Notes:

Bold - background well

* - elevations were not surveyed on November 9, 2018 - previous elevations reported

[g] - elevations are geodetic

masl - metres above sea level

BR - Bouwer and Rice method (1976)

--- - not available

ND - not detected

** - HBT, 1994

*** - Clifton, 2002

Notes:

Bold - background well

--- - not analyzed

NS - not specified

Cl - dependent on chloride value

H - standard level is dependent on hardness value

amph - standard may not protect all amphibians

HH - standard is specific to protection of human health

LS - standard varies with type of livestock

TAO - standard to protect against taste and odour concerns

* - *Contaminated Sites Regulation 375/96* (Province of British Columbia November 2017)

Italics - indicates value does not meet applicable standards

Notes:

Bold - background well
NS - not specified
H - standard level is dependent on hardness value
pH - standard varies with soil pH; most stringent applied
appl - standard for continuous application on crops; standard for intermittent application on crops is 50 ug/L
crop - standard level is dependent on type of crop; standard shown is the most stringent value
Cr3 - guideline value for Cr(III)
Cr6 - guideline value for Cr(VI)
HH - standard is specific to protection of human health
IC2 - standard applies to a site used for an industrial or commercial purpose or activity set out in Schedule 2
WT - standard may not address aesthetic (organoleptic) concerns related to drinking water quality. Water treatment may be required.
* - *Contaminated Sites Regulation 375/96* (Province of British Columbia November 2017)
Italics - indicates value does not meet applicable standards

Notes:

Bold - background well

--- - not analyzed

NS - not specified

^{HH} - standard is specific to protection of human health

^{IWU} - standard is applicable to all sites, irrespective of water use

^{WT} - standard may not address aesthetic (organoleptic) concerns related to drinking water quality. Water treatment may be required.

* - LEPHs and HEPHs do not include CSR-regulated PAHs

** - *Contaminated Sites Regulation 375/96* (Province of British Columbia November 2017)

VPHw - does not include BTEX

VHw (C_6-C_{10}) - includes BTEX

Italics - indicates value does not meet applicable standards

APPENDIX A
Environmental Management Act Permit 17150

September 1, 2017

Tracking Number: 354730
Authorization Number: 17150

REGISTERED MAIL

Tervita Corporation
500, 140 10TH AVENUE S.E.
CALGARY AB T2G 0R1

Dear Permittee:

Enclosed is Amended Permit 17150 issued under the provisions of the *Environmental Management Act*. Your attention is respectfully directed to the terms and conditions outlined in the permit. An annual fee will be determined according to the Permit Fees Regulation.

This permit does not authorize entry upon, crossing over, or use for any purpose of private or Crown lands or works, unless and except as authorized by the owner of such lands or works. The responsibility for obtaining such authority rests with the permittee. This permit is issued pursuant to the provisions of the *Environmental Management Act* to ensure compliance with Section 120(3) of that statute, which makes it an offence to discharge waste, from a prescribed industry or activity, without proper authorization. It is also the responsibility of the permittee to ensure that all activities conducted under this authorization are carried out with regard to the rights of third parties, and comply with other applicable legislation that may be in force.

This decision may be appealed to the Environmental Appeal Board in accordance with Part 8 of the *Environmental Management Act*. An appeal must be delivered within 30 days from the date that notice of this decision is given. For further information, please contact the Environmental Appeal Board at (250) 387-3464.

Administration of this permit will be carried out by staff from the Environmental Protection Division's Regional Operations Branch. Plans, data, reports, non-compliance notifications and non-compliance reports pertinent to the permit are to be submitted to the Director via email or other electronic means as described in the following web link: http://www2.gov.bc.ca/gov/content/environment/waste-management/waste-discharge-authorization/data-and-report-submissions, or as further instructed.

Yours truly,

Environmental Protection Division

MINISTRY OF ENVIRONMENT

PERMIT

17150

Under the Provisions of the Environmental Management Act

Tervita Corporation

500, 140 10TH AVENUE S.E.
CALGARY AB T2G 0R1

is authorized to discharge refuse to ground at the Silverberry Landfill facility located north of Fort St. John, British Columbia, subject to the terms and conditions listed below.

Contravention of any of these conditions is a violation of the *Environmental Management Act* and may result in prosecution.

This Permit supersedes and amends all previous versions of Permit 17150 issued under Part 2, Section 14 of the *Environmental Management Act.*

1. AUTHORIZED DISCHARGES

1.1 This section applies to the discharge of refuse from a **SECURE LANDFILL**. The EMS site reference number for this discharge is E249572.

1.1.1 The maximum quantity of waste authorized to be discharged is 3,933,000 m^3.

1.1.2 The characteristics of the discharge are those of refuse including hazardous and naturally occurring radioactive materials (NORM), except waste as set out in Section 6.

1.1.3 The authorized works are a landfill, liner systems, leachate collection systems and related appurtenances approximately located as shown on the attached Site Plan.

Date issued: October 18, 2002
Date amended: September 1, 2017
(most recent)

Julie Orban P. Geo.
for Director, *Environmental Management Act*
Authorizations - North Region

1.1.4 The location of the point of discharge is approximately 50 kilometers north of Fort St John on a 25 hectare site within Block A, Section 8, Township 88, Range 20, west of the 6th Meridian.

2. POSTING OF SECURITY

2.1 The Permittee must submit a cost estimate for maintenance, monitoring and closure of the landfill for the active life of the site and a minimum twenty-five year post-closure period. The cost estimate must be prepared or reviewed by a suitably qualified, independent third party. An updated cost estimate must be submitted each year with the ANNUAL REPORT proposing the security for the following calendar year.

2.2 The Permittee must provide and maintain security in the amount agreed upon by the Director. The security may be applied at the discretion of the Director under the provisions of the *Environmental Management Act* to dispose of the waste, correct inadequacies relating to construction or operation, monitor the site, or carry out post-closure maintenance.

2.3 The operation of the facility without valid security is not authorized.

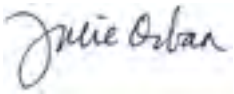
2.4 The Director may extend the post-closure period where the landfill will produce contaminants at levels that could have an unacceptable impact if they were to be discharged to the environment surrounding the landfill.

2.5 The Permittee may request the return of security where the title of the works has been transferred to a municipal authority or where the posted amount exceeds the estimated closure and post-closure costs. Granting the request is at the discretion of the Director.

3. HAZARDOUS WASTE REGULATION REQUIREMENTS

The Permittee must comply with all applicable provisions of the Hazardous Waste Regulation of the *Environmental Management Act*. Where a conflict exists between this Permit and the Hazardous Waste Regulation, the latter must take precedence.

Date issued: October 18, 2002
Date amended: September 1, 2017
(most recent)



Julie Orban P. Geo.
for Director, *Environmental Management Act*
Authorizations - North Region

4. GENERAL REQUIREMENTS

4.1 Plans

Plans and specifications of any new works, future upgrades or modifications to existing works must be submitted to the Director and his/her consent must be obtained in writing before construction commences. All plans and specifications must be generated by a Qualified Professional and include:

a) a Design Plan and Specifications for the proposed construction;

b) a Construction Quality Assurance Plan; and,

c) a Construction Quality Control Plan.

The works must be constructed in accordance with the approved plans. Consent of the Director in writing must be obtained for any modifications to approved plans.

Upon completion of construction and prior to accepting waste, all plans and specifications must be stamped and signed by a Qualified Professional.

4.2 Auditing

The facility must be audited by a qualified independent 3rd party a minimum of once every three years. The results of the audit must be submitted to the Director within 30 days of completing the audit.

4.3 Site Restoration

Provision of fencing, site access, vehicle safety barriers, surface water diversionary works, firebreaks and site restoration as required, must be carried out to the satisfaction of the Director.

4.4 Site Access Security

The Permittee must provide adequate security for the facility and restrict access to authorized personnel. All valves, pumps, doors and controls, accessible if security were breached, are to be locked.

4.5 Warning Signs

Warning signs conforming to Section 8(d) of the Hazardous Waste Regulation are to be posted at each entrance to the facility and at other locations as required by the Director.

Date issued: October 18, 2002
Date amended: September 1, 2017
(most recent)

Julie Orban P. Geo.
for Director, *Environmental Management Act*
Authorizations - North Region

4.6 **Burning**

Burning of waste materials is prohibited other than, in compliance with section 6 of the *Environmental Management Act*, and for the sole purpose of comfort heating in an appliance meeting the Canadian standard as defined by the Solid Fuel Burning Domestic Appliance Regulation.

4.7 **Emergency Procedures**

The Permittee must inspect the authorized works regularly and maintain them in good working order. In the event of an emergency or condition beyond the control of the Permittee which prevents continuing operation of the approved method of pollution control, the Permittee must take appropriate remedial action and notify the Director immediately.

4.8 **Non-Compliance Reporting**

The Permittee must immediately notify the Director, or designate by e-mail, of any non-compliance with the requirements of this Permit.

The Permittee must identify the non-compliance and any remedial action taken to deal with the non-compliance.

Written confirmation of all non-compliance events, including available test results, is required by email within 24 hours of the original notification unless otherwise instructed by the Director.

4.9 **Process Modifications**

The Permittee must notify the Director, in writing, prior to implementing changes to the authorized works or to any process that may affect the quality and/or quantity of the discharge.

4.10 **Changes to the Operations or Works**

Based on monitoring data, or any other information related to the impact of the landfill operation on human health or the environment, the Director may require the Permittee to make changes to the quantity or type of waste accepted at the landfill, the construction and maintenance of the landfill, the operating procedures and/or the monitoring program**.**

Date issued: October 18, 2002
Date amended: September 1, 2017
(most recent)

Julie Orban P. Geo.
for Director, *Environmental Management Act*
Authorizations - North Region

5. OPERATIONAL REQUIREMENTS

5.1 Operational Plan

Prior to construction, an OPERATIONAL PLAN must be submitted to and approved by the Director.

The OPERATIONAL PLAN must address, at a minimum, all of the following:

a) waste acceptance policies and procedures;

b) policies and procedures for complying with:

i. Section 6.4 of this Permit;

ii. the regional protocol for the management of landfilling of contaminated soils and other hazardous and non-hazardous waste streams; and

iii. all applicable parts of the Hazardous Waste Regulation for the facility.

c) a leachate monitoring and management program;

d) a surface water monitoring and management program;

e) a ground water monitoring and management program;

f) a detailed description of maximum design; elevations, slope and boundary for final landfill contours;

g) a nuisance control program;

h) an emergency response plan; and,

i) any other information requested by the Director.

The facility must operate in accordance with the approved OPERATIONAL PLAN and any requirements which the Director may attach to the OPERATIONAL PLAN as a condition of approval.

5.2 Compaction and Contouring

The Permittee must compact and contour the refuse daily. The OPERATIONAL PLAN must include details on a progressive closure plan. The purpose of the progressive closure is to minimize the amount of leachate generated at the site.

Final cover requirements must be in accordance with the approved OPERATIONAL PLAN and CLOSURE PLAN.

Date issued: October 18, 2002
Date amended: September 1, 2017
(most recent)

Julie Orban P. Geo.
for Director, *Environmental Management Act*
Authorizations - North Region

5.3 Quality Assurance and Quality Control (QA/QC)

During the construction phase and/or the addition of new works, a QA/QC program must be carried out by a qualified independent 3rd party. The permittee must submit to the Director a summary report of the QA/QC program results confirming the integrity of the liners and leachate collection system prior to depositing waste into any new landfill cell.

6. MANAGEMENT OF SELECT WASTE

6.1 Prohibited Waste

The following wastes are prohibited from disposal in the landfill:

a) Liquids,

b) Waste materials which contain free liquids,

c) Containers with:
   i Liquids, or
   ii. Waste materials which contain free liquid,

d) Empty waste containers unless they are crushed, shredded or similarly reduced in volume to the maximum practical extent,

e) Materials having properties of substances defined and regulated in Class 1 through Class 6 and Class 8 of the Transportation of Dangerous Goods Regulations of Canada (TDG) excluding UN3175 Solids Containing Flammable Liquids,

f) Materials having properties of substances defined and regulated in Class 9 of the TDG,

g) Materials listed as "forbidden" in column 3 of Schedule 1 of the TDG,

h) Wastes which contain Benzene, Toluene, Ethylbenzene and/or Xylene (BTEX) in total combined concentration greater than 1,000 mg/kg,

i) Wastes which contain halogenated organic compounds, except for tetrachloroethylene, in total concentrations greater than 100 mg/kg,

j) Wastes which contain tetrachloroethylene in total concentrations greater than 500 mg/kg,

k) Wastes which contain dioxin TEQ, as defined by the Hazardous Waste Regulation, in a concentration greater than 100 parts per billion by weight,

l) Waste which when subjected to the Modified Leachate Extraction Procedure, referenced in Part 2 of Schedule 4 of the Hazardous Waste Regulation, produce an extract which contains one or more contaminants in Column 1 of Table 1 of Schedule 4 in concentrations equal to or greater than the concentration specified for each contaminant in Column II of the Table except for BTEX,

m) Oil products covered under the BC Used Oil Management Association, including but not limited to oil, oil filters and containers,

n) Recyclable Oily Rags,

o) PCB Wastes,

p) Radioactive wastes, except for Naturally Occurring Radioactive Material (NORM) which meets and is handled in accordance with the requirements of Section 6.4 of this document.

6.2 Free Liquid

Waste which are or contain "free liquid" must be determined by US EPA method 9095A Paint Filter Liquids Test, Test Methods for Evaluating Solid Wastes- Physical/Chemical Methods (EPA Publication No. Sw-846).

6.3 Metallic Wastes

Large metallic waste must be segregated into a separate area of the landfill site. The preferred method of final disposal of these metal wastes is through recycling.

6.4 Naturally Occurring Radioactive Material (NORM)

For the purposes of this section, the following definitions apply:

NORM waste means waste material containing or contaminated with naturally occurring radioactive material that exceeds the limits specified as Unconditional Derived Release Limits in Tables 5.1, 5.2 or 5.3 of the *Canadian Guidelines for*

the Management of Naturally Occurring Radioactive Materials (NORM), 2011 Revision;

Non-NORM waste means any other waste as authorized by this Permit, and which may contain small amounts of NORM that does not exceed the Unconditional Derived Release Limits in Tables 5.1, 5.2 or 5.3 of the *Canadian Guidelines for the Management of Naturally Occurring Radioactive Materials (NORM), 2011 Revision*;

Canadian Guidelines for the Management of Naturally Occurring Radioactive Materials (NORM), 2011 Revision *means the document:*

a) prepared by the Canadian NORM Working Group of the Federal Provincial Territorial Radiation Protection Committee;

b) published by Health Canada; and

c) as amended from time to time.

6.4.1 All NORM must be managed in accordance with an approved NORM Management Plan and must include monitoring procedures for NORM in leachate and groundwater, including parameters to be sampled and analyzed, and frequency of sampling.

A Groundwater Monitoring Plan for radiological parameters must be prepared by a Qualified Professional and submitted to the Director for approval. **The approved plan must be implemented in the fall of 2017**.

An updated NORM Management Plan must be received by the Director on or before **December 1, 2017**, or on another date as authorized by the Director. The plan must be implemented once approved by the Director. The Director may require changes to the plan at any time.

6.4.2 All loads entering the Tervita Silverberry facilities must be screened at the gate for NORM by screening procedures as described in the approved NORM Management Plan.

6.4.3 Any loads with radioactive emission exceeding twice background must be sampled for and meet acceptable concentrations for parameters outlined in 6.4.5. prior to being landfilled.

6.4.4 An incremental (i.e. above background) radiation dose of 0.3 milliSieverts per year (mSv/yr) must not be exceeded at the property boundary of the Silverberry Landfill. Methods for measuring and calculating the dose at the property boundary must be as described in the approved NORM Management Plan.

6.4.5 The maximum acceptable radioactive concentration for NORM is 70 Bq/g, with a maximum radioactive concentration due to Radium 226 of 5 Bq/g. **Any load exceeding these concentrations must not be accepted for disposal.**

6.4.5 All NORM waste must be co-disposed with non-NORM waste at a minimum ratio of 3 parts non-NORM to 1 part NORM, by mass to a maximum of 1,500,000 tonnes.

6.5 Non-Recyclable Municipal Solid Waste

Non-recyclable office waste and food waste generated on-site by Tervita operations may be directed to the Secure Landfill. Recyclable products include paper, cardboard, printer ink and goods covered by a stewardship program.

Waste is to be immediately covered with a minimum of 0.15 metres of suitable cover material.

All other Municipal Solid Waste, as defined by the *Environmental Management Act*, is prohibited for disposal unless the Director specifically authorizes in writing the disposal of a discrete type and source of "municipal solid waste".

6.6 Spilled Materials

Despite Section 6.1, spilled materials, as authorized by a Director may also be accepted for treatment and/or disposal under authority of Section 52(1) of the Hazardous Waste Regulation.

7. MONITORING – LANDFILL MONITORING

Monitoring must be performed as outlined in the OPERATIONAL PLAN. Any changes to the monitoring program must be submitted as part of an updated OPERATIONAL PLAN for the approval of the Director.

Date issued: October 18, 2002
Date amended: September 1, 2017
(most recent)

Julie Orban P. Geo.
for Director, *Environmental Management Act*
Authorizations - North Region

The need for subsequent increased or decreased monitoring will be assessed on the basis of the monitoring data submitted, any other data gathered in connection with the discharges and/or as otherwise specified by the Director.

8. SAMPLING AND ANALYSIS

8.1 Sampling

Sampling is to be carried out in accordance with procedures described in the most current edition of "British Columbia Field Sampling Manual" (January 2003, or most recent update), or by suitable alternative procedures as Authorized by the Director.

8.2 Analyses

Analyses are to be carried out in accordance with procedures described in the "British Columbia Laboratory Manual (2009 Permittee Edition)", or the most recent edition, or by suitable alternative procedures as authorized by the Director.

Copies of the above manuals may be purchased from the Queen's Printer Publications Centre, P. O. Box 9452, Stn. Prov. Gov't. Victoria, British Columbia, V8W 9V7 (1-800-663-6105 or (250) 387-6409), at the internet at www.crownpub.bc.ca. A copy of the manual is also available for review at all Environmental Protection offices.

9. REPORTING

The Director may, in writing, change the reporting requirements outlined below.

9.1 Annual Discharge Reporting for Determination of Permit Fees

For the purpose of determining discharge fees, the permittee must report the actual tonnage of waste discharged for the preceding calendar year as per section 9.3 of this permit.

Date issued: October 18, 2002
Date amended: September 1, 2017
(most recent)

Julie Orban P. Geo.
for Director, *Environmental Management Act*
Authorizations - North Region

9.2 **Drawings**

"As built" drawings certified correct and sealed by a qualified professional must be submitted electronically within 60 days of completion of the work or as otherwise specified by the Director.

9.3 **Annual Report**

The Permittee must submit an annual report, in a format satisfactory to the Director, once each year on or before March 31 for the previous calendar year. The annual report must include the following:

a) the category and tonnage of waste received, recycled and discharged for the preceding calendar year;

b) a review of the decision matrix for determining which wastes will be treated versus directly disposed and recommended revisions to the matrix;

c) a current topographic map of the site;

d) the remaining capacity and estimated site life;

e) a cost estimate of the financial security required by Section 2.1;

f) a review of operations for the previous calendar year and detailed plans for the next 12 months. Operational changes must be identified in the ANNUAL REPORT and may require revision of the OPERATIONAL PLAN;

g) any revisions to plans and specifications;

h) up to date contingency plans;

i) the results of all monitoring programs as specified in this Permit. Data interpretation and trend analysis, as well as an evaluation of the impacts of the discharges on the receiving environment in the previous year must be carried out by a qualified independent professional; and,

j) the methods and amounts of leachate collection, treatment and disposal, if applicable.

10. **CLOSURE PLAN**

Specifications for the final cap must be submitted at least 60 days in advance of each area of the landfill reaching final elevations or as otherwise specified by the Director.

Details must include the thickness and permeability of barrier and drainage layers, information on topsoil, vegetative cover and erosion prevention controls.
At least one year in advance of decommissioning the landfill, or as otherwise specified by the Director, a CLOSURE PLAN must be submitted for the approval of the Director which includes at least the requirements of Section 27(9) of the Hazardous Waste Regulation plus the following information:

a) a topographic plan showing the final elevations and contours of the landfill and surface water diversion and drainage controls;
b) Proposed end use of the site;
c) Provisions for monitoring radioactivity at the property boundaries, groundwater, surface water, landfill gas, erosion and settlement for a minimum 25 year post- closure period; and,
d) Provisions for maintenance and corrective measures for a minimum 25-year post- closure period.

11. **DEFINITION**

For the purposes of this permit the following definition applies:

"Qualified professional" means:

An applied scientist or technologist specializing in an applied science or technology applicable to the duty or function, including, if applicable and without limiting this, of agrology, biology, chemistry, engineering, geology or hydrogeology and who:

i. is registered with the appropriate professional organization, is acting under that organization's code of ethics and is subject to disciplinary action by that organization, and
ii. through suitable education, experience, accreditation and/or knowledge, may be reasonably relied on to provide advice within their area of expertise.

6 Statement of Limitations

NLR/AE Consultants Standard Disclaimer for Contaminated Site Investigations, Monitoring and Confirmation of Remediation Services

Subject to the following conditions and limitations, the investigation described in this report has been conducted in a manner consistent with a reasonable level of care and skill normally exercised by members of the environmental science profession currently practicing under similar conditions in the area.

1. The scope of the investigation described in this report has been limited by the budget set for the investigation in the work program. The scope of the investigation has been reasonable having regard to that budget constraint.

2. The investigation described in this report has been limited to the scope of work described in the work program.

3. The investigation described in this report has relied upon information provided by third parties concerning the history of the Site. Except as stated in this report, we have not made an independent verification of such historical information.

4. The investigation described in this report has been made in the context of existing government regulations generally promulgated at the date of this report. Except as specifically noted, the investigation did not take account of any government regulations not in effect and generally promulgated at the date of this report.

5. The findings and conclusions are valid only for the specific site identified in the report.

6. Since site conditions may change over time, the report is intended for immediate use.

This report is intended for the exclusive use of Tervita Corporation, including all successors and assigns. The material in it reflects NLR/AE Consultants best judgement, in light of the information available to it, at the time of preparation. Any use which a third party makes of this report or any reliance on or decisions to be made based on it, are the responsibility of such third parties. Inc. accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report. NLR/AE Consultants makes no representation of fact or opinion of any nature whatsoever to any person or entity other than Tervita Corporation.

In accepting delivery of this report, Tervita Corporation, hereby agrees that:

1. NLR/AE Consultants liability for all claims of Tervita Corporation, arising out of the agreement between NLR/AE Consultants and Tervita Corporation, pursuant to which this report has been prepared (the “Agreement”) shall absolutely cease to exist after a period of six (6) years from the date of:

   a) substantial completion of the investigation described in this report,
   b) termination of NLR/AE Consultants services under the Agreement,
   c) commencement of the limitation period for claims prescribed by any statute of the Province or Territory for the Site of the investigation described in this report,
   d) any significant alteration of the site of the investigation described in this report and/or neighbouring properties after the date of the final report.

   whichever shall first occur and following the expiration of such period, Tervita Corporation shall have no claim whatsoever against NLR/AE Consultants.

2. Any and all claims which it may have against NLR/AE Consultants or any of its servants, agents or employees arising out of or in any way connected with the investigation described in this report or the preparation of this report, whether such claims are in contract or in tort and whether such claims are based on negligence or otherwise, shall be limited to a total amount equal to the fees payable to NLR/AE Consultants under our contract with Tervita Corporation. NLR/AE Consultants shall bear no liability whatsoever for any consequential loss, injury or damage incurred by Tervita Corporation including but not limited to claims for loss of profits and loss of markets.

APPENDIX C
Previous Investigations

APPENDIX C

PREVIOUS INVESTIGATIONS

Groundwater monitoring and sampling programs have been conducted regularly since landfill commissioning. Key findings from the 2013 groundwater monitoring and sampling program (NLR /AE 2013) are summarized below:

- The magnesium, sulphate, and total dissolved solids concentrations, which exceeded British Columbia *Environmental Management Act* Contaminated Sites Regulation (CSR) standards in the shallow groundwater beneath the site, were interpreted to be naturally occurring. Sodium concentrations also exceeded British Columbia CSR standards in samples collected from background well BH-103 and deeper downgradient well MW92-7. All general and inorganic parameters measured in 2013 were generally consistent with historical data.

- Some general and inorganic parameters concentrations measured in samples collected from the leachate vault were several orders of magnitude higher than the concentrations measured in the samples collected from the onsite wells.

- The 2013 dissolved cadmium concentration in the sample collected from background well BH-103 exceeded the British Columbia CSR standard. Dissolved uranium concentrations also exceeded the standard at more than half of the monitoring wells and the leak detection system sampled in 2013. The dissolved uranium and cadmium concentrations were low and consistent across the site, and were considered naturally occurring.

- Several dissolved metal concentrations exceeded standards in the leachate vault samples but were either not detected or in lower concentrations in the groundwater samples collected in 2013.

- In 2013, dissolved petroleum hydrocarbons (PHCs) and polycyclic aromatic hydrocarbons (PAHs) were not detected in any of the samples collected from monitoring wells and did not exceed British Columbia CSR standards in samples collected from the leak detection system. Dissolved PHC and PAH concentrations were consistent with historical data.

- Dissolved PHC and PAH concentrations exceeded standards in the samples collected from the leachate vault; some were detected at concentrations several orders of magnitude above those recorded at the monitoring well network.

Key findings from the 2014 groundwater monitoring and sampling program (Matrix 2015) are summarized as follows:

- The shallow groundwater flow at the landfill was to the northwest. The calculated horizontal velocity in the shallow groundwater was less than 1 m/year. Vertical groundwater gradients indicated recharging conditions across the site.

- The magnesium and sulphate concentrations exceeded British Columbia CSR standards in the shallow groundwater beneath the site, and were interpreted to be naturally occurring. Sodium concentrations also exceeded the British Columbia CSR standard in samples collected from

background well BH-103 and downgradient wells MW92-7 and MW92-7A. All general and inorganic parameters measured in 2014 were generally consistent with historical data.

- Some general and inorganic parameters concentrations measured in samples collected from the leachate vault were several orders of magnitude higher than the concentrations measured in the samples collected from the onsite wells.

- The dissolved boron and cadmium concentrations in the samples collected from background well BH-103 exceeded the British Columbia CSR standards. Dissolved boron and cadmium were below the standards in all other samples collected at the site.

- Dissolved uranium concentrations exceeded the standard at more than half of the monitoring wells sampled in 2014. The dissolved uranium concentrations were low and consistent across the site, and may be considered naturally occurring.

- Several dissolved metal concentrations exceeded standards in the leachate vault samples but were either not detected or in lower concentrations in the groundwater samples collected from the monitoring wells in 2014.

- In 2014, dissolved PHCs and PAHs were not detected in any of the samples collected from monitoring wells, and did not exceed British Columbia CSR standards in samples collected from the leak detection system (with the exception of benzo[a]pyrene, which exceeded the British Columbia CSR standard in the sample collected from the leak detection system in September 2014). Dissolved PHC and PAH concentrations were consistent with historical data, with select dissolved PHC and PAH concentrations exceeding their respective standards in the samples collected from the leachate vault.

Key findings from the 2015 groundwater monitoring and sampling program (Matrix 2016) are summarized as follows:

- Five monitoring wells were installed downgradient and west of the landfill cells in 2015, two of which were replacement wells for monitoring wells BH-104 and BH-105. Geology encountered during the installation of all the wells was consistent with the historical information at the landfill and of the surrounding area.

- The shallow groundwater flow at the landfill was to the northwest. The calculated horizontal velocity in the shallow groundwater was less than 0.3 m/year in 2015, similar to historical calculations.

- The vertical groundwater gradients indicated recharge conditions across the landfill.

- The sodium, magnesium, and sulphate concentrations that exceeded British Columbia CSR standards in the shallow groundwater beneath the site were interpreted to be naturally occurring.

- Chloride concentrations at monitoring well BH-104 exceeded the British Columbia CSR (irrigation water use) standard in April and June 2015 but met the standard in September. This monitoring well was replaced with BH-104(R) in 2015. The anomalous chloride concentrations at BH-104 may be attributed to the low well volumes encountered. BH-104 was replaced in 2015 to ensure

representative samples could be collected on a frequent basis and chloride concentrations could be closely monitored in future sampling events.

- Nitrate-nitrogen concentrations exceeding the British Columbia CSR standard were detected in samples collected from background well BH-103 in three of the four monitoring events in 2015. A general increasing trend in nitrate-nitrogen concentration was displayed at the background well and appeared related to an offsite source.

- All general and inorganic parameters measured in 2015 were generally consistent with historical data.

- Some general and inorganic parameters concentrations measured in samples collected from the leachate vault were several orders of magnitude higher than the concentrations measured in the samples collected from the onsite wells.

- The 2015 dissolved boron and cadmium concentrations in the samples collected from background well BH-103 exceeded the British Columbia CSR standards; dissolved cadmium appeared to be displaying an apparent increasing trend at well BH-103. Dissolved boron and cadmium were below the standards in all other samples collected at the site.

- Dissolved uranium concentrations exceeded the standard at more than half of the monitoring wells sampled in 2015. The dissolved uranium concentrations were low and consistent across the site, and may be considered naturally occurring.

- Several dissolved metal concentrations exceeded standards in the leachate vault samples but were either not detected or in lower concentrations in the groundwater samples collected from the monitoring wells in 2015.

- In 2015, dissolved PHCs were not detected in any of the samples collected from monitoring wells, and did not exceed British Columbia CSR standards in samples collected from the leak detection system. Dissolved PAHs benzo[a]pyrene and pyrene were detected above British Columbia CSR standards in three downgradient wells in 2015; these concentrations were consistent with historical data, displayed no discernible trends, and may have been caused by the presence of sediment in the groundwater samples. Dissolved PAH concentrations above standards were also detected in samples collected from the leak detection system in April but dropped back below laboratory detection limits the following sampling event. Dissolved PHC and PAH concentrations were consistent with historical data.

- Select dissolved PHC and PAH concentrations exceeded the British Columbia CSR standards in the samples collected from the leachate vault in 2015.

- Based on the results of the groundwater chemistry data collected in 2015, the activities of the Silverberry Landfill did not appear to have impacted the groundwater below the site. It was concluded that the 2015 chloride concentrations above the standard downgradient from the landfill cells should be monitored closely in 2016. Although PAH concentrations were detected above standards in both monitoring well and leak detection samples, there was a lack of any discernible trends. A review of the leak detection sample data suggested that the current leachate collection and containment system was operating properly.

Key findings from the 2016 groundwater monitoring and sampling program (Matrix 2017) are summarized as follows:

- The shallow groundwater flow at the landfill was to the northwest. The calculated horizontal velocity in the shallow groundwater was less than 0.4 m/year in 2017, which is similar to historical calculations.

- The sodium, magnesium, and sulphate concentrations that exceeded British Columbia CSR standards in the shallow groundwater beneath the site were interpreted to be naturally occurring, with the exception of up-gradient monitoring well BH-103.

- The increasing and decreasing trends in inorganic parameters at BH-103 observed since the 2013 sampling events were confirmed with the 2017 data. The trending data were believed to be the result of till material oxidation at this location. Pre-2013 data from this well were stable and were used to establish background conditions at the site.

- Chloride concentrations were below the British Columbia CSR (IW) standard at all monitoring wells sampled in 2017.

- Nitrate-nitrogen concentrations exceeding the British Columbia CSR standard were detected in samples collected from well BH-103 in 2017. An increasing trend in nitrate-nitrogen concentration is displayed at the background well and appears related to an offsite source.

- All general and inorganic parameters measured in 2017 were generally consistent with historical data, with the exception of BH-103 and the June and September 2017 data at well MW92-1A, which were abnormally low when compared to historical data. The inorganic parameters will be monitored closely in MW92-1A in the coming sampling events.

- Some general and inorganic parameters concentrations measured in samples collected from the leachate vault were several orders of magnitude higher than the concentrations measured in the samples collected from the onsite wells.

- The 2017 dissolved boron and cadmium concentrations in the samples collected from well BH-103 exceeded the British Columbia CSR standards; dissolved boron was within historical range, while cadmium concentrations appeared to be displaying an increasing trend at well BH-103. Dissolved boron and cadmium were below the standards in all other samples collected at the site.

- Concentrations of dissolved selenium and uranium have been detected at monitoring wells across the landfill historically and display no discernible increasing or decreasing trends.

- Several dissolved metal concentrations exceeded standards in the leachate vault samples but were either not detected or in lower concentrations in the groundwater samples collected from the monitoring wells in 2017.

- In 2017, dissolved PHCs and PAHs were either not detected or were below the British Columbia CSR standards in samples collected from all onsite wells. Dissolved PHC and PAH concentrations were consistent with historical data.

- Several dissolved PHC and PAH concentrations exceeded the British Columbia CSR standards in the samples collected from the leachate vault in 2017.

Key findings from the 2017 groundwater monitoring and sampling program (Matrix 2018) are summarized as follows:

- The shallow groundwater flow direction and velocities were consistent with previous interpretations.

- The ongoing changes in inorganic parameters at BH-103 observed since the 2013 sampling events were not observed with the 2017 data; inorganic parameter concentrations generally returned to their pre-2013 background levels. The trending data that started in 2013 is believed to be the result of till material oxidation at this location; data observed in 2017 could be the result of the oxidation effects beginning to wane. Pre-2013 data from this well was used to establish background conditions at the site until further sampling confirms if concentrations at the background well have returned to original compositions.

- Chloride concentrations were below the British Columbia CSR (IW) standard at all monitoring wells sampled in 2017. The November chloride concentration at 15-9 appears to be anomalous when compared to historical data. Chloride concentrations at downgradient well 92-6A are increasing but continue to remain well below the standard.

- All general and inorganic parameters and dissolved metal concentrations measured in 2017 were generally consistent with historical data at all non-background monitoring wells.

- In 2017, dissolved petroleum hydrocarbons (PHCs) and PAHs were either not detected or were below the British Columbia CSR standards in samples collected from all onsite wells. These concentrations were consistent with historical data.

- Some general and inorganic parameters concentrations measured in samples collected from the leachate vault were several orders of magnitude higher than the concentrations measured in the samples collected from the onsite wells. Several dissolved metal concentrations exceeded standards in the leachate vault samples but were either not detected or in lower concentrations in the groundwater samples collected from the monitoring wells in 2017.

- Several dissolved PHC and PAH concentrations exceeded the British Columbia CSR standards in the samples collected from the leachate vault in 2017.

- LDS results in 2017 were consistent with historical data.

APPENDIX D
Groundwater Monitoring and Sampling Methods

APPENDIX D

GROUNDWATER MONITORING AND SAMPLING METHODS

Matrix Solutions Inc. followed the following sampling protocol at each well:

1. The water level was measured relative to the top of the PVC pipe using a Solinst® electronic water level tape. Groundwater elevations at each well were calculated by subtracting measured depths to water from the surveyed top of PVC casing elevations. The water elevation data were contoured to produce flow maps that were used to estimate groundwater flow directions and horizontal hydraulic head gradients.

2. Wells that may contain free product were monitored in a similar manner. The depth to free product and the depth to groundwater beneath the free product were measured with the Solinst® electronic interface tape. The thickness of free product in the monitoring well was determined as the difference between the two readings. Piezometric (potentiometric) elevations were calculated at each well as follows:

$$PE = WE + \left(SG \times thickness\ of\ free\ product\right)$$

   where *PE* and *WE* are the piezometric and groundwater elevations, respectively, and *SG* is the specific gravity of the free product.

3. Monitoring wells were purged before groundwater sampling to obtain samples that represent the water quality in the formation. The optimal method for purging before sampling is a subject of debate among scientists; however, the method adopted to purge a well is probably less important than maintaining a consistent method between sampling events. In general, purging is accomplished in one of two ways: removing a known volume of water from the well, e.g., a minimum of three casing volumes (CCME 1994), or purging from the well until indicator parameters (temperature, pH, electrical conductivity [EC], and/or dissolved oxygen) achieve stabilization (ASTM 1999). Matrix used the Canadian Council of Ministers of the Environment method (CCME 1994) for collecting groundwater samples. Monitoring wells were developed historically using similar purging methods to ensure the removal of fine-grained sediments from the vicinity of the well screens, allowing water to flow freely from the formation into the well and reduce turbidity.

4. The field-measured parameters included pH, EC, and temperature. These measurements were conducted on groundwater samples collected from the wells once purging was complete. The instruments were calibrated before measuring the field parameters.

5. For each routine analysis, a clean 500 mL plastic bottle (provided by the laboratory) was filled to within 5 to 15 mm of the top, then capped.

6. Dissolved organic carbon analysis was performed on water from the routine analyses bottle. A portion of the sample was filtered and preserved upon arrival at the laboratory.

7. For each phenol analysis, a clean 125 mL glass bottle (provided by the laboratory) was filled to within 5 to 15 mm of the top, then 2 mL of 12.5% sulphuric acid solution preservative was added, and the bottle was capped and shaken.

8. Three 40 mL glass vials were used for the benzene, toluene, ethylbenzene, and xylenes and styrene analyses. The vials were filled from the bottom of the bailer using the bailer spout until a positive meniscus was formed at the lip of each vial. The vials were then capped and checked for entrapped air by inverting the vials and inspecting them for air bubbles. If air bubbles were present, the procedure was repeated until entrapped air was eliminated.

9. For the total extractable hydrocarbon and polycyclic aromatic hydrocarbon analyses, one laboratory-cleaned, 1,000 mL amber glass bottle was used. Bottles were filled to within 5 to 15 mm of the top, then capped.

10. For dissolved metal analyses of groundwater samples, a clean 500 mL plastic bottle (provided by the laboratory) was filled to within 5 to 15 mm of the top, then capped. The laboratory filtered and preserved each sample immediately upon arrival at the laboratory.

11. Upon completion of the required sampling at each well, all equipment was thoroughly rinsed with distilled water to reduce the potential for cross-contamination between wells.

12. All samples were each labelled with a unique sample number. Sample codes usually follow the form SITEYYMMDDNUM, where SITE is a five-digit project code, YYMMDD is the sampling date, and NUM is a three-digit number indicating the sample number for that date. For example, a sample labelled 01444130201001 was the first sample collected at Site 01444 on February 1, 2013. The sample numbers were recorded and cross-referenced with the sample location in Matrix's log book.

13. Samples were submitted to ALS Environmental and AGAT Laboratories for analysis. An appropriate chain-of-custody form indicating sample numbers was submitted to and signed at the laboratory. Copies of the signed forms were placed in the project files and are available upon request.

14. Blind replicate samples were submitted to the laboratory as part of the site quality control program.

15. Results of laboratory analyses were downloaded into Matrix's database management system from data provided by the analytical laboratory. Matrix's database management system was used to construct the data tables and figures provided in the report.

APPENDIX E
Descriptions and Rationale for Use of Selected Field Tests and Laboratory Analyses

APPENDIX E

DESCRIPTIONS AND RATIONALE FOR USE OF SELECTED FIELD TESTS AND LABORATORY ANALYSES

Soil and water quality characterization employs a number of field-screening tests and laboratory analyses. Analytical programs depend on the type of media being assessed (i.e., soil or water), the identity and nature of the contaminants being investigated, the results of previous analyses, and other site-specific factors, such as the physical and hydrogeological setting.

The following are brief descriptions and rationales for the use of some of the most common measures of soil and water quality. Measurement of pH, electrical conductivity (EC), temperature, and dissolved oxygen (DO) concentrations is routinely performed in the field; the remaining parameters are subcontracted to qualified analytical laboratories.

- ***Water levels*** in each monitoring well are measured from the top of well casing and converted to a relative elevation with respect to a surveyed site datum. Relative groundwater elevations are mapped and used to determine rates and patterns of groundwater flow.

- ***pH*** is defined as the negative log activity of hydrogen ions in a medium (soil or water). pH values less than 7 indicate acidic conditions, while pH values greater than 7 indicate basic conditions. At sour gas plants or sulphur handling facilities, acidic conditions can be created by the oxidation of elemental sulphur to sulphate that, in turn, creates sulphuric acid in water. Generally, acidic conditions are seen only after the natural buffering capacity of the soil has been lost by the depletion of calcium-carbonate. Values in the acidic range can also indicate the presence of process chemicals, such as glycols. In addition to reducing the availability of some nutrients to most plants and animals, low pH conditions can result in the dissolution and mobilization of metals that are otherwise either adsorbed to or comprise part of the mineral composition of soil particles.

- ***Electrical conductivity (EC)*** is a measurement of the ability of a medium (soil or water) to conduct electricity. The EC of water samples can be measured directly, but for soils, a soil-water paste must first be prepared. Water becomes more conductive with increasing concentrations of certain dissolved constituents that are usually inorganic in nature and include sodium, chloride, calcium, magnesium, bicarbonate, sulphate, metals, and nutrients. The EC of water is generally proportional to the total dissolved solids (TDS) content; therefore, the EC measurement is commonly used as a field analog for TDS. Because EC increases 1% to 3% for every 1°C increase in temperature, all readings are usually standardized to 25°C.

- ***Temperature*** is a measure of a medium's heat transfer potential and is usually expressed on a relative scale, such as in degrees Celsius (°C). Water temperature affects physical, biological, and chemical processes in the environment, as well as EC, the solubility of chemical constituents, and the availability of DO necessary for aquatic life. Groundwater and surface water bodies exhibit seasonal (and sometimes diurnal) temperature fluctuations in response to climatic changes. Surface water temperatures can range from 0°C under ice cover to 40°C near hot springs. Groundwater temperatures generally exhibit less variability than surface water temperatures. In summer, groundwater temperatures are typically cooler than air temperatures, whereas in winter, the opposite is true.

- ***Total dissolved solids (TDS)*** is the sum of the concentrations of major cations and anions dissolved in water. It is an indicator of elevated concentrations of major ions, such as sodium, chloride, magnesium, and sulphate. Fresh, non-saline water exhibits TDS concentrations less than 1,000 mg/L. Because TDS analysis does not reveal the identity of dissolved ions, water exhibiting high TDS concentrations may warrant analysis for specific major ions.

- ***Chloride*** is often present at high concentrations at locations where chloride salts or brines have been stored or handled. Many petroleum processing plants and batteries handle produced formation water, which is typically a sodium-chloride brine. Chloride is usually present in concentrations ranging from 5,000 to over 50,000 mg/L in the formation waters of Western Canada (RPCL 1996). Therefore, chloride may be used as an indicator parameter at oil and gas production facilities. Chloride can also enter groundwater as a result of infiltration from feedlots, septic tanks, snow removal activities, and landfills. In shallow groundwater, natural chloride concentrations are usually less than 50 mg/L. Chloride is generally considered a conservative (non-reactive) constituent in groundwater and can be used as a tracer of groundwater flow.

- ***Sulphate*** concentrations are used as indicators of sulphur species. Elemental sulphur in soils is readily oxidized to sulphate, which is highly soluble and percolates to the water table. High sulphate concentrations are not uncommon at sour gas processing plants and sulphur storage and handling facilities but can also result from the leaching of minerals, such as gypsum and anhydrite. Excessive sulphate in groundwater can lower the pH of the water. The use of sulphate as an indicator of groundwater contamination is complicated by the fact that sulphate participates in chemical reactions in the subsurface. However, in the presence of dissolved hydrocarbons, sulphate concentrations can be abnormally low. It is believed that biodegradation of the hydrocarbons consumes the available DO in the subsurface. When the system becomes anoxic, anaerobic bacteria can reduce the sulphate to hydrogen-sulphide. The organic matter (hydrocarbons) acts as a source of energy for the sulphate reducing bacteria and will be oxidized to bicarbonate and eventually carbon dioxide.

- ***Iron and manganese*** are both more soluble in their reduced states than in their oxidized states. The presence of iron and/or manganese is also used to demonstrate the occurrence of natural attenuation of dissolved hydrocarbons. Because aerobic biodegradation of hydrocarbons often leads to strong reducing conditions, relatively high concentrations of iron and/or manganese may be present in groundwater.

- ***Uranium*** occurs naturally and is widespread in nature, occurring in granites and various other mineral deposits. Uranium concentrations of up to 0.7 mg/L have been found in private groundwater supplies in Canada (Moss 1985). It often enters water supplies as a result of leaching from natural deposits or from human activity, such as mill tailings and phosphate fertilizers. In water, uranium is usually hexavalent and is present as the uranyl ion (McNeely et al. 1979). Most uranyl salts are soluble in water and form soluble ion complexes. The uranyl salts impart an objectionable taste and colour to water and may cause kidney damage (McNeely et al. 1979). Uranium can be studied from a chemical or a radiological aspect of toxicity. The maximum acceptable concentration (MAC) for uranium in drinking water (0.02 mg/L) is a toxicological guideline based on the chemical aspects of uranium (Health Canada 2014). Additionally, there are guidelines for uranium that are based on radiological effects; however, the guidelines are greater than the chemical toxicology MAC guideline.

- ***Calcium, magnesium, and sodium*** are the three most prevalent cations in natural groundwater systems. Of the three, sodium is usually the dominant cation, but because the main source of naturally occurring calcium, magnesium, and sodium is from the weathering of rocks and minerals, concentrations vary according to local geology. Both calcium and magnesium contribute to water hardness. Commercial or industrial use of concentrated calcium, magnesium, and sodium products (e.g., lime, soda ash, and caustic soda) can lead to increased concentrations in soil and groundwater.

- ***Hardness*** of a water supply affects the amount of lather generated by soap. The chief constituents implicated with water hardness are calcium and magnesium. In addition, iron, manganese, and aluminum may also contribute to hardness, but these are usually present at much lower concentrations. Hardness is expressed as a total calcium-carbonate equivalent. Water with a hardness less than 60 mg/L is considered soft, whereas water with a hardness exceeding 120 mg/L is considered hard.

- ***Alkalinity*** is a measure of the ability of soil or water to neutralize an acid and indicates the presence of compounds with some degree of acid buffering capacity. To employ a relative scale, alkalinity is expressed as a total calcium-carbonate equivalent. However, the contributing compounds could include not only carbonates and bicarbonates, but also hydroxides, borates, silicates, phosphates, and some organic substances. Natural surface waters typically exhibit alkalinity of less than 500 mg/L, with most of the alkalinity attributed to bicarbonates.

- ***Carbonate and bicarbonate*** together with carbonic acid are the three forms that inorganic carbon exists as in natural groundwater systems. The speciation of inorganic carbon depends on pH; at pH 7 to 8, bicarbonate will predominate and account for 60% to 90% of total inorganic carbon in water samples. Bicarbonate ions are the main buffer in freshwater aqueous systems and provide carbon-dioxide for photosynthesis. At higher pH, carbonate will predominate, and at lower pH, carbonic acid will be present. In surface water, bicarbonate concentrations are usually less than 500 mg/L and carbonate is typically absent (because the pH of surface water rarely exceeds 9). Groundwater is more likely to exhibit alkalinity and contain 10 mg/L or more of carbonate.

- ***Dissolved nitrite/nitrate-nitrogen*** is a measure of soluble oxidized nitrogen. Nitrite/nitrate-nitrogen can be derived from natural oxidation and weathering of clay minerals in till material (Hendry et al. 1984), as well as from animal wastes, sewage discharge, and the surface application of fertilizers (McNeely et al. 1979). In gas plants, elevated nitrite/nitrate-nitrogen can occur from the oxidation of organic nitrogen in amines. In the presence of hydrocarbons, nitrite/nitrate-nitrogen concentrations can be decreased due to microbial reduction.

- ***Dissolved organic carbon (DOC)*** is often used as an indicator of DOC constituents in shallow groundwater from both naturally occurring organic matter and introduced compounds containing organic carbon (such as glycols and dissolved hydrocarbons). It is Matrix's experience that at concentrations above 100 mg/L, DOC typically correlates to the presence of dissolved extractable hydrocarbon constituents or process chemicals containing organic carbon. In the analysis for DOC, groundwater is filtered first to remove any contribution of organic carbon from suspended solids. Due to the nature of the analytical procedures, volatile organic carbon compounds are not usually detected in DOC analyses. Concentrations of DOC are naturally variable, particularly in the presence of natural organic soils, such as peat and muskeg; therefore, it is recommended that a background groundwater sample also be analyzed for DOC. DOC is a more convenient and direct expression of total organic content than either biological oxygen demand or chemical oxygen demand.

- ***Phenols*** are aromatic organic compounds in which one or more hydroxy groups are attached directly to a benzene ring. Phenolic compounds may impart an undesirable taste and odour. Phenols can occur naturally in groundwater, usually in low amounts associated with decomposing organic matter. Sources of phenolic compounds are widespread, as it may be released as a by-product from many major industry sectors, including pulp, paper, and wood products, chemical plants, steel and metal products, petroleum refining and products, animal and human wastes, and municipal wastewater treatment facilities. Fish and fish-food organisms may be adversely affected by phenolic substances due to oxygen depletion in water and production of undesirable flavours in the edible flesh of fish.

- ***Benzene, toluene, ethylbenzene, and xylenes (BTEX)*** are monoaromatic compounds that are often present in petroleum hydrocarbon (PHC) mixtures. These constituents make up a small fraction of petroleum mixtures and are of most concern due to their toxicological, chemical, and physical characteristics. In Canada, gasoline typically contains 1% to 2% benzene and approximately 30% total BTEX. Relative to most hydrocarbon compounds, BTEX constituents are more soluble in water, and, therefore, more mobile in the environment.

- ***Volatile petroleum hydrocarbon (VPH)*** is the total concentration of volatile hydrocarbon components ranging from C_6-C_{10} (i.e., hydrocarbon compounds containing 6 to 10 carbon atoms). The hydrocarbons are extracted from the medium (soil or water) using a solvent. The resulting extract is then analyzed using gas chromatography with flame ionization detection (GC/FID). This range captures the majority of most unweathered gasolines, mineral spirits, and paint thinners. The VPH analysis is also used as an indicator for condensate and the light fractions of oil or other process chemicals.

- ***Light extractable petroleum hydrocarbon ($LEPH_{10-19}$) and heavy extractable petroleum hydrocarbon ($HEPH_{19-32}$)*** is calculated using results from GC/FID that determines the total concentration of hydrocarbons in the C_{10}-C_{19} and C_{19}-C_{32} ranges (i.e., hydrocarbon compounds containing 10 to 19 and 19 to 32 carbon atoms). The hydrocarbons are extracted from the medium (soil or water) using a solvent. The resulting extract is then analyzed using GC/FID. PHCs are detected as the gas chromatograph separates the extract into distinct groups based on boiling point, which is related to the number of carbons atoms present in each component. This range captures the majority of most furnace and diesel fuel, lubricating oils, and hydraulic oils.

- ***Polycyclic aromatic hydrocarbons (PAHs)*** are analyzed by solvent extraction, followed by cleanup and analysis by a gas chromatograph equipped with a mass spectrometer. PAHs are hydrocarbon compounds consisting of multiple benzene rings. Eight of the PAHs are carcinogenic, and the carcinogenic potency of each compound is expressed relative to benzo[a]pyrene. Lighter hydrocarbons, such as gasoline, condensate, and petroleum solvents, do not generally include significant concentrations of PAHs. Heavier hydrocarbons, including crude oil, fuel oil, diesel, and waste oil, and unknown hydrocarbon mixtures may contain PAHs. Examples of upstream facilities or components of facilities where PAH contamination could be expected include but are not limited to flare pits, sumps, tank bottom sludges, soil subjected to flare stack carry-over, landfills, and drilling sumps where diesel based mud was used.

Notes:

Bold - background well

--- - not analyzed

^ - all data after 2012 are no longer considered to represent background conditions

* - LEPHs and HEPHs do not include CSR-regulated PAHs

VPHw - does not include BTEX

VHw (C_6-C_{10}) - includes BTEX

SAMPLED BY:

Subcontracted - Gross alpha and beta Analysis

SAMPLE TYPE: Water | SAMPLE ID: 9437511 | DATE RECEIVED: Jul 27, 2018

DATE SAMPLED: Jul 27, 2018 | DATE REPORTED: Aug 31, 2018

SAMPLE DESCRIPTION: 17507180727003 A-08-088-20W6M

PARAMETER	UNIT	RESULT	G / S	RDL	DATE ANALYZED	INITIAL	DATE PREPARED
Gross alpha	Bq/L	<0.56		0.56	Aug 24, 2018	LN	
Gross beta	Bq/L	<0.40		0.4	Aug 24, 2018	LN	

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Note: Performed by subcontracted laboratory.

SAMPLE DESCRIPTION: 17507180727001 A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507180727002 A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507180727003 A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507180727005 A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507180727008 A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507180727009 A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507180727012 A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507180727015 A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507180727017 A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507180727016 A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

Comments: If Matrix spike value is NA, the spiked analyte concentration was lower than that of the matrix contribution.
If the RPD value is NA, the results of the duplicates are under 5X the RDL and will not be calculated.

pH has been analyzed past the recommended holding time of 15 minutes from sampling (field measurement ideal if more accurate data required)

Nitrate and Nitrite: The regulatory hold time for the analysis of nitrate and/or nitrite in water is 72 hours.

SAMPLE TYPE: Water | SAMPLE ID: 9546006 | DATE RECEIVED: Sep 11, 2018

DATE SAMPLED: Sep 11, 2018 | DATE REPORTED: Sep 18, 2018

SAMPLE DESCRIPTION: 17507180911001 A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507180911003 A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

British Columbia CSR - Extended Site Remediation Analysis - Water

SAMPLE TYPE: Water | SAMPLE ID: 9546024 | DATE RECEIVED: Sep 11, 2018

DATE SAMPLED: Sep 11, 2018 | DATE REPORTED: Sep 18, 2018

SAMPLE DESCRIPTION: 17507180911014 A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507180911017 A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

Comments: If Matrix spike value is NA, the spiked analyte concentration was lower than that of the matrix contribution.
If the RPD value is NA, the results of the duplicates are under 5X the RDL and will not be calculated.

pH has been analyzed past the recommended holding time of 15 minutes from sampling (field measurement ideal if more accurate data required)

Nitrate and Nitrite: The regulatory hold time for the analysis of nitrate and/or nitrite in water is 72 hours.

Comments: If Matrix spike value is NA, the spiked analyte concentration was lower than that of the matrix contribution.
If the RPD value is NA, the results of the duplicates are under 5X the RDL and will not be calculated.

pH has been analyzed past the recommended holding time of 15 minutes from sampling (field measurement ideal if more accurate data required)

Nitrate and Nitrite: The regulatory hold time for the analysis of nitrate and/or nitrite in water is 72 hours.

SAMPLE DESCRIPTION: 17507181207001 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507181207003 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507181207004 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507181207005 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507181207013 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE TYPE: Water | SAMPLE ID: 9781337 | DATE RECEIVED: Dec 10, 2018

DATE SAMPLED: Dec 07, 2018 | DATE REPORTED: Dec 17, 2018

SAMPLE DESCRIPTION: 17507181207014 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507181207017 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

DATE SAMPLED: Dec 07, 2018 | DATE REPORTED: Dec 17, 2018

SAMPLE DESCRIPTION: 17507181207011 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507181207019 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

PARAMETER	Batch	Sample Id	Dup #1	Dup #2	RPD	Method Blank	Measured Value	Acceptable Limits		Recovery	Acceptable Limits		Recovery	Acceptable Limits	
								Lower	Upper		Lower	Upper		Lower	Upper
Dissolved Selenium	9782814		0.0012	0.0010	NA	< 0.0005	93%	80%	120%	99%	80%	120%	105%	80%	120%
Dissolved Silver	9782814		<0.0001	<0.0001	NA	< 0.0001	98%	80%	120%	93%	80%	120%	87%	80%	120%
Dissolved Sodium	9781238	9781238	209	210	0.5%	< 0.6	98%	80%	120%	96%	80%	120%	NA	80%	120%
Dissolved Strontium	9782814		0.914	0.936	2.4%	< 0.001	101%	80%	120%	100%	80%	120%	NA	80%	120%
Dissolved Thallium	9782814		<0.0001	<0.0001	NA	< 0.0001	106%	80%	120%	102%	80%	120%	98%	80%	120%
Dissolved Tin	9782814		<0.0005	<0.0005	NA	< 0.0005	109%	80%	120%	104%	80%	120%	103%	80%	120%
Dissolved Titanium	9782814		0.007	0.006	15.4%	< 0.001	98%	80%	120%	104%	80%	120%	103%	80%	120%
Dissolved Uranium	9782814		0.006	0.006	0.0%	< 0.001	113%	80%	120%	98%	80%	120%	105%	80%	120%
Dissolved Vanadium	9782814		<0.001	0.001	NA	< 0.001	109%	80%	120%	99%	80%	120%	99%	80%	120%
Dissolved Zinc	9782814		0.041	0.045	9.3%	< 0.004	105%	80%	120%	100%	80%	120%	99%	80%	120%

Comments: If Matrix spike value is NA, the spiked analyte concentration was lower than that of the matrix contribution.
If the RPD value is NA, the results of the duplicates are under 5X the RDL and will not be calculated.

Water Anaysis - DOC, Phenols															
Dissolved Organic Carbon (DOC)	9777139		17	17	0.0%	< 1	99%	80%	120%	116%	80%	120%	NA	80%	120%
Phenols	9784861		0.009	0.011	NA	< 0.002	96%	80%	120%	96%	80%	120%	112%	80%	120%

Comments: If the RPD value is NA, the results of the duplicates are under 5X the RDL and will not be calculated.

SAMPLE DESCRIPTION: 17507181207001 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507181207004 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507181207005 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507181207013 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE TYPE: Water | SAMPLE ID: 9781337 | DATE RECEIVED: Dec 10, 2018

DATE SAMPLED: Dec 07, 2018 | DATE REPORTED: Dec 20, 2018

SAMPLE DESCRIPTION: 17507181207014 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507181207017 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507181207011 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

SAMPLE DESCRIPTION: 17507181207019 Block A-08-088-20W6M

COMMENTS:

RDL - Reported Detection Limit; G / S - Guideline / Standard
Xylenes is a calculated parameter. The calculated value is the sum of m&p-Xylenes + o-Xylene.
VPH results have been corrected for BTEX contributions.
LEPH & HEPH results have been corrected for PAH contributions.
VPH: Volatile Petroleum Hydrocarbons (n-C6 - n-C10); all volatile compounds in the n-C6 to n-C10 range quantified based on toluene response.
LEPH: Light Extractable Petroleum Hydrocarbons (n-C10 - n-C19); all extractable compounds in the n-C10 to n-C19 range quantified based on n-eicosane response.
HEPH: Heavy Extractable Petroleum Hydrocarbons (n-C19 - n-C32); all extractable compounds in the n-C19 to n-C32 range quantified based on n-eicosane response.

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Nitrate (as N)	MS-B	L2095619-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2095619-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2095619-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2095619-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2095619-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Sample Submission Listed:

Qualifier	Description
SFPL	DOC LAB FILTER/PRESERVE - Sample was Filtered and Preserved at the laboratory

Sample Parameter Qualifier Key:

Qualifier	Description
DLCI	Detection Limit Raised: Chromatographic Interference due to co-elution.
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLI	Detection Limit Raised: Dilution required to address Internal Standard response problems caused by matrix interference.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DLQ	Detection Limit raised due to co-eluting interference. GCMS qualifier ion ratio did not meet acceptance criteria.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RRV	Reported Result Verified By Repeat Analysis
SDO:RNA	Surrogate diluted out:% recovery not available

Test Method References:

ALS Test Code	Matrix	Test Description	Preparation Method Reference	Method Reference**
BTXSM-HS-MS-CL	Water	BTEX, Styrene and MTBE		EPA 8260C/5021A
The water sample, with added reagents, is heated in a sealed vial to equilibrium. The headspace from the vial is transferred into a gas chromatograph. BTEX Target compound concentrations are measured using mass spectrometry detection.				
C-DIS-ORG-CL	Water	Dissolved Organic Carbon		APHA 5310 B-Instrumental
This method is applicable to the analysis of ground water, wastewater, and surface water samples. The form detected depends upon sample pretreatment: Unfiltered sample = TC, 0.45um filtered = TDC. Samples are injected into a combustion tube containing an oxidation catalyst. The carrier gas containing the combustion product from the combustion tube flows through an inorganic carbon reactor vessel and is then sent through a halogen scrubber into a sample cell set in a non-dispersive infrared gas analyzer (NDIR) where carbon dioxide is detected. For total inorganic carbon and dissolved inorganic carbon, the sample is injected into an IC reactor vessel where only the IC component is decomposed to become carbon dioxide. The peak area generated by the NDIR indicates the TC/TDC or TIC/DIC as applicable. The total organic carbon content of the sample is calculated by subtracting the TIC from the TC. TOC = TC-TIC, DOC = TDC-DIC, Particulate = Total - Dissolved.				
CL-IC-N-CL	Water	Chloride in Water by IC		EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.				
F-IC-N-CL	Water	Fluoride in Water by IC		EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.				
HG-D-CVAA-CL	Water	Dissolved Mercury in Water by CVAAS		APHA 3030B/EPA 1631E (mod)
Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.				
IONBALANCE-CL	Water	Ion Balance Calculation		APHA 1030E
LEPH/HEPH-CALC-CL	Water	LEPHs and HEPHs		BC MELP; CSR-Analytical Method 3
LEPH/HEPH-CL	Water	LEPHs and HEPHs		BC MELP; CSR-Analytical Method 3

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Preparation Method Reference	Method Reference**
MET-D-CCMS-CL	Water	Dissolved Metals in Water by CRC ICPMS		APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

N2N3-CALC-CL	Water	Nitrate+Nitrite		CALCULATION
NO2-IC-N-CL	Water	Nitrite in Water by IC		EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-N-CL	Water	Nitrate in Water by IC		EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PAH-BCCSR-CL	Water	PAHs - BC CSR Regs		EPA 3511/8270D

PAHs are extracted from water using a hexane micro-extraction technique, with analysis by GC/MS.
Container: 250 ML AMBER-EPH/PAH

PH/EC/ALK-CL	Water	pH, Conductivity and Total Alkalinity		APHA 4500H,2510,2320

All samples analyzed by this method for pH will have exceeded the 15 minute recommended hold time from time of sampling (field analysis is recommended for pH where highly accurate results are needed)
pH measurement is determined from the activity of the hydrogen ions using a hydrogen electrode and a reference electrode.
Alkalinity measurement is based on the sample's capacity to neutralize acid
Conductivity measurement is based on the sample's capacity to convey an electric current

PHENOLS-4AAP-WT	Water	Phenol (4AAP)		EPA 9066

An automated method is used to distill the sample. The distillate is then buffered to pH 9.4 which reacts with 4AAP and potassium ferricyanide to form a red complex which is measured colorimetrically.

SO4-IC-N-CL	Water	Sulfate in Water by IC		EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TEH-BC-CL	Water	EPH (C10-C19) & EPH (C19-C32)		BC Lab manual

EPH is extracted from water using a hexane micro-extraction technique, with analysis by GC-FID, as per the BC Lab Manual. EPH results include PAHs and are therefore not equivalent to LEPH or HEPH.
Container: 250 ML AMBER-EPH/PAH

VH-HS-FID-CL	Water	VHs		BC Env. Lab Manual (VH in Water)

The water sample, with added reagents, is heated in a sealed vial to equilibrium. The headspace from the vial is transfered into a gas chromatograph. Compounds eluting between n-hexane and n-decane are measured and summed together using flame-ionization detection.

VPH-CALC-CL	Water	VPH Calculation		BC MOE LABORATORY MANUAL (2005)

These results are determined according to the British Columbia Ministry of Environment, Lands, and Parks Analytical Method for Contaminated Sites "Calculation of Volatile Petroleum Hydrocarbons in Solids or Water" (Version 2.1, July 20, 1999). According to this method, the concentrations of specific Monocyclic Aromatic Hydrocarbons (Benzene, Toluene, Ethylbenzene, Xylenes and Styrene) are subtracted from the collective concentration of Volatile Hydrocarbons (VH) that elute between n-hexane (nC6) and n-decane (nC10). Analysis of Volatile Hydrocarbons adheres to all prescribed elements of BCMELP method "Volatile Hydrocarbons in Solids by GC/FID" (Version 2.1, July 20, 1999).

XYLENES-CALC-CL	Water	Sum of Xylene Isomer Concentrations		CALCULATION

Calculation of Total Xylenes

Total Xylenes is the sum of the concentrations of the ortho, meta, and para Xylene isomers. Results below detection limit (DL) are treated as zero. The DL for Total Xylenes is set to a value no less than the square root of the sum of the squares of the DLs of the individual Xylenes.

** The indicated Method Reference is the closest nationally or internationally recognized reference for the applicable ALS test method. ALS methods may incorporate modifications from the specified reference to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

MD-CB1805152217507

Reference Information

GLOSSARY OF REPORT TERMS

Surr - Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.
MU: Measurement Uncertainty. The reported uncertainty is an expanded uncertainty calculated using a coverage factor of 2 which gives a level of confidence of approximately 95%.
Bias: The reported method bias is the average long term deviation from the target value for a long term reference or control sample, measured in percent. Zero values indicate no detectable method bias.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Contact: SUE RAYNARD

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
J	Duplicate results and limits are expressed in terms of absolute difference.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

NORMS-SR	Misc.	NORMS		NORMS analysis performed by SRC
RADIO-ALPHA/BETA-SR	Water	Gross Alpha, Beta Radio Chemistry		ASTM D1943-90/D1890-90

** The indicated Method Reference is the closest nationally or internationally recognized reference for the applicable ALS test method. ALS methods may incorporate modifications from the specified reference to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SR	Saskatchewan Research Council - Saskatoon, Saskatchewan, Can

Chain of Custody Numbers:

md-cb1805154217507

GLOSSARY OF REPORT TERMS

Surr - Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.
MU: Measurement Uncertainty. The reported uncertainty is an expanded uncertainty calculated using a coverage factor of 2 which gives a level of confidence of approximately 95%.
Bias: The reported method bias is the average long term deviation from the target value for a long term reference or control sample, measured in percent. Zero values indicate no detectable method bias.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Quality Control Report

Ryan Smyth
ALS Laboratory Group
2559 29th St NE
Calgary, AB T1Y 7B5

Reference Materials and Standards:

A reference material of known concentration is used whenever possible as either a control sample or control standard and analyzed with each batch of samples. These "QC" results are used to assess the performance of the method and must be within clearly defined limits; otherwise corrective action is required.

QC Analysis	Units	Target Value	Obtained Value
Gross alpha	Bq/L	17.5	13.9
Gross alpha	Bq	0.40	0.51
Gross beta	Bq/L	11.7	10.9
Gross beta	Bq	0.35	0.23
Lead-210	Bq/L	20.9	19.0
Lead-210	Bq	1.99	1.78
Radium-226	Bq/L	21.4	17.5
Radium-226	Bq	2.13	1.99
Radium-228	Bq/L	0.38	0.41
Thorium-230	Bq/L	20.5	19.1
Thorium-232	Bq	0.203	0.186

Duplicates:

Duplicates are used to assess problems with precision and help ensure that samples within a given batch were processed appropriately. The difference between duplicates must be within strict limits, otherwise corrective action is required. Please note, the duplicate(s) in this report are duplicates analyzed within a given batch of test samples and may not be from this specific group of samples.

Duplicate Analysis	Units	Sample ID	First Result	Second Result
Gross alpha	Bq/L	19193	<0.43	<0.45
Gross alpha	Bq/L	19232	<2.6	<2.6
Gross beta	Bq/L	19193	0.19	<0.18
Gross beta	Bq/L	19232	<1.1	1.3
Lead-210	Bq/L	19231	<0.08	<0.08
Radium-228	Bq/L	19229	<0.2	<0.2
Radium-226	Bq/L	19227	0.03	0.03
Thorium-232	Bq/L	19232	<0.04	<0.04

All quality control results were within the specified limits and considered acceptable.

Roxane Ortmann - Quality Assurance Supervisor

APPENDIX H
Data Quality Evaluation Procedure

APPENDIX H

DATA QUALITY EVALUATION PROCEDURE

1 INTRODUCTION

The analytical data received from laboratories are used extensively to monitor soil and water quality and to make decisions and recommendations about work completed for a project. Because of this, it is necessary to ensure that the analytical data received and used by Matrix Solutions Inc. are of the highest quality. To accomplish this, a number of measures are used to assess the quality of the data. A description of these measures and subsequent criteria for evaluation are detailed in this document.

