

# Assessment Report for Tilbury Phase 2 LNG Expansion Project

WITH RESPECT TO THE APPLICATION BY FORTISBC FOR AN ENVIRONMENTAL ASSESSMENT CERTIFICATE PURSUANT TO THE *ENVIRONMENTAL ASSESSMENT ACT* (2018) (THE ACT) AND THE *IMPACT ASSESSMENT ACT* (2019) AS A SUBSTITUTED ASSESSMENT

WRITTEN BY  
THE BRITISH COLUMBIA ENVIRONMENTAL ASSESSMENT OFFICE

AUGUST 27, 2026

## PREFACE

When a major project is proposed in British Columbia, it may be subject to both a federal impact assessment and a provincial environmental assessment. The Environmental Assessment Office (EAO) is a neutral regulatory agency within the provincial government that carries out responsibilities under the [Environmental Assessment Act \(the Act\)](#). The EAO works with First Nations, the proponent, the public, local governments, scientific professionals, and federal and provincial agencies to identify and assess the potential environmental, economic, social, cultural and health effects that may occur during the lifetime of a major project.

This Assessment Report (Report) provides an overview of the Tilbury Phase 2 Project and describes the EAO's findings, conclusions, and recommendations. A final version is provided to provincial Ministers, including proposed Table of Conditions, Certified Project Description, for their consideration on whether to approve the project.

You can learn more about the environmental assessment process [here](#). Information and records relating to environment assessments are available on the EAO's website at [www.eao.gov.bc.ca](http://www.eao.gov.bc.ca). Questions or comments can be directed to:

### Environmental Assessment Office

PO Box 9426 Stn Prov Govt  
Victoria BC V8W 9V1  
Email: [eaoinfo@gov.bc.ca](mailto:eaoinfo@gov.bc.ca)

The Impact Assessment Agency of Canada (IAAC), a federal body accountable to the Minister of Environment, Climate Change, and Nature is responsible for conducting federal impact assessments under the [Impact Assessment Act](#). You can learn more about the Impact Assessment process [here](#). Information and records relating to federal impact assessment are available on IAAC's [Canadian Impact Assessment Registry](#). Questions or comments can be directed to:

### Impact Assessment Agency of Canada, Pacific and Yukon Regional Office

1800-1138 Melville St.  
Vancouver BC V6E 4S3  
Email: [pacificandyukonregion-regiondupacificetduyukon@iaac-aeic.gc.ca](mailto:pacificandyukonregion-regiondupacificetduyukon@iaac-aeic.gc.ca)

When both an environmental assessment under the *Environment Assessment Act* and impact assessment under the *Impact Assessment Act* are required, [the Impact Assessment Cooperation Agreement between Canada and British Columbia](#) sets out the administrative processes required from both the EAO and IAAC to ensure an efficient and effective assessment process, including the use of substitution. Under substitution, there is a single review process (the provincial environmental assessment) designed to meet both provincial and federal legislative requirements, thereby enabling two decisions (provincial and federal).

## ACKNOWLEDGEMENTS

The EAO would like to acknowledge and thank the people who participated in this substituted environmental assessment. We are grateful to the First Nations in whose territory this assessment took place and who participated in the review of this assessment, community members, technical advisors, local government members, consultants, staff, and all of those who helped this process run fairly and efficiently and who provided the important evidence and advice required to provide a comprehensive assessment for the provincial and federal decision makers. Thank you for your passion, contributions, and effort.

## EXECUTIVE SUMMARY

### Overview of the Assessment Report

This Assessment Report (Report) summarizes the findings and recommendations of the environmental assessment (EA) for the Tilbury Phase 2 Liquefied Natural Gas (LNG) Expansion Project (Tilbury Phase 2 or the Project), an expansion of an existing LNG production and storage facility proposed by FortisBC Holdings Inc. (FortisBC or the Proponent), with its natural gas subsidiary FortisBC Energy Inc. (collectively referred to as FortisBC or the Proponent). This report aims to inform the provincial Ministers responsible for making a decision on whether to issue an Environmental Assessment Certificate (Certificate) and the federal Minister of Environment, Climate Change, and Nature (or Governor in Council) for decision-making under the *Impact Assessment Act*. This report also aims to inform participating Indigenous nation's decisions on providing a notice of consent or lack of consent to issuing the environmental assessment certificate under Section 29(2)(c) of British Columbia (B.C.)'s *Environmental Assessment Act* (the Act) and in accordance with their own legal traditions.

