in "Methods Manual for Chemical Analysis of Water and Wastes" published by the Alberta Environmental Centre. This automated method is based on the distillation of phenol and subsequent reaction of the distillate with alkaline ferricyanide and 4-aminoantipyrine to form a red complex which is measured at 505 nm.

PHN-ED	Water	Chlorinated and Non-Chlorinated Phenols	EPA 3510/8270-GC/MS

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
TEMP-SAMP-PCT-VA	Water	Sample Temperature of pH/EC Analysis	APHA 2550 B

Measured sample temperature during pH/EC analysis.

TROUT-LC50-WP	Water	Trout Bioassay LC50	EPS 1/RM/13, EPS 1/RM/9

Certified, disease-free rainbow trout (Oncorhynchus mykiss) are exposed to several concentrations of a sample including full strength, under static conditions in order to estimate the median lethal concentration (LC50) - the concentration of the sample in water that is estimated to be lethal to 50% of the test organisms within a 96-hour exposure period.

Studies have shown that the major contributor to measurement uncertainty (MU) for this test is biological response. The best estimation of MU is therefore provided in the test report as the 95% CI of the reference toxicant.

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter. TSS is determined by drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
BU	ALS ENVIRONMENTAL - BURLINGTON, ONTARIO, CANADA
ED	ALS ENVIRONMENTAL - EDMONTON, ALBERTA, CANADA
WP	ALS ENVIRONMENTAL - WINNIPEG, MANITOBA, CANADA
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

10-146460

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
A	Method Blank exceeds ALS DQO. Refer to narrative comments for further information.
DLA	Detection Limit adjusted for required dilution
DLM	Detection Limit Adjusted due to sample matrix effects.
J	Duplicate results and limits are expressed in terms of absolute difference.
J,R	The analyte was detected below the calibrated range but above the EDL, and the ion abundance ratio(s) did not meet the acceptance criteria. Value is an estimated maximum.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.
[J]	The analyte was detected below the calibrated range but above the EDL.
[U]	The analyte was not detected above the EDL.

Hold Time Exceedances:

ALS Product Description	Sample ID	Sampling Date	Date Processed	Rec. HT	Actual HT	Units	Qualifier
Physical Tests							
pH by Meter (Automated)	1	12-MAY-14 15:00	15-MAY-14 07:18	0.25	64	hours	EHTR-FM

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1454055 were received on 12-MAY-14 17:00.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Re: **L1454055** Work Order: **1405809**

Dear Geoff,

ALS Environmental received 1 sample on 15-May-2014 02:00 PM for the analyses presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested.

Sample results are compliant with NELAP standard requirements and QC results achieved laboratory specifications. Any exceptions are noted in the Case Narrative, or noted with qualifiers in the report or QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained from ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

The total number of pages in this report is 8.

If you have any questions regarding this report, please feel free to contact me.

Sincerely,

Electronically approved by: Bill Carver

Tom Beamish
Senior Project Manager

Certificate No: MN 532786

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte is present at an estimated concentration between the MDL and Report Limit
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
Q	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL

Acronym	Description
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
LOD	Limit of Detection (see MDL)
LOQ	Limit of Quantitation (see PQL)
MBLK	Method Blank
MDL	Method Detection Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
TDL	Target Detection Limit
TNTC	Too Numerous To Count
A	APHA Standard Methods
D	ASTM
E	EPA
SW	SW-846 Update III

Units Reported	Description
mg/L	Milligrams per Liter

Mangnese, dissolved	0.5 mg/l	0.01	Pass	
Molybdenum, dissolved	0.5 mg/l	0.001	Pass	
Nickel, dissolved	0.5 mg/l	0.0029	Pass	
Selenium, dissolved	0.05 mg/l	0.0005	Pass	
Tin, dissolved	0.5 mg/l	0.00005	Pass	
Zinc, dissolved	0.2 mg/l	0.007	Pass	
Mercury, total	0.001 mg/l	0.000005	Pass	

Laboratory Report #	1013745
Date:	18-Jul-14
Operator (Print Name)	Lisa Jordan
Operator (Signature)	

Comments:

[1] *if it is suspected that other chemical have entered the surface water retention pond the water is not suitable for discharge*
[2] *landowner consent must be obtained and kept on file*

Notes To Clients:

- Sample 1013745-1; 4794993 Sample 1013745-1: There was insufficient sample volume to reach a detection limit of 1 mg/L for TSS analysis. The detection limit was adjusted accordingly.
- Sample 1013745-1; 4794993 Sample formed an emulsion during oil and grease extraction. Centrifugation was required in order to complete analysis.

Subject: Results of Volatile Organic Compound Air Sampling Activities
August 23 and 24 2016
Tervita Silverberry Landfill

Dear Mr. Nelson,

1. Introduction

Based on comments from the Working Group to Tervita Corporation (Tervita) for the Silverberry Landfill Capacity Replacement Project, Tervita has retained CH2M Hill Energy Canada Limited (CH2M) to conduct volatile organic compound (VOC) air sampling for the Silverberry site. The landfill is used primarily for the disposal of waste associated with oil and gas exploration. The landfill has the potential to generate some emissions from the hydrocarbon contaminated waste accepted. The waste inherently contains petroleum hydrocarbons.

The Silverberry landfill is located approximately 50 kilometres northwest of Fort St John in northeastern British Columbia. The VOC air sampling study was done over a two-day period on August 23 and August 24, 2016.

Details of the study and the results are provided in the sections below.

2. Sampling Activities

The objective of the study was to evaluate the chemical composition of potential landfill gas emissions generated from the Silverberry landfill. The VOC air sampling concentrated on the active cell #7 since the majority of cells are now under a progressive cap (a bitumen or low density polyurethane), which would limit the potential release of landfill gas. Due to the possible effects of winds on collection of the landfill gas, the measurements were taken on days of relatively low wind speeds.

The sampling was comprised of a preliminary monitoring phase where a portable handheld landfill gas analyzer was used to potentially identify areas in the active cell where emissions may be greater than other areas (“hotspots”). This sampling was conducted on August 23, 2016. The intent of the preliminary monitoring was to help identify possible locations where summa canister samples were taken on August 24, 2016.

The sampling program provides a snapshot of the VOCs at the time the measurements were recorded. It does not provide a method to estimate the quantity or rate of landfill gas emissions.

Preliminary Sampling:

Landfill gas can migrate through pores and opening in the soil and these gases have a tendency to emit from high points in the landfill terrain. Therefore, a portable instrument was used to identify possible "hotspots" or locations on the landfill surface where relatively high concentrations of methane or other landfill gas emissions might be detected. A Landfill GEM5000 gas analyzer was used to survey the landfill surface. Measurements using the portable instrument were taken at 12 points spaced approximately 50-75 metres apart on the landfill surface to identify possible hotspots. The portable gas monitor measured CH_4 (methane), CO_2 (carbon dioxide), H_2S (hydrogen sulfide), and CO (carbon monoxide). The monitor is sensitive to 0.1% by volume of CH_4 and CO_2 and to 1 ppm H_2S and CO.

Over the grid of measurement locations described above, there were no detectable concentrations of CH_4, CO_2, H_2S, or CO.

Summa Canister Samples:

Due to the less than detectable concentrations of gases taken in the preliminary sampling phase, CH2M identified two locations on the landfill surface site that were higher in elevation than the surrounding areas and therefore may potentially emit more landfill gas than other (slightly) lower terrain areas. One air sample (1/2-hr collection) in proximity to each of these two locations were then taken using a Summa canister and flow controller and sent to an accredited laboratory for quantitative analyses of several contaminants composing the landfill gas, specifically volatile organic compounds (VOCs). The samples were taken near the surface of the landfill at a height of approximately 0.5 metres to help minimize the effect of wind on the collection.

VOC samples collected were analyzed in accordance with US EPA Method TO-15 Determination of Volatile Organic Compounds (VOCs) In Air Collected in Specially-Prepared Canister and Analyzed by Gas Chromatography/Mass Spectrometry (GC/MS) (US EPA, January 1999). The method is based on the measured intake of VOC-containing air into a specially prepared canister over a known period of time.

Constituent VOCs will be quantified consistent with Table 1 of US EPA Compendium Method TO-15 EPA/625/R-96/010b (US Environmental Protection Agency, January 1999). The list of VOCs that are measured through this technique are shown in the Certificate of Analysis shown in Attachment 1. The lab analyses were performed by ALS Environmental (ALS), accredited by the Standards Council of Canada for VOC analysis.

The locations for the canister sample collections are shown in Attachment 2. The geographical coordinates of the sample locations are shown in the Table 1 below. Table 2 summarizes the time of collection and prevailing winds at that time as recorded at the Environment Canada Fort St John Automated weather station.

Field notes for the preliminary and summa canister sampling are provided in Attachment 3.

Table 1. Location of Summa Canister Sample Collections

Sample	UTM Easting (m)	UTM Northing (m)	Latitude	Longitude
SA01 – south central location of Cell 7	612817	6276755	56.6214 N	121.16137 W

Table 2. Sampling Schedule and Wind Conditions

Contaminants	Sampling Event #	Sampling Period		Predominant Wind at the Site	
		Start	End	Wind Direction (blow from)	Wind Speed (km/h)
CH_4, CO, H_2S	NA	08/23/2016, Approx. 4:01 pm	08/23/2016, Approx. 4:35 pm	South southwest	6
VOCs	SA01	08/24/2016, Approx. 8:15 am	08/24/2016, Approx. 8:45 am	Southwest	10
	SA02	08/24/2016, Approx. 8:41am	08/24/2016, Approx. 9:11 am	Southwest and northwest	7-10

Notes: Data from Environment Canada Fort St John meteorological station (WMO 71943)

3. Results

ALS Certificate of Analysis (COA) for VOCs are included in Attachment 1. A summary of the results of the two VOC samples are provided below in Table 3. This list shows only the VOCs that had at least one measured concentration above the method detection limit at either one of the two sampling locations.