2 QUALITY CONTROL MEASURES

Quality control (QC) measures, including duplicate samples, field blanks, trip blanks, equipment blanks, and spiked samples, can provide valuable information with respect to sampling protocols and laboratory performance. An overview of these measures is provided in the following subsections.

2.1 Blind Samples

Samples collected by Matrix are each assigned a unique sample number and submitted to the laboratory as a blind sample using this number for identification to ensure that the sample location cannot be identified by the laboratory and bias the results. The sample number follows Matrix's sample naming protocol of SITE#YYMMDDXXX, where SITE# is a five-digit project code, YYMMDD is the sampling date, and XXX is a three-digit number indicating the sample number for that date. For example, 11428121006001 is the first sample collected for Project 11428 on October 6, 2012.

All samples, including QC samples, are given these blind sample numbers.

2.2 Duplicate Samples

Results obtained from duplicate sample analysis are used to monitor the reproducibility (precision) and the expected variability of the sampling method and laboratory analysis. A representative duplicate sample is obtained by collecting both field samples in duplicate, ensuring that the same sampling techniques are used and that the environmental conditions in which the samples are collected are as similar as possible. The duplicate samples are submitted as blind samples to the laboratory and are typically not given sequential unique sample numbers. A minimum of 10% of all samples is collected in duplicate.

3 EVALUATION CRITERIA FOR QUALITY CONTROL MEASURES

The Matrix data management group provides the initial review of all analytical data that are received from the laboratory. Results of the QC review are summarized electronically on the *Data Quality Checklist* that is saved along with the report of laboratory results. Evaluation criteria for the QC measures are provided in the following subsections.

3.1 Evaluation of Duplicate Sample Results

The criteria for evaluation of the field duplicate samples take into account the method detection limit (MDL), the reliable detection limit (RDL; 5 times the MDL), the absolute difference between the duplicate values, and/or the relative percent difference (RPD) calculated for each set of duplicate parameter analyses (U.S. EPA 1992, 1993; Zeiner 1994). As well, the criteria take into consideration the matrix of the sample and the concentration of the specific parameter (Zeiner 1994). Three data scenarios require different methods of evaluation.

For each set of duplicate parameter results:

Scenario 1 - if both results are <MDL

- The duplicate samples cannot be assessed using absolute difference or RPD; however, the duplicate samples show acceptable precision (both duplicate samples display no results above the MDL).

Scenario 2 - if one result is non-detected (<MDL) and the other result is positive (>MDL)

- The duplicates show acceptable precision if the positive result is ≤ 2 × RDL.

Scenario 3 - if both results are >MDL

- If both results are <RDL, then the duplicates show acceptable precision.
- If one result is <RDL and the other result is >RDL, then the duplicates show acceptable precision if the absolute difference between results is ≤ 2 × RDL.
- If both results are >RDL, then reproducibility is acceptable if the RPD is:

  a) <30% for inorganic waters
  b) <40% for solids and organics

The results of the field duplicate sample analyses are indicated on the *Data Quality Checklist,* and the results of the duplicate analyses are summarized in a project-specific QC sample results table.

The RPD is calculated as follows (Eaton et al. 1998):

$$RPD = \frac{Absolute\ difference\ \ between\ the\ two\ duplicate\ results}{Mean\ of\ \ the\ two\ duplicate\ results} \times 100$$

3.2 Evaluation of Laboratory Quality Control

The Canadian Association for Laboratory Accreditation approved environmental laboratories used by Matrix employ QC measures to ensure that the data released by the laboratory are as accurate and precise as possible. These measures include using laboratory blank samples, duplicate samples, and spiked samples, and measuring surrogate recoveries. Upon receipt of the analytical report, the data management group checks to ensure that the data have passed the laboratory's QC measures for blanks, duplicates, spikes, and surrogate recoveries. If a discrepancy is found, the laboratory is contacted

and asked to explain the discrepancy and, if necessary, a recheck is requested, or all of the samples are reanalyzed for the parameter of concern. The data management group also reviews holding time, extraction time, detection limits, and ion balances. Results of this evaluation are indicated on the *Data Quality Checklist* for each batch of samples analyzed.

3.2.1 Holding Time

Holding time is the maximum amount of time that a sample can be stored before analysis. The date that a sample was analyzed or extracted is noted on the report from the laboratory; the data management group checks to ensure that samples were analyzed or extracted within the holding time appropriate for that parameter. Data review results are indicated on the *Data Quality Checklist* for each batch of samples analyzed.

3.2.2 Extraction Time

Extraction time is the maximum amount of time that a sample can be stored before extraction, measured from the sample collection date. Extraction time for

- organics in water is 14 days
- volatile organics in soil is 7 days
- semi-volatile organics in soil is 14 days

3.2.3 Detection Limits

The data management group checks to ensure that the MDLs reported by the laboratory are adequate to meet the applicable assessment guidelines defined for the project. MDLs for a parameter should not be greater than the applicable guideline value for that parameter. If any MDLs are found to be higher than the applicable guideline, a second analysis may be requested at the discretion of the project manager.

3.2.4 Ion Balance

The data management group evaluates any ion balance reported by the laboratory to ensure that the balance is acceptable. For water and soil samples, it is Matrix's experience that ion balances between 90 and 110 for water and between 80 and 120 for soil are indicative of acceptable laboratory data quality. For soil samples, the cation/electrical conductivity (EC) ratio is also calculated on samples with EC >2 dS/m, and ratios between 9 and 15 are considered acceptable.

3.3 Historical Comparison of Data

The data management group compares laboratory results from a sample point to historical parameter levels, if available. Significant changes from historical levels are identified, and rechecks may be requested from the laboratory.

APPENDIX I
Quality Control Sample Results

APPENDIX I

QUALITY CONTROL SAMPLE RESULTS

In accordance with Matrix Solutions Inc.'s standard practices, quality control (QC) protocols were followed for the sampling program. The QC measures included collecting and analyzing QC samples and reviewing the laboratory QC sample results. A detailed description of these QC measures is provided in the Matrix Data Quality Evaluation Procedure (Appendix H).

During the course of the sampling program, duplicate sample sets were collected from well BH-103 and BH-105(R) in 2018. All samples were analyzed for general and inorganic parameters, dissolved metals, dissolved hydrocarbons, polycyclic aromatic hydrocarbons and NORM isotopes. The results of the QC samples are presented as follows:

- Table I1 (Field Parameters)
- Table I2(General and Inorganic Parameters)
- Table I3 (Dissolved Metals)
- Table I4 (Dissolved Hydrocarbons)
- Table I5 (Polycyclic Aromatic Hydrocarbons)
- Table I6 (Isotopes Duplicates)

The reproducibility of all parameters was judged to be acceptable in 2018, with the exception of:

- Reproducibility of nitrate-nitrogen and nitrite + nitrate-nitrogen in duplicate samples collected in July.

- Reproducibility of cadmium and manganese and boron, cobalt, lithium, titanium and uranium in duplicate samples collected in July and December, respectively.

TABLE I1

Water Quality Control Sample Results - Field Parameters

Tervita Corporation

Block A-18-088-20 W6M

Sample Point	Sample Date	MSI Sample Number	Temp °C	Field pH	Field EC µS/cm
BH-103	27-Jul-18	17507180727009	16.3	5.98	4530
BH-103	27-Jul-18	17507180727010	16.3	5.98	4530
Detection Limit (DL)			1	---	10
Reliable Detection Limit (RDL)**			5	---	50
Absolute Difference*			0	0	0
Absolute Relative Percent Difference (RPD)*			0	---	0
Duplicate Sample Results Evaluation			Good	Good	Good

Notes:

--- - not applicable

* - non-detectable concentrations are assessed at 95% of the detection limit

** - the reliable detection limit (RDL) or practical detection limit (PDL) is defined as 5 times the DL

Good - evaluation indicates acceptable reproducibility

Poor - evaluation indicates poor reproducibility

Evaluation of Duplicate Analyses:

- reproducibility is unacceptable if RPD is > 30% for inorganic waters and > 40% for soils and organics
- if RPD is not applicable (---), reproducibility is evaluated based on Absolute Difference (unacceptable if > 2 x RDL)
- if Absolute Difference is not applicable (---), reproducibility is evaluated based on the parameter concentration (unacceptable if > 2 x RDL)
- pH is evaluated based on Absolute Difference (unacceptable if > 0.5)

Executive Summary

Clifton Associates Ltd. was retained by Canadian Crude Separators Inc. to conduct a preliminary hydrogeological siting suitability investigation in Block A, Section 8, Township 88, Range 20, West of Sixth Meridian. Canadian Crude Separators Inc. is proposing to construct a Secure Landfill at the Site as defined in the British Columbia Waste Management Act, Special Waste Regulations.

The objective of this investigation was to assess the suitability of the proposed Site with respect to requirements for landfill siting as required by British Columbia Ministry of Environment Water, Land and Air Protection Waste Management Act, Special Waste Regulation and other applicable documents.

Development of the regional setting was established from data collected within a 15 km radius of the Site (Study Area). The Study Area is bounded to the north by the Blueberry River, to the southwest by the Alaska Highway and to the east by the Beatton River. The Study Area lies at the western edge of the Alberta Plateau of the Great Plains of North America. The predominant landforms in the Study Area are characterized as rolling uplands and low relief platforms.

A total of 16 surface water bodies were identified within the Study Area. The nearest permanent surface water body to the Site is an unnamed creek located 1.4 km north of the Site. Drainage from the northern portion of the Study Area flows north into the Blueberry River. Drainage from the southern portion of the Study Area flows south into the Beatton River.

Based on a review of available regional geological information the Study Area is underlain by glacial till and glaciolacustrine deposits associated with glacial Lake Peace. Mathews (1978) indicated the bedrock surface is likely located within approximately 15 m of ground surface and would be consistent with the surface topography in the Study Area.

The Dunvegan Formation is the youngest bedrock unit in the Study Area. The lithology of the Dunvegan Formation consists of marine and non-marine beds ranging from clay shale to boulder conglomerate. In the Study Area, the lithology consists primarily of interbedded clay shale, mudstone and sandstone. The

Dunvegan Formation in the Study Area ranges in thickness from 50 m to 250 m thick.

Based on available hydrogeology information within the Study Area, no known major aquifers were identified. A search of British Columbia Ministry of Water, Land, and Air Protection water well records indicated 14 water wells have been drilled within approximately a 16 km radius of the Site. The closet known water well is located approximately 8.5 km south of the Site.

The hydrogeological siting suitability investigation consisted of a bore hole drilling and test pit excavation program, topographic survey of the Site, laboratory geotechnical soil testing, and groundwater analytical testing. Subsurface conditions were investigated by seven bore holes drilled between 7 m and 20 m below ground surface in November 2001. Piezometers were installed in bore holes completed at the Site to establish shallow groundwater conditions and piezometric conditions at depth.

Laboratory testing was performed to determine soil classification, in-situ water content, unified soil classification, grain size distribution and hydraulic conductivity of selected soil samples. Groundwater monitoring was conducted in December 2001 and January 2002. A total of five field response tests were conducted on selected piezometers. A groundwater sampling program was conducted on 18 January 2002.

The topography of the Site is sloped from the southeast to northwest at approximately 45 horizontal to 1 vertical (45:1). Approximately 30 m of vertical relief is present within the proposed Secure Landfill Site.

Stratigraphy at the Site generally consists of clay or silt overlying clay till to approximately 20 m below ground surface. In two bore holes, a clay and silt stratum was encountered beneath the till at a depth of between 13.8 m and 15.1 m below ground surface and extended to the depth of exploration.

The groundwater monitoring results indicate the presence of a shallow water table that varies between 1.8 m below surface to 3.8 m below existing surface. The depth to groundwater is deepest in the north central portion of the Site. Groundwater flow is directed horizontally towards the north west under a hydraulic gradient of 0.03 m/m (shallow) and 0.04 m/m (deep). Stacked piezometers located at the Site

and in the vicinity of the Site indicate a downward vertical gradient ranging between 0.4 m/m and 1.3 m/m.

The laboratory hydraulic conductivity tests conducted by Clifton Associates Ltd. on selected undisturbed samples in the clay till ranged from 6×10^{-9} cm/s to 2×10^{-8} cm/s. The hydraulic conductivity of the clay till as determined from the field response tests ranged from 3×10^{-7} cm/s to 8×10^{-7} cm/s.

The laboratory results of selected groundwater samples collected from the Site suggest that the parameter concentrations are reflective of natural background conditions and groundwater within 20 m of surface would not be considered potable for aesthetic reasons due to high sulphate, sulphide, and TDS concentrations. No discernable water quality variations were observed between groundwater samples collected from the shallow piezometers and groundwater samples collected from the deeper piezometers.

The proposed landfill Site meets all General Landfill Siting Requirements. The proposed landfill Site also meets all Secure Landfill Siting Requirements with the exception of the depth of unsaturated soil above the seasonally high water table.

Development of the proposed Site as a Landfill at or below the seasonally high water table must address the following potential issues:

- Seepage into the Landfill; and
- Potential impact of shallow groundwater in the vicinity of the proposed Landfill

Given the low hydraulic conductivity of the near surface soils (0 m to 20 m below surface) seepage rates would be low. An engineered liner and leachate collection system would mitigate any potential seepage issues related to the proposed Landfill development.

Based on the results of the Siting Suitability Investigation, near surface soils have low hydraulic conductivity and no appreciable water resource has been identified below the Site (within 20 m below surface) or within several kilometers of the proposed Site. Groundwater and potential impact migration rates would be in the order of centimeters per year based on an advective dominant flow system. Likely diffusion would be a predominant process given the low hydraulic flow system present at the Site.

Based on the Hydrogeologic Siting Suitability Investigation the Site is considered favorable for the proposed Landfill development based on the following:

- Meets all siting requirements in the British Columbia Waste Management Act, Special Waste Regulations with engineered design alternatives to mitigate the noted exceptions;
- No surface water courses and/or major drainage courses are present in the vicinity of the Site;
- The near surface soils (0 m to 20 m below surface) have a low hydraulic conductivity; and
- No appreciable groundwater resource has been identified below the Site (within 20 m of surface) or within several kilometers of the Site.

1.0 Introduction

Clifton Associates Ltd. was retained by Canadian Crude Separators Inc. to conduct a preliminary hydrogeological siting suitability investigation at km 11 of the Mile 73 (Beatton River) Road off the Alaska Highway. Canadian Crude Separators Inc. is proposing to construct a Secure Landfill at the Site.

1.1 Site Location

The Site is located approximately 45 km northwest of Fort St. John, British Columbia, in Block A, Section 8, Township 88, Range 20, West of Sixth Meridian. Block A consists of an area of approximately 72 ha (1200 m east-west and 600 m north-south) in the northwest portion of Section 8. Drawing No. 1 shows the location of the proposed landfill Site.

Located directly northwest of the Site in Block A, Section 18, Township 88, Range 20, West of Sixth Meridian is the Silverberry Environmental Waste Treatment Facility. This facility is currently owned and operated by Canadian Crude Separators Inc. The facility is operated as a Special Waste Treatment Facility.

1.2 Objective

The objective of this investigation was:

- To assess the suitability of the proposed Site with respect to requirements for landfill siting as required by British Columbia Ministry of Environment Water, Land and Air Protection Waste Management Act, Special Waste Regulation and other applicable documents.

1.3 Scope of Work

The scope of work for this investigation was:

- To review the regional geology and hydrogeology based on available information from published reports and data bases;
- To drill seven bore holes and install seven piezometers to assess soil and groundwater conditions;

- To excavate six test pits on the west half of Block A;
- To conduct geotechnical soils testing, including laboratory hydraulic conductivity testing;
- To monitor piezometric conditions and conduct in-situ hydraulic conductivity testing;
- To conduct groundwater sampling to characterize groundwater quality; and,
- To compile a report documenting the findings and provide recommendations with respect to the suitability of the Site for siting a Secure Landfill.

2.0 Project Description

Canadian Crude Separators proposes to construct a Secure Landfill at the Site as defined in the British Columbia Waste Management Act, Special Waste Regulations (01 April 1988). Details with respect to specific waste streams are provided in the Environmental Impact Assessment. Specific detailed design components of the landfill have not been established; however, initial concepts include a below grade landfill with liner and leachate collection system.

3.0 Previous Investigation

Previous investigation work conducted at the Site available for review included the following:

- AGRA Earth and Environmental Group – Preliminary Site Assessment Proposed Landfill/Landfarm Site, Mile 73, Alaska Highway, British Columbia, February 1993.

The above noted report was prepared for the existing Silverberry Environmental Waste Treatment Facility northwest of the Site. The investigation consisted of drilling bore holes and installing piezometers in Block A, Section 18-Twp88-Rge20-W6M northwest of the Site and Block A Section 17-Twp88-Rge20-W6M immediately to the north of the Site. Relevant data from the AGRA report has been summarized in this report for completeness.

AGRA provided subsequent correspondence (letter dated 31 March 1994) related to BC Environments requests in a letter dated 15 February 1994. The AGRA correspondence provided additional groundwater monitoring data and estimated hydraulic conductivity values based on the monitor well groundwater level data.

Bore hole logs from the AGRA investigation and a copy of correspondence provided to Rudiger Enterprises Ltd. dated 31 March 1994 are included in Appendix A.

4.0 Regional Setting

For discussion purposes, development of the regional setting was established from data collected within a 15 km radius of the Site (Study Area) as shown on Drawing No.1. In general the Study Area is bounded to the north by the Blueberry River, to the southwest by the Alaska Highway and to the east by the Beatton River. A BCRAIL line is located approximately in the center of the Study Area running north south. Specific data with respect to climate was collected from the nearest weather station (Ft. St. John) and Regional Geology and Hydrogeology information was collected for the Charlie Lake Region (NTS Map 94A).

Drawing No. 2 presents an aerial photograph covering the immediate vicinity around the Site (4 km radius) at a scale of 1:25,000.

4.1 Geomorphology and Topography

The Study Area lies at the western edge of the Alberta Plateau of the Great Plains of North America. The predominant landforms in the Study Area are characterized as rolling uplands and low relief platforms. Located at the north edge of the Study Area is a stream cut trench now containing the Blueberry River.

The Study Area elevation generally ranges between 650 m above sea level (ASL) to 850 m ASL. The topographic high within the Study Area is located near the Alaska Highway. Generally, the north portion of the Study Area slopes northwards towards the Blueberry River with approximately 200 m of elevation change. The southern portion of the Study Area generally slopes south towards the Peace River with approximately 100 m of elevation change.

4.2 Climate

The climate of the Peace River Region of British Columbia is characterized by Catto (1991) as continental boreal, having *cold winters (mean January temperature – 18°C), warm summers (mean July temperature 17°C), moderate annual precipitation (600 mm), and prevailing westerly winds.* Climate normals for the period 1951 to 1980 for Fort St. John, the nearest station for which records are available, indicate mean annual precipitation of 494 mm, a mean January temperature of -18°C and a mean July temperature of 16°C. Evapo-transpiration data indicates potential evaporation of 545 mm/year. The evapo-transpiration at the Landfill Site is expected to be greater than precipitation.

4.3 Surface Water Bodies

A summary of surface water bodies located within the Study Area is presented in Table 4.1. A total of 16 surface water bodies were identified within the Study Area. The nearest permanent surface water body to the Site is an unnamed creek located 1.4 km north of the Site. Creeks are located north, west and southeast of the Site and two small lakes (sloughs) are located approximately 3.4 km east of the Site. Drawing No. 2 identifies the location of surface water bodies located within 4 km of the Site.

4.4 Regional Hydrology

Drainage patterns within the Study Area are primarily dendritic. Drainage from the northern portion of the Study Area flows north within approximately 7 major creeks which ultimately discharge into the Blueberry River. Drainage from the southern portion of the Study Area flows south within approximately 2 major creeks which directly discharge into the Beatton River. Two additional major creeks collecting drainage from the south portion of the Study Area discharge into Charlie Lake which flows into the Beatton River.

Localized peat and/or bog areas have been identified within the eastern portion of the Study Area approximately 3.5 km east of the proposed Landfill Site.

The major water course within the Study Area is the Blueberry River located approximately 7 km north of the Site. The elevation of the Site is greater than 100 m

above the elevation of the Blueberry River. It is unlikely that the site is located within the Blueberry River 200 year floodplain.

4.5 Regional Geology

Regional geologic information for the Study Area was compiled from the following sources:

- Quaternary Stratigraphy and Geomorphology of Charlie Lake (94A) Map-Area, British Columbia, Mathews, W.H., 1978.
- Lower Cretaceous Fort St. John Group and Upper Cretaceous Dunvegan Formation of the Foothills and Plains of Alberta, British Columbia, District of Mackenzie and Yukon Territory. Geological Survey of Canada, Stott, D.F., 1982.
- Water well records within a 15 km radius of the Site

4.5.1 Bedrock Geology

Mathews (1978) indicates that the bedrock surface is likely within approximately 15 m of ground surface within the Study Area. The bedrock surface topography would be consistent with the surface topography in the Study Area (relatively low relief).

Based on a review of available information, relevant Bedrock Geology within the Study Area consists of the following (oldest to youngest):

Bedrock – Cretaceous

Gething Formation

Fort St. John Group – consisting of Buckinghorse, Sikanni and Sully Formations

Dunvegan Formation

Gething Formation

The Gething Formation is the oldest Cretaceous unit in the Study Area. The lithology of the Gething Formation consists of fine to coarse grained, calcareous, carbonaceous sandstone, coal, and shale.

Fort St. John Group

Buckinghorse Formation

The Buckinghorse Formation is the oldest unit in the Fort St. John Group. The lithology consists of dark grey to black shale or mudstone. Bentonite layers are found in the lower part of the formation. The upper Buckinghorse mudstones grade into the sandstones of the Sikanni Formation. The Buckinghorse Formation in the Study Area ranges from 700 m to 800 m thick.

Sikanni Formation

The Sikanni Formation may or may not be present in the Study Area. The lithology consists of three to four fine grained, finely laminated sandstone units separated by silty shale. The sandstone grades into interbedded silty sandstone, siltstone and shale in an eastward direction from the foothills. The Sikanni Formation in the Study Area ranges from 0 m to 150 m thick.

Sully Formation

The Sully Formation is the youngest unit of the Fort St. John Group. The Sully Formation consists of three members. The lithology of the basal member consists of silty, dark grey to black mudstone. The middle member consists of mudstone. The upper member consists of interbedded fine-grained sandstone, siltstone and mudstone. The mudstone is silty, and dark grey to black. The siltstone and fine-grained sandstone are laminated in 12 mm to 75 mm beds. The Sully Formation in the Study Area ranges in thickness from 250 m to 300 m.

Dunvegan Formation

The Dunvegan Formation is the youngest bedrock unit in the Study Area. The lithology of the Dunvegan Formation consists of marine and non-marine beds ranging from clay shale to boulder conglomerate. Near the Rocky Mountain

foothills, the Dunvegan Formation consists of conglomerates. In the Study Area, the lithology consists primarily of interbedded clay shale, mudstone and sandstone. The Dunvegan Formation in the Study Area ranges in thickness from 50 m to 250 m thick.

4.5.2 Glacial Geology

Based on a review of available information, Glacial Geology within the Study Area consists of the following:

Glacial – ***Quaternary***

Tills and glaciolacustrine deposits

Glacial and Glaciolacustrine Deposits

The Study Area is underlain by glacial till and glaciolacustrine deposits associated with glacial Lake Peace. In the Fort St. John area surficial materials were derived from the Cordilleran ice and Laurentide ice sheets. During the retreat of the ice sheets, Lake Peace was formed and glaciolacustrine deposits were formed in portions of the Study Area. Along the Blueberry River in the northern portion of the Study Area terrace deposits of sand, gravel, and silt are found.

The till in the Study Area is described as being *massive, clay rich, containing scattered pebbles and boulders* (Mathews, 1978). The till in the Study Area contains boulders derived from the Canadian Shield. West of the Alaska Highway, the till contains boulders derived from the Rocky Mountains.

Glaciolacustrine deposits overlay till deposits in most of the Study Area, ranging from a thin veneer in the immediate vicinity of the Site to thick deposits in low lying areas to the east and north of the Site. The glaciolacustrine deposits are predominantly clay, although silt deposits are commonly found within the clay deposits. Sand and gravel, as glaciolacustrine deposits, are generally only found along the shorelines of the former glacial lakes. The clay and silt in the deposits is varved reflecting seasonal differences in depositional patterns.

4.5.3 Geology From Water Well Records

A search of British Columbia Ministry of Water, Land, and Air Protection water well records indicated 14 water wells have been drilled within approximately a 15 km radius of the Site. Table 4.2 provides a summary of the water wells drilled in the area. Drawing No. 3 shows the location of the water well locations to the nearest section.

Based on the water well records, bedrock was typically encountered at depths of between 6 m and 18 m below ground surface within the Study Area where indicated. Based on the water well logs the bedrock material consisted of sandstone or clay shale. The surficial material in all the water wells was clay. The water well logs were not sufficient in detail to determine if the surficial clay is of glacial origin.

4.6 Regional Hydrogeology

Limited information was available with respect to hydrogeology within the Study Area. No known major aquifers were identified. Water bearing units were identified based on a review of regional geologic information and available water well records collected within the Study Area.

Bedrock Aquifers

Within the Study Area bedrock aquifers may be present in sandstone units of the Dunvegan Formation. Of the 14 water wells records collected within the Study Area only one record contained well completion data. This one well (located approximately 10 km west of the Site), is reportedly completed in sandstone, likely of the Dunvegan Formation. The sandstone in the driller's log was recorded to be from 8 m to 11 m below ground surface. Groundwater quality and quantity in the Dunvegan Formation is not known.

Sandstone of the Sikanni Formation of the Fort St. John Group, which may or may not be present within the Study Area at a depth of greater than 300 m, may contain quantities of developable groundwater. The quality of groundwater in the Sikanni Formation is not known.

Bedrock Aquitards

Clay shale and mudstone of the Dunvegan Formation and Fort St. John Group are expected to be present within the Study Area. The thickness of these aquitards is not known.

Pre-Glacial and Inter-till Aquifers

Matthews (1978) reports that pre-glacial aquifers of Saskatchewan sands and gravels and inter-till aquifers may be present within the Study Area. However, there is no indication in the available water well records collected within the Study Area of pre-glacial sands or gravels.

Surficial Drift Aquifers

Surficial drift aquifers include those sands and gravels deposited over the last glacial till by processes including meltwater and wind. Terrace deposits of silt, sand or gravel are located along the Blueberry River located in the northern portion of the Study Area. Wells in Township 113 (exact location not provided on well records), although not shown as being located along the Blueberry River, likely are withdrawing water from the terrace deposits along the Blueberry River. Shoreline features which may contain sand or gravel were identified by Mathews (1978) 5 km southwest of the Site. Mathews also identified drumlinized features within the Study Area which may contain localized sand and gravel deposits.

Surficial Drift Aquitards

The till and clayey glaciolacustrine deposits are generally expected to have low hydraulic conductivities within the Study Area. Based on water well records the surficial drift thickness in the Study Area likely ranges from 5 m to greater than 20 m.

4.7 Water Well Inventory

A search of British Columbia Ministry of Water, Land, and Air Protection water well records indicated 14 water wells have been drilled within approximately a 15 km radius of the Site. No field verification survey was undertaken to determine how many of the wells are actively being used for water withdrawal.

Table 4.2 provides a summary of the water wells drilled in the area. Drawing No. 3 shows the location of the water well locations to the nearest section. The closet known water well is located approximately 8.5 km south of the Site. All other water wells of record are located greater than 10 km from the Site. Appendix B contains a copy of the water well search results.

4.8 Regional Physical/Environmental Constraints

Based on a review of aerial photographs, no slope failures were identified within 100 m of the Site. No national, provincial, regional or municipal parks, wildlife management areas, sanctuary, ecological reserves, etc. were identified within the Study Area. The only community within the Study Area is the Blueberry River First Nations Reserve, located approximately 7.5 km north of the Site.

The Study Area is located in an region with a peak horizontal ground acceleration of less than 4 Percent of gravity with a probability of exceedance of 10 Percent in 50 years based on the National Building Code of Canada. Based on the geologic summary of the *Quaternary Stratigraphy and Geomorphology of Charlie Lake (94A) Map-Area, British Columbia, Paper 76-20* prepared by Mathew (1978), no Holocene faults were identified in the Study Area.

5.0 Site Investigation

5.1 Purpose

The purpose of the investigation was to establish existing subsurface conditions at the Site, with respect to hydrogeology, soil properties, and groundwater chemistry. The investigation consisted of a bore hole drilling and test pit excavation program, topographic survey of the Site, laboratory geotechnical soil testing, and groundwater analytical testing.

5.2 Bore Hole Drilling and Test Pit Excavation

Subsurface conditions were investigated by seven bore holes drilled between 26 November and 28 November 2001 and by six test pits excavated on 29 November 2001 at the locations shown on Drawing No. 4. The bore hole locations were selected to provide a reasonable representation of the subsurface conditions across the proposed Secure Landfill Site (Block A Section 8-Twp88-

Rge20-W6M). The test pit program was focused on the western portion of the proposed Site as initial development is planned in this area.

Bore holes were drilled with a B-53 truck mounted drill rig using 150 mm diameter solid stem continuous flight auger. Bore hole depths ranged from 7.3 m to 21.0 m below surface. Test pits were excavated with a Cat 225 LC tracked excavator. Test pit depths ranged from 4.6 m to 5.5 m below surface. Representative disturbed and undisturbed samples were recovered for laboratory analysis. Samples were recovered at maximum 1.5 m intervals or at changes in stratigraphy.

5.3 Piezometer and Monitor Well Construction Details

Piezometers were installed in bore holes completed at the Site to establish shallow groundwater conditions and piezometric conditions at depth. Shallow (BH101 and BH107) and Deep piezometers (BH102, BH105 and BH106) were installed at depths of approximately 7 m to 20 m below surface. Shallow monitor wells (BH103 and BH104) were installed at depths of approximately 7 m to 7.5 m below surface.

Standpipe piezometers were constructed with 50 mm diameter Schedule 40 PVC pipe and a machine slotted PVC (No. 10 slot) screen. The machine slotted screen sections varied from 1.5 m to 3 m in length. The piezometer screen was surrounded with silica sand, sealed with bentonite and backfilled to surface with a mixture of sand and bentonite chips. Above ground protective steel casings were placed over the completed piezometers.

Monitor wells were constructed with 50 mm diameter Schedule 40 PVC pipe with a machine slotted PVC (No. 10 slot) screen. The machine slotted screen sections varied from 5.5 m to 6 m in length. The monitor well screen was surrounded with silica sand, sealed with bentonite and backfilled to surface with a mixture of sand and bentonite chips. Above ground protective steel casings were placed over the completed monitor wells.

5.4 Laboratory Testing Program

Soil

Laboratory testing was performed to determine soil classification, in-situ water content, unified soil classification, grain size distribution and hydraulic conductivity

of selected soil samples. Two bulk samples were tested to determine standard Proctor density and hydraulic conductivity. Observations made during the field investigation, visual descriptions of the soils, and the results of laboratory tests are presented in the Bore Hole Logs and the Summary of Sampling and Laboratory Test Data appended to this report.

A total of five hydraulic conductivity tests were conducted on selected undisturbed soil samples. All five selected soil samples (IH12, IH18, IH47, IH62 and IH74) were tested in the Clifton Associates Ltd. laboratory using a falling head test methodology. The undisturbed soil samples were trimmed and placed in consolidation rings under a seating pressure of approximately 12 kPa. The falling head tests were run using an average hydraulic gradient ranging from 2.5 to 7.2. Similarly, two bulk (composite samples) soil samples were tested for hydraulic conductivity after the samples were compacted to approximately 95 Percent standard proctor density and 2 Percent above optimum moisture content. The hydraulic conductivity of the two bulk samples were determined using the falling head test methodology.

A duplicate sample (IH12) was submitted to EBA Engineering Consultants Ltd. for determination of the hydraulic conductivity using a constant head test methodology. The constant head test on sample IH12 was conducted under a gradient of 55.

Groundwater

A total of six groundwater samples were obtained from the piezometers and monitor wells (three samples representing the shallow groundwater from BH101, BH103, and BH107; and three samples representing the deep groundwater from BH102, BH105, and BH106) and submitted to Enviro-Test Laboratories in Edmonton, Alberta. Analyses were conducted to characterize the shallow and deeper groundwater chemical concentrations with respect to hydrocarbons, major ions, metals, inorganics, phenols, total organic carbon, and nutrients.

5.5 Groundwater Monitoring and Sampling Program

Groundwater monitoring was conducted on 10 December 2001, 17 December 2001, and 12 January 2002. The monitoring program consisted of measuring the depth to groundwater surface using an electronic water level indicator.

Groundwater samples were obtained from all piezometers and monitor wells installed as part of this investigation, with the exception of monitor well BH104. BH104 was dry at the time of groundwater sampling. The groundwater sampling program was conducted on 18 January 2002.

All groundwater samples were collected at the completion of the field rising head tests with the exception of the sample collected from BH107. Prior to collecting the groundwater samples, each well had at least three well volumes of groundwater removed or the well was bailed dry.

A groundwater sample was collected from each well using a dedicated disposable plastic bailer. The samples were placed into appropriate bottles supplied by the laboratory. Where required, preservatives were added to the sample. The sample bottles were stored and transported in coolers containing ice.

5.6 Field Hydraulic Response Tests

Field hydraulic response tests were conducted to estimate the in-situ hydraulic conductivities of the subsurface soils at the Site. The field response tests were conducted on BH101, BH102, BH103, BH105 and BH106.

The hydraulic response tests were initiated on 12 January 2002 and completed on 18 January 2002. The tests were conducted by bailing water from the well and recording the recovery at regular intervals over the six day time period. The data recorded was assessed according to the Bower and Rice methodology for determination of hydraulic conductivity.

The methodology used in conducting the hydraulic response tests, the calculations used, and assumptions made in estimating the hydraulic conductivities from the field data are provided in Appendix C.

5.7 Survey

A topographic survey was conducted by McElhanney Associates Ltd. of Fort St. John and included the following; the Site, Block A, Section 18-Twp88-Rge20-W6M north west of the Site, Block A Section 17-Twp88-Rge20-W6M north of the Site and Block B, Section 7-Twp88-Rge20-W6M directly west of the Site. Survey of bore hole and test pit locations were included as part of the work conducted by

McElhanney with elevations determined relative to geodetic datum and locations determined relative to the UTM co-ordinate system.

6.0 Site Investigation Results

6.1 Topography

The topography of the Site is sloped from the southeast to northwest at approximately 45 horizontal to 1 vertical (45:1). Approximately 30 m of vertical relief is present within the proposed Secure Landfill Site.

6.2 Surface Drainage

The Site is cleared with the surrounding land wooded. Drainage from the Site is in a northwesterly direction towards unnamed creeks located 1.4 km north and 1.4 km west of the Site. These creeks flow into Blueberry River located approximately 6.3 km north of the Site.

A surface water divide running in a northeast – southwest direction is located within 200 m of the southeast corner of the proposed Landfill Site. Drainage on the south side of the divide is southward towards Stoddart, St. John and Roseland Creeks. Drawing No. 2 shows the location of nearby surface drainage features.

6.3 Stratigraphy

Drawing No. 4 shows the location of representative stratigraphic cross sections and the location of the bore holes including the bore holes drilled in 1992 as part of the AGRA investigation. Drawing Nos. 5 and 6 present stratigraphic cross sections A-A' and B-B' respectively.

Stratigraphy at the Site generally consists of clay or silt overlying clay till consistent with the previous investigation conducted in the vicinity of the Site. The surficial clay or silt was absent in bore holes BH102, BH105, and BH106 and in all the test pits. In bore hole BH105 a clay and silt stratum was encountered beneath the till at a depth of 13.8 m below ground surface and extended to the depth of exploration at 21.0 m. In bore hole BH106 a clay stratum was encountered beneath the till at a depth of 15.1 m below ground surface, extending to the depth of exploration at 19.2 m. Based on the bore holes drilled on the proposed Site, bedrock of the

Dunvegan Formation was not encountered. However in the 1992 investigation conducted by AGRA, BH92-2 indicated clay stone at a depth of 3.5 m. Bore hole BH107 drilled in the vicinity of BH92-2 did not conclusively identify bedrock material.

Surficial Clay or Silt

The surficial clay and silt ranged in thickness from 0.4 m to 1.0 m when encountered. The surficial deposits were primarily clay in the western portion of the Site (BH101 and BH104) coinciding with areas of lower elevations. The surficial deposits were primarily silt in the eastern portion of the Site (BH103 and BH107) coinciding with areas of higher elevation. The surficial clay encountered at the western portion of the Site contained a trace of silt and a trace of sand. It was moist and firm to stiff in consistency. The surficial silt encountered at the eastern portion of the Site contains some sand and a trace of clay. The silt was dry to moist.

Clay Till

Clay till was encountered in all bore holes and test pits from surface (except where surficial clay and silt was encountered) and extended to the maximum depth of the investigation (approximately 20 m) in all bore holes and test pits except for BH105 and BH106. The till was silty, with some sand and a trace of gravel. It was moist and firm to stiff in consistency. The till varied in color from dark greyish brown to light grey. The till exhibited signs of oxidation at all depths encountered. The till was jointed. Shale, sandstone and coal inclusions were commonly identified in the till. Based on the bore holes completed at the Site no significant inter till sand and/or gravel lenses were identified in the till stratum. Fine grained sand lenses and silt lenses were sporadically encountered within the till; however, the presence of these lenses appeared to be localized and not extensive.

Unified soil classification tests, sieves and/or hydrometers were conducted on eight samples of the till stratum. Table 6.1 presents a summary of the grain size analysis conducted on the eight selected samples of till. The till had a minimum of 76 Percent fines, a maximum of 99 Percent fines, and an average of 85 Percent fines. Samples on which hydrometers were performed indicated 31 Percent to 78 Percent clay sized particles and 21 Percent to 47 Percent silt sized particles. The minimum sand content in the till was 1 Percent, the maximum was 19 Percent and the average

was 13 Percent. The till had a trace of gravel with gravel content ranging from 0 Percent to 12 Percent and an average of 3 Percent. The till has low plasticity, with a minimum plastic limit of 16 Percent and maximum of 27 Percent, and an average of 19 Percent and a minimum liquid limit of 27 Percent, a maximum of 51 Percent and an average of 35 Percent.

Clay and Silt

In bore hole BH105, from 13.7 m to the depth of exploration (21.0 m below surface) a clay and silt stratum was encountered. A Unified Soil Classification test was performed on one sample of the clay and silt. The results indicated a low plasticity clay with plastic limit of 21 Percent, liquid limit of 46 Percent and a plasticity index of 24 Percent. The clay sample was composed of 1 Percent sand, 42 Percent silt and 57 Percent clay sized particles.

In bore hole BH106 from 15.1 m to the depth of exploration (19.2 m below surface), a clay stratum was encountered. A Unified Soil Classification test was performed on one sample of the clay stratum. The results indicated a low plasticity clay with plastic limit of 14 Percent, liquid limit of 23 Percent and a plasticity index of 9 Percent. The clay sample was composed of 35 Percent sand, 38 Percent silt and 27 Percent clay sized particles.

Based on visual and laboratory testing results the clay and silt layers identified at the bottom of BH105 and BH106 are not considered to be bedrock.

6.4 Piezometric Conditions

Groundwater Levels

Groundwater levels measured in all wells at the Site and in the vicinity of the Site are summarized in Table 6.2. Groundwater elevations are also shown in Section A-A' and B-B' in Drawings No. 5 and 6. Drawing No. 7 shows a contour map of depth to groundwater below existing ground surface.

The groundwater monitoring results indicate the presence of a shallow water table that varies between 1.8 m below surface to 3.8 m below existing surface. The depth to groundwater is deepest in the north central portion of the Site. Bore hole BH104

completed in the northwest corner of the Site to a depth of 7 m was dry during monitoring conducted in December 2001 and January 2002.

Direction of Flow and Gradients

Drawing Nos. 8 and 9 indicate groundwater elevation contours of the shallow piezometric conditions (7 m below surface) and deep piezometric conditions (20 m below surface), respectively.

Groundwater flow is directed horizontally towards the north west under a hydraulic gradient of 0.03 m/m (shallow) and 0.04 m/m (deep). Stacked piezometers (BH101 and BH102) located in the south west corner of the Site indicated a downward vertical gradient of 1.3 m/m. Stacked piezometers completed in 1992 by AGRA north (92-8) and west (92-4) of the Site indicate downward vertical gradients of 0.7 m/m and 0.4 m/m, respectively.

6.5 Hydraulic Conductivity Testing

Laboratory

Table 6.3 below provides a summary of the laboratory hydraulic conductivity results completed on selected soil samples collected from the Site. Table 6.3 also presents the results of the laboratory hydraulic conductivity testing results from the AGRA investigation conducted in 1992 north west of the Site.

The laboratory hydraulic conductivity tests conducted by Clifton Associates Ltd. on selected undisturbed samples in the clay till ranged from 6×10^{-9} cm/s to 2×10^{-8} cm/s. These values are similar to the results obtained in the 1992 AGRA investigation which indicated the laboratory hydraulic conductivity of selected till samples ranged from 4×10^{-9} cm/s to 6×10^{-9} cm/s. The average laboratory hydraulic conductivity from all till samples tested is 7×10^{-9} cm/s. The laboratory hydraulic conductivity of the clay and silt sample collected from BH105 was 3×10^{-7} cm/s.

Two remolded bulk (composite samples) soil samples were compacted to approximately 95 Percent standard proctor density and 2 Percent above optimum moisture content. The remolded samples, considered to be representative of

potential liner construction material, had hydraulic conductivity values of 9×10^{-9} cm/s to 1×10^{-8} cm/s from TP201 and TP203, respectively.

Field Response Tests

Table 6.4 provides a summary of the field hydraulic conductivity results. Appendix C resents the response test plots. The field hydraulic conductivity testing was completed only once for each well. To verify the field response test results presented below, two additional response tests should be conducted on each well.

The hydraulic conductivity of the clay till as determined from the field response tests ranged from 3×10^{-7} cm/s to 8×10^{-7} cm/s. The field response test conducted in piezometer BH103 was interpreted to be dominated by flow from a 0.6 m silt lens within the Till and the screen length in the Bower and Rice analysis was modified to reflect this interpretation. The hydraulic conductivity of the clay stratum in BH106 as determined from one field response test was 1×10^{-7} cm/s.

Based on the field hydraulic conductivity test results presented in Table 6.4, a one to two order of magnitude increase in hydraulic conductivity of the Till was observed when compared to the laboratory hydraulic conductivity results. This inherent discrepancy is expected based on differences between measuring a bulk (field) and matrix (laboratory) hydraulic conductivity.

Included in Appendix A are field hydraulic conductivity values estimated by AGRA based on monitoring results conducted in 1993 and 1994 on the AGRA wells installed in 1992. The field hydraulic conductivity values estimated by AGRA are approximately one to two orders of magnitude lower than the hydraulic conductivity values estimated from the field response tests conducted by Clifton Associates Ltd. in 2002. The variation in results are likely are result of two issues:

- The hydraulic conductivity values estimated by AGRA are based on groundwater levels measured over a significant period of time (one year) rather than regular interval monitoring consistent with appropriate response testing methodologies. Estimated hydraulic conductivities using the monitoring data presented may not have accounted for a seasonal fluctuation in groundwater levels.

- The hydraulic response tests conducted in 2002 may not have been initiated under static conditions. Long term monitoring is required to confirm static levels before additional hydraulic response tests are conducted.

6.6 Chemistry Results

The groundwater chemical analyses results for general water quality parameters, metals, and hydrocarbons are presented on Tables 6.5, 6.6, and 6.7 respectively. The aquatic life criteria has been presented for comparison purposes. A trilinear plot (piper plot) of the major ion chemistry is presented on Figure 1. The results indicate that the groundwater is predominately a sulphate type water with no dominant cation with total dissolved solids (TDS) concentration ranging from 1160 mg/L in BH107 to 7060 mg/L in BH106. The water would be considered brackish based upon the TDS concentration. No discernable water quality variations were observed between groundwater samples collected from the shallow piezometers and groundwater samples collected from the deeper piezometers.

The results suggests that the parameter concentrations are reflective of natural background conditions and groundwater within 20 m of surface would not be considered potable for aesthetic reasons due to high sulphate, sulphide, and TDS concentrations.

7.0 Site Suitability Assessment

Table 7.1 provides a summary of the siting requirements provided in the British Columbia Waste Management Act, Special Waste Regulations (01 April 1988). The proposed landfill Site meets all General Landfill Siting Requirements.

The proposed landfill Site also meets all Secure Landfill Siting Requirements with the exception of the depth of unsaturated soil above the seasonally high water table.

Development of the proposed Site as a Landfill at or below the seasonally high water table must address the following potential issues:

- Seepage into the Landfill; and
- Potential impact of shallow groundwater in the vicinity of the proposed Landfill

Given the low hydraulic conductivity of the near surface soils (0 m to 20 m below surface) seepage rates would be low. An engineered liner and leachate collection system would mitigate any potential seepage issues related to the proposed Landfill development.

Based on the results of the Siting Suitability Investigation, near surface soils have low hydraulic conductivity and no appreciable water resource has been identified below the Site (within 20 m below surface) or within several kilometers of the proposed Site. Groundwater and potential impact migration rates would be in the order of centimeters per year based on an advective dominant flow system. Likely diffusion would be a predominant process given the low hydraulic flow system present at the Site.

Based on the Hydrogeologic Siting Suitability Investigation the Site is considered favorable for the proposed Landfill development based on the following:

- Meets all siting requirements in the British Columbia Waste Management Act, Special Waste Regulations with engineered design alternatives to mitigate the noted exceptions;
- No surface water courses and/or major drainage courses are present in the vicinity of the Site;
- The near surface soils (0 m to 20 m below surface) have a low hydraulic conductivity; and
- No appreciable groundwater resource has been identified below the Site (within 20 m of surface) or within several kilometers of the Site.

8.0 Closure

This report was prepared by Clifton Associates Ltd. for the use of Canadian Crude Separators Inc. and their agents for the Hydrogeological Siting Suitability Investigation at Block A, Section 8, Township 88, Range 20, West of Sixth Meridian. The material in it reflects Clifton Associates Ltd. best judgement available to it at the time of preparation. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. Clifton Associates Ltd. accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

This report has been prepared in accordance with generally accepted engineering practice common to the local area. No other warranty, expressed or implied is made.

Our conclusions are preliminary and based upon the information obtained from the referenced subsurface exploration. The bore holes and test pits indicate subsurface and groundwater conditions only at the specific locations and time investigated, only to the depth penetrated and only for the soil properties tested. The subsurface conditions may vary between the bore holes and with time. The subsurface interpretation provided is a professional opinion of conditions and not a certification of the Site conditions. The nature and extent of subsurface variation may not become evident until construction or further investigation. If variations or other latent conditions do become evident, Clifton Associates Ltd. should be notified immediately so that we may reevaluate our conclusions and recommendations. Although subsurface conditions have been explored, we have not conducted analytical laboratory testing on soil samples obtained nor evaluated the Site with respect to the potential presence of contaminated soil conditions.

The enclosed report contains the results of our investigation as well as certain recommendations arising out of such investigation. Our recommendations do not constitute a design, in whole or in part, of any of the elements of the proposed work. Incorporation of any or all of our recommendations into the design of any such element does not constitute us as designers or co-designers of such elements, nor does it mean that such design is appropriate in geotechnical terms. The designers of such elements must consider the appropriateness of our recommendations in the light of all design criteria known to them, many of which may not be known to us. Our mandate has been to investigate and recommend which we have completed by means of this report. We have had no mandate to design, or review the design of, any elements of the proposed work and accept no responsibility for such design or design review.

Notes:

1 The 92 series (ie 92-1) were installed by HBT Agra Limited from 14 to 21 December 1992.
The REL series (ie REL2) were installed by Rudiger Enterprises Ltd. after December 1992.
The boreholes series (ie BH101) were installed by Clifton Associates Ltd. from 26 to 28 November 2001.

2 Elevation shown are Geodetic.

Table 7.1 – Site Suitability Assessment
Hydrogeological Siting Suitability Investigation
Block A, Sec. 8, Twp. 88, Rge. 20, W6M
British Columbia

Criteria	Proposed Secure Landfill Site	Meets Criteria
General Landfill Siting Requirements		
Not in a 200 year floodplain	Not likely	Yes
Not within 100 m of a holocene fault	None identified	Yes
Not subject to tsunamis	No	Yes
Not within 100 m of land subject to slope failure	No unstable land identified within 100 m of site	Yes
Not within boundaries of parks, wildlife sanctuary, ecological reserve, bird sanctuary	No parks etc. identified within the 14 km of site	Yes
Secure Landfill Siting Requirements		
Not in or having natural drainage to wetland	None identified	Yes
Not on land with predicted maximum peak seismic acceleration greater than 8% with a probability of 10% exceedence in 50 years	< 4%	Yes
Must be entirely above seasonally high water table	Piezometers installed in November, seasonally high water table expected in late spring or early summer	To be established
Must have 3 m unsaturated soil with hydraulic conductivity less than 1×10^{-6} cm/s above seasonally high water table	Based on January monitoring results, approximately 1 m to 3m unsaturated soil with a hydraulic conductivity of 3×10^{-7} cm/s underlie the site	See Discussion section in report (Section 7.0)
Not in a recharge area for an unconfined aquifer with high capacity wells	No wells within 7 km of site	Yes
Must have 5 m of fine grained "unconsolidated" soil with hydraulic conductivity of 1×10^{-6} cm/s when site is underlain by fractured or permeable bedrock formations	Greater than 5 m of "unconsolidated" soil in all boreholes drilled at site with a hydraulic conductivity value of 3×10^{-7} cm/s.	Yes
Not within 300 m of any nonintermittent watercourses or other permanent water body	Nearest permanent water body is 1.4 km from site	Yes
Not with a community water supply watershed	None identified	Yes
Not in an area where monthly precipitation is greater than evapotranspiration plus storage in landfill cover	Dependent on design of cover	To be established in design
Not in an area where annual precipitation is greater than evapotranspiration	Evapotranspiration is likely greater than precipitation at the Site based on available data	Yes

Symbols & Terms

Soil Descriptive Terms

A soil description for geotechnical applications includes a description of the following properties:

- texture
- color, oxidation
- consistency ond condition
- primary and secondary structure

Texture

The soil texture refers to the size, size distribution and shape of the individual soil particles which comprise the soil. The Unified Soil Classification System (ASTM D2487-85) is a quantitative method of describing the soil texture. The basis of this system is presented overleaf. The following terms are commonly used to describe the soil texture.

Particle Size (ASTM D2487-85)

Boulder	300 mm plus
Cobble	75 - 300 mm
Gravel	4.75 - 75 mm
Coarse	19 - 75 mm
Fine	4.75 - 19 mm
Sand	0.075 - 4.75 mm
Coarse	2 - 4.75 mm
Medium	0.425 - 2 mm
Fine	0.075 - 0.425 mm
Silt and Cloy	smaller than 0.075 mm

Relative Proportions (CFEM, 3rd Ed., 1992)

Trace	1 - 10 %
Some	10 - 20 %
Gravelly, sandy, silty, clayey, etc.	20 - 35 %
and	>35 %
Gravel, Sand, Silt, Clay	>35 % and main fraction

Gradation

Well Graded	having a wide range of grain sizes and substantial amount of all intermediate sizes.
Uniform or Poorly Groded	possessing particles of predominontly one size.
Gap Groded	possessing particles of two distinct sizes.

Particle Shape

Angular	sharp edges and relatively plane sides with unpolished surfaces.
Subangular	similar to 'angular' but have rounded edges.
Subrounded	well-rounded corners and edges, neorly plane sides.
Rounded	no edges ond smoothly curved sides.

Also may be flat, elongated or both.

Color And Oxidation

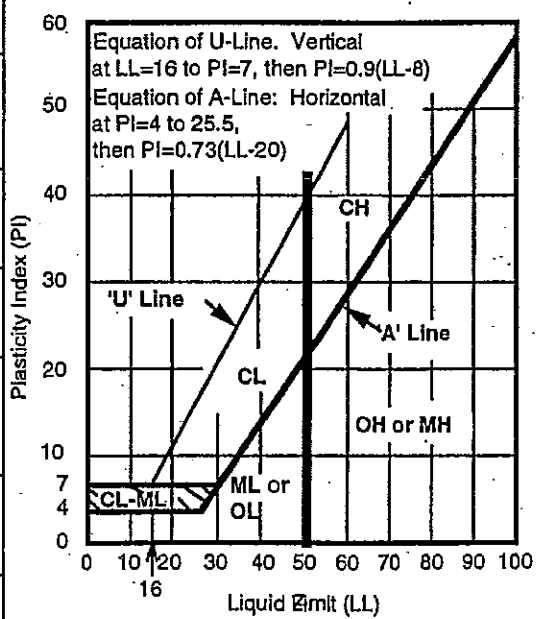
The soil color at its naturol moisture content is described by common colors and, quantitatively, in terms of the Munsell color notation; (eg. 5Y 3/1). The notation combines three variables, hue, value and chroma to describe the soil color. The hue indicates its relation to red, yellow, green, blue and purple. The volue indicates its lightness. The chroma indicates its strength of departure from a neutral of the same lightness.

Departure of the soil color from a neutrol color indicates the soil has been oxidized. Oxidation of o soil occurs in a oxygen rich environment where most commonly metallic iron, oxidizes and turns a neutral colored soil 'rusty' or reddish brown. Oxidized manganese gives a purplish tinge to the soil. Oxidation may occur throughout the entire soil mass or on fracture/joint/fissure surfaces.

Classification of Soils for Engineering Purposes

ASTM Designation D 2487-85 (Unified Soil Classification System)

Major divisions			Group Symbols	Typical names	Classification criteria
Coarse-grained soils: More than 50% retained on No. 200 sieve* (>0.075 mm)	Gravels: More than 50% of coarse fraction retained on No. 4 sieve(≥4.75 mm)	Clean gravels <5% fines	GW	Well-graded gravel	Classification on basis of percentage of fines: Less than 5% pass No. 200 sieve.....GW, GP, SW, SP; More than 12% pass No. 200 sieve.....GM, GC, SM, SC; 5 to 12% pass No. 200 sieve.....Borderline classifications requiring use of dual symbols: $C_U = \frac{D60}{D10}$ greater than 4; $C_C = \frac{(D30)^2}{D10 \times D60}$ between 1 and 3
			GP	Poorly graded gravel	Not meeting either C_U or C_C criteria for GW
		Gravels with fines >12% fines	GM	Silty gravel	Atterberg limits below "A" line or PI less than 4 / Atterberg limits on or above "A" line and PI greater than 7: Atterberg limits plotting in hatched area are borderline classifications requiring use of dual symbols
			GC	Clayey gravel	
	Sands: 50% or more of coarse fraction passes No. 4 sieve(<4.75 mm)	Clean sands <5% fines	SW	Well-graded sand	$C_U = \frac{D60}{D10}$ greater than 4; $C_C = \frac{(D30)^2}{D10 \times D60}$ between 1 and 3
			SP	Poorly graded sand	Not meeting either C_U or C_C criteria for SW
		Sands with fines >12% fines	SM	Silty sand	Atterberg limits below "A" line or PI less than 4 / Atterberg limits on or above "A" line and PI greater than 7: Atterberg limits plotting in hatched area are borderline classifications requiring use of dual symbols
			SC	Clayey sand	
Fine-grained soils: 50% or more passes No. 200 sieve* (≤0.075 mm)	Silts and Clays: Liquid limit <50%	Inorganic	ML	Silt	Plasticity Chart
			CL	Lean Clay -low plasticity	
		Organic	OL	Organic silt or clay	
	Silts and Clays: Liquid limit ≥50%	Inorganic	MH	Elastic silt	
			CH	Fat Clay -high plasticity	
		Organic	OH	Organic clay or silt	
	Highly organic soils		PT	Peat, muck and other highly organic soils	



*Based on the material passing the 3 in.(75 mm) sieve

Consistency And Condition

The consistency of a cohesive soil is a qualitative description of its resistance to deformatian and can be correlated with the undrained shear strength of the soil. The condition of a coarse grained soil qualitatively describes the soil campactness and can be correlated with the standard penetration resistance (ASTM D1586-84).

Consistency Of Cohesive Soil (CFEM, 2nd Edit., 1985)

Consistency	Undrained Shear Strength (kPa) (CFEM, 2nd Edt., 1985)	Field Identification (ASTM D 2488-84)
Very Soft	<12	Thumb will penetrate soil more than 25 mm.
Soft	12-25	Thumb will penetrate soil about 25 mm.
Firm	25-50	Thumb will indent soil about 6 mm.
Stiff	50-100	Thumb will indent, but penetrate only with great effort (CFEM).
Very Stiff	100-200	Readily indented by thumbnail (CFEM).
Hard	>200	Thumb will not indent soil but readily indented with thumbnail.
Very Hard	N/A	Thumbnail will not indent soil.

Condition Of Coarse Grained Soil (CFEM, 2nd Edt., 1985)

Compactness Condition	SPT N - Index (Blows/300mm)
Very Loase	0 - 4
Loase	4 - 10
Compact	10 - 30
Dense	30 - 50
Very Dense	over 50

Moisture Conditions (ASTM D2488-84)

Description	Criteria
Dry	Absence of moisture, dusty, dry to touch.
Maist	Damp, but no visible water.
Wet	Visible, free water, usually soil is below water table.

Attention: Mr. E. Rudiger

Dear Sir:

Re: Application Pursuant to the Waste Management Act on behalf of Rudiger Enterprises Ltd., dated April 15, 1991

Thank you for the water level data from February 2 and 14, 1994.

Section 28 (3) of the Special Waste Regulation requires that a land treatment facility have a minimum separation of 1 metre of unsaturated soil with a permeability less than 1×10^{-6} cm/s above the seasonally high water table.

I require confirmation from a qualified professional that your proposed site meets this minimum separation requirement. It is my understanding that periodic water levels have been measured at your site. This information may be sufficient to show the depth to the seasonally high water level.

I look forward to receiving this information in the near future so that I can continue with my assessment of your application.

Yours truly,

Ian Mitchell, P.Eng.
Environmental Protection Officer

Attention: Emil Rudiger

Dear Sir:

RE: WATER LEVEL DETERMINATIONS
PROPOSED LANDFILL/LANDFARM SITE
MILE 73, ALASKA HIGHWAY, B.C.

A preliminary geotechnical assessment for the proposed landfill/landfarm site was completed by HBT AGRA Limited in February, 1993. Background data on site characteristics and monitoring well completions were presented in a summary report titled "Preliminary Site Assessment, proposed Landfill/Landfarm Site, Mile 73, Alaska Highway, B.C., dated, February 1993. The present letter summarizes the condition of the site with respect to groundwater levels.

The monitoring wells were last purged on January 29, 1993. Table 1 records water level determinations in the wells since that date. The water levels were measured by Rudiger Enterprises Ltd., and reported to HBT AGRA Limited. Measurements were taken five times during February/March, 1993, once in February, 1994, and again in March, 1994. The readings during 1993 showed a continuous rise in water level in all except two of the 14 monitoring wells for which measurements could be made. The two exceptions were wells 92-6 and 92-8A, both of which showed a very slight drop in water level over the 1993 period of record. Readings in 1993 were taken over a period of 51 days.

Water levels in 1994 were considerably higher than the levels in 1993. The net rise in water level from 1993 to 1994 varied from approximately 1.5 m to nearly 6 m in the shallow monitoring wells, and from 0.2 m to 18 m in the deeper wells. The greatest rise of approximately 18 m occurred in well 92-7. Other notable rises were in 92-1 (more than 8 m), and 92-6A and 92-5A (almost 6 m in both).

Water levels in 1994 were at a shallow depth in all the shallower ("A") wells. Measured water levels in these wells were within a very narrow range of 1.15 m to 1.67 m below ground surface. The water was frozen in two wells (92-2A and 92-8A), implying an even higher water level in these two wells.

The deeper wells (92-1, 92-3 to -8) showed a wide range of water levels. The water level in 92-7 was high (at 1.28 m below ground surface on February 2, 1994), but was at a much greater depth, varying from 4.43 m to 17.68 m, in all the other deep wells.

The water level differences from 1993 to 1994 are believed to be related to very low hydraulic conductivity of the natural earth materials at the site. It is believed that water levels in all or nearly all the monitoring wells still had not stabilized at the end of the 51 days of record in 1993, and were still rising at that time towards stability. The 1994 levels are assumed to be stabilized levels which will henceforth be affected only (mainly) by natural seasonal fluctuations and construction drainage.

The rising water levels following purging in 1993, have allowed a calculation of hydraulic conductivity to be made. The resultant values (field determinations) compared to laboratory determinations made previously are shown in Table 2. The field determinations correspond very closely to the laboratory determinations. All values are very low, in the range of 3×10^{-8} cm/sec to less than 10^{-9} cm/sec, which is in keeping with the long time period required for water level stabilization. The near correspondence of field and laboratory determinations also indicates that secondary permeability (fissures, fractures, granular lenses) which may not be detected in laboratory determinations is largely lacking or ineffective.

As noted in our previous report, the land slopes from the southeast to the northwest, with a total elevation difference of approximately 55 m from the highest point of land to the lowest. The shallow groundwater table in the February/March, 1994 readings was within 2 m of the land surface (at the eight shallow monitoring wells). These wells are completed in surficial silty clay and/or in the uppermost few metres of the thick underlying glacial clay till sequence. The deeper monitoring wells are all completed within the clay till sequence at depths greater than 15 m below ground surface, and all but one have water levels deeper than 4 m below ground surface. Contours of the water level elevations (Figure 1) show that the deep groundwater flow direction is to the northwest co-incident with the general slope of the land surface. Depths to water level from ground surface are, in general, greatest in upslope locations.

The water level data also show that there is a strong downward component of groundwater movement at all monitoring wells except possibly wells 92-7/7A. Water levels in the deep and shallow wells at 92-7/7A may be approximately the same (February 2, 1994 readings), or may be slightly higher in the shallow well (92-7A), as determined on March 19, 1994.

There is a shallow groundwater zone within the silty clay/uppermost till which has a high water table level. Perimeter ditching to prevent flow of surface water across the site and to channel flow around the site of proposed landfilling would help to alleviate this condition. The low hydraulic conductivity shows that the rate of groundwater movement through this zone would be very slow. Low volumes of flow would therefore be involved.

The site is considered to be suitable for landfill/landfarming after making provision to lower and control the shallow groundwater table, and to channel runoff away from the site. The low hydraulic conductivity of the surficial silty clay and underlying clay till, and low water table levels recorded within the deeper monitoring wells are favourable characteristics of the site for the proposed development.

Respectfully submitted,

Attention: Mr. Emil Rudiger

Dear Emil:

Re : Rudiger, Fort St. John Land Treatment Facility, Plans

We have reviewed the AGRA Earth & Environmental letter dated May 29, 1995 and the associated plans, dated 05-08-95 (Figure 1), titled Rudiger Enterprises Ltd., Proposed Landfarm Facility. The plans submitted are acceptable.

These plans are a requirement of clause 4.1 of Permit PR-10758. Acceptance of the submitted plans is for the purpose of administration of the permit. It is responsibility of the Permittee to ensure that the works are adequately designed and operated to meet permit conditions and the requirements of the *Special Waste Regulation*. Acceptance of the plans does not preclude the requirement that additional works may be necessary.

If you have any questions, please contact Ian Mitchell at 565-6452

Yours truly,

Blake Medlar
Assistant Regional Waste Manager
Omineca-Peace Region

Appendix 6
Vegetation Survey Report

Vegetation Survey Report for the Tervita Silverberry Landfill Amendment Application Project

PREPARED FOR:	Tervita Corporation
PREPARED BY:	Jacobs
DATE:	July 31, 2018

Background

Tervita Corporation (Tervita) owns and operates the Silverberry Secure Landfill (the existing landfill), which is located on Tervita-owned land at 8-88-20 W6M, approximately 50 km northwest of Fort St. John, British Columbia (BC). Tervita is proposing to expand the capacity of the existing landfill in the Tervita Silverberry Landfill Amendment Application Project (the Project).

A Project Approval Certificate (now known as an Environmental Assessment Certificate) Application was submitted to the BC Environmental Assessment Office for the existing landfill in March 2002 and the project was approved in July 2002, with the existing landfill being constructed in 2003. The existing landfill consists of seven secure landfill cells, with one to be developed under the existing approval, for a total of eight cells and an approved capacity of 6 million tonnes.

The purpose of the Project is to replace the depleted capacity of the existing landfill. The Project will be located immediately east of the existing landfill, and will be approximately the same size as the existing landfill footprint (roughly 25 ha). Similar to the existing landfill, the Project will be developed as a series of cells. The future landfill development area has been conceptually designed to accommodate six cells of varying sizes. As additional cells are developed, the liner and leachate collection systems will be tied together to provide a continuous liner system under the entire Project footprint. This will allow final development of the area as one contiguous fill mass, rather than six individual pockets, as is standard landfill operating and construction practice. The location of the Project provides for a 50-m wide secure buffer zone on the property owned by Tervita, surrounding the active area of the existing landfill, as required under Section 25 (10) of the *Hazardous Waste Regulation*.

Survey Methods

The landfill expansion study area was traversed on foot during vegetation, wildlife and soil surveys by three qualified professionals. Several databases, field guides and protocols were used during the vegetation field visit, including the field guide to ecosystem identification for the Boreal White and Black Spruce Zone of British Columbia the British Columbia (DeLong et al. 2011), Conservation Data Centre Species and Ecosystems Explorer (2018), Protocols for Rare Plant Surveys (Penny and Klinkenberg 2013), Field Manual for Describing Terrestrial Ecosystems – Second Edition (BC Ministry of Forests and Range and BC Ministry of Environment 2010), Field Guide to Noxious and Other Selected Weeds of British Columbia – Fourth Edition (Cranston et al. 2014).

The BC *Weed Control Regulation* includes lists of provincial weeds (Schedule A, Part I) and regional weeds (Schedule A, Part II). Provincial weeds are non-native vascular plants that are designated as Noxious within all regions of BC. Regional weeds are non-native vascular plants that are designated as

Noxious within the boundaries of corresponding regional districts, as identified in the BC *Weed Control Regulation*. Noxious weeds must be controlled as per the BC *Weed Control Act*. In addition to the BC *Weed Control Regulation*, the Peace River Regional District (PRRD) *Invasive Plant Program Strategic Plan and Profile* (PRRD, 2018) was consulted to determine weeds of management concern and locations that warrant mitigation.

Survey Results

A vegetation survey was conducted for the Project on June 24, 2015.

The majority of the Project footprint is a hayfield, with a young aspen-rose-creamy peavine forest at the eastern edge. The hayfield is dominated by common timothy grass (*Phleum pratense*) and clover [white clover (*Trifolium repens*) and alsike clover (*Trifolium hybridum*)]. The young aspen-rose-creamy peavine forest at the eastern edge is characterized as a zonal ecosystem in the Moist Warm Boreal White and Black Spruce (BWBSmw/101$4B) in a pole/sapling structural stage. The forests to the south of the Project footprint (> 100 m from the Project footprint boundary) are also dominated by young aspen-rose-creamy peavine forests (BWBSmw/101$5B) with remnant patches of white spruce-trailing raspberry-step moss forests (BWBSmw/1015M) ranging between 60 and 80 years old.

A moist, shrubby area was observed at the eastern side of the Project footprint composed of willows (*Salix* spp.), alder (*Alnus incana*) and bluejoint reedgrass (*Calamagrostis canadensis)*. Wet swales were evident, however they were dry during the time of the survey.

No occurrences of invasive plants were observed in the Project footprint or adjacent young forests. The hayfield is mainly composed of agronomic species as mentioned above with a mix of non-native and native plants.

No occurrences of rare vegetation species (species of conservation concern) were observed in the Project footprint or in the adjacent forests to the south.

During wildlife surveys in June 2017, there was no changes observed to the vegetation conditions in the landfill expansion area, however logging activities and wildfires had occurred nearby to the north and south.

Appendix 7
Early Summer Wildlife Survey Report

TECHNICAL MEMORANDUM

Wildlife Survey Results for the Tervita Silverberry Landfill Amendment Application Project

PREPARED FOR:	Peter Nelson, Tervita
COPY TO:	Suzanne Byrne, Project Manager, CH2M HILL Canada Limited
PREPARED BY:	Jessica Harvey, Biologist, CH2M HILL Canada Limited
DATE:	March 31, 2016
PROJECT NUMBER:	661198
REVISION NO.:	0
APPROVED BY:	Heather Conquergood, Environmental Planner, CH2M Hill Canada Limited

Introduction

Tervita Corporation (Tervita) owns and operates the Silverberry Secure Landfill approximately 50 km north of Fort St John, British Columbia (BC). Tervita is proposing to replace the depleted capacity of the Silverberry Secure Landfill in the proposed Tervita Silverberry Landfill Amendment Application Project (the proposed Project). The proposed landfill capacity replacement is located immediately east of the current landfill footprint at 8-88-20 W6M, and is approximately the same size as the existing landfill footprint (approximately 25 hectares).