The Report outlines key issues, consultation and engagement with Indigenous nations, environmental, social, health, economic and culture effects, including cumulative effects, and proposed measures to mitigate potential adverse impacts.

### Project Details

The Proponent is proposing to expand the capacity of its existing Tilbury LNG facility located on Tilbury Island in Delta, in the Greater Vancouver Regional District. The expansion will include the construction of a new LNG storage tank, with a working volume of 142,400 cubic meters (m<sup>3</sup>) (3.5 petajoule) (Storage Tank) and up to 7,700 tonnes per day (t/d) of LNG liquefaction (Liquefaction Capacity), natural gas receiving facilities, as well as supporting infrastructure within the existing LNG facilities' area. Tilbury Phase 2 will be constructed entirely within the existing Tilbury LNG Facility site and will not require expansion of the facility footprint onto previously undeveloped lands.

The Proponent has stated that the purposes of Tilbury Phase 2 are to strengthen resiliency by providing instantaneous backup gas supply to FortisBC customers in the event of a supply emergency and to provide a fuel alternative for local and global markets to meet the growing demand.

### Regulatory Review

Tilbury Phase 2 is subject to an EA under the Act and an impact assessment under Canada's *Impact Assessment Act* (IAA). On January 20, 2022, the former federal Minister of Environment and Climate Change approved the substitution of the federal impact assessment to the Province of B.C. The Environmental Assessment Office (EAO) conducted the substituted assessment to meet both provincial and federal requirements, thereby enabling decisions under both B.C.'s Act and Canada's IAA. The Project also requires authorizations under the *Energy Resources Activities Act* (ERAA) from the BC Energy Regulator (BCER) for the LNG facility, from Metro Vancouver under the *Environmental Management Act* (EMA) for air emissions, and a Certificate of Public Convenience and Necessity from the B.C. Utilities Commission (BCUC) for the LNG storage tank as part of a utility system.

The EAO prepared this Assessment Report in consultation with a technical advisory committee, comprising of federal, provincial and local government representatives with mandates and skill sets relevant to the review of Tilbury Phase 2, as well as representatives of Indigenous nations potentially affected by Project activities. The Impact Assessment Agency of Canada (IAAC) also provided advice to the EAO in relation to fulfilling requirements of the IAA.

The EAO undertook public consultation activities during the EA including holding four public comment periods and establishing a Community Advisory Committee (CAC) to help share information with interested community members throughout the process. All public comments, as well as the Proponent's and the EAO's responses to these comments, were considered in completing the EA.

## Assessment of Effects

The EAO assessed all effects required by the Act and potential adverse effects within federal jurisdiction as required under the IAA. The assessment was informed by the Revised Application for an Environmental Assessment Certificate provided by the Proponent as well as by comments received from the Technical Advisory Committee (TAC), Indigenous nations, CAC, and the public.

The EAO assessed effects on the Valued Components (VCs) that were identified as potentially affected by Tilbury Phase 2, specifically: air quality, acoustics, culture, vegetation, wildlife and wildlife habitat, fish and fish habitat, groundwater, surface water, soil, employment and economy, infrastructure and services, land and resource use, archaeological and heritage resources, and human health. The EAO considered whether any adverse effects to these VCs would be significant.

For all Indigenous nations potentially affected by Tilbury Phase 2, the EAO assessed the potential effects of Tilbury Phase 2 on the asserted or established Aboriginal rights and title, as recognized and affirmed by Section 35 of the *Constitution Act, 1982*, as well as on any broader interests related to an Indigenous nation (collectively, “Indigenous Interests”).

The assessment also considered other assessment matters as required under the provincial and federal legislation including: risks and uncertainties associated with effects, interactions between effects, the risks of malfunctions and accidents, disproportionate effects on distinct human populations, effects on biophysical factors that support ecosystem functions, effects on current and future generations, contributions to sustainability, consistency with land use plans, greenhouse gas (GHG) emissions, alternative means for carrying out the project, and potential changes to the project that may be caused by the environment.