British Columbia has no applicable ambient air criteria for any of the speciated VOCs analyzed using the TO-15 method. Therefore, for comparison purposes only, ambient air guidelines are listed preferentially from Alberta (Alberta Environment, 2013), and then from Ontario (Ontario Ministry of the Environment, 2012) as necessary. Some of the compounds have both 1-hour and 24-hour averaging periods, and in those cases, the lower of the two (i.e. the 24-hr average) is listed in the Table.

The results indicate that one VOC (benzene) for sample (SA-01) was at the Alberta 1-hour average ambient air standard. None of the remaining VOC concentrations are greater than the listed standards or guidelines at both sampling locations during the sampling event.

The identifier **ND** in the table below means that the contaminant was not detectable by the laboratory for that sample, meaning that within the uncertainties in the analysis method, the concentration is not statistically greater than zero.

Table 3. Summary of VOC Lab Results

Contaminants	CAS Number	Ambient Air Objective, Standard, or Guideline ($\mu g/m^3$)	Sample Concentration ($\mu g/m^3$)	
			SA01	SA02
Acetone	67-64-1	5,900 (1-hr; Alberta)[1]	34	7.9
Benzene	71-43-2	30 (1-hr; Alberta)	30	ND
Chloromethane	74-87-3	320 (24-hr; Ontario)[2]	ND	1.2
Cyclohexane	110-82-7	6100 (24-hr; Ontario)	152	1.23
Dichlorodifluoromethane	75-71-8	500,000 (24-hr; Ontario Guideline)[3]	ND	2.41
4-Ethyltoluene	25550-14-5	500 (24-hr; Ontario JSL)[4]	36	ND
n-Heptane	142-82-5	11,000 (24-hr; Ontario)	438	2.29
n-Hexane	110-54-3	7,000 (24-hr; Alberta)	201	4.24

Table 3. Summary of VOC Lab Results

Contaminants	CAS Number	Ambient Air Objective, Standard, or Guideline (µg/m³)	Sample Concentration (µg/m³) SA01	SA02
Toluene	108-88-3	400 (24-hr; Alberta)	168	1.26
Trichlorofluoromethane	75-69-4	6,000 (24-hr; Ontario Guideline)	ND	1.9
1,2,4-trimethylbenzene	95-63-6	220 (24-hr; Ontario)	175	ND
1,3,5-trimethylbenzene	108-67-8	220 (24-hr; Ontario)	91	ND
m&p xylenes	1330-20-7	700 (24-hr; Alberta)[5]	371	ND
o xylenes	1330-20-7	700 (24-hr; Alberta)[5]	107	ND

Notes:

ND - Not detected

1 Alberta Ambient Air Quality Objectives and Guidelines Summary, August 2013.

2 Ontario Ambient Air Quality Criteria, April 2012.

3 Summary of Standards and Guidelines, to support Ontario Regulation 419/05 – Air Pollution – Local Air Quality, April 2012.

4 Jurisdictional Screening Level (JSL) List – A Screening Tool for Ontario Regulation 419: Air Pollution – Local Air Quality, February 2008.

5 Total Xylenes.

Need conclusion or opinion on the whether there are landfill gases being emitted into the atmosphere and if mitigation/monitoring is required.

4. Conclusion

The VOCs concentrations measured at the Silverberry site were compared against ambient air quality standards from Alberta and Ontario as described in Section 3. The VOCs that were detected by the analysis method are all less than the ambient air standards listed in Table 3 except for benzene, which was just at the 1-hr ambient air quality standard of 30 µg/m^3 for one of the two samples. The samples were taken directly over the landfill and did not account for any dispersion that would occur as the landfill gas migrates off-property. Therefore, it is unlikely that the off-site concentration of any landfill gases (including benzene) are at or higher than the standard due to the dispersion and dilution of the landfill emissions. Based on the results presented above, additional monitoring is not warranted.

5. Closure

The results presented in this report are reflective of the conditions at the time of the sample collection, and at the locations where the samples were collected. CH2M does not attest to the conditions at the Facility or emissions therefrom at any other time or location.

CH2M's air quality specialist has reviewed the information contained in this report. Darryl Chartrand, Ph.D., has over 18 years of ambient air quality monitoring, emissions inventory development, and dispersion modelling expertise for many different industrial sectors including automotive, iron and steel, upstream and downstream oil and gas, and several manufacturing sectors. Darryl has significant experience in atmospheric monitoring and data analysis, including QA/QC, the formation of ambient air and source monitoring plans, and fugitive dust and odour mitigation plans.

Use of this Report or any information contained herein, if by any party other than Tervita, shall be at the sole risk of such party and shall constitute a release and agreement by such party to defend and indemnify CH2M and its affiliates, officers, employees and subcontractors from and against any liability for direct, indirect, incidental, consequential or special loss or damage or other liability of any nature arising from its use of the Report or reliance upon any of its content. To the maximum extent permitted by law, such release from and indemnification against liability shall apply in contract, tort (including negligence), strict liability, or any other theory of liability.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
CAN-DATA-WT	Canister	Canister Information	EPA TO-15A
TO15-GCMS-WT	Canister	Canister EPA TO-15	EPA TO-15

This analysis is performed using procedures adapted from EPA Method TO-15. Air samples are collected into cleaned evacuated canisters. A volume of air sample is transferred from the canister to a preconcentrator system where the analytes are trapped & focused. The analytes are then thermally desorbed into a GC-MSD for analysis. Test results are not blank corrected unless indicated by a qualifier.

Canister samples will be retained for 7 calendar days after final report. If you require a longer canister storage time, please contact your account manager.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

NORM GAMMA RADIATION SCREENING SURVEY

TABLE OF CONTENTS

Tervita Corporation
N.O.R.M. Air Monitoring Survey

A-08-88-20W6 - Silverberry Landfill
May 11, 2017

I. BACKGROUND INFORMATION:

Tervita NORM Services was requested by Tervita Corporation to conduct a Naturally Occurring Radioactive Material (NORM) air monitoring survey of the Silverberry Landfill. The purpose of the survey was to determine if airborne NORM contamination was present; and the degree to which it would affect workers and their daily operations. The NORM survey was completed by a certified Radiation Safety Officer (RSO) on May 11, 2017.

Although the concentration of Naturally Occurring Radioactive Material (NORM) in most natural substances is low, higher concentrations can arise as the result of oil and gas production activities. For example, if Radium is present in the formation, production activities can cause Radium to precipitate out of produced waters, concentrating as scales and sludge internal to process equipment. Radium scales can easily become airborne creating a significant radiation inhalation hazard. The radioactive half-life of Radium is 1600 years and, consequently, it can represent a long-term health hazard to personnel and the environment.

Another typical source of NORM is Radon gas. Radon has a half-life of 3.8 days and quickly decays into Lead (^{210}Pb), which is a thin film or dust that builds up on the inner walls of process equipment and piping.^{210}Pb can easily become airborne creating an inhalation hazard if not contained. As ^{210}Pb emits low energy gamma radiation, NORM screening surveys of gas processing facilities must be performed on a flowing gas stream. The concentration of Radon gas is only an indication there may be a ^{210}Pb build up within the process equipment as its presence is dependent on residency time and flows within the equipment.

In an environmental setting such as a landfill, Radon gas emissions are generated through biological decay of organic matter which can increase with the presence of petroleum and radon-bearing constituents. Radon gas generally enters the atmosphere through the surface of the landfill or vents in the landfill cover. The emissions can be inhibited when partitioned in the solids, liquid and organic matter which allows for more time for radioactive decay to occur in the subsurface. Based on a study conducted in 2011, in Canada, the average outdoor environmental concentration of Radon gas is 24 Bq/m^3.

Unprotected overexposure to Radium and Radium daughter contaminated dusts is associated with an increased risk of lung cancer and leukemia. Radium will not clear

from the body significantly over time. For this reason, all exposures should be kept below recognized exposure standards for the general public and unnecessary exposure to radiation should be kept as low as reasonably achievable (ALARA).

II. INSTRUMENTATION:

The NORM survey was conducted using a calibrated Ludlum 3-97 General Purpose Survey Meter which incorporates both an internal 1"x1" sodium iodide (Na-I) scintillator and an external 44-9 Geiger-Mueller (G-M) pancake probe. Function tests and stabilization of the instruments were conducted utilizing a Cesium 137 check source prior to taking survey measurements.

The air monitoring was conducted using AirChek XR5000 air pumps with flow rates calibrated using a Bios Defender 510-M flow monitor. An Environmental Instruments Canada TM372 sample counter was used to analyze the filter discs for airborne NORM particulates post-sample.

III. METHODOLOGY:

Once calibrated, the AirChek XR5000 air pumps were placed in three locations on the perimeter of the landfill (Southwest corner, Southeast corner and North side); and set to draw a collective $1m^3$ of air through 0.8µm filter discs for 133 minutes. The filter discs were then counted using the Environmental Instruments Canada TM372 sample counter. Samples were counted immediately after the initial run time and then counted 5 days post-sample; after the decay of all Short Lived Radon Daughters "SLRD" has occurred. This ensures there are no false positives recorded due to the presence of Radon gas in the atmosphere.

The survey work was conducted in accordance with procedures outlined in the Canadian Guidelines for the Management of Naturally Occurring Radioactive Material, published by Health Canada, Revised 2011.

IV. REGULATIONS AND GUIDELINES:

The Canadian Nuclear Safety Commission (CNSC) has legislative control over nuclear cycle materials and man-made radio nuclides. Naturally Occurring Radioactive Material (NORM) is exempt from CNSC legislation except for the import, export, and transportation of the material. The jurisdiction over use and radiation exposure to NORM is the responsibility of each Canadian province and territory.