In support of the Environmental Assessment Certificate amendment application, CH2M conducted a wildlife desktop/literature review and wildlife field work for the proposed Project footprint. This technical memo provides the methods and results of the desktop review and field survey conducted on June 24, 2015.

Methods

The objectives of the wildlife field work were to:

- identify wildlife presence and use on and adjacent to the proposed Project footprint including habitats to support wildlife species with special conservation status; and
- identify habitat features (*e.g.,* stick nest) that may be affected by construction and/or operations of the proposed Project.

Desktop/Literature Review

Primary sources of information that were used in the preparation of this report include the following:

- Guidelines for Raptor Conservation during Urban and Rural Land Development in BC (BC Ministry of Environment [BC MOE] 2013a);
- Develop with Care 2014 (BC MOE 2014a);
- provincially identified wildlife areas (e.g., Ungulate Winter Ranges [UWRs], Wildlife Habitat Areas [WHA]) (BC MOE 2012, 2014b);
- BC Conservation Data Centre (BC CDC) element occurrence database (BC CDC 2012a,b);
- Parks and Protected Areas (BC MOE 2013b); and
- Migratory Bird Sanctuaries (Environment Canada 2016), National Wildlife Areas (Environment Canada 2016), Important Bird Areas (Bird Studies Canada and Nature Canada 2016), Western Hemisphere Shorebird Reserves (Western Hemisphere Shorebird Reserve Network [WHSRN] 2014), Ramsar Wetlands (Bureau of the Conservation on Wetlands 2016) and World Biosphere Reserves (United Nations Educational, Scientific and Cultural Organization [UNESCO] 2016).

Field Data Collection

Wildlife surveys were on the proposed Project footprint and within immediately adjacent areas to document wildlife and wildlife sign (*e.g.,* scat, browse, tracks, cavity nests, stick nests, etc.). In addition, areas of potential interest beyond the Footprint were investigated (*e.g.,* game trails, riparian areas). The areas surveyed were reviewed for their potential to support species with special conservation status, as well as to provide comment on the proposed Project footprint from a wildlife and wildlife habitat perspective.

All wildlife observations, evidence of wildlife use and wildlife habitat features were documented during the field surveys and their location recorded (*i.e.,* field data sheets, UTM coordinates taken with a hand-held GPS and photographs for record keeping). All incidental wildlife observations and sign and wildlife features (*e.g.,* stick nests) were also recorded. Selected Photoplates from the field work are provided in Appendix A.

Breeding Bird Survey

Breeding bird point count surveys were conducted to collect information on the presence of breeding bird species and information on habitat use. Survey protocols were modified from the point count survey protocols outlined in the Inventory Methods for Forest and Grassland Songbirds (BC MELP 1999a). Survey locations were selected to represent different habitat types (e.g., young forest, mature forest), maintaining a minimum separation of 200 m between point count locations to avoid detection of individual birds in more than one count and to maintain a minimum 100 m buffer from any habitat edge or transitional area (BC MELP 1999).

Observers positioned themselves at a good vantage point to observe the surrounding habitat. A 2 minute quiet period was observed to allow for any disturbances in accessing the site to subside. Species observed during this time period were recorded as incidental observations. At each survey point, both acoustic and visual records of songbirds were recorded over a 5 minute period. Binoculars were used to observe species at a distance and to confirm identification. Birds observed by sight or sound within a 50 m radius of the observer were recorded. The approximate location, species, age, gender (where possible) and number of all birds detected were recorded at each point count station. Birds outside the 50 m radius, detected outside of the 5 minute survey period and flyovers were recorded as incidental observations.

The surveys were completed between sunrise and 10:00 AM, and during suitable weather conditions (wind <10 km/h, temperature >7°C, minimal precipitation and visibility >10 km) to achieve the most accurate results. Additional information that will be recorded at each station will include the date, time, weather conditions, noise level, GPS location and description of the general habitat, and any site-specific features.

Incidental Wildlife Observations

Incidental wildlife observations were recorded during meandering general wildlife surveys of each habitat type, when travelling to and from point count locations, non-focal species observed during surveys, and observations that occur outside of the specified survey locations and/or time period (*e.g.,* birds observed outside of the 50 m radius during breeding bird surveys). All incidental wildlife observations (visual/auditory) and sign (*e.g.,* tracks, scat/pellets, foraging), as well as habitat features (*e.g.,* stick nest), are recorded. Where possible, information recorded for each observation includes the date, time, species, number, age and sex, general habitat description and GPS location. Photographs were also taken where possible.

Results

Desktop/Literature Review

The Project is located in the Boreal White and Black Spruce Zone Biogeoclimatic Zone (Meidinger and Pojar 1991) within the Peace River Regional District. Land uses in the area include agriculture and oil and gas activity.

The Project is not located within any provincially identified wildlife areas (*e.g.,* UWR or WHA) (BC MOE 2012, 2014b). The Project is not located within any Parks and Protected Areas (BC MOE 2013b), Important Bird Areas (Bird Studies Canada and Nature Canada 2016), Migratory Bird Sanctuaries (Environment Canada 2016), National Wildlife Areas (Environment Canada 20146), Western Hemisphere Shorebird Reserves (WHSRN 2014), or Ramsar wetlands (Bureau of the Convention on Wetlands 2016).

Species of Conservation Concern

The BC CDC (2016) identifies 47 potentially occurring species at risk in the Peace River Forest District (which includes the Project Area), including 42 species on the provincial red and blue lists, and 15 species listed as Threatened, Endangered or Special Concern on Schedule 1 of SARA. Only a fraction of these species are expected to occur in the vicinity of the project due to, for example, species range and habitat requirements.

Results of Field Work

The results of the wildlife field work are summarized below. Wildlife fieldwork identified 4 mammal species, 23 bird species and 1 amphibian species within the proposed Project footprint and immediately adjacent areas.

Selected Photoplates from the field work are provided in Appendix A. A summary of wildlife species and/or their sign observed is provided in Appendix B.

General Site Description

The Project is located in an area that may provide habitat for wildlife species, including mammals, birds and amphibians. Boreal forests, including coniferous, deciduous and mixedwood stands, may provide nesting and foraging habitat for birds (e.g., songbirds and raptors), as well as thermal and security cover for mammals (e.g., moose). Seasonally wet areas may provide nesting habitat for waterfowl and riparian birds, dispersal habitat for amphibians, and foraging habitat for mammals.

Terrain within the proposed Project footprint is level to gently undulating. The Project footprint is dominated by an agricultural hayfield (Plate 1). Adjacent to the Project footprint on the northern,

eastern and southern edges are forested areas (Plates 2,3, and 4). The forest extends up to 70 m onto the Project footprint on the eastern side (Plate 5). A damp, shrubby area, approximately 40 m x 60 m, extends into the hayfield from the forest on the eastern side of the footprint (Plate 6).

Birds

A total of 23 bird species were observed during the wildlife fieldwork on June 24, 2015. During the breeding bird surveys, 23 bird species were recorded at 3 point count stations. An additional 29 bird species were observed outside the point counts or during general wildlife surveys that were completed for the remainder of the Project footprint.

Of the 23 species of bird observed, 21 were songbirds. Most commonly observed were black-and-white warblers (observed primarily in the forest), Wilson's warblers and white-throated sparrows (observed in both forest and shrubby habitats), and savannah sparrows (observed primarily in the hayfield).

One raptor was observed, a northern harrier hovering over and diving into the hayfield. One nightjar species, the common nighthawk, was observed taking off from the ground in the hayfield when flushed by the northern harrier.

Mammals

Four mammal species or their sign were observed during wildlife fieldwork on June 24, 2015. Moose, elk and deer scat were observed in several locations, primarily in the shrubby margin between the forest and the hayfield (Plate 7). One set of elk tracks were observed. Several red squirrels middens were observed in the forested area of the Project footprint.

Amphibians

One amphibian species was observed during the wildlife fieldwork on June 24, 2015 (western toad). Seven juvenile western toads were observed in the damp shrubby area within the Project footprint (Plate 8). No suitable breeding habitat was observed within the Project footprint.

Species with Special Conservation Status

Three species of conservation concern were observed during the wildlife field survey on June 24, 2015:

- Canada warbler (Blue-listed in BC [BC CDC 2016], Threatened under Schedule 1 of *SARA* and by COSEWIC [COSEWIC 2016, Environment Canada 2016]);
- common nighthawk (Threatened under Schedule 1 of *SARA* and by COSEWIC [COSEWIC 2016, Environment Canada 2016]); and
- western toad (Blue-listed in BC [BC CDC 2016], Special Concern under Schedule 1 of *SARA* and by COSEWIC [COSEWIC 2016, Environment Canada 2016]).

Notes:

1 Species that are Red or Blue-listed (BC CDC 2016).

2 Species listed as Endangered, Threatened or Special Concern on Schedule 1 of SARA (Environment Canada 2016).

3 Species listed as Endangered, Threatened or Special Concern by COSEWIC (2016).

Appendix 8
Early-mid Winter Snow Tracking Survey Report

Early-mid Winter Snow Tracking Surveys for the Tervita Silverberry Landfill Expansion Project

PREPARED BY: Jessica Harvey, CH2M

DATE: January 31, 2017

PROJECT NUMBER: 661198

Introduction

The first of two winter supplemental wildlife surveys was conducted to collect information on mammals and game bird abundance and habitat use in the vicinity of the Project to supplement existing information and desktop review, and to inform Project mitigation measures. Ungulates (e.g., moose), mesocarnivores (e.g., weasel, marten), and predators (e.g., lynx and wolves) are readily detected during winter snow track surveys, and can have very low detection frequencies during surveys throughout the rest of the year.

In addition to the snow track surveys, the area of trees overlapping the Project footprint was surveyed for wildlife trees and potential wildlife trees that may be affected by clearing for the Project.

Participants from local First Nations were present for the winter survey. Mabel Harding was present form the Doig River First Nation, and Beaufort Acko was present from the Blueberry River First Nation. Both completed visitor orientations for the two days of work. Jessica Harvey (CH2M) recertified the contractor orientation for 2017.

Methods

Winter track surveys were used to collect information on the presence, distribution, relative abundance, and habitat associations of mammals and upland bird species in the Project area. The protocols used for the winter track surveys were adapted from those outlined in the Inventory Methods for Medium-Sized Territorial Carnivores: Coyote, Red Fox, Lynx, Bobcat, Wolverine, Fisher & Badger (BC Ministry of Environment, Lands and Parks [BC MELP] 1999a), Inventory Methods for Marten and Weasel (BC MELP 1998a), and Ground-Based Inventory Methods for Ungulates Snow-Track Surveys (D'Eon et al. 2006).

The locations of the transects were selected prior to fieldwork using a review of 1:20,000 base maps and aerial imagery. A modified version of the Finnish track transect method (Linden et al. 1996) was used. Transects were 500m long, and created triangles on the landscape, where feasible. Transect locations were stratified by habitat type. Three transects were placed in each habitat type: open field, shrub, and forest.

Winter snow tracking surveys must be completed between 12 hours and 8 days following a major snowfall event (i.e., complete ground cover and obliteration of previous wildlife tracks) to allow for accumulation and accurate identification of tracks. The most recent snowfall on the Silverberry site was on January 23rd, 2017. Winter tracking surveys were completed on January 24th and 25th.

All wildlife tracks that either crossed the transect or were observed within 1 m of the transect mid-line were recorded. In the case where the exact number of individuals could not always be determined for hare and squirrel 'runs', track categories of five tracks/hare run and three tracks/squirrel run were used in calculating track densities. Wildlife tracks were identified to species, where possible, or assigned to

broader categories: deer (mule deer and white-tailed deer); upland game birds (spruce grouse, ruffed grouse, sharp-tailed grouse); fisher/marten (distinguishing female fisher and male marten tracks is unreliable); and weasel (weasels, mink and ermine).

Detailed habitat information was recorded every 100 m and included the abundance of cavity trees, snags, canopy composition, structural information, amount of browse and amount of cover. Browse and cover were categorized as nil (0-5%), low (6-25%), moderate (26-50%), high (51-75%), or very high (>75%). Snow depths were recorded with a graduated probe (mean of 3 depths at each location) and snow condition (e.g., crust, powder) was noted every 100 m.

All incidental (sign, visual observations, observations outside the survey boundary or time period) wildlife observations and sign, as well as habitat features (e.g., stick nest) were recorded during field surveys.

Track density was calculated for each species along each transect using the following formula (Thompson et al. 1989):

$$Tracks/km/day = \frac{total\ \#\ of\ tracks}{\sum[(segment\ length\ in\ km) \times (days\ since\ last\ snow)]}$$

Results

A total of 13 wildlife species or their sign were observed during the early/mid winter supplemental wildlife survey on January 24th and 25th, 2016 (Table 1). No species of conservation concern were conclusively observed during the survey (i.e., marten/fisher tracks were observed, but it is not possible to confirm which species).

Mammal tracks that were observed during the surveys included moose, deer, coyote, lynx, marten/fisher, weasel/ermine, snowshoe hare, red squirrel and mouse/vole. The most abundant tracks observed by a significant margin were snowshoe hare. Photos of selected tracks are provided in Appendix A.

Five types of tracks were observed in the open hayfield, deer, moose, coyote, hare and mouse. With the exception of mouse and vole tracks, tracks occurred at lower density in the hayfield than in either the shrubby and forested habitats, as during the winter there is very little cover and/or forage in the open field.

The tracks of eight species were observed in the shrubby habitat to the north of the hayfield. Moose and coyote tracks were observed at the highest density in the shrubby habitat. In addition, a shed moose antler and evidence of browsing activity was observed. The shrubby habitat provides sufficient cover for these species, while providing abundant moose forage and hunting grounds for coyotes.

The highest number of species was observed in the forest to the east of the hayfield and landfill: the tracks of ten species were observed in the forest. Tracks of seven of these species were at the highest density in the forest habitat. Lynx and grouse tracks were observed only in the forest habitat.

Table 1. Wildlife Species Observed during Winter Snow Tracking Surveys on January 24th and 25th, 2016 at the Tervita Silverberry Landfill

Common Name	Conservation Status	Type of Observations	Total Number of Observations	Mean Density of Tracks (tracks/km/day) in Habitat Type		
				Hayfield	Shrubby	Forest
Deer	--	Tracks	4	0.7	0	**1.0**
Elk	--	Scat	1	0	0	0
Moose	--	Tracks, scat, antler, browse	22	1.3	**6.0**	0.7
Coyote	--	Tracks	23	2.0	**6.0**	0.7
Lynx	--	Tracks	19	0	0	**6.3**
Black bear	--	Markings/scratches on trees	1	0	0	0
Marten/fisher	--/Blue-listed[a]	Tracks, scat	15	0	1.0	**4.0**

[a]BC Provincial List (BC CDC, 2017). Only Red and Blue list designations are displayed.

Red List: includes species that have been legally designated as Endangered or Threatened under the BC Wildlife Act, are extirpated, or are candidates for such designation.
Blue List: includes species not immediately threatened, but of concern due to characteristics that make them particularly sensitive to human activities or natural events.

No existing wildlife trees were observed within the Project footprint. Several potential wildlife trees, including both existing and newly burned snags were observed, however, no evidence of wildlife use or nesting was observed.

Late-Winter Snow Tracking Survey Report

Late-Winter Snow Tracking Surveys for the Tervita Silverberry Landfill Expansion Project

PREPARED BY: Jessica Harvey, CH2M

DATE: March 17, 2017

PROJECT NUMBER: 661198

Introduction

The second of two winter supplemental wildlife surveys was conducted to collect information on mammals and game bird abundance and habitat use in the vicinity of the Project to supplement existing information and desktop review, and to inform Project mitigation measures. Ungulates (e.g., moose), mesocarnivores (e.g., weasel, marten), and predators (e.g., lynx and wolves) are readily detected during winter snow track surveys, and can have very low detection frequencies during surveys throughout the rest of the year.

Participants from local First Nations were invited for the winter survey. Peter Yahey, from the Blueberry River First Nation, was present for a portion of the fieldwork (March 14). Peter completed a visitor orientation for the days work.

Methods

Winter track surveys were used to collect information on the presence, distribution, relative abundance, and habitat associations of mammals and upland bird species in the Project area. The protocols used for the winter track surveys were adapted from those outlined in the Inventory Methods for Medium-Sized Territorial Carnivores: Coyote, Red Fox, Lynx, Bobcat, Wolverine, Fisher & Badger (BC Ministry of Environment, Lands and Parks [BC MELP] 1999a), Inventory Methods for Marten and Weasel (BC MELP 1998a), and Ground-Based Inventory Methods for Ungulates Snow-Track Surveys (D'Eon et al. 2006).

The locations of the transects were selected prior to fieldwork using a review of 1:20,000 base maps and aerial imagery. A modified version of the Finnish track transect method (Linden et al. 1996) was used. Transects were 500m long, and created triangles on the landscape, where feasible. Transect locations were stratified by habitat type. Three transects were placed in each habitat type: open field, shrub, and forest.

Winter snow tracking surveys must be completed between 12 hours and 8 days following a major snowfall event (i.e., complete ground cover and obliteration of previous wildlife tracks) to allow for accumulation and accurate identification of tracks. The most recent snowfall on the Silverberry site was on March 12th, 2017. Winter tracking surveys were completed on March 13th and 14th.

All wildlife tracks that either crossed the transect or were observed within 1 m of the transect mid-line were recorded. In the case where the exact number of individuals could not always be determined for hare and squirrel 'runs', track categories of five tracks/hare run and three tracks/squirrel run were used in calculating track densities. Wildlife tracks were identified to species, where possible, or assigned to broader categories: deer (mule deer and white-tailed deer); upland game birds (spruce grouse, ruffed grouse, sharp-tailed grouse); fisher/marten (distinguishing female fisher and male marten tracks is unreliable); and weasel (weasels, mink and ermine).

Detailed habitat information was recorded every 100 m and included the abundance of cavity trees, snags, canopy composition, structural information, amount of browse and amount of cover. Browse and cover were categorized as nil (0-5%), low (6-25%), moderate (26-50%), high (51-75%), or very high (>75%). Snow depths were recorded with a graduated probe (mean of 3 depths at each location) and snow condition (e.g., crust, powder) was noted every 100 m.

All incidental (sign, visual observations, observations outside the survey boundary or time period) wildlife observations and sign, as well as habitat features (e.g., stick nest) were recorded during field surveys.

Track density was calculated for each species along each transect using the following formula (Thompson et al. 1989):

$$Tracks/km/day = \frac{total\ \#\ of\ tracks}{\sum[(segment\ length\ in\ km) \times (days\ since\ last\ snow)]}$$

Results

Seven of nine planned winter transects were completed on March 13 and 14th, 2016. The final two transects were not completed due to rain, and therefore, unsuitable track-counting conditions.

A total of 10 wildlife species or their sign were observed during the late-winter supplemental wildlife survey (Table 1). No species of conservation concern were conclusively observed during the survey (i.e., marten/fisher tracks were observed, but it is not possible to confirm which species). Notably, fewer tracks were observed overall during the late-winter survey than during the early to mid-winter survey in January 2017.

Mammal tracks that were observed during the surveys included moose, deer, coyote, lynx, marten/fisher, weasel/ermine, snowshoe hare, red squirrel. The most abundant tracks observed were snowshoe hare. Photos of selected tracks are provided in Appendix A.

Only one type of tracks was observed in the open hayfield: coyote. The previous survey identified a number of mouse tracks that were not observed during the late-winter survey. This may be due to the deeper snow covering much of the vegetation and multiple crust layers later in the winter that make surface access more difficult for small animals in this habitat. Fewer tracks were observed in the hayfield than in either the shrubby and forested habitats, as during the winter there is very little cover and/or forage in the open field.

The tracks of four species were observed in the shrubby habitat to the north of the hayfield, including moose, snowshoe hare, squirrel and mouse/vole tracks. The shrubby habitat provides sufficient cover for moose, while providing abundant moose forage. Smaller animals may be using this habitat in late winter to search for fresh browse.

The highest number of species was observed in the forest to the east of the hayfield and landfill: the tracks of eight species were observed in the forest. Tracks of seven of these species were at the highest density in the forest habitat. Lynx, marten/fisher, weasel/ermine, deer and grouse tracks were observed only in the forest habitat. The forest habitat provides the most abundant cover during the winter season.

Table 1. Wildlife Species Observed during Late-Winter Snow Tracking Surveys on March 13th and 14th, 2017 at the Tervita Silverberry Landfill

Common Name	Conservation Status	Type of Observations	Total Number of Observations	Mean Density of Tracks (tracks/km/day) in Habitat Type		
				Hayfield	Shrubby	Forest
Deer	--	Tracks	4	0	0	**5.3**
Moose	--	Tracks, scat, browse	5	0	**8.0**	1.3
Coyote	--	Tracks	1	**2.0**	0	0
Lynx	--	Tracks	2	0	0	**0.9**
Marten/fisher	--/Blue-listed[a]	Tracks	1	0	0	**0.4**
Weasel/ermine	--	Tracks	3	0	0	**1.3**
Snowshoe hare	--	Tracks, scat, browse/chews	81	0	28.0	**36.9**
Red squirrel	--	Tracks	15	0	6.0	**6.2**
Mouse/vole	--	Tracks	1	0	**2.0**	0
Grouse sp.	--	Tracks, visual	2	0	0	**0.9**

[a]BC Provincial List (BC CDC, 2017). Only Red and Blue list designations are displayed.

Red List: includes species that have been legally designated as Endangered or Threatened under the BC Wildlife Act, are extirpated, or are candidates for such designation.

Blue List: includes species not immediately threatened, but of concern due to characteristics that make them particularly sensitive to human activities or natural events.

Appendix 10
Spring Breeding Bird and Amphibian Survey Report

REPORT

Spring Breeding Bird and Amphibian Survey Report for the Tervita Silverberry Landfill Expansion Project

PREPARED BY: Tyler Innes, CH2M

DATE: July 31, 2017

PROJECT NUMBER: 661198

Background

Tervita Corporation (Tervita) owns and operates the Silverberry Secure Landfill approximately 50 km north of Fort St. John, British Columbia (BC). Tervita is proposing to expand the capacity of the Silverberry Secure Landfill in the Tervita Silverberry Landfill Amendment Application Project (the Project).

Tervita's Silverberry Secure Landfill was constructed in 2003 and currently operates seven secure landfill cells as defined under the Hazardous Waste Regulation (HWR). The landfill is constructed on privately owned land at 8-88-20 W6M. Within the current landfill footprint, an additional landfill cell (Cell 8) will be constructed approximately the same size as the existing landfill footprint (roughly 25 hectares). The location of the expansion area provides for a 50-m-wide secure buffer zone on the property owned by Tervita, surrounding the active area of the secure landfill, as required by the HWR, Section 25 (10).

Introduction

Three spring supplemental wildlife surveys were conducted in June 2017 to collect information on breeding birds, amphibians, and habitat use in the vicinity of the Project to supplement existing information and desktop review, and to inform Project mitigation measures.

CH2M HILL Energy Canada, Ltd. (CH2M) has prepared this Report to detail the results of the wildlife surveys. Breeding bird point count surveys can be used to collect information on the presence, distribution, and habitat associations of birds, including songbirds, that may not have been observed during the 2015 summer survey. Amphibian surveys in the area can be used to expand the survey coverage beyond the areas checked in 2015. Juvenile western toads were observed in 2015 at the east boundary of the footprint expansion and a spring survey may provide insight into their breeding areas, as well as determine whether breeding amphibians are using the on-site ~~wetland~~low-lying areas.

Participants from local First Nations were invited for the spring surveys.

Methods

Surveys were conducted during suitable weather conditions (wind < 10 km/h, temperature > 3°C, minimal precipitation, and visibility > 10 km) to obtain the most accurate results. Additional information recorded at each station includes the date, time, weather conditions, noise level, GPS location, and description of the general habitat and any site-specific features. All incidental (outside the survey boundary or time period) wildlife observations (visual/auditory) and signs (e.g., tracks, scat/pellets, foraging), as well as habitat features (e.g., stick nest), were recorded during field surveys.

The locations of the point counts and amphibian surveys were selected prior to fieldwork using a review of 1:20,000 base maps and aerial imagery. Survey locations were selected to sample a variety of habitats and ~~wetlands~~ low-lying areas both outside the expansion area and within the expansion footprint.

Breeding Birds

Spring breeding bird surveys were used to collect information on the presence, distribution, and habitat associations of birds, including songbirds in the Project area. Survey protocols are modified from the point count survey protocols outlined in the Inventory Methods for Forest and Grassland Songbirds (BC MELP 1999). Survey locations were selected to represent a variety of habitat types, maintain a minimum separation of 200 m between point count locations to avoid detection of individual birds in more than one count, and to maintain a minimum 100 m buffer from any habitat edge or transitional area (BC MELP 1999).

The field crew was positioned at a good vantage point to observe the surrounding habitat. A 2-minute quiet period was observed to allow for any disturbances in accessing the site to subside. At each survey point, both acoustic and visual records of songbirds were recorded over a 5-minute period. Binoculars were used to observe species at a distance and to confirm identification. Birds observed by sight or sound (including fly-overs and fly-throughs) within a 50-m radius of the observer were recorded. The approximate location, species, age, gender (where possible) and number of all birds detected were recorded at each point count station. Birds observed outside the 50-m radius or detected outside of the 5-minute survey period were recorded as incidental. Surveys were generally completed between sunrise and 10:00 a.m.

Amphibians

Amphibian surveys were targeted at ~~open water wetland~~low-lying wet areas adjacent to the expansion area to expand the survey coverage beyond the areas checked in 2015. Juvenile western toads were observed in 2015 at the east edge of the capacity replacement footprint. One of the goals of these spring surveys was to identify potential breeding habitat near the Project, including the possible habitat in a small shrubby ~~wetland~~ low-lying area at the east edge of the capacity replacement footprint.

Pond-dwelling amphibian survey protocols are modified from the presence/not-detected survey protocols outlined in the Inventory Methods for Pond-Breeding Amphibians and Painted Turtle (BC MELP 1998). At ~~open water wetland~~low-lying wet area ~~location~~s, time-constrained searches were used as this survey technique is the most effective method for determining presence/not detected of a species within a specific area (BC MELP 1998). This technique also provides the number of individuals per unit of search effort and eliminates the bias of clustered populations. A 15-minute survey time was set for each site and therefore provided a 30-minute survey time effort when two crew members were searching (e.g., two people searching for 15 minutes).

Results

The Silverberry Landfill expansion area was visited in June on three separate days, June 9, 13, and 30, 2017 (refer to Figure 1 at the end of this document). “A” waypoints refer to amphibian surveys and “B” waypoints refer to bird surveys.

- June 9 – waypoints: A01 to A08 and B01 to B09
- June 13 – waypoints: AA01 to AA07 and BB01 to BB09
- June 30 – waypoints: AAA01 to AAA07 and BBB01 to BBB09

Breeding Birds

A total of 27 bird point counts were conducted in June 2017. For each site visit, a total of nine breeding bird point count surveys were performed, two inside the expansion footprint and seven outside the footprint within 200 m of the footprint boundary. The same nine breeding bird point count locations were surveyed during each site visit.

A total of 36 bird species were observed during the June 2017 site visits, including ten incidental observations (See Table 1). Many of the incidental observations were observed during the amphibian surveys.

Table 1. Bird Species Observed During Spring Breeding Bird Surveys on June 9, 13, and 30, 2017 at the Tervita Silverberry Landfill

Common Name	BC Status Designation	Federal Status Designation	Observation Type
Alder flycatcher	--	--	Visual/audio

Table 1. Bird Species Observed During Spring Breeding Bird Surveys on June 9, 13, and 30, 2017 at the Tervita Silverberry Landfill

Common Name	BC Status Designation	Federal Status Designation	Observation Type
Red-winged blackbird	--	--	Visual
Ruby-crowned kinglet	--	--	Audio
Savannah sparrow	--	--	Visual/audio
Song sparrow	--	--	Audio
Swainson's thrush	--	--	Audio
White-throated sparrow	--	--	Visual/audio
Wilson's phalarope	--	--	Incidental/visual
Wilson's snipe	--	--	Incidental/visual
Winter wren	--	--	Audio
Yellow warbler	--	--	Incidental/audio

One auditory, incidental observation of an olive-sided flycatcher (*Contopus cooperi*) was recorded on June 30 in the southeast corner approximately 100 m from the expansion footprint. The olive-sided flycatcher is listed as Threatened under the *Species at Risk Act* and is Blue-listed in BC. The species has a relatively wide, yet sparse, distribution across Canada and breeds in open coniferous or mixedwood forests, often located near water or wetlands with the presence of tall snags. Population trends follow widespread and unabated declines. The causes of the population decreases are not well understood. Threats include reduced availability of insect prey, fire suppression, deforestation and land conversion in nonbreeding habitat, forest harvesting, energy and mining exploration and extraction, and residential and commercial development. The significance of each threat varies across olive-sided flycatcher's geographical range (Environment Canada 2016).

Amphibians

A total of 22 amphibian surveys were conducted in June 2017. Amphibian surveys were conducted at eleven ~~open water wetland~~low-lying wet areas during the course of the June surveys, one location inside the expansion footprint and nine outside the footprint. The breakdown of amphibian surveys are as follows:

- June 9 – Eight ~~wetlands~~ low-lying areas were surveyed (waypoints: A01 to A08)
- June 13 – Seven ~~wetlands~~ low-lying areas were surveyed (waypoints: AA01 to AA07)
- June 30 – Seven ~~wetlands~~ low-lying areas were surveyed (waypoints: AAA01 to AAA07)

Two amphibian species were observed during the June 2017 site visits, including numerous wood frog tadpoles, juveniles and adults; and only one western toad juvenile observation (see Table 2). Wood frog tadpoles and adults were observed in all but three ~~wetland location~~low-lying areas during the site (Photos 1 and 2).

Table 2. Amphibian Species Observed During Spring Surveys on June 9, 13, and 30, 2017 at the Tervita Silverberry Landfill

Common Name	BC Status Designation	Federal Status Designation	Observation Type
Western toad	Yellow-listed	(COSEWIC) Special Concern	Juvenile
Wood frog	--	--	Tadpoles/juveniles/adults

One western toad juvenile was observed at the east edge of the expansion footprint (10 V 613623 6276731) in the same ~~wetland~~ low-lying ditch where the other toad was observed in 2015 (Photos 3 and 4). No breeding habitat was observed during the site visits in June 2017, therefore it is still unknown where the western toad breeding habitat occurs.

Western toads use a wide variety of aquatic and upland habitats. They breed in a variety of ~~wetlands including~~habitats such as shallow, sandy margins of lakes, ponds, streams, river deltas, river backwaters, river estuaries, and geothermal springs. Following breeding, adults may remain to forage in the marshy or riparian edges of breeding sites, or they may disperse several kilometres to foraging areas in other ~~wetlands,~~ riparian areas along streams, or upland sites (COSEWIC 2012).

Recommendations

An amphibian salvage permit from BC Ministry of Forests, Land and Nature Resource Operations is recommended to salvage any potential frogs or toads from the capacity replacement footprint prior to construction. The highest likelihood of amphibians occurring in the capacity replacement footprint is in the southeast quadrant. In addition, CH2M recommends nest sweeps in the shrubby ~~wetland~~ low-lying area (southeast corner) prior to construction if vegetation clearing occurs in the breeding bird window of May 1 to July 10 (BC MELP 1999).

SECTION 1

Introduction

CH2M HILL Canada Limited (CH2M) was retained by Tervita Corporation (Tervita) to prepare a screening level human health risk assessment (SLHHRA) to support the assessment of human health impacts associated with the expansion of the Silverberry Secure Landfill (the Facility). Tervita is proposing to replace the depleted capacity of the Facility in the proposed landfill expansion outlined in the Tervita Silverberry Landfill Amendment Application Project (the proposed Project).

The Facility is located approximately 50 kilometres (km) northwest of Fort St. John in northeastern British Columbia (BC). The landfill is used primarily for the disposal of waste associated with oil and gas exploration.

The Environmental Assessment Certificate Amendment Application for the proposed Project has been initiated with the BC Environmental Assessment Office (BC EAO) with the submission of the Valued Component (VC) Rationale document. As part of the VC review, BC EAO and Working Group members have requested a SLHHRA to be completed in support of the assessment of human health impacts. This screening level risk assessment (SLRA) will be appended to the BC EAO Amendment Application and used to support the assessment of effects to human health, as well as the identification of proposed mitigation measures.

1.1 Background

The Facility was constructed in 2003, and currently consists of seven secure landfill cells, as defined under the Hazardous Waste Regulation. Cells are constructed in a staged manner dependent on fill rate, typically with only one cell operational at a time. The landfill is on privately owned land. Associated infrastructure and facilities located on the same property include access roads, drainage ditches, and groundwater monitoring wells, as well as the office and weigh scales. Infrastructure and associated facilities are in operation for the existing landfill and will continue to be used for the landfill capacity replacement area. Stormwater and leachate management and monitoring systems are in place at the Facility and will be expanded or upgraded, where appropriate, to account for stormwater retention and leachate generation associated with the proposed landfill capacity replacement. The proposed replacement capacity is approximately the same size as the existing landfill footprint (approximately 25 hectares). Similar to the existing landfill footprint, the proposed Project will be developed as a series of cells.

One more secure landfill cell (Cell 8) is proposed to be constructed within the current approved footprint and to accept waste. The types of waste that are currently accepted at the Facility include hydrocarbon-contaminated soils and sands, sulphur-contaminated soil, salt-contaminated soils, drill cuttings, and other wastes associated with the oil and gas industry. Examples of other waste that may be accepted include construction and demolition materials such as cement, absorbents and desiccants, and other sources of industrial waste.

1.2 Scope and Objectives

The scope of this SLHHRA was developed based on the approved Amendment Application Information Requirements (AAIR), the nature of the proposed Project, regulatory requirements and standards, and concerns expressed by Aboriginal groups, the public, regulatory agencies, and other stakeholders. This report qualitatively evaluates the potential risks to the Human Health VC associated with the proposed Project.

The objectives of this SLHHRA are to:

- Predict the incremental risk to human health from the proposed Project
- Identify potential mitigation or risk management options to reduce potential health risks to human receptors

Risks to the Human Health VC from the proposed Project may be related to changes in environmental conditions, such as noise levels, air quality, drinking water quality, or soil quality. Changes to country foods quality may occur if there is a change to water or soil quality. Country foods are defined as foods that are trapped, fished, hunted, harvested, or grown for subsistence or medicinal purposes, or obtained from recreational activities, such as sport fishing or game hunting. Country foods do not include foods produced in commercial operations, such as large farms or greenhouses (Health Canada, 2012).

This SLHHRA uses a desktop analysis to identify potential risks to the Human Health VC within the proposed Project assessment boundaries and evaluates potential exposure pathways and receptors, as well as the nature and magnitude of exposures to these receptors using conservative estimates. It also discusses the potential health risks associated with the predicted exposure scenarios. If there are no pathways or receptors identified, there are no predicted health risks associated with the proposed Project. In situations where the desktop SLHHRA identifies potential risks, the risks are evaluated in greater detail. The assessment is based on the assumption that the expansion operates under a similar condition, accepting similar wastes, and will impact the environment with similar environmental emissions and exposures, as observed to date.

The BC Ministry of Environment and Climate Change Strategy (BC MECCS) provides guidance for the use of Risk Assessment (RA) methods as part of the Contaminated Sites Regulation (CSR) legislation. This assessment uses BC MECCS Protocol No. 13 (BC MOE, 2008) and Health Canada (2010a) guidance.

The following reference documents from Health Canada were also utilized, and provided additional guidance for the assessment of human health risk:

- Evaluating Human Health Impacts in Environmental Assessment: Noise (2017a)
- Evaluating Human Health Impacts in Environmental Assessment: Air Quality (2017b)
- Evaluating Human Health Impacts in Environmental Assessment: Water Quality (2017c)
- Evaluating Human Health Impacts in Environmental Assessment: Radiological Impacts (2017d)

SECTION 2

Environmental Setting

The following subsections summarize the general geographic, geologic, and hydrogeologic conditions of the area surrounding the Facility. This information provides regional context for the site to identify viable release points and exposure pathways. Identifying these pathways assisted with the development of the conceptual site model (CSM) to support the SLHHRA.

2.1 Regional Context

The Facility is situated in the Boreal Plains Ecoprovince and the Boreal White and Black Spruce Zone (CCS, 2002). This zone is characterized by long and cold winters, with a warm and short growing season. Approximately 35 to 55 percent of precipitation falls as snow (BC MOF, 1991). The topography ranges from 650 metres (m) above sea level (asl) to 850 m asl (Clifton, 2002).

The Blueberry River is located approximately 6.5 km to the north of the Facility.

2.2 Geology

The Facility is underlain by bedrock of middle Cenomanian age known as the Dunvegan Formation. The formation is characterized as grey sandstone, interbedded with grey to dark siltstone, shale, and carbonaceous shale (CCS, 2002; Matrix, 2017). This formation ranges from 50 to 250 m in thickness and is located at depths of approximately 6 to 18 m below ground surface (mbgs) in the vicinity of the Facility (Clifton, 2002). Surficial deposits are characterized as glaciolacustrine deposits (clay) overlying clay till (CCS, 2002; Clifton, 2002; Matrix, 2017). This information is consistent with CH2M's observations during shallow soil sampling at the Facility (CH2M, 2017), where topsoil underlain by clay and silty clay with trace fine sand and gravel was encountered.

2.3 Hydrogeology

A hydrogeological study (Clifton, 2002) was completed prior to the construction of the Facility. This study encountered a shallow water table ranging from 1.8 to 3.8 mbgs. No aquifers identified as a groundwater resource are located below or within several kilometres of the Facility. Groundwater flow was found to be to the northwest. The hydraulic conductivity of the clay till was found to be low, ranging from 3×10^{-7} centimetres per second (cm/s) to 8×10^{-7} cm/s. Horizontal groundwater migration rates were estimated in the range of centimetres per year (cm/y).

Recent investigations (Matrix, 2017) have encountered the water table ranging from 0.65 to 9.54 mbgs, with flow to the northwest. Horizontal groundwater velocity was estimated at approximately 40 cm/y.

2.4 Facility History and Existing Conditions

Canadian Crude Separators Inc. (CCS) (2002) provides the following history of the Facility:

- The Facility is located within the provincial Agricultural Land Reserve (ALR), and is surrounded by Crown land.
- Between 1970 and 1972, the south part of Block A, Section 8 and Block B, Section 7 was cleared. There is no evidence of cultivation of this land.
- Between 1973 and 1987, land in Block B, Section 18 and Block A, Section 17 was cleared. This land was used for range land and a hay field until 1996.

- The Silverberry Land Treatment Centre was established in 1996 and was purchased by CCS from Rudiger Enterprises Ltd. in 2002.

Tervita (2014a) provides the following additional history:

- The first landfill cell at the Facility was opened in October 2002, with additional cells opened in the period between 2003 and 2012.

More recently, cell 7 was opened in 2015. The following subsections describe the existing environmental conditions based on site studies conducted from 2002 to 2017.

2.4.1 Surface Water

Clifton (2002) identified several permanent creeks and lakes within a 10-km radius of the Facility. The nearest surface water bodies include two unnamed creeks (tributaries to the Blueberry River), that are located approximately 1.4 km both to the west and north of the Facility. Upset Creek, St. John Creek, an unnamed creek, and two unnamed lakes or sloughs are also listed as being present within 5 km of the Facility (Clifton, 2002). The nearest major surface water body is the Blueberry River, located approximately 7 km to the north, at an elevation approximately 100 m lower than the elevation of the Facility. An ephemeral stream is located adjacent to the Facility, to the north (CH2M, 2017; Matrix, 2017).

At the Facility, precipitation and runoff that does not contact waste drains offsite to the northwest following the topography. Precipitation that falls on the landfill is directed west using berms and ditches towards a stormwater retention pond (Tervita, 2014a). Surface water is sampled and analyzed prior to being pumped offsite to a forested area to the north of the Facility for re-infiltration (CH2M, 2017). There are no known channel connections between the Facility and nearby fish-bearing water bodies (CCS, 2002).

Section 3.1.1 summarizes the results of the most recent surface water sampling activities. Section 3.1.3 describes soil sampling activities that were conducted within the area where surface water is re-infiltrated.

2.4.2 Groundwater

As part of the Clifton (2002) study, groundwater was sampled and analyzed for general chemistry, metals, hydrocarbons, phenols, and polycyclic aromatic hydrocarbons (PAHs). The groundwater was characterized as a “sulphate type water with no dominant cation”. Total dissolved solids concentrations ranged between 1,160 milligrams per litre (mg/L) to 7,060 mg/L, and is considered “brackish”. Hydrocarbons, phenols, and PAHs were absent (nondetect) in the samples collected, while metals analytes were generally detected. Clifton (2002) indicates that the concentrations measured in groundwater are indicative of natural background conditions, and that the groundwater would not be suitable for potable use because of high sulphate, sulphide, and TDS concentrations.

Matrix (2017) recently conducted a water well search through the BC Water Resources Atlas. Within 5 km of the Facility, three water wells were identified. Two wells are located 2.5 km to the east, owned by Leucrotta Exploration Inc., and used for monitoring; the third well is a domestic well owned by the BC Railway Company, and located 4 km to the northwest.

Potable water is trucked to the Facility, where it is stored in a cistern for general water use. A septic tank captures and stores waste water until it is pumped out for offsite disposal (CCS, 2002).

To prevent impacts to groundwater from the operations at the Facility, the landfill is lined and equipped with a leachate collection and leak detection system (Tervita, 2014a). The proposed landfill expansion will be lined and connected to the existing leachate collection and leak detection systems.

Per the Facility's BC MECCS permit, a groundwater monitoring program is conducted (Tervita, 2014a). A summary report of the groundwater monitoring program is prepared annually (EBA, 2009, 2010; Golder, 2006, 2007; Matrix, 2004, 2015, 2017; NLR/AE, 2012, 2013). The annual reports assess whether groundwater shows evidence of impacts from the landfill or if the groundwater quality is indicative of natural conditions. The reports also comment on whether the leachate collection and leak detection systems are functioning as designed.

Section 3.1.2 summarizes the results of the 2003 through 2016 groundwater sampling activities.

2.4.3 Soil

Soils within the proposed landfill expansion comprise topsoil underlain by clay and silty clay with trace fine sand and gravel (CH2M, 2017). The proposed Project will extend the existing double-liner system already in place to the new landfill cells. The liner is in place to protect existing soil and groundwater from impacts from the landfill activities (Tervita, 2014a).

During construction and operation of the landfill, topsoil and subsoil is salvaged, stockpiled, and maintained with the purpose of using the salvaged soil as the final cover for the landfill cells (Tervita, 2014a). Measures taken to maintain these soils can include: "seeding, hydroseeding, erosion mitigation, cutting, weeding, or contouring to maintain efficient drainage" (Tervita, 2014a).

Section 3.1.3 describes soil sampling activities that were conducted within two areas: where surface water is re-infiltrated, and the area downwind of the existing Facility for potential dust migration.

The types of waste that are currently accepted at the Facility include hydrocarbon-contaminated soils and sands, sulphur-contaminated soil, and salt-contaminated soils. These soils generate leachate. The Facility is equipped with a leachate collection and a leak detection system (CCS, 2002). The proposed Project will connect to the existing system. The collected leachate is pumped into leachate vault, which is subsequently pumped out and disposed of in an offsite licenced disposal well (Golder, 2008). As described in Section 2.4.3, leachate is monitored as part of the groundwater monitoring program.

Section 3.1.3 summarizes the results of the 2003 through 2016 leachate sampling activities as part of the groundwater monitoring program.

2.4.4 Country Foods

Members of Blueberry River First Nation have indicated that they use the land in proximity to the Facility and the proposed Project for traditional land and resource use activities, such as gathering, fishing, hunting, and trapping.

2.4.5 Air

Industrial emission sources (for example, well sites, flare stacks, and gas plants) are present in the region surrounding the Facility, and with the exception of Tervita's adjacent TRD facility none are located within 1 km of the Facility (CCS, 2002; Tervita, 2014a).

Onsite, as part of the existing landfill operations, air emissions are generated by heavy machinery and one diesel generator, which supplies power to the Facility (CCS, 2002; Tervita, 2014a).

Dust from construction material handling and earth grading may contain potential contaminants of concern that could affect human health. As part of the current landfill operations, roadways are wetted on an as-needed basis to reduce dust generation by vehicular traffic (Tervita, 2014a). Naturally occurring radioactive materials (NORMs) may be present in dust, and could be released in the air when moving vehicles and other equipment over the proposed Project area. Tervita conducts air monitoring for NORM activity levels bi-annually to determine if dust being carried in the air has NORM activity levels above regulatory restrictions.

Due to the waste types present at the landfill (that is, waste materials from the oil and gas industry), minimal landfill gas is generated; however, this material can produce odours and vapours from volatile petroleum hydrocarbons (VPH) present in the waste (CCS, 2002; Tervita, 2014a). Section 3.1.5 summarizes the results of a sampling event for hydrocarbon-related volatile organic compound (VOC) vapours from the Facility.

2.4.6 Noise

The major source of noise contributing to existing sound levels around the proposed Project area are road and train traffic. Buick Creek Road is present to the west of the site with railway lines beyond. Frequent daily rail traffic is present; however, the noise from the road and rail traffic is considered "variable and intermittent" (Tervita, 2014a). Average car traffic along Buick Creek Road during the summer is estimated to be 735 vehicles per day (CCS, 2002). Natural sounds, such as wind rustling through vegetation and birds, are also expected to contribute to ambient noise levels when vehicle traffic is absent.

At the Facility, noise is generated from the waste-handling machinery and trucks hauling the waste (CCS, 2002). The noise from normal daytime Facility operations includes "truck traffic, heavy equipment, back-up beepers, speaker systems and radios" (Tervita, 2014a). These noise sources are also associated with cell construction activities.

The nearest neighbour to the Facility is seasonal and is located at a distance of 2.5 km from the Facility (Tervita, 2014a). The Facility is also surrounded by forest, which dampens noise generated from Facility operations (CCS, 2002).

These noise sources represent the baseline noise levels in the vicinity of the Facility.

2.4.7 Naturally Occurring Radioactive Materials

NORMs can accumulate in waste streams from the oil and gas industry at levels greater than background. Within the subsurface formations from which oil and gas are extracted, the source of NORMs is primarily naturally-occurring uranium-238 (U-238) and thorium-232 (Th-232) (Smith, 1992). Of most concern is the radium-226 (Ra-226) isotope, which is a decay product of U-238. Radon-222 (Rn-222) (a decay product of Ra-226) and lead-210 (Pb-210) (a decay product of Rn-222) may also be present (Smith, 1992). Depending on the geographic source, the original concentrations of U-238 and Th-232 in the formation, and the waste stream, levels of NORMs can vary widely (Smith, 1992).

All waste loads are screened for NORMs prior to acceptance at the landfill and known NORM waste loads must have proof of analysis prior to acceptance. NORMs may occur in the oil and gas waste streams accepted at the Facility, including decommissioned infrastructure materials, such as spent catalyst and refractory brick. As per Silverberry's *Environmental Management Act* (*EMA*) Permit, 17150, the maximum acceptable radioactive concentration for NORMs is 70 becquerels per gram (Bq/g), with a maximum radioactive concentration due to Ra-226 of 5 Bq/g.

SECTION 3

Identification of Contaminants of Potential Concern

3.1 Data Sources

The following subsections summarize the key information from previous reports, investigations, and studies that were used to identify the contaminants of potential concern (COPCs) for evaluation in the SLHHRA.

3.1.1 Surface Water

Three reports related to surface water monitoring and discharge were available for review (Nichols, 2015; 2016; 2017). Surface water at the Facility is directed via drainage ditches to a stormwater pond, located in the northwest corner of the Facility. Surface water from the stormwater pond is subsequently tested prior to discharge to a Surface Water Drainage Area (SWDA), which is a forested area containing an ephemeral stream, located offsite to the north of the Facility (CH2M, 2017). The surface water monitoring reports document the sampling of surface water from the stormwater pond twice per year. During the surface water sampling events, one or more of the following laboratory analyses are requested: metals, nutrients, phenols, petroleum hydrocarbons (PHCs), oil and grease, polychlorinated biphenyls (PCBs), extractable organic halides, and trout bioassay. In these reports, the analytical results are compared to the BC CSR water standards in the former Schedule 6 (Generic Numerical Water Standards) and Schedule 10 (Generic Numerical Soil and Water Standards) tables for the following water uses: Drinking Water (DW), Irrigation Water (IW), Livestock Water (LW), and Aquatic Life (AW) (freshwater). A summary of the results for each report is as follows:

- In 2014, over two events (May and July), all concentrations were below the applicable BC CSR water standards or nondetect. Nichols (2015) concluded that there were “no deleterious effects on the environment due to surface water discharge from the Silverberry Landfill”.
- In 2015, over two events (April and May), all concentrations were below the applicable BC CSR water standards or nondetect. A trout bioassay completed in April 2016 indicated no effects. It is noted that in 2015, no surface water was discharged offsite, as all the available surface water runoff (approximately 2,359 cubic metres [m^3]) was used onsite by the Facility for dust control and hydrating the clay liner as part of the construction of Cell 7 (Nichols, 2016).
- In 2016, over two events (April and August), all concentrations were below the applicable BC CSR water standards or nondetect. A trout bioassay completed in April 2015 indicated no effects. Based on these results, a total of 18,189 m^3 of surface water was discharged offsite from the stormwater pond.

3.1.2 Groundwater

Twelve annual reports were available for review regarding the quarterly groundwater monitoring program conducted as part of the *EMA* Permit 17150 for the Facility for the years 2003 through 2016 (EBA, 2009, 2010; Golder, 2007, 2008; Matrix, 2004, 2015 2017; NLR/AE, 2012, 2013). The effectiveness of the leachate collection system and leak detection system beneath the Facility is conducted concurrently with the groundwater monitoring program (Matrix, 2017).

As of 2016, 14 monitoring wells are included as part of the groundwater monitoring program; including nested (shallow/deep) monitoring wells located both upgradient and downgradient of the Facility (Matrix, 2017). Groundwater samples are submitted for analysis of one or more of the following tests: general chemistry, dissolved metals, PHCs, benzene, toluene, ethylbenzene, xylenes (BTEX), methyl tert butyl ether (MTBE), and PAHs. Analytical results are compared to the BC CSR water standards in the former Schedule 6 (Generic Numerical Water Standards) and Schedule 10 (Generic Numerical Soil and Water Standards) tables for the following water uses: DW, IW, LW, and AW (freshwater). The more recent groundwater results are also compared to groundwater data collected between 2008 and 2012 from an upgradient monitoring well which is considered representative of the local background conditions (Matrix, 2017).

Analytes which have had concentrations in groundwater greater than the former BC CSR Schedule 6 and 10 standards include: benzo(a)pyrene, cadmium, chloride, iron, lithium, magnesium, manganese, nitrate, nitrite, selenium, sodium, sulphate, and uranium. The reports generally attribute the concentrations of sodium, chloride, cadmium, magnesium, sulphate, manganese, iron, and uranium to be naturally occurring (Golder, 2007; EBA, 2009; NLR/AE, 2012; Matrix, 2015). The sporadic exceedances of benzo(a)pyrene in groundwater may be attributed to sediment entrained in the groundwater sample (Matrix, 2017). The general conclusion of the annual monitoring reports is that the leachate collection and containment system is operating and that the Facility does not appear to be impacting groundwater.

Leachate and leak detection sampling is conducted concurrently with the groundwater monitoring program. Leachate samples are compared to the BC CSR standards for water. An evaluation of the effectiveness of the leachate collection and containment system typically involves comparing the results of the leachate samples to that of the groundwater samples to determine if groundwater has been impacted by leachate.

Throughout the leachate monitoring program, concentrations of BTEX, metals, PAHs, PHCs, phenols, nitrate, nitrate, and sulphate have been detected greater than the BC CSR standards for water within the leachate vault riser. To a lesser extent, the same chemicals have been detected at concentrations greater than the BC CSR standards in the leak detection riser. Several reports (Golder, 2007; Matrix, 2004) indicate that the presence of certain COPCs in the leak detection riser was attributed to an issue with the leachate collection system at the time and was not related to a failure of the primary liner.

These results are consistent with the wastes accepted at the landfill, which may contain the following:

- Hydrocarbons, including BTEX, VPH, light extractable petroleum hydrocarbons (LEPHs), heavy extractable petroleum hydrocarbons (HEPHs), and PAHs
- Trace metals, including copper, cadmium, chromium, nickel, lead, vanadium and zinc and trace metals associated with wear from drilling equipment in waste
- Salts
- Trace NORMs, which may include uranium, strontium and thorium

3.1.3 Soil

Limited data were available on existing soil quality. In 2016, CH2M conducted a soil sampling investigation to assess soil quality in the SWDA and the Potential Dust Migration Area (PDMA) (CH2M, 2017), which are relevant to the Facility and the proposed Project. The objective of the SWDA soil sampling investigation was to assess concentration and distribution of potential impact in surficial soils resulting from surface water discharge pumped offsite and overland flow onsite draining towards the ephemeral stream. The PDMA covers the footprint associated with the proposed Project, as well as

additional land located to the south and west, which was determined from a wind rose analysis of prevailing winds and estimates of area of potential distribution. Ten and six shallow boreholes were advanced in the SWDA and PDMA, respectively, with a broad range of chemical parameters analyzed. Soil samples collected from soil borings identified concentrations of boron (SWDA and PDMA) and barium (PDMA) which exceeded BC CSR standards (agricultural land [AL] and industrial land [IL] use or Protocol 4 background) for soil. The BC CSR standards are broadly protective of human and ecological health. The boron concentrations greater than the BC CSR standards were concluded to be associated with naturally occurring background, as there were elevated concentrations present in both the SWDA and PDMA, as well as in boreholes advanced in undisturbed areas, and no other COPCs associated with the Facility (that is, hydrocarbons) were detected within the samples. Concentrations of barium were elevated above soil background concentrations (Protocol 4) in two samples. The report indicates that there is uncertainty as to whether these concentrations are indicative of naturally occurring concentrations or related to the materials stored at the Facility. The main source of the materials accepted at the Facility come from the oil and gas industry activities, where barite is a common mud additive (CH2M, 2017).

Soil beneath the landfill also may be impacted by leachate in the event that the leachate collection system or liner is not functioning as designed (refer to Section 3.1.2).

3.1.4 Country Foods

Blueberry River First Nation has indicated that they gather, hunt, fish, and trap in the vicinity of the proposed Project. COPCs for country foods will be based on the COPCs identified in soil, groundwater, and surface water. Vegetation, fish, and wildlife may uptake COPCs in these media.

3.1.5 Air

An air quality report was reviewed with respect to the emission of hydrocarbon-related VOC vapours from landfill wastes (CH2M, 2016b). The intent of the study was to measure the chemical composition of landfill gas emissions at the existing landfill cells. Bitumen or low-density polyurethane caps are in place on closed landfill cells, which limit the release of landfill gases. Therefore, the VOC sampling was conducted on cell 7, which was active and not capped at the time of sampling.

The sampling activities were conducted in two phases: the first phase was a survey to identify "worst-case" sampling locations, while the second phase involved sampling using Summa canisters. The preliminary survey was conducted over a grid using a hand-held landfill gas analyzer, measuring methane (CH_4), carbon dioxide (CO_2), hydrogen sulphide (H_2S), and carbon monoxide (CO) to potentially identify "hotspots" where emissions may be greatest. No detectable concentrations of CH_4, CO_2, H_2S, or CO were detected during this survey. As a result, the locations for the second phase of sampling were based on the terrain of the landfill cell. Two sampling points at higher elevations were selected for the Summa canister sampling. The results were compared to ambient air guidelines from Alberta and Ontario, as BC MECCS does not have ambient air criteria applicable to the VOCs analyzed (BC MOE, 2016b). Concentrations of VOCs were less than the selected ambient air criteria, except benzene. The concentration of benzene in one sample was equal to the Alberta 1-hr ambient air criteria. The report concludes that considering dispersion and dilution, VOC emissions from the landfill are unlikely to be greater than ambient air criteria at an offsite location.

As mentioned in Section 2.4.5, as part of the Facility operations, air emissions are generated by heavy machinery and one diesel generator which supplies power to the Facility (CCS, 2002; Tervita, 2014a). Criteria air contaminants (CACs) that may be emitted during current operations include nitrogen oxide (NO_x), sulphur oxide gases, and airborne particulate matter (PM), along with minor amounts of VOCs, as discussed above.

3.1.5.1 Ambient Air Quality in Project Region

There are numerous industrial emission sources near the proposed Project site (for example, well sites, flare stacks, and gas plants) and with the exception of Tervita's adjacent TRD facility, none are located within 1 km of the Facility (CCS, 2002; Tervita, 2014a).

Ambient air quality monitoring data were obtained from the Province of BC Northeast Air Zone dataset to define existing air quality near the proposed Project area. Specifically, data from the Fort St. John – Key Learning Center, Monitor Station ID# E299830 for the year 2016 were downloaded from BC MECCS (BC MOE, 2016a). The station is located at latitude 56.244722, and longitude -120.856111 approximately 46 km southeast of the proposed Project. This station was chosen because it is the nearest station to the proposed Project that measures a comprehensive list of CACs. Table 3-1 summarizes the results of the data.

Table 3-1. Summary of Ambient Air Quality in the Project Region – 2016 Data

NO	NO_2	NO_x	SO_2	O_3	$PM_{2.5}$	PM_{10}	Comments
ppb	ppb	ppb	ppb	ppb	µg/m³	µg/m³	--
18.9	20.5	39.2	1.2	41.0	15.4	49.8	98th percentile of 24-hour averages
2.9	5.7	7.7	0.32	22.6	5.6	15.7	Average of 24-hour averages (annual)

Notes:

µg/m³ = micrograms per cubic metre
NO = nitric oxide
NO_2 = nitrogen dioxide
O_3 = ozone
PM_{10} = small particles with a diameter of 10 microns
$PM_{2.5}$ = fine particles with a diameter of 2.5 microns
ppb = part(s) per billion
SO_2 = sulphur dioxide

3.1.5.2 Project Emissions

Dust from construction material (rock, gravel) handling and earth grading may contain contaminants, which could be transported away from the proposed Project. As part of the current landfill operations, roadways are wetted on an as-needed basis to reduce dust generation by vehicular traffic (Tervita, 2014a). Operational restrictions will take place if visible dust clouds are noted by on-site operators. These restrictions could include curtailment or cessation of work under high wind conditions, minimizing drop distances, covering or watering of open stockpiles, rehabilitating completed sections of the landfill as soon as practical, and adhering to posted speed limits on-site. Typically, fugitive dust particles are larger particles that will redeposit to the ground within a few hundred meters of the fugitive dust source. Therefore, total PM concentrations will approach background levels within a localized area. In addition, there is a significant distance to any potentially affected receptors, meaning that there is little potential for off-site dust nuisance. Emissions from construction equipment are expected to be localized and temporary in nature.

Table 3-2 summarizes the details of typical equipment to be used during cell construction. All equipment will adhere to low-emission Tier 4 engine specifications.

Table 3-2. Summary of Cell 9 Construction Equipment

Equipment Type	Number	Engine Model	Engine Size	Comments
CAT D6T Dozers	2	C9.3 ACERT	161-kW net	USEPA Tier 4
CAT 330F L Excavators	2	C7.1 ACERT	175-kW net	USEPA Tier 4

Table 3-2. Summary of Cell 9 Construction Equipment

Equipment Type	Number	Engine Model	Engine Size	Comments
CAT 735 C Trucks	6	C15 ACERT	329-kW net	USEPA Tier 4
CAT 815K compactors	2	C7.1 ACERT	185-kW net	USEPA Tier 4

Notes:

USEPA = United States Environmental Protection Agency
kW = kilowatt(s)

Due to the waste types present at the Facility (that is, waste materials from the oil and gas industry), minimal landfill gas is expected to be generated during operations of the proposed Project; however, this material can produce odours and vapours from VPH present in the waste (CCS, 2002; Tervita, 2014a). As discussed above, a preliminary study of landfill emissions was done in 2016 to quantify the nature and concentration or emissions of VOC vapours from the Facility (CH2M, 2016b). The results show that minor amounts of VOCs are emitted from the existing landfill cells under typical operating conditions. Due to the fact that similar wastes will be accepted at the proposed new landfill cell, VOC emissions are expected to be similar in nature and quantity.

3.1.6 Noise

Health Canada does not regulate noise levels, but does provide recommendations for the assessment of noise impacts, including:

- Identification and mapping of noise-sensitive receptors such as residences, schools, nursing homes and First Nations communities, relative to a project location
- Estimation of baseline sound levels for a project be estimated at both day and night
- Identification of all potential project noise during all project phases
- Comparison of baseline noise levels with predicted noise levels at sensitive receptor locations
- Evaluation of severity of predicted changes and prediction of health impacts
- Implementation of mitigation measures, noise management and complaint resolution planning (Health Canada, 2010a; 2017a)

An evaluation of the expected future operations and construction phase noise levels is discussed in the following subsections.

3.1.6.1 Construction Stage

During construction of the proposed Project, it is expected that the following equipment will be used:

- Two CAT D6T dozers
- Two CAT 330F excavators
- Six 30-ton CAT 735C rock trucks
- Two CAT 815K compactors

It is highly unlikely that all equipment will be used simultaneously and construction is only anticipated during the daylight hours. According to the U.S. Department of Transportation, Federal Highway Administration, *Construction Noise Handbook* (2017), the equipment listed above have measured and averaged sound pressure level measurements at 50 feet as follows: compactor (83 decibels [dBA]), dozer (82 dBA), dump truck (76 dBA), and excavator (81 dBA).

3.1.6.2 Operations Stage

The operations stage of the proposed Project will require the use of similar equipment in the same quantities as what is currently being used at the Facility.

3.1.7 Naturally Occurring Radioactive Materials

Six documents containing raw radiation level survey data from select locations across the Facility were reviewed. Data were reported on a monthly basis from up to 17 locations between January 2011, and November 2016. Table 3-3 presents the tabulated data and measurements.

Table 3-3. Summary of Radiation Survey Data for the Existing Facility

Statistic	nSv/h
Maximum	500
Minimum	20
Median	95

Note:

nSv/h = nanosievert(s) per hour

Review of the data suggests that the maximum value of 500 nSv/h is an outlier. This value was measured at Cell 6 in June of 2014. Of the 847 measurements provided, the next highest value is 200 nSv/h. If this value is present, it is noted that once the waste is covered, the cover material provides shielding for external exposure and blocks direct contact pathways with NORMs.

Two additional reports (Tervita, 2014b; 2016b) and one set of raw data were reviewed related to NORM monitoring activities in air (dust/particulates) for the years 2014 through 2016. Limited details were provided with regards to specific sample methodology. Samples were collected on filter discs via an air pump which drew air from three locations at the perimeter of the Facility (southwest, southeast, and north). Alpha counts were measured for background and from the filter discs after sampling and after 5 days using an Environmental Instruments Canada TM372B Sample Counter for a duration of 10 minutes. The 5-day sample was collected to account for the presence of radon gas (which has a half-life of 3.8 days) versus long-lived radioactive content. After 5 days, the decay of short-lived radon daughters would have occurred and can be compared to the initial counts to determine if long-lived radiation is present.

Tervita (2014b, 2016b) provides an interpretation of the data from each sampling event. In general, initial counts from the filter discs were measured greater than the initial background counts. However, after 5 days, the counts on the filter discs were found to be less than or equal to the 5-day background counts and less than the initial filter and background counts, suggesting the presence of radon gas. Tervita (2014b, 2016b) concluded that the data indicate no loose NORM contaminants or evidence of NORM-contaminated dust leaving the property.

3.2 Contaminants of Potential Concern Screening Process

Based on the current and anticipated future conditions of the Facility, the COPC screening process was conducted using the BC CSR standards (BC MOE, 1996), where applicable. As described in Section 18(3) of the CSR, “acceptable” risks to human health for carcinogens are one in one hundred thousand (that is, $1x10^{-5}$) and a hazard index of 1 for noncarcinogens.

The BC CSR establishes standards for six designated land-use categories: Wildlands (WL) (natural and reverted) AL, Urban Park (PL), Residential (RL) (low- and high-density), Commercial (CL), and IL.

The applicable standards depend on the primary land use on-site. The Facility is categorized as IL use and is surrounded by areas of undeveloped forest supporting natural ecosystems. Based on an iMapBC land search, the Facility, including the proposed Project and surrounding area, are located within the ALR. Per the Facility permit, the end land use for the Facility and proposed Project would be AL.

3.2.1 Screening Criteria

3.2.1.1 Surface Water

Water use standards applied at the site are determined based on the four water-use categories designated in the CSR: AW Water Use, IW Use, LW Use, and DW Use. The applicable water standards are provided in Schedule 3.2 (Generic Numerical Water Standards) of the CSR (BC MOE, 1996).

The AW standards were not applied as they are not applicable to human health. As there may be use of water for agricultural purposes in the vicinity of the proposed Project in the future, both the IW and LW standards were applied to the water at the site (both groundwater and storm water). Therefore, the Schedule 3.2 IW, LW, and DW standards were used for the initial screening of groundwater COPCs.

The lowest guideline value (that is, the most stringent standard) was compared with the analytical data, providing the most conservative approach to characterizing the groundwater conditions and selecting COPCs for further assessment. This criterion is referred to as the “Lowest Water Standard” throughout this report.

Table 3-4 provides the results of the preliminary screening of storm water data to identify COPCs in surface water. Section 3.2.2 provides greater detail regarding the screening process for surface water.

3.2.1.2 Groundwater

Groundwater data were screened against the Lowest Water Standard, as described in Section 3.2.1.1.

Table 3-5 provides the results of the preliminary screening to identify COPCs in groundwater. Section 3.2.2 provides greater detail regarding the screening process for groundwater.

3.2.1.3 Soil

The applicable soil standards are provided in Schedule 3.1 – Part 1 (Matrix Numerical Soil Standards) and Schedule 3.2 – Part 2 (Generic Numerical Soil Standards to Protect Human Health) of the CSR (BC MOE, 1996).

As part of Schedule 3.1 – Part 1, there are two site-specific factors applicable to the proposed Project. These factors take into account existing and possible human receptors and primary exposure pathways, as follows:

1. Intake of contaminated soil
2. Groundwater used for drinking water

For these site-specific factors, the lowest guideline value (that is, the most stringent standard) was compared with the analytical data, providing the most conservative approach to characterizing the soil conditions and selecting COPCs for further assessment. This criterion is referred to as the “Lowest AL Soil Standard” or the “Lowest IL Soil Standard” throughout this report.

A subset of the soil standards for groundwater used for drinking water (that is soil standards protective of groundwater used for drinking water) are based on soil pH (hydrogen [ion] concentration) (specifically for cadmium, copper, lead, and zinc). Soil pH from samples taken in the SWDA and PDMA was found to range from 4.75 to 7.18. The appropriate soil standard associated with this pH range was incorporated into the Lowest AL Soil Standard or Lowest IL Soil Standard used for COPC screening of soil.

Table 3-6a provides the results of the preliminary screening to identify COPCs in soil.

Leachate data were screened against the Lowest Water Standard, as described in Section 3.2.1.1. Table 3-6b provides the results of the preliminary screening to identify COPCs in leachate. Section 3.2.2 provides greater detail regarding the screening process for soil and leachate.

Table 3-4. Summary of Chemicals Detected and Maximum Concentrations in Surfacewater - Chemical of Concern Screening

SLHRRA, Tervita Silverberry Landfill, BC

Parameter	Volatility Designation [a.]	No. of Stations	No. of Samples	Units	Lowest Water Standard [b.]	Max Concentration Detected	Max Nondetect Concentration	Max Concentration [c.]	Count of Detects Exceeding Lowest Water Standard	Count of Nondetects Exceeding Lowest Water Standard (using Max SDL)	Included/Excluded as COC (Rationale)

Xylenes, Total	Volatile	1	3	µg/L	300		1	1	--	--	Excluded (Max ≤ Lowest Water Standard)
Zinc	Non-Volatile	1	8	µg/L	2000	11.1		11.1	--	--	Excluded (Max ≤ Lowest Water Standard)

Table 3-4. Summary of Chemicals Detected and Maximum Concentrations in Surfacewater - Chemical of Concern Screening

SLHRRA, Tervita Silverberry Landfill, BC

Parameter	Volatility Designation [a.]	No. of Stations	No. of Samples	Units	Lowest Water Standard [b.]	Max Concentration Detected	Max Nondetect Concentration	Max Concentration [c.]	Count of Detects Exceeding Lowest Water Standard	Count of Nondetects Exceeding Lowest Water Standard (using Max SDL)	Included/Excluded as COC (Rationale)
Zirconium	Non-Volatile	1	8	µg/L			1	1	--	--	Excluded (no standard available; not detected, no elevated SDL)

[a.] Indicates whether the parameter is considered volatile or nonvolatile.