To fulfill federal requirements, the EAO assessed potential adverse federal effects as required under the IAA specifically on: fish and fish habitat, migratory birds, and federal lands. The EAO also assessed adverse federal effects with respect to the Indigenous peoples of Canada, specifically: an adverse impact resulting from any changes to the environment on cultural and physical heritage; current use of lands and resources for traditional purposes, and any structure, site or thing that is of historical, archaeological, paleontological or architectural significance, and to health, social and economic conditions of Indigenous peoples. The EAO determined whether adverse federal effects are likely to be significant and, if so, to what extent.

## Indigenous Consultation

Potential effects from Tilbury Phase 2 would occur in the territories of the following First Nations (listed alphabetically):

- Chawathil First Nation;
- Xwchíyò:m (Cheam) First Nation;
- Katzie First Nation;
- q̓ʷa:ń̓ł̓əń̓ (Kwantlen) First Nation;
- kʷikʷəł̓əm (kwikwetlem) First Nation;
- Leqʷá:mel First Nation;
- Malahat First Nation;
- M̓athexwi (Matsqui) First Nation;
- xʷməθkʷəy̓əm (Musqueam Indian Band);
- Pauquachin First Nation;

- Pópkw'em (Popkum First Nation);
- Quw'utsun Nation (Cowichan Tribes, Halalt First Nation, Lyackson First Nation, Penelakut Tribe and Stz'uminus First Nation);
- Semiahmoo First Nation;
- S'ólh Téméxw Stewardship Alliance members (Aitchelitz First Nation, Kwaw-kwaw-Apilt First Nation, Seabird Island Band, Semá:th (Sumas) First Nation, Shxwhá:y Village, Shxw'ōwhámél First Nation, Skowkale First Nation, Skwah First Nation, Soowahlie First Nation, Sq'ewá:lxw (Skawahlook) First Nation, Sq'éwlets (Scowlitz) First Nation, Squiala First Nation, Tzeachten First Nation, Yakweakwioose First Nation, and Yale First Nation);
- Snuneymuxw First Nation;
- Skwxwú7mesh Úxwumixw (Squamish First Nation);
- SṪÁUTW (Tsawout) First Nation;
- Tsartlip First Nation;
- Tsawwassen First Nation;
- Tseycum First Nation;
- Tsleil-Waututh Nation; and,
- Ts'uubaa-asatx.

The EAO, on behalf of the provincial and federal Crown, consulted with these Indigenous nations throughout the substituted assessment process. IAAC worked in coordination with the EAO on consultation activities leading up to the substitution decision and throughout the effects assessment phase.

The EAO also consulted with Métis Nation British Columbia, on behalf of the federal Crown as part of the substituted assessment, and with Lummi Nation which is a United States Tribe that asserts Aboriginal Rights within the vicinity of the Lower Fraser River.

One of the purposes of the EAO is to support reconciliation with Indigenous peoples in B.C. The EAO sought consensus throughout the process at key milestones with participating Indigenous nations, including:

- Chawathil First Nation;
- Cheam First Nation;
- Kwantlen First Nation;
- kʷikʷə́ləm First Nation;
- xʷməθkʷəyəm (Musqueam Indian Band);
- Quw'utsun Nation (Cowichan Tribes, Halalt First Nation, Lyackson First Nation, Penelakut Tribe and Stz'uminus First Nation);
- Snuneymuxw First Nation;
- S'ólh Téméxw Stewardship Alliance (on behalf of Kwaw-Kwaw-Apilt First Nation, Sq'éwlets (Scowlitz) First Nation, Sq'ewá:lxw (Skawahlook) First Nation, Skwah First Nation, Seabird Island Band, Semá:th (Sumas) First Nation, Yale First Nation, Aitchelitz First Nation, Shxwhá:y Village, Skowkale First Nation, Soowahlie First Nation, Squiala First Nation, Tzeachten First Nation, and Yakweakwioose First Nation);

- Ts'uubaa-asatx;
- Sᑭᐱᐱᐱ First Nation;
- Tsawwassen First Nation; and,
- Tsleil-Waututh Nation.