The Canadian Guidelines for the Management of Naturally Occurring Radioactive Materials is published by Health Canada, and was prepared by the Canadian NORM Working Group by the Federal Provincial Territorial Radiation Protection Committee

(FPTRPC). The FPTRPC is a Canadian intergovernmental committee established to support federal, provincial, and territorial protection agencies in carrying out their respective mandates. The basic principal of the guideline is to protect workers, the public, and the environment from situations where NORM has been technologically enhanced or concentrated as a result of industrial activities.

The Health Canada NORM guideline establishes a NORM Investigation Threshold and NORM Management Threshold. The NORM Investigation Threshold is an incremental dose of 0.3 mSv/yr. If the potential NORM exposure levels are above 0.3 mSv/yr, then NORM Management is required. The Guidelines also provide Unconditional Derived Release Limits for NORM waste of 0.3 Bq/g and Unconditional Derived Release Limits for fixed surface contamination on equipment of 1.0 Bq/cm^2 averaged over a 100 cm^2 area. All loose surface contamination must be removed.

V. SURVEY RESULTS:

The average environmental background was measured at 90 nSv/hr (nano Sieverts per hour) and 60 CPM (counts per minute). These background radiation levels are indicative of typical background radiation levels.

As seen in Table 1, the initial sample count, also known as the 10 minute count (DPM), was found to be slightly above background readings however, after 5 days the samples were measured below background. This decrease over the 5 day period is indicative of the presence of radon gas. With a short half-life of 3.8 days, the radon gas is constantly decaying leaving behind Short Lived Radon Daughters (SLRD). These SLRD are detected on the initial sample count however, the lack of activity on the final count is evidence that the SLRD have completely decayed over the 5 day period. The result of Radon concentration (Bq/m^3) found from each filter can also be found in Table 1. Based on air monitoring results there is no evidence of airborne NORM particles.

Based on the survey results, at the measured dose rates, the workers are not at risk of being exposed to gamma radiation in excess of the Dose Constraint of 0.3mSv/a as outlined in the Health Canada – Canadian Guidelines for the Management of Naturally Occurring Radioactive Material “NORM”.

VI. CONCLUSIONS AND RECOMMENDATIONS:

1. Appropriate NORM management and safe work procedures should be in place and followed by all employees who may potentially come in contact with NORM contamination from opening or working on NORM impacted equipment.
2. The external gamma radiation dose levels detected would result in exposure levels to workers that are below Health Canada’s Canadian NORM guidelines of 0.3 mSv/a. As a result, there is no need to implement an employee dose

management program or restrict worker access to the identified NORM contaminated equipment, providing it remains sealed until it can be decontaminated.

RE: 2018 Surface Water Discharge Report
Silverberry Landfill
Block A 08-088-20-W6M, British Columbia

Dear Mr. Nelson:

Nichols Environmental (Canada) Ltd. is pleased to present this summary report of the 2018 Surface Water Discharge to Tervita Corporation (Tervita) for the Silverberry Landfill. This facility is at a location legally described as Block A 08-088-20-W6M, approximately 45 km northwest of Fort St. John, British Columbia (herein referred to as the "Site"). Figure 1 (attached) shows the location of the Site relative to the surrounding area.

BACKGROUND

The facility is located within the Peace River Regional District, northwest of the City of Fort St. John, British Columbia. The Site consists of the Tervita Silverberry Landfill whose facilities are located to the north and east of the Tervita Silverberry Treatment, Recovery and Disposal (TRD) facility, with which it shares central access.

Tervita's Silverberry Landfill facility was granted an operating permit (No. 17150) on October 18, 2002, pursuant to the Waste Management Act which has since been appealed and is now the *Environmental Management Act*. The permit was last amended on September 1, 2017.

The Silverberry Landfill accepts solid hazardous wastes in accordance with the Hazardous Waste Regulation of the Environmental Management Act and the operating permit and approved operational plan. The Tervita Silverberry Landfill is also the only facility in British Columbia licensed to accept naturally occurring radioactive material (NORM) that exceeds federal and provincial guidelines.

The stormwater pond on the Site is shared between the Landfill and the Hazardous Soil Treatment Facility, and it collects surface waters from across the Site and directs flow toward the stormwater pond located in the northwest corner of the facility. All collected surface waters are retained in the stormwater pond, which is sampled prior to discharge to the environment. The location of the stormwater pond in relation the Site is presented on Figure 2.

The adjoining TRD facility activities consist of the treatment, storage, and recovery of oilfield wastes such as sludges, wastewater, pigging waste, drilling sump material, contaminated debris, and crude oil. On-site facilities which may pose a potential source of environmental impact include the aboveground storage tank (AST) containment area, flare stack, and all processing, terminal, and treatment areas. Leachate collected from the landfill is also disposed of by the Silverberry TRD.

Nichols Environmental has completed the Surface Water Discharge Reports for the Site since 2014. Based on the laboratory analysis provided by Tervita in 2017, it was Nichols Environmental's opinion that there were no deleterious effects to the environment from the surface water discharge.

ASSESSMENT GUIDELINES

Regulatory Framework

The analytical results are presented in the context of the British Columbia Ministry of Environment and Climate Change Strategy (BC MOECCS) Contaminated Sites Regulations (BC CSR 1997). The most recent amendment (B.C. Reg. 196/2017) to the BC CSR was issued in November 2017 and is reflected in this assessment. The BC CSR was developed to provide a system to ensure that contaminated soil, surface water, sediments and groundwater are cleaned up to scientifically based standards for sites in British Columbia.

Under the BC CSR, there are two types of remediation standards for a particular site; Numerical Standards, and Risk-Based Standards. The Numerical Standards refer to concentrations of given substances in soil or groundwater for a particular land use or a particular land use and site-specific exposure pathway. Generic Numerical Standards for some substances are applied to a site based on the applicable land use of that site, while Matrix Numerical Standards are applied for some substances in soil, taking into account various site-specific factors such as proximity to receiving waters, likelihood of human ingestion, and use of land for livestock rearing. The second type of remediation standard is the site-specific risk-based standard, which involves the generation of a standard for a specific site based on a risk assessment protocol by BC MOECCS.

The above remediation criteria may be used as benchmarks to evaluate the need for further investigation, remediation or to guide in the establishment of land-use restrictions. The water use pathways required to be assessed for applicability to the Site include the Drinking Water (DW) pathway, the Marine/Estuarine Aquatic Life pathway (MW), the Irrigation pathway (IW), the Livestock pathway (LW), and the Freshwater Aquatic Life pathway (FW).

The analytical are also discussed in the context of the BC MOECCS' Hazardous Waste Regulations, (HWR) which addresses the proper handling and disposal of hazardous wastes under the Environmental Management Act. Schedule 1.2 of the HWR outlines effluent standards for Hazardous Waste Facilities for discharges to the environment.

Water Use Assessment

The Site is situated within an area of predominately natural land use with some surrounding oil and gas and forestry related activities. There are no adjacent agricultural land uses, but agricultural activities are present to the northeast of the Site, and the Site is within the provincial Agriculture Land Reserve (ALR).

Several lakes were noted within a 10-km radius of the Site including two unnamed lakes (approximately 4.5 km east), as well as several oxbow lakes located to the north along the Blueberry River system. Two small unnamed creeks are located to the immediate north and west of the Site and are tributaries to the Blueberry River, located approximately 6.5 km to the north.

The topography of the Site is generally flat, with a local area slope generally to the northwest toward the Blueberry River system. A surface water collection ditch is present across the Site and to the east, south, and west of the TRD's processing infrastructure, through which stormwater and melt water are directed to the stormwater pond on the west perimeter of the Site. Based on previous assessments, groundwater flow direction is to the north by northwest.

Based on the current land uses, all water use pathways would be operative with the exception of the marine/estuarine aquatic life (MW) pathway.

RESULTS

Based on information provided by Tervita, 17,440 m^3 of surface water discharged during the 2018 reporting year.

Nichols Environmental reviewed the laboratory analysis completed on samples collected from the stormwater pond by Tervita personnel. Samples were collected on April 24, May 10, May 18, July 16, July 30, and September 21, 2018.

Surface water samples collected from the stormwater pond were submitted for select laboratory analysis of metals, nutrients, and water quality, petroleum hydrocarbons (PHCs), trout bioassay, polychlorinated biphenyls (PCBs), organic halides, and oil and grease. The results of these analyses are attached and discussed below.

Surface Water Analysis - Petroleum Hydrocarbons

The results of the PHC and oil and grease analyses reported all concentrations below the laboratory's method detection limits (MDLs) and below the standards, where applicable. The results of the PHC and oil and grease analyses are presented in Table 1 (attached).

Surface Water Analysis - Organics

The results of the April 24, 2018 analyses indicated that PCBs, dioxins/furans, and organic halides concentrations were below their respective applicable standards (where available). The results of the organics analyses are presented in Table 2.

Surface Water Analysis - Metals

The results of the metals analyses indicated that all of the analysed parameters were below their respective standards, where available. The results of the metals analyses are presented in Table 3.

Surface Water Analysis - Nutrients, Water Quality, and Trout Bioassay

Chloride concentrations were elevated above the BC CSR IW standard of 100 mg/L during the July 16, 2018 sampling event (469 mg/L) . However, chloride concentrations were below the applicable standard in the subsequent sampling events on July 30 and September 21, 2018, prior to the October 2018 discharge events. All other nutrient and water quality results were below their respective applicable standards, where available.

The results of the trout bioassay reported that the endpoints for mortality could not be reached (LC50 > 100), indicating that no effect occurred. The results of the nutrients, water quality, and trout bioassay analyses are presented in Table 4.