[b.] Lowest of the BC CSR Reg. 375/96 Schedule 3.2 Standards for Irrigation, Livestock, and Drinking Water Generic Numerical Water Standards.

[c.] Column lists the greater of the maximum concentration between Max Detected Concentration and Max Nondetect Concentration.

Notes:

Bold parameters are identified as COCs

COC = chemical of concern

EPH = extractable petroleum hydrocarbon

max = maximum (concentration)

No. = number

SDL = sample detection limit

VH = volatile hydrocarbon

-- = not applicable

Uranium	Non-Volatile	14	268	mg/L	0.01	0.092	0.005	0.092	167	--	**Included (Max > Lowest Water Standard)**
Vanadium	Non-Volatile	14	268	mg/L	0.02	0.0081	0.01	0.01	--	--	Excluded (Max ≤ Lowest Water Standard)
Volatile Hydrocarbons (VH)	Volatile	14	312	µg/L	15000	22	100	100	--	--	Excluded (Max ≤ Lowest Water Standard)

Table 3-5. Summary of Chemicals Detected and Maximum Concentrations in Groundwater - Chemical of Concern Screening

SLHRRA, Tervita Silverberry Landfill, BC

Parameter	Volatility Designation [a.]	No. of Stations	No. of Samples	Units	Lowest Water Standard [b.]	Max Concentration Detected	Max Nondetect Concentration	Max Concentration [c.]	Count of Detects Exceeding Lowest Water Standard	Count of Nondetects Exceeding Lowest Water Standard (using Max SDL)	Included/Excluded as COC (Rationale)
Volatile Petroleum Hydrocarbon (VPH)	Volatile	14	312	µg/L		42	100	100	--	--	**Included (no standard available; known to be present)**
Xylenes, Total	Volatile	14	312	µg/L	90	2.83	100	100	--	6	**Included (Max > Lowest Water Standard)**
Zinc	Non-Volatile	14	268	mg/L	1	0.57	0.05	0.57	--	--	Excluded (Max ≤ Lowest Water Standard)

[a.] Indicates whether the parameter is considered volatile or nonvolatile.

[b.] Lowest of the BC CSR Reg. 375/96 Schedule 3.2 Standards for Irrigation, Livestock, and Drinking Water Generic Numerical Water Standards.

[c.] Column lists the greater of the maximum concentration between Max Detected Concentration and Max Nondetect Concentration.

Note:

Bold parameters are identified as COCs

Table 3-6b. Summary of Chemicals Detected and Maximum Concentrations in Leachate - COC Screening

Screening Level Human Health Risk Assessment, Tervita Silverberry Landfill, British Columbia

Parameter	Volatility Designation [a.]	No. of Stations	No. of Samples	Units	Lowest Water Standard [b.]	Max Concentration Detected	Max Nondetect Concentration	Max Concentration [c.]	Count of Detects Exceeding Lowest Water Standard	Count of Nondetects Exceeding Lowest Water Standard (using Max SDL)	Included/Excluded as COC (Rationale)
Tin	Non-Volatile	2	47	mg/L	2.5		1	1	--	--	Excluded (Max ≤ Lowest Water Standard)

[a.] Indicates whether the parameter is considered volatile or nonvolatile.

[b.] Lowest of the BC CSR Reg. 375/96 Schedule 3.2 Standards for Irrigation, Livestock, and Drinking Water Generic Numerical Water Standards.

[c.] Column lists the greater of the maximum concentration between Max Detected Concentration and Max Nondetect Concentration.

Notes:

Bold parameters are identified as COCs

F = fraction

3.2.1.4 Country Foods

No data were available for plant or animal tissue. Health Canada (2010c) lists several questions to consider when determining whether the country foods pathway is feasible and should be evaluated. These questions, along with responses outlining the applicability to the Facility and proposed Project are provided as follows:

1. **Does a contaminated site represent a significant source of chemical contamination to potentially harvestable plant or animal species?**
   - A landfill, by nature, represents a source of chemical contamination but the landfill is meant to contain the contamination and prevent it from being released to the surrounding environment.
2. **Is there a transport mechanism for contaminants from the contaminated soil, groundwater, surface water and/or sediment at the site to reach potential harvestable species onsite or offsite?**
   - Dust from the expanded landfill may be transported (during a very short window, when landfilling takes place and before waste is covered) via wind to downwind land areas and deposited onto the soil surface or on the leaves of harvestable vegetation. The COPCs identified for soil are applicable to this pathway.
   - Leachate may reach groundwater via a spill or leak in the existing liner and containment system, which will also be implemented as part of the proposed Project. Impacted groundwater may reach harvestable species via migration of groundwater with subsequent uptake from vegetation from a shallow water table or discharge to a downgradient water body. The COPCs identified in groundwater are applicable to this pathway.
   - Surface water (that is, overland flow) is collected in onsite berms and either reused onsite for dust control or sampled prior to being discharged to the ground beyond the Facility. Harvestable vegetation may contact surface water discharged to the ground. The COPCs identified in surface water are applicable to this pathway.
3. **Can the chemicals of potential concern bioaccumulate or bioconcentrate in the edible tissue of harvestable species?**
   - MacDonald and Ingersoll (2003) identifies the following chemicals as bioaccumulative:
     - Metals
     - Methyl mercury
     - PAHs
     - PCBs
     - Organochlorine pesticides
     - Chlorophenols
     - Dioxins and furans
   - As shown in Tables 3-4, 3-5, and 3-6a, metals have been identified as COPCs in surface water, soil, and groundwater and PAHs have been identified as COPCs in groundwater. Therefore, COPCs with the potential to bioaccumulate in the tissue of harvestable species are associated with the Facility and the proposed Project.
   - NORMs are not considered a COPC for the country foods pathway via dust based on the dust monitoring reports (Tervita, 2014b, 2016b) which concluded that there is no loose NORM contaminants or evidence of NORM-contaminated dust leaving the property.

4. Are local plants and animals being harvested, and if so, what tissues are being consumed?

- Local plants and animals are reported to be harvested from the land in proximity to the Facility and the proposed Project by members of the Blueberry River First Nation. Specifics regarding the tissues being consumed are currently unknown. No data were available for plant or animal tissue. It is assumed that plant, fish, and mammal tissues are being consumed.

5. What are the consumption patterns and characteristics of the consumers (people), with respect to those harvested plants or animals?

- Specifics regarding consumption patterns and receptor characteristics with respect to consumption are currently unknown. However, it is very unlikely that country foods collected in the vicinity of the proposed Project are the primary food sources for the consumers of country foods.

Based on these considerations, a qualitative assessment of the country foods pathway will be undertaken using currently available information.

3.2.1.5 Air

Ambient air quality in BC is managed through provincial acts and regulations, with input from federal, regional, and municipal governments. The BC *EMA* is the main provincial legislation for air quality and other environmental issues, and the Waste Discharge Regulation under the Act regulates the release and disposal of wastes to land, water, and air in BC.

Ambient Air Quality Objectives (AAQOs) are pollutant concentration thresholds that are set to protect human and environmental health across Canada. These limits provide regulatory benchmarks against which pollutant concentrations of CACs can be measured and assessed. Air quality criteria used to inform decisions on the management of CACs in BC are from a variety of provincial and federal objectives, depending on the contaminant. For example, BC has developed its own AAQOs for PM, carbon monoxide (CO) and SO_2. For other CACs, BC uses the National Ambient Air Quality Objectives or the Canadian Ambient Air Quality Standards (BC MOE, 2016b).

Table 3-7 presents a summary of BC AAQOs.

Table 3-7. Summary of British Columbia Ambient Air Quality Objectives

Contaminant	Averaging Period	Air Quality Objective	
		µg/m³	ppb
NO_2	1-hour	188	100
	Annual	60	32
O_3	1-hour	160	82
	8-hour	123	63
$PM_{2.5}$	24-hour	25	--
	Annual	8	--
PM_{10}	24-hour	50	--
SO_2	1-hour	183	70
	Annual	13	5
TSP	24-hour	120	--
	Annual	60	--

Table 3-7. Summary of British Columbia Ambient Air Quality Objectives

Contaminant	Averaging Period	Air Quality Objective	
		µg/m³	ppb

Note:

TSP = total suspended particulate

The ambient air quality in the proposed Project area in northeast BC, as measured at the Key Learning Center Monitoring Station (refer to Section 3.1.5.1), is well below provincial criteria for all contaminants measured. This monitoring station is in central Fort St John and is likely a conservative estimate of actual air quality concentrations at the proposed Project site, which is more remote with fewer nearby emission sources.

Greenhouse gases are expected to be released as a result of proposed Project activities. These emissions are expected to be primarily from combustion sources such as construction equipment tailpipe emissions and generator use. As described in Section 3.1.5.2, all construction equipment will adhere to low-emission Tier 4 engine specifications.

Due to the nature of the waste accepted at the Facility, generation of methane is not expected to be significant although some biodegradation of hydrocarbon materials will contribute to CO_2 emissions.

Based on the VOC sampling results (CH2M, 2016b) described in Section 3.1.5, VOCs in ambient air are less than or equal to relevant provincial ambient air quality criteria (Alberta and Ontario). Therefore, no COPCs related to landfill gases have been identified from this potential source.

Based on this screening evaluation for combustion sources and waste materials, greenhouse gas emissions from the proposed Project will not be significant.

3.2.1.6 Noise

Noise levels during the operations stage are estimated to be the same as baseline (existing) conditions since the proposed Project will use similar equipment in the same quantities as what is currently being used at the Facility. The existing cells at the Facility will no longer be used once the proposed Project is in operation and minimal noise is expected from periodic maintenance vehicles and equipment. Therefore, it is not expected that there will be a noticeable increase in noise at off-property receptors associated with the use of equipment and vehicles during the operations phase of the proposed Project.

To screen the potential for adverse noise impacts during the construction stage, noise levels have been estimated from the equipment list (Section 3.1.6.1) and compared to Permissible Sound Levels (PSLs). The BC Oil and Gas Commission (BC OGC) *British Columbia Noise Control Best Practices Guideline* (BC OGC, 2009) were designed to control noise levels for activities under BC OGC jurisdiction and have also been applied to assess noise levels that may disturb local residents. The guidelines compare predicted noise levels to PSLs for day and night.

If it is conservatively assumed that dozers, excavators, and compactors will be on-site, with any two of these pieces of equipment working in the same area simultaneously (the remaining vehicles/equipment will likely be travelling to and from other areas at the construction site), and the predicted total sound level at 50 feet will be 90 dBA. This noise level will attenuate to less than 55 dBA (BC noise guidelines for daytime operations with less than 60 days or operations [Class B] adjustment) at a distance of less than 1 km. This estimate conservatively assumes only distance attenuation and no other attenuation due to foliage, terrain, and so forth. Therefore, based on the noise screening, these temporary construction noise levels will not significantly affect off-site sensitive receptors in the area.

3.2.1.7 Naturally Occurring Radioactive Materials

The *Canadian Guidelines for the Management of Naturally Occurring Radioactive Materials* (Health Canada, 2011) were developed by the Federal Provincial Territorial Radiation Protection Committee to regulate and ensure appropriate control of NORMs throughout the country.

Part 7, Division 3 of the *Workers Compensation Act*, *Occupational Health and Safety Regulation* (B.C. Reg. 296/97, as amended by B.C. Reg. 142/2017) is administered by WorkSafe BC, and contains the legal requirements that must be met in all workplaces for ionizing radiation (WorkSafe BC, 2017).

The *Canadian Guidelines for the Management of NORMs* and the *Occupational Health and Safety Regulation* provide the regulatory framework for exposure to NORMs in BC workplaces and incidentally exposed members of the public. The *Occupational Health and Safety Regulation* provides the effective dose to a worker's entire body for 1 year, based on the *Canadian Guidelines for the Management of NORMs.* In addition, the *Occupational Health and Safety Regulation* has guidelines for the annual equivalent doses to specific body parts including the eyes, skin, hands, and feet. The *Canadian Guidelines for the Management of NORMs* also outlines annual exposure limits for incidentally exposed members of the public. The guidelines are used to set annual exposure limits for radiation health risks to people from work and general exposure.

Table 3-8 presents the Annual Effective Dose Limits for those who may be exposed to NORMs as part of their occupational duties (workers) and the public. A Dose Constraint value of 0.3 millisieverts per annum (mSv/a) is also provided for the public which allows "exposure from other sources without the annual limit being exceeded" (Health Canada, 2011). These values are protective of exposures that are incrementally greater than the typical Canadian background exposure, which is cited to range from 1.2 mSv/a to 3.2 mSv/a, with an average of 2.0 mSv/a (Health Canada, 2011).

Table 3-8. Summary of Health Canada Radiation Dose Limits

Receptor Type	Effective Dose Limit (mSv/a)	Dose Constraint (mSv/a)
Worker	20	--
Public	1	0.3

The Canadian Nuclear Safety Commission (CNSC) provides background radiation dose data for specific geographies across the country (CNSC, 2017). Table 3-9 presents the Canadian average and value for the closest major city to the Facility (that is, Edmonton, Alberta).

Table 3-9. Selected Background Radiation Dose Data

Geography	Dose (mSv/a)
Canada - Average	1.8
Edmonton, Alberta	2.4

To screen the Facility NORM data described in Section 3.1.7 against regulatory limits, the data needed to be converted to annual doses representing the receptor groups for which regulatory limits have been derived:

- Worker – exposure dose based on 40 hours per week for 50 weeks per year (equivalent to 2,000 hours per annum [h/a])
- Public – exposure dose based on 24 hours per day for 52 weeks per year (equivalent to 8,760 h/a)

As the public would not be expected to be exposed to NORM radiation from inside the Facility's fenceline, only survey data from locations denoted as "corners" or "fenceline" were considered relevant to the public. Workers could be exposed to NORM radiation at any location; therefore, the entire dataset was considered for workers.

Table 3-10 provides the summary statistics relevant to each receptor group, the calculated estimated annual dose, and a comparison of the estimates to the regulatory Effective Dose Limit and Dose Constraint for each receptor group.

Table 3-10. Estimated Annual Radiation Doses from the Existing Facility for Workers and the Public

Statistic	Radiation Level (mSv/h)	Relevant Receptor	Estimated Exposure (h/a)	Estimated Annual Dose (mSv/a)
Entire Site - Maximum	5.0E-04	Worker	2000	1.0E+00
Entire Site - Minimum	2.0E-05	Worker	2000	4.0E-02
Entire Site - Median	9.5E-05	Worker	2000	1.9E-01
Fenceline - Maximum	1.5E-04	Public	8760	**1.3E+00**
Fenceline - Minimum	2.0E-05	Public	8760	1.8E-01
Fenceline - Median	9.0E-05	Public	8760	7.9E-01

Notes:

mSv/h = millisievert(s) per hour

Bold = value greater than Effective Dose Limit

Underline = value greater than Dose Constraint

Estimated Annual Dose (mSv/a) = Radiation Level (mSv/h) x Estimated Exposure (h/a)

The estimated annual dose for workers is below the Health Canada limits for that receptor group. The annual dose from NORM waste at the Facility for workers, based on the maximum radiation level, is similar to the background dose for Canada (average) and the City of Edmonton.

For the public, the maximum radiation level at the Facility fenceline is estimated to result in an annual dose greater than the Effective Dose Limit; the maximum, minimum, and median radiation levels at the Facility fenceline are also estimated to result in an annual dose greater than the Dose Constraint. The annual dose from NORM waste at the Facility for the public, based on the maximum radiation level at the Facility fenceline, is similar to the background dose for Canada (average) and the City of Edmonton.

As radiation dose is based on lifetime exposure, the median radiation levels measured at the Facility are considered the most "typical" exposure level. At the median level, the estimated annual dose is predicted to be greater than the Dose Constraint, but less than the Effective Dose Limit.

Based on this screening process, worker exposure is anticipated to fall within the allowable regulatory guideline limits. Estimated exposure to the public may be greater than regulatory guideline limits and will be assessed further in this SLHHRA.

3.2.2 Screening Process – Soil, Groundwater, Surface Water, and Leachate

The list of COPCs for initial consideration in the SLHHRA was determined according to the following three-step screening process, where data were available.

1. A maximum concentration was identified for each parameter. The maximum concentration in each media was determined as either the maximum measured value or the highest detection limit (if greater than the maximum measured value).
2. Parameters were retained for further consideration under the screening process in each media, if the identified maximum concentration exceeded either the Lowest AL Soil Standard for soil or the Lowest Water Standard for surface water, groundwater, and leachate. Tables 3-4 through 3-6a-b show the detailed screening process, including the measured concentrations, number of samples, and number of detects greater than the applicable criteria, for COPCs in surface water, groundwater, soil, and leachate, respectively.
3. Chemicals with no applicable BC CSR Standard were treated as follows:
    - Chemicals that were 100 percent nondetect were examined further to determine whether the reported maximum was based on an elevated SDL. Chemicals that were 100 percent nondetect with nonelevated SDLs were not considered COPCs, as they have not been detected based on the supporting data. The reported SDLs for each nondetect chemical without an applicable BC CSR standard were examined compared to other sample results. If all SDLs reported for the same chemical were equal in value, the SDLs were considered to be nonelevated. If one or more SDLs was greater than those from the same chemical, the maximum SDLs were considered to be elevated and the chemical was retained as a COPC.
    - Chemicals that were detected and had no applicable BC CSR standard, or that were nondetect with elevated SDLs (determined per Step 3), were retained as COPCs.

SECTION 4

Screening Level Human Health Risk Assessment

4.1 Problem Formulation

The problem formulation step is an important information-gathering and interpretation stage that serves to plan and focus the approach of the SLHHRA. The data evaluated in this stage focus on proposed Project information that is relevant to the SLHHRA in order to identify human receptors, possible exposure pathways, and other specific areas or issues of concern. The general problem formulation process involves:

- Describing the environmental setting
- Identifying receptors of concern
- Identifying sources of potential risks of adverse effects to the Human Health VC
- Using a CSM to summarize the potential links between contaminant sources and receptor groups

The environmental setting is described in Section 2.4 as part of the existing conditions in the proposed Project area pertaining to drinking water quality, soil quality, country foods quality, noise levels, air quality, and NORMs. Potential receptors and COPCs are characterized in Section 4.1.4. The CSM is used to establish plausible interaction pathways between the potential adverse effects of the proposed Project on the Human Health VC. The CSM is explained in Section 4.1.1 in the discussion of the risk assessment paradigm.

In a standard or typical SLHHRA, the quality of the environment (for example, chemical concentrations in environmental media) is screened against appropriate soil, water, or air standards, guidelines, or objectives that are in effect in the jurisdiction where a project is located. For the purpose of this assessment, available studies for the Facility and the proposed Project were used to identify COPCs and other potential stressors for human receptors.

4.1.1 Risk Assessment Paradigm

For a risk of adverse effects to the Human Health VC to be plausible, three components are required:

- A stressor (that is, a COPC in environmental media or other hazard, such as noise) must be present at a concentration or magnitude that can present a hazard
- An exposure pathway for the stressor to contact the receptor must be present
- A human receptor must be present

When all three components are present, the potential risk of adverse effects to the Human Health VC can be assessed. If one component is missing, there is no human health risk. While the presence of all three components is required for a potential risk of adverse effects to the Human Health VC to exist, it does not indicate that an adverse health effect will be the certain outcome, only that risk of adverse effect is possible. An exposure to a stressor must be of substantial magnitude and duration in order to elicit an adverse effect on the Human Health VC. Where a potential risk is identified, the risk can then be managed and mitigated by affecting a change to any one of the three risk components. Figure 4-1 illustrates the risk assessment paradigm.

Potential health concerns were assessed using a CSM to determine if potential risks of adverse effects could exist in relation to the Human Health VC. The CSM integrates and assembles the risk components

illustrated in Figure 4-1 and schematically illustrates the relationships of COPCs and their release, transport pathways, and exposure routes to receptors of concern. The risk components (COPCs detected, pathways and receptors, as well as the proposed Project) are combined to synthesize the CSM for the potential adverse effects to the Human Health VC. The CSM is used to direct the qualitative health assessment.

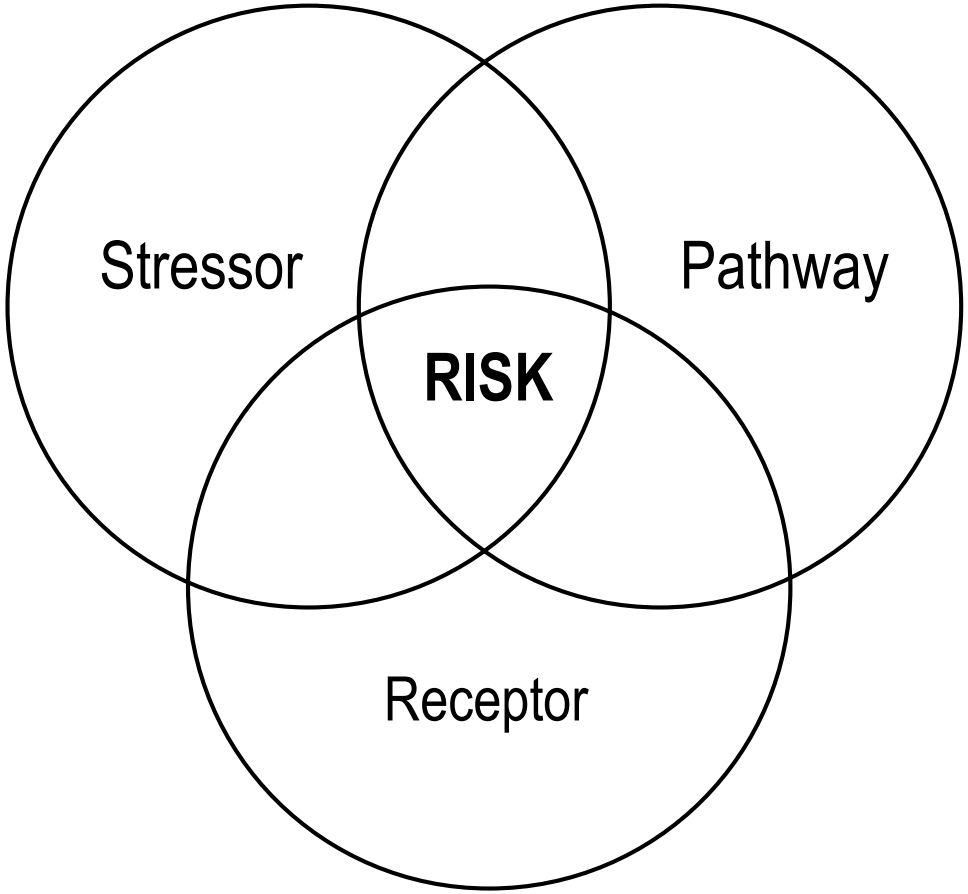

FIGURE 4-1
Risk Assessment Paradigm
Screening Level Human Health Risk Assessment
Silverberry Secure Landfill

The typical SLHHRA process is not designed to evaluate other nonchemical stressors, such as noise; however, noise as a stressor is carried through this desktop SLHHRA to qualitatively evaluate the human health risk from increased noise levels due to the proposed Project.

In the following sections, the CSM identifies those complete exposure pathways where receptors may be directly exposed to noise or COPCs in air, soil, and water, or may be indirectly exposed to COPCs from soil and water via vapour transport or other pathways. With respect to COPCs, an exposure pathway is complete if a receptor takes in (to their body) chemical constituents through ingestion, inhalation, or dermal absorption (that is, contact with the skin). The CSM also identifies that some pathways were considered to be negligible since the pathway could be interrupted (that is, incomplete, blocked, or not present). The CSM is the basis for the qualitative risk assessment through the identification of sources of COPCs, pathways or potential pathways, and receptor combinations that appear to be plausible and, therefore, require an evaluation of the magnitude of risk present. Detail is provided in Section 4.1.4 regarding the receptors and pathways included in the qualitative assessment as well as justification for the inclusion or exclusion of receptors and pathways.

For each potential stressor, a CSM was developed to identify the pathway of exposure from the COPC in the source media, through release mechanism and finally exposure routes into human receptors. Where an expected hazard and level of exposure were identified, the potential risks were qualitatively assessed using the hazard-exposure interaction matrix in Figure 4-2. For the purposes of this assessment, risks of adverse effects to the Human Health VC will be qualitatively characterized as low risk, medium risk, or high risk based on the hazard level of the stressor and the level of exposure.

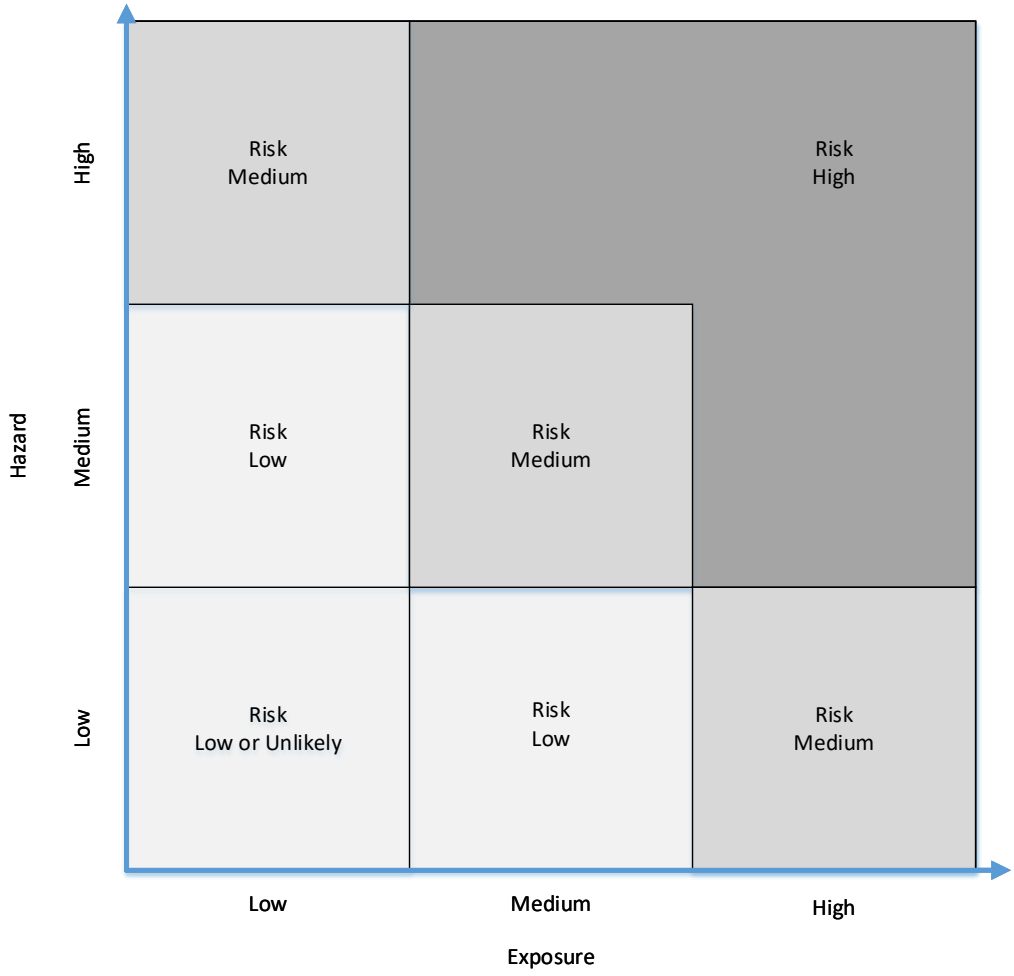

Figure 4-2. Hazard-Exposure Interaction Matrix

4.1.2 Risk Management Considerations

The risk assessment paradigm facilitates risk management through the identification of hazards (that is, safety risk or COPC exposure risk) and the pathways of exposure to human receptors. Where possible, during the lifetime of the proposed Project, the risks of adverse effects to the Human Health VC can be mitigated through risk management measures, such as:

- Reducing hazards (such as., reducing the number of hazardous situations, reducing dust concentrations, reducing COPC concentrations, reducing noise)
- Reducing the frequency and duration of exposure by reducing the pathway (such as, preventing human access to the proposed Project area, reducing consumption of water, vegetation, wildlife, and fish)
- Preventing exposure by introducing barriers (such as, capping contaminated soil)
- Changing the behaviour of receptors (such as, restricting certain land use, changing worker schedules)

The approach to risk management may include changing the stressor, receptor or pathway, as follows:

- Stressor: the reduction or elimination of noise via abatement technologies, reduction or elimination of COPCs in air, soil, and water via management, treatment, or abatement technologies (such as, air filters, catalytic converters for air emissions, and soil treatment).
- Pathways: implementing engineered barriers to environmental media and requiring the use of personal protective equipment (PPE) such as gloves and protective clothing.
- Receptors: preventing access to contaminated land, encouraging land use during seasons where exposure to environmental media is limited and imposing restrictions or limits on the consumption of vegetation, fish, or wildlife.

In the event that this SLHHRA identifies any unacceptable risk to human health, risk management plans may be recommended to control exposure and risk.

4.1.3 Study Area Boundaries

The spatial boundaries used in this SLHHRA include the Project Footprint, a Local Assessment Area (LAA), and a Regional Assessment Area (RAA).

The assessment boundaries match the AAIR for the proposed Project and include the boundaries defined for the Human Health VC, which consists of the following subcomponents:

- Soil quality
- Air quality
- Water quality
- Leachate quality
- Noise
- NORMs
- Country foods quality (such as, quality of vegetation, fish, wildlife, and water consumed as country foods, including consumption of First Nation-specific foods)

The Project Footprint is the land area that will be directly disturbed by proposed Project construction and clean-up activities, including associated physical works and activities.

The LAA includes the area in which all or most of the potential adverse health effects would be expected to occur. The LAA for this SLHHRA includes the LAA of the Human Health VC, which is the maximum extent of the area encompassed by the Acoustic Environment LAA, the Surface Water LAA, and the Groundwater LAA, and also includes the LAA of the Land and Resource Use VC to account for potential adverse health effects from country foods.

A larger RAA can be used to provide additional context in the assessment of potential adverse effects, including cumulative effects. The RAA for this SLHHRA includes the RAA for the Human Health VC, which is the maximum extent of the area encompassed by the Acoustic Environment RAA, the Air Quality RAA, the Surface Water RAA, and the Groundwater RAA, and also includes the RAA of the Land and Resource Use VC to account for potential adverse health effects from country foods.

Table 4-1 describes the assessment area boundaries that apply to each subcomponent under the Human Health VC (CH2M, 2016a).

The water quality subcomponent is encompassed by the assessment boundaries for the Surface Water and Groundwater VCs. The Terrain and Soils LAA (that is, the Project Footprint) is the only assessment boundary for the leachate quality subcomponent. The LAA and RAA for the NORMs subcomponent is the maximum extent of the area encompassed by the Terrain and Soils, Air Quality, Surface Water, and Groundwater LAAs and RAAs. The LAA and RAA for the country foods subcomponent is equivalent to the assessment boundaries for the Land and Resource Use VC.

Table 4-1. Spatial Boundaries for the SLHHRA

Subcomponents	Assessment Boundaries
Terrain and Soils	• LAA – same as Project Footprint. • RAA – A 1-km radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities.
Air Quality	• RAA – A 10-km radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities.
Surface Water	• LAA – A 500-m radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities. • RAA – The watershed of Monnery Creek from the headwaters of its main branch, including the watersheds of all tributaries, downstream from the headwater of Monnery Creek for a distance of 15 km, and the watershed of the Blueberry River and its tributaries for a distance of 15 km upstream and downstream of the confluence with the Blueberry River, of the unnamed creek located immediately west of the Project site.
Groundwater	• LAA – A 500-m radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities. • RAA – The watershed of Monnery Creek from the headwaters of its main branch, including the watersheds of all tributaries, downstream from the headwater of Monnery Creek for a distance of 15 km, and the watershed of the Blueberry River and its tributaries for a distance of 15 km upstream and downstream of the confluence with the Blueberry River, of the unnamed creek located immediately west of the Project site.
Acoustic Environment (Noise)	• LAA – A 1-km radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities. • RAA – A 5-km radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities.
NORMs	• Refer to the assessment boundaries for Terrain and Soils, Air, Surface Water, and Groundwater.

Table 4-1. Spatial Boundaries for the SLHHRA

Subcomponents	Assessment Boundaries
Country Foods	• LAA – A 1-km radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities. • RAA – A 5-km radius extending outwards from the proposed Project Footprint boundary, including associated physical works and activities.

4.1.4 Receptor Identification

The following human receptors were considered in the assessment.

- **Construction and operational workers** for the proposed Project include adult workers employed in facility construction activities, operations phase workers at proposed Project facilities or engaged in periodic site-specific maintenance activities, and workers engaged in decommissioning or abandonment activities after the operational life of the proposed Project.

  Construction workers will be present in all areas of the Project Footprint and will be subject to *Occupational Health and Safety Regulation* requirements as legislated in BC for the protection of workers. Construction workers may be exposed to noise and may come into contact with COPCs released to air, water, or soil. Given the nature of the facility (that is, a landfill), it is unlikely that construction personnel would consume country foods (for example, consumption of berries or other flora or fauna). Finally, construction workers are the most likely receptor group to be exposed to COPCs or increased noise in the event of an accident or malfunction related to the proposed Project.

  Workers employed for the operations phase and in any decommissioning or abandonment activities of the proposed Project are not included as a separate receptor group for the purposes of this assessment. The risk for these types of workers is conservatively grouped with the risk for workers engaged in facility construction activities.

- **Residents of local communities and recreational users** include children and adults in the LAAs and RAAs described in Table 4-1. Receptors include sensitive subpopulations such as residents of care homes, hospitals, schools and daycares, as well as recreational users. The duration may vary: residents are considered to be present throughout the life of the proposed Project; however, recreational users may visit the area for a short period of time. Residents and recreational users may come in contact with COPCs released to the air, soil, or water or may be exposed to noise in the vicinity of the facility.

  Exposure to air-borne COPCs from the proposed Project will likely be restricted to the Project Footprint; however, may be influenced by air dispersion and wind effects. Human receptors may be exposed to noise in the Project Footprint and Acoustic Environment LAA; however, exposure would diminish rapidly within a short distance from noise sources. Potential exposure to COPCs in water or soil, if present, is also possible, which could potentially impact country foods quality. In the event of an accident or malfunction, residents could be exposed to increased noise or COPCs in the RAA. If no health effects are expected for the residential receptor due to proposed Project activities, then recreational receptors are also protected, since it is expected that opportunities for exposure to proposed Project-related effects are much less frequent.

- **First Nations members** include children and adults in the LAAs and RAAs described in Table 4-1 making use of the land and resources for cultural, sustenance, social, economic, and traditional land use. The proposed Project occurs in the traditional territories of the Blueberry River First Nation and Doig River First Nation and is in proximity to areas important for a variety of traditional land uses, which are assumed to be conducted year-round including hunting, trapping, fishing, gathering, and cultural pursuits.

These receptors will be present throughout the lifetime of the proposed Project and may be present in the Project Footprint, LAAs, or RAAs, as described in Table 4-1. First Nations members may be exposed to noise from the proposed Project and may come into contact with COPCs released to the air, water, and soil. It is possible that country foods quality may be affected by the proposed Project and First Nations members are considered the most likely receptor group to consume country foods. In the event of an accident or malfunction, First Nations members could be exposed to increased noise or COPCs.

4.1.5 Pathway Analysis

In order for chemicals to cause a health effect, some form of exposure or contact between the contaminant and the person must occur. The route by which this occurs is referred to as an exposure pathway. The potential exposure pathways are dictated primarily by the nature of the contaminants and the potential human receptors identified. Typically, individuals are exposed to contaminants in the environment via three basic pathways:

1. Ingestion of contaminated water, food, or soil, or a combination thereof.
2. Inhalation of chemical vapours or particulates, or both.
3. Dermal contact with contaminated water, soil, or a combination thereof.
4. Hearing of transmitted noise via the auditory pathway.

In assessing potential exposures of the identified receptors to contaminants in environmental media at the proposed Project, possible exposure pathways were evaluated in order to identify those that are potentially complete. The following subsections present the potential exposure pathways for the proposed Project and the rationale for including or eliminating them from the SLHHRA.

4.1.5.2 Surface Water – Ingestion and Dermal Contact

Drainage at the Facility is presently controlled by ditches and berms, and is directed towards the storm water retention pond. Surface water quality is currently, and will continue to be, assessed using provincial guidelines before being discharged, which is away from wetlands in the area. As surface water is discharged to the ground (after testing) away from existing surface water bodies, it is unlikely that COPCs would be transported away from the Facility via creeks or streams to a downstream user of surface water. It is possible that vegetation in the discharge area would uptake the discharged surface water via root systems. This vegetation may subsequently be consumed by wildlife which in turn may be consumed by land users and First Nations receptors. Refer to Section 4.1.5.5 for a discussion of the country foods pathway.

Human exposure to COPCs in surface water is possible for construction and operation workers during the construction, maintenance, sampling, or decommissioning of the storm water management system. However, this exposure will be mitigated through the use of PPE during these activities.

The CSM for surface water exposure is presented in Figure 4-3.

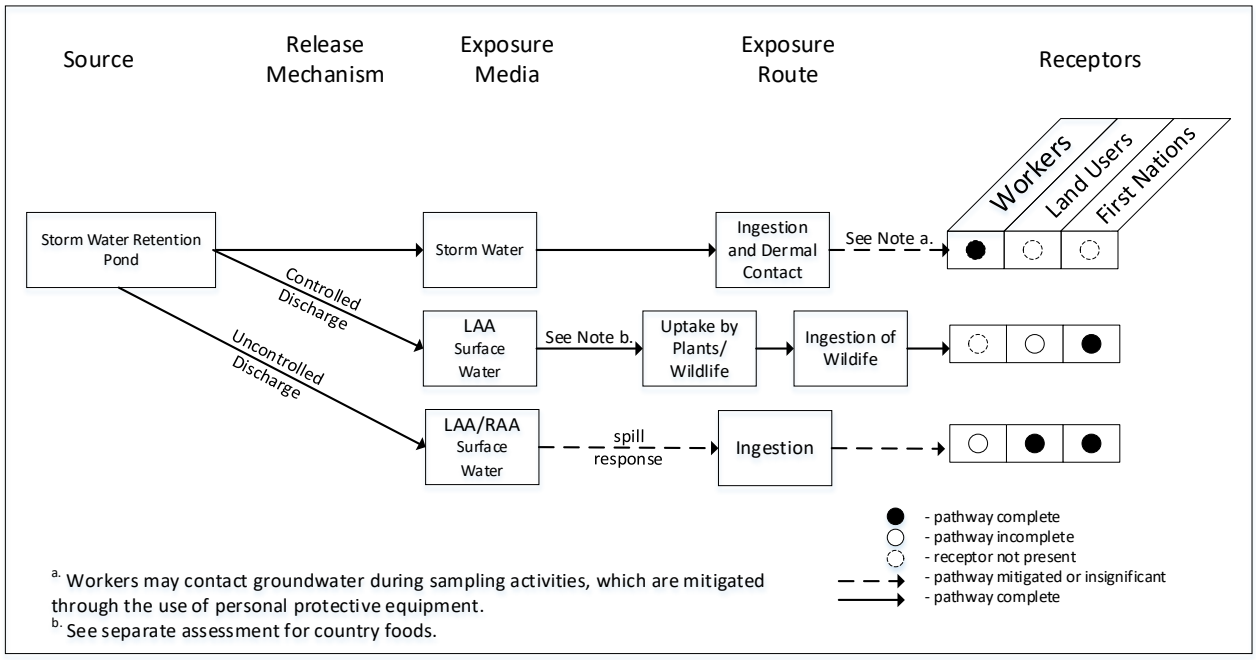

Figure 4-3. Conceptual Site Model – Surface Water

4.1.5.3 Groundwater – Ingestion and Dermal Contact

COPCs could migrate to groundwater if groundwater contacts the landfill waste. Groundwater contamination may occur during facility pumping of a high-water table. Although the landfill is lined to prevent contamination, accidental contamination during operation may occur and could affect downstream surface water or drinking water if leachate migrates through the soil to groundwater or aquifers. Groundwater monitoring occurs and will continue to occur as mitigation in the event of groundwater contamination. Potential receptors in the area include trappers and First Nations. If contaminated groundwater is ingested, pathways will be complete; there are no known uses of groundwater in the Groundwater LAA, but it is possible that groundwater is used for drinking water purposes in the Groundwater RAA.

Therefore, human exposure to COPCs in groundwater is possible for construction and operation workers during the maintenance, sampling, or decommissioning of the monitoring well network. However, this exposure will be mitigated by the use of PPE during these activities.

The CSM for groundwater exposure is presented in Figure 4-4.

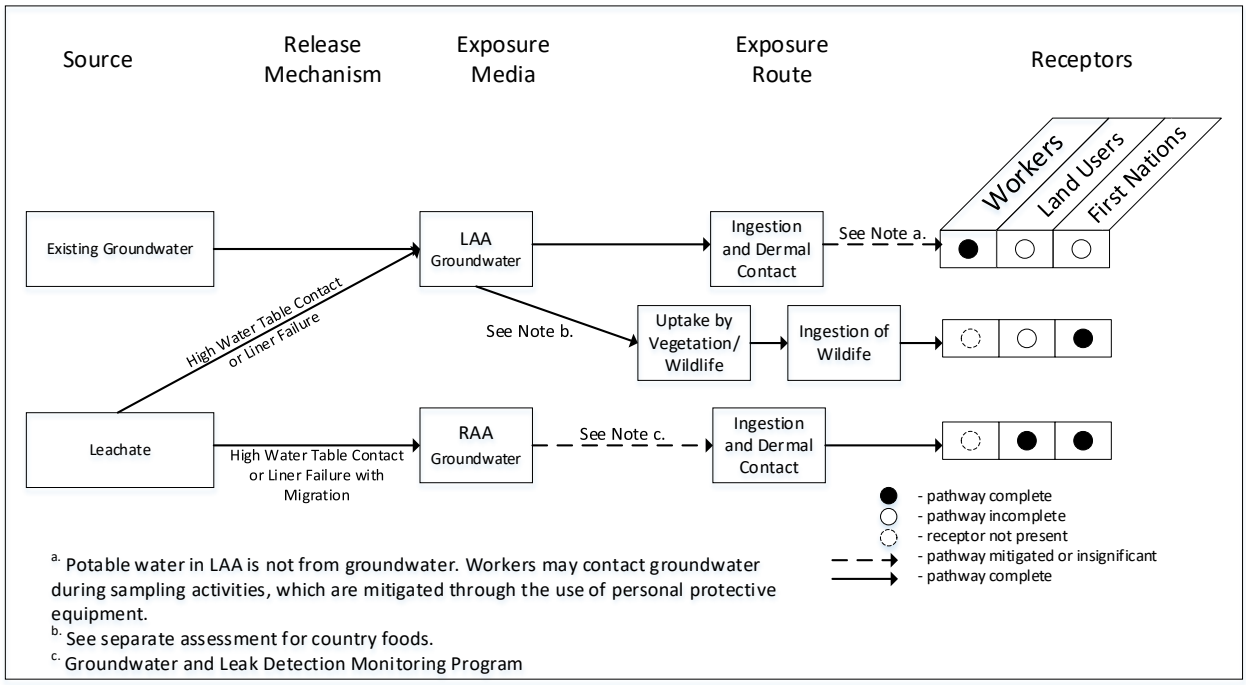

Figure 4-4. Conceptual Site Model – Groundwater

4.1.5.4 Soil - Ingestion, Inhalation, and Dermal Contact

COPCs can be transported to other areas within the Terrain and Soils LAA or RAA via wind erosion of landfill wastes or soil salvaged for capping materials that may have contacted waste. These soils may be inhaled as dust by construction or operation workers. Dust may also be deposited to the surface or on vegetation in the Air Quality RAA. Vegetation may be consumed by wildlife in the area, which could travel to human receptors through hunting or trapping.

Surface water is discharged to soil in the Terrain and Soils RAA. Soil quality is unlikely to be impacted by these activities as surface water is sampled and compared to provincial and federal guidelines prior to discharge. However, the vegetation growing in this area may uptake COPCs from dust and surface water. This vegetation may subsequently be consumed by wildlife, which, in turn, may be consumed by land users and First Nations receptors. Refer to Section 4.1.5.5 for a discussion of the country foods pathway.

Therefore, human exposure to COPCs in soil is possible for construction and operation workers via dust inhalation or direct contact with soil, where dust containing COPCs has been deposited. However, this exposure will be mitigated by measures such as dust suppression activities.

The CSM for soil exposure is presented in Figure 4-5a.

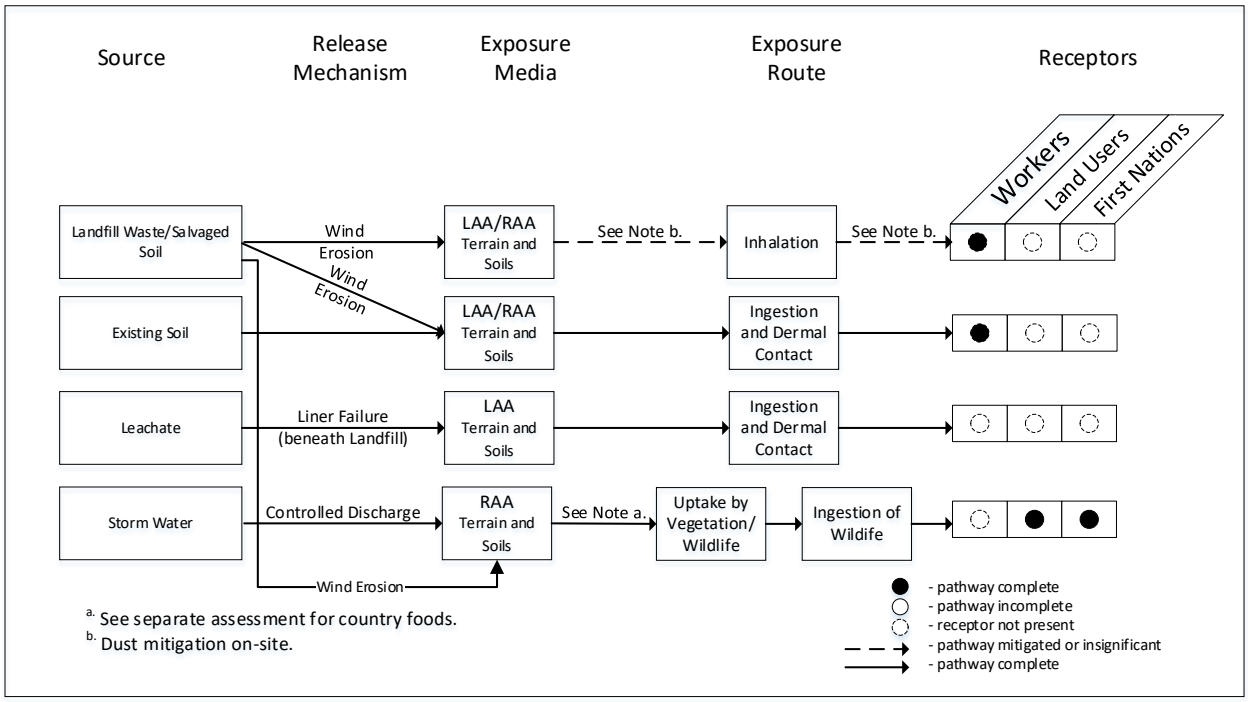

Figure 4-5a. Conceptual Site Model – Soil

Leachate is generated by the wastes accepted at the landfill and collected via a leachate collection system. Leachate is stored in a holding tank, which is subsequently pumped out and disposed of in an offsite licenced disposal well (Golder, 2008).

Dermal contact with leachate is possible, but unlikely for construction and operation workers during the construction, maintenance, sampling, or decommissioning of the leachate collection system or leachate holding tank due to use of PPE.

The CSM for leachate exposure is presented in Figure 4-5b.

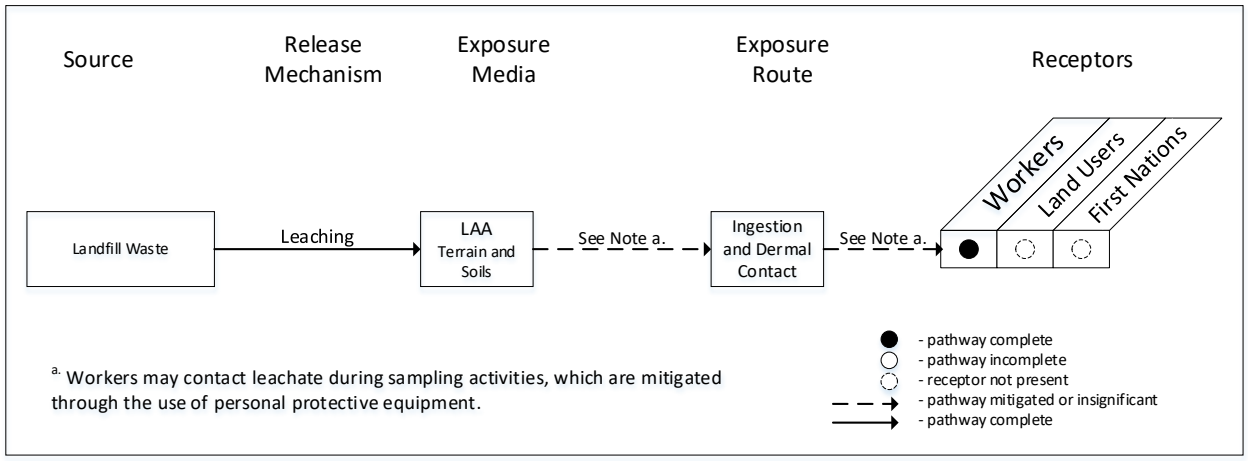

Figure 4-5b. Conceptual Site Model – Leachate

4.1.5.5 Country Foods – Ingestion

No additional assessment for country foods is necessary if any of the following criteria are met:

- No COPCs are identified
- No feasible, operable transport pathways into country foods exist
- No country foods are harvested from the areas, or
- No human receptors are identified during the proposed Project lifespan, or after the proposed Project lifespan if there are any residual contaminants (Health Canada, 2010b)

The Project Footprint is located on private land which is not currently used for traditional purposes (Tervita, 2016a); however, land in the Land and Resource Use LAA and RAA is used by First Nations for traditional activities such as hunting, trapping, fishing, and gathering. Therefore, the country foods pathway may be considered complete. COPCs have been identified in soil, groundwater, and surface water that may have an impact on country foods.

The BC CSR AW standards for groundwater were derived to protect surface water from groundwater discharge (where fish may be impacted). This transport pathway is therefore relevant to country foods (that is, human ingestion of fish). The BC MOE (2017) *Protocol No. 21 for Contaminated Sites, Water Use Determination* document was consulted to determine the applicability of this pathway in the context of the BC CSR. This document states that the AW standards are applicable to groundwater located within 500 m of an aquatic receiving environment, or to groundwater located greater than 500 m of an aquatic environment where COPCs are present and have the potential to migrate to within 500 m of the water body. Section 2.4.1 indicates that the nearest surface water bodies to the Facility and proposed project (unnamed creeks) are located approximately 1.4 km away and Section 2.3 indicates that the hydraulic conductivity of the groundwater in the vicinity of the Facility and proposed Project is approximately 40 cm/y. Based on this information, the groundwater discharge to surface water pathway is considered incomplete, because of the combination of low hydraulic conductivity paired with a large distance to the nearest water bodies. Therefore, the only complete pathways for country food are from soil sources and terrestrial plant uptake from groundwater or directly discharged surface water.

The CSM for country food exposure is presented in Figure 4-6.

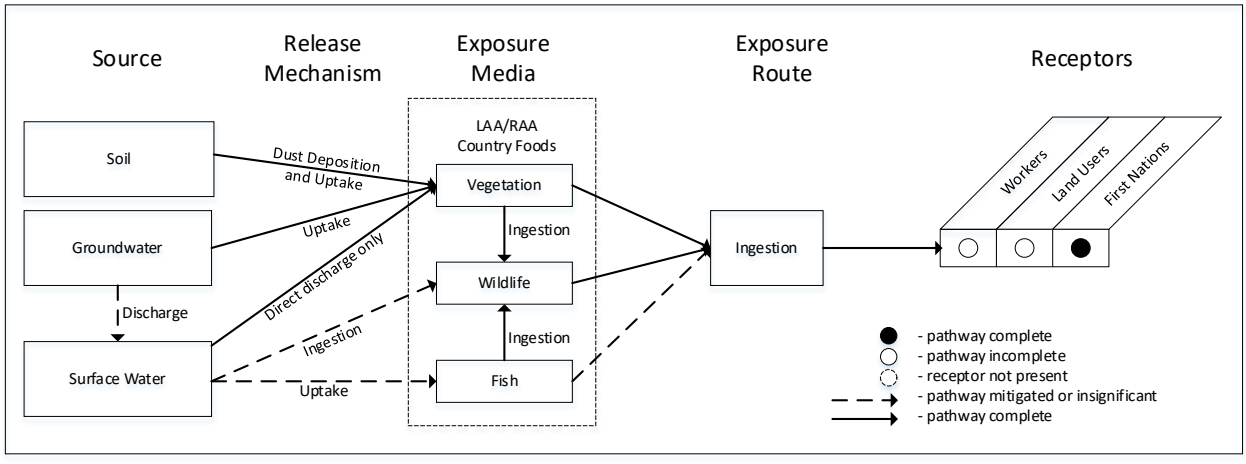

Figure 4-6. Conceptual Site Model – Country Foods

4.1.5.6 Air – Inhalation

Possible receptors to air emissions include construction workers and facility operators, although best management practices such as the use of PPE and engineering controls (on equipment) will mitigate the potential for air contaminants to be conveyed to receptors. Furthermore, air concentrations of contaminants will diminish rapidly with increasing distance from the proposed Project and, therefore, land use receptors, including First Nations, are not likely to experience exposure. However, inhalation of air-borne contaminants is possible by these receptor groups and was considered in the CSM.

The CSM for air inhalation exposure is presented in Figure 4-7.

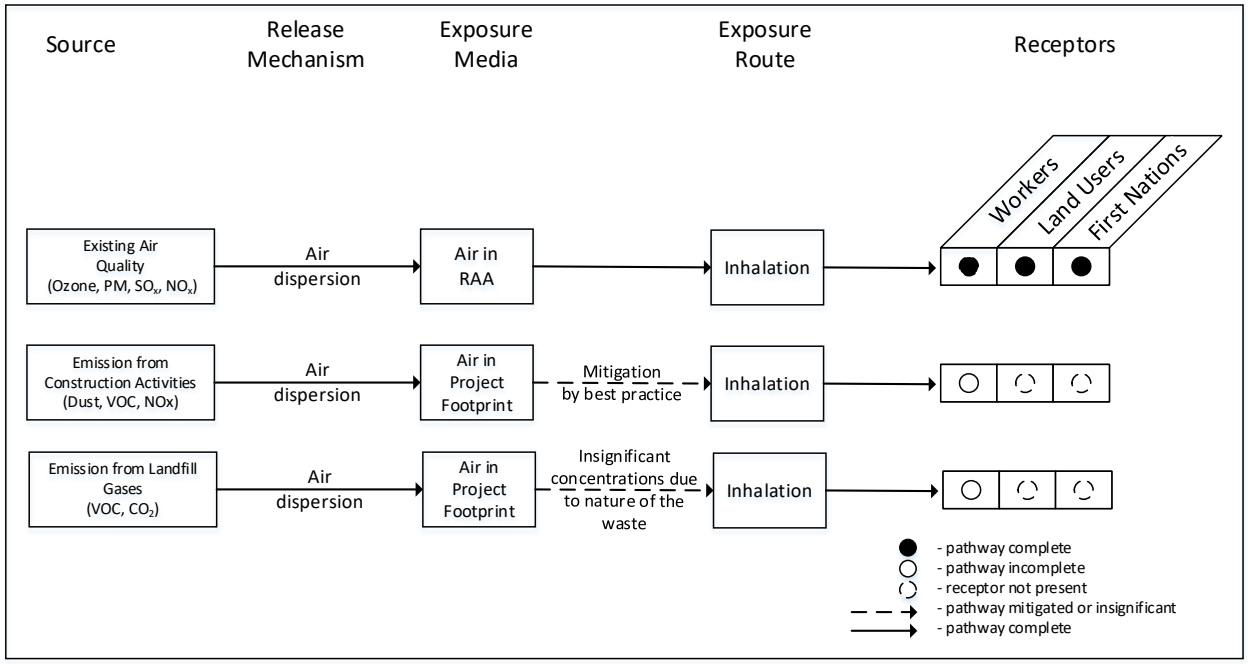

Figure 4-7. Conceptual Site Model - Air

4.1.5.7 Noise – Hearing

Human receptor exposure to noise is a complete pathway for construction workers; however, it will be reduced to acceptable levels using industry-accepted best practices such as requiring PPE during construction activities. Workers may be exposed to noise levels over 80 dBA during construction activities; however, workers will use mandatory hearing protection per BC OGC guidelines. Temporary noise exposures exist during construction activities for nearby land users, including First Nations; however, noise is expected to be within the BC OGC PSL within 1 km of the proposed Project and this pathway is considered mitigated.

The CSM for noise exposure is presented in Figure 4-8.

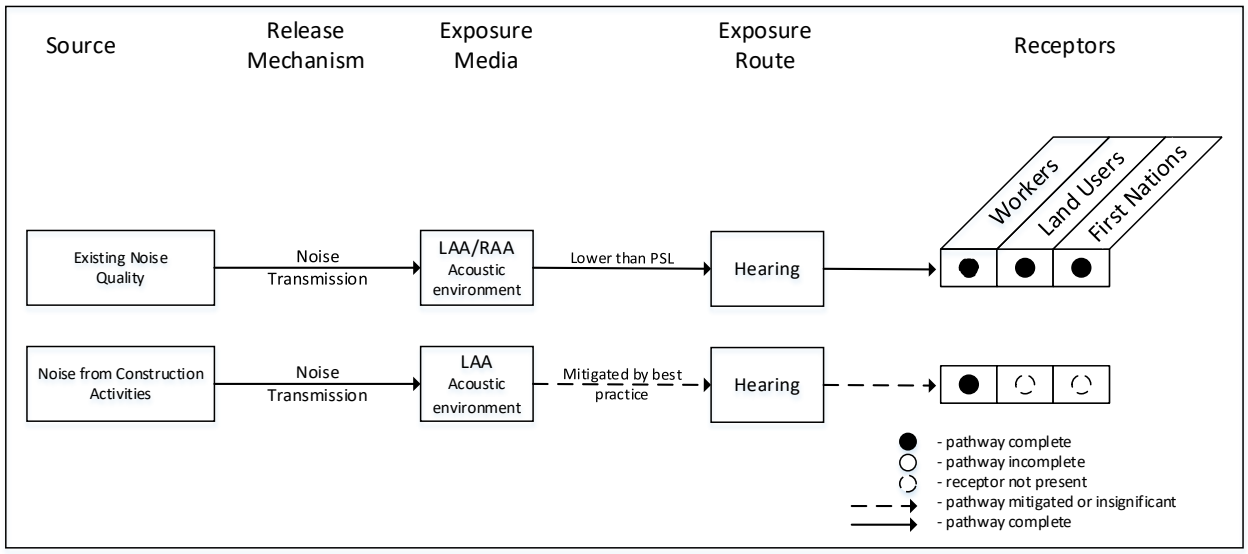

Figure 4-8. Conceptual Site Model - Noise

4.1.5.8 NORMs – Internal Exposure (Ingestion, Dermal Contact, and Inhalation) and External Exposure

Possible receptors to NORMs include construction workers and facility operators. Concentrations of NORMs will diminish rapidly with increasing distance from the proposed Project and, therefore, land use receptors, including First Nations, are not likely to experience exposure. Best management practices such as the use of personal dosimeters for on-site staff and air monitoring for NORMs in dust will mitigate receptor exposure.

The CSM for NORM exposure is presented in Figure 4-9.

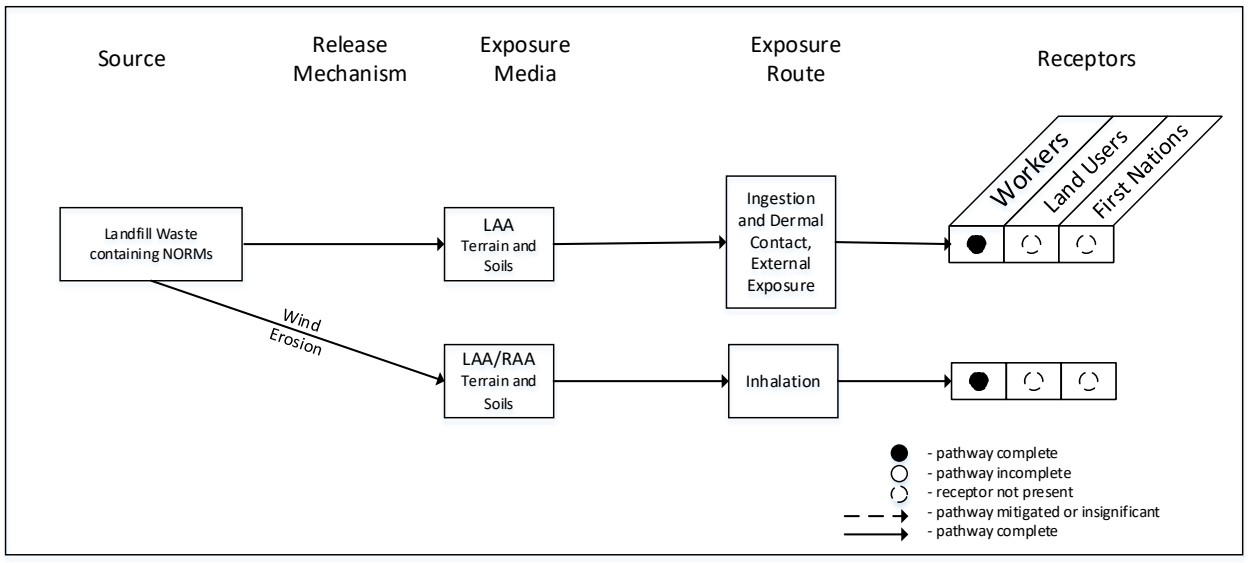

Figure 4-9. Conceptual Site Model – Naturally Occurring Radioactive Material

4.2 Exposure Assessment and Risk Characterization

This step analyzes the likelihood and magnitude of the risk based on the CSM developed in the problem formulation step. A risk matrix may be used to describe the potential risks to human health (see example risk matrix below) or a risk index may be used to identify the potential quantity and quality of the risk. An example risk index is a hazard index (HI) expressed as:

$$HI = (\text{estimated exposure point concentration})/(\text{benchmark concentration})$$

This step also examines the assumptions used in the assessment and discusses the various sources of uncertainty.

The COPC, receptor, and pathway combinations identified above form the basis for the CSM used to assess potential exposures and risk of adverse health effects to human receptors.

The SLRA is the qualitative assessment of risk of adverse health effects from the proposed Project. This analysis integrates the information about the known or predicted hazards with the potential magnitude for exposure for those COPC-receptor-pathway combinations identified. Receptor behaviour and hazard duration also has an effect on the qualitative assessment and characterization of risk. The hazard-exposure interaction matrix shown in Figure 4-2 was used to qualitatively characterize the risk of adverse effects from the proposed Project on the Human Health VCs.

The following subsections outline the qualitatively risk outcomes for the identified exposure scenarios in each of the CSMs described in Section 4.1.5.

4.2.1 Surface Water

Table 4-2 compares the concentrations of the retained COPCs in surface water (based on existing studies) to human health-specific criteria and calculates a hazard index for each COPC. Table 4-2 provides details regarding the potential for risk for each identified COPC in surface water. Based on the assessment, surface water is unlikely to be affected by the proposed Project construction or operations. The Facility has existing mitigation measures in place that will be applied to the proposed Project, which ensure that surface water leaving the Facility has either not been in contact with waste materials or has been collected, sampled, tested, and evaluated against regulatory criteria prior to discharge to the environment from the storm water retention pond. Accidental spills (for example, leaks from equipment), would require an immediate response, thereby limiting the effect of any spill and subsequent effects on surface water.

Table 4-2. Human Health Secondary Screening - Direct Contact with Surface Water

Screening Level Human Health Risk Assessment, Tervita Silverberry Landfill, British Columbia

		Human-Health Specific Screening Values						
			Direct Contact					
COC	Units	Max Concentration [a.]	Lowest Water Standard [b.]	Health Canada [c.]	AEP [d.]	ON MOECC [e.]	Average Hazard Index [f.]	Comment
Ammonia	µg/L	50	--	--	--	--	nc	Naturally occurring, low toxicity to human health.
Bismuth	µg/L	200	--	--	--	--	nc	Naturally occurring, low toxicity to human health.
Manganese	µg/L	210	200	50	50	--	**1.05**	HI >1, based on anomalous concentration from 2014, concentrations typically less than BC Sch. 3.2 or non-detect.
Oil & Grease	µg/L	5000	--	--	--	--	nc	Elevated SDL only.
Silicon	µg/L	7490	--	--	--	--	nc	Naturally occurring, low toxicity to human health.
Silver	µg/L	0.05	--	--	--	100	0.001	HI ≤ 1. Elevated SDL only.
Thallium	µg/L	2	--	--	--	2	1	HI ≤ 1
Titanium	µg/L	129	--	--	--	--	nc	Naturally occurring, low toxicity to human health.

[e.] Ontario Ministry of the Environment and Climate Change (ON MOECC). 2011. *Rationale for the Development of Soil and Ground Water Standards for Use at Contaminated Sites in Ontario* . Groundwater Components for Potable Water Scenario; All Land Uses; Coarse Textured Soil; GW1.

[f.] Average Hazard Index is equal to Max Concentration/BC Standards. If a BC Standard was not available the Average Hazard Index is equal to Max Concentration/Average of Available Screening Values.

Notes:

Shading indicates Max Concentration is greater than the screening criteria identified.

nc = not calculated

VI = vapour intrusion

Workers

- Hazard is low; the COPCs identified present a low risk to human receptors.
- Exposure is low; workers do not use surface water from the Facility as potable water. Workers must comply with occupational health and safety requirements (for example, the use of PPE).
- Therefore, risk is low or unlikely, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-3).

Land Users, including First Nations

- Hazard is low; the COPCs identified present a low risk to human receptors. No COPCs in surface water were identified as being both persistent and bioaccumulative (via food chain).
- Exposure is low; the proposed Project will be tied into the existing storm water management system where surface water is discharged to the land (not an existing surface water body) following sampling, analysis, and evaluation against regulatory criteria.
- Therefore, risk is low or unlikely, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-3).

Table 4-3. Risk Evaluation for Surface Water

Exposure Pathway[a]	Hazard Level	Exposure Level	Predicted Risk
Surface Water – Construction and Operation Stages			
Workers	Low	Low	Low or Unlikely
Land Users/First Nations	Low	Low	Low or Unlikely

[a] Decommissioning or abandonment is considered equivalent to the construction pathway for this assessment.

4.2.2 Groundwater

Table 4-4 compares the concentrations of the retained COPCs in groundwater (based on existing studies) to human health-specific criteria and calculates a hazard index for each COPC. Table 4-4 provides details regarding the potential for risk for each identified COPC in groundwater. Based on the assessment, groundwater is unlikely to be affected by the proposed Project construction or operations. The Facility has existing mitigation measures in place that will be applied to the proposed Project to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system). Accidental spills (for example, leaks from equipment), would require an immediate response, thereby limiting the effect of any spill and subsequent effects on groundwater. The existing low hydraulic conductivity of the soils beneath the Facility and the proposed Project limits groundwater migration and therefore, exposure, to receptors within the Groundwater LAA and RAA.

[h.] Carbon range (C) C10-C19 spans the carbon range associated with CCME PHC F1, F2, and F3. Lowest value of PHC F1, F2, and F3 selected as an approximation of EPH C10-C19 and LEPH C10-C19.

[i.] Carbon range (C) C5-C9 spans the carbon range associated with CCME PHC F1. PHC F1 values selected as an approximation of VPH.

Notes:

Shading indicates Max Concentration is greater than the screening criteria identified.

Bold indicates HI greater than 1.

≤ = less than or equal to

CCME = Canadian Council of Ministers of the Environment

Workers

- Hazard is medium; the COPCs identified present a low to medium risk to human receptors.
- Exposure is low; workers do not use groundwater from the Facility as potable water. Workers must comply with occupational health and safety requirements (for example, the use of PPE).
- Therefore, risk is low, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-5).

Land Users, including First Nations

- Hazard is low; the COPCs identified present a low to medium risk to human receptors.
- Exposure is low; existing quarterly groundwater monitoring program will be applied to the proposed Project to detect any impacts to groundwater (and potential migration, if applicable). No aquifers identified as a groundwater resource are located below or within several kilometres of the Facility, therefore exposure via potable water use is unlikely.
- Therefore, risk is low, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-5).

Table 4-5. Risk Evaluation for Groundwater

Exposure Pathway[a]	Hazard Level	Exposure Level	Predicted Risk
Groundwater – Construction and Operation Stages			
Workers	Low to Medium	Low	Low
Land Users/First Nations	Low to Medium	Low	Low

[a] Decommissioning or abandonment is considered equivalent to the construction pathway for this assessment.

4.2.3 Soil

Table 4-6 compares the concentrations of the retained COPCs in soil (based on existing studies) to human health-specific criteria and calculates a hazard index for each COPC. Table 4-6a provides details regarding the potential for risk for each identified COPC in groundwater. Based on the assessment, soil is unlikely to be affected by the proposed Project construction or operations. The Facility has existing mitigation measures in place that will be applied to the proposed Project to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system). Accidental spills (for example, leaks from equipment), would require an immediate response, thereby limiting the effect of any spill and subsequent effects on soil. Dust suppression measures will be employed to minimize the dust generated from vehicular traffic.

Notes:

Shading indicates Max Concentration is greater than the screening criteria identified.

Bold indicates HI greater than 1.

Italics values adjusted from source indicated. Values representing a cancer risk of 10^{-6} were adjusted to align with BC MECCS's acceptable cancer risk of 10^{-5} for human health (carcinogenic chemicals only).

Underlined values adjusted from source indicated. Values representing a hazard quotient (HQ) (that is, noncancer risk) of 1, were adjusted to an HQ of 0.2 (per pathway) to align with BC MECCS's acceptable HQ of 1 for total exposure for human health (noncarcinogenic chemicals only).

Workers

- Hazard is low; the COPCs identified present a low risk to human receptors.
- Exposure is low; workers must comply with occupational health and safety requirements (for example, the use of PPE). Mitigation measures such as dust suppression are currently in place at the Facility and will be implemented for the proposed Project.
- Therefore, risk is low or unlikely, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-7).

Land Users, including First Nations

- Hazard is low; the COPCs identified present a low risk to human receptors.
- Exposure is low; there are no land users, including First Nation land users, within the Project Footprint, however, First Nation traditional land use may occur within the Terrain and Soils RAA (that is, a 1-km radius extending outwards from the Project Footprint boundary).
- Therefore, risk is low or unlikely, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-7).

Table 4-7. Risk Evaluation for Soil

Exposure Pathway[a]	Hazard Level	Exposure Level	Predicted Risk
Soil – Construction and Operation Stages			
Workers	Low	Low	Low or Unlikely
Land Users/First Nations	Low	Low	Low or Unlikely

[a] Decommissioning or abandonment is considered equivalent to the construction pathway for this assessment.

Table 4-8 compares the concentrations of the retained COPCs in leachate (based on existing studies) to human health-specific criteria and calculates a hazard index for each COPC. Leachate is unlikely to affect surface water, groundwater, or soil as part of the proposed Project construction or operations. The Facility has existing mitigation measures in place that will be applied to the proposed Project to prevent waste materials or leachate from being released to the subsurface (for example, landfill liner, leachate collection system, and leak detection system). Accidental spills (for example, leaks from equipment), would require an immediate response, thereby limiting the effect of any spill and subsequent effects on surface water, groundwater, or soil. Land users, including First Nations receptors, will not be present within the Terrain and Soils LAA (that is, the Project Footprint), as the perimeter of the proposed Project will be fenced.

Workers

- Hazard is low to high; the COPCs identified present a range of risks (from low to high) to human receptors. Leachate is only expected to be present during the operations stage. Leachate would not be present during the construction stage; therefore, the hazard is considered low.
- Exposure is low; workers must comply with occupational health and safety requirements (for example, the use of PPE). Leachate would not be present during the construction stage; therefore, the exposure is considered low.
- Therefore, risk is low/unlikely and medium for the construction and operation stages, respectively, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-9).

Workers	Low	Low	Low or Unlikely
Leachate – Operation Stage			
Workers	High	Low	Medium

[a] Decommissioning or abandonment is considered equivalent to the construction pathway for this assessment.

4.2.4 Country Foods

The following subsections evaluate the potential risks from the proposed Project to country foods for the following pathways:

- Soil Source - dust from the expanded landfill may be transported via wind to downwind areas and deposited into the soil surface or on the leaves of harvestable vegetation.
- Groundwater Source - impacted groundwater from the proposed Project may reach harvestable species via migration of groundwater with subsequent uptake from vegetation from a shallow water table.
- Surface Water Source – impacted surface water (that is, overland flow) is discharged directly to the ground with subsequent uptake from vegetation.

4.2.4.1 Soil Source

As shown in the CSM for country foods (Figure 4-6), the transport mechanism for soil from the Facility and proposed Project to the Country Foods LAA and RAA would be via dust deposition in downwind areas. Dusts containing COPCs in soil from the proposed Project could be deposited on the foliage of plants which are in turn ingested by animals or humans. Five COPCs were identified in soil based on the preliminary screening, including three metals and one PAH. The PAH analyte was retained because it does not have a BS CSR Standards. The following qualitatively evaluates the soil COPCs with respect to the country foods pathway:

- Arsenic – This COPC may be naturally occurring. BC MOE recently reduced the background concentration of arsenic in the Omineca/Peace Region from 15 to 10 mg/kg (BC MOE, 2010; BC MECCS, 2017b). The range of arsenic concentrations encountered during the soil study (CH2M, 2017) were 9.5 to 14 mg/kg, which is within the previous range of background concentrations.
- Barium – This COPC may be naturally occurring. Adriano (2001) indicates that while barium “can be passed through the food chain, evidence suggests that it is not concentrated in either aquatic or terrestrial organisms and should generally be considered to have low toxicity.” Based on this information, the risks to human receptors from this COPC in vegetation or animal tissue via soil from the proposed Project is considered low.
- Beryllium - This COPC may be naturally occurring. BC MOE recently reduced the background concentration of beryllium in the Omineca/Peace Region from 2.0 to 1.0 mg/kg (BC MOE, 2010; BC MECCS, 2017b). The range of beryllium concentrations encountered during the soil study (CH2M, 2017) were 0.48 to 1.32 mg/kg, which is within the previous range of background concentrations.

- PAHs (specifically, benzo[g,h,i]perylene) – PAHs were detected in the soil samples collected from within the Facility; however, PAHs were nondetect in soil samples collected from the downwind area of the Facility (CH2M, 2017). Concentrations in soil of benzo(g,h,i)perylene within the Facility ranged from less than 0.01 to 0.036 mg/kg (CH2M, 2017); this PAH was identified as COPC because there is no BC CSR Standard for this chemical. Other PAHs, which were detected at similar concentrations, were found at levels less than the Lowest AL Soil Standard and were not identified as COPCs, indicating a low potential for risk from PAHs in general. PAHs are considered bioaccumulative, but have low soil to plant uptake factors (University of Tennessee, 2018), meaning that the uptake by plants from soil is typically several orders of magnitude lower than the concentration present in soil. Considering the low detected concentrations occurring within the Facility which were not detected within the downwind area, the lack of other PAHs retained as COPCs when compared to BC CSR Standards, and low plant uptake factors, risks to human receptors from benzo[g,h,i]perylene in vegetation or animal tissue via soil from the proposed Project is considered low.
- Total Phenols – The detection of total phenols marginally greater than the detection limit in the downwind area was determined to be anomalous based on the soil data set (CH2M, 2017); this result does not appear to be associated with the Facility or the proposed Project. Total phenols refers to nonchlorinated phenols (therefore, are not bioaccumulative) and does not have a BC CSR Standard. Therefore, risks to human receptors from this COPC in vegetation or animal tissue via soil from the proposed Project is considered negligible.

Land Users, including First Nations

- Hazard is low; based on the data provided, the COPCs measured in soil in areas downwind of the Facility do not appear to be present at levels which would be of concern for the country foods pathway. COPCs present at concentrations similar to background would not be expected to present risks in excess of background levels.
- Exposure is low; mitigation measures such as dust suppression are currently in place at the Facility and will be implemented for the proposed Project. Dust impacts would only be expected on the downwind side of the proposed Project; therefore, the extent of dust deposition is likely limited compared to the area in which country foods would be harvested from. Concentrations of COPCs in dust diminish rapidly with dispersion and dilution in air and with distance (USEPA, 2002).
- Therefore, risk is low or unlikely, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-10).

Table 4-10. Risk Evaluation for Country Foods – Soil Source

Exposure Pathway[a]	Hazard Level	Exposure Level	Predicted Risk
Country Foods (Soil Source) - Construction Stage			
Land Users/First Nations	Low	Low	Low or Unlikely
Country Foods (Soil Source) - Operation Stage			
Land Users/First Nations	Low	Low	Low or Unlikely

[a] Decommissioning or abandonment is considered equivalent to the construction pathway for this assessment.

4.2.4.2 Groundwater Source

As shown in the CSM for country foods (Figure 4-6), the transport mechanism for groundwater from the Facility and proposed Project to the Country Foods LAA and RAA would be via groundwater migration, in the event of a spill or a leak in the existing liner and containment system, which will also be implemented as part of the proposed Project. Thirty-four COPCs were identified in groundwater based on the preliminary screening, of these, there are 8 PAHs and 13 metals COPCs, which have the potential to bioaccumulate in the environment. Concentrations of these COPCs were compared to the BC CSR Schedule 3.2 Freshwater Aquatic Life Standard and similar criteria from other jurisdictions (Table 4-11) to provide a preliminary evaluation of the potential risks to human receptors from ingestion of terrestrial vegetation. Based on the assumption made by the Ontario MOECC in the derivation of Ontario's generic soil and groundwater standards, the groundwater to surface water values were "assumed to provide a sufficient degree of protection to plants, soil organisms, mammals and birds such that separate calculations for these receptors for ingestion of exposure to shallow groundwater or groundwater seeps is not needed" (ON MOECC, 2011). For this qualitative assessment, it has been assumed that since the standards are considered to be protective of plant and animal health, foods derived from these sources are unlikely to be significant sources of COPCs, moreover if the COPCs are not considered to bioaccumulate. If COPCs were to affect the health of plants or animals, the appearance of such items would unlikely be favoured as country foods and therefore likely be avoided for harvesting. This assumption has been applied, in the absence of plant tissue data, to qualitatively assess the potential for risks to human health from ingestion of terrestrial plants or wildlife that has ingested terrestrial plants near the Facility and proposed Project.

Based on using groundwater standards as comparators for health risks, nine COPCs have HQs greater than 1. However, of these:

- One COPC (thallium) was retained for assessment based on elevated detection limits only. Risks from this COPC would not be expected as it has not been positively identified as being present in groundwater.
- Four COPCs (cadmium, iron, manganese, and uranium) have been noted to be associated with naturally occurring background based on the historical groundwater monitoring activities (Matrix, 2017). Risks, if any, would not be expected to exceed risks associated with background exposure.
- Four COPCs (chromium, cobalt, LEPH, and selenium) have only had sporadic detections greater than the screening criteria over the monitoring period; since elevated concentrations are not consistently present and available for plant uptake, these COPCs pose a low risk to human receptors.

The COPCs with HQs less than 1, but which have the potential to bioaccumulate (that is, PAHs and some metals) were also reviewed as the potential risk from bioaccumulation is not considered in the selected screening criteria. Potentially bioaccumulative COPCs with HQs less than 1 include nine PAHs analytes and two metals:

- The nine PAHs with HQs less than 1 were retained for assessment as COPCs in country foods based on sporadic detections or elevated detection limits in groundwater. PAHs tend to sorb strongly to soils and exhibit very low solubility in water, therefore, their occasional presence in groundwater samples is likely attributed to suspended sediments in the groundwater sample (which are not mobile during groundwater migration), and not representative of dissolved concentrations which would be available for plant uptake. Since elevated concentrations of PAHs in groundwater are not consistently present or in a form available for plant uptake (that is, dissolved), the presence of these COPCs in groundwater pose a low risk for plant uptake located some distance from the facility and therefore low risk to human receptors through country foods exposure.

- Metals retained with HQs less than 1 include nickel and titanium. Nickel concentrations greater than the lowest water standard appear in less than 5 percent of groundwater samples analyzed as part of the facility's monitoring program. Elevated concentrations of nickel are not consistently present and therefore not available for plant uptake. Nickel poses a low risk to human receptors through the country foods pathway. Titanium is naturally occurring and generally regarded to be nonbioaccumulating and of low toxicity to humans through the ingestion pathway.

Land Users, including First Nations

- Hazard is low; based on the data provided, the COPCs measured in groundwater near Facility do not appear to be present at levels which would be of concern for the country foods pathway or are not consistently present to be available for plant uptake.
- Exposure is low; the existing quarterly groundwater monitoring program will be applied to the proposed Project to detect any impacts to groundwater (and potential migration, if applicable). The foraging range of wildlife and of humans consuming country foods is much larger than the areas where COPCs have been historically detected in groundwater (and includes areas which currently are and will be fenced in the future). Therefore, vegetation in the vicinity of the Facility and proposed Project which may intermittently be exposed to low concentrations of COPCs in groundwater are unlikely to contribute to significant proportion of an individual's diet.
- Therefore, risk is low or unlikely, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-12).

Table 4-11. Human Health Secondary Screening - Country Foods Groundwater Source

Screening Level Human Health Risk Assessment, Tervita Silverberry Landfill, British Columbia

			Groundwater Protective of Terrestrial Plants and Wildlife Contact (Assumed Protection from Aquatic Life Standards)				
COC	**Max Concentration [a.]**	**Units**	**BC Schedule 3.2 Standard - AW [b.]**	**AEP [c.]**	**ON MOECC [d.]**	**Average Hazard Index [e.]**	**Comment**
Acenaphthene	0.15	µg/L	60	5.8	6600	0.0025	HI ≤ 1. PAHs generally not considered mobile. Sporadic detections, likely related to sediments in the groundwater sample.
Acridine	0.2	µg/L	0.5	--	--	0.4	HI ≤ 1. Elevated SDL only.
Anthracene	0.15	µg/L	1	0.0012	2.4	0.15	HI ≤ 1. Elevated SDL only.
Benzo(a)anthracene	0.15	µg/L	1	0.018	1.6E+11	0.15	HI ≤ 1. PAHs generally not considered mobile. Sporadic detections, likely related to sediments in the groundwater sample.
Benzo(a)pyrene	0.068	µg/L	0.1	0.015	3.4E+12	0.68	HI ≤ 1. PAHs generally not considered mobile. Sporadic detections, likely related to sediments in the groundwater sample.
Benzo(b)fluoranthene	0.02	µg/L	--	--	6.9E+12	2.9E-15	HI ≤ 1. PAHs generally not considered mobile. Sporadic detections, likely related to sediments in the groundwater sample.
Cadmium	0.0135	mg/L	0.004	0.00037	0.0027	**3.4**	HI >1. Naturally occurring (background) (Golder, 2007; EBA, 2009; NLR/AE, 2012; Matrix, 2014)
Chloride (Cl)	166	mg/L	1500	120	2300	0.11	HI ≤ 1. Naturally occurring (background) (Golder, 2007; EBA, 2009; NLR/AE, 2012; Matrix, 2014)
Chromium	0.025	mg/L	0.01	0.001	0.14	**2.5**	HI >1. Sporadic exceedances on 4 occassions between 2002 and 2007. No exceedances since 2007.Criteria presented is the more stringent of hexavalent and trivalent chromium, however, chromium (total) was reported. Therefore, there is low potential for uptake of elevated concentrations considering the overall data set for chromium.
Cobalt	0.0435	mg/L	0.04	--	0.066	**1.1**	HI > 1. Cobalt detected at concentrations greater than the BC Sch. 3.2 AW Standard in 1 of 259 samples (less than 1 percent of samples). Therefore, there is low potential for uptake of elevated concentrations considering the overall data set for cobalt.
Electrical Conductivity	14840	µS/cm	--	--	--	nc	Naturally occurring, low toxicity.
Extractable Petroleum Hydrocarbons (EPH) C19-C32 [f]	0.32	mg/L	--	--	--	nc	Not considered mobile.
Heavy Extractable Petroleum Hydrocarbons (HEPH) C19-C32 [f]	500	µg/L	--	--	--	nc	Not considered mobile.
Iron	8.98	mg/L	--	0.3	--	**30**	HI >1. Naturally occurring (background) (Golder, 2007; EBA, 2009; NLR/AE, 2012; Matrix, 2014)
Light Extractable Petroleum Hydrocarbons (LEPH) C10-C19 [g]	540	µg/L	500	1300	750	**1.1**	HI > 1. Sporadic detections of hydrocarbons noted in annual reports. No increasing or decreasing trend (Matrix, 2017). LEPH detected at concentrations greater than the BC Sch. 3.2 criteria in 1 of 312 samples (less than 1 percent of samples). Exceedance is anomalous, as was preceeded by 8 samples with nondetect concentrations and followed by 17 samples with nondetect concentrations. Therefore, there is low potential for uptake of elevated concentrations considering the overall data set for LEPH.
Lithium	2.69	mg/L	--	--	--	nc	Naturally occurring, low toxicity.
Magnesium	562	mg/L	--	--	--	nc	Naturally occurring (background) (Golder, 2007; EBA, 2009; NLR/AE, 2012; Matrix, 2014)
Manganese	5.99	mg/L	--	0.05	--	**120**	HI >1. Naturally occurring (background) (Golder, 2007; EBA, 2009; NLR/AE, 2012; Matrix, 2014)
Nickel	0.128	mg/L	1.5	0.17	0.49	0.09	HI ≤ 1. Average concentrations less than the Lowest Water Standard.
Nitrate (as N)	216	mg/L	400	3	--	0.54	HI ≤ 1. Average detected concentration (8.1 mg/L) less than the Lowest Water Standard of 10 mg/L.
Nitrate and Nitrite - N	135	mg/L	400	--	--	0.34	HI ≤ 1. Average detected concentration (2.1 mg/L) less than BC MOE Lowest BC Schedule 3.2 Standard of 10 mg/L
Phenanthrene	0.8	µg/L	3	0.4	920	0.27	HI ≤ 1. PAHs generally not considered mobile. Sporadic detections, likely related to sediments in the groundwater sample.
Potassium	19	mg/L	--	--	--	nc	Naturally occurring, low toxicity.
Quinoline	3.4	µg/L	34	--	--	0.1	HI ≤ 1. Elevated SDL only.
Selenium	0.0388	mg/L	0.02	0.000001	0.063	**1.9**	HI > 1, sporadic detections noted in annual report. No increasing or decreasing trend (Matrix, 2017). Concentrations greater than BC Sch. 3.2 in only 2 of 268 samples (less than 1 percent of samples). Both samples were collected from wells located immediately west of the existing landfill cells. Subsequent sampling events in both wells (total of 5 samples) indicates concentrations less than the BC Sch. 3.2 criteria. Therefore, there is low potential for uptake of elevated concentrations considering the overall data set for selenium.
Silicon	7.45	mg/L	--	--	--	nc	Naturally occurring, low toxicity.
Sodium	836	mg/L	--	--	2300	0.36	HI ≤ 1. Naturally occurring (background) (Golder, 2007; EBA, 2009; NLR/AE, 2012; Matrix, 2014)

[e.] Average Hazard Index is equal to Max Concentration/BC Standards. If a BC Standard was not available the Average Hazard Index is equal to Max Concentration/Average of Available Screening Values.

[f.] Carbon range (C) C19-C32 spans the carbon range associated with CCME PHC F3. PHC F3 values selected as an approximation of EPH C19-32 and LEPH C19-C32.

[g.] Carbon range (C) C10-C19 spans the carbon range associated with CCME PHC F1, F2, and F3. Lowest value of PHC F1, F2, and F3 selected as an approximation of EPH C10-C19 and LEPH C10-C19.

[h.] Carbon range (C) C5-C9 spans the carbon range associated with CCME PHC F1. PHC F1 values selected as an approximation of VPH.

Notes:

Shading indicates Max Concentration is greater than the screening criteria identified.

Bold indicates HI greater than 1.

Table 4-12. Risk Evaluation for Country Foods – Groundwater Source

Exposure Pathway[a]	Hazard Level	Exposure Level	Predicted Risk
Country Foods (Groundwater Source) - Construction Stage			
Land Users/First Nations	Low	Low	Low or Unlikely
Country Foods (Groundwater Source) - Operation Stage			
Land Users/First Nations	Low	Low	Low or Unlikely

[a] Decommissioning or abandonment is considered equivalent to the construction pathway for this assessment.

4.2.4.3 Surface Water Source

As shown in the CSM for country foods (Figure 4-6), it is possible that vegetation in the surface water discharge area would uptake the discharged surface water via root systems. This vegetation may subsequently be consumed by wildlife which in turn may be consumed by land users and First Nations receptors. Eight COPCs were identified in surface water based on the preliminary screening, of these, there are 5 metals COPCs, which have the potential to bioaccumulate in pant and wildlife tissue. Similar to the approach taken for groundwater (Section 4.2.4.2), concentrations of these COPCs were compared to the BC CSR Schedule 3.2 Freshwater Aquatic Life Standard and similar criteria from other jurisdictions (Table 4-13) to provide a preliminary evaluation of the potential risks to human receptors from ingestion of terrestrial vegetation in contact with discharged surface water.

Based on this assessment, one COPC (manganese) has an HQ greater than 1. However, this chemical is surface water was retained on the basis of a single anomalous value from 2014. Concentrations of manganese have typically been lower or nondetect based on the surface water monitoring program. Since elevated concentrations of manganese in overland flow (surface water) are not consistently present and available for plant update, this COPC poses a low risk to human receptors from this pathway.

The COPCs with HQs less than 1, but which have the potential to bioaccumulate (that is, metals) were also assessed as the potential risk from bioaccumulation is not considered in the selected screening criteria:

- Silver was retained as a COPC based on elevated detection limits in surface water. Risks from this COPC would not be expected as it has not been positively identified as being present in groundwater.
- Thallium was retained on the basis of a single anomalous value from 2014. Concentrations of thallium are typically non-detect based on the surface water monitoring program. Since elevated concentrations of thallium in overland flow (surface water) are not consistently present and available for plant update, this COPC poses a low risk to human receptors from this pathway.
- Titanium is naturally occurring and generally regarded to be non-bioaccumulating and of low toxicity to humans through the ingestion pathway.

Land Users, including First Nations

- Hazard is low; based on the data provided, the COPCs measured in surface water (from overland flow) not appear to be present at levels which would be of concern for the country foods pathway.
- Exposure is low; the existing surface water monitoring program will be applied to the proposed Project to detect any impacts to water before it is discharge to the ground. The foraging range of wildlife and of humans consuming country foods is much larger than the areas where water is discharged and water is not discharged unless it meets the BC CSR Schedule 3.2 Standards.
- Therefore, risk is low or unlikely, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-14).

Table 4-13. Human Health Secondary Screening - Country Foods Surface Water Source

Screening Level Human Health Risk Assessment, Tervita Silverberry Landfill, British Columbia

			Groundwater Protective of Terrestrial Plants and Wildlife Contact (Assumed protection from Aquatic Life Standards)

Notes:

Shading indicates Max Concentration is greater than the screening criteria identified.

Table 4-14. Risk Evaluation for Country Foods – Surface Water Source

Exposure Pathway[a]	Hazard Level	Exposure Level	Predicted Risk
Country Foods (Surface Water Source) - Construction Stage			
Land Users/First Nations	Low	Low	Low or Unlikely
Country Foods (Surface Water Source) - Operation Stage			
Land Users/First Nations	Low	Low	Low or Unlikely

[a] Decommissioning or abandonment is considered equivalent to the construction pathway for this assessment.

4.2.5 Air

Tail-pipe emissions of contaminants such as NO_x, PM, SO_2, and CO are expected during construction of the proposed Project due to the temporary use of dozers, trucks, excavators, and compactors. Additionally, dust can be generated through movement and handling of soils and gravel, resuspension of dust from unpaved roadways, and dust suspended to air though wind erosion of open storage piles. The air quality effects of construction emissions are expected to be temporary, localized, and reversible, meaning that when the construction work stops, ambient concentrations in the area are expected to return to pre-construction levels. It is not anticipated that levels of CACs will exceed BC AAQOs at the property line or at any sensitive receptors further downwind. It is not expected that future operational emissions from equipment required to maintain the proposed Project will be significantly different than emissions currently released at the Facility.

Workers

- Hazard is low to medium; inhalation of polluted air can cause adverse health effects. Emissions and generation of dust are expected to be greater during the construction stage (medium) compared to the operations stage (low).
- Exposure is low; elevated emissions are expected to be short-term during the construction stage and localized to the immediate vicinity of heavy equipment. All construction equipment will adhere to low-emission Tier 4 engine specifications. Emissions will return to pre-construction limits during the operations stage.
- Therefore, risk is low/unlikely and low, for the construction and operation stages, respectively, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-15).

Land Users, including First Nations

- Hazard is low; based on the data provided, CAC levels will be within the BC ambient air quality guidelines at the property line during both the construction and operation stages.
- Exposure is low; since CAC levels will be within the BC ambient air quality guidelines at the property line, air quality within the Air Quality RAA will be expected to be similar to existing regional conditions.
- Therefore, risk is low or unlikely, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-15).

Table 4-15. Risk Evaluation for Air

Exposure Pathway[a]	Hazard Level	Exposure Level	Predicted Risk
Air Quality - Construction Stage			
Workers	Medium	Low	Low

Table 4-15. Risk Evaluation for Air

Exposure Pathway[a]	Hazard Level	Exposure Level	Predicted Risk
Land Users/First Nations	Low	Low	Low or Unlikely
Air Quality - Operation Stage			
Workers	Low	Low	Low or Unlikely
Land Users/First Nations	Low	Low	Low or Unlikely

[a] Decommissioning or abandonment is considered equivalent to the construction pathway for this assessment.

4.2.6 Noise

Construction noise levels were estimated based on simultaneous operation of several pieces of equipment expected to be used during cell preparation. This equipment is only expected to be used during daytime hours. The noise levels are conservatively expected to attenuate to less than 55 dBA within 1 km of the Project Footprint and will not affect sensitive receptors to levels greater than BC noise guidelines. The noise effects of construction are expected to be temporary, localized, and reversible.

Workers

- Hazard is low to medium; excessive noise can cause hearing loss or nuisance. Noise is expected to be louder during the construction stage (medium) compared to the operations stage (low).
- Exposure is low; workers must comply with occupational health and safety requirements (for example, the use of PPE).
- Therefore, risk is low/unlikely and low, for the construction and operation stages, respectively, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-16).

Land Users, including First Nations

- Hazard is low; noise levels are expected to be less than 55 dBA within the Acoustic Environment LAA (that is, a 1-km radius extending outwards from the Project Footprint boundary).
- Exposure is low; there may be land users, including First Nations, within the Acoustic Environment LAA on an intermittent basis and a limited number of users within the Acoustic Environment RAA (that is, a 5-km radius extending outwards from the Project Footprint boundary). The noise levels within the Acoustic Environment LAA during the construction stage are expected to be within BC noise guideline acceptable levels; therefore, the levels within the RAA will also be acceptable.
- Therefore, risk is low or unlikely, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-16).

Table 4-16. Risk Evaluation for Noise

Exposure Pathway[a]	Hazard Level	Exposure Level	Predicted Risk
Noise - Construction Stage			
Workers	Low	Medium	Low
Land Users/First Nations	Low	Low	Low or Unlikely
Noise - Operation Stage			
Workers	Low	Low	Low or Unlikely

Table 4-16. Risk Evaluation for Noise

Exposure Pathway[a]	Hazard Level	Exposure Level	Predicted Risk
Land Users/First Nations	Low	Low	Low or Unlikely

[a] Decommissioning or abandonment is considered equivalent to the construction pathway for this assessment.

4.2.7 Naturally Occurring Radioactive Materials

Based on the screening process for NORMs completed in Section 3.2.3, comparisons of estimated annual worker doses to Health Canada limits indicated a low risk to workers. A potential risk to the public was identified; however, the screening process in Section 3.2.3 assumed that receptors are present at the Facility fenceline for 24 hours per day and 365 days per year, which is not the case. To assess a more reasonable exposure level for the public (that is, land users and First Nations) based on existing/future conditions, it was assumed that a receptor is present at the Facility fenceline for approximately 1 hour per month (equivalent to 12 h/a). Table 4-17 presents the re-evaluation of the public for this scenario.

Table 4-17. Revised Estimated Annual Radiation Doses from the Existing Facility for the Public

Statistic	Radiation Level (mSv/h)	Relevant Receptor	Estimated Exposure (h/a)	Estimated Annual Dose (mSv/a)
Fenceline - Maximum	1.5E-04	Public	12	1.8E-03
Fenceline - Minimum	2.0E-05	Public	12	2.4E-04
Fenceline - Median	9.0E-05	Public	12	1.1E-03

Notes:

Bold = value greater than Effective Dose Limit of 1 mSv/a for the Public

Underline = value greater than Dose Constraint of 0.3 mSv/a for the Public

Estimated Annual Dose (mSv/a) = Radiation Level (mSv/h) x Estimated Exposure (h/a)

Considering this exposure scenario, the estimated annual dose to the public is well below the Effective Dose Limit and Dose Constraint levels set by Health Canada (2011).

The Facility has existing mitigation measures in place that will be applied to the proposed Project to prevent NORMs from impacting human receptors. These measures include: dust suppression measures to minimize the dust generated from vehicular traffic; air filter monitoring at the perimeter to evaluate whether NORMs are present in dust and, if so, if the dust is leaving the Facility; screening of incoming waste streams to ensure that the maximum radioactive NORM concentrations per the *EMA* Permit are not exceeded; radiation level surveys conducted on a monthly basis from select interior and perimeter fence locations; and employees wear dosimeter badges to track exposure.

Workers

- Hazard is low; the radiation levels of the NORMs accepted at the Facility are relatively low compared to other sources of radiation, but a hazard is still present when exposure is possible at levels greater than background. Hazard is considered low during both the construction and the operations stages.
- Exposure is low; workers must comply with occupational health and safety requirements (for example, the use of PPE and wearing dosimeters). Mitigation measures such as dust suppression and various monitoring programs for NORMs are in place. Exposure is low during both the construction and operations stages.

- Therefore, risk is low or unlikely considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-18).

Land Users, including First Nations

- Hazard is low; radiation levels are lower near the perimeter of the Facility and will be similar for the proposed Project.
- Exposure is low; there are no land users, including First Nations within the Terrain and Soils LAA (that is, Project Footprint); however, there may be First Nation traditional land use within the Terrain and Soils RAA (that is, a 1-km radius extending outwards from the Project Footprint boundary). Therefore, risk is low or unlikely, considering the hazard-exposure interaction matrix (Figure 4-2 and Table 4-18).

Table 4-18. Risk Evaluation for Naturally Occurring Radioactive Material

Exposure Pathway[a]	Hazard Level	Exposure Level	Predicted Risk
NORMs - Construction and Operation Stages			
Workers	Low	Low	Low or Unlikely
Land Users/First Nations	Low	Low	Low or Unlikely

[a] Decommissioning or abandonment is considered equivalent to the construction pathway for this assessment.

4.3 Occupational Health and Safety Risk Assessment

The use of legislated requirements and industry-accepted best practices are key components for maintaining construction worker health and safety during the various construction and operations activities. Strict adherence to safety regulations, safety protocols and industry-accepted best practices (for example, the use of task hazard analysis, implementation of programs for confined spaces, site access, site and building security, traffic control, waste management, use of PPE, or industrial hygiene) is key to reducing exposures and controlling worker health and safety risks.

Mitigation implemented during construction activities such as noise mitigation, dust mitigation, spill prevention and proper storage and management of fuels and chemicals are considered to be sufficient to protect human health during proposed Project construction in the Project Footprint.

4.4 Uncertainty Assessment

This qualitative assessment of the risk of adverse effects of the proposed Project on the Human Health VC is based on an understanding of how the proposed Project would affect the three components of risk. Where information was available for environmental concentrations of COPCs, assumptions about the nature of the potential hazard and potential receptor exposure were made to qualitatively estimate the level of risk from proposed Project activities. However, data gaps exist and additional data would reduce the uncertainties inherent in the assumptions selected in this assessment. Additional data may also support a quantitative assessment of the health risks using the same assessment framework of examining hazards and exposure levels. The following assumptions influence the assessed potential for risks:

- Industry-accepted best practices will reduce or eliminate potential releases of COPCs to the environmental media, thus eliminating sources in media for exposure. If reduction or elimination of potential releases is not effective then risks could be higher.

- Health and safety requirements during construction will reduce or prevent exposure to COPCs already present or potentially released into the environment. If reduction or prevention of exposure is not effective then risks could be higher.
- The nature, type and magnitude of identified COPCs released during the operations phase of the proposed Project meet the regulatory requirements for emissions. If COPCs are different or if releases are higher than expected, new potential risks may be present or the risks to identified COPCs could be higher.
- The proposed Project is unlikely to affect the nature, type and magnitude of COPCs in soil, water, or country foods.

SECTION 5

Conclusions

Based on the CSMs and data and information available, this qualitative SLHHRA predicts that there are not significant risks of adverse health effects to human receptors from the proposed Project. All pathways are predicted to have risks that are low or unlikely.

JACOBS

James Sprenger, QPRA, CCEP CChem

HUMAN HEALTH RISK ASSESSMENT

James specializes in conducting human health and ecological risk assessments (HHERA) and guides and implements strategic monitoring and management plans leading to closure. He routinely prepares risk assessments for both regulatory acceptance and due diligence, and collects, analyzes, and reviews site-specific data. On the Gas Plus Project in Alberta, he assessed risk factors for the LNAPL-contaminated site and helped implement a risk-based RAP. Additionally, he performs defined risk assessments, most notably for hydrocarbon-impacted soils, and uses scientifically defensible measures to address hydrogeological issues, including developing toxicological exposure models and databases and incorporating biostatistics and quantitative bioassay (toxicity tests), to implement effective alternative cleanup objectives. James applies this experience to help prepare an RMP that meets NEB guidelines for your Site.

EDUCATION/QUALIFICATIONS

MS, Courses in Occupational and Environmental Health/Biostatistics, University of Toronto

BS, Biochemistry, University of Waterloo

REGISTRATIONS/CERTIFICATES

Canadian Certified Environmental Practitioner (CCEP), Specializations: Site Assessment, Reclamation, and Environmental Manager

Chartered Chemist (CChem), Ontario Association of the Chemical Profession in Ontario (ACPO)

Qualified Person for Risk Assessment (QPRA), Ontario Regulation (O.Reg.) 153/04, Ontario Ministry of the Environment, Conservation, and Parks (MECP), 2004

QPRA, Saskatchewan

OTHER

- Years of Experience: 27
- Office Location: Toronto, Ontario

Relevant Project Experience

Risk-based Soil and Groundwater Remediation, Edmonton, Alberta

Client: Confidential Client

Title: Senior Risk Assessor

Scope/Description: Performed remedial investigation, risk assessment, risk management, remedy selection, and design and construction activities at an industrial site containing chlorinated hydrocarbons. Managed site-specific risks and used new Alberta Environment Tier 1 and Tier 2 guidance to establish cleanup goals based on industrial land use.

West Don Lands, Toronto, Ontario

Client: Ontario Infrastructure and Lands Corporation (IO)

Title: Lead Risk Assessor (QPRA) and Human Health Risk Assessment (HHRA) Lead

Scope/Description: Revitalizing the largest brownfield site currently under development at a former industrial and commercial site serving as the Pan American Athletes' Village (PAAV). Conducting scope on an aggressive schedule to secure environmental approvals required prior to infrastructure construction by development partners. Performing site characterization, risk assessment (RA), remedial option feasibility studies (ROFSs), remediation, and risk mitigation measures (RMMs). Developed risk-based concentrations for each parcel to support development of soil barriers as an RMM. Conducted field investigations and prepared multiple Phase I and Phase II environmental site assessment (ESA), ROFS, and RA reports in parallel to meet development schedule. Reports complied with Ontario Regulation (O. Reg.) 153/04 under the *Environmental Protection Act*, as amended by O. Reg. 511/09, to obtain Records of Site Condition (RSCs) for

properties prior to development. Coordinated a team of 20 HHRA staff to complete 8 RA reports on an accelerated schedule while engaging with multiple stakeholders on numerous technical issues. Additionally, serving as key RA contact for ecological risk assessment (ERA), ESA, and Risk Management teams, liaising with teams to confirm consistency across concurrent development of multiple report sections. Currently, acting as the third-party Ontario Ministry of the Environment (MOE) Qualified Person (QP) to audit compliance with Certificates of Property Use (CPUs) and RAs during RMMs implementation. Selected by the Canadian Urban Institute for the 2011 Brownie Award due to brownfield project redevelopment innovation and environmental sustainability.

Closure Plans of NAPL Sites, Northern Manitoba and Saskatchewan

Client: Canadian National Rail

Title: Senior Technical Consultant and Peer Reviewer

Scope/Description: Peer reviewed risk management plans associated with risk-based closure of former rail yard sites located in northern geographies with non-aqueous phase liquid (NAPL) present on historical sites. Other consultants had previously assessed permafrost and other geological characteristics. Supported assessment by providing review and feedback on technical and regulatory aspects of due diligence assessments under Manitoba's *Contaminated Sites Remediation Act* and Saskatchewan's *Environmental Management and Protection Act*.

Gas Plus Remediation Project, Bow River, Calgary, Alberta

Client: Alberta Environment and Parks

Title: Senior Technical Consultant and Human Health Risk Assessor

Scope/Description: Remediated soil, bedrock/groundwater, and LNAPL-contaminated hydrocarbon plumes on commercial and residential properties contaminated due to a leak at former service station. Performed senior technical consultancy for HHRA/vapour intrusion to develop and review soil vapour and indoor air sampling at residential properties affected by a gasoline and diesel petroleum hydrocarbon plume. Peer reviewed site-specific, risk-based guidelines developed for use at site. Reviewed reports prepared to document pilot tests and vapour sampling results. Interpreted health of hydrocarbon concentrations in vapour and indoor air samples. Also supplied human health risk assessment guidance related to soil, groundwater, soil vapour, and indoor air sampling programs. Interpreted field data (soil structure, hydrogeology, geology, contaminant fate and transport mechanisms) and supported site remedial action plan implementation.

Enhanced Brownfield Screening Level Risk Assessment, Whitehorse, Yukon

Client: Government of Yukon

Title: Senior Risk Assessor

Scope/Description: Prepared a screening level human health and ecological risk assessment of metals and hydrocarbons in soil and groundwater on a site historically contaminated with hydrocarbons from former storage tanks. Screened direct and indirect exposure pathways using risk-based criteria. Assessed soil and groundwater to indoor air pathway for potential (human) residential receptors through an enhanced approach using probabilistic risk assessment methods in advance of designing buildings for future use at site. Quantified site-specific data concentrations, depths, and other parameters to assess potential need for vapour intrusion mitigation measures to manage risk.

Water Vulnerability Assessments, 22 Wing North Bay, Ontario, and 17 Wing Detachment Dundurn, Saskatchewan

Client: Canadian Department of National Defence

Title: Senior Technical Consultant

Scope/Description: Used risk-based (human and ecological health risk) approach to review interpretation of hydrogeological, hydrological, and contaminant of concern (COC) information to determine source water vulnerability. Assessed site COC, including Per- and Polyfluoroalkyl Substances (PFAS), hydrocarbons, metals, VOCs, PAHs, and nutrients. Applied statistical analysis to environmental chemistry data to characterize background surface water and groundwater chemistry, to delineate well head protection areas and intake protection zones, to determine and rank threats to water supply quantity and quality, and to develop monitoring and management plans for ongoing source water protection.

Port Lands Community-based Risk Assessment, Toronto, Ontario

Client: Waterfront Toronto

Title: Senior Consultant, Senior Reviewer, and Risk Assessor

Scope/Description: Performing senior consultancy, senior review, strategy, risk assessment, statistics, and modelling for the Port Lands, a 356-hectare (880-acre) urban area. Re-establishing historical wetlands and re-constructing mouth of the Don River. Preparing an area-wide risk assessment and interacting with various agencies, public and private (Toronto Port Lands Company, Ontario MOE, City of Toronto, Toronto Conservation Authorities), and the public. Site COCs are comprehensive, including VOCs, PAHs, PHCs, metals, and inorganics. Conducting mobility and exposure assessment, including for free-phase hydrocarbon presence. Assessing human and ecological risks associated with exposure to soil and groundwater during and following river mouth reconstruction process. Performing significant soil reuse via options analysis for remediation and other sustainability metrics. Employing risk-based intervention values as trigger values to support soil management and risk management decisions. Interpreted historical and recent large-scale Phase II data spatially and statistically for exposure and risk assessment of various pathways, including vapour intrusion and indoor air. Also, performed bioassays (toxicity tests) to support hydrocarbon aquatic reference values development.

Appendix 12
British Columbia Environmental Assessment Office Working Group Government Agency Comments during Pre-Application Stage for the Proposed Project Expansion

JACOBS

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-1	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Please indicate in which section traffic-related injuries will be captured.	Traffic-related accidents will be captured when there is transportation/mobilization of workers to site. Transportation of workers to site occurs during the construction, operation and closure/reclamation project activities. Traffic-related injuries will be captured via the Accidents and Malfunctions section.	N/A	23-Jan-16
NH-2	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document	Section 4.2	The "Subcomponent" section includes "dust, odours, and emissions from combustion." This should also include landfill gas and air contaminants from non-combustion sources, or provide justification for their exclusion.	Rationale for their exclusion will be included in Table 3 of Section 4.2 of the Valued Components Document. Silverberry does not accept municipal solid waste therefore landfill gas generation is minimal. Hydrocarbons associated with the waste tend to be heavier end and do not rapidly volatilize. To prevent dust roads and waste will be wetted.	N/A	23-Jan-16
NH-3	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document	Section 4.2	The "Rationale" section noted that "landfill gas generation is expected to be minimal." Northern Health inquires what the justification is for this. An exposure pathway should not be excluded without justification.	Rationale for exclusion will be elaborated on in Table 3 of Section 4.2 of the Valued Components Document. Silverberry does not accept municipal solid waste therefore landfill gas generation is minimal. Hydrocarbons associated with the waste tend to be heavier end and do not rapidly volatilize.	N/A	23-Jan-16
NH-4	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document	Section 4.2	Please assess the potential for volatilization of chemicals from soil and surface water into the air, or provide justification for exclusion of this from assessment.	Rationale for exclusion will be elaborated on in Table 3 of Section 4.2 of the Valued Components Document. Silverberry does not accept municipal solid waste therefore landfill gas generation is minimal. Hydrocarbons associated with the waste tend to be heavier end and do not rapidly volatilize.	N/A	23-Jan-16
NH-4a	10-Feb-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Please provide further clarification on the specific constituents of waste that will be accepted at the site (with consideration of volatility). We recognize that the hydrocarbons accepted may tend to be heavier, but also note that VOCs may be contained in oil and gas waste (e.g. BTEX) and we would expect further justification that there would be no vapour emissions associated with waste (with consideration of reaction/degradation by-products). We are encouraged by Tervita's commitment to developing an air quality study proposal; Northern Health looks forward to further discussions and collaborative efforts.	The types of waste accepted at the Silverberry landfill include hydrocarbon contaminated soils and sands, sulphur contaminated soil, salt contaminated soils, and other wastes associated with the oil and gas industry. Examples of other waste that may be accepted include construction and demolition materials such as cement, absorbents and desiccants, and drill cuttings and other sources of industrial waste. There may be VOCs such as BTEX emitted from the site in minor quantities based on the nature of the waste accepted. The scope of work presented to the Working Group for the landfill gas emissions study is designed to quantify a full suite of VOCs including BTEX through a summa canister collection and analysis through appropriate lab methods designed for identification and quantification of petroleum fuel and waste emissions. The use of a portable monitor will aid in the identification of emission hotspots and help focus the location(s) the lab samples will be taken.	N/A	3-Mar-16
NH-5	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Key indicators listed are ambient air concentrations of PM and NOx. Please provide a rational on how these were selected; other contaminants should not be excluded without justification. Northern Health expects the HHRA to be completed in accordance with Health Canada's guidelines.	Emissions from site will largely be from internal (diesel) combustion engines. According to BC Air Quality - Pollutant Vehicles Emit, Nitrogen Oxides (NO_x) and Fine Particulate Matter ($PM_{2.5}$) are found in larger amounts in emissions from diesel engines than gasoline engines. Most of the combustion at site will be associated with the diesel engines of Silverberry's heavy equipment.	N/A	23-Jan-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-5a	10-Feb-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Please clarify whether PM10 emissions will be assessed. Also, please provide further justification as to why the potential for SO2 emissions was excluded from the assessment.	PM10 emissions will not assessed, but are represented by the PM2.5 indicator. The equipment will use low sulfur diesel and therefore, it is not expected that SO2 will be a substantial source of emissions from the on-site equipment. Further the ambient air quality criteria for another combustion source contaminant NO2 is more stringent than that for SO2 (188 ug/m3 for NO2 versus 200 ug/m3 over a 1-hour average), therefore focusing the impact assessment to NO2 will still provide a good indication of air quality effects based on equipment tailpipe emissions. No SO2 emissions are expected from the landfill itself.	N/A	3-Mar-16
NH-6	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Please consider health service impacts under the community services VC.	Tervita will incorporate health service impacts under the community services VC.	N/A	23-Jan-16
NH-6a	10-Feb-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Thank you; Northern Health is satisfied with this response.	Tervita appreciates the positive feedback and looks forward to a continuing relationship with Northern Health.	N/A	3-Mar-16
NH-7	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		As noted previously, the HHRA should follow Health Canada's guidance documents and the documents included as attachments. The HHRA technical report should be a stand-alone section of the Application. The HHRA should begin with a qualitative screening level risk assessment that describes the potential hazards, human receptors and exposure pathways and determines the presence of complete exposure pathways that will require further assessment in the quantitative HHRA. For exposure pathways to be deemed incomplete, a rationale for exclusion must be included.	The facility is undergoing an amendment to the existing Environmental Assessment Certificate. Health risks have not changed since the original application, except a permit amendment to accept NORM material. Health risks will be addressed under the Health Pillar of the Valued Components. All regulatory guidance will be reviewed and considered when drafting the application.	N/A	23-Jan-16
NH-7a	10-Feb-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Given that the proposed increase in waste capacity is substantial, we maintain that the proposed amendments require further assessment of potential impacts to health. Further, human health risk assessment methodologies, standards and guidelines, and expectations have changed substantially since the original assessment was completed (in 2002), as has the availability of toxicity data. We look forward to further discussions with Tervita regarding the human health risk assessment to be completed.	Information on human health receptors and pathways was given to the EAO for circulation to the Working Group. Tervita looks forward to working with Northern Health on refining scope for a Human Health Risk Assessment through the dAAIR process.	N/A	3-Mar-16
NH-8	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document	Section 4.2	According to Health Canada's guidelines, HHRAs should consider the potential for the volatilization of chemicals from contaminated groundwater, surface water and soils and consider inhalation exposures. Otherwise, justification should be provided for the exclusion of this pathway from the assessment.	Rational for exclusion will be elaborated on in Table 3 of Section 4.2 of the Valued Components. Silverberry does not accept municipal solid waste therefore landfill gas generation is minimal. Hydrocarbons associated with the waste tend to be heavier end and do not rapidly volatilize. Surface water and groundwater monitoring since incorporation of the site hasn't indicated the presence of potentially volatile compounds present in the water.	N/A	23-Jan-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-8a	10-Feb-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		See previous response (to row 2, 3 and 4 comments). The fact that surface and groundwater monitoring data has not indicated the presence of potentially volatile compounds in water does not indicate the absence of these compounds (compounds that readily volatilize may have evaporated from surface water/groundwater and soils such that they are not detected when sampling these media). We are encouraged by Tervita's commitment to developing an air quality study proposal; Northern Health looks forward to further discussions and collaborative efforts.	Comment acknowledged. Tervita has given an air study and soil study scope, human health receptor information and vegetation tissue sampling to the EAO for circulation to Working Group members. Tervita looks forward to Working Group member comments on the submitted documents.	N/A	3-Mar-16
NH-9	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		According to Health Canada's guidelines, HHRAs should also assess potential for impacts on human health due to the ingestion of produce, livestock, country foods or fish that has been contaminated from soil, water or air. Otherwise please provide justification for the exclusion of these pathways from assessment.	Rational for exclusion will be elaborated on in Table 3 of Section 4.2 of the Valued Components. Due to the lack of agriculture and food sources in the vicinity of the project and the low volatilization of accepted landfill materials there will be limited impact on human health due to the ingestion of produce, livestock, country foods or fish.	N/A	23-Jan-16
NH-9a	10-Feb-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		See previous comments; we would expect further rationale that the potential for the volatilization of accepted landfill materials will be low. As per our correspondence, we also ask for more detail on the types of agriculture, hunting and trapping in the area. Please provide further justification that there are no pathways for human consumption of contaminated foods. We look forward to further discussion around the tissue collection studies that may be completed (and encourage the completion of such a study), and ask that linkages be made to the human health section (with reference to health-based criteria).	Comment acknowledged. Tervita has given an air study and soil study scope, human health receptor information and vegetation tissue sampling to the EAO for circulation to Working Group members. Tervita looks forward to Working Group member comments on the submitted documents.	N/A	3-Mar-16
NH-10	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Northern Health notes that other indicators for the HHRA should include hazard quotients and incremental lifetime cancer risk.	See Row 7 for a discussion of the HHRA.	N/A	23-Jan-16
NH-11	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		The health risk assessment should include both 'toxicity-based', and 'persistence and bio-accumulation-based' criteria.	See Row 7 for a discussion of the HHRA.	N/A	23-Jan-16
NH-11a	10-Feb-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		We would expect the AIR to provide more detail on the HHRA methodology to be utilized. We look forward to further discussions with Tervita regarding the human health risk assessment methodologies that will be used.	Comment acknowledged. Tervita will provide detail on HHRA methodology in the dAAIR and will work with Northern Health on human health risk assessment methodologies.	N/A	3-Mar-16
NH-12	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Potential for traffic related injuries, impacts to public health in the case of malfunctions or emergencies and other public health risks should be included in the assessment.	See Row 7 for a discussion of the HHRA.	N/A	23-Jan-16
NH-13	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		The potential for traffic related injuries should be also considered as part of the assessment and should encompass the traffic corridors associated with the project.	Traffic-related injuries will be captured via the Health Pillar under Human Health.	N/A	23-Jan-16
NH-13a	10-Feb-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Please clarify if traffic-related injuries will be captured under both sections indicated: the “Health Pillar under Human Health” and “Accidents and Malfunctions” sections?	Traffic related injuries will be captured in the Application under "Accidents and Malfunctions", and will be linked back to the Health pillar in the assessment.		

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-14	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Northern Health questions the described air quality RSA will allow potential impacts to health to be sufficiently assessed. Please provide justification for the selection of the 5km radius.	The expected contaminants of concern for the proposed Project are primarily fugitive dust emissions (particulate matter), and to a lesser extent various minor combustion tailpipe emissions. This choice of study area dimensions is expected to be sufficient to capture the area of maximum impact for such low lying releases. Also, although no modeling is planned for the proposed Project, the extent of the study area is consistent with current British Columbia Air Dispersion Modelling Guidance (see Section 6.1 of Guideline for Air Quality Dispersion Modelling in British Columbia, BC MOE, October 2006).	N/A	23-Jan-16
NH-14a	10-Feb-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Thank you; Northern Health is satisfied with this response. We ask that if the air quality study identifies potential impacts beyond this boundary, consideration be given to extending the LSA/RSA for this VC. Additionally, please clarify whether traffic corridors will be included (with respect to dust emissions), or provide a rationale (either in the VC document or application) for excluding this from the assessment.	Comment acknowledged. Traffic corridors within the RSA will be considered for their impact to dust emissions. Traffic volumes are not expected to increase along local traffic corridors due to the expansion, therefore dust emissions are expected to remain consistent.	N/A	3-Mar-16
NH-15	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Northern Health questions the described surface water/groundwater RSA will allow potential impacts to health to be sufficiently addressed. Provide justification for the selection of the 15km radius/bounded by the Blueberry River. What about the potential for persistent chemicals to have health impacts downstream? The Blueberry River is part of the Beaton River drainage and flows into the Peace River (which is a common drinking water source).	Potential effects of the Project on surface water and groundwater are considered within the context of the Local Study Area (LSA) and the Regional Study Area (RSA). The LSA is the geographic area in which direct interaction of the Project with surface water and groundwater is expected. The RSA is a larger area that provides context for the assessment of direct and cumulative adverse effects of the proposed Project, and is not the area within which direct Project effects are expected. Cumulative effects of the proposed Project with existing and reasonably foreseeable projects on surface water and groundwater are considered within the boundary of the RSA. The 15 km radius of the RSA is delimited by the Blueberry River, as the Project is not expected to act cumulatively on surface and groundwater with other existing or reasonable foreseeable projects beyond the Blueberry River. The LSA is considered to be the extent in which direct potential effects could occur (i.e., the geographic area in which direct interaction of the Project with surface water and groundwater may occur). The LSA boundary is defined as a 30 m radius extending outwards from the Project Footprint, including associated physical works and activities. Management measures to contain contaminated water within the facility will ensure that no effects to surface or groundwater occur beyond the LSA, therefore, effects on the Blueberry River, or other watercourses beyond the LSA, are not anticipated. Ongoing management measures include surface and groundwater collection and monitoring to ensure potential waterborne contaminants do not enter the environment.	N/A	23-Jan-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-15a	10-Feb-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Either in the VC document or in the application, please clarify why the project "is not expected to act cumulatively on surface and groundwater with other existing or reasonable foreseeable projects beyond the Blueberry River". Given that surface water runoff is discharged outside of the secure landfill area, we would ask that the LSA for surface water include downstream watersheds, or that justification be provided that contaminants would not be carried downstream (with consideration of the persistence of all constituents). We note that highly persistent contaminants may have health impacts far downstream from emission sources, and that some contaminants can cause health effects even at very low concentrations. Please provide further justification that "ongoing management measures" would be sufficient to "ensure potential waterborne contaminants do not enter the environment" (into groundwater), or consider extending the groundwater LSA. We would ask that historical groundwater monitoring data be referenced (either in the VC document or application) to support the conclusion that there will be no impacts to groundwater outside of the project footprint.	The application will provide information on the spatial boundary of each potential cumulative effect to surface water and groundwater, with rationale. Comment acknowledged. Tervita will provide justification and clarification on the impacts of discharged surface water on downstream watersheds. Tervita has committed to soils testing in the surface water discharge area to determine if contamination is present. Surface water is tested prior to discharge and is not discharged into a high water table or in the vicinity of surface water drainage. Comment acknowledged. Tervita will provide further justification in the application that mitigation measures prevent waterborne contaminants from entering the environment. Mitigation measures include a liner that will be constructed to prevent connectivity from landfill waste to groundwater. Historical groundwater monitoring data will be referenced in the application to support that there have been no groundwater impacts outside of the Project footprint, and groundwater monitoring will be continued during and after Project construction.	N/A	3-Mar-16
NH-16	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Description of baseline conditions should also characterize potential receptors, nearby water sources and historic usage of land.	The description of baseline conditions in the Application will include potential receptors, nearby water sources and historic usage of land.	N/A	23-Jan-16
NH-17	15-Dec-15	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Data collection appears to focus only on baseline information. How will potential effects be assessed and estimated using standard health risk assessment protocols.	The methodology for assessing potential effects will be captured in the draft Amendment Application Information Requirements document and reviewed by the EAO and Working Group at that time.	N/A	23-Jan-16
NH-17a	10-Feb-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		We are aware of a document outlining Health Canada's guidelines for radiological risk assessment: Federal Contaminated Site Risk Assessment in Canada, Part VI: Guidance on Human Health Detailed Quantitative Radiological Risk Assessment (DQRARad). If this is found to be applicable, would ask that it be referenced in terms of evaluating risks to human health.	The MoE is going to review Tervita's Radiation Protection Plan (RPP) and then propose a scope for a Radiological Risk Assessment. In working with the MoE on a scope the *Federal Contaminated Site Risk Assessment in Canada, Part VI: Guidance on Human Health Detailed Quantitative Radiological Risk Assessment* (DQRARad) will be reviewed.	N/A	3-Mar-16
NH-18	10-Feb-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		We are aware of a document outlining Health Canada's guidelines for radiological risk assessment: Federal Contaminated Site Risk Assessment in Canada, Part VI: Guidance on Human Health Detailed Quantitative Radiological Risk Assessment (DQRARad). If this is found to be applicable, would ask that it be referenced in terms of evaluating risks to human health.	The MoE is going to review Tervita's Radiation Protection Plan (RPP) and then propose a scope for a Radiological Risk Assessment. In working with the MoE on a scope the *Federal Contaminated Site Risk Assessment in Canada, Part VI: Guidance on Human Health Detailed Quantitative Radiological Risk Assessment* (DQRARad) will be reviewed.	N/A	3-Mar-16
NH-19	16-Mar-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		We ask that this information is carried forward to the application as a Screening Level Risk Assessment and is expanded upon based on the findings of the soil, water, air and other assessments contained within the application.	Comment acknowledged.	N/A	6-Apr-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-20	16-Mar-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Please confirm that the “provincial and federal guidelines” that will be used to assess surface water, air and soil quality will be health-based and will be clearly identified in the Health pillar.	Guidelines referenced will include, but not be limited to the following: • Canadian Environmental Quality Guidelines • Guidelines for Canadian Drinking Water Quality • British Columbia Contaminated Sites Regulation • British Columbia Waste Discharge Regulation • Guidance will be identified in the Amendment Application	N/A	6-Apr-16
NH-21	16-Mar-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		We also note that it is stated in the Project Description that the project site will be “reclaimed to agricultural land”. Accordingly, we ask whether there is a potential for human consumption of contaminated foods during the closure and post-closure periods. Please include detail on the proposed timeline for reclamation (i.e. time before agricultural usage is initiated). Please identify any persistent contaminants that could accumulate in these agricultural products. We ask that this information is carried forward into the application.	Tervita would like to clarify this point in the Project Description. The landfill waste itself will not be reclaimed however, final cover upon closure will meet agricultural standards as provided in the Contaminated Sites Regulation. During closure and post-closure there is no intention to use the land for agriculture thus there should be low potential for consumption of contaminated food. After Tervita's closure and post closure commitments are complete (~25 years), the title of the property will be transferred to the crown as stipulated in Section 27(10)(b) of the Hazardous Waste Regulation. Tervita is not sure what the British Columbia government's intentions are after transfer of title.	N/A	6-Apr-16
NH-22	16-Mar-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Similarly, we ask that all potential future land uses are considered.	Comment acknowledged. Tervita will work with the Ministry of Environment to consider future land uses upon closure.	N/A	6-Apr-16
NH-23	16-Mar-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		We ask that either here, or in the Application, further information is provided to justify that there are “no registered wells, aquifers or community watersheds near the proposed Project Area”. It should also be recognized that not all existing wells are registered; please ensure that any ground or surface water intakes in the vicinity of the site are identified. Information on receptor locations should be carried forward to the application.	Comment acknowledged. Tervita will ensure that any groundwater or surface water intakes and receptors in the vicinity of the site are identified in the application.	N/A	6-Apr-16
NH-24	16-Mar-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Similarly to the potential for surface water NORM contamination, it should be recognized that surface water could be contaminated by metals contained in dust which also could “settle into surface water”.	Comment acknowledged. Rational under the VC component surface water will modified to acknowledge this concern.	N/A	6-Apr-16
NH-25	16-Mar-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		How were Potential Contaminants of Concern identified? Please include this information in the application. Accordingly, we ask that the application include a Screening Level Risk Assessment, that includes the screening of all potential contaminants (e.g. dioxins, furans, PCBs, VOCs, asbestos, etc.).	Potential contaminants of concern are chosen by reviewing historical waste profiles and its related chemical contamination, and through regulatory guidance. This information will be included in the application.	N/A	6-Apr-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-26	16-Mar-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		It is stated that a “potential, low probability pathway includes uptake of contaminated water by wildlife or vegetation, which is then consumed by land users and First Nations receptors”. We ask that the potential for the uptake of contaminants into the food chain (from soil, air and water) is further discussed based upon the findings of the surface water and soil quality assessments (as well as other relevant assessments). Please ensure that this information is carried forward to the application.	Comment acknowledged. The information will be included in the application.	N/A	6-Apr-16
NH-27	16-Mar-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		We ask that the Screening Level Risk Assessment in the application includes the potential for wildlife to enter the project vicinity (e.g. floating on ponds or grazing). We ask that information is also provided in the application on the controls that will be implemented to prevent wildlife, birds, and people from entering the waste storage areas (to prevent direct contaminant exposures or uptake into the food chain).	Comment acknowledged. This information will be included in the application.	N/A	6-Apr-16
NH-28	16-Mar-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		The information provided indicates how baselines will be collected. How will the effects assessment on these VCs be conducted and will there be consideration of follow-up monitoring?	After results of the initial studies are reviewed, the possibility of follow up monitoring can be discussed with the EAO and working group members. The assessment of effects will be detailed in the dAAIR document and sent for Working Group review.	N/A	6-Apr-16
NH-29	16-Mar-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		How will potential dust impacts be captured in the air quality study, considering that the Site may be a source of contaminant laden dust? Would soil sampling methodology be able to capture dust impacts or would this require specific sampling methodology? Please clarify if these study results are intended to not only form the baseline, but also to inform the project effects assessment (i.e. considering current risk to be representative of future risk)? If so, we note that any limitations in the study methodology may be of added concern.	Dust is not captured in the air quality study. The air quality study focuses on landfill gas emissions. However, particulate matter (PM) is captured under the Air Quality VC and will be looked at during the application as having the potential to impact air quality. Soil sampling will give an indication of any off-site impacts. If impacts are found, Tervita will have to do further investigation to determine what the source of the impact is (air versus surface water). The study results are intended to inform the project effects assessment as current condition information. The potential effects of the current facility are one factor that will feed into the determination of potential effects of the capacity replacement.	N/A	6-Apr-16
NH-30	16-Mar-16	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		It is noted that the soil data will be compared to the BC CSR Schedule 4 Standards. We ask that other applicable CSR Schedules (e.g. Schedule 5) are also included in the assessment.	Comment acknowledged. Applicable criteria from Schedule 5 will also be reviewed.	N/A	6-Apr-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-31	7-Jul-16	Melisa Aalhus	Northern Health	Human Health	Air/Soil Study Scope		Please provide further clarification on how the results of the studies will be used to inform the baseline and effects assessments. Will there be consideration of follow-up monitoring? It is not clear how the Proponent intends to integrate these studies into the broader dAAIR and Environmental Assessment work plan. We ask that detail is provided on how the results of these studies will be used to inform further assessment, and in particular, to inform the Human Health Risk Assessment (HHRA) work plan.	The results of the air and soil studies will be used as a reference to assess the effects of the capacity replacement of the Silverberry Landfill. For example, if soil monitoring at the discharge area indicates that no contamination is present, the probability and magnitude of the potential effect of soil contamination from water discharge in the Amendment Application may be labelled low. However, since Silverberry Landfill operates under a current Environmental Assessment Certificate, no follow-up monitoring of the existing landfill is required at this time. Follow-up monitoring of the capacity replacement project will be discussed in the mitigation presented in the Amendment Application. The HHRA is considered to be a Screening Level Human Health Risk Assessment (SLHHRA). The current information under review is the scope of the Air and Soil studies and therefore, more information around the SLHHRA will be presented to the Working Group in the draft Amendment Application Information Requirements. However, the SLHHRA is expected to include all available information around current conditions, including information collected during Project field work.	N/A	25-Jul-16
NH-32	7-Jul-16	Melisa Aalhus	Northern Health	Human Health	Air/Soil Study Scope		We ask that detail is provided on how the results of these studies will be used to inform further assessment, and in particular, to inform the Human Health Risk Assessment (HHRA) work plan. Specifically, we have questions around water quality, and how the results of the soil study of the Surface Water Drainage Area will be used to inform the assessment of potential effects from the Project on surface water.	The current information under review is the scope of the Air and Soil studies and therefore, more information around the SLHHRA will be presented to the Working Group in the draft Amendment Application Information Requirements. In addition, the scope of the assessment to air and soils will be determined during the Amendment Application Information Requirements stage. The information collected around the potential effects of the current Silverberry Landfill will be used to inform the effects assessment in the Amendment Application with regard to the prediction of potential effects that the capacity replacement project may have. Tervita acknowledges that soil contamination, if present, may travel to surface water and the assessment of potential effects to the Surface Water Valued Component will consider the Water Quality Parameters Key Indicator for the activities associated with the capacity replacement. In addition, mitigation will be provided based on the level of potential effects predicted.	N/A	25-Jul-16
NH-33	7-Jul-16	Melisa Aalhus	Northern Health	Human Health	Air/Soil Study Scope		If the results of these studies will be incorporated into the HHRA, we expect that Health Canada's Guidance Documents1 on HHRAs are adhered to in the development of sampling methodologies and the assessment of risk. We suggest that a similar work plan be developed for the HHRA to ensure that our understanding and expectations for the HHRA are aligned.	The SLHHRA is expected to include all available information around current conditions, including information collected during Project field work. The current information under review is the scope of the Air and Soil studies and the Project is currently in the draft Valued Components review stage. More information around the SLHHRA will be presented to the Working Group in the draft Amendment Application Information Requirements and the work plan will be reviewed and revised at that time.	N/A	25-Jul-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-34	7-Jul-16	Melisa Aalhus	Northern Health	Human Health	Air/Soil Study Scope		Please clarify how radiological contaminants will be assessed (including those contained in dust, deposited in soil and emitted to air). Will these contaminants be captured in separate studies?	As a part of the Radiological Protection Plan (RPP) at Silverberry, NORM air monitoring occurs. Historical results can also be shared with Northern Health upon request. Information regarding results of NORM air monitoring will be provided in the application, and the scope of the SLHHRA will be developed during the draft Amendment Application Information Requirements phase. NORMs will be assessed as a subcomponent under the Human Health Valued Component in the Amendment Application.	N/A	25-Jul-16
NH-35	7-Jul-16	Melisa Aalhus	Northern Health	Human Health	Air/Soil Study Scope		Given that contaminant air emissions may vary over time, please provide justification that the sampling time point can be expected to be representative of worst case emissions. How do the waste loads received at the site vary throughout the year? Please provide a rationale that “maximum emissions from the site are expected” in July. For example, what if the days used to sample in July are cold, resulting in reduced air emissions? Further, considering the current slowdown of oil and gas activity in the region, please provide detail on how current waste loads compare to those when oil and gas development is operating at full capacity in the region. Will follow-up monitoring be completed if the rate of waste deposition increases?	Historically, July is the hottest month in the Fort St. John area. Temperature will vary throughout the month but the monitoring will provide a sufficient snapshot to determine the gases being produced at Silverberry Landfill. The temperature of the air survey will be logged and reported so it can be compared against historical mean temperatures in the region. Waste loads are fairly consistent throughout the year, produced from the exploration of oil and gas (drilling muds and inverts). Depending on spills in the area, waste may see some variability. However, most spill material is crude oil/hydrocarbon impacted. Follow-up monitoring is not expected as waste deposition increases. As waste deposition increases, capacity is used, which results in progressive capping of the landfill. Capping reduces generated gas from reaching the surrounding environment.	N/A	25-Jul-16
NH-36	7-Jul-16	Melisa Aalhus	Northern Health	Human Health	Air/Soil Study Scope		Please provide a detailed rationale for the use of only 1 ambient air sample to test the landfill gas composition, and justification that this can be considered representative of worst case emissions. It should be recognized that reviewers would likely be more comfortable in the study results with an increased number of samples and sampling frequency.	The purpose of the air sampling plan submitted is to characterize the chemical nature of the gases being emitted from the landfill using a standard laboratory TO-15 VOC scan. One sample taken at a “hotspot” location (as described in the proposal) should provide adequate information about the nature of the contaminants emitted. The purpose of the sampling plan is not to quantify the emission rates from the landfill.	N/A	25-Jul-16
NH-37	7-Jul-16	Melisa Aalhus	Northern Health	Human Health	Air/Soil Study Scope		It is stated that “VOCs will be compared to ambient air standards and guidelines”. How will the results of this study be applied in the HHRA? Please clarify whether and which health-based guidelines will be utilized. We ask that in the HHRA it is recognized that the BC Ambient Air Quality Objectives may not be safe thresholds for health effects (e.g. for PM) and that some sensitive individuals may still be affected below these objectives.	The SLHHRA is expected to include all available information around current conditions, including information collected during Project field work. The current information under review is the scope of the Air and Soil studies and the Project is currently in the draft Valued Components review stage. More information around the SLHHRA will be presented to the Working Group in the draft Amendment Application Information Requirements and the work plan will be reviewed and revised at that time.	N/A	25-Jul-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-38	7-Jul-16	Melisa Aalhus	Northern Health	Human Health	Air/Soil Study Scope		It is stated that measured contaminant concentrations will be compared to "British Columbia (if available) and federal regulatory guidance". Please clarify how the results of these studies will be applied to the HHRA, and ensure that health-based guidelines are used to account for all potential exposure pathways.	The SLHHRA is expected to include all available information around current conditions, including information collected during Project field work. The current information under review is the scope of the Air and Soil studies and the Project is currently in the draft Valued Components review stage. More information around the SLHHRA will be presented to the Working Group in the draft Amendment Application Information Requirements and the work plan will be reviewed and revised at that time.	N/A	25-Jul-16
NH-39	7-Jul-16	Melisa Aalhus	Northern Health	Human Health	Air/Soil Study Scope		Please include additional detail on how Potential Contaminants of Concern were identified.	For the air study, the contaminants of concern for the portable gas monitor were selected as being typical of a landfill site. However, the portable measurements are primarily being used to identify an emissions "hotspot", where a canister collection will then be done. The lab analysis will use a US EPA TO-15 method that will provide an assessment of a large number of VOC contaminants including BTEX, chlorinated compounds, alkanes, and alkenes, and others. Since the purpose of the study was to determine the chemical nature of the emissions, it was decided to use the TO-15 method, which can identify a large number of compounds. For soil, potential contaminants of concern were identified based on previous site investigations of surface water on site (Nichols Environmental, 2016) and chemical characteristics of hazardous and non-hazardous waste streams accepted at the facility.	N/A	25-Jul-16
NH-40	7-Jul-16	Melisa Aalhus	Northern Health	Human Health	Air/Soil Study Scope		We ask for a rationale that the proposed soil sampling depths will adequately capture Project impacts.	Soil sampling depths were selected based on expectation of event-based rather than continuous surface water runoff as source for potential contaminants. Impacts to vegetation were a concern, so sampling within the rooting zone was also a consideration in determining sampling depths.	N/A	25-Jul-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-41	4-Nov-16	Melisa Aalhus	Northern Health	Human Health	Air Study		It was our understanding that the study methodology was designed to assess the constituents of landfill gas (in particular, to test for the presence VOCs). Please refer to responses received from the Proponent to NH comments on the study proposal: • Since the purpose of the study was to determine the chemical nature of the emissions, it was decided to use the TO-15 method, which can identify a large number of compounds" • The purpose of the air sampling plan submitted is to characterize the chemical nature of the gases being emitted from the landfill using a standard laboratory TO-15 VOC scan. One sample taken at a "hotspot" location (as described in the proposal) should provide adequate information about the nature of the contaminants emitted. The purpose of the sampling plan is not to quantify the emission rates from the landfill." Accordingly, the reviewer is confused as to why the report drew conclusions about contaminant concentrations as compared to objectives, and as to why it was concluded that additional monitoring is not warranted. It is our understanding that the methodology was designed to analyze the chemical composition of landfill gas, and not to draw conclusions about emission rates. We feel that an important conclusion of the study is the presence of a number of VOCs at detectable levels in the landfill gas.	Additional monitoring is not needed as the monitoring event provided an adequate snapshot to understand the chemical composition of landfill gas, collected during a warm summer day and at a location when/where emissions would be expected to be near maximum. The intent of the study was not to quantify emission rates for various VOCs, but it is important to understand its composition at facility boundaries.	N/A	21-Nov-16
NH-42	4-Nov-16	Melisa Aalhus	Northern Health	Human Health	Air Study		Recognizing that the 1-hour average Alberta AAQO for benzene is 30 ug/m^3 based on hematological effects, we note that the Alberta annual average AAQO is 3 ug/m^3 as based on carcinogenic effects. The benzene concentration could be lower than 30ug/m^3 outside of the project footprint "due to dispersion that would occur as the landfill gas migrates off-property". However, it is not clear how benzene concentrations are expected to vary over time, and it is of concern that the annual average AAQO (3ug/m^3) might be exceeded at public receptor locations. Why was the potential for chronic effects not considered?	The purpose of the study was to characterize the VOCs emitted from the landfill at a time and location when near maximum emissions might be reasonably expected. One of the samples, taken just above the landfill surface, was just at the Alberta 1-hour average AAQO of 30 ug/m3 and would be less than that concentration at any sensitive receptors. Over the course of a year, when emissions over the winter period are reduced, and winds are blowing in different directions; the concentrations at any one sensitive receptor is likely to be much less than 3 ug/m3 based on CH2M's experience with similar fugitive type emissions. Tervita notes that the nearest residence to the landfill is over 1 km away. The means through which health effects will be addressed will be reviewed by the Working Group in the draft Amendment Application Information Requirements (dAAIR).	N/A	21-Nov-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-43	4-Nov-16	Melisa Aalhus	Northern Health	Human Health	Air Study		Insufficient rationale was provided for the air quality criteria that were used. We recognize that BC may not have applicable criteria, however it is not clear why criteria from specific jurisdictions were selected (preferentially Alberta Air Quality Objectives and Guidelines and then Ontario Ambient Air Quality Criteria). For the HHRA that is to be completed, we recommend a table is provided to compare any applicable criteria from key agencies (Health Canada, US EPA IRIS, California OEHHA, WHO, Texas CEQ, etc.), and which includes information on the health basis of each criteria and the year of its development.	Comparing to nearby provinces that have standards/objectives for the specific VOC measured is a reasonable way to gauge the magnitude of the concentrations captured in the canisters. As applicable criteria are available through Canadian provincial agencies, CH2M does not recommend the comparison to US federal or state objectives. However, CH2M can include comparison to Northern Health's agency of choice (e.g., Alberta Air Quality Objectives). The methodology for the health assessment to be completed will be included in the dAAIR which will be reviewed by the Working Group, including Northern Health.	N/A	21-Nov-16
NH-44	4-Nov-16	Melisa Aalhus	Northern Health	Human Health	Air Study		It should be recognized that some contaminants can work cumulatively (e.g. impacting the same target organ), and that there can be compounded effects from multiple exposure pathways. Why were additive effects not considered?	The results of the air study are intended to report on the findings of the field work, not provide an effects assessment. The atmospheric environment as well as human health will be assessed in the Environmental Assessment Certificate Amendment Application, which will consider potential cumulative and additive impacts.	N/A	21-Nov-16
NH-44a	22-Nov-16	Melisa Aalhus	Northern Health	Human Health	Air Study		We have reviewed Tervita's responses and are still confused about the purpose of the study. If the purpose was to determine whether VOCs should be included as a COPC in the AIR then this is sufficient. The results show that a number of VOCs are present in landfill gas at high enough levels to be of concern (in particular, the benzene concentration at the hotspot was at the 1-hour threshold). Based on this, VOCs definitely need to be included as a COPC in the AIR. We ask that the VC document is revised to include VOCs as a Key Indicator for Air Quality and Human Health, or at least that VOCs are included in the AIR. The study definitely doesn't constitute an HHRA. It may form part of the baseline assessment, but they still will need to complete a proper baseline characterization of VOCs (with further monitoring and/or modelling) as well as an effects assessment of VOC emissions for the future landfill. Accordingly, the dAIR should include methodology for the completion of a more thorough effects assessment/HHRA for VOCs. When this methodology is being developed and assessed during the dAIR review, we ask that our comments on the Air Study are carried forward and considered	Tervita understands that the air study doesn't constitute an HHRA. The study was to understand the composition of landfill gas being generated at the landfill. Ongoing monitoring requirements will be discussed in the Draft Amendment Application Information Requirements (dAAIR). The draft Valued Components will also be edited to include VOCs as an indicator of air quality.	N/A	7-Dec-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-45	26-Jan-17	Melisa Aalhus	Northern Health	Human Health	Soil Study		Our review of this report is limited by the fact that it is not yet clear how the Proponent intends to integrate these studies into the broader dAAIR and Environmental Assessment work plan, and in particular, how these results will inform the Human Health Risk Assessment (HHRA). The results of this study do not provide sufficient justification for the exclusion of dust deposition and surface water discharge as operable pathways within the HHRA that will be completed in the EAC Amendment Application. Further, as noted previously, for the purposes of the HHRA it should be ensured that Health Canada's guidance is adhered to for sampling methodologies and the assessment of risk (including sampling depths, screening criteria, etc.). It is our recommendation that the HHRA be conducted by a risk assessor with expertise and experience conducting human health risk assessments.	The results of the study are intended to report on the findings of the field work, not to provide an effect assessment. The environmental impact as well as human health will be assessed (using the study as support) in the Environmental Assessment Certificate (EAC) Amendment Application, which will consider cumulative and additive impacts. The studies scope and intent wasn't to provide justification for the exclusion from an HHRA. The study was performed to address working group concerns and help inform them on potential impacts listed in the draft Valued Components., therefore BC sampling regulations and guidelines were used. If a study is used to specifically inform the HHRA then Health Canada's guidance will be adhered to. Tervita will take into consideration the qualifications of each subject matter expert in developing the EAC Amendment Application.	N/A	1-Mar-17
NH-46	26-Jan-17	Melisa Aalhus	Northern Health	Human Health	Soil Study		For the purposes of the HHRA, justification will need to be provided that the screening criteria used are protective of health. It should be recognized that CSR standards are intended for the remediation of contaminated sites. Accordingly, there are limitations in their application for environmental assessments in which a contaminated site is not being remediated.	If results from the study are used in the HHRA, justification will be provided.	N/A	1-Mar-17
NH-47	26-Jan-17	Melisa Aalhus	Northern Health	Human Health	Soil Study		Further, there are currently no soil/sediment guidelines that are protective of human health for the country food pathway. It is common for risk assessors to screen sediment against CCME's human health-based soil quality guidelines and/or BC CSR standards but this is only acceptable for assessing the risk from direct contact. If there is a potential for the bioaccumulation of contaminants into the food chain, tissue modelling and/or sampling would be required to assess the risk to human health from the consumption of country foods.	Potential for bio-accumulation in the food chain, if applicable, will be addressed in the HHRA.	N/A	1-Mar-17
NH-48	26-Jan-17	Melisa Aalhus	Northern Health	Human Health	Soil Study		Additional information is required to support the claim that sample locations for BH-9A and 10A, as well as 14A and 15A represent "undisturbed native areas". Based upon review of the maps provided in Appendix A, these locations are very close to the site. It will be important to accurately identify background soil concentrations in order to understand whether incremental changes in contaminant levels are occurring due to project activities. Historical sampling data from the site should also be considered (including data from the original EAC Application).	Further investigation for confirmation of background relative to site is taken under consideration.	N/A	1-Mar-17