Copies of the final signed surface water laboratory reports are attached.

CONCLUSIONS

Nichols Environmental has completed the 2018 Surface Water Discharge Report for the Silverberry Landfill at Block A 08-088-20-W6M, British Columbia. The field and analytical results are summarized as follows:

- In total, 17,440 m^3 of water was discharged from the Site in 2018;

- Surface water samples were collected from the stormwater pond on April 24, May 10, May 18, July 16, July 30, and September 21, 2018 and submitted for laboratory analysis of select PHCs, oil and grease, metals, nutrients and water quality, phenols, PCBs, organic halides, and a trout bioassay;

- All analytical results were compared to the BC CSR standards for the DW, IW, LW, and FW pathways as well as the BC HWR Effluent Standards for Hazardous Waste Facilities for discharges to the environment;

- Chloride concentration in the stormwater pond sample collected on July 16, 2018 exceeded the BC CSR IW standard. However, chloride concentrations were below the applicable BC CSR standard in subsequent sampling events on July 30 and September 21, 2018, prior to discharging in October 2018;

- All remaining concentrations were reported below their respective laboratory MDLs and/or BC MOECCS standards, where available. The results of the trout bioassay indicated that there was no effect; and

- It is the opinion of Nichols Environmental that there were no deleterious effects on the environment due to surface water discharge from the Silverberry Landfill in 2018.

LIMITATIONS

In conducting the 2018 Surface Water Discharge Report at the Site and in rendering our conclusions on the potential presence or level of contamination, Nichols Environmental (Canada) Ltd. gives the benefit of its best judgment based on its experience and in accordance with generally accepted professional standards for this type of investigation. Our conclusions are limited by the following:

- Nichols Environmental did not visit the Site for sample collection. Sample collection was completed by Tervita personnel with the laboratory results being provided to Nichols Environmental for the purpose of preparing this report. As such, we cannot comment on the sampling methodology and QA/QC program utilized by Tervita; and

- The sampling area was limited to the sample locations outlined in Figure 2.

This report is intended to provide information to reduce, but not necessarily eliminate, uncertainty regarding the potential for contamination of a property. This report has been prepared for the exclusive use of Tervita Corporation for the purpose of assessing the current environmental conditions that may be present at the Site. Any uses which a third party makes of this report, or any reliance on or decisions made based on it, are the responsibility of such third parties. Nichols Environmental (Canada) Ltd. accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

CLOSURE

We trust this meets your current requirements. If you have any questions, please contact our office at 780-484-3377 at your convenience.

Yours truly,
NICHOLS ENVIRONMENTAL (CANADA) LTD.

TEST TYPES

- Rainbow trout 96-h LC50 test

RESULTS

Toxicity test results

Sample ID	Rainbow trout LC50 (% v/v)
1266553-1	>100
1266553-2	>100
1266553-3	>100

LC = Lethal Concentration

QA/QC

QA/QC summary	Rainbow trout
Reference toxicant LC50 (95% CL)	4.2 (3.7-4.6) g/L KCl[1]
Reference toxicant historical mean (2 SD Range)	3.1 (2.3-4.3) g/L KCl
Reference toxicant CV	10.5%
Organism health history	Acceptable
Protocol deviations	None
Water quality range deviations	None
Control performance	Acceptable
Test performance	Valid

[1] Test date, April 5, 2018
LC = Lethal Concentration; CL = Confidence Limit

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) survival test.

Test species	*Oncorhynchus mykiss*
Organism source	LSL Fish Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	22-L plastic pails with polyethylene liners
Test volume	20 L
Test solution depth	Minimum 15 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	De-chlorinated City of Calgary tap water
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light/8 hours dark
Aeration	6.5 ±1 mL/min/L
Test Measurements	pH, conductivity, dissolved oxygen and temperature were measured at test initiation and test completion; salinity measured at test initiation; evaluated for survival daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 &2016 amendments
Statistical software	None
Test endpoints	96-hour LC50
Test acceptability criteria for controls	Survival ≥ 90%
Reference toxicant	Potassium chloride (KCl)

Acronyms used in reporting dioxins and furans:

TCDD = Tetrachlorodibenzo-*p*-dioxin
PeCDD = Pentachlorodibenzo-*p*-dioxin
HxCDD = Hexachlorodibenzo-*p*-dioxin
HpCDD = Heptachlorodibenzo-*p*-dioxin
OCDD = Octachlorodibenzo-*p*-dioxin

TCDF = Tetrachlorodibenzofuran
PeCDF = Pentachlorodibenzofuran
HxCDF = Hexachlorodibenzofuran
HpCDF = Heptachlorodibenzofuran
OCDF = Octachlorodibenzofuran

Acceptable recoveries for surrogates	**EPA 1613**	
	Min (%)	**Max (%)**

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2130359-1
Matrix Spike	Boron (B)-Dissolved	MS-B	L2130359-1
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2130359-1
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2130359-1
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2130359-1
Matrix Spike	Molybdenum (Mo)-Dissolved	MS-B	L2130359-1
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2130359-1
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2130359-1
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2130359-1
Matrix Spike	Sulfate (SO4)	MS-B	L2130359-1

Qualifiers for Individual Parameters Listed:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

OGG-SF-VA	Water	Oil & Grease by Gravimetric	BCMOE (2010), EPA1664A

The procedure involves an extraction of the entire water sample with hexane. This extract is then evaporated to dryness, and the residue weighed to determine Oil and Grease.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA	Water	Sulfate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

VOC7-HSMS-VA	Water	BTEX/MTBE/Styrene by Headspace GCMS	EPA 5021A/8260C

The water sample, with added reagents, is heated in a sealed vial to equilibrium. The headspace from the vial is transfered into a gas chromatograph. Target compound concentrations are measured using mass spectrometry detection.

VOC7/VOC-SURR-MS-VA	Water	VOC7 and/or VOC Surrogates for Waters	EPA 5035A/5021A/8260C
XYLENES-CALC-VA	Water	Sum of Xylene Isomer Concentrations	CALCULATION

Calculation of Total Xylenes

Reference Information

Total Xylenes is the sum of the concentrations of the ortho, meta, and para Xylene isomers. Results below detection limit (DL) are treated as zero. The DL for Total Xylenes is set to a value no less than the square root of the sum of the squares of the DLs of the individual Xylenes.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

15-

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Quality Control Report

Hold Time Exceedances:

ALS Product Description	Sample ID	Sampling Date	Date Processed	Rec. HT	Actual HT	Units	Qualifier
Physical Tests							
pH by Meter (Automated)							
	1	16-JUL-18 15:30	24-JUL-18 08:10	0.25	185	hours	EHTR-FM

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2130359 were received on 17-JUL-18 09:00.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

ALS ENVIRONMENTAL ANALYTICAL REPORT

	Sample ID	L2138787-1				
	Description	Water				
	Sampled Date	30-JUL-18				
	Sampled Time	15:00				
	Client ID	SBLF STORM POND				
Grouping	**Analyte**					
WATER						
Physical Tests	pH (pH)	8.14				
Anions and Nutrients	Chloride (Cl) (mg/L)	77.9				

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode It is recommended that this analysis be conducted in the field.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

ALS ENVIRONMENTAL ANALYTICAL REPORT

	Sample ID	L2169058-1				
	Description	Water				
	Sampled Date	21-SEP-18				
	Sampled Time	13:00				
	Client ID	STORM POND				
Grouping	**Analyte**					
WATER						
Dissolved Metals	Thallium (Tl)-Dissolved (mg/L)	<0.000010				
	Thorium (Th)-Dissolved (mg/L)	0.00010				
	Tin (Sn)-Dissolved (mg/L)	<0.00010				
	Titanium (Ti)-Dissolved (mg/L)	0.0599				
	Tungsten (W)-Dissolved (mg/L)	<0.00010				
	Uranium (U)-Dissolved (mg/L)	0.000593				
	Vanadium (V)-Dissolved (mg/L)	0.00173				
	Zinc (Zn)-Dissolved (mg/L)	0.0029				
	Zirconium (Zr)-Dissolved (mg/L)	0.00216				
Aggregate Organics	Oil and Grease (mg/L)	<5.0				
Volatile Organic Compounds	Benzene (mg/L)	<0.00050				
	Ethylbenzene (mg/L)	<0.00050				
	Methyl t-butyl ether (MTBE) (mg/L)	<0.00050				
	Styrene (mg/L)	<0.00050				
	Toluene (mg/L)	<0.00045				
	ortho-Xylene (mg/L)	<0.00050				
	meta- & para-Xylene (mg/L)	<0.00050				
	Xylenes (mg/L)	<0.00075				
	Surrogate: 4-Bromofluorobenzene (SS) (%)	98.5				
	Surrogate: 1,4-Difluorobenzene (SS) (%)	85.0				

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2169058-1
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2169058-1
Matrix Spike	Iron (Fe)-Dissolved	MS-B	L2169058-1
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2169058-1
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2169058-1
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2169058-1
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2169058-1

Qualifiers for Individual Parameters Listed:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-T-CVAA-VA	Water	Total Mercury in Water by CVAAS or CVAFS	EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

OGG-SF-VA	Water	Oil & Grease by Gravimetric	BCMOE (2010), EPA1664A

The procedure involves an extraction of the entire water sample with hexane. This extract is then evaporated to dryness, and the residue weighed to determine Oil and Grease.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA	Water	Sulfate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

VOC7-HSMS-VA	Water	BTEX/MTBE/Styrene by Headspace GCMS	EPA 5021A/8260C

The water sample, with added reagents, is heated in a sealed vial to equilibrium. The headspace from the vial is transfered into a gas chromatograph. Target compound concentrations are measured using mass spectrometry detection.