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-49	26-Jan-17	Melisa Aalhus	Northern Health	Human Health	Soil Study		It is stated that “it is determined that the measured boron concentrations are resulting from naturally occurring sources”. We expect that further justification is provided to support the conclusion that elevated boron concentrations are resulting from naturally occurring sources. While it is true that “the absence of other primary contaminants of concern for the facility (hydrocarbons) within the samples” could suggest that contaminants are not accumulating, we note the following: • Other factors such as the solubility of contaminants (such as hydrocarbons) may affect whether they are presence in leachate as well as whether they would persist in soils (and at what depth) • While the measured concentrations of many contaminants may currently be below the screening criteria, this does not indicate whether or not they are increasing due to project activities The reviewer would be interested in whether there are incremental changes occurring in contaminant concentrations in soil, as this would be more meaningful in understanding how the proposed expansion may impact contaminant levels. We note that this is of particular concern given that measured boron concentrations in soil are many magnitudes higher than the CSR AL standard of 2 mg/kg. Further information on background boron levels will be required.	Further investigation for confirmation of background relative to site is taken under consideration.	N/A	1-Mar-17
NH-50	26-Jan-17	Melisa Aalhus	Northern Health	Human Health	Soil Study		Further assessment of barium (to determine if the elevated levels are due to project activities) is of particular interest, given that, as noted in the report, “the main source of materials accepted at the Facility come from the oil and gas industry activities, where barite is a common mud additive”. As noted above, while contaminant levels may be below the screening criteria employed, there may be incremental increases in contaminant concentrations in soil occurring due to project activities. Further, as noted previously, the screening criteria used are not protective of bioaccumulation in country foods. Additionally, it should be recognized that while some substances may not have been detected in soils (at the selected sampling depths), they may be present in surface water discharge and/or dust. For example, highly soluble substances might not accumulate in surficial soils, and may migrate to downstream environments. Similarly, some substances may be more readily taken up by wind and could be found at concentrations above air quality standards/criteria that would be protective of the inhalation pathway.	Thanks for taking the time to read the soil study. Tervita will take Northern Health’s comment regarding further investigation on the source of barite into consideration.	N/A	1-Mar-17
NH-51	26-Jan-17	Melisa Aalhus	Northern Health	Human Health	Soil Study		Until such time as additional information is provided on how this study will feed into the AIR and Environmental Assessment work plan (including the HHRA), it is difficult to complete a meaningful review of this report. We look forward to further discussions and collaborative efforts regarding potential impacts to human health.	The results of the study are intended to report on the findings of the field work, not to provide an effect assessment. The environmental impact as well as human health will be assessed (using the study as support) in the EAC Amendment Application, which will consider cumulative and additive impacts. Northern Health will have the chance to comment on the Draft Amendment Application Information Requirements (DAAIR) which will show how studies are being used and outline human health impacts in more detail.	N/A	1-Mar-17

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-52	17-Jun-17	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Please ensure these guidance documents are referenced either here (in the VC Rationale Document) or in the AIR: • Evaluating Human Health Impacts in Environmental Assessments: Noise • Evaluating Human Health Impacts in Environmental Assessments: Air Quality • Evaluating Human Health Impacts in Environmental Assessments: Water Quality • Evaluating Human Health Impacts in Environmental Assessments: Radiological Impacts In general, please ensure that Health Canada's guidance is adhered to when selecting indicators for the Human Health VC.	Tervita will review the Health Canada guidance documents provided by Northern Health. If applicable, Tervita will reference them in the draft Amendment Application Information Requirements (dAAIR).	N/A	8-Aug-17
NH-53	17-Jun-17	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		If modeling studies show that there is a potential for effects to occur beyond the proposed spatial boundaries for a VC then these boundaries should be amended as appropriate. We ask that it is indicated either here or in the AIR that the spatial boundaries will be expanded if the assessment identifies a potential for effects to occur beyond these boundaries.	It is standard practice for information gathered during each VC study and effects assessment to inform the zone of influence. If information is produced that indicates the zone of influence should be adjusted, it has the potential to change the study area boundaries. Tervita will provide this wording in the dAAIR document.	N/A	8-Aug-17
NH-54	17-Jun-17	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		4.1 Recommended Valued Components The document states that the key indicator for the Acoustic Environment VC will be "noise levels" (Table 2). Please ensure that the Health Canada's guidance for assessing noise effects is adhered to (including "Evaluating Human Health Impacts in Environmental Assessment: Noise" see the reference above). Accordingly, indicators of potential health affects related to noise should include noise complaints and long-term high annoyance.	Tervita will review the Health Canada guidance document provided by Northern Health and apply applicable criteria. Appropriate indicators for noise impacts on human health will be used.	N/A	8-Aug-17
NH-55	17-Jun-17	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		4.3 Spatial Boundaries for Valued Components It is stated that "no separate LSA defined" for the Air Quality VC. Please clarify what is meant by this statement. Does this proponent intend to define the LSA for the Air Quality based upon the effects assessment? Or will the LSA and RSA for air quality be the same? (i.e. a 10km radius)	The LSA and RSA for air quality radius will be the same at 10km.	N/A	8-Aug-17
NH-56	17-Jun-17	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		In addition, subcomponents for the Air Quality VC have been expanded to include emissions from the other sources (such as volatilization), and there could presumably be a potential for long or medium range transport of contaminants of potential concern. If the air quality study identifies potential effects beyond these boundaries, the LSA will need to be expanded. We ask that this is indicated either here or in the AIR.	It is standard practice for information gathered during each VC study and effects assessment to inform the understanding of the zone of influence, and therefore the LSA and RSA accordingly. If information is produced that indicates the zone of influence should be adjusted, it has the potential to change the study area boundaries. Tervita will provide this wording in the dAAIR document.	N/A	8-Aug-17

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-57	17-Jun-17	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Further will traffic corridors that are potentially affected by dust beyond the 5 km area be considered?	Beyond the 5km radius it is difficult to scientifically quantify dust effects from the proposed Project due to the active industry in the area. The Amendment Application is being submitted to assess the impacts of a potential capacity replacement of the existing Silverberry landfill. Therefore, the existing conditions adjacent to the capacity replacement site are an operational facility with similar operations. Mitigation on effects to air quality will be provided in the Amendment Application.	N/A	8-Aug-17
NH-58	17-Jun-17	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Is there potential for deposition to soil beyond the project footprint? As noted above, we ask that if the assessment identifies potential effects beyond these boundaries (e.g. through soil deposition) then that they are expanded. We ask that this is indicated either here or in the AIR.	It is standard practice for information gathered during each VC study and effects assessment to inform the understanding of the zone of influence, and therefore the LSA and RSA accordingly. If information is produced that indicates the zone of influence should be adjusted, it has the potential to change the study area boundaries. Tervita will provide this wording in the dAAIR document.	N/A	8-Aug-17
NH-59	17-Jun-17	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		Please provide a detailed rationale (either here or in the AIR) that a 1 km radius extending from the Project Footprint would allow effects to be captured. If the assessment indicates that effects may occur beyond the LSA then the boundaries will need to be expanded. Based on our previous correspondence, we understand that the closest permanent and temporary receptors will be captured (which may have different permissible noise levels)	It is standard practice for information gathered during each VC study and effects assessment to inform the understanding of the zone of influence, and therefore the LSA and RSA accordingly. If information is produced that indicates the zone of influence should be adjusted, it has the potential to change the study area boundaries. Tervita will provide this wording in the dAAIR document.	N/A	8-Aug-17
NH-60	17-Jun-17	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		The LSA for Human Health should be the maximum extent of the area encompassed by any VC LSA that might feed into the HHRA (including air quality, terrain and soils, and potentially country food pathways).	The LSA for Human Health encompasses the largest LSA for the VCs that have pathways to human health, including Air Quality, Terrain and Soils, Noise and Surface Water.	N/A	8-Aug-17
NH-61	17-Jun-17	Melisa Aalhus	Northern Health	Human Health	Draft Valued Components Document		In addition, we note that considering locations where people may be exposed to the highest concentrations of COPCs may be conservative approach. However, consideration should also be given to identifying areas where concentrations may be lower but where there may be people at a potentially greater risk (e.g. longer duration of exposure, such as permanent dwelling.) For instance, the surface and ground water LSAs are limited to a 500 m radius. However, drinking water intakes might be outside that area, and may be the point where receptors are at the greatest risk of exposure. Please ensure this is considered.	Tervita takes into account that more sensitive receptors may be present and they will be considered when Tervita is drafting the methodology for the assessment in the dAAIR and the effects assessment in the Amendment Application.	N/A	8-Aug-17
NH-62	19-Apr-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 1)	General (and in Proponent's responses to comments NH-53, NH-56 and NH-59)	*"It is standard practice for information gathered during each VC study and effects assessment to inform the zone of influence. If information is produced that indicates the zone of influence should be adjusted, it has the potential to change the study area boundaries. Tervita will provide this wording in the dAAIR document."* (As per the Proponent's responses to comments NH-53, NH-56 and NH-59)¶The reviewer could not locate wording in the dAAIR indicating that spatial boundaries will be expanded if the assessment identifies a potential for effects to occur beyond these boundaries. Please clarify where this can be found.	Tervita will add this wording to Section 3.2.1 of the dAAIR.	N/A	20-Apr-18

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-62a	15-Aug-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 4)		Thank you, NH is satisfied with this response.	Tervita appreciates Northern Health's timely review of the dAAIR.	N/A	2=Sep 5
NH-63	19-Apr-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 1)	dAAIR 4.3 Acoustic Environment	The proposed Key Indicator for the acoustic environment is “noise levels”. Additional indicators of potential health effects relating to noise should include complaints, change in the percent highly annoyed (%HA), sleep disturbance and interference with speech comprehension as applicable (as per Health Canada’s *Guidance for Evaluating Human Health Impacts in Environmental Assessment: Noise*).	The noise level indicator is brought over from the Valued Component Document. Tervita does not intend to change or add key indicators at this time.	N/A	20-Apr-18
NH-63a	15-Aug-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 1)		As per NH-67, health-based indicators will need to be used to screen and assess noise-related effects, in accordance with the methodology described in Health Canada's Guidance for Evaluating Human Health Impacts in Environmental Assessment: Noise. As noted below, the dAAIR should indicate that relevant health based indicators will be used to assess effects to the Human Health VC.	Health based indicators to screen noise related effects were used in the SLHHRA. Tervita does not intend to change or add key indicators in the VCs or dAAIR at this time.	N/A	5-Sep-18
NH-63b	31-Oct-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 5)		Thank you, NH is satisfied with this response.	Tervita looks forward to working with Northern Health on the Application.	N/A	1-Nov-18
NH-64	19-Apr-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 1)	General (and in Proponent's response to comment NH-61)	*“Tervita takes into account that more sensitive receptors may be present and they will be considered when Tervita is drafting the methodology for the assessment in the dAAIR and the effects assessment in the Amendment Application.”* (As per the Proponent's response to comment NH-61) Please clarify how the locations of sensitive receptors have been considered in drafting the methodology for assessment in the dAAIR? For example, the LAAs for surface and ground water are limited to a 500 m radius from the site. This area may represent the area with the highest COPC concentrations. However, drinking water intakes may be outside that area and may represent the locations where receptors are a greater risk of exposure. These locations should therefore also be captured in the LAA.	There are no proposed changes to the LAA boundaries at this time. The locations of sensitive receptors will be considered on a case by case basis depending on the potential for, and severity of, Project interactions with that receptor. Receptors identified beyond the specific LAA with the potential to be adversely affected by the Project will be included in the assessment, either through an adjustment to the LAA boundary (see NH-62), or by expanding the assessment area to the RAA.		
NH-65	19-Apr-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 1)	dAAIR 4.1.1.1 Spatial Boundaries (Terrain and Soils)	The LAA for terrain and soils is defined as the Project Footprint. However, the Soil Sampling study conducted August 2016 suggested potential off-site soil contamination associated with surface water discharge and dust deposition. Accordingly the LAA for soils should be expanded to capture these potential effects. It should be recognized that although COPC concentrations may be expected to be lower outside the project footprint, there may be a greater risk of exposure due to the presence of receptors, greater exposure durations, etc.	There are no proposed changes to the LAA boundaries at this time. Potential effects on soils that extend beyond the Project Footprint will be encompassed under the RAA, which is a 1 km radius extending from the Project Footprint.		

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-65a	15-Aug-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 4)	dAAIR 4.1.1.1 Spatial Boundaries (Terrain and Soils)	We stand by our original comment and continue to feel the LAA for soils should be expanded beyond the project footprint to capture direct effects associated with the Project as identified in the Soil Sampling Study (as a result of surface water discharge and dust deposition)	Tervita does not intend to expand the LAA for soils at this time.		
NH-65b	31-Oct-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 5)		Outstanding.	In order to address these concerns, Tervita has added the following information under Section 3.2.1 of the dAAIR:"It is standard practice for information gathered during each VC study and effects assessment to inform the zone of influence. If information is produced that indicates the zone of influence should be adjusted, it has the potential to change the study area boundaries."		
NH-66	19-Apr-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 1)	dAAIR 4.2 Air Quality	As per the Proponent's response to Comment NH-5a, we understand that PM2.5 emissions will be assessed. We recommend that this be clearly indicated in the AAIR. We recommend that PM10 be assessed as well, particularly given that PM emissions will include combustion and dust sources, which would include both the finer (PM2.5) as well as coarser fractions (PM10). While we are aware that PM2.5 is associated with a greater burden of disease, exposure to PM2.5-10 (particles greater than or equal to 2.5 um and less than or equal 10 um in diameter) has been shown to be associated with health effects, including increased cardiovascular and respiratory morbidity and mortality (EPA Integrated Science Assessment for Particulate Matter, 2009).	Wording in the dAAIR will be changed to clarify that PM2.5 emissions will be assessed. Tervita notes Northern Health's recommendation regarding PM10, but at this point PM 2.5 emissions are only being assessed.		
NH-66a	15-Aug-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 4)	dAAIR 4.2 Air Quality	Thank you. Please clarify where this can be found in the updated dAAIR, as the reviewer could not locate this wording in Revision 4. Please also note that a detailed rationale for the exclusion of any contaminants of potential concern (PM10) will be required in the Human Health Effects Assessment.	Tervita apologizes for the oversight and will include the methods of data collection to 4.2 to the next version of the dAAIR.		
NH-66b	31-Oct-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 5)		Please clarify on which page this is captured. This comment is outstanding; we continue to recommend that PM10 is assessed as well if dust is a main emission source.	Changes have been made to the third bullet in the dAAIR in Section 4.2 to now read: • Ambient air concentrations of particulate matter (PM10), nitrogen oxides (NOx), and other landfill gases;		
NH-66c	23-Nov-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 5)		The only issue we've identified as outstanding is we'd like to see both PM2.5 and PM10 assessed (not just PM10 as indicated in response to NH-66b. We appreciate the inclusion of PM10, but given that health effects assocaited with both finer and coarser fractions of particulate, we feel it will be important that both are considered.	Changes have been made to the third bullet in the dAAIR in Section 4.2 to now read: "Ambient air concentrations of particulate matter (PM10 and PM2.5), nitrogen oxides (NOx), and other landfill gases;		

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-67	19-Apr-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 1)	dAAIR 8.1 Human Health	*"The KIs that will be used to measure the potential adverse effects of the proposed Project on the Human Health VC include:* • Indicators under the Terrain and Soils, Air Quality, Acoustic Environment, Vegetation, Fish and Fish Habitat, Wildlife and Wildlife Habitat and Surface Water VCs as applicable;" • Please ensure health-based indicators and guidelines are used for the purposes of the health assessment. Should a detailed quantitative HHRA be required, KIs should include Hazard Quotients (HQs) and Incremental Lifetime Cancer Risk (ILCR).	In the HHRA, assessment identification of Contaminants of Potential Concern (COPCs) were looked at in the following receptors: surface water, groundwater, soil, country foods, air, noise and naturally occurring radioactive material. If COPCs were identified, relevant health based indicators will be used to assess their effect on human health.		
NH-68	19-Apr-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 1)	dAAIR 8.1.2 Existing Conditions	*"Interpretation and analysis of results obtained by air quality, noise, and water quality specialists as they relate to human health."* Please ensure that sampling protocols for environmental data intended to feed into the HHRA adhere to health-based guidance for sampling programs (e.g. Health Canada Federal Contaminated Site Risk Assessment in Canada guidance for HHRAs), which may be quite different from sampling methodologies for assessing environmental VCs.	Sampling already done adheres to the BC Field Sampling Manual and BC Laboratory Manual. Sampling done was to identify environmental concerns, but the data can still be reviewed to identify COPCs and potential human health impacts.		
NH-68a	15-Aug-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 4)	dAAIR 8.1.2 Existing Conditions	Thank you. Please note that data and statistics used for the health assessment will need to align with health-based guidance. This should be clearly captured in the dAAIR.	The methods of data collection listed in 8.1.2 has references for Health Based Guidance that will be used in the dAAIR.		
NH-68b	31-Oct-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 5)		Thank you, NH is satisfied with this response.	Tervita looks forward to working with Northern Health on the Application.		
NH-69	19-Apr-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 1)	dAAIR 8.1.2 Existing Conditions (and Proponent's response to comment NH-16)	*"The description of baseline conditions in the Application will include potential receptors, nearby water sources and historic usage of land."* (As per the Proponent's response to comment NH-16) The methods of data collection to characterize existing conditions are summarized in S. 8.1.2. As per the Proponent's response to NH-16, this should also include data collection to characterize potential receptors, nearby water sources and historic usage of land.	Tervita will add these methods of data collection to Section 8.1.2		
NH-69a	15-Aug-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 4)		The reviewer could not locate this change in section 8.1.2 of version 4 of the dAAIR. Please clarify.	Tervita apologizes for the oversight and will include the methods of data collection to 8.1.2 to the next version of the dAAIR.		
NH-69b	31-Oct-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 5)		Thank you, please clarify on which page this is captured.	The following bullet has been added to 8.1.2: • Description potential receptors, nearby water sources and historic usage of land		

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-70	19-Apr-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 1)	dAAIR 8.1.2 Existing Conditions	We appreciate the inclusion of a Screening Level Human Health Risk Assessment (SLHHRA) approach. However, depending on the results of the SLHHRA (i.e. whether operable exposure pathways are identified, screening criteria are exceeded, etc.), a detailed quantitative HHRA may be necessary to understand health effects associated with the Project. This should be clearly indicated in the AAIR.	Once the results of the SLHHRA are shared to the working group and feedback is received, Tervita will make a determination on whether a detailed quantitative HHRA will done.		
NH-70a	15-Aug-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 4)		The need for a detailed HHRA cannot be ruled out at this stage in the EA. We appreciate the early opportunity to review the SLHHRA; however, a fulsome review of the screening level HHRA will be required, likely with several rounds of comments and information requests (depending on the quality of the SLHHRA), to confirm that a detailed HHRA is not required. Please update the dAAIR to indicate that a detailed HHRA will be conducted if deemed necessary based on the screening level HHRA.	The Screening Level Human Health Risk Assessment (SLHHRA) was conducted to provide a conservative evaluation of potential risks to human health associated with the proposed Silverberry Secure Landfill Expansion (the Facility). The SLHHRA evaluated chemical concentrations in applicable environmental media (i.e., soil, groundwater, leachate, and surface water) and compared analytical data against the applicable BC CSR Standards (BC MOE, 1996). The BC CSR Standards are derived using conservative exposure assumptions to be sufficiently protective of the general public within each land use category. Air, noise and naturally occurring radioactive materials (NORMs) have also been evaluated in the SLHHRA using applicable BC and Health Canada criteria. To identify contaminants of potential concern (COPCs), the SLHHRA compared the maximum measured concentration or highest detection limit (if greater than the maximum measured value) of chemical parameters against the most stringent BC CSR Standard for each environmental media to provide the most conservative approach to characterize on-site conditions. The risk assessment paradigm specifies that for a risk of adverse effects to human health to be plausible, three components are required to be present: a stressor (e.g., COPC in environmental media) at a concentration or magnitude that can present a hazard; an exposure pathway for the stressor to contact the receptor; and, a human receptor. The SLHHRA qualitatively evaluated the level of risk by considering potential receptor of concern (i.e., workers, land users, First Nations), the potential hazard of COPCs in an environmental media and the level of exposure. Finally, the SLHHRA considered occupational health and safety requirements and risk management measures currently in place at the Facility that will mitigate risks of adverse effects to human health. The conclusions of the SLHHRA is likely to be consistent with the conclusions of a quantitative human health risk assessment. Therefore, a quantitative human health risk assessment is not warranted at this time.		
NH-70b	31-Oct	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 5)		Please see NH-71b below. As per our previous comment, a detailed review of the SLHHRA by the working group will be required before it can be confirmed that a quantitative HHRA is not required. We continue to stand by our initial comment and advise that the AAIR be updated to indicate that a quantitative HHRA will be conducted if necessary.	Tervita will be able to send the SLHHRA to NH for review so we can collaboratively determine if an HHRA is required for the Application.		

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-71	19-Apr-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 1)	dAAIR 8.1.3 Potential Effects	This section should indicate how potential effects to human health will be assessed and estimated. As per the Proponent's response to comment NH-29, we understand that "the potential effects of the current facility are only one factor that will feed into the determination of potential effects of the capacity replacement". What other methodology is proposed for assessing potential effects to human health? As per previous correspondence with the Proponent (in response to comments NH-17 and NH-28), we understood that the methodology for assessing potential effects would be captured in the dAAIR. Currently, a Human Health Risk Assessment approach is only proposed for existing conditions, presumably based on the assumption that effects associated with the expansion would be similar to current effects. However, for certain pathways, effects might be additive (e.g. effects to soil quality as a result of dust deposition). A detailed rationale would be required that this approach allows a conservative estimation of health effects through all pathways. We feel that at this early stage in the process, the need for a detailed assessment of predicted conditions cannot be ruled out; the AAIR should indicate that an HHRA of future conditions will be conducted if determined to be necessary to understand Project-related health effects.	Once the results of the SLHHRA are shared to the working group and feedback is received, Tervita will make a determination on whether a detailed quantitative HHRA will done.		
NH-71a	15-Aug-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 4)	dAAIR 8.1.3 Potential Effects	We stand by our original comment; a scientifically defensible rationale will need to be provided that future impacts will be the same as existing impacts before this can be ruled out. For example, evidence is required that existing and predicted impacts to soil as a result of dust deposition and surface water discharge would not be additive. A Human Health Risk Assessment of predicted conditions associated with project activities will need to be conducted if determined to be necessary to understand health effects. Please update the dAAIR to ensure this is reflected (i.e. A Human Health Risk Assessment of future conditions will be conducted if deemed necessary to characterize health effects associated with the Project). As noted above, a fulsome review of the screening level HHRA will be required, likely with several rounds of comments and information requests (depending on the quality of the SLHHRA), before it can be confirmed that a detailed HHRA is not required. The dAAIR continues to be vague and lack detail on assessment methodology. Please note that if methodological concerns are identified during Application screening/review this could cause significant delays, detailed information requests and make it difficult to meet the 180 day review period.	Tervita appreciates Northern Health's concerns. Tervita will work with Northern Health to address concerns on the SLHHRA before determining whether an HHRA will be required.		
NH-71b	31-Oct-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 5)		Thank you, we are pleased with this response. We would prefer that this be captured in the AAIR (i.e. that not only an SLHHRA will be completed but also a detailed quantitative HHRA if determined necessary to characterize health effects). Currently section 8.1.2 indicates that only a screening level HHRA will be completed.	The following comment has been added to 8.1.2. "An HHRA report if deemed required after review of the SLHHRA."		

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
NH-72	19-Apr-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 1)	General	Please note that we expect that the HHRA is conducted by a professional with training/experience/qualifications in health risk assessment, recognizing that health assessment principles and methodologies can be very different from those used to assess environmental effects.	The HHRA will be conducted by an experienced HHRA professional(s)		
NH-72a	15-Aug-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 4)		Thank you. We ask that the HHRA and/or Human Health Effects Assessment includes a professional statement indicating the risk assessor's qualifications and experience in conducting HHRAs relevant to the purposes of supporting an EA.	Tervita can add a statement of qualifications to the SLHHRA.		
NH-72b	31-Oct-18	Melissa Aalhus	Northern Health	Human Health	draft Amendment Application Information Requirements document (version 5)		Thank you, we are pleased with this response.	Tervita looks forward to working with Northern Health on the Application.		
FLNRO-1	8-Jan-16	Mike D'Aloia	Forestry Land and Natural Resource Operations	Groundwater	Draft Valued Components Document		Surface Water - new water legislation requires ground water works to be authorized by the FLNRO. Ground water wells and monitoring may require water authorizations. Water Sustainability Act. Ground water Monitoring - Contact Yin Jun at the Omnica Region - Ground water specialist	Tervita will review the Water Sustainability Act and contact Yin Jun to determine if the existing groundwater monitoring network requires authorization. Tervita would like to note that the Ministry of Environment will review the groundwater monitoring network during the Waste Discharge Permit Amendment for Silverberry Landfill.	N/A	23-Jan-16
FLNRO-2	8-Jan-16	Mike D'Aloia	Forestry Land and Natural Resource Operations	Terrestrial Vegetation	Draft Valued Components Document		Terrestrial Vegetation - VC should address plant species at risk and first nation culturally important species and potential for transplant for rare and important species found.	Comment acknowledged. The 'plant species of concern' subcomponent will address plant species at risk and First Nation culturally important species. Mitigation procedures to rare and First Nation culturally important plant species will be addressed in the application.	N/A	23-Jan-16
FLNRO-3	8-Jan-16	Mike D'Aloia	Forestry Land and Natural Resource Operations	Surface Water	Draft Valued Components Document		Surface water - analysis of discharge of storm water + contaminated water will need to be developed - a plan on disposal of water and emergency overflow (flood event)	Due to the existing landfill in operation Tervita has developed plans to analyze, control and discharge storm water. Details of surface water controls will be provided in the application.	N/A	23-Jan-16
FLNRO-4	8-Jan-16	Mike D'Aloia	Forestry Land and Natural Resource Operations	Fish and Fish Habitat	Draft Valued Components Document		Fish and Fish Habitat - note that drainages may be regulated under the Water Act and WSA if they meet the definition of a stream regardless of fish presence or value; therefore, proponent needs to ensure drainages are not streams as defined under water legislation.	Comment acknowledged. Tervita will review the WSA and Water Act and address applicable mitigation measures in the application.	N/A	23-Jan-16
FLNRO-5	8-Jan-16	Mike D'Aloia	Forestry Land and Natural Resource Operations	Surface Water	Draft Valued Components Document		Surface water - land ownership - although a stream is found on private land - the water and stream/bed channel is vested property to the crown; therefore, if a stream does not appear on a desktop exercise, a drainage having stream characteristics whether flowing or not any time of the year can be a regulated stream under water legislation. Proponent should ensure surface water surveys address stream classification in the field to meet legislative standards.	Comment acknowledged. Tervita will review applicable legislation to ensure surface water is classified properly.	N/A	23-Jan-16
FLNRO-6	8-Jan-16	Mike D'Aloia	Forestry Land and Natural Resource Operations	Groundwater	Draft Valued Components Document		Ground water - should references to existing monitoring well information be included in methods of data collection and assessment and monitoring plan.	Existing well information will be provided in the monitoring plan which will be detailed in the application.	N/A	23-Jan-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
PRRD-1	7-Jan-16	Paulo Eichelberger	Peace River Regional District	Groundwater	Draft Valued Components Document		I noted that groundwater is not marked off as a candidate VC. Please clarify whether the construction of the expansion goes below ground for the first cells and if so, is it deep enough to interact with groundwater.	Groundwater is identified as a Candidate VC. The new cells will be built below grade and shallow groundwater is present at site. In 2002 the Ministry of Environment granted Tervita an exemption to the Special Waste Regulation because "…the natural geology and designs exceed the minimum requirements of the Special Waste Regulation with respect to groundwater protection." Tervita will continue to work with the Ministry of Environment to ensure the landfill design minimizes risk to groundwater. (Please note that the Special Waste Regulation has now been replaced by the Hazardous Waste Regulation)	N/A	23-Jan-16
PRRD-2	7-Jan-16	Paulo Eichelberger	Peace River Regional District	Surface Water	Draft Valued Components Document		Is the surface water retention pond sized adequately to accommodate potential increased loading from seasonal run-off emitted from the new footprint and prevent risk of overflow? Should a KI for a retention volume be included here?	Tervita will meet the requirements of the Hazardous Waste Regulations for Secure Landfills. Section 27(5) states: "The owner of a secure landfill must design, construct and maintain a) a system capable of preventing water from draining onto any cells of the secure landfill, and b) a system to collect and control water draining from any cells of the secure landfill during a storm with a magnitude that is exceeded, on average, only once in 25 years. A KI for retention volume is not considered necessary at this time.	N/A	23-Jan-16
PRRD-3	7-Jan-16	Paulo Eichelberger	Peace River Regional District	Groundwater	Draft Valued Components Document		For reference documents, has BC CSR Technical Guidance Document #6 (2010) been taken into account for water well and water body searches in the BC Water Resources Atlas? This is specific to any aquifer that may be within 500 metres of a site, such as the planned expansion area and focuses on whether or not the water quality of the aquifer could be affected.	Relevant technical baseline information and guidance documents will be in the application.	N/A	23-Jan-16
PRRD-4	7-Jan-16	Paulo Eichelberger	Peace River Regional District	Terrestrial Vegetation	Draft Valued Components Document		Under rationale, recommend an additional point. When ground has been disturbed (during construction) and left exposed for a period of time, there is a high risk of occurrence of noxious weeds. To seed the perimeter, and limit this risk, here is the link for the Peace Forage Association Website & Seeding Tool, used by re-seeding contractors in the PRRD: • Peace Forage Association http://www.peaceforage.bc.ca/ • Seeding Tool http://www.peaceforagetool.ca/ For questions regarding this tool, contact the PRRD invasive Plants Department @ 250-784-3200	Tervita clarifies the point in Table 2 , Terrestrial Vegetation, Rationale, that noxious weeds may occur in disturbed construction soil. Tervita re-seeds all soil stockpiles and new berms to prevent noxious weeds, erosion and soil loss after construction. The Peace Forage Association Website & Seeding Tool will be passed onto Tervita's construction contractor.	N/A	23-Jan-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
PRRD-5	7-Jan-16	Paulo Eichelberger	Peace River Regional District	Community Infrastructure	Draft Valued Components Document		During the construction phase, will there be any need by Tervita to send waste from construction activities to the North Peace Regional Landfill (construction/demo waste) or the Charlie Lake Sewer Facility (domestic sewage)? I did not see this addressed as a key indicator under the health pillar nor an excluded point under Section 4.2. Further, it is assumed that any excavated soils from the construction of the new expansion will be kept onsite for operational cover.	Construction waste will be sent to the existing Silverberry Secure Landfill. Sewage will be continued to be hauled by a subcontractor to Charlie Lake Sewer Facility.	N/A	23-Jan-16
PRRD-6	7-Jan-16	Paulo Eichelberger	Peace River Regional District	Community Infrastructure	Draft Valued Components Document		Under Community Infrastructure, I note that surrounding municipalities are being consulted. Will there be additional notices, signage posted, radio ads etc. during the construction to make those traveling back and forth on Beaton Airport Rd. aware?	As part of the consultation process of this application, Tervita will be consulting local residents, posting ads, open houses etc. Depending on resident concern and feedback Tervita will consider posting notice during construction. Mitigation will be addressed in the application.	N/A	23-Jan-16
PRRD-7	7-Jan-16	Paulo Eichelberger	Peace River Regional District	Terrestrial Vegetation	Draft Valued Components Document		Regarding Plant Species of Concern/Invasive Plant species, recommend consulting the Invasive Plants Dept. at PRRD (250-784-3200). The department receives updates on plant species of concern annually and has additional up-to-date knowledge of the area through its weed contractors as to which plants to watch out for.	Comment acknowledged. Mitigation will be addressed in the application.	N/A	23-Jan-16
PRRD-8	7-Jan-16	Paulo Eichelberger	Peace River Regional District	Air Quality	Draft Valued Components Document		A general question - what size PM dust contaminants are monitored in the air monitoring program during construction and operation?	If an air monitoring program is required PM2.5 would be the focus. Emissions from site will largely be from internal (diesel) combustion engines. According to BC Air Quality - Pollutant Vehicles Emit, Nitrogen Oxides (NOx) and Fine Particulate Matter (PM2.5) are found in larger amounts in emissions from diesel engines than gasoline engines. Most of the combustion at site will be associated with the diesel engines of Silverberry's heavy equipment.	N/A	23-Jan-16
PRRD-9	7-Jan-16	Paulo Eichelberger	Peace River Regional District	N/A	Draft Valued Components Document		Just a comment, I do not see any issues with the Study Areas. The buffers seem quite adequate, tight to the footprint of the project area and encompassing a significant area.	Tervita appreciates the positive feedback and looks forward to a continuing relationship with the Peace River Regional District.	N/A	23-Jan-16
PRRD-10	25-Feb-16	Paulo Eichelberger	Peace River Regional District	Community Infrastructure	Draft Valued Components Document		In communicating with Area C Director, we would like to echo the concerns raised by Blueberry FN under the “Community Infrastructure” regarding the status of the road in front of the facility. The PRRD sees that there are issues not only with rock damage to windshields but also dirt tracked from the site onto the Beatton River Airport Rd. I believe it was asked during the working group meeting but can Tervita provide more clarity around how they perform road maintenance to prevent the tracking of the dirt/foreign material onto the public road?	All trucks leaving the landfill site must try and clear tires and tire wells of as much mud as possible. Tervita checks the roadway daily for tracking of dirt on to Beatton River Airport Rd. During wet conditions a skid steer is used to blade off any mud on the public roadway and brings it back to the landfill. When its dry out the skid steer has a sweeper bucket attachment to sweep any gravel and mud from the roadway. There is also an exit grid in place at Silverberry Landfill that trucks must drive over to remove excess mud from tires. Swamp/rig mats are also used in the landfill cells during wet conditions. Due to public concerns Tervita is looking at other mechanisms to prevent tracking on to public roadways. Tracking of dirt will be captured under the Transportation Infrastructure Disturbance key indicator in the Amendment Application.	N/A	15-Mar-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
PRRD-11	7-Mar-16	Paulo Eichelberger	Peace River Regional District	Terrain and Soils	Draft Valued Components Document		Regarding soil sampling, while they have a sample regimen stated in one of their documents, it's unclear how often they would be sampling (whether it's monthly, annually, case-by-case, etc.). Can we get that clarification?	The soil sampling program is planned to be a one time only study to determine if existing operations have impacted the surrounding soils.	N/A	15-Mar-16
PRRD-12	15-Nov-16	Paulo Eichelberger	Peace River Regional District	Air Quality	Air Study		The proponent performed the study as outlined in the tracking log: prelim then follow-up sampling. With the exception of benzene in one sample, the results were well below the limits applicable. Rationale for non-detect samples is clear as well.	Thanks for the time to comment on the air study results. Tervita appreciates the feedback from Peace River Regional District.	N/A	13-Dec-16
PRRD-13	15-Nov-16	Paulo Eichelberger	Peace River Regional District	Air Quality	Air Study		In the conclusion, we note the rationale that samples will be stronger in concentration directly on the landfill rather than off of it, due to dispersion via wind. This makes sense. However, it is not clear how the last statement of the conclusion that "Based on the results…additional monitoring is not required" can be made based on one sample shot in time. As the landfill develops over time, there should be some form of continuous monitoring, which should be covered off in the recommended valued components under air quality. If this can be clarified, there should be no issue.	The Hazardous Waste Regulation doesn't stipulate conditions or guidelines on air/ landfill gas monitoring at Secure Landfills. Ongoing monitoring requirements will be discussed in the Draft Amendment Application Information Requirements (dAAIR). The draft Valued Components will also be edited to include VOCs as an indicator of air quality.	N/A	13-Dec-16
PRRD-14	15-Nov-16	Paulo Eichelberger	Peace River Regional District	Air Quality	Air Study		General question to the Ministry of Environment: what is typically used as an air quality standard in these cases? The proponent states that BC has no applicable ambient air criteria for any of the VOC's in the specified method used for sampling.	Please reference the Ministry of Environments response on December 1st 2016.	N/A	13-Dec-16
PRRD-15	26-May-17	Paulo Eichelberger	Peace River Regional District	Surface Water	Draft Valued Components Document		Boundaries of study expanded to include the ephemeral drainage area in the Northwest corner of the site, this should satisfy a lot of the concerns with respect to risk of degrading soil quality in that area. We are pleased to see that this has been added.	Thanks for taking the time to comment on the draft Valued Components. Tervita appreciates the feedback from Peace River Regional District.	N/A	12-Jun-16
PRRD-16	26-May-17	Paulo Eichelberger	Peace River Regional District	Air Quality	Draft Valued Components Document		Road dust mitigation is adequately recognized under the air quality VC. Air quality mitigation will be of tremendous aid to area traffic regularly passing the site.	Thanks for taking the time to comment on the draft Valued Components. To help enhance the reduction in dust, Tervita will be paving the access road to the scale house in the summer of 2017.	N/A	12-Jun-16
PRRD-17	26-May-17	Paulo Eichelberger	Peace River Regional District	Terrestrial Vegetation	Draft Valued Components Document		We note an emphasis on data gathering in the Terrestrial Vegetation VC with respect to spread of invasive plant species, which is excellent. It will be important for Tervita to mitigate any possible impacts with the washing of equipment, as indicated in the document. Treatment and monitoring should be considered on any area of the landfill where the ground is disturbed then left for a period of time during the continued operation of the site.	Currently, construction equipment has to be steamed/washed prior to mobilizing and demobilizing from site to control the spread of noxious weeds. This practice will continue. After soil stockpiles are seeded they will be monitored and noxious weeds controlled as needed. Mitigation measures will be detailed in the Amendment Application.	N/A	12-Jun-16
PRRD-17.1	10-Apr-18	Paulo Eichelberger	Peace River Regional District	Terrestrial Vegetation	Draft Valued Components Document		We are satisfied as per comment PRRD-4.1. No further comment.	Tervita thanks the PRRD for taking the time to review the dAAIR document.	N/A	16-Apr-18

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
PRRD-18	10-Apr-18	Paulo Eichelberger	Peace River Regional District	Health Hazard Risk Assessment	Tervita_SLRA_Memo		The SLRA methodology outlined seems to assign metrics as well as provide a step-by-step process for performing the assessment qualitatively and quantitatively. Our takeaway is that the idea behind identifying possible exposure pathways will help decide the level of risk and therefore help inform recommendations to address specific health hazards. This methodology makes sense provided that it the results clearly describe what, if any, risks there are and what the recommendations are to mitigate those risks. We look forward to seeing the resulting HHRA document.	Tervita will be circulating the draft HHRA for comment very soon and looks forward to the PRRD's comments.	N/A	16-Apr-18
MOE-1	18-Jan-16	Patrick Williston	Ministry of Environment	Surface Water	Draft Valued Components Document		This section should include a brief description of the proposed leachate treatment system, the locations of discharge, and the parameters of concern in the discharged effluent, including radioactivity.	Comment acknowledged. Leachate characteristics, disposal, etc. will be discussed in the application.	N/A	23-Jan-16
MOE-1a	10-Feb-16	Patrick Williston	Ministry of Environment	Surface Water	Draft Valued Components Document		1a. (leachate characterization and treatment)--MOE requests long-term data showing seasonal variability of leachate chemistry and volume. The data should include mean, median, max, min, and 95th percentiles of leachate chemistry and addition to volume summary statistics. In short, a complete characterization is expected based upon the currently produced leachate. 1b. This same characterization is requested for the storm water discharge effluent.	Comment acknowledged. Tervita feels an in-depth leachate and surface water analysis is more pertinent to Tervita's upcoming EMA permit amendment. Tervita suggests a meeting between the MoE and our internal hydrogeologists to determine what data will be needed to satisfy this request so its ready for the EMA Permit amendment.	N/A	3-Mar-16
MOE-2	18-Jan-16	Patrick Williston	Ministry of Environment	N/A	Draft Valued Components Document		In the last paragraph of this section there is a reference to the PAC. This is also repeated in Section 5. I recommend up-dating the terminology used in this VC document to reflect the current process.	Tervita will confirm with the EAO on preferred wording.	N/A	23-Jan-16
MOE-3	18-Jan-16	Patrick Williston	Ministry of Environment	N/A	Draft Valued Components Document		This section (Section 3) includes conflicting statements - it states that the VCs were based upon the 2002 PAC assessment and then suggests that this reflects Tervita's current understanding of what is important to First Nations, the public, and government agencies. It is not clear from this methodology whether recent (within the last two years) and relevant First Nations, public, and agency input was solicited to inform the list of candidate VCs relating to this 2016 certificate amendment application. Tervita's extensive experience operating secure landfills is a benefit in refining VCs, but it does not replace independent review by individuals and organizations that may have more extensive knowledge and understanding of regional sensitivities.	Tervita has had an on-going relationship with many First Nations and government agencies through the operation of Silverberry Landfill. Through the comment period on the draft VCs and the amendment process, Tervita will be able to work with First Nations, agencies and the public to understand and address regional sensitivities.	N/A	23-Jan-16
MOE-4	18-Jan-16	Patrick Williston	Ministry of Environment	Surface Water	Draft Valued Components Document		How were the Important Features in the Project area identified? How were priorities of local, provincial or federal governments, First Nations, or the public determined (3rd bullet in Step 3)? Why was the creek to the west of the project area omitted as an Important Feature?	Through the comment periods of the application process Tervita will be able to determine the priorities of local, provincial and federal government, First Nations and the public. Nearby creeks that may be impacted are an Important Feature. Surface water is a proposed VC.	N/A	23-Jan-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MOE-5	18-Jan-16	Patrick Williston	Ministry of Environment	Surface Water	Draft Valued Components Document		The surface water streams to the north and west of the Tervita property should be included in the assessment of potential impacts to surface waters. The topography of the site slopes to the northwest, indicating that these streams are the closest surface waters to the facility. Water quality data, representing high flows and low flows and showing seasonal variation, is recommended for these two streams. These two streams are inexplicably omitted from Figure 2 - the figure should be corrected to show them.	Figure 2 represents the LSA and RSA boundaries and surface water bodies shown are to give reference to those boundaries. Surface water streams to the north and west will be included in the assessment of potential impacts to surface waters.	N/A	23-Jan-16
MOE-6	18-Jan-16	Patrick Williston	Ministry of Environment	Groundwater	Draft Valued Components Document		The list of ground water quality parameters is incomplete and should be corrected. Furthermore, an analysis of risks posed by an exceptionally high or seasonally high water table should be completed. Details about the direction of flow and flow rate of the groundwater are recommended.	The water quality parameters in Table 2 are an example of what may be analyzed. Full details of parameters and the groundwater monitoring program will be discussed in the application. Risks of a high groundwater table will also be taken in for consideration and discussed in the application.	N/A	23-Jan-16
MOE-7	18-Jan-16	Patrick Williston	Ministry of Environment	Human Health	Draft Valued Components Document		The statement that "NORM waste has a low potential to affect human health" should not be made in advance of a radiological risk assessment. NORMs are recognized by the Canadian Association of Petroleum Producers (CAPP) as having both long-term and short-term human health effects. Exposure to NORMs is one of the key risks associated with this project and a thorough radiological risk assessment that includes appropriate public and First Nations consultation will be necessary.	Due to the engineering controls and the on-going monitoring as part of the Radiation Protection Plan (RPP) present at site, there is data to make these assertions. NORMS will be assessed under the Health pillar and details on NORM monitoring and health and safety programs will be discussed in the application.	N/A	23-Jan-16
MOE-8	18-Jan-16	Patrick Williston	Ministry of Environment	Air Quality	Draft Valued Components Document		What data can be presented to support the assertion that the site does not produce uncontrolled releases of methane?	Data regarding air monitoring and landfill gas generation will be discussed in the application.	N/A	23-Jan-16
MOE-9	18-Jan-16	Patrick Williston	Ministry of Environment	Air Quality	Draft Valued Components Document		MOE requests data from ambient air quality monitoring to demonstrate that the landfill is not producing potentially harmful concentrations of methane or other landfill gasses. If this monitoring is not presently occurring, it should commence immediately to provide the supporting data for the EA Application.	Comment acknowledged. Tervita has given an air study scope to the EAO for circulation to Working Group members. Tervita looks forward to Working Group member comments on the study scope.	N/A	23-Jan-16
MOE-10	18-Jan-16	Patrick Williston	Ministry of Environment	Terrain and Soils	Draft Valued Components Document		What soil sampling will be collected to support the assessment of soils? Where will soil chemistry be sampled and analyzed? What is the soil quality at the existing effluent discharge location and in soils that are downwind of the facility?	There was a siting investigation done before the original landfill was built. The original geology of the area will not have changed. However, Tervita is supplementing the original siting investigation with some further analysis of the expansion area. Soil chemistry, quality etc. will be assessed in the field and discussed in the application.	N/A	23-Jan-16
MOE-11	18-Jan-16	Patrick Williston	Ministry of Environment	Terrain and Soils	Draft Valued Components Document		9a. (soil sampling)--MOE requests soil chemistry sampling downgradient to determine if storm water effluent discharge has impacted soil quality. 9b. Representative soil chemistry should also be presented from sampling locations downwind of the landfill to evaluate the efficacy of current dust suppression mitigation for preventing contamination of regional soils. Representative windrose data is recommended to support the selection of soil sampling locations. Soil samples should be tested for NORMs. A qualified professional should be engaged to design and implement the soil sampling program to ensure that it is scientifically defensible.	Comment acknowledged. Tervita has given soil study scope to the EAO for circulation to Working Group members. Tervita looks forward to Working Group member comments on the study scope.	N/A	23-Jan-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MOE-12	18-Jan-16	Patrick Williston	Ministry of Environment	Air Quality	Draft Valued Components Document		What information is gathered through ongoing monitoring and data collection efforts? What ambient air quality monitoring occurs on-site?	Monitoring (including air) will be discussed in the application.	N/A	23-Jan-16
MOE-12a	10-Feb-16	Patrick Williston	Ministry of Environment	Air Quality	Draft Valued Components Document		MOE requests a summary of the ambient air quality program (what is being monitored, how frequently, and analysis of trends). It is necessary to describe the current ambient air quality on site and review historic trends. If an ambient air quality program is not in place, MOE requests a program to be implemented by a qualified professional to the satisfaction of MOE. The assessment will require site specific monitoring data to demonstrate that current practices are protective of human health and the environment.	Air monitoring for NORM occurs bi-annually and recent results and the air monitoring program design will be summarized in the application. After the results of the air quality scope being circulated are completed further discussion on air monitoring can be had with the MoE during the EMA permit amendment.	N/A	3-Mar-16
MOE-13	18-Jan-16	Patrick Williston	Ministry of Environment	Human Health	Draft Valued Components Document		List all parameters that will be measured to assess this component, where, and how frequently. Will the existing water treatment system be used to support the expanded landfill? What is the predicted increase in leachate production? Where is the treated effluent discharged?	Leachate is currently deep welled at approved facilities. Leachate quality, treatment, production etc. will be discussed in the application.	N/A	23-Jan-16
MOE-14	18-Jan-16	Patrick Williston	Ministry of Environment	Groundwater	Draft Valued Components Document		Explain what parameters are measured, where, and how frequently. The regional groundwater flows northwest. What is the rate? What is the predicted fate of leachate should a liner breach occur during high and low groundwater seasons?	Groundwater monitoring will be discussed in detail in the application. A leak detection system is also in place to ensure landfill integrity is maintained.	N/A	23-Jan-16
MOE-14a	10-Feb-16	Patrick Williston	Ministry of Environment	Groundwater	Draft Valued Components Document		What would be the fate of leachate in the event of a liner breach? What direction/path is the groundwater flow pattern and what is the rate of groundwater movement? How long would it take to reach the nearest receptors? MOE requests that these concerns be addressed in the groundwater section of the application.	In the event of a liner breach the leachate is still contained by the compact clay liner and driven towards the leachate collection. The shallow groundwater flows to the Northwest. The horizontal groundwater velocity beneath the site is estimated to be less than 0.3m/year in 2014. Potential receptors and potential accidents and malfunctions will be discussed in the application.	N/A	3-Mar-16
MOE-15	18-Jan-16	Patrick Williston	Ministry of Environment	Terrestrial Vegetation	Draft Valued Components Document		What data collection has been completed to date to determine if the vegetation in the receiving environment has been exposed to contaminants during existing operations?	Surface water is tested before being released to the environment. Stressed vegetation around the landfill will be noted by Operations and measures taken to investigate the source.	N/A	23-Jan-16
MOE-15a	10-Feb-16	Patrick Williston	Ministry of Environment	Terrestrial Vegetation	Draft Valued Components Document		MOE requests vegetation tissue sampling downwind from the landfill to evaluate the efficacy of existing mitigation for preventing the contamination of vegetation off-site. A qualified professional should be engaged to design and implement the vegetation tissue sampling program to ensure that it is scientifically defensible.	Tervita has committed to completing soil sampling at the surface water Discharge Area and in the Project Area adjacent to the existing landfill to determine if contamination is present. If contamination is discovered, mitigation will be implemented to reduce the risk that contaminants will reach receptors. In addition, Tervita has committed to conducting air quality monitoring to determine if emissions are being produced by the landfill, and naturally occurring radioactive materials (NORMs) are monitored twice a year to determine if atmospheric levels are within regulatory standards. Since the possible pathways for contamination are being studied, it would be duplicative to sample vegetation tissue to determine if contamination is being spread through air, water or soil. Therefore, Tervita is not proposing a tissue sampling program at this time.	N/A	3-Mar-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MOE-15b	29-Aug-18	Kym Keogh	Ministry of Environment	Terrestrial Vegetation	dAAIR		The dAAIR needs to ensure that if air quality emissions and dust concentrations are over a predetermined threshold, then potential impacts to vegetation are evaluated. These impacts should not just include a decrease in vegetative species and abundance but also evaluate how those air contaminants will be taken up by wildlife utilizing that vegetation. The human health risk assessment seems to be addressing something similar. However, the connection still needs to be made to the wildlife assessment section in the dAAIR. Impacts to wildlife, if there are any from air contaminants on vegetation, are not just about how those impacts translate to human health but also about the health of the wildlife itself. Despite earlier comments and responses, this remains as a gap	Tervita has taken the MOE's comment into consideration and revised the dAAIR to address potential effects of dust on vegetation and wildlife. Section 4.2.3 (Air Quality Potential Effects), Section 4.6 (Terrestrial Vegetation Key Indicators), Section 4.6.3 (Terrestrial Vegetation Potential Effects), Section 4.8 (Wildlife and Wildlife Habitat Key Indicators), Section 4.8.3 (Wildlife and Wildlife Habitat Potential Effects) have been edited accordingly. Tervita performed a soil sampling program as requested by the Working Group to address the Potential Dust Migration Area (PDMA). To mitigate dust impacts, Tervita progressively caps cells as they reach capacity and will actively water waste to prevent potential dispersion drying dry periods. Tervita can work with the MOE on the potential of an air monitoring plan during the EMA Permit amendment. Tervita would like to note that Silverberry is in an active Oil and Gas Area and would be difficult to delineate contamination and contaminant migration between operations.	N/A	5-Sep-18
MOE-16	18-Jan-16	Patrick Williston	Ministry of Environment	Groundwater	Draft Valued Components Document		Groundwater contamination from leachate leakage through ruptured cell liners or elevated groundwater events.	Concerns noted. Groundwater contamination is a Valued Component and it is noted that leachate may migrate into groundwater. Tervita will discuss mitigation in the application.	N/A	23-Jan-16
MOE-17	18-Jan-16	Patrick Williston	Ministry of Environment	Surface Water	Draft Valued Components Document		Surface water contamination from leachate leakage, or from contaminated storm water discharge.	Concerns noted. Surface water contamination is a Valued Component and it is noted that surface water may come into contact with waste (leachate). Tervita will discuss mitigation in the application.	N/A	23-Jan-16
MOE-18	18-Jan-16	Patrick Williston	Ministry of Environment	Terrain and Soils	Draft Valued Components Document		Impacts to soils and biota on lands and surface waters downwind of the prevailing winds from the transport of contaminated or radioactive dust.	Concerns noted. As discussed in the January 27 2016, working group meeting Tervita will be circulating proposed studies to look at the possibility of contamination around the facility. Tervita performs NORM air monitoring bi-annually to ensure on on-site mitigation measures are sufficient to prevent the spread of naturally occurring radiation outside the landfill.	N/A	23-Jan-16
MOE-19	18-Jan-16	Patrick Williston	Ministry of Environment	Human Health	Draft Valued Components Document		Impacts to workers, the public and biota from elevated radiation due to the exposure of NORMS.	Concerns noted. As discussed in the January 27 2016, working group meeting Tervita has shared information regarding their Radiation Protection Plan at Silverberry. The Ministry of Environment is going to review applicable material and propose a scope for a Radiological Risk Assessment.	N/A	23-Jan-16
MOE-20	18-Jan-16	Patrick Williston	Ministry of Environment	Human Health	Draft Valued Components Document		A radiological risk assessment on human and environmental health including a summary of the current monitoring program with methods and data representing worker and fence-line exposures (comparisons should be made to the relevant national and international standards and guidelines)	See row above for response.	N/A	23-Jan-16
MOE-21	18-Jan-16	Patrick Williston	Ministry of Environment	Air Quality	Draft Valued Components Document		An assessment of the risk posed by contaminated dust mobilization supported by field sampling to show the current status of soils downwind of the existing facility, and an estimate of dust deposition and composition.	Concerns noted. As discussed in the January 27 2016, working group meeting Tervita will be circulating proposed studies to look at the possibility of contamination around the facility.	N/A	23-Jan-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MOE-22	18-Jan-16	Patrick Williston	Ministry of Environment	Surface Water/Groundwater	Draft Valued Components Document		Baseline water quality data (including hydrocarbons and radiation) for surface waters and groundwater, capturing seasonal variation in streams to the north and west of the landfill facility	Concerns noted. Relevant information will be provided in the application.	N/A	23-Jan-16
MOE-23	18-Jan-16	Patrick Williston	Ministry of Environment	Human Health	Draft Valued Components Document		Best Available Control Technology review for leachate minimization and full treatment with a surface discharge	Concerns noted. Tervita can discuss practical and economical leachate disposal options in the application.	N/A	23-Jan-16
MOE-23a	10-Feb-16	Patrick Williston	Ministry of Environment	Human Health	Draft Valued Components Document		MOE requests a review of secure landfill facilities operated by Tervita and/or others with full landfill leachate treatment and surface discharge. The BACT review should explain why full leachate treatment is or is not appropriate for the Silverberry Landfill.	Leachate disposal will be discussed in the application but a full BACT discussion will not occur. Tervita has pursued treatment technologies in the past and they are not economically feasible. The Ministry and other working group members have already expressed concern over the surface water discharges from site (collected storm water), thus leachate treatment and discharge to the environment is not recommended at this time. Tervita welcomes Ministry recommendations on BACT for leachate treatment.	N/A	3-Mar-16
MOE-24	18-Jan-16	Patrick Williston	Ministry of Environment	Human Health	Draft Valued Components Document		Leachate characterization using the toxicity leachate characteristic procedure (TCLP)—is the leachate hazardous waste? How much leachate is discharged and are there ways to minimize leachate volumes including the implementation of the free liquid test rather than the paint filter test and containing or covering the leachate storage facilities to prevent dilution by rain?	Concerns noted. Relevant information regarding leachate characterization, volumes and minimization will be provided in the application.	N/A	23-Jan-16
MOE-25	2-Mar-16	Patrick Williston	Ministry of Environment	Terrain and Soils	Draft Valued Components Document		Secure Landfills: Common Issues and Commitments Report. EAO 2009. Section 5.4.2. Primary Atmospheric Concerns and Proposed Mitigation. “Potential atmospheric impacts associated with a proposed secure landfill site include: fugitive dust from equipment activities that may adversely affect vegetation and increase the intake of particles on wildlife and human receptors;”	Concerns noted. Please see response 48a. Fugitive dust emissions will be addressed under the Dust subcomponent in the Amendment Application.	N/A	6-Apr-16
MOE-26	2-Mar-16	Patrick Williston	Ministry of Environment	Terrestrial Vegetation	Draft Valued Components Document		Landfill Criteria for Municipal Solid Waste. MOE 1993. Section 7.15. Monitoring. “Monitoring of other environmental media such as vegetation and soils should be assessed and a program developed as the site-specific situation warrants.”	There may be some applicable information from the Landfill Criteria for Municipal Solid Waste, 1993, that can be applied to Secure Landfills, however it should be noted that the Hazardous Waste Regulation should be used as the Regulation for operations of Secure Landfills. There is a substantial difference in what wastes are landfilled at a Secure Landfill and a Municipal Solid Waste (MSW) Landfill. There is no direction in the Hazardous Waste Regulation that directs vegetation sampling for secure landfills.	N/A	6-Apr-16
MOE-27	2-Mar-16	Patrick Williston	Ministry of Environment	Terrain and Soils	Draft Valued Components Document		Integrated Approach for the Analysis of Ecosystems at Risk: a case study in a waste landfill. R. Mazzeo et al. 2013. Environmental Engineering and Management Journal 12: 165-168. “Quantification of heavy elements levels in soil and air cannot generate sufficient information on impact because the absolute metal concentration alone does not reflect the degree to which these compounds affect the environment (Cheung et al., 1993). Data on the bioaccumulation and effects of leachate on wild populations are essential to assess the environmental impact of these disposal sites.”	Tervita read the extended abstract of the article referenced. The landfill referenced in the abstract is a municipal solid waste landfill. No details of landfill design, siting or geology are given. Therefore, a correlation between the environmental effects of Ginestreto and Tervita Silverberry cannot be made. A picture of the Ginestreto landfill is in the following link: http://www.soglianoambiente.it/it/case-history/attivita/smaltimento-rifiuti/ampliamento-discarica-ginestreto	N/A	6-Apr-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MOE-28	2-Mar-16	Patrick Williston	Ministry of Environment	Terrestrial Vegetation	Draft Valued Components Document		There are a growing number of studies showing effects of airborne landfill contaminants on vegetation, particularly lichens: • Paoli, L., Grassi, A., Vannini, I. Maslaňáková, I. Bil'ová, M. Bačkor, A. Corsini, and S. Loppi. 2015. Epiphytic lichens as indicators of environmental quality around a municipal solid waste landfill (C Italy).Waste Management 42:67-73. • Paoli, L., A. Corsinib, V. Bigaglib, J. Vanninib, C. Bruscolib, and S. Loppia. 2012. Long-term biological monitoring of environmental quality around a solid waste landfill assessed with lichens. Environmental Pollution 161: 70–75 • Kotovicova, J., F. Toman, M. Vaverkova, and B. Stejskal. 2010. Evaluation of Waste Landfills' Impacts on the Environment using Bioindicators. Polish Journal of Environmental Studies 20: 371-377. And a link has also been established between landfill gas and impaired vegetation: • Chan, G.Y.S, M.H. Wong and B.A. Whitton. 1991. Effects of landfill gas on subtropical woody plants. Environmental Management 15:411-431. • Buekens, A.G and V.V. Dragalov (eds.). 1998. Environmentally devastated areas in river basins in Eastern Europe. Environment Vol. 45.	Concerns noted. Please see response MOE-15a. Airborne landfill contaminants will be assessed under the Air Quality VC in the Amendment Application.	N/A	6-Apr-16
MOE-29	2-Mar-16	Patrick Williston	Ministry of Environment	Air Quality	Draft Valued Components Document		The potential impacts from landfill dust and emissions remains a key uncertainty that should be resolved prior to the submission of an application. A limited sampling program would go a long way in showing that current practices provide adequate environmental protection for vegetation and the wildlife that use the nearby habitat for forage. I have conducted lichen sampling and tissue analysis in the past—it is an approach that is broadly used around the world for assessing the potential impact of emissions and is not a complicated undertaking.	Concerns noted. Please see response MOE-15a. In order to determine effects of emissions on vegetation the potential emissions from Silverberry first have to be understood. If vegetation sampling or monitoring is required then this should be discussed in the EMA Permit amendment.	N/A	6-Apr-16
MOE-30	2-Mar-16	Patrick Williston	Ministry of Environment	Air Quality	Air/Soil Study Scope		I ran the Tervita Air Study and Soil Study Scope by MOE meteorologist Warren McCormick and he indicated that the plan seems okay, but noted that the Air Scope did not list the parameters to analyzed. He also suggested that the study purpose and objectives could be more clearly defined.	The parameters to be assessed through a summa canister collection during the air study include a full suite of volatile organic compounds including benzene, toluene, ethylbenzene, and xylenes. The study purpose is to identify and quantify potential petroleum fuel and waste emissions from the current Silverberry landfill, as baseline information. The baseline information will be used to assess the potential effects and magnitude of potential effects of the capacity replacement project in the Amendment Application.	N/A	6-Apr-16
MOE-31	30-Mar-16	Patrick Williston	Ministry of Environment	Wetlands	Draft Valued Components Document		Ministry of Environment letter, dated March 30, 2016.	Tervita responded by letter on April 6th to the EAO and the MoE.	N/A	6-Apr-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MOE-32	13-Jul-16	Patrick Williston	Ministry of Environment	Terrain and Soils	Soil Study		The work plan states that Qualified Professionals (QP) will summarize the method, equipment used, and interpret the results of both the air and soil study, however, it is not stated that this plan has been developed by QPs and there was no QP signature on the document. A QP operating within their area of expertise should be developing any sampling plans that will be used to determine potential effects to the environment as a result of existing or proposed activities. Several of the MOE comments in the tracking table speak to the need for QPs at the design phase	The work plan states that a QP will provide a technical memorandum summarizing the method and equipment used, lab results and a discussion of findings for the soil survey. The current scope of work has been developed by CH2M senior technical consultants with 15-25 years of experience in the air and soil assessment industry, including experience with landfills in Canada. The intent of the air and soil sampling is to provide high level baseline information to inform the assessment of potential effects of the proposed capacity replacement. The intent of the air and soil survey is not to assess the effects of the existing landfill, or provide long-term monitoring information, as that level of detail is not warranted in order to be able to assess the effects of the capacity replacement. The study methods will for the assessment of effects in the Amendment Application will be finalized in the draft Amendment Application Information Requirements stage.	N/A	11-Aug-16
MOE-33	13-Jul-16	Patrick Williston	Ministry of Environment	Air Study	Air Study		Proposed monitoring of emissions for the air study appears to occur on a single day in July. The comment number 43a in the tracking table from the Ministry of Environment requested monitoring to verify that the landfill is not currently producing emissions that are potentially harmful to the environment and human health. Further explanation is needed to demonstrate how July was determined to be the period of maximum emissions. Typically, monitoring involves more than one sampling event and should be a scheduled period of sampling to capture annual and seasonal variations that take into account temperature and precipitation changes.	The purpose of the proposed study is not to quantify the emission rates of the possible contaminants. The purpose of the study is to determine which contaminants are being emitted and in order for the lab to detect the possible contaminants, a sampling period of likely maximum emissions is desired. The rationale for a July survey date was because maximum emissions are likely during a period of warm weather.	N/A	11-Aug-16
MOE-34	13-Jul-16	Patrick Williston	Ministry of Environment	Air Quality	Air Study		Warren McCormick, Emission Inventory Specialist, also reviewed the recent work plan air study and Northern Health comments and provided these thoughts. These additional comments from Warren McCormick were after further consideration of the parameters and purpose, as identified missing in comment 63, that were now provided in the air study. As the majority of wastes are industrial in origin, I would propose that use of a CH4/CO2 analyser to survey the site is likely not going to work in the way described. A suitable BTEX type analyzer, with appropriate resolution, would be a better survey tool. I also have to agree with the NH question of whether a single survey will be adequate to characterize the situation. The facility could purchase a suitable analyzer and have on-site staff survey the active area at appropriate times. Speciation analysis via the Summa canisters can also be done annually at the appropriate times as well.	The rationale for choosing a CH4 monitor for the initial survey part of the study was to identify a “hotspot” location where gases were emitting to the atmosphere. Based on CH2M’s technical experience, a CH4/CO/H2S monitor would suit this purpose given the wide range of waste types collected at the site. However, CH2M and Tervita agree than a portable BTEX analyzer would also suit this purpose. A suitable characterization of the types of contaminants emitted can be accomplished with a single sample at a hotspot location as determined through the preliminary survey. The information collected will be used to assess the potential effects of air emissions from the proposed capacity replacement.	N/A	11-Aug-16