VOC7/VOC-SURR-MS-VA	Water	VOC7 and/or VOC Surrogates for Waters	EPA 5035A/5021A/8260C
XYLENES-CALC-VA	Water	Sum of Xylene Isomer Concentrations	CALCULATION

Calculation of Total Xylenes

Total Xylenes is the sum of the concentrations of the ortho, meta, and para Xylene isomers. Results below detection limit (DL) are treated as zero. The DL for Total Xylenes is set to a value no less than the square root of the sum of the squares of the DLs of the individual Xylenes.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

Reference Information

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

ALS Product Description	Sample ID	Sampling Date	Date Processed	Rec. HT	Actual HT	Units	Qualifier
Physical Tests							
pH by Meter (Automated)							
	1	21-SEP-18 13:00	26-SEP-18 12:43	0.25	120	hours	EHTR-FM

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2169058 were received on 21-SEP-18 17:20.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

EXECUTIVE SUMMARY

Tervita Corporation retained Matrix Solutions Inc. to conduct the quarterly groundwater monitoring program at the Silverberry Landfill as required under the *Environmental Management Act* Permit 17150. The Silverberry Landfill is located at Block A-18-088-20 W6M, approximately 45 km northwest of Fort St. John, British Columbia. Potential contaminants of concern identified for the site include general and inorganic parameters, dissolved metals, petroleum hydrocarbons, polycyclic aromatic hydrocarbons, and radioactive isotopes.

In 2018, shallow groundwater beneath the site was interpreted to flow toward the northwest with an estimated horizontal groundwater velocity of < 1 m/year. Groundwater beneath the landfill generally shows recharge conditions.

In 2018, sodium, sulphate, fluoride, and several dissolved metal concentrations exceeded the applicable British Columbia *Environmental Management Act* Contaminated Sites Regulation standards in samples collected from one or more monitoring wells. However, analyte concentrations were comparable to background concentrations.

Overall, shallow groundwater at the landfill does not appear to have been impacted by daily site activities. Future monitoring at well BH-103 will determine if till oxidation is no longer having an effect on groundwater chemistry conditions and whether data from this background well can be considered reflective of natural groundwater conditions at the landfill. A review of the leak detection sample data suggests that the current landfill leachate collection and containment system is operating effectively.

Matrix recommends a reduction in sampling frequency from a quarterly to semi-annual (spring and fall) groundwater monitoring and sampling program in 2019.

1 INTRODUCTION

Tervita Corporation retained Matrix Solutions Inc. to conduct the quarterly groundwater monitoring program at the Silverberry Landfill. Quarterly groundwater monitoring at the Silverberry Landfill is a requirement of Sections 5.1, 7.0, 8.1, 8.2, and 9.3 of the *Environmental Management Act* Permit 17150 (Appendix A). Tervita also requested that Matrix collect leachate and leak detection system (LDS) samples as part of the groundwater monitoring program.

This report presents the results of the 2018 quarterly groundwater monitoring program and includes the leachate and pond water quality results for comparison purposes.

The quarterly groundwater monitoring program reporting requirements outlined in Sections 5.1, 7.0, 8.1, 8.2, and 9.3 of the Silverberry Landfill's permit are summarized in the concordance table below (Table A). Table A references the relevant permit requirements and the corresponding sections, figures, tables, and/or appendices that address each requirement.

TABLE A Concordance with the *Environmental Management Act* Permit 17150, Sections 5.1, 7.0, 8.1, 8.2, and 9.3

Permit Section Number	Requirement	Location Herein
Operational Plan		
5.1 (c)	A leachate monitoring and management program	Section 3
5.1 (e)	A groundwater monitoring and management program	Sections 2.3 and 3
Monitoring - Landfill Monitoring		
7.0	Monitoring shall be performed as outlined in the OPERATIONAL PLAN.	Section 3; Appendices A, D, and E
Sampling and Analysis		
8.1	Sampling is to be carried out in accordance with procedures described in the most current edition of "British Columbia Field Sampling Manual" (January 2003, or most recent update), or by suitable alternative procedures as authorized by the Director.	Section 3; Appendices D and E
8.2	Analyses are to be carried out in accordance with procedures described in the "British Columbia Laboratory Manual (2009 Permittee Edition)", or the most recent edition, or by suitable alternative procedures as authorized by the Director.	Section 3; Appendix G
Annual Report		
9.3 (i)	The results of all monitoring programs as specified in this permit. Data interpretation and trend analysis, as well as an evaluation of the impacts of the discharges on the receiving environment in the previous year shall be carried out by a qualified independent professional.	Section 4; Figures 5 to 15; Tables 3 to 7

1.1 Objectives

The objectives of the 2018 groundwater monitoring program were to evaluate shallow groundwater flow conditions and groundwater quality beneath the Silverberry Landfill, and to compare the results to background and/or historical results and regulatory criteria to determine if any changes in these conditions were the result of landfill activities onsite.

1.2 Scope of Work

The 2018 scope of work included the following:

- collecting groundwater samples from all accessible monitoring wells
- collecting leachate and LDS samples from the appropriate collection points during each groundwater monitoring event
- submitting samples to an accredited laboratory for analytical testing
- reviewing and technically assessing the data
- preparing a groundwater monitoring report in accordance with the permit requirements

2 BACKGROUND

2.1 Site Description

The Silverberry Landfill is located at Block A-18-088-20 W6M, approximately 45 km northwest of Fort St. John, British Columbia (Figure 1).The landfill was commissioned by Canadian Crude Separators (now Tervita), with operations starting in October 2002 (Tervita 2013), the completion of Cells 2 and 3 in November 2004, and the completion of Cells 4 and 5 in 2006. The landfill is an engineered secure landfill that accepts non-hazardous solid industrial and oilfield waste from surrounding areas in compliance with the standards for landfills in British Columbia (Province of British Columbia 2018a, 2018b). The Silverberry treatment, recovery, and disposal (TRD) facility is located directly west of the landfill. The landfill incorporates a composite liner system, with a primary top liner consisting of a 60 mil high density polyethylene liner underlain by a 0.6 m thick compacted clay liner (CCL). This system lies above a LDS that is located above a second 0.6 m thick CCL (Tervita 2013).

A leachate collection and removal system is also present. The leachate collection and removal system consists of a series of gravel-filled trenches accompanied by a perforated collection piping system above the liner system overlain by either a 0.6 m permeable granular layer or a geocomposite material across the entire base of the landfill cell (Tervita 2013).

The LDS located between the primary composite liner and the secondary CCL is constructed of a high-flow geonet synthetic drainage medium that is connected to a drainage system that leads to a collection sump.

Surface water is managed to prevent clean surface water from entering the landfill. Water contacting waste within the landfill cells is contained and collected as leachate. Surface water is diverted and collected in the stormwater retention pond located northwest of the bioremediation cells (Tervita 2013). The bioremediation cells are no longer accepting waste.

The site layout is shown on Figure 2 and consists of the following major areas:

- Cells 1 to 7 - function as leachate collection systems for the landfill
- stormwater pond - designed to collect and store rainwater across the landfill
- subsoil and topsoil stockpiles - storage locations for bulk soil materials
- common stockpiles - storage locations for bulk landfill materials
- leachate pond - designed to contain leachate
- frac water pond - designed to contain produced water

The landfill waste acceptance protocol uses a waste approval application that is submitted with appropriate third-party accredited laboratory analyses. The waste stream is approved for disposal by the landfill, and an approval number is issued. The first load from every approval location is tested with random sampling of waste streams entering the facility. The landfill uses a three-dimensional alphanumeric grid locating system with surveyed elevations. Documentation is maintained showing the location of each load. Every load of waste coming to the site must be accompanied by documentation with a corresponding approval number, which serves as a certificate of transportation and disposal.

2.2 Regional Setting

2.2.1 Physiography and Topography

The landfill is situated at an elevation of approximately 755 m above sea level. The landfill topography slopes between 1 and 2% to the northwest toward an unnamed tributary of the Blueberry River, approximately 500 m west, and an ephemeral drainage directly north of the landfill. Blueberry River is located approximately 6 km north of the landfill (Figure 1). Several unnamed tributaries are present within several hundred metres of the landfill with a small tributary extending onto the northeast portion of the site (B.C. ENV 2018). The landfill is situated in close proximity to a surface water divide which separates surface water draining to the Blueberry River from that draining toward the Saint John Creek (Figure 3).

Surface water on the land surrounding the plant follows the surface topography and surface water drainage paths. Natural drainage across the landfill is generally good (NLR/AE 2013). Surface water within the site is controlled by a water management system consisting of a network of onsite ditches, runon and runoff systems, and a surface water (stormwater) pond (Figure 2).

2.2.2 Adjacent Land Use

The landfill is within the agricultural land reserve. Most of the land around the landfill is primarily forested. The closest active facility is the Silverberry TRD facility, located directly west of the landfill and south of the land treatment area (Figure 2).

2.2.3 Regional and Local Geology

Most of the surficial deposits in the landfill area are of glacial origin, with till and stony, silty clay being predominant. A thin, patchy cover of lacustrine material may also be present (Mathews 1978). The local surficial geology is composed of a thin clay unit that overlies a thick clay till unit (HBT 1994). The overlying clay typically has a thickness between 1.5 and 3 m. According to cross-section A-A' and the borehole logs (Figures 4 & 5; Appendix B), the underlying clay till unit may extend to the maximum depth drilled of 20.7 m below ground surface (bgs).

Bedrock in the general area is mapped as the Dunvegan Formation. The Dunvegan Formation is composed of grey sandstone, interbedded with grey to dark siltstone shale, carbonaceous shale, some ironstone bands, and some thin coal seams. The Dunvegan Formation ranges from 152 to 183 m in thickness. The lower 90 to 110 m are characterized by three massive, cross-bedded, cliff-forming beds up to 12 m thick, which in places grade into and are replaced laterally by less massive beds. The upper part of the formation consists of a succession of thin-bedded sandstone and arenaceous shale strata that are transitional into the overlying Kaskapau Formation (Irish 1958). The bedrock beneath the site has been mapped as a bedrock aquifer in the BC Water Resource Atlas (B.C. ENV 2018).

2.2.4 Regional and Local Hydrogeology and Hydrochemistry

Locally, shallow groundwater flow is likely directed to the northwest toward the Blueberry River. However, regional groundwater may flow south toward the Peace River (Figure 1).

The results of previous groundwater monitoring programs indicate that background shallow groundwater total dissolved solid (TDS) concentrations ranged from 1,810 to 4,620 mg/L (NLR/AE 2013). TDS were predominantly composed of calcium, magnesium, and sulphate, with lesser amounts of sodium and bicarbonate. Based on previous investigations, regional hydrochemistry is classified as a calcium/magnesium-sulphate type. Calcium and magnesium typically comprise greater than 70% of the total cation content, while sulphate comprises greater than 70% of the total anion content. Chloride comprises less than 5% of the total anion content (Matrix 2005).

2.2.5 Local Groundwater Users

Four water wells were identified within a 5 km radius of the TRD facility, as documented in the *BC Water Resources Atlas* (B.C. ENV 2018); the wells are listed in Table 1 and presented on Figure 3. One well is located approximately 0.3 km south-southeast of the TRD facility and is used for non-domestic purposes; it is owned by Tervita Coporation. Two other wells are located approximately 2.5 km east of

the TRD facility; they are both used for monitoring purposes and are owned by Leucrotta Exploration Inc. The nearest domestic use well (Well 4; ID 104393) is located approximately 4 km northwest of the TRD and is owned by British Columbia Railway Company. Locations of the water wells were not field verified by Matrix personnel.

2.3 Monitoring Well Network

Regular groundwater monitoring has been conducted at the landfill before and after site commissioning. The current groundwater monitoring well network consists of 14 active monitoring wells located in the landfill area (Figure 2). A brief rationale for the locations of the wells is provided in Table B.

TABLE B Groundwater Monitoring Well Network Rationale

Monitoring Well	Rationale
MW92-1	Deep well hydraulically downgradient and approximately 800 m northwest of the landfill and north of the treatment area; part of a nested pair
MW92-1A	Shallow well hydraulically downgradient and approximately 800 m northwest of the landfill and north of the treatment area; part of a nested pair
MW92-6A	Shallow well hydraulically downgradient and approximately 5 m north of the landfill; adjacent to Cells 2 and 5
MW92-7	Deep well hydraulically downgradient and approximately 500 m northwest of the landfill; part of a nested pair
MW92-7A	Shallow well hydraulically downgradient and approximately 500 m northwest of the landfill; part of a nested pair
03-3	Shallow well hydraulically downgradient and approximately 450 m northwest of the landfill; located adjacent to the treatment area
03-4	Shallow well hydraulically downgradient and approximately 550 m northwest of the landfill; located adjacent to the treatment area; historically dry
03-5	Shallow well hydraulically downgradient and approximately 750 m northwest of the landfill; located adjacent to the treatment area
BH-103	Shallow well hydraulically upgradient and approximately 670 m southeast of the landfill
BH-104(R)	Shallow well hydraulically downgradient and approximately 5 m west of the landfill; located adjacent to Cell 1; part of a nested pair; historically dry
BH-105(R)	Deep well hydraulically downgradient and approximately 5 m west of the landfill; located adjacent to Cell 1; part of a nested pair
15-9	Shallow monitoring well, located hydraulically downgradient and approximately 35 m west of the landfill; located adjacent to Cells 1 and 3
15-10	Shallow monitoring well, located hydraulically downgradient and approximately 35 m west of the landfill; located adjacent to Cell 3
15-11	Shallow monitoring well, located hydraulically cross-gradient and approximately 30 m west of the landfill; located adjacent to newly constructed Cell 7

All monitoring wells were designed to evaluate the characteristics of shallow and, in some areas, deep groundwater in the unconsolidated surficial deposits and in suspected bedrock. The shallow

monitoring wells are screened to a maximum depth of 11 m bgs and are screened across clay till. The deep monitoring wells are screened to a maximum depth of 24 m bgs.

The groundwater monitoring well locations were chosen based on groundwater flow directions and the potential for impact to groundwater quality associated with onsite facilities. Pre-2012 data from monitoring well BH-103 were used to determine background conditions for the site, as presented in Section 4.

Well 15-11 is presented in this report but the laboratory results are presented and interpreted in the Silverberry TRD annual report.

The well completion details are summarized in Table 2.

Previous investigations at the Silverberry Landfill are summarized in Appendix C.

3 METHODS

Matrix personnel were required to comply with legislated, Matrix, and Tervita health and safety standards.

3.1 Groundwater and Leachate Sampling, and Analytical Program

Matrix personnel conducted groundwater monitoring and sampling programs on May 15, July 27, September 11, and December 7, 2018, according to the methods outlined in Appendix D.

Matrix personnel collected leachate and LDS samples in conjunction with the groundwater monitoring events during all four sampling events. The leachate vault was sampled from a dedicated sampling spigot located on the TRD facility and the LDS was sampled from a dedicated sampling culvert on the north corner of Cell 1 using a dedicated bailer (Figure 2). Samples were submitted to ALS Environmental (May) and AGAT Laboratories (July, September, and December) for analyses.

The 2018 analytical program was conducted in accordance with the Silverberry Landfill's permit, the analytical program outlined by Matrix (Matrix 2018a), and the British Columbia sampling methodology (B.C. WLAP 2013).

Groundwater samples collected in 2018 were analyzed for the following parameters:

- field-measured temperature, pH, and electrical conductivity (EC)
- general and inorganic parameters including pH, EC, calcium (Ca), magnesium (Mg), sodium (Na), potassium (K), chloride (Cl), sulphate (SO_4), fluoride (F), nitrite-nitrogen (NO_2-N), nitrate-nitrogen (NO_3-N), nitrite/nitrate-nitrogen (NO_2/NO_3-N), total alkalinity, bicarbonate (HCO_3), hardness, TDS, phenol, and dissolved organic carbon (DOC)

- dissolved metals, including aluminum (Al), antimony (Sb), arsenic (As), barium (Ba), beryllium (Be), boron (B), cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), iron (Fe), lead (Pb), lithium (Li), manganese (Mn), mercury (Hg), molybdenum (Mo), nickel (Ni), selenium (Se), silver (Ag), strontium (Sr), thallium (Tl), tin (Sn), titanium (Ti), uranium (U), vanadium (V), and zinc (Zn)
- petroleum hydrocarbons (PHC) including benzene, toluene, ethylbenzene, and xylenes (BTEX); styrene, volatile petroleum hydrocarbons (VPHw), volatile hydrocarbons (VHw), extractable petroleum hydrocarbons (EPHw; [C_{10}-C_{19}] and [C_{19}-C_{32}]), light extractable petroleum hydrocarbons (LEPHw), heavy extractable petroleum hydrocarbons (HEPHw), and methyl *tert*-butyl ether (MTBE)
- polycyclic aromatic hydrocarbons (PAHs)
- naturally occurring radioactive materials (NORM) isotopes including Pb-210, Ra-226, Ra-228, gross alpha, gross beta, Th-228, Th-230, Th-232, U-234, U-235, and U-238

NORM groundwater analyses adhere to the proposed NORM groundwater monitoring program that was submitted on October 3, 2017 to fulfill the requirements of Section 6.4.1 and the approval response from the Ministry of Environment and Climate Change Strategy (B.C. Env) for the proposed program that commenced in 2017 (Matrix 2018a).

In 2018, leachate and LDS samples were collected and analyzed for the parameters listed above. Leachate vault 1 was sampled during all monitoring events but field parameters were not analyzed due to the presence of free product. In May and July 2018, NORM analyses were not collected from Leachate Vault 1 due to limited sample volume. In September 2018, some isotopes could not be analyzed due to the amount of free product in the leachate sample.

The general rationale and description for the use of specific analyses is discussed in Appendix E.

3.2 Recent Changes to Monitoring and Sampling Program

In 2018, changes to the sampling and monitoring program included the following:

- Monitoring wells 03-4 and BH-104(R) were not sampled by Matrix in accordance with the groundwater monitoring program due to dry conditions. Monitoring well 03-4 has been dry since 2011. BH104 and its replacement well BH104(R) have been dry since 2004 and 2015, respectively.

- Monitoring wells BH-103, 03-3, 03-5, and MW92-7 had insufficient water during one or more sampling events. Matrix was unable to collect samples for one or more of the following parameters: field parameters, general and inorganic parameters, dissolved metals, and PAHs.

- Groundwater samples were collected for NORM isotopes in 2018 as per the proposed program that was submitted and approved in 2017.

3.3 Regulatory Framework

Matrix assessed groundwater quality at the site using the contaminated sites regulation (CSR) most conservative water standards that are protective of freshwater aquatic life, livestock and irrigation watering and drinking water use (Province of British Columbia 2018b) and *Protocol 21 for Contaminated Sites: Water Use Determination* (B.C. ENV 2017).

Water quality results were also compared to historical groundwater quality data from 2008 to 2012 which was interpreted to be representative of baseline conditions for the site (Monitoring well BH-103 is located hydraulically upgradient of the landfill and onsite facilities; Figure 2).

NORM concentrations in groundwater were compared to Alberta Tier 1 Soil and Groundwater Remediation Guidelines (Tier 1; AEP 2016), as outlined in the proposed NORM groundwater monitoring program (Matrix 2018b). Applicable pathways included natural area, agricultural, residential/parkland and commercial/industrial. The Guidelines for Canadian Drinking Water Quality Summary Table (CDWQ; Health Canada 2017) are also provided for reference purposes.