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MOE-35	13-Jul-16	Patrick Williston	Ministry of Environment	Air Quality	Air Study		The proposed soil sampling study appears to address part of the MOE request for soil sampling in comment 44a of the tracking table. However, within the list of contaminants to be analysed, I did not see any reference to radioactive elements. The request for monitoring in 44a identified a need to test for NORMs in the soil. A recent e-mail indicates that a separate radiation assessment will be completed. Please identify if this area and/or these soils will be included in this assessment as requested by MOE's earlier comments.	Testing for NORMs is conducted biannually within the Tervita Silverberry landfill. Therefore, testing for NORMs outside of the landfill boundaries is not considered to be warranted at this time. NORMs are considered to be a subcomponent under the Human Health Valued Component and therefore, potential effects to human health from NORMs will be assessed in the Amendment Application within the Screening Level Human Health Risk Assessment.	N/A	11-Aug-16
MOE-36	1-Dec-16	Warren McCormick	Ministry of Environment	Air Quality	Air Study		Objectives, Standards and/or guidance for VOCs: BC does not have any made-in-BC objectives, standards or guidance for ambient concentrations of the VOCs listed in this project study. When needed, the use of other jurisdictions numbers can be used; as was done here (i.e. Alberta and Ontario). Others could have included Environment and Health Canada. Texas and Washington also have a good list of screening values. One of the main issues is that many of these VOCs are carcinogenic and use a long term (annual) value to assess impacts	Thank you for taking the time to answer Peace River Regional District's comment.	N/A	1-Mar-17
MOE-37	1-Dec-16	Warren McCormick	Ministry of Environment	Air Quality	Air Study		Given the type of waste being landfilled here I would support the comments from other reviewers regarding monitoring. I would support an annual or other monitoring survey (perhaps monitoring tied to operational schedules). This is supported by the results shown, especially benzene. I am also suggesting that the proponent install and operate a meteorological tower/station to assist the monitoring program and to support operational issues. This would include wind speed and direction, temperature and humidity/dew point measurements archived on an hourly basis as per Ministry of Environment requirements.	The Hazardous Waste Regulation doesn't stipulate conditions or guidelines on air/ landfill gas monitoring at Secure Landfills. Ongoing monitoring requirements will be discussed in the Draft Amendment Application. The draft Valued Components will also be edited to include VOCs as an indicator of air quality. Silverberry Secure Landfill currently has a weather station installed that records wind speed and direction, temperature and humidity. Could the Ministry of Environment please let us know what guidelines exist in place for cataloging the data to ensure we meet your requirements.	N/A	1-Mar-17
MOE-38	1-Dec-16	Kym Keogh	Ministry of Environment	Air Quality	Air Study		The concerns with the need for long-term air emission monitoring and evaluation of potential contaminants of concern also apply to whether there will be effects to nearby waterbodies and terrestrial ecosystems from the landfill gas emissions. Changes in water quality and damage to terrestrial foliage can result in impacts to aquatic and wildlife ecosystems. Benzene appears to have potential for such an impact. Because of this, I see a need for air monitoring to follow a program that allows for proper evaluation of the potential for impacts and addresses the issues raised by both MOE's air quality specialist and Northern Health's technical advisor. The information gathered from this type of program would provide the basis to further determine if there could be an impact to the terrestrial and aquatic receiving environment.	The Hazardous Waste Regulation doesn't stipulate conditions or guidelines on air/ landfill gas monitoring at Secure Landfills. Ongoing monitoring requirements will be discussed in the Draft Amendment Application. The draft Valued Components will also be edited to include VOCs as an indicator of air quality, and VCs to assess effects to aquatic and terrestrial environments have been included.	N/A	1-Mar-17
MOE-39	20-Apr-18	Jeannette Lough	Ministry of Environment	Economy	dAAIR		Including Financial Security Requirements, (EMA Section 14(1)(b)	If economic benefit information is available in the financial security estimate, it will be used in the application.	N/A	24-Apr-18
MOE-40	20-Apr-18	Jeannette Lough	Ministry of Environment	Economy	dAAIR		Annual EMA Permit Fees	When Tervita describes annual government revenues in the application , fee associated with the Waste Discharge Regulation will be detailed.	N/A	24-Apr-18

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MOE-41	20-Apr-18	Jeannette Lough	Ministry of Environment	Water (Surface)	dAAIR		Will assessment include a look at best Achievable Technology Standards for leachate treatment and disposal?	Section 1.4 of the dAAIR is to look at alternative project locations. If the MOE, would like to discuss best Achievable Technology Standards for leachate treatment, Tervita feels the discussion is best suited for the upcoming EMA permit amendment.	N/A	24-Apr-18
MOE-42	20-Apr-18	Jeannette Lough	Ministry of Environment	Cumulative Effects Assessment	dAAIR		Will existing landfill be considered in cumulative effects assessment.	The existing landfill will be considered in the CEA as an existing development per S3.10.1 - "*The following development categories will be considered in the Application:* • *Projects or activities that have already been built or conducted for which the environmental effects overlap with those of the proposed Project (i.e. certain)"*	N/A	24-Apr-18
MOE-43	20-Apr-18	Jeannette Lough	Ministry of Environment	Effects and Mitigation	dAAIR		Will financial security requirements be considered as part of appropriate strategy?	Financial Security is based off an estimate for decommissioning/closure/post-closure. If the assessment of effects and mitigation effectiveness need to be altered, financial security will be reviewed to determine if changes are necessary.	N/A	24-Apr-18
MOE-44	20-Apr-18	Jeannette Lough	Ministry of Environment	Effects and Mitigation	dAAIR		Although written with municipal solid waste in mind, this may be helpful for use as a procedure for assessing landfill gas: https://www2.gov.bc.ca/assets/gov/environment/waste-management/garbage/lgassessment.pdf	Tervita will review the Landfill Gas Generation Assessment Procedure Guidelines for any applicable material when determining air quality.	N/A	24-Apr-18
MOE-45	23-Apr-18	Ben Weinstein	Ministry of Environment	Air Quality	dAAIR	4.2 - Visual dust	KIs should be quantitative in nature. 'Visible' is qualitative and subject to interpretation by different people. I recommend an alternate measure to ensure that this KI is adequately addressed. For example, air quality instruments can quantify the concentration of particles in the coarse fraction. Other instruments can provide a measure of visual range.	Tervita recognizes the subjectivity of visible dust, but has proposed quantitative KI's such as ambient air concentrations of particulate matter, nitrogen oxides, VOCs and GHG emissions. These quantitative KIs will be expanded upon in the application.	N/A	25-Apr-18
MOE-46	23-Apr-18	Ben Weinstein	Ministry of Environment	Air Quality	dAAIR	4.2 - Detectable odour	Why not simply state odour levels at sensitive receptor? Does including the word 'detectable' add clarity to the KI?	"Detectable" helps provide clarity for the chosen KI.	N/A	25-Apr-18
MOE-47	23-Apr-18	Ben Weinstein	Ministry of Environment	Air Quality	dAAIR	4.2 - Ambient PM and NOx	A) What size fractions of PM is this statement describing? B) Also note that this KI has links with the first and fourth bullets, and that some linkages should be made.	The PM size fraction is PM2.5. This KI will be expanded upon in the application.	N/A	25-Apr-18
MOE-48	23-Apr-18	Ben Weinstein	Ministry of Environment	Air Quality	dAAIR	4.2 GHGs in the AQ chapter	Suggest adding a separate chapter for GHGs.	GHG's were originally excluded in the VC document. After working group feedback, Tervita added GHGs under the air quality VC as a KI.	N/A	25-Apr-18
MOE-49	23-Apr-18	Ben Weinstein	Ministry of Environment	Air Quality	dAAIR	4.2.2 Existing Conditions	When including the discrete data collected on August 24 2016, ensure to compare the nature of this sampling program to the bullets detailed in section 3.3 of the dAAIR. Specifically, consider these two samples relative to the first bullet: "A description of the quality and reliability of the existing (or baseline) data and its applicability for the purpose used, including any gaps, insufficiencies and uncertainties, particularly for the purpose of monitoring activities". The reason I say this is because the collection of two samples on one day at two locations in a landfill needs to be evaluated in the context of uncertainty, and sufficiency.	The data gathered on air quality and potential effectiveness regardin+I180:K184g uncertainty and sufficiency will be expanded upon in the application.	N/A	25-Apr-18

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MOE-50	23-Apr-18	Ben Weinstein	Ministry of Environment	Air Quality	dAAIR	4.2.2 - Some nearby baseline data available	For the baseline data review note that there was ambient air quality monitoring at Blueberry River from July 2016 - Nov 2017, and at Buick Creek from Feb 2015 to July 2016. The data from Blueberry River are on the MOE website and data for Buick Creek should be obtained through the OGC.	Tervita appreciates the reference to the data. The data will be reviewed and will be considered when developing baseline conditions regarding air quality.	N/A	25-Apr-18
MOE-51	23-Apr-18	Ben Weinstein	Ministry of Environment	Air Quality	dAAIR	4.2.2 - Some nearby baseline data available	In addition to ambient concentrations at BC monitoring stations, the desktop review should look for ambient CAC measurements on/at/near other landfills.	Tervita will look to determine if there are any BC monitoring stations by the other developed Secure Landfills in the Province (Northern Rockies, Peejay).	N/A	25-Apr-18
MOE-52	23-Apr-18	Ben Weinstein	Ministry of Environment	Air Quality	dAAIR	4.2.2 - Air Quality Technical Report	In addition to all other parts of the AQTR please include the following: an outline of the conditions which lead to maximum fugitive emissions of dust and VOCs. (Soil moisture, incoming solar radiation, outgoing longwave radiation, ambient air temperature, soil temperature, wind speed, etc.) Include supporting literature. Also include proposed method(s) for how those will be measured onsite. The proponent should develop a fugitive emissions model which will predict the time of maximum emissions. The proponent should install all relevant equipment which can measure this on the ground. At the time of maximum emissions the proponent should collect enough baseline data in order to adequately characterize baseline conditions. The sampling program can be refined as more samples are taken. This way, if future monitoring is required (post expansion), these can be put in the context of the robust baseline. Proponent currently has 2 samples within one hour and proposes that this is sufficient information to conclude additional monitoring is not required. However, the proponent also states that "the results presented in this report are reflective of the conditions at the time and at the locations where the samples were collected". There is insufficient evidence to conclude that these samples represent worst-case emissions and if they do, the uncertainty of data given two very different benzene concentrations will make it difficult to determine whether there is a change associated with a future expansion. (For fugitive dust it appears that there have been zero samples, can this be confirmed).	At this time there are no further air sampling/monitoring programs proposed.	N/A	25-Apr-18
MOE-53	23-Apr-18	Ben Weinstein	Ministry of Environment	Air Quality	dAAIR	4.2.3 - Potential Effects	This list is missing fugitive emissions (of coarse particles, VOCs and odorants). Fugitive emissions should be considered an activity of sorts.	Tervita can add fugitive emissions to the list of Potential effects in 4.2.3.	N/A	25-Apr-18
MOE-54	23-Apr-18	Ben Weinstein	Ministry of Environment	Air Quality	earlier comments		In response to earlier comments by MOE and other agencies concerning the air study, the proponent stated: "Ongoing monitoring requirements will be discussed in the Draft Amendment Application Information Requirements (dAAIR)." (MOE 37, 38; NH 44a; PRRD 13). Note that the dAAIR does not discuss ongoing monitoring requirements; instead it defers ongoing monitoring requirements to a technical report which will be attached as an appendix to the amendment application. It appears that this technical report will include the results of the air study, which is a form of circular discussion. Regardless of whether the AQTR contains the results of the August samples, earlier comments must be fully addressed.	The NORM program is the only on-going air monitoring program at Silverberry. The dAAIR will be edited to remove reference to "Other on-going monitoring", since the NORM sampling is referenced in the second bullet of 4.2.2.	N/A	25-Apr-18

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MOE-55	23-Apr-18	Ben Weinstein	Ministry of Environment	Air Quality	earlier comments		Furthering the discussion on MOE-37, MOE can provide documents relating to the installation of a meteorological monitoring station, and can assist with station siting if desired.	Tervita would appreciate the documents referenced by the MOE so they can be reviewed for any future installations.	N/A	25-Apr-18
MOE-56	24-Apr-18	Kym Keogh	Ministry of Environment	Assessment Methodology	dAAIR	3.0	I would suggest the final AAIR have a conceptual site model, which illustrates the potential pathways of contaminants to VCs. Some may have multiple pathways from the site such as wildlife which can be exposed directly by being on site or indirectly by the movement of a contaminant through the environment. It would provide guidance to the proponent on what data is needed for the EA Environmental Impact Study. And would create a clearer understanding for agencies, First Nations, and public for reviewing the environmental assessment of VCs.	The HHRA will illustrate potential pathways of contaminants to VCs.	N/A	1-May-18
MOE-57	24-Apr-18	Kym Keogh	Ministry of Environment	Terrain and Soils	dAAIR	4.1.2	Where CCME soil quality guidelines do not exist for a particular parameter, the BC CSR numerical standards should be used in the evaluation of soil analysis results. Alternatively, other applicable guidelines or standards can be used if available such as from the US EPA.	The BC CSR will be added as a source of data under Section 4.1.2.	N/A	1-May-18
MOE-58	24-Apr-18	Kym Keogh	Ministry of Environment	Surface Water	dAAIR	4.4	Water quality parameters. This needs more definition. Is sediment, TSS or sediment from the bottom of a watercourse? Which hydrocarbons and what analysis? Total Extractable Hydrocarbons are an outdated test and does not include enough information to determine the potential for effects. Will other standard water quality parameters be used to monitor the site such as turbidity, TDS or pH, conductivity, etc.? If so, it should also be collected.	Currently, the surface water at site is tested for Schedule 1.2 of the HWR. Historical results will be reviewed.	N/A	1-May-18
MOE-59	24-Apr-18	Kym Keogh	Ministry of Environment	Surface Water	dAAIR	4.4.1.4	It appear that only a few years of data containing 3 samples are currently available despite discharging from the sediment pond occurring throughout the season. Sampling needs to match the discharging. Considering the evaluation of effects of the project, additional sampling may be needed to properly determine the effects for this amendment.	Tervita keeps records of analytical, date and volumes of surface water discharged. Tervita analyzes the water prior to discharge against Schedule 1.2 of the HWR. Discharge is intermittent depending on precipitation and is only typically done in spring and fall.	N/A	1-May-18
MOE-59a	29-Aug-18	Kym Keogh	Ministry of Environment	Surface Water	dAAIR	4.4.1.4	There are only 3 samples for water quality for the discharge from the sediment pond over a 2 year period. It is not appropriate to evaluate the predictions for impacts to the environment from 3 sample points. I realize discharging from this pond is intermittent but there appeared to be additional flows that would have allowed for more sampling. I would suggest that during the EA process, the proponent collects some additional data to validate the predictions.	Tervita performed a soil sampling program as request by Working Group members to help determine impacts of the surface water discharge. Tervita can re-supply this report to the MOE.	N/A	5-Sep-18
MOE-59b	6-Nov-18	Kym Keogh	Ministry of Environment	Surface Water	dAAIR	4.4.1.4	Tervita should include any monitoring surface water data collected during operation of the existing landfill developing the water quality predictions for the expansion. This information would not only strengthen their predictions but would also give more certainty to the surface water quality assessment portion of the application.	Tervita will include existing monitoring data in the application when developing the water quality predictions for the expansion.	N/A	12-Nov-18

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MOE-60	24-Apr-18	Kym Keogh	Ministry of Environment	Surface Water	dAAIR	4.4.2	Enough data is needed to determine the potential effects. An understanding is also needed as to whether water quality is better by dilution from snow melt in the spring or whether than spring runoff picks up more contaminants and reduces water quality. And the same understanding is needed for the late summer period when the main contributor to runoff is from groundwater. Is there enough data collected to answer these questions?	Currently, the surface water at site is tested for Schedule 1.2 of the HWR. Historical results will be reviewed.	N/A	1-May-18
MOE-60a	6-Nov-18	Kym Keogh	Ministry of Environment	Surface Water	dAAIR	4.4.2	There needs to be a bullet added to Section 4.4.2 Surface Water/Existing Conditions for the requirement to compare surface water quality data to the British Columbia Water Quality Guidelines (BC WQGs), at a minimum. This comparison should cover a number of water uses including aquatic life, wildlife, agriculture, and drinking water. If there are no BC WQGs applicable, Tervita should expand their comparison to other guidelines such as CCME guidelines. Other jurisdictions that have applicable guidelines could also be used if the comparison is provided along with rationalization. But the BC WQGs need to be used at least in this Section. I realize that there may be other predefined, water quality standards Tervita must meet for discharging but the comparison to BC WQGs allows for an understanding of the characteristics in the receiving environment.	Tervita will add the following bullet to Section 4.4.2 of the dAAIR: • Comparison of the surface water quality data to the British Columbia Water Quality Guidelines (BC WQGs), at a minimum. This comparison should cover a number of water uses including aquatic life, wildlife, agriculture, and drinking water. If there are no BC WQGs applicable, Tervita could expand their comparison to other guidelines such as CCME guidelines.	N/A	12-Nov-18
MOE-61	24-Apr-18	Kym Keogh	Ministry of Environment	Surface Water	dAAIR	4.4	How will the sampling of water quality be evaluated? Against which standards? No information is provided on whether BC CSR numeric standards are to be used or BC WQGs or CCME guidelines. BC CSR standards have limits on their application, are based on broad use, and assume a minimum 1:10 dilution which would need to be verified if discharging to a creek. As the discharge is entering an ephemeral stream, there could be times that no dilution is available until reaching a larger watercourse. BC WQGs should be used for when the discharge from the sediment pond is going directly to a creek whether it is ephemeral or not. This is essential if this ephemeral creek is used at times by fish and other key aquatic organisms.	Currently, the surface water at site is tested for Schedule 1.2 of the HWR. Historical results will be reviewed.	N/A	1-May-18
MOE-62	24-Apr-18	Kym Keogh	Ministry of Environment	Surface Water	dAAIR	4.4	The spatial boundaries of the RAA include a number of creeks and rivers. How will those be monitored to ensure no deleterious effects to surface water from the discharge and from groundwater infiltration? Sites will need to be established for long term monitoring.	Tervita can work with the MOE on potentially developing a surface water monitoring plan during the EMA permit amendment. Due to the development of oil and gas infrastructure in the area, potential contamination found in rivers and creeks may be inadvertently and incorrectly tied to Silverberry Landfill operations. Tervita follows the HWR developed by the MOE to ensure surface water discharge has limited impacts on the surrounding environment.	N/A	1-May-18
MOE-63	24-Apr-18	Kym Keogh	Ministry of Environment	Groundwater	dAAIR	4.5	Like surface water, the water quality parameters for groundwater need to be laid out clearly and relate to the potential contaminants. Should hydrocarbons be included in the groundwater quality parameters.	Tervita is continually working with the MOE on Silverberry's groundwater monitoring plan. Most recently, with Linda Elder, Rusto Martinka and Jeannette Lough. Tervita can list hydrocarbons in the groundwater quality parameters.	N/A	1-May-18
MOE-64	24-Apr-18	Kym Keogh	Ministry of Environment	Groundwater	dAAIR	4.5	How will groundwater sample results be evaluated? Will the BC CSR numeric standards be used or the contaminated sites federal interim groundwater guidelines?	Tervita's groundwater consultant uses the BC CSR when interpreting the monitoring results. For consistency, the application will also use the BC CSR when comparing results.	N/A	1-May-18

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MOE-65	24-Apr-18	Kym Keogh	Ministry of Environment	Groundwater	dAAIR	4.5	The background well, BH-103 has had issues and periodic parameter levels higher than the monitoring wells. This should be discussed and the work completed to understand why the results are high and how it is assured to be background only. Has there been consideration of another background well?	Tervita has discussed BH-103 with MOE staff. Tervita will properly decommission and replace background monitoring well BH-103, including the installation of a deeper nested monitoring well with landfill cell 8 construction in 2019.	N/A	1-May-18
MOE-66	24-Apr-18	Kym Keogh	Ministry of Environment	Terrestrial Vegetation	dAAIR	4.6.3	Dust from construction and operation needs to be added to potential effects. While dust itself can cause damage to the plants by limiting growth or causing die-off, if metals and other contaminants are present in the dust that settles on the plants, it can be picked up by wildlife consuming the plants.	The bullet points in 4.6.3 detail project phases when Terrestrial Vegetation will interact with the project. Potential effects of dust will be expanded in the Environmental Affects Assessment, Section 4.2 Air Quality of the application.	N/A	1-May-18
MOE-67	24-Apr-18	Kym Keogh	Ministry of Environment	Terrestrial Vegetation	dAAIR	4.6.1.1	With respect to vegetation, there is a 100 m uniform buffer around the site. I gather from the meteorologist that the predominant wind direction in this area is SW. This is confirmed in the March 2017 soils study by CH2M. This should be considered when evaluating the potential effects from the dust to the environment and whether the 100 m along the SW side of the site is sufficient.	Tervita will review buffers surrounding the Silverberry Landfill.	N/A	1-May-18
MOE-68	24-Apr-18	Kym Keogh	Ministry of Environment	Fish and Fish Habitat	dAAIR	4.7	While I think it is great that this VC is including Aboriginal Interests, I also want to see health of the aquatic ecosystem considered rather than just a few key food fish species. Smaller and more localized species, such as sculpin, are better sentinels for contaminants than many food fish. A few species should be considered when looking at effects to the habitat.	Tervita can work with the MOE and our consultant on potential indicator species to be used in the application.	N/A	1-May-18
MOE-69	24-Apr-18	Kym Keogh	Ministry of Environment	Fish and Fish Habitat	dAAIR	4.7	It is important that the change in habitat incorporates water quality as well as the physical changes such as loss of habitat types or invertebrates. Both of these are good identifiers of potential effects but should also tie in the findings on water quality.	Tervita recognizes the interrelated nature of certain VCs and will conduct a a comprehensive assessment of each VC with this in mind.	N/A	1-May-18
MOE-70	24-Apr-18	Kym Keogh	Ministry of Environment	Fish and Fish Habitat	dAAIR	4.7	Does the change in mortality risk account for the chronic conditions such as lowered fecundity, reduced growth or difficulties avoiding predators.	Tervita is be unable to meaningfully assess how increased mortality risk would contribute to chronic conditions such as lower fecundity, reduced growth or difficulties avoiding predators.	N/A	1-May-18
MOE-71	24-Apr-18	Kym Keogh	Ministry of Environment	Fish and Fish Habitat	dAAIR	4.7.2	Will the existing conditions identify species and their current use of the RAA? Have benthic invertebrate collections occurred in areas that will receive surface water discharges?	There is no direct discharge of surface water to water bodies.	N/A	1-May-18
MOE-72	24-Apr-18	Kym Keogh	Ministry of Environment	Fish and Fish Habitat	dAAIR	4.7.2	The immediate receiving environment is an ephemeral creek. Does the creek get used during the season by fish? If so, are these times critical to the fish lifecycle such as spawning or rearing.	The creek has not been identified as suitable for fish habitat. As per the Fisheries Habitat Assessment done during the original EAC application, "A non fish-bearing, ephemeral tributary along the northwest corner of the existing facility offers seasonal connectivity to the downstream fish habitat from an area immediately adjacent to the north property boundary."	N/A	1-May-18
MOE-73	24-Apr-18	Kym Keogh	Ministry of Environment	Fish and Fish Habitat	dAAIR	14.0	A water quality management plan should be included. This should identify both the ongoing groundwater sampling and a surface water sampling plan, including some basic biological sampling to confirm that the receiving environment is fine.	Tervita feels additional monitoring plans should be discussed during the EMA permit amendment application .	N/A	1-May-18

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MOE-74	29-Aug-18	Ben Weinstein	Ministry of Environment	Air Quality	dAAIR	4.2	Key indicators should be quantifiable. The KI 'visual dust' is not, unless it refers to something like 'coarse-fraction particulate matter', or 'total suspended particulate matter'… A KI should be a measurable thing so that a mitigation strategy can be developed and, if necessary, implemented and evaluated.	Tervita would like to continue using Visual Dust as a KI since it is relatable for the general public reviewing the application. Tervita can discuss other quantifiable measurements during the EMA Permit amendment application.	N/A	5-Sep-18
MOE-75	29-Aug-18	Ben Weinstein	Ministry of Environment	Air Quality	dAAIR	4.2	2 grab air quality samples are insufficient to be called a baseline air quality dataset. There is no way around this. The proponent cannot state that they have collected air quality data in a manner sufficient to be termed 'baseline'. If baseline air quality data is important (for any air pollutant), a baseline sampling program must be designed and executed. Unfortunately, since the proponent's April responses did not arrive until August, it is too late to do this now. This program was likely time-sensitive to summer months.	Tervita can work with the MOE on a suitable air monitoring program (if necessary) during the EMA Permit amendment application.	N/A	5-Sep-18
MNGD-1	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 3.1, addition of GPS coordinates to the report tables.	Borehole logs were inadvertently omitted from Appendix C. GPS coordinates will be included with the borehole logs when Appendix C is updated	N/A	1-Mar-17
MNGD-2	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 3.1, what are specific COPCs for this site?	Tervita Silverberry Secure Landfill mainly takes oilfield waste. The site is permitted to take BTEX levels over limits specified in Schedule 4 of the Hazardous Waste Regulation. The main contaminants of concern are hydrocarbon based due to the nature of the waste, thus BTEX, VPHs, LEPHs, HEPHs, PAHs and metals are the main contaminants of concern.	N/A	1-Mar-17
MNGD-3	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 5.1, it doesn't appear any samples were taken to the northwest, just north.	When surface water is discharged, it is discharged directly north from the storm water pond. If there is no sign of contamination directly north where water is discharged, it can be assumed that no/minimal contamination is reaching the ephemeral drainage that drains northwest.	N/A	1-Mar-17
MNGD-4	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 5.1, surface water flow outlet, depressions, tree line are not shown on figure.	There is no permanent surface water flow outlet. Water is discharged using a trash pump with the location varying between borehole 5 and 8 as shown on Figure 2 of the study.	N/A	1-Mar-17
MNGD-5	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 5.1, is there no sample BH11?	Correct no BH11 was taken due to time constraints in the field.	N/A	1-Mar-17
MNGD-6	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 5.2, is there weather information from the landfill itself?	The Landfill now records weather information but not at the time of study. For the purpose of the study information from the Fort St. John weather station is sufficient to direct sampling. The study was to gain an understanding of potential contamination to address concerns from the working group and wasn't part of a full delineation program.	N/A	1-Mar-17

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MNGD-7	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 5.2, why was no sample collected southwest of the work area (i.e. south/southeast of the leachate frac/water ponds or west of cell 6 given prevalent conditions.	Land by the leachate ponds is on the footprint of an oilfield waste management facility and water injection facility. Any sampling taken in this area would make it difficult to differentiate between contamination caused by the landfill and oilfield waste management facility. Land directly west of Cell 6 is going to be developed into a new landfill cells. The study work plan was circulated to the working group prior to initiation and the sampling locations were deemed satisfactory.	N/A	1-Mar-17
MNGD-8	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 5.2, from the aerial photo, it appears that there are breaks/cuts in the tree line to the south and west of the site...why were samples not collected there at further downwind locations? In addition, at least one downwind sample could have been taken regardless of the limited access (i.e. the forest is not completely impenetrable, or use other access points within 200 m?)	The study was to gain an understanding of potential contamination to address concerns from the working group and wasn't part of a full delineation program. The study work plan was circulated to the working group prior to initiation and the sampling locations were deemed satisfactory.	N/A	1-Mar-17
MNGD-9	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 5.4, maximum depth of holes? number of samples per location collected/analyzed?	The report will be revised and the details added in the borehole logs, Appendix C.	N/A	1-Mar-17
MNGD-10	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 5.5, it would be useful to have a summary table noting each sample location, and what it was analyzed for.	Comment noted. Existing table and borehole logs provide the information.	N/A	1-Mar-17
MNGD-11	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 6.3, Inconsistent naming of the BH locations throughout text/tables/figures...is it 1 or BH-1 or BH-1A or BH1-A or BH-1-A (I'm assuming they are all the same, but this isn't always true)	The report will be revised and corrections made.	N/A	1-Mar-17
MNGD-12	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 6.3.1.1 does not match table 2a...results reported for all locations and values range from 5.63-7.18 (SWDA) and 4.75-5.73 (PDMA). Are these regionally normal levels?	The report will be revised and corrections made. Regional pH levels will be researched to see if they are available.	N/A	1-Mar-17
MNGD-13	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 7.6, I don't see any documentation to support this noted in the laboratory reports in the appendix.	The correspondence with ALS will be appended to the report.	N/A	1-Mar-17
MNGD-14	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 7.7, Again, I would like to see this statement supported in writing from the lab/in the lab reports.	The correspondence with ALS will be appended to the report.	N/A	1-Mar-17
MNGD-15	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 8, any correlation between the depths of the samples and the results? Can you provide a figure with exceedance results shown?	Sampling depth was a fixed variable, thus it is hard to draw a conclusion between depth and results. A figure showing exceedances will be considered	N/A	1-Mar-17
MNGD-16	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 8.1, barium results from on-site locations are consistently higher than off-site locations. Are we seeing a possible impact from operations here (even though they are still below regional background levels)?	Further investigation will have to be performed to draw a more substantial correlation between operations and a possible barium impact. Tervita will take into consideration further investigation on the source of barite/barium.	N/A	1-Mar-17
MNGD-17	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 8.1, or is this a small APEC? dumping area? this could be confirmed by additional sampling of soil and surface water.	There is a small probability of an APEC. Tervita will take into consideration further sampling programs.	N/A	1-Mar-17
MNGD-18	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 8.2, are there any studies/geologic reports to support this	Natural background concentrations are derived from MoE Protocol 4. MoE provides background barium concentrations in protocol 4 and outlines a procedure in Protocol 14 to differentiate between anthropogenic and non-anthropogenic sources.	N/A	1-Mar-17

Table 1. Government Agency Comments Table

ID #	Comment Date (i.e. 22-May-16)	Reviewer Name / Agency	Reviewer agency/organization	Subject (See "instructions" tab)	Document	Document section	Comment (Include Memo reference as applicable)	Proponent Response/Change/Action (include memo reference if applicable)	Memo number (if applicable)	Response Date
MNGD-19	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 8.2, Can you really say with 100% certainty that it is due to natural background conditions? Is there more support for this argument? i.e. What is the natural source? has this been accepted at other regionally similar sites by MoE?	As noted in the report “additional investigation may be warranted to confirm the source of the barium, whether it is from naturally occurring barium concentrations or the materials stored at the Facility.” Tervita will take into consideration further sampling programs to determine possible natural/artificial sources. Tervita doesn’t know what the MoE has accepted from other companies in Northeast BC and the ability to apply MoE Protocol 14 Determining a Barite Site.	N/A	1-Mar-17
MNGD-20	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Section 9, or that they are attributed to natural background concentrations. Sec 8.2 says to confirm applicability of using this protocol first.	Tervita would ask the Ministry of Natural Gas Development to clarify. Section 8.2 does not specifically say that the applicability of Protocol would be reviewed first. As stated in Section 9, “To confirm whether these barium concentrations are a result of potential barite presence within the soils handled at the Facility or due to natural elevated background concentrations in the native soils…” barium concentrations could still be attributed to natural background concentrations.	N/A	1-Mar-17
MNGD-21	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Attachment B, where is table 1?	The report will be revised and corrections made.	N/A	1-Mar-17
MNGD-22	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Table 3a for results <600 (regional background) would you still consider them an exceedance in this table? should be somehow highlighted differently.	Tervita would ask the Ministry of Natural Gas Development to clarify. There are exceedances depending on what criteria is being referenced. The different exceedances and their reference are at the bottom of the Table under Notes.	N/A	1-Mar-17
MNGD-23	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Table 3a, why was the barium result for BH-13-A not calculated	The report will be revised and corrections made.	N/A	1-Mar-17
MNGD-24	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Attachment C shows air monitoring results, not borehole logs.	The report will be revised and a comment will be made.	N/A	1-Mar-17
MNGD-25	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Attachment D, this is not discussed in the text...occurs for more than one sample in the lab report.	The mercury is biased low, but results show that results are less than 1% of the applicable standard thus results won’t influence the report.	N/A	1-Mar-17
MNGD-26	30-Jan-17	Jennifer White	Ministry of Natural Gas Development	Terrain and Soils	Soil Study		Attachment D (page 119), was this done?	The comment refers to a generic list of acronyms. The particular one referenced by the reviewer was not used to qualify the data within the lab report. As such, there is no amendment required to the report at this time.	N/A	1-Mar-17

Appendix 13
British Columbia Environmental Assessment Office Working Group First Nations Comments during Pre-Application Stage for the Proposed Project Expansion

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
Comments Received Through BC EAO Working Group									
BRFN-1	13-Jan-16	Norma Pyle	BRFN	Aboriginal Groups Rights and Interests	Draft VCs Document		Tervita clearly relied heavily on BC EAO's guidelines for VC selection (2013), without engaging with Blueberry to discuss VC selection.	Tervita was following guidance documents provided by the BC EAO. The BC EAO will have to discuss relevance of their guidance documents with BRFN.	23-Jan-16
BRFN-2	13-Jan-16	Norma Pyle	BRFN	Aboriginal Groups Rights and Interests	Draft VCs Document		Tervita be required to revise the VC document in direct consultation with Blueberry prior to the development of the dAAIR.	Tervita would like to note that this is the draft VC document Blueberry provided comment on. Comments and concerns received from Blueberry will be incorporated into the finalized version of the VC.	23-Jan-16
BRFN-3	13-Jan-16	Norma Pyle	BRFN	Aboriginal Groups Rights and Interests	Draft VCs Document		None of the VCs proposed contemplate Project impacts on aboriginal peoples or their treaty rights practices. One of the social pillar VCs - Land and Resource Use - identifies agriculture, oil and gas activity, and trapping as subcomponents. The rationale for this selection is that "agriculture, oil and gas activity, trapping and forestry are the four main land and resource uses that occur within a 5-km radius of the proposed Project site". Both the subcomponents and rationale ignore the myriad of practices that Blueberry relies on the lands and resources that stand to be impacted by the Project. As a result, this VC will not assess potential impacts on Blueberry's treaty rights.	As part of the Application process Tervita will engage with Blueberry as per Tervita's First Nation Consultation Plan. Blueberry also has the opportunity to comment on the draft VCs, dAAIR and Application. Through this process, the BC EAO and Tervita will be able to address applicable impacts on Blueberry's treaty rights.	23-Jan-16
BRFN-4	13-Jan-16	Norma Pyle	BRFN	Aboriginal Groups Rights and Interests	Draft VCs Document		Of the biophysical VCs proposed, such as Wildlife and Wildlife Habitat, the subcomponents fail to identify species of critical importance to Blueberry and there is no distinction made between species of greater and lesser importance to Blueberry. For example, proposing to treat western toad on the same footing as furbearers and ungulates does not take into consideration the relative importance of these animals. An assessment of the Wildlife and Wildlife Habitat generally, and general subcomponent of ungulates, may well mask impacts to the most valued wildlife such as moose.	As part of the Application process Tervita will engage with Blueberry as per Tervita's First Nation Consultation Plan. Tervita has also engaged local trappers. Blueberry also has the opportunity to comment on the draft VCs, dAAIR, and Application. Through this process, Tervita will be able to address applicable impacts and mitigation on wildlife "valued" by Blueberry First Nation.	23-Jan-16
BRFN-5	13-Jan-16	Norma Pyle	BRFN	Aboriginal Groups Rights and Interests	Draft VCs Document		An increase in noise could have devastating impacts on wildlife, which will in turn adversely impact Blueberry's interests.	Comment acknowledged. Tervita will add noise as a VC.	23-Jan-16
BRFN-6	13-Jan-16	Norma Pyle	BRFN	Economy	Draft VCs Document		Tervita's exclusion on an economic VC. Tervita states that it did not include an economic VC because the "Project is expected to have a positive impact balance on the economy and no negative effects pathways are anticipated." However, the Project could have adverse effects on Blueberry's treaty rights practices, affecting our economic interests and traditional economy.	Comment acknowledged. Tervita will add the economy as a VC.	23-Jan-16
BRFN-7	13-Jan-16	Norma Pyle	BRFN	Fish and Fish Habitat	Draft VCs Document		Blueberry requests that Fish and Fish Habitat be included as a VC or, alternatively, that a much more fulsome justification of the exclusion of this VC be provided for working group review and comment.	Comment acknowledged. Tervita will talk to our subject matter experts to provide a more fulsome justification for exclusion. Updated: Tervita has incorporated Fish and Fish Habitat as a VC.	23-Jan-16
BRFN-8	13-Jan-16	Norma Pyle	BRFN	Environmental Assessment Methods	Draft VCs Document		Tervita's methods for data collection rely largely on desktop reviews. Significantly more data collection will be required and it is critical that Tervita shares plans for data collection and analysis, including sampling site locations, season and specific parameters that will be measured.	Additional details regarding data collection will be laid out in technical investigations, monitoring programs etc. as a part of the Application. Updated: The air study and soil sampling scope has been distributed by the BC EAO.	23-Jan-16

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-9	13-Jan-16	Norma Pyle	BRFN	Environmental Assessment Methods	Draft VCs Document		There is no rationale provided for the VC's spatial boundaries listed in Table 4. There is no reference to scientific, local or traditional knowledge, expertise, evidence, or biophysical and social cultural, economic and environmental baseline conditions. Consultation with Blueberry is necessary to ensure that the local and regional assessment boundaries consider all available information and expertise. Tervita must provide a rational for the different VC spatial boundaries.	Please see the following for justification of spatial boundaries. Air RSA - The expected contaminants of concern for the proposed Project are primarily fugitive dust emissions (particulate matter), and to a lesser extent various minor combustion tailpipe emissions. This choice of study area dimensions is expected to be sufficient to capture the area of maximum impact for such low lying releases. Also, although no modeling is planned for the proposed Project, the extent of the study area is consistent with current BC Air Dispersion Modelling Guidance (see Section 6.1 of Guideline for Air Quality Dispersion Modelling in BC, BC MECCS, October 2006). Surfacewater and groundwater RSA/LSA - Potential effects of the Project on surface water and groundwater are considered within the context of the LSA and the RSA. The LSA is the geographic area in which direct interaction of the Project with surface water and groundwater is expected. The RSA is a larger area that provides context for the assessment of direct and cumulative adverse effects of the proposed Project, and is not the area within which direct Project effects are expected. Cumulative effects of the proposed Project with existing and reasonably foreseeable projects on surface water and groundwater are considered within the boundary of the RSA. The 15-km radius of the RSA is delimited by the Blueberry River, as the Project is not expected to act cumulatively on surface and groundwater with other existing or reasonabl foreseeable projects beyond the Blueberry River. The LSA is considered to be the extent in which direct potential effects could occur (that is, the geographic area in which direct interaction of the Project with surface water and groundwater may occur). The LSA boundary is defined as a 30-m radius extending outwards from the Project Footprint, including associated physical works and activities. Management measures to contain contaminated water within the facility will ensure that no effects to surface or groundwater occur beyond the LSA, therefore, effects on the Blueberry River, or other watercourses beyond the LSA, are not anticipated. Ongoing management measures include surface and groundwater collection and monitoring to ensure potential waterborne contaminants do not enter the environment. Update: The air RSA is now 10 km and incorporates most of Blueberry First Nation. The justification and rational for chosen LSA and RSA boundaries are explained in full in Table 4 of the draft VC document.	23-Jan-16
BRFN-10	13-Jan-16	Norma Pyle	BRFN	Aboriginal Groups Rights and Interests	Draft VCs Document		Need for a Blueberry Treaty Rights stand alone VC.	Tervita followed BC EAO technical guidance documents. Blueberry First Nation will need to engage the BC EAO on the possibility of a stand-alone VC for Blueberry Treaty Rights.	23-Jan-16
BRFN-11	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Trigger points for additional mitigation measures should be identified before surveys are conducted to ensure findings are objectively used to develop appropriate avoidance and mitigation measures.	The intent of the Wildlife Survey as drafted is to first complete the survey to understand the species present and local habitat usage. With this information, local and regional habitat use patterns can be assessed against the proposed project development. Given this knowledge, supported by supplemental surveys, we will be able to understand what triggers if any exist and what mitigation measures will be required to address the triggers identified. Given the majority of the Project Footprint is actively cultivated, the anticipated number of trigger points is low due to cultivated agricultural land having a lower wildlife capacity when compared to woodlands and wetlands. That said, post survey completion, the mitigation measures will be provided to BRFN and other working group members for review once survey results are finalized.	8-Sep-16

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-12	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Additional information about Blueberry's role in the fieldwork, including detail on how Blueberry's traditional knowledge will be collected, understood and incorporated into the surveys is required.	Tervita wishes to engage Blueberry First Nation Members to provide one wildlife spotters / observers / field monitors for the surveys. With respect to the collection, understanding and incorporation of traditional knowledge, Tervita is willing to work with Blueberry River First Nation on a Traditional Knowledge and Use Study. Tervita received a scope of work from BRFN for a Traditional Knowledge and Use Study (Appendix 1). Tervita responded (Appendix 2) to Blueberry's request on June 17th seeking more clarity on the scope of work. Please provide the clarity Tervita is seeking so Blueberry's traditional knowledge can be collected, understood and incorporated.	8-Sep-16
BRFN-13	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		The proposed SOW does not account for the impact of recent wildfires in the area. As a result of this recent change to the landscape a wildlife tree survey is needed.	Wildfires result in a structural mosaic of wildlife habitat, including the creation of wildlife trees (that is, standing snags) (y et al. 2004). However, current forest practices such as salvage logging may reduce the number of wildlife trees present in recently burned areas. Based on the 2015 site survey, large trees are predominantly located outside of the Project Footprint, particularly to the south. Tervita is including wildlife tree survey to catalogue wildlife trees in the Project Footprint in the supplemental winter wildlife surveys.	8-Sep-16
BRFN-14	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		The SOW proposes two wildlife cameras, but based on information about groundwater flow, Blueberry requests that two additional wildlife cameras be installed in the north and west of the Project area to determine activity levels at areas where there is a potential risk of contamination from the Project.	Tervita has purchased and installed two additional wildlife cameras. The cameras are installed along the north and west edges of the Project area. There are now a total of four wildlife cameras onsite.	8-Sep-16
BRFN-15	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Additional information about the fall survey is required, including how observation stations will be selected and how many times the survey will be repeated.	The survey sites for the fall survey will be selected to represent a sample of the available habitat types present within the Project area (for example, wetlands and ponds, hayfield, shrubby areas, forested areas). A total of 10 observation stations have been selected for the fall survey (Figure 1). All potential staging waterbodies within the Project area will be visited, therefore, six observation stations are located in the area of ponds and wetlands that may be used by staging migratory waterfowl. Two replicate observation stations were placed in each other general habitat type (shrubby/field and forested) to capture other migratory species that may be present in the Project area: two observation stations are located within shrubby or previously disturbed areas and two observation stations are located within forested habitats. The fall survey will be repeated once, as this will provide an adequate snapshot of migratory bird use in the area to supplement existing information and desktop review, and to inform Project mitigation measures.	8-Sep-16
BRFN-16	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Additional information about the winter survey is required, including information about where survey transects will be located and how many times the survey will be repeated.	Additional information regarding the winter survey locations will be provided before the fieldwork begins (details are currently being developed). The winter survey will be repeated twice, in early and late winter, as to provide adequate data on ungulate, medium sized mammal, small mammal, and game bird usage of the Project area in winter and to inform Project mitigation measures.	8-Sep-16

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-17	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		The spring surveys should be improved by ensuring surveys of breeding birds include nest surveys in addition to point count surveys and by ensuring that amphibian surveys are repeated three times, identify migration pathways for western toad (assuming they are present) and record the presence of egg masses and larvae.	Nest surveys will not be included in the spring surveys. The assessment of Project effects and development of mitigation measures takes a precautionary approach whereby conclusions and mitigation are derived based on the assumption that species that have potential to occur will interact with the Project. Therefore, it is assumed that birds detected during the breeding bird point counts are breeding in the Project area and it is unnecessary to perform invasive nest surveys. Tervita performs nest surveys before any cell construction at Silverberry, to accurately understand impacts prior to construction and apply appropriate mitigation measures to specific nests found in the area. The spring survey, including bird point counts and amphibian surveys, will be repeated three times, as to ensure amphibian habitat use by a variety of life history stages (for example, breeding adults, eggs, tadpoles, and dispersing juveniles) is accurately captured and to provide adequate data to inform Project mitigation measures.	8-Sep-16
BRFN-18	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Blueberry expects that all fieldwork conducted in our territory is monitored by Blueberry field monitors, we look forward to ensuring the same occurs for these studies.	Tervita wishes to engage Blueberry First Nation Members to provide one wildlife spotters / observers / field monitors for the surveys.	8-Sep-16
BRFN-19	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Survey timing (fall, winter, and spring) is important to understand how wildlife are currently using the area and determine what the additional impacts will be from the proposed Project.	We agree with this statement and thus as proposed Tervita will be completing fall winter and spring surveys according to the BC Resource Inventory Methods for each target wildlife group (for example, breeding birds, amphibians, and ungulates).	8-Sep-16
BRFN-20	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		It is not clear how the information collected in the proposed surveys will be used to develop meaningful mitigations for wildlife that are currently using the area, and may be displaced or otherwise impacted by the proposed expansion of the landfill. If high ungulate use of the area is observed, how will this be mitigated? If small/medium sized mammal use is high, how will impacts be determined and mitigated? If specific wildlife trails or migration pathways (for example, for amphibians) are observed, how will these sites be protected? What findings would trigger additional mitigations? Best practices for impact assessments require determining these potential trigger points before surveys are conducted to ensure findings can be objectively used to develop appropriate mitigations.	Wildlife mitigation measures will be developed following the supplemental wildlife surveys and informed by the survey results. These surveys will enhance our understanding of how wildlife is using the habitat within the Project area in order to inform Project mitigation measures. Given the majority of the Project Footprint is actively cultivated, the anticipated number of trigger points is low due to cultivated agricultural land having a lower wildlife capacity when compared to woodlands and wetlands. The mitigation measures will be provided to BRFN and other working group members for review once survey results are finalized.	8-Sep-16
BRFN-21	26-Aug-16	Norma Pyle	BRFN	Aboriginal Groups Rights and Interests	Wildlife Survey		More detail is required on the proposed role of First Nations “throughout” fieldwork, as stated in broad strokes in Section 5 of the SOW, as well as a commitment to work with Blueberry to appropriately collect, interpret and incorporate our traditional knowledge.	Tervita welcomes the engagement of Blueberry First Nation in the wildlife studies. Please refer to question FN12 and FN18 for more detail.	8-Sep-16
BRFN-22	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Recent wildfire in the area makes protection of wildlife habitat and habitat features even more important at this time, potentially exacerbating existing cumulative effects and further reducing the number of wildlife trees in the area. These trees are an important habitat feature for many species of birds and mammals (including bats). A focused survey is needed to look at wildlife tree occurrence and determine whether additional mitigations should be considered to restore this habitat feature. The resulting frequency of snag occurrence should be compared to normal occurrence frequencies for this BEC zone / variant to provide a target for wildlife tree creation / restoration as a mitigation for wildlife trees lost due to clearing—an effect that will compound the potential loss of large, old trees and snags due to the recent wildfire.	Wildfires result in a structural mosaic of wildlife habitat, including the creation of wildlife trees (that is, standing snags) (Nappil et al. 2004). However, current forest practices such as salvage logging may reduce the number of wildlife trees present in recently burned areas. Based on the 2015 site survey, large trees are predominantly located outside of the Project Footprint, particularly to the south. Tervita is including wildlife tree survey to catalogue wildlife trees in the Project Footprint in the supplemental winter wildlife surveys.	8-Sep-16

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-23	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Use of the area by ungulates, including moose, deer and elk, is of interest and concern to Blueberry. Our members are concerned about animals browsing shrubs and using lick sites or getting water from areas immediately downstream and downgradient of the Silverberry Secure Landfill. We note that, based on the Project description from the proponent, groundwater generally flows to the northwest (p. 24 of *CEA Act* Project Description). Surface water also flows northwest, towards an unnamed tributary of the Blueberry River about 500 m west of the site (p. 6 of BC EAO Project Description). Though the proponent reports that ground and surface water quality monitoring has not raised any concerns to date, there are concerns that an expanded Project Footprint or a spill could increase the potential for contamination of ground and surface water, which could result in contamination risks to wildlife using the area. To capture wildlife activity in the area most at risk of contamination from ground and surface water, Blueberry recommends that at minimum four wildlife cameras be deployed in the north and west of the Project area (in addition to the two cameras currently proposed to the north and east) throughout all seasons (fall, winter, spring) to determine how moose and other ungulates are using these areas, including determining activity levels and assessing the likelihood of contamination from water sources and mineral.	Tervita has purchased and installed two additional wildlife cameras. The cameras are installed along the north and west edges of the Project area. There are now a total of 4 wildlife cameras on site.	8-Sep-16 8-Sep-16
BRFN-24	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		If there are known mineral licks in the area (within 2 km), these should be monitored with wildlife cameras.	Tervita is unaware of any mineral licks in the area. Could BRFN show the location of mineral licks within 2 km of Silverberry Landfill on a map so Tervita can consider the viability of placing wildlife cameras at the licks.	8-Sep-16
BRFN-25	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Results of these surveys should be shared with Blueberry on completion and analyzed and presented to decision-makers as part of the Project Application to ensure results are incorporated into the assessment of Project impacts.	Results of the surveys will be shared with Blueberry upon finalization and will be used in the Project Application to ensure they are incorporated into the assessment of Project impacts and to inform the development of Project mitigation measures.	8-Sep-16
BRFN-26	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		The brief description provided on p. 3-1 is not explicit about how observation stations will be selected and how often the survey will be repeated. Because migration events can be sporadic and may be difficult to predict due to climate change, we recommend repeating the survey at least three times over the course of the expected migration period (beginning, middle and end).	The survey sites for the fall survey will be selected to represent a sample of the available habitat types present within the Project area (for example, wetlands and ponds, hayfield, shrubby areas, and forested areas). A total of 10 observation stations have been selected for the fall survey (Figure 1). All potential staging waterbodies within the Project area will be visited, therefore, six observation stations are located in the area of ponds and wetlands that may be used by staging migratory waterfowl. Two replicate observation stations were placed in each other general habitat type (shrubby/field and forested) to capture other migratory species that may be present in the Project area: two observation stations are located within shrubby or previously disturbed areas and two observation stations are located within forested habitats. The fall survey will be repeated once, as this will provide an adequate snapshot of migratory bird use in the area to supplement existing information and desktop review, and to inform Project mitigation measures.	8-Sep-16
BRFN-27	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Blueberry requests additional information about where the surveys will be located and what habitat types will be represented in the survey. Blueberry would like the opportunity to comment on proposed survey locations once this information has been provided.	The survey sites for the fall survey will be selected to represent a sample of the available habitat types present within the Project area (for example, wetlands and ponds, hayfield, shrubby areas, forested areas). A total of 10 observation stations have been selected for the fall survey (Figure 1). All potential staging waterbodies within the Project area will be visited, therefore, six observation stations are located in the area of ponds and wetlands that may be used by staging migratory waterfowl. Two replicate observation stations were placed in each other general habitat type (shrubby/field and forested) to capture other migratory species that may be present in the Project area: two observation stations are located within shrubby or previously disturbed areas and two observation stations are located within forested habitats. The fall survey will be repeated once, as this will provide an adequate snapshot of migratory bird use in the area to supplement existing information and desktop review, and to inform the Project mitigation measures.	8-Sep-16

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-28	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		As with the fall survey, the description provided on p. 3-1 is not explicit about whether surveys will be conducted more than once or where survey transects will be located. To increase certainty regarding the results of winter track surveys and translate that information into developing meaningful mitigations, Blueberry recommends that track surveys be repeated at least three times over the course of the winter. This will also capture any changes in use of the area depending on timing during the winter.	Additional information regarding the winter survey locations will be provided before the fieldwork begins (details are currently being developed). The winter survey will be repeated twice, in early and late winter, as to provide adequate data on ungulate, medium sized mammal, small mammal, and game bird usage of the Project area in winter and to inform Project mitigation measures.	8-Sep-16
BRFN-29	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Blueberry requests an opportunity to review proposed survey locations and recommend additional survey sites based on our knowledge of how ungulates, medium sized mammals, small mammals, and game birds are using the area.	Proposed winter survey locations will be shared with BRFN.	8-Sep-16
BRFN-30	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		For breeding birds, nest surveys should occur in addition to point count surveys. A sample of the located nests should be monitored to determine fledgling success rates.	Nest surveys will not be included in the spring surveys. The assessment of Project effects and development of mitigation measures takes a precautionary approach whereby conclusions and mitigation are derived based on the assumption that species that have potential to occur will interact with the Project. Therefore, it is assumed that birds detected during the breeding bird point counts are breeding in the Project area and it is unnecessary to perform invasive nest surveys. Tervita performs nest surveys before any cell construction at Silverberry, to accurately understand impacts prior to construction and apply appropriate mitigation measures to specific nests found in the area.	8-Sep-16
BRFN-31	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		If western toads are present, an emphasis should be placed on finding migration pathways between wetland breeding sites and upland areas, to ensure that these migration routes can be protected.	The spring surveys will collect information amphibian habitat use by a variety of life history stages (for example, breeding adults, eggs, tadpoles, and dispersing juveniles) to inform Project mitigation measures.	8-Sep-16
BRFN-32	26-Aug-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		The spring surveys will collect information amphibian habitat use by a variety of life history stages (for example, breeding adults, eggs, tadpoles, and dispersing juveniles) to inform Project mitigation measures.	The spring surveys will collect information amphibian habitat use by a variety of life history stages (for example, breeding adults, eggs, tadpoles, and dispersing juveniles) to inform Project mitigation measures	8-Sep-16
BRFN-33	27-Sep-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		What mitigations are going to be proposed if important wildlife features are found (for example, what can be realistically be done to protect a game trail or mineral lick, if one is found in the proposed footprint or LSA). As outlined in our August 26, 2016 letter it is important that potential mitigations are identified at this time.	Results of each survey event will be shared with BRFN. If important wildlife features are found, mitigation measures will be addressed in the Application which will be reviewed by BRFN as part of the Working Group process. Tervita would also like to meet with BRFN to discuss potential mitigation measures appropriate to the results of the surveys. No species of conservation concern were observed during the survey and results will be shared as soon as possible with BRFN.	24-Oct-16
BRFN-34	27-Sep-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		What role Blueberry will be offered in the development and implementation of the wildlife survey and subsequent mitigation, monitoring and reclamation programs given our stewardship rights and responsibilities are high in this area and in the heart of our territory.	Thus far, Tervita has listened to and made substantial changes to the wildlife surveys due to Blueberry First Nation's input. Due to Blueberry's feedback, Tervita has increased the amount of wildlife cameras and added six additional field survey dates. We look forward to BRFN, Lands Department, continued input into the wildlife surveys. Subsequent mitigation, monitoring and reclamation, appropriate to the results of the wildlife surveys, will be discussed in the Application and in consultation with BRFN.	24-Oct-16
BRFN-35	27-Sep-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Whether the surveys proposed will be adequate to find all wildlife features, without a more dedicated effort to incorporate multiple Blueberry Land Users who have a long relationship with this area. Finding specific wildlife features (for example game trails, bear dens, stick nests, lick sites, amphibian movement corridors) will require a full walk through/ survey of the site and LSA. Blueberry members should be leading this work and be given the authority to mark areas for protection from disturbance.	Thus far, Tervita has listened to and made substantial changes to the wildlife surveys due to Blueberry First Nation's input. Due to Blueberry's feedback, Tervita has increased the amount of wildlife cameras and added six additional field survey dates. We look forward to BRFN, Lands Department, continued input into the wildlife surveys. Additionally, Tervita is committed to working with BRFN and would like to meet BRFN, Lands Department, to see how we can incorporate some of the above concerns in the proposed TLU survey. Specific wildlife features and their protection will be discussed in the Application and in consultation with BRFN. Tervita would also like to meet with BRFN to discuss potential mitigation measures appropriate to the results of the surveys.	24-Oct-16

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-36	27-Sep-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Please identify what mitigation measures will be committed to/ conducted if important wildlife features (for example, stick nests, lick sites, wildlife trails, amphibian movement corridors) are encountered during fieldwork.	Results of the fieldwork will be shared with BRFN. Mitigation measures will be addressed in the Application which will be reviewed by BRFN as part of the Working Group process. Tervita would also like to meet with BRFN to discuss potential mitigation measures appropriate to the results of the surveys.	24-Oct-16
BRFN-37	27-Sep-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Will additional fieldwork be proposed if initial surveys identify important features that should be avoided during construction?	Results of the fieldwork and surveys will be shared with BRFN. Initial results of the surveys will have to be reviewed by Tervita and Jacobs' Registered Professional Biologist to determine whether further fieldwork would be required. If further surveys are required, Tervita will notify BRFN.	24-Oct-16
BRFN-38	27-Sep-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Is there any leeway to adjust the boundaries of the proposed construction site if needed?	The EAC Amendment proposed construction area looks to minimize impact through use of Tervita's currently privately owned land, maximizing the utilization of existing land use (currently cultivated lands), adjacency to the existing landfill, and use of the existing landfill infrastructure. The boundaries of the construction will remain consistent throughout the EAC Amendment.	24-Oct-16
BRFN-39	27-Sep-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		What other mitigation measures are being considered to reduce the impacts of the proposed Project on important wildlife features in the area?	Results of the fieldwork will be shared with BRFN. Mitigation measures will be addressed in the Application which will be reviewed by BRFN as part of the Working Group process. Tervita would also like to meet with BRFN to discuss potential mitigation appropriate to the results of the surveys.	24-Oct-16
BRFN-40	27-Sep-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		What role does Tervita commit to engage BRFN in regard to the development of site-specific wildlife mitigation, monitoring and adaptive management program development?	Results of the fieldwork will be shared with BRFN. Mitigation measures will be addressed in the Application which will be reviewed by BRFN as part of the Working Group process. In addition, information that may contribute to wildlife mitigation may be shared during Blueberry River First Nation's TLU program. Tervita would also like to meet with BRFN to discuss potential mitigation appropriate to the results of the surveys. Adaptive management strategies can also be discussed once survey results are finalized and mitigations measures are discussed.	24-Oct-16
BRFN-41	27-Sep-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		At this time, Blueberry is participating in field studies on a monitor basis only, despite a desire to be involved in developing and implementing field studies and the assessment of Project impacts based on the same.	Tervita would like continue the dialogue with BRFN, Lands Department, to discuss the development and implementation of the wildlife surveys. To date, Tervita has listened to and made substantial changes to the wildlife surveys due to Blueberry First Nation's input. Due to Blueberry's feedback, Tervita has increased the amount of wildlife cameras and added six additional field survey dates.	24-Oct-16
BRFN-42	27-Sep-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Blueberry should be consulted regarding the timing of field surveys, as our knowledge holders have very thorough local knowledge of how animals are using these areas. To date Blueberry's traditional knowledge has not informed the timing of the surveys.	The timing of the wildlife field surveys will be guided by the appropriate survey guidelines provided by BC Resource Inventory Standards Committee. Local knowledge of the timing of wildlife habitat use will be welcomed during consultation with BRFN and will be considered in survey timing. At present, two winter surveys are planned for January and February 2017, and three spring surveys are planned for May and June 2017 (a total of five more surveys). Tervita would value Blueberry River First Nation's input on the dates of the additional proposed surveys.	24-Oct-16
BRFN-43	27-Sep-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Please see additional issues raised under point 1, above. Blueberry is interested in hearing more from Tervita about what options may be considered in terms of mitigations, particularly whether there are still opportunities to adjust the location or design of the site to protect important wildlife features, if they are observed during fieldwork.	The initial and most important mitigation is in the section of the proposed project site. The EAC Amendment proposed construction area looks to minimize impact through use of Tervita's currently privately owned land, maximizing the utilization of existing land use (currently cultivated lands), adjacency to the existing landfill, and use of the existing landfill infrastructure. Results of the fieldwork will be shared with BRFN. Mitigation measures will be addressed in the Application which will be reviewed by BRFN as part of the Working Group process. Tervita may discuss design mitigations in the Application, if applicable. As noted above the location of the Project (construction boundaries) is not expected to change based on the sighting mitigation strategies discussed above.	24-Oct-16