There are currently no Tier 1 guidelines for gross alpha or gross beta isotopes; additionally, there are currently no CSR guidelines for NORMs in groundwater (Province of British Columbia 2018b).

4 RESULTS

4.1 Groundwater Flow Conditions

Groundwater depth measurements were collected from all accessible monitoring wells on May 15, July 27, September 11, and December 7, 2018 (Table 2). Shallow groundwater elevations determined from the 2018 water levels are posted and contoured on Figures 6, 7, 8, and 9. Groundwater elevations measured at well BH-103 were not used for contouring, as its located approx. 600 m upgradient of site.

Groundwater elevations collected from the deeper monitoring wells, suspected to be installed in bedrock, could not be contoured due to insufficient data points.

The following is a summary of the groundwater conditions:

- In 2018, shallow groundwater was measured at depths ranging from 1.27 m (MW92-6A; July 27, 2018) to 8.51 m below ground surface [bgs]; 03-5; September 11, 2018). Deep groundwater was measured at depths ranging from 5.32 m (MW92-1; May 15, 2018) to 18.23 m btoc (MW92-7; September 11, 2018). Historical groundwater elevations are posted on Figure 10. The 2018 shallow and deep groundwater elevations were similar to historical elevations.

- Shallow groundwater beneath the site is interpreted to flow toward the northwest.

- Permeability testing at the site by previous consultants indicates an estimated hydraulic conductivity (K) within the shallow clay unit to range from 7×10^{-8} to 4×10^{-9} m/s (HBT 1994; Clifton 2002).

- In 2018, the calculated horizontal hydraulic gradient (i) within the shallow clay unit was 0.03 m/m. Groundwater flow was calculated using Darcy's equation:

$$v_L = \frac{Ki}{n_e}$$

  assuming an effective porosity (n_e) of 20% for the clay till and a maximum hydraulic conductivity of 7×10^{-8} m/s (Clifton 2002). The horizontal groundwater velocity (vL) beneath the landfill is estimated to be < 1 m/year and is consistent with historical calculations.

- In 2018, vertical hydraulic gradient beneath the landfill were estimated using measured water depths in nested well pairs MW92-1/1A and MW92-7/7A (Table D). These nested well pairs consist of two wells in the same location completed at different depth intervals.

TABLE C 2018 Estimated Vertical Gradients

Nested Well Pair	Vertical Gradient (m/m)			
	May15, 2018	July 27, 2018	September 11, 2018	December 7, 2018
MW92-1/1A	0.29 (downward)	0.35 (downward)	0.46 (downward)	0.33 (downward)
MW92-7/7A	0.82 (downward)	0.30 (downward)	1.02 (downward)	1.02 (downward)

4.2 Groundwater Quality

The 2018 groundwater quality data are presented in Table 3 (Field Parameters), Table 4 (General and Inorganic Parameters), Table 5 (Dissolved Metals), Table 6 (Hydrocarbons), Table 7 (Polycyclic Aromatic Hydrocarbons), and Table 8 (Isotopes). The 2018 piper diagrams are presented on Figures 11a and 11b and historical groundwater concentrations are presented graphically on Figures 11 to 15.

Historical groundwater quality results are tabulated in Appendix F. Laboratory reports are included in Appendix G. Based on piper diagrams (Figures 11a and 11b), groundwater beneath the site is classified as a calcium/magnesium-sulphate type.

The 2018 leachate and LDS quality results are presented alongside the 2018 groundwater quality data (Tables 3 to 8) for comparative purposes in assessing leachate impact on the groundwater below and downgradient of the landfill.

4.2.1 Background

Monitoring well BH-103, located hydraulically upgradient and away from the landfill activities, was historically used to determine background conditions for the site. However, Matrix monitored the following trends in the inorganic chemistry data at this location from 2013 to 2016:

- EC, sodium, potassium, sulphate, nitrate-nitrogen, and TDS have been increasing
- pH, calcium, magnesium, bicarbonate (alkalinity), and hardness have been decreasing

The explanation for these trends were outlined in a previous monitoring report (Matrix 2018). Water quality results from 2018 appear to be consistent with 2017 results that show BH-103 parameters reverting back to average pre-2012 background concentrations.

While the data collected in 2018 indicates that the majority of the parameters listed above have returned to historical concentration levels; until these trends can be confirmed, the laboratory concentrations between 2008 and 2012 were averaged to derive background concentrations for the site and are tabulated in Table E below:

TABLE D BH-103 Background Concentrations (2008 to 2012)

pH	EC (µS/cm)	Ca (m/L)	Mg (m/L)	Na (m/L)	K (m/L)	Cl (m/L)	SO_4 (m/L)	NO_3-N (m/L)	Alkalinity (m/L)	HCO_3 (m/L)	Hardness (m/L)	TDS (m/L)
7.1	4,561	408	363	370	8.2	ND	3,054	ND-0.5	131	159	2,513	4,283

4.2.2 pH and Electrical Conductivity

Field and laboratory pH and EC results are discussed below:

- Field-measured pH values at all monitoring wells ranged from 5.5 to 7.5, and were consistent with historical measurements (Table 3; Appendix F, Table F1).

- Laboratory-measured pH values were generally higher than the corresponding field-measured pH values, likely due to a loss of carbon-dioxide, which usually occurs during the time between sample collection and sample analysis.

- Field- and laboratory-measured EC values were comparable and within historical ranges. (Tables F1 and F2).

- Laboratory-measured EC values are comparable to background values at all onsite monitoring wells. (Table 4).

4.2.3 General and Inorganic Parameters

Sodium, sulphate, and fluoride concentrations exceeded British Columbia CSR standards at one or more of the wells sampled. The 2018 results for those parameters are presented in Table 4 and are discussed

in the following subsections. Chloride, magnesium, and TDS were also graphed and are discussed below at the request of Tervita.

4.2.3.1 Sodium and Chloride

- Sodium concentrations exceeded the British Columbia CSR (DW) standard at all monitoring wells except for MW92-1A, MW92-6A, 03-3, and 03-5. The wells with exceedances were within expected background concentrations in 2018 (Table 4). Sodium concentrations at monitoring well MW92-7, screened deeper in the clay till, displays a decreasing trend.

- Fluroride concentrations exceeded the British Columbia CSR (DW) standard of 1.00 mg/L at monitoring wells MW92-7A and BH-105(R) during the July sampling event (Table 4). July marked the first time that concentrations were detected above CSR standards at these wells, but concentrations dropped below guideline limits in the following September sampling event. Concentrations at these wells, in 2018, were higher than historical values, which were all below laboratory detection limits.

- Chloride concentrations at background monitoring well BH-103 in 2018 were below CSR (DW) standard, which is consistent with historical concentrations at that well. Concentrations at all monitoring wells sampled in 2018 were below the British Columbia CSR (IW) standard of 100 mg/L, with approximately half the readings being below the laboratory method detection limit (Table 4).

- Mann-Kendall trend analysis was conducted for chloride at monitoring well 92-6A (Figures 13b and 13c). The Mann-Kendall trend test has been identified as the primary statistical analysis to be used for the detection of trends (U.S. EPA 2009).

- The Mann-Kendall trend analysis test confirmed that the chloride concentrations at monitoring well MW92-6A display no increasing or decreasing trends; this is in contrast to the increasing trend seen in chloride concentrations in 2017. Well MW92-6A is located downgradient to Cells 2 and 5 and chloride concentrations remained below 20 mg/L in 2018.

4.2.3.2 Magnesium, Sulphate, and Total Dissolved Solids

- Magnesium concentrations were within expected background concentrations at all monitoring wells sampled in 2018. There are no discernable trends over time (Figure 14; Appendix F, Table F2).

- Sulphate concentrations exceeded the British Columbia CSR (DW) standard at all monitoring wells sampled in 2018, but were within expected background concentrations (Table 4). The 2018 sulphate concentrations are within historical ranges (Figure 15; Appendix F, Table F2).

- TDS concentrations were consistent with historical data and display no apparent increasing or decreasing trends (Figure 16; Appendix F, Table F2).

4.2.3.3 Nitrate-nitrogen

In 2018, nitrate-nitrogen concentrations were below the British Columbia CSR standard (DW) of 10 mg/L and within expected background concentrations at all wells analyzed (Table 4). Nitrate-nitrogen concentrations at well BH-103 have previously been detected below British Columbia CSR standards, with a large increase in concentrations detected in samples collected between May and September 2014. Nitrate-nitrogen concentrations at well BH-103 had been displaying an increasing trend between 2013 and 2016, when it peaked at 20 mg/L, but has decreased in 2017 and 2018 to historical levels. Nitrate-nitrogen concentrations have varied across the landfill, and no increasing or decreasing trends are apparent at any of the other monitoring wells (Appendix F, Table F2).

4.2.4 Dissolved Metals

In 2018, dissolved boron, cadmium, cobalt, lithium, manganese, nickel, selenium, strontium, and uranium exceeded the British Columbia CSR standards in samples collected from select monitoring wells including background well BH-103. Results are discussed below:

- Dissolved cadmium and nickel concentrations exceeded their respective British Columbia CSR standards at background monitoring well BH-103 in September 2018 (Table 5). Results are consistent with historical data.

- Dissolved boron exceeded the standard at background well BH-103 during the May, July, and September 2018 sampling events. Historically, dissolved boron has been detected above standards at BH-103; its highest concentration was recorded in July 2018. (Appendix F, Table F3). Dissolved boron concentrations were detected above standards in several other samples collected from monitoring wells in 2018 (Table F3).

- Dissolved cobalt exceeded the British Columbia CSR standard (DW) of 0.001 mg/L at background well BH-103 (July and September), and monitoring wells MW92-6A (July), MW92-7A (May and September), 03-5, and BH-105(R). The 2018 concentrations are consistent with historical data.

- Dissolved lithium exceeded the British Columbia CSR standard (DW) of 0.008 mg/L at all monitoring wells sampled in 2018. The 2018 concentrations are consistent with historical data.

- Dissolved selenium exceeded the British Columbia CSR standard (DW) of 0.01 mg/L at monitoring well MW92-7 in December.

- Dissolved manganese, strontium, and uranium exceeded their respective British Columbia CSR standards in the majority of the monitoring wells sampled in 2018. The 2018 concentrations are consistent with historical data.

4.2.5 Dissolved Hydrocarbons and Polycyclic Aromatic Hydrocarbons

All dissolved hydrocarbons concentrations were below CSR standards, and for the most part, below laboratory methods detection limits (Table 6). Historical results indicate that since monitoring began, dissolved hydrocarbons have been detected only in samples collected from wells MW92-1 in 2009/2012, MW92-1A in 2012, MW92-7 in 2008/2011, 03-5 in 2012, and BH-104 in 2010. Toluene was detected for the first time at well BH-103 in 2017, but has since returned to below detection limit in 2018.

Dissolved PAHs were above the British Columbia CSR standards in July 2018 at MW92-6A (pyrene). Dissolved PAHs were either below the British Columbia CSR standards or below detection limits for all other monitoring wells sampled in 2018. Dissolved benzo(a)pyrene has been historically detected above the British Columbia CSR standard in monitoring wells MW92-6A, 03-5, and BH105(R). Dissolved quinolone was detected above standard at monitoring well MW92-7 in 2017 and has returned to below laboratory detection limits in 2018. Dissolved pyrene concentrations have historically been detected either above laboratory method detection limits or CSR standards in background well BH-103 and monitoring wells MW92-1, MW92-6A, MW92-7, MW92-7A, 03-3, 03-5, and BH-104.

The 2018 dissolved hydrocarbon and PAHs results are consistent with historical results and display no apparent increasing or decreasing trends at any of the monitoring wells sampled at the landfill (Appendix F, Table F5).

4.2.6 Isotopes

Various isotopes were detected in all monitoring wells sampled as part of the program but were all below Tier 1 and CDWQ guidelines in 2018 (Table 8). Isotope concentrations were generally lower in samples collected from background well BH-103 in 2018, with concentrations of PB-210, Ra-228, gross alpha, gross beta, Th-228, and Th-232 being below laboratory detection limits. Concentrations were generally lower in 2018 in comparison to results from November 2017 for the majority of the NORM parameters analyzed (Table 8).

4.3 Leachate and Leak Detection System Sample Quality

For comparison purposes, leachate quality results were compared to the British Columbia CSR standards for groundwater.

The 2018 leachate vault sample quality results are summarized below:

- Calcium, sodium, chloride, sulphate, fluoride, nitrite- and nitrate-nitrogen, and phenol concentrations measured in samples collected from the leachate vault exceeded British Columbia CSR standards and interpreted background measurements. The leachate parameters were one or more orders of magnitude higher than the measurements from all wells in 2018, with the exception of sulphate concentrations; sulphate concentrations were an order of magnitude lower than

expected background groundwater concentrations. The 2018 results are consistent with historical data (Appendix F, Table F2).

- Dissolved arsenic, barium, boron, chromium, cobalt, iron, lithium, manganese, molybdenum, nickel, selenium, strontium, uranium, and validium concentrations exceeded the British Columbia CSR (DW) standards in 2018 in one or more of the leachate vault samples (Table 5). Chromium exceeded the standard for the first time in 2018. The rest of the parameters have historically been detected in the leachate samples, showing variable concentrations from year to year (Appendix F, Table F3).

- Several dissolved hydrocarbons and PAH parameters were detected in the samples collected from the leachate vault in 2018 and exceeded the British Columbia CSR (DW and AW) standards (Table 6). The highest hydrocarbon concentrations were in the C_{10} to C_{19} range (Table 6). Various PAHs were detected above both British Columbia CSR (DW and AW) standards in leachate samples collected in 2018, including several PAHs not detected in any of the monitoring wells at the landfill (Table 7).

- Isotope Ra-228 was detected in the leachate sample but at a value less than the Tier 1 guideline (Table 8).

The 2018 LDS samples quality results are summarized below:

- Sodium LDS concentrations exceeded the British Columbia CSR (DW) standard of 200 mg/L in July 2018. Calcium concentrations collected from the LDS exceeded the British Columbia CSR livestock standard of 1,000 mg/L in 2017 and returned to below standard in 2018. Chloride concentrations from samples collected from the LDS exceeded the CSR standards in 2018, except in May and December (Table 4).

- Sulphate concentrations exceeded the British Columbia CSR standard of 500 mg/L at the LDS in 2018 (Table 4). Nitrite-nitrogen and nitrite and nitrate-nitrogen exceeded their respective British Columbia CSR standards in July 2018. Concentrations in 2018 at the LDS were comparable to background and historical concentrations and show no discernible trends.

- Cobalt, iron, lithium, manganese, and uranium exceeded their respective British Columbia CSR standards in 2018. The cobalt concentrations appear to be increasing overtime whereas the manganese and uranium concentrations have been variable over time with no discernable trends at the LDS.

- Dissolved hydrocarbons were not detected above British Columbia CSR standards in samples collected from the LDS in 2018 (Table 6). EPH (C_{10}-C_{19}) and HEPH have historically been measured above and below the standards from 2011 to 2016.

- PAHs concentrations were either not detected or below the British Columbia CSR standards in all LDS samples collected in 2018. PAHs concentrations have historically been detected in the LDS samples; varying from year to year at the LDS and they show no discernible trends (Appendix F, Table F5).

4.4 Quality Control Sample Results

In accordance with Matrix's standard practices, quality control (QC) protocols were followed for the sampling program. The QC measures included collecting and analyzing duplicate samples, submitting trip blanks and field blanks for dissolved hydrocarbons and PAHs analysis, and reviewing the results of the laboratory-reported QC measures. The results from duplicate samples help monitor the quality of sampling and analysis. A detailed description of these QC measures is provided in Appendix H. QC sample results are included in Appendix I.

While the reproducibility of some routine and dissolved metal parameters in select duplicate results were judged to be poor, from samples collected in May, July and December,there were no concerns with the overall quality of the laboratory results.

5 CONCLUSIONS

The following conclusions are based on the results of the 2018 groundwater monitoring and sampling program conducted at the Silverberry Landfill:

- In 2018, the calculated horizontal groundwater velocity beneath the site in the shallow clay till was estimated to be < 1 m/year and is consistent with historical calculations. Groundwater was interpreted to flow toward the northwest.

- The ongoing changes in inorganic parameters at BH-103 observed since the 2013 sampling events were not observed with the 2018 data; inorganic parameter concentrations generally returned to their pre-2012 background levels. The trending data that started in 2013 is believed to be the result of till material oxidation at this location; data observed in 2018 could be the result of the oxidation effects beginning to wane. Pre-2012 data from this well was used to establish background conditions at the site until further sampling confirms if concentrations at the background well have returned to original compositions.

- Chloride concentrations were below the British Columbia CSR (IW) standard at all monitoring wells sampled in 2018.

- Fluoride concentrations exceeded the British Columbia CSR (DW) standard of 1.00 mg/L at monitoring wells MW92-7A and BH-105(R) during the July sampling event. July marked the first time that concentrations were detected above CSR standards at these wells, but concentrations dropped

below standard in the following September sampling event. Concentrations at these wells, in 2018, were higher than historical values, which were all below laboratory detection limits.

- All general and inorganic parameters measured in 2018 are generally consistent with historical data at all non-background monitoring wells.

- In 2018, several dissolved metals concentrations in samples collected from well BH-103 exceeded the British Columbia CSR standards. Dissolved boron has stayed within historical range, until the July 2018 sampling event when its highest concentration was recorded. All other parameters appear to be consistent with historical data. Concentrations of dissolved selenium and uranium have been detected at monitoring wells across the landfill historically, but were below laboratory method detection limits in 2018.

- In 2018, dissolved PHCs and PAHs were either not detected or were below the British Columbia CSR standards in samples collected from all onsite wells. These concentrations were consistent with historical data.

- Some general and inorganic parameters concentrations measured in samples collected from the leachate vault were several orders of magnitude higher than the concentrations measured in the samples collected from the onsite wells.

- Several dissolved metal concentrations exceeded standards in the leachate vault samples but were either not detected or in lower concentrations in the groundwater samples collected from the monitoring wells in 2018. Chromium exceeded the standard in leachate samples for the first time in 2018. The rest of the parameters have historically been detected in the leachate samples, showing variable concentrations from year to year.

- Several dissolved PHC and PAH concentrations exceeded the British Columbia CSR standards in the samples collected from the leachate vault in 2018.

- LDS results in 2018 were consistent with historical data. Samples collected from the LDS had concentrations of sodium, chloride, sulphate, nitrite-nitrogen, NO_2+NO_3-N, and select dissolved metals that exceeded their respective British Columbia Standards. PHCs and PAHs concentrations were either not detected or below the British Columbia CSR standards in all LDS samples collected in 2018.

- NORM concentrations analyzed in groundwater samples collected in 2018 were consistent with 2017 data.

In conclusion, based on the results of the groundwater chemistry data collected in 2018, the activities of the Silverberry Landfill do not appear to have impacted the groundwater below the site.

6 RECOMMENDATIONS

Based on the requirements of the permit, the results of the 2018 groundwater monitoring program, and the previous investigations, Matrix recommends reducing NORM sampling in 2019 to a semi-annual basis and otherwise continuing with the quarterly groundwater monitoring and sampling program in 2019.