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-44	27-Sep-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		As suggested in the original question, please identify baseline comparison numbers that will be used to determine whether wildlife tree restoration should be considered in the area. For example, how many snags/ha may be a good target in this ecosystem; has it been considered?	A survey of wildlife trees in the Project Footprint and surrounding areas will be completed during the winter fieldwork, before spring leaf-out. Existing conditions will be described in the Application from the results of the wildlife fieldwork. Mitigation measures including wildlife tree restoration, if required, will be addressed in the Application which will be reviewed by BRFN as part of the Working Group process.	24-Oct-16
BRFN-45	27-Sep-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Wildlife Survey		Blueberry is hopeful that a Knowledge and Use Study can be conducted with funding provided by Tervita. Provided adequate funding is offered, Blueberry will be able to identify the locations of mineral licks that stand to be impacted by the proposed Project. Irrespective of such a study, it is critical that lands impacted by the proposed Project are properly surveyed (that is, the full area should be walked) to identify the lick sites and wildlife movement corridors and ensure these areas are monitored and protected. Blueberry recommends that an independent field crew be funded by Tervita, and coordinated by Blueberry, to walk the entire site and survey for important wildlife features (for example lick sites, game trails, bear dens, and stick nests). These areas should be marked and avoided during new construction.	Tervita is committed to working with BRFN and would like to meet BRFN, Lands Department, to see how we can incorporate some of the above concerns in the proposed TLU survey. Specific wildlife features and their protection will be discussed in the Application and in consultation with BRFN. Tervita would also like to meet with BRFN to discuss potential mitigation measures that can be used to help protect important wildlife features.	24-Oct-16
BRFN-46	7-Jun-17	Norma Pyle	BRFN	Air Quality	Draft VCs Document		The VC document suggests that the Project may result in release of particulates which may contain NORM. BFRN's concern is that atmospheric transport will lead to deposition of these materials beyond the selected LSA for this VC (currently established as a 1-km polygon around the Project), with consequent effects on soil quality, surface and groundwater quality, vegetation quality, wildlife health, and traditional use of resources.	With respect to spatial boundaries: • The LSA and RSA were changed after the draft VCs) working group meeting and comments were received. Please refer to Tervita's January 23rd 2016, letter to BRFN providing justification for the LSA and RSA boundaries. The spatial boundaries are based on the anticipated zone of influence for each VC. Changes to the LSA and RSA during the dAAIR and Application stage will only be warranted if information is produced during the technical assessment that changes the understanding of the zone of influence. Applicable results in the TUS, once published, will be used to help determine potential effects and appropriate mitigation measures in the Application.With respect to data collection: • There is no further soil sampling planned at this point. Applicable results in the TUS, once published, will be used to help determine potential effects and appropriate mitigation measures in the Application. Effects to plants will be assessed under the Vegetation VC and effects to wildlife will be assessed under the Wildlife and Wildlife Habitat VC. • Please refer to the March 6th 2017 Soil Study done at Silverberry Landfill. The study was given to the BC EAO for subsequent distribution to the working group. Results of the study will be used to help address concerns of uptake in the Application.	3-Aug-17
BRFN-47	7-Jun-16	Norma Pyle	BRFN	Air Quality	Draft VCs Document		Odour from the present facility is a significant concern to BRFN because it has a profound effect on the experience of the land and to avoidance/alienation from lands. It will be very important to adequately characterize the odour associated with the expansion in locations important to BRFN.	With respect to spatial boundaries: • The LSA and RSA boundaries were changed after the draft VC working group meeting and comments were received. Please refer to Tervita's January 23rd, 2016 letter to BRFN providing justification for the LSA and RSA boundaries. The spatial boundaries are based on the anticipated zone of influence for each VC. Changes to the LSA and RSA during the dAAIR and Application stage will only be warranted if information is produced during the technical assessment that changes the understanding of the zone of influence. • Applicable results in the TUS, once published, will be used to help determine potential effects and appropriate mitigation measures in the Application. With respect to data collection: • Effects to traditional use will be assessed in the Application, Part C, using information from the TUS. Applicable results in the TUS, once published, will be used to help determine appropriate receptors. NORM dust and any accompanying studies will be assessed in the Application and will be addressed under the Human Health VC.	3-Aug-17

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-48	7-Jun-16	Norma Pyle	BRFN	Human Health	Draft VCs Document		Since there are various components and experiences of noise, it will be important to identify parameters for study and measure them appropriately. In particular, wildlife are known to be sensitive to different frequencies. Both A-weighted and C-weighted noise must be considered, as must low-frequency noise/vibration.	With respect to spatial boundaries: • Effects to traditional use will be assessed in the Application, Part C, using information from the TUS. Applicable results in the TUS, once published, will be used to help determine appropriate receptors. With respect to data collection: • The methodology for the noise study will be addressed in the dAAIRs. Mitigation measures for noise will be addressed in the Application. The landfill capacity replacement currently under assessment is located adjacent to the existing Silverberry landfill, which is considered to be part of the baseline existing conditions. Therefore, the assessment of changes to the acoustic environment is expected to be minimal given that the operations in the expanded landfill area are expected to be equivalent to current operations.	3-Aug-17
BRFN-49	7-Jun-16	Norma Pyle	BRFN	Surface Water	Draft VCs Document		We are not aware of extent of the surface water monitoring program at the site. It is not clear from the documents provided, which potential pathways of exposure and potential surface water receptors are considered. BRFN is concerned the identified 500-m LSA is not sufficient. No technical rationale was provided to justify this distance. Ontario Guideline D-4 was referenced which does not apply to landfills that accept/have accepted hazardous or liquid industrial waste. As D-4 states: “For proposals in the vicinity of landfills and dumps that have accepted liquid industrial, toxic or hazardous waste, the BC MECCS shall expect proponents to undertake further investigations and provide a report to the approving authority.”	With respect to spatial boundaries: • Please refer to Tervita's January 23rd, 2016 letter to Blueberry River First Nation providing justification for the LSA and RSA boundaries. The spatial boundaries are based on the anticipated zone of influence for each VC. Changes to the LSA and RSA during the dAAIR and Application stage will only be warranted if information is produced during the technical assessment that changes the understanding of the zone of influence. With respect to data collection: • Currently, there is no surface water monitoring program or a requirement to do so. Water is tested and passes specific criteria before being discharged. Tervita can share the latest surface water analytical. Analytical, date and volume of discharge are all recorded and kept on file. Please see the attached Figure showing pathways and receptors. The surface water effects assessment will be determined during the AAIRs process.	3-Aug-17
BRFN-50	7-Jun-16	Norma Pyle	BRFN	Groundwater	Draft VCs Document		We are not aware of the extent of the groundwater monitoring program at the site. It is not clear from the documents provided, which potential pathways of exposure and potential surface water receptors are considered. BRFN is concerned the identified 500-m LSA is not sufficient. No technical rationale was provided to justify this distance. Ontario Guideline D-4 was referenced which does not apply to landfills that accept/have accepted hazardous or liquid industrial waste. As D-4 states: “For proposals in the vicinity of landfills and dumps that have accepted liquid industrial, toxic or hazardous waste, BC MECCS shall expect proponents to undertake further investigations and provide a report to the approving authority.”	With respect to related VCs: • Tervita provided the 2011-2015 groundwater reports to the BC EAO in spring 2016 for distribution to the working group. Tervita can provide the 2016 groundwater report to supplement the reports already provided. There is no interaction between the zone of influence of groundwater and wetlands. With respect to spatial boundaries: • Please refer to Tervita's January 23, 2016 letter to BRFN providing justification for the LSA and RSA boundaries. The spatial boundaries are based on the anticipated zone of influence for each VC. Changes to the LSA and RSA during the dAAIR and Application stage will only be warranted if information is produced during the technical assessment that changes the understanding of the zone of influence. With respect to data collection: • Tervita provided the 2011-2015 groundwater reports to the BC EAO spring 2016 for distribution to the working group. Tervita can provide the 2016 groundwater report to supplement the reports already provided. The methodology for assessing effects will be determined during the AAIR stage. Pathways and receptors will be discussed in the Application.	3-Aug-17

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-51	7-Jun-16	Norma Pyle	BRFN	Terrestrial Vegetation	Draft VCs Document		BRFN continues to be concerned that this VC is not sufficiently defined to allow a determination of effects on plant species, or desirability of/access to plant species, used for traditional purposes and/or the desire/ability to harvest these species in the context of noise and odour issues.	With respect to subcomponents: • Effects to traditional use will be assessed in the Application, Part C, using information from the TUS. With respect to spatial boundaries: • Please refer to Tervita's January 23rd, 2016 letter to BRFN providing justification for the LSA and RSA boundaries. The spatial boundaries are based on the anticipated zone of influence for each VC. Changes to the LSA and RSA during the dAAIR and Application stage will only be warranted if information is produced during the technical assessment that changes the understanding of the zone of influence. With respect to data collection: • Please refer to Tervita's January 23rd, 2016 letter to BRFN providing justification for the LSA and RSA boundaries. The spatial boundaries are based on the anticipated zone of influence for each VC and any changes to the LSA and RSA during the dAAIR and Application stage will be based on information that changes the understanding of the zone of influence.	3-Aug-17
BRFN-52	7-Jun-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Draft VCs Document		BRFN remains concerned that the subcomponent is not sufficiently disaggregated to identify those species and their habitats that are of particular concern to BRFN. BRFN notes that these species should be identified through a TLU study. Distributions and appropriate sampling locations could also be identified, at least in part, by the same. BRFN is also concerned that “habitat” as a subcomponent, and “change” as a KI, are not yet adequately defined to ensure that study is not limited to physical change. An effects assessment must also address changes in invertebrate community composition as these are a leading indicator of ecosystem health. These in turn may affect human health, sense of place, and transmission of knowledge and must be carried forward for assessment accordingly.	With respect to subcomponents: • Effects to traditional use will be assessed in the Application, Part C, using information from the TUS. With respect to spatial boundaries: • Please refer to Tervita's January 23rd, 2016 letter to BRFN providing justification for the LSA and RSA boundaries. The spatial boundaries are based on the anticipated zone of influence for each VC. Changes to the LSA and RSA during the dAAIR and Application stage will only be warranted if information is produced during the technical assessment that changes the understanding of the zone of influence. With respect to data collection: • Effects to invertebrates will be captured under effects to Fish and Fish Habitat, under the Change in Habitat KI. Applicable mitigation measures will be addressed in the Application.	3-Aug-17
BRFN-53	7-Jun-16	Norma Pyle	BRFN	Wildlife and Wildlife Habitat	Draft VCs Document		BRFN remains concerned that the KIs are poorly characterized and that traditional knowledge has not been used to understand behaviors and movement patterns of particular species of importance to BRFN. The concern, therefore, is that these effects will be under-emphasized when carried forward to assessment of effects on TLU, sense of place, and transmission of knowledge, among others. The species of importance to BRFN and the practice of BRFN’s treaty rights are not identified with clear and relevant indicators for assessment that capture how these species are relied upon by BRFN.	With respect to subcomponents: • Tervita will engage with BRFN on the furbearers of concern. Effects to traditional use will be assessed in the Application, Part C, using information from the TUS. • The Silverberry landfill and capacity replacement area is not within or in proximity to woodland caribou range. In addition, the area in the Wildlife and Wildlife Habitat LSA is poor caribou habitat. • Porcupine and Beaver will be assessed under the Furbearers KI. With respect to KIs: • The key concerns listed by Blueberry River First Nation will be assessed under the Wildlife and Wildlife Habitat KIs including change in habitat and change in movement. With respect to spatial boundaries: • Please refer to Tervita's January 23, 2016 letter to BRFN providing justification for the LSA and RSA boundaries. The spatial boundaries are based on the anticipated zone of influence for each VC. Changes to the LSA and RSA during the dAAIR and Application stage will only be warranted if information is produced during the technical assessment that changes the understanding of the zone of influence. With respect to data collection: • Effects to traditional use will be assessed in the Application, Part C, using information from the TUS.	3-Aug-17

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-54	7-Jun-16	Norma Pyle	BRFN	Aboriginal Groups Rights and Interests	Draft VCs Document		By identifying “First Nation hunting…” as a subcomponent of this VC, it is clear that this VC is intended to be used to assess effect of the Project on BRFN use. BRFN remains deeply concerned that the proponent has an unduly narrow understanding of traditional use that is restricted to extractive uses or travel patterns associated with extractive uses. A full suite of nonextractive values exist that may be affected by the Project. These may include (but are by no means limited to): • Experience of the land/sense of place associated with food and water taste, quality, and abundance • Sense of cultural identity associated with place, place (visual/odour/light) quality, and ability to exercise traditional practices • Intergenerational cultural transmission Spirituality and Stewardship: • As set out in the letter enclosing these comments, key concerns specific to the present project must be identified in the context of a TLU study, measured appropriately, and assessed accordingly. Rather than taking an unduly narrow view of Blueberry’s interests as attempted by this VC, a VC	With respect to subcomponents: • Effects to traditional use, including an assessment specific to Blueberry River First Nation, will be assessed in the Application, Part C, using information from the TUS. With respect to KIs: • Effects to water are covered under the surface water and groundwater VC. • Effects of odour are covered under the air quality, noise under the acoustic environment VC respectively. Light and its effect are not being considered a VC at this time. Effects to Blueberry River First Nation land will be considered in Part C of the Application. • Effects of the Project on Blueberry River First Nation will be addressed in Part C of the Application. With respect to spatial boundaries: • Please refer to Tervita's January 23rd, 2016 letter to BRFN providing justification for the LSA and RSA boundaries. The spatial boundaries are based on the anticipated zone of influence for each VC. Changes to the LSA and RSA during the dAAIR and Application stage will only be warranted if information is produced during the technical assessment that changes the understanding of the zone of influence. With respect to data collection: • BRFN will have the opportunity to comment on data and data gathering methods.	3-Aug-17
BRFN-55	7-Jun-16	Norma Pyle	BRFN	Aboriginal Groups Rights and Interests	Draft VCs Document		BRFN note that Visual Quality and Aesthetics have been excluded from consideration on the grounds that the site is remote and that a visual barrier will be erected to disguise the new landform created by the landfill. This exclusion represents a fundamental misunderstanding of First Nations’ relationship to land. Landforms reflect important elements of culture and are used as a tool for intergenerational transmission of knowledge. The remoteness of a location and, by extension, its “naturalness” is a key component of cultural identity and sense of place, where naturalness has distinct features that differ by season and time. Night-time “naturalness” (notably the absence of artificial light is important to BRFN members both because night sky viewing is important and because BRFN is concerned that artificial light will have a disruptive effect on birds and wildlife.)	The Application is being submitted to assess the impacts of a potential capacity replacement of the existing Silverberry landfill. Therefore, the existing conditions adjacent to the capacity replacement site is an operational facility, including visual disturbance and light emissions. There are no expected changes to visual quality or light emissions based on the proposed capacity replacement. The operating hours of the landfill are mainly during daylight hours and night operations are rare. There are no plans to include visual quality as a VC at this time.	3-Aug-17

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-56	7-Jun-16	Norma Pyle	BRFN	Human Health	Draft VCs Document		BRFN members continue to be concerned that the landfill is, or will, affect water, air, and collected, gathered, or harvested consumables that in turn will affect BRFN member health. Whether or not contaminants are below regulated levels is one important KI; a second KI is the extent to which perception leads to avoidance of country foods, leading to adverse health and economic effects of reliance on store-bought foods.	With respect to subcomponents: • The Application is being submitted to assess the impacts of a potential capacity replacement of the existing Silverberry landfill. Therefore, the existing conditions adjacent to the capacity replacement site is an operational facility. • Traditional use effects specific to BRFN, will be discussed in Part C of the Application. With respect to KIs: • The human health effects assessment is based on pathways of potential effects from the Air Quality, Terrain and Soils, Noise and Surface Water VCs. Effects to traditional use of the Blueberry River First Nation will be assessed in Part C of the Application. With respect to boundaries: • Please refer to Tervita's January 23rd, 2016 letter to BRFN providing justification for the LSA and RSA boundaries. The spatial boundaries are based on the anticipated zone of influence for each VC. Changes to the LSA and RSA during the dAAIR and Application stage will only be warranted if information is produced during the technical assessment that changes the understanding of the zone of influence.With respect to data collection: • The Blueberry River First Nation-specific Socio-Economic Study will be used inform the effects assessment in the Application. • Information on traditional use provided by Blueberry River First Nation will inform the assessment to TLU in Part C of the Application.	3-Aug-17
BRFN-57	7-Jun-16	Norma Pyle	BRFN	Socio-Economic	Draft VCs Document		BRFN's direct experience has been that the negative socio-economic impacts of industrial developments are disproportionately experienced by BRFN. While the VC contemplates assessing impacts on First Nations separately from the general public a specific BRFN subcomponent is needed to ensure appropriate KIs and appropriate data is gathered.	With respect to subcomponents: • Effects specific to Blueberry River First Nation will be addressed in Part C of the Application. With respect to KIs: • The Application is being submitted to assess the impacts of a potential capacity replacement of the existing Silverberry landfill. Therefore, changes to employment and economy from the baseline conditions are expected to be small. Potential impacts to the proposed KIs will be covered under the current KI Economic Activity Levels in the LSA and RSA. With respect to data collection: • The Blueberry River First Nation-specific Socio-Economic Study will be used inform the effects assessment in the Application.	3-Aug-17
BRFN-58	12-Sep-18	Jane Calvert	BRFN	General	dAAIR (February 2018)	Application Summary	If the summary reflects the methodology of the Application, the bullet points are out of order: a summary of key effects, mitigation measures, residual, and cumulative effects will inform effects on Aboriginal interests and therefore should precede this bullet.	Tervita will switch the ordering of the bullets in the Application Summary.	18-Sep-18
BRFN-59	12-Sep-18	Jane Calvert	BRFN	Project Description	dAAIR (February 2018)	1.2, 3rd bullet	In addition to describing the location of the proposed Project relative to Aboriginal groups' territories, please provide maps identifying project components in relation to territories.	Tervita can include this figure in the draft Application. Tervita currently, has Figure A-3 in the VCs, that show's the Project in relation to BRFN and DRFN.	18-Sep-18
BRFN-59a	31-Oct-18	Jane Calvert	BRFN	Project Description	dAAIR (February 2018)	1.2, 3rd bullet	For clarity, BRFN is requesting a figure in addition to VC Figure 3 that identifies the Project within the Nation's traditional territory, not just it's proximity to the existing IR.	Tervita will be able to supply this Figure in the Application.	1-Nov-18
BRFN-59b	14-Nov-18	Jane Calvert	BRFN	Project Description	dAAIR (February 2018)	1.2, 3rd bullet	Resolved	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-60	12-Sep-18	Jane Calvert	BRFN	Project Description	dAAIR (February 2018)	1.2, 8th bullet	Please add the Agreement to the list of provincial documents to be considered	Tervita will add the Agreement to the list of provincial documents to be considered. Tervita would like to note that the Agreement is for Oil and Gas Applications under the OGC and that the landfill expansion will take place on private land.	18-Sep-18

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-60a	31-Oct-18	Jane Calvert	BRFN	Project Description	dAAIR (February 2018)	1.2, 8th bullet	Resolved. BRFN believes it is important that the Environmental Assessment reference the Agreement to provide context: BRFN's territory is already heavily impacted and efforts to reduce further impact should underpin all future activities, including those on private lands.	Tervita thanks BRFN for providing context to the requested reference.	1-Nov-18
BRFN-60b	14-Nov-18	Jane Calvert	BRFN	Project Description	dAAIR (February 2018)	1.2, 8th bullet	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-61	12-Sep-18	Jane Calvert	BRFN	Project Description	dAAIR (February 2018)	1.2, 8th bullet	Please add national, or international planning or management designations (for example Cecil Lake Important Bird Area etc.) to the list of land uses to be considered.	Tervita will add Wildlife Management Areas (WMAs) under the 8th bullet.	18-Sep-18
BRFN-61a	31-Oct-18	Jane Calvert	BRFN	Project Description	dAAIR (February 2018)	1.2, 8th bullet	Since Cecil Lake is the only area with another management designation (an Important Bird Area, what is the reason for its omission? Will this be mentioned in the context of assessment of Eared Grebes in the Wildlife and Wildlife Habitat Section?	Currently, Tervita does not anticipate that the Cecil Lake Important Bird Area overlaps or will be potentially effected by the Project.	1-Nov-18
BRFN-61b	14-Nov-18	Jane Calvert	BRFN	Project Description	dAAIR (February 2018)	1.2, 8th bullet	BRFN is concerned that cumulative effects to what is understood to be an important area for birds, including the Eared Grebe, are assessed. To that end, BRFN requests that cumulative effects to this Important Bird Area be assessed.	The 8th bullet in Section 1.2 of the dAAIR has been revised as follows to include the Cecil Lake Important Bird Area: Provincial land use plans (for example Land and Resource Management Plans) and provincial land use designations (for example Agricultural Land Reserve, Old Growth Management Areas, Wildlife Management Areas (including the Cecil Lake Important Bird Area), *Forests and Range Practices Act* designations) and provincial land use management objectives	22-Nov-18
BRFN-62	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.1 (Issues Scoping and Selection of VCs)	Please include "Odour" in the title of the Air Quality VC to make this specific value explicit.	Tervita will edit the document and add "Odour" to the Air Quality VC bullet under 3.1 of the dAAIR.	18-Sep-18
BRFN-62a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.1 (Issues Scoping and Selection of VCs)	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-62b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.1 (Issues Scoping and Selection of VCs)	BRFN would like to understand and contribute to developing the methodology for assessing odour prior to submission of the Application.	Tervita will reach out to BRFN to discuss methodologies for assessing odour prior to submission of the Application.	22-Nov-18
BRFN-63	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.1 (Issues Scoping and Selection of VCs)	Please add "Visual Quality" as a VC to permit data collection about, and assessment of, Project effects on conditions important to BRFN.	Tervita will edit the document and incorporate Visual Quality under the Human Health bullet, as "Human Health including Visual Quality."	18-Sep-18
BRFN-63a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.1 (Issues Scoping and Selection of VCs)	Partially Resolved. For clarity, visual quality is a contributor to well-being. Scoping this sub-VC carefully will be important to ensure data is adequately captured so that the Crown can assess effects to rights.	Tervita thanks BRFN for the clarification and will scope relevant data to assess visual quality.	1-Nov-18
BRFN-63b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.1 (Issues Scoping and Selection of VCs)	BRFN would like to understand and contribute to the scoping and methodology for this sub-VC prior to receiving the Application.	Tervita will reach out to BRFN to discuss methodologies for assessing visual quality prior to submission of the Application.	22-Nov-18
BRFN-64	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.1 (Issues Scoping and Selection of VCs)	Please add revise the title of the VC to "Cultural and Heritage Resources" to permit data collection about, and assessment of Project effects on, BRFN's cultural practices, values, and nonconsumptive uses.	Tervita will edit the document and change "Heritage Resources" to "Cultural and Heritage Resources."	18-Sep-18
BRFN-64a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.1 (Issues Scoping and Selection of VCs)	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-65	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.1 (Issues Scoping and Selection of VCs)	Please revise the title of the VC to "Economies" to permit data collection about, and assessment of, Project effects on traditional or barter economy.	Tervita can edit the subcomponents under Section 5.1 of the dAAIR to add barter economy.	18-Sep-18
BRFN-65a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.1 (Issues Scoping and Selection of VCs)	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-66	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.1 (Issues Scoping and Selection of VCs)	Please add "Treaty Rights" as a VC to permit data collection about, and assessment of, Project effects on BRFN's rights and culture.	The BC EAO will have to discuss the addition of Treaty Rights as they are a Crown obligation to address and not the permittee.	18-Sep-18

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-66a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.1 (Issues Scoping and Selection of VCs)	It will be critical, however, for Tervita to collect the data needed regarding effects to biophysical and socio-economic conditions to adequately assess effects on Rights. We urge BC EAO and the Proponent to engage with BRFN to identify the information required in the Application to enable a trustworthy assessment of effects on Treaty Rights.	Tervita looks forward to working with BRFN to identify relevant information required for the Application.	1-Nov-18
BRFN-66b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.1 (Issues Scoping and Selection of VCs)	As indicated in the conference call facilitated by BC EAO on November 9, 2018, BRFN would like to work together to scope baseline studies to ensure that data regarding its interests is sufficiently captured for use by the Crown. BC EAO for the Crown should facilitate these meetings since they will require the information to conduct their assessment.	If any further baseline studies are required, Tervita will share the scope with working group members for comment. Studies/assessments scopes conducted so far have been shared with working group members for comment prior to the work being conducted. Tervita looks forward to further collaboration between BRFN, Tervita and the BC EAO.	22-Nov-18
BRFN-67	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.2 (Assessment Boundaries)	In describing the LAA, please add the following text: "In establishing the LAA for each VC, preference must be given to natural ecological boundaries, (for example watersheds) through which local effects may propagate, as opposed to uniform linear or area boundaries." This will guide the development of ecologically appropriate boundaries for the remaining assessment.	In order to address these concerns, Tervita has added the following information under Section 3.2.1: • "It is standard practice for information gathered during each VC study and effects assessment to inform the zone of influence. If information is produced that indicates the zone of influence should be adjusted, it has the potential to change the study area boundaries."	18-Sep-18
BRFN-67a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.2 (Assessment Boundaries)	For clarity, BRFN views the landscape as a set of integrated ecological and cultural units. To ensure this is reflected in the AAIR, BRFN requests that this addition be revised to read "It is standard practice for information gathered during each VC study and effects assessment to result in alterations to the spatial and temporal boundaries of a VC's LAAs and RAAs. If information is produced that indicates assessment boundaries should be adjusted to better reflect ecosystem boundaries and divides, ~~it has the potential to change the~~ study area boundaries will be revised." (bold italics reflect the addition requested by BRFN)	This language has been revised in the methods section (Section 3.2 and 3.6) and pertains to all VCs.	1-Nov-18
BRFN-67b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.2 (Assessment Boundaries)	BRFN welcomes the opportunity to work with Tervita to develop appropriate study boundaries to ensure that adequate spatial data is collected prior to submission of the Application.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-68	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.2 (Assessment Boundaries)	In describing the RAA, please add the following text: "In establishing the RAA for each VC, preference must be given to natural ecological boundaries, for example watersheds) through which local effects may propagate, as opposed to uniform linear or area boundaries." This will guide the development of ecologically appropriate boundaries for the remaining assessment.	In order to address these concerns, Tervita has added the following information under Section 3.2.1: "It is standard practice for information gathered during each VC study and effects assessment to inform the zone of influence. If information is produced that indicates the zone of influence should be adjusted, it has the potential to change the study area boundaries."	18-Sep-18
BRFN-68a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.2 (Assessment Boundaries)	For clarity, BRFN views the landscape as a set of integrated ecological and cultural units. To ensure this is reflected in the AAIR, BRFN requests that this addition be revised to read "It is standard practice for information gathered during each VC study and effects assessment to result in alterations to the spatial and temporal boundaries of a VC's Local and/or LAAs and RAAs. If information is produced that indicates assessment boundaries should be adjusted to better reflect ecosystem boundaries and divides, ~~it has the potential to change the~~ study area boundaries will be revised." (bold italics reflect the addition requested by BRFN).	This language has been revised in the methods section (Section 3.2 and 3.6) and pertains to all VCs.	1-Nov-18
BRFN-68b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.2 (Assessment Boundaries)	BRFN welcomes the opportunity to work with Tervita to develop appropriate study boundaries.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-69	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.2 (Assessment Boundaries)	Temporal boundaries for this project are not provided. This represents a gap in the dAAIR. Temporal boundaries must be provided. As well, the following text should be added to section to guide the proponent: "It is important to situate temporal effects within broader ecological windows (for example, breeding, feeding, nesting, calving, migratory periods) to understand the context of effects, regardless of duration." This guidance is important to identify and implement critical life cycle windows or periods of the seasonal round for which additional seasonal or temporal mitigations will be required.	In order to address these concerns, Tervita has added the following information under Section 3.2.1: "It is standard practice for information gathered during each VC study and effects assessment to inform the zone of influence. If information is produced that indicates the zone of influence should be adjusted, it has the potential to change the study area boundaries."	18-Sep-18

Table A13-1. First Nations Comments Table

BRFN-69a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.2 (Assessment Boundaries)	For clarity, BRFN views the landscape as a set of integrated ecological and cultural units. To ensure this is reflected in the AAIR, BRFN requests that this addition be revised to read "It is standard practice for information gathered during each VC study and effects assessment to result in alterations to the spatial and temporal boundaries of a VC's LAAs and RAAs. If information is produced that indicates assessment boundaries should be adjusted to better reflect ecosystem boundaries and divides, ~~it has the potential to change the~~ study area boundaries will be revised." (bold italics reflect the addition requested by BRFN).	This language has been revised in the methods section (Sections 3.2 and 3.6) and pertains to all VCs.	1-Nov-18
BRFN-69b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.2 (Assessment Boundaries)	BRFN welcomes the opportunity to work with Tervita to develop appropriate study boundaries to ensure that adequate spatial data is collected prior to submission of the Application.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-70	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.3 (Existing Conditions), 6th bullet	Please add the following text to this bullet in order to direct the way in which proponents uses TEK provided by BRFN: "An effort should be made, and the effort described in the Application, to integrate TEK with western data to identify both mutually supporting conclusions and areas of disagreement. Areas of disagreement may point to areas where further data collection is required."	Tervita will be able to incorporate TEK provided by BRFN into the Application. Tervita will edit bullet 6 to: "Description of what TEK, including Aboriginal Traditional Knowledge, was used in the VC assessment. Western Data can be integrated during the assessment to support conclusions or areas of disagreement."	18-Sep-18
BRFN-70a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.3 (Existing Conditions), 6th bullet	Please indicate what is meant by "…(TEK), Including Aboriginal Traditional Knowledge". This implies the existence of traditional knowledge besides aboriginal ecological knowledge. Is there other traditional knowledge available besides that held by aboriginal peoples? Alternatively, please revise bullet 6 to remove the subordinate clause "including Aboriginal TEK".	Tervita will remove the clause "including Aboriginal TEK."	1-Nov-18
BRFN-70b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.3 (Existing Conditions), 6th bullet	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-71	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.3 (Existing Conditions)	This section must also describe and discuss the context for existing conditions by providing baseline data available for the period prior to construction of the existing facility in order to more clearly understand potential cumulative effects on rights and the ability to regain traditional practices.	Tervita takes Blueberry River First Nation's comment into consideration and will discuss baseline conditions in the Application.	18-Sep-18
BRFN-71a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.3 (Existing Conditions)	This is not referenced in the revised dAAIR (Rev 5). Please explicitly state in this section that "Tervita will consider baseline conditions prior to the construction of the original landfill as context for the cumulative effects assessment".	Tervita will add this bullet to Section 3.3 of the dAAIR. Tervita will consider baseline conditions prior to construction of the original landfill as context for the assessment on Environmental, Economic, Social, Heritage and Health effects.	1-Nov-18
BRFN-71b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.3 (Existing Conditions)	What is the rationale for omitting the reference to cumulative effects? BRFN respectfully requests that the reference to cumulative effects be explicit in the dAAIR.	The bullet has been revised as follows: • Tervita will consider baseline conditions prior to construction of the original landfill as context for the cumulative effects assessment on Environmental, Economic, Social, Heritage and Health effects.	22-Nov-18
BRFN-72	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.5 (Mitigation Measures), 2nd and 3rd bullets.	This bullet must provide more information about the ways in which the proponent is required to describe mitigation as follows: "Mitigation measures must be described with sufficient detail (for example areas, rations, timelines) in order that implementation can be measured and meaningful predictions regarding effectiveness can be made."	Tervita takes Blueberry River First Nation's comment into consideration and will discuss mitigation measures in the Application.	18-Sep-18

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-72a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.5 (Mitigation Measures), 2nd and 3rd bullets.	For clarity, it is the level of detail that is of interest to BRFN. BRFN will be looking for sufficient detail (in terms of ratios, areas, thresholds, timelines, etc.) in the description of mitigations to evaluate their potential effectiveness as it relates to conclusions regarding residual project effects. We request that the AAIR clarify the detail required for mitigation measures, as per our original comment	The current wording addresses the area by the word in bold in the second bullet of Section 3.5 (for example equipment selection, placement, emissions, abatement measures), and construction and operation procedures and practices.The current wording addresses timelines by the word in bold in the second and eight bullet of Section 3.5: • Describe the mitigation measures incorporated into the Project, including site and route selection, project scheduling. • Include the time required for mitigation to become effective. Thresholds are addressed by bullet 7 in Section 3.5 where Tervita has to measure the success of each mitigation measure.	1-Nov-18
BRFN-72b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.5 (Mitigation Measures), 2nd and 3rd bullets.	BRFN looks forward to working with Tervita to ensure that detail sufficient to assess mitigation efficacy is provided. BRFN would like to review proposed mitigations prior to submission of the Application.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-73	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.5 (Mitigation Measures)	Please add a bullet that reads "Identify any mitigation measures associated with land use planning processes or bilateral/government to government agreements" to ensure that these processes are recognized in permitting and operations.	Tervita will add this bullet to Section 3.5 of the dAAIR.	18-Sep-18
BRFN-73a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.5 (Mitigation Measures)	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-73b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.5 (Mitigation Measures)	Resolved.	N/A	22-Nov-18
BRFN-74	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.6 (Characterization of Residual Effects)	As commented with reference to section 3.3, this section must provide appropriate grounding in the history of the area. To that end, the following should be added to section 3.6.1 (Context): "Context must include a discussion of pre-contact conditions, as they are best understood, to be able to adequately assess effects to each VC contributing to an assessment of effects on Treaty Rights."	The BC EAO will have to discuss the addition of Treaty Rights as they are a Crown obligation to address and not the permittee. TLU of Blueberry River First Nation will be discussed in Section 11 of the Application.	18-Sep-18
BRFN-74a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.6 (Characterization of Residual Effects)	It will be critical, however, for Tervita to collect the data needed regarding effects to biophysical and socio-economic conditions to adequately assess effects on Rights as identified in BRFN comment #BRFN-66.	Tervita looks forward to working with BRFN to identify relevant information required for the Application.	1-Nov-18
BRFN-74b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.6 (Characterization of Residual Effects)	As indicated in the conference call facilitated by BC EAO on November 9, 2018, BRFN would like to work together to scope baseline studies to ensure that data regarding its interests is sufficiently captured for use by the Crown. BC EAO for the Crown should facilitate these meetings since they will require the information to conduct their assessment.	If any further baseline studies are required, Tervita will share the scope with working group members for comment. Studies/assessments scopes conducted so far have been shared with working group members for comment prior to the work being conducted. Tervita looks forward to further collaboration between BRFN, Tervita and the BC EAO.	22-Nov-18
BRFN-75	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.6 (Characterization of Residual Effects)	As commented with reference to section 3.2, this section must lay the foundation for ecosystem management. To that end, the following text should be added to section 3.6.2 (Spatial boundary) to guide the proponent: "All boundaries should preferentially be scoped based on an ecologically meaningful basis (for example, watershed, airshed, ecozone, critical habitat) to ensure that the effects assessment is able to reflect potential adverse effects on functional systems at a landscape or ecosystem basis. A rationale should be provided that identifies the functional nature of each selected boundary."	In order to address these concerns, Tervita has added the following information under Section 3.2.1: "It is standard practice for information gathered during each VC study and effects assessment to inform the zone of influence. If information is produced that indicates the zone of influence should be adjusted, it has the potential to change the study area boundaries."	18-Sep-18
BRFN-75a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.6 (Characterization of Residual Effects)	For clarity, BRFN views the landscape as a set of integrated ecological and cultural units. To ensure this is reflected in the AAIR, BRFN requests that this addition be revised to read "It is standard practice for information gathered during each VC study and effects assessment to result in alterations to the spatial and temporal boundaries of a VC's LAAs and RAAs. If information is produced that indicates assessment boundaries should be adjusted to better reflect ecosystem boundaries and divides, ~~it has the potential to change the~~ study area boundaries will be revised." (bold italics reflect the addition requested by BRFN).	This language has been revised in the methods section (Sections 3.2 and 3.6) and pertains to all VCs.	1-Nov-18

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-75b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.6 (Characterization of Residual Effects)	BRFN welcomes the opportunity to work with Tervita to develop appropriate study boundaries to ensure that adequate spatial data is collected prior to submission of the Application.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-76	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.6 (Characterization of Residual Effects)	As commented with reference to Section 3.2, it will be important to provide guidance for situating temporal effects in their ecological context. To that end, the following text should be added to guide the proponent: "Temporal effects (duration, frequency, and magnitude) must be described with reference to ecological windows (for example, breeding, feeding, nesting, calving, migratory periods) to understand the context of effects, regardless of duration."	Temporal Boundaries are listed under 3.2.1 as boundary that will be assessed. In order to address these concerns, Tervita has added the following information under Section 3.2.1: "It is standard practice for information gathered during each VC study and effects assessment to inform the zone of influence. If information is produced that indicates the zone of influence should be adjusted, it has the potential to change the study area boundaries."	18-Sep-18
BRFN-76a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.6 (Characterization of Residual Effects)	For clarity, BRFN views the landscape as a set of integrated ecological and cultural units. To ensure this is reflected in the AAIR, BRFN requests that this addition be revised to read "It is standard practice for information gathered during each VC study and effects assessment to result in alterations to the spatial and temporal boundaries of a VC's LAAs and RAAs. If information is produced that indicates assessment boundaries should be adjusted to better reflect ecosystem boundaries and divides, ~~it has the potential to change the~~ study area boundaries will be revised." (bold italics reflect the addition requested by BRFN)	This language has been revised in the methods section (Section 3.2 and 3.6) and pertains to all VCs.	1-Nov-18
BRFN-76b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.6 (Characterization of Residual Effects)	BRFN welcomes the opportunity to work with Tervita to develop appropriate study boundaries to ensure that adequate spatial data is collected prior to submission of the Application.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-77	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.10 (Cumulative Effects Assessment)	The map showing the location of projects and activities being included in the cumulative effects assessment should display projects by industry sector to understand the regional distribution of project, and therefore, impact types.	A very thorough search was completed and only one future development (a small oil and gas project) was identified within the Wildlife RAA. Distances to future developments from the Project site are detailed where information was available, however, due to the limited number of future developments mapping was not deemed necessary. Granted, there are more in the socio-eco related RAAs, and specific details (including distance from Project) on these developments are provided, however, there is no assessment value in mapping these for socio-economic related VCs and in many cases specific footprint details are unavailable.	18-Sep-18
BRFN-77a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.10 (Cumulative Effects Assessment)	Respectfully, BRFN disagrees with the statement that "there is no assessment value in mapping these for socio-economic related VCs". BRFN is concerned with spatial use changes throughout its territory because these have the potential to affect traditional patterns of land use. A figure will help BRFN understand the way in which the Project, in relation to other land uses, will result in alteration of traditional use and practice. BRFN requests the provision of a figure as requested on 12 September 2018. Points in lieu of specific footprints are sufficient where footprints are not available.	Tervita will be able to supply this Figure in the Application.	1-Nov-18
BRFN-77b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.10 (Cumulative Effects Assessment)	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-78	12-Sep-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.11 (Follow-up Strategy)	Follow-up strategies must be sufficiently defined to allow evaluation of their likelihood of success. It is not sufficient to say that monitoring will be done to identify deviations from predicted Project effects. Schedules for follow-up must be provided, and specific processes for developing and implementing further mitigation must be described.	Tervita is obligated to communicate about the Project throughout its life. The Application will elaborate on the follow-up strategy, including tools likes schedules and on-going consultation to address mitigation concerns.	18-Sep-18
BRFN-78a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.11 (Follow-up Strategy)	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-79	12-Sep-18	Jane Calvert	BRFN	Air Quality	dAAIR (February 2018)	4.2 (re: selection of KIs)	This section must provide guidance on how to measure effects on Kiss. To that end, this section should include the following direction: "The location of sensitive receptors should be identified in consultation with First Nations in order to be able to address potential effects to VCs of importance to Aboriginal communities."	The location of sensitive receptors will be done in consultation with BRFN.	18-Sep-18

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-79a	31-Oct-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.11 (Follow-up Strategy)	Resolved. BRFN looks forward to working with Tervita to define these locations.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-79b	14-Nov-18	Jane Calvert	BRFN	Environmental Assessment Methods	dAAIR (February 2018)	3.11 (Follow-up Strategy)	BRFN welcomes the opportunity to work with Tervita to identify these locations prior to conducting baseline studies	If any further baseline studies are required, Tervita will share the scope with working group members for comment. Studies/assessments scopes conducted so far have been shared with working group members for comment prior to the work being conducted. Tervita looks forward to further collaboration between BRFN, Tervita, and the BC EAO.	22-Nov-18
BRFN-80	12-Sep-18	Jane Calvert	BRFN	Acoustic Environment	dAAIR (February 2018)	4.3 (re: selection of KIs)	Please add "% Annoyance" as a KI. This is a first step in being able to assess the effects of Project noise on traditional use of lands, where silence and solitude are valued.	% Annoyance is difficult to adequately quantify. The Human Health VC will assess impacts to the surrounding community.	18-Sep-18
BRFN-80a	31-Oct-18	Jane Calvert	BRFN	Acoustic Environment	dAAIR (February 2018)	4.3 (re: selection of KIs)	BRFN understands that it is difficult to quantify this. Nevertheless, % Annoyance is a common metric in Environmental Assessment and a prediction of potential effect is critical as a tool for the Crown to effectively consider effects to aboriginal rights. Please include it as a metric for assessment.	Level of annoyance has been added to Section 4.3.	1-Nov-18
BRFN-80b	14-Nov-18	Jane Calvert	BRFN	Acoustic Environment	dAAIR (February 2018)	4.3 (re: selection of KIs)	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-81	12-Sep-18	Jane Calvert	BRFN	Surface Water	dAAIR (February 2018)	4.4 (re: selection of KIs)	Please add "Taste/Smell" as a KI. These data may be qualitative but must be collected in order to permit the effects of the Project noise on the perceived health, safety, or desirability of surface water.	Taste/Smell of surface water in the area is difficult to adequately quantify. Tervita can add this as a potential adverse effect to Aboriginal interests in Section 11.1 and will then be able to discuss mitigation measures.	18-Sep-18
BRFN-81a	31-Oct-18	Jane Calvert	BRFN	Surface Water	dAAIR (February 2018)	4.4 (re: selection of KIs)	BRFN understands that it is difficult to quantify this. Nevertheless, the perceived value and safety of water - as experienced through water taste and smell - is central to aboriginal values. A prediction of potential effects to these physical properties of water is critical as a tool for the Crown to effectively consider effects to aboriginal rights. Please include it as a metric for assessment.	The following bullet has been modified under Section 4.4 to reflect perceived taste/smell; Water quality parameters (for example, sediment, metals, hydrocarbons, perceived taste and smell); and	1-Nov-18
BRFN-81b	14-Nov-18	Jane Calvert	BRFN	Surface Water	dAAIR (February 2018)	4.4 (re: selection of KIs)	BRFN welcomes the opportunity to work with Tervita to define the methodology to be used to assess taste and smell prior to submission of the Application	Tervita will reach out to BRFN to discuss methodologies for assessing taste/smell prior to submission of the Application.	22-Nov-18
BRFN-82	12-Sep-18	Jane Calvert	BRFN	Groundwater	dAAIR (February 2018)	4.5 (re: selection of KIs)	Please add "Taste/Smell" as a KI. These data may be qualitative but must be collected in order to permit the effects of the Project noise on the perceived health, safety, or desirability of groundwater.	Taste/Smell of groundwater in the area is difficult to adequately quantify. Tervita can add this as a potential adverse effect to Aboriginal interests in Section 11.1 and will then be able to discuss mitigation measures.	18-Sep-18
BRFN-82a	31-Oct-18	Jane Calvert	BRFN	Groundwater	dAAIR (February 2018)	4.5 (re: selection of KIs)	BRFN understands that it is difficult to quantify this. Nevertheless, the perceived value and safety of water - as experienced through water taste and smell - is central to aboriginal values. A prediction of potential effects to these physical properties of water is critical as a tool for the Crown to effectively consider effects to aboriginal rights. Please include it as a metric for assessment.	The following bullet has been modified under Section 4.5 to reflect perceived taste/smell; Water quality parameters (for example, inorganic parameters, ions, dissolved metals, perceived taste and smell and other contaminants); and	1-Nov-18
BRFN-82b	14-Nov-18	Jane Calvert	BRFN	Groundwater	dAAIR (February 2018)	4.5 (re: selection of KIs)	BRFN welcomes the opportunity to work with Tervita to define the methodology to be used to assess taste and smell prior to submission of the Application.	Tervita will reach out to BRFN to discuss methodologies for assessing taste/smell prior to submission of the Application.	22-Nov-18
BRFN-83	12-Sep-18	Jane Calvert	BRFN	Terrestrial Vegetation	dAAIR (February 2018)	4.6 (re: selection of KIs)	Please add two additional KIs as follows: (a) "spatial distribution of losses" and (b) landscape change (for example, changes in forest age/seral stage, patch size). These data are important to understand effects on TLU in terms of distance travelled for harvest and peaceful enjoyment of wilderness.	Tervita will adequately address these requested Kis under the current KI - Loss of Vegetation Communities of Concern. The spatial distribution is described under the LAA and RAA.	18-Sep-18
BRFN-83a	31-Oct-18	Jane Calvert	BRFN	Terrestrial Vegetation	dAAIR (February 2018)	4.6 (re: selection of KIs)	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-83b	14-Nov-18	Jane Calvert	BRFN	Terrestrial Vegetation	dAAIR (February 2018)	4.6 (re: selection of KIs)	Resolved.	N/A	22-Nov-18

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-84	12-Sep-18	Jane Calvert	BRFN	Fish and Fish Habitat	dAAIR (February 2018)	4.7 (existing conditions)	Given BRFN's intimate knowledge of the landscape and legal guidance regarding the equal standing of traditional knowledge, existing conditions must be informed by traditional knowledge. To that end, "Traditional Knowledge information regarding species presence, abundance, and distribution" must be added as a means of describing existing conditions.	Tervita will add the following bullet: "Traditional Knowledge information regarding species presence, abundance, and distribution"	18-Sep-18
BRFN-84a	31-Oct-18	Jane Calvert	BRFN	Fish and Fish Habitat	dAAIR (February 2018)	4.7 (existing conditions)	Resolved. BRFN looks forward to working with Tervita to incorporate this information in section 4.7 of the assessment.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-84b	14-Nov-18	Jane Calvert	BRFN	Fish and Fish Habitat	dAAIR (February 2018)	4.7 (existing conditions)	BRFN welcomes the opportunity to work with Tervita to ensure that TK informs the study designs prior to submission of the Application.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-85	12-Sep-18	Jane Calvert	BRFN	Wildlife and Wildlife Habitat	dAAIR (February 2018)	4.8.1.1 (Spatial Boundaries)	Further to comment made associated with section 3.2 of the dAAIR, the spatial boundaries for this Section should be revised to reflect meaningful ecological boundaries (for example habitat, breeding/rearing areas, important migration corridors, etc.)	In order to address these concerns, Tervita has added the following information under Section 3.2.1: "It is standard practice for information gathered during each VC study and effects assessment to inform the zone of influence. If information is produced that indicates the zone of influence should be adjusted, it has the potential to change the study area boundaries."	18-Sep-18
BRFN-85a	31-Oct-18	Jane Calvert	BRFN	Wildlife and Wildlife Habitat	dAAIR (February 2018)	4.8.1.1 (Spatial Boundaries)	For clarity, BRFN views the landscape as a set of integrated ecological and cultural units. To ensure this is reflected in the AAIR, BRFN requests that this addition be revised to read "It is standard practice for information gathered during each VC study and effects assessment to result in alterations to the spatial and temporal boundaries of a VC's LAAs and RAAs. If information is produced that indicates assessment boundaries should be adjusted to better reflect ecosystem boundaries and divides, ~~it has the potential to change the~~ study area boundaries will be revised." (bold italics reflect the addition requested by BRFN).	This language has been revised in the methods section (Section 3.2 and 3.6) and pertains to all VCs.	1-Nov-18
BRFN-85b	14-Nov-18	Jane Calvert	BRFN	Wildlife and Wildlife Habitat	dAAIR (February 2018)	4.8.1.1 (Spatial Boundaries)	BRFN welcomes the opportunity to work with Tervita to develop appropriate study boundaries to ensure that adequate spatial data is collected prior to submission of the Application.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-86	12-Sep-18	Jane Calvert	BRFN	Wildlife and Wildlife Habitat	dAAIR (February 2018)	4.8.1.3 (Administrative boundaries)	This section should be revised to identify any proposed critical habitat for Species at Risk (SAR) within the revised LAA and RAA.	There are no anticipated changes to the LAA or RAA at this time. In order to address these concerns, Tervita has added the following information under Section 3.2.1: "It is standard practice for information gathered during each VC study and effects assessment to inform the zone of influence. If information is produced that indicates the zone of influence should be adjusted, it has the potential to change the study area boundaries."	18-Sep-18
BRFN-86a	31-Oct-18	Jane Calvert	BRFN	Wildlife and Wildlife Habitat	dAAIR (February 2018)	4.8.1.3 (Administrative boundaries)	For clarity, BRFN views the landscape as a set of integrated ecological and cultural units. To ensure this is reflected in the AAIR, BRFN requests that this addition be revised to read "It is standard practice for information gathered during each VC study and effects assessment to result in alterations to the spatial and temporal boundaries of a VC's LAAs and RAAs. If information is produced that indicates assessment boundaries should be adjusted to better reflect ecosystem boundaries and divides, ~~it has the potential to change the~~ study area boundaries will be revised." (bold italics reflect the addition requested by BRFN)	This language has been revised in the methods section (Section 3.2 and 3.6) and pertains to all VCs.	1-Nov-18
BRFN-86b	14-Nov-18	Jane Calvert	BRFN	Wildlife and Wildlife Habitat	dAAIR (February 2018)	4.8.1.3 (Administrative boundaries)	BRFN welcomes the opportunity to work with Tervita to develop appropriate study boundaries to ensure that adequate spatial data is collected.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-87	12-Sep-18	Jane Calvert	BRFN	Wildlife and Wildlife Habitat	dAAIR (February 2018)	4.8.2 (Existing Conditions)	Given BRFN's intimate knowledge of the landscape and legal guidance regarding the equal standing of traditional knowledge, existing conditions must be informed by traditional knowledge. To that end, "Traditional Knowledge information regarding species presence, abundance, distribution, and the presence of game trails, bear dens, stick nests, lick sites, amphibian movement corridors, etc." must be added as a means of describing existing conditions.	Tervita will add the following bullet: "Traditional Knowledge information regarding species presence, abundance, distribution, and the presence of game trails, bear dens, stick nests, lick sites, amphibian movement corridors, etc."	18-Sep-18

Table A13-1. First Nations Comments Table

BRFN-87a	31-Oct-18	Jane Calvert	BRFN	Wildlife and Wildlife Habitat	dAAIR (February 2018)	4.8.2 (Existing Conditions)	Resolved. BRFN looks forward to working with Tervita to incorporate this information in section 4.8 of the assessment.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-87b	14-Nov-18	Jane Calvert	BRFN	Wildlife and Wildlife Habitat	dAAIR (February 2018)	4.8.2 (Existing Conditions)	BRFN welcomes the opportunity to work with Tervita to ensure that TK informs the study designs prior to submission of the Application.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-88	12-Sep-18	Jane Calvert	BRFN	Economy	dAAIR (February 2018)	5.1	In order to assess effects on traditional use and practices, please add and collect data regarding a sub-VC for "Subsistence/traditional economy". Data collected for this sub-VC must be disaggregated by First Nation. An appropriate KI for this VC is "harvest levels and sharing among community members".	Effects on TLU will be addressed in Section 11 of the Application.	18-Sep-18
BRFN-88a	31-Oct-18	Jane Calvert	BRFN	Economy	dAAIR (February 2018)	5.1	Understood. It will be critical, however, for Tervita to collect the data needed regarding effects to biophysical and socio-economic conditions to adequately assess effects on Rights as identified in comment #BRFN-66. In this regard, it will be important to disaggregate data by First Nation.	Tervita looks forward to working with BRFN during the Application phase to ensure Section 11 is adequate.	1-Nov-18
BRFN-88b	14-Nov-18	Jane Calvert	BRFN	Economy	dAAIR (February 2018)	5.1	As indicated in the conference call facilitated by BC EAO on November 9, 2018, BRFN would like to work together to scope baseline studies to ensure that data regarding its interests is sufficiently captured for use by the Crown. BC EAO for the Crown should facilitate these meetings since they will require the information to conduct their assessment.	If any further baseline studies are required, Tervita will share the scope with working group members for comment. Studies/assessments scopes conducted so far have been shared with working group members for comment prior to the work being conducted. Tervita looks forward to further collaboration between BRFN, Tervita and the BC EAO.	22-Nov-18
BRFN-89	12-Sep-18	Jane Calvert	BRFN	Visual Environment	dAAIR (February 2018)	5.2 (New Section)	In order to meaningfully assess effects on traditional use and practices, data must be collected on all aspects of the environment that are of value to BRFN. To that end, the proponent must add, collect data, and establish an additional VC that addresses Visual Quality. Appropriate subcomponents and their indicators are landscape profile (assessed through project mock-ups) and night sky (assessed in terms of increased skyglow.) Since this was not assessed with the initial project, a robust cumulative effects assessment that meaningfully addresses context is required. This assessment is required, in turn, to inform the regulators determination regarding effects on treaty rights. Note that this VC also has linkages to migratory bird behavior and distribution (particularly in the case of night-time migrators) so the results of this assessment must be carried back to the assessment of project effects on Wildlife and Wildlife habitat. and then carried forward to an assessment of effects on harvesting.	Visual Quality can be discussed under Human Health Effects. There are no anticipated additions to light infrastructure at the landfill due to the expansion. The landfill also operates during daylight hours most of the year therefore cumulative impacts on skyglow and light effects on wildlife are not anticipated.	18-Sep-18
BRFN-89a	31-Oct-18	Jane Calvert	BRFN	Visual Environment	dAAIR (February 2018)	5.2 (New Section)	If the facility operates during daylight hours most of the year, what portion of the year do operations occur after dark? Is the facility unlit when not in operation? Will the expansion remain unlit?	Tervita has another facility (Silverberry TRD) on the same footprint which has light infrastructure associated with it. Currently, the TRD operates 24 hours a day, so from a casual observer's standpoint it may seem light is coming from the landfill during all nighttime hours. The landfill operates from 7 a.m. to 7 p.m. From approximately, end of April to the beginning of September there is enough daylight where light stands do not need to be operated. The rest of the year the light stands only operate a couple hours a day prior to sunrise and after sunset. The landfill portion of the footprint remains unlit when not in operation. The expansion area will have lighting where required but light stands from the current footprint will be moved over to the active area and no new light stands are anticipated.	1-Nov-18
BRFN-89b	14-Nov-18	Jane Calvert	BRFN	Visual Environment	dAAIR (February 2018)	5.2 (New Section)	BRFN remains concerned that additional lighting at dawn and dusk - which are critical periods for migratory birds - may have cumulative effects on bird navigation and way-finding. BRFN understands that no new lighting will be added and will request that lighting is an element to be monitored.	Tervita will work with BRFN during the Application to address Light Management/Monitoring and subsequent mitigation strategies.	22-Nov-18

Table A13-1. First Nations Comments Table

Identifier Number	Comment Date	Reviewer Name/ Agency	Reviewer Agency/Organization	Subject	Document	Document Section	Comment	Proponent Response, Change, and Action	Response Date
BRFN-90	12-Sep-18	Jane Calvert	BRFN	Land and Resource Use	dAAIR (February 2018)	6.1 (VCs)	The VCs selected for this assessment are primarily consumptive in nature (that is relate to collection or harvest). This represents a gap in the assessment: BRFN also relies on the landscape to supply a number of nonconsumptive benefits, ranging from peaceful enjoyment to education to spiritual practice. To that end, an additional VC with appropriate subcomponents (for example recreation/nonconsumptive enjoyment; education; spiritual practices) and KIs (for example land disturbance, noise, light) must be developed in collaboration with BRFN to identify and collect data regarding nonconsumptive uses and the potential effects of the Project on these uses. These data are also critical for regulators when determining effects to Treaty Rights.	Tervita will discuss nonconsumptive effects on BRFN under Section 11 of the Application.	18-Sep-18
BRFN-90a	31-Oct-18	Jane Calvert	BRFN	Land and Resource Use	dAAIR (February 2018)	6.1 (VCs)	Understood. It will be critical, however, for Tervita to collect the data needed regarding effects to biophysical and socio-economic conditions to adequately assess effects on Rights as identified in comment #BRFN-66. In this regard, it will be important to establish subcomponent values that fall under the category of Land and Resource Use, such as recreation/nonconsumptive enjoyment; education; spiritual practices, and assess these in order that the data on which the assessment in Section 11 is well supported by adequate data.	Tervita looks forward to working with BRFN during the Application phase to ensure Section 11 is adequate.	1-Nov-18
BRFN-91	12-Sep-18	Jane Calvert	BRFN	Land and Resource Use	dAAIR (February 2018)	6.1.1.1 and 6.1.1.2 (Spatial and Temporal Boundaries)	See comments associated with Section 3.2 regarding boundaries. Boundaries must be established that fully reflect use in order that potential impacts to these uses can be assessed. Examples of appropriate spatial boundaries include trap-line lengths (in order to assess increased effort associated with reliance on farther reaches of the line) and appropriate temporal boundaries could include important harvest periods during the seasonal round. Boundaries should be rescoped in consultation with BRFN.	In order to address these concerns, Tervita has added the following information under Section 3.2.1: "It is standard practice for information gathered during each VC study and effects assessment to inform the zone of influence. If information is produced that indicates the zone of influence should be adjusted, it has the potential to change the study area boundaries."	18-Sep-18
BRFN-91a	31-Oct-18	Jane Calvert	BRFN	Land and Resource Use	dAAIR (February 2018)	6.1.1.1 and 6.1.1.2 (Spatial and Temporal Boundaries)	For clarity, BRFN views the landscape as a set of integrated ecological and cultural units. To ensure this is reflected in the AAIR, BRFN requests that this addition be revised to read "It is standard practice for information gathered during each VC study and effects assessment to result in alterations to the spatial and temporal boundaries of a VC's LAAs and RAAs. If information is produced that indicates assessment boundaries should be adjusted to better reflect ecosystem boundaries and divides, ~~it has the potential to change the~~ study area boundaries will be revised." (bold italics reflect the addition requested by BRFN).	This language has been revised in the methods section (Section 3.2 and 3.6) and pertains to all VCs, therefore, language was excluded from the Land Use Section.	1-Nov-18
BRFN-91b	14-Nov-18	Jane Calvert	BRFN	Land and Resource Use	dAAIR (February 2018)	6.1.1.1 and 6.1.1.2 (Spatial and Temporal Boundaries)	BRFN welcomes the opportunity to work with Tervita to develop appropriate study boundaries to ensure that adequate spatial data is collected.	Tervita looks forward to working with BRFN during the Application phase.	22-Nov-18
BRFN-92	12-Sep-18	Jane Calvert	BRFN	Heritage Resources	dAAIR (February 2018)	7.1.1.2 (Temporal Boundaries)	It is not clear why the operations phase has been omitted. Noise, light, and other potential Project effects may affect the continued use or value of archaeological sites and must therefore be assessed either here or in the Land and Resource Use section of the final Application.	Tervita will add the Operations Phase to Section 7.1.1.2.	18-Sep-18
BRFN-92a	31-Oct-18	Jane Calvert	BRFN	Heritage Resources	dAAIR (February 2018)	7.1.1.2 (Temporal Boundaries)	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-92b	14-Nov-18	Jane Calvert	BRFN	Heritage Resources	dAAIR (February 2018)	7.1.1.2 (Temporal Boundaries)	Resolved.	N/A	22-Nov-18
BRFN-93	12-Sep-18	Jane Calvert	BRFN	Human Health	dAAIR (February 2018)	8.1 (VC Selection)	The selection of VCs results in a very narrow definition of health restricted to physical wellbeing. In order to better capture Project effects to BRFN, additional subcomponents/indicators must be added that address mental and/or community health. These should be selected in collaboration with BRFN.	Tervita will add "Community Health" as a KI under Section 8.1.	18-Sep-18
BRFN-93a	31-Oct-18	Jane Calvert	BRFN	Human Health	dAAIR (February 2018)	8.1 (VC Selection)	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18

Table A13-1. First Nations Comments Table

BRFN-94	12-Sep-18	Jane Calvert	BRFN	Human Health	dAAIR (February 2018)	8.1.1.1 (Spatial Boundaries)	It is assumed that the Air Quality RAA is the largest of all RAAs. Nevertheless, the RAA must also include the maximum extent of the Fish RAA and Wildlife RAA in order to properly capture potential effects to human health from harvested foods.	The dAAIR will be edited to include Wildlife and Fish LAA to be listed in 8.1.1.1	18-Sep-18
BRFN-94a	31-Oct-18	Jane Calvert	BRFN	Human Health	dAAIR (February 2018)	8.1.1.1 (Spatial Boundaries)	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-95	12-Sep-18	Jane Calvert	BRFN	Accidents and Malfunctions	dAAIR (February 2018)	9	Please add "Fires" to the list of accidents to be assessed.	Fires will be added to Section 9 as an accident to be assessed.	18-Sep-18
BRFN-95a	31-Oct-18	Jane Calvert	BRFN	Accidents and Malfunctions	dAAIR (February 2018)	9	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-96	12-Sep-18	Jane Calvert	BRFN	Effects of the Environment on the Project	dAAIR (February 2018)	10	Please clarify the effect by revising the factor name to "Wildfires" (emphasis added for clarity).	Section 10 of the dAAIR will be edited to reflect this comment.	18-Sep-18
BRFN-96a	31-Oct-18	Jane Calvert	BRFN	Effects of the Environment on the Project	dAAIR (February 2018)	10	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-97	12-Sep-18	Jane Calvert	BRFN	Aboriginal interests	dAAIR (February 2018)	11.1	Please add the following topic to the list of potential effects on Page 84: "Effects on sense of community and identity, where identity is predicated, in part, on the condition of the land and its resources." The addition of this topic should not be construed as the only topic required to be added to the list.	"Effects on sense of community and identity, where identity is predicated, in part, on the condition of the land and its resources," will be adequately addressed by following two potential effects already listed in Section 11.1: • Effects to the exercise of traditional practices, including via perceived odour, noise and light • Effects to the exercise of traditional practices, including via perceived odour, noise and light	18-Sep-18
BRFN-97a	31-Oct-18	Jane Calvert	BRFN	Aboriginal interests	dAAIR (February 2018)	11.1	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-98	12-Sep-18	Jane Calvert	BRFN	Management Plans	dAAIR (February 2018)	13	Please add specific Management Plans for "Odour Control" and "Night-time Light Management".	Tervita will edit the document and list these Management Plans in Section 13..	18-Sep-18
BRFN-98a	31-Oct-18	Jane Calvert	BRFN	Management Plans	dAAIR (February 2018)	13	Resolved.	Tervita looks forward to working with BRFN during the Application phase.	1-Nov-18
BRFN-99	6-Dec-18	Jane Calvert	BRFN	Assessment Methodology	dAAIR (February 2018)	3	Following the final paragraph of this section, please add: “The Application will describe the way in which BRFN was engaged in establishing and refining study scoping and methodology to ensure that data needed to assess effects on VCs relevant to BRFN were adequately assessed.”	BRFN’s engagement will be detailed in Part C of the Application. This will include any conversations Tervita had with BRFN regarding study scoping methodology. Part C of the Application includes a description of potential adverse effects of the proposed Project on Aboriginal interests.	4-Jan-19
BRFN-100	6-Dec-18	Jane Calvert	BRFN	Issues Scoping and Selection of VCs	dAAIR (February 2018)	3.1	Following the final paragraph of this section, please add: “The Application will identify the VCs modified as a result of consultation with BRFN and provide a rationale for their omission if they have not been assessed.”	Section 4.2 of the VC document includes rational for the exclusion of candidate VCs. Tervita will ensure VC selection rationale is carried forward into the Application.	4-Jan-19
BRFN-101	6-Dec-18	Jane Calvert	BRFN	Assessment Boundaries	dAAIR (February 2018)	3.2	Following the final paragraph of this section, please add: “The Application will identify any requested study boundary revisions for each VC and provide the rationale for boundary revisions or the retention of original boundaries.”	Section 4.3 and Table 4-4 of the VC document, outlines the rationalization for the spatial boundaries. As outlined in Section 3.2 the dAAIR “the draft Application will include rational for any differences in boundaries from those presented in the final AAIR.” Tervita has added the following sentence to Section 3.2 to address BRFN's request: "The Application will identify any requested revisions for each VC and provide the rationale for boundary revisions or the retention of original boundaries."	4-Jan-19
BRFN-102	6-Dec-18	Jane Calvert	BRFN	Potential Effects	dAAIR (February 2018)	3.3	Following the final paragraph of this section, please add: “The Application will identify those effects being assessed that were specifically requested by BRFN and, if any were not, the rationale for excluding these effects from consideration will be provided.”	Part C of the Application includes a description of potential adverse effects of the proposed Project on Aboriginal interests. As noted in Section 11.1 of the dAAIR the Application will include “a summary of any outstanding Aboriginal interests issues identified by Aboriginal Groups.” BRFN will be able to review Part C of the draft Application and provide feedback on effects.	4-Jan-19

BRFN-103	6-Dec-18	Jane Calvert	BRFN	Cumulative Effects Assessment	dAAIR (February 2018)	3.10	Following the final paragraph of this section, please add: “The Application will include a discussion of cumulative effects since European contact to provide a context for the Project and development in the region.”	Tervita will work collaboratively with BRFN to ensure the Application adequately addresses key effects, proposed mitigation measures and residual and cumulative effects on VCs. Part C of the Application will also address Aboriginal interests. To has added the following bullet to Section 3.10 to address BRFN's request. The Application will include a discussion of cumulative effects since European contact to provide a context for the Project and development in the region. BRFN will be able to provide feedback on the draft Application and the cumulative effects.	4-Jan-19
BRFN-104	6-Dec-18	Jane Calvert	BRFN	Follow-up Strategy	dAAIR (February 2018)	3.11	Following the final paragraph of this section, please add: “The follow-up strategy shall be sufficiently described with timelines and structures such that its efficacy can be assessed.”	Section 3.11 of the Application will include measures to evaluate the effectiveness of proposed mitigation measures. Tervita has added the following bullet to Section 3.11 to address BRFN's request: • The follow-up strategy shall be sufficiently described with timelines and structures such that its efficacy can be assessed.	4-Jan-19
Comments Received through First Nations TUS									
DRFN - 1	18-Dec-17	Urban Systems	DRFN	Tervita Silverberry Project	N/A	N/A	Through the Tervita Silverberry Non-Confidential Desktop TUS (December 18, 2017), DRFN identified hunting, trapping, fishing and plant gathering activities within the LAA and RAA. Travel routes and an archaeological site was identified within the LAA. No land and resource use sites were identified within the Project Footprint. DRFN expressed concerns about access to TLU areas and a healthy ecosystem that supports hunting, trapping, fishing, and peaceful enjoyment of the land.	Tervita held a phone meeting with DRFN to discuss the TUS report. The meeting was attended by Cec Heron (DRFN), Dave Flanders (Urban Systems), Heather Conquergood (Jacobs), and Todd Frankel and Peter Nelson (both Tervita). Tervita and DRFN discussed working with DRFN when placing final cover, to ensure the proper vegetation is planted to help support local wildlife populations. Tervita will work with local First Nations on the appropriate seed mix for revegetation and capping. DRFN also expressed concern of the deforestation around Silverberry affecting Caribou populations. Tervita and DRFN discussed the potential off restoration at a later date. Lastly, DRFN expressed concern about the amphibians found at site. Tervita will perform amphibian surveys prior to expansions construction.	18-Dec-17

Silverberry Secure Landfill –
Name Change to Tervita Corporation

May 21st, 2019

Environmental Assessment Office
836 Yates Street
Victoria, BC
V8W 1L8

Attention: Natalie Schell

RE: Silverberry Secure Landfill – Name Change to Tervita Corporation

As a leader in environmental and energy services, Tervita Corporation (Tervita) has a strong track record of safety and environmental compliance. We have built our track record on the safe, secure management of industrial and oil and gas wastes through our network of Treatment and Recovery facilities and industrial landfills.

Tervita is requesting that the name on Environmental Assessment Certificate (EAC) WD02-01 is changed from CCS Corporation to Tervita Corporation. In 2012 CCS Corporation and 12 owned subsidiaries (HAZCO, Prodrill, Concord etc.) came together under the new name of Tervita Corporation. There were no ownership changes to the company. Attachment 1 is the historical amalgamation filed with BC Registry Services.

Should you require further information, please feel free to contact me directly at (403) 234-4875.

Sincerely,

Tervita Corporation

Peter Nelson