These First Nations had the opportunity to provide a notice of consent or lack of consent at the end of the environmental assessment process. Five (5) participating Indigenous nations chose to provide notices of consent, three (3) chose to provide notices of lack of consent, which are included with the final referral documents for Ministers. This report highlights efforts to incorporate Indigenous knowledge into the assessment process and outlines the consensus-seeking processes with participating Indigenous nations.

### Key Issues

The EAO assessed a wide range of potential positive and adverse effects to understand the predicted residual, and where applicable, cumulative effects of Tilbury Phase 2. Three key issues arose during the assessment process:

1. **Greenhouse Gas (GHG) Emissions:** The Project's contribution to climate change was a key concern. While the proponent's application states that the project will help reduce global emissions by displacing higher-carbon energy sources, there remained concerns about its alignment with provincial, federal, local, and First Nation climate goals. Mitigation measures and regulatory conditions have been proposed to address GHG concerns alongside the implementation of legislation and policy frameworks to achieve future net-zero goals from both B.C. and Canada. After implementation of the proposed mitigation measures and conditions, the EAO determined that the Project would not have significant adverse effects on GHG emissions.
2. **Effects to Air Quality and Human Health:** Concerns were raised about the potential impacts of air quality as it relates to human health. This includes concerns related to ongoing emissions during Operation as well as the inclusion of a flare as part of the Project. Mitigation measures and regulatory conditions have been proposed to minimize these effects and complementing permitting requirements. Following implementation of the proposed mitigation measures and conditions, the EAO determined that the Project's residual effects on air quality and human health, as well as its contribution to cumulative adverse effects, would not be significant.
3. **Project Scope and Aquatic Effects:** Although no marine traffic is directly connected with this Project, concerns were raised by First Nations about impacts on marine mammals, fisheries and those who rely upon the marine environment and resources. Concerns regarding impacts to fish were also raised relating to the release of water from hydrostatic testing of the LNG storage tank and impacts of 6PPD-Quinone (6-PPDQ) from trucks during Construction. Mitigation measures and regulatory conditions have been proposed to minimize these effects to the extent they are related to the Project. Following implementation of the proposed mitigation measures and conditions, the EAO determined that the Project's residual effects on aquatic interests, as well as its contribution to cumulative adverse effects, would not be significant.

### Measures to Reduce Effects

To mitigate potential adverse effects, the Proponent proposed a suite of mitigation measures as part of project design and operations. Additionally, the EAO has proposed provincial conditions as legally-binding requirements in the event a Certificate is issued. The EAO has identified federal Key Mitigation Measures and Follow-up Programs and made recommendations regarding them to IAAC to inform federal decision making under the *Impact Assessment Act*. If approved, the EAO notes that Tilbury Phase 2 would require a number of additional provincial, federal and municipal approvals and permits that would also impose additional requirements.

### Conclusions

The EAO carefully considered all information submitted by the Proponent, Indigenous nations, local governments, public, the CAC, and the TAC. Based on a thorough analysis of the assessment materials, the proposed mitigation measures, acceptable implementation of the proposed provincial conditions, the KMMs and federal follow-up programs under the IAA, and the permitting and other regulatory requirements that the Project would be subject to, the EAO has determined that Tilbury Phase 2 is not likely to result in significant adverse project-specific effects or contribute significantly to adverse cumulative effects.

The EAO acknowledges ongoing concerns regarding cumulative effects to air quality as a result of residual effects of Tilbury Phase 2 interacting with the effects of other past, present, and reasonably foreseeable future projects. The EAO concludes, however, that Tilbury Phase 2's contribution to these cumulative effects would be limited, due to the nature and scale of the project's effects, and not significant.

In reaching its conclusions, the EAO considered the adverse effects within federal jurisdiction as defined in Section 2 of the IAA. The EAO concluded that residual and cumulative adverse federal effects to fish and fish habitat, migratory birds, air quality and acoustic resources that would occur on federal lands, to physical and cultural heritage and any structure, site or thing that is of historical, archaeological, paleontological or architectural significance, are not significant. The EAO concluded that residual effects to Indigenous peoples' physical and cultural heritage are not significant, and the cumulative effects are significant to a low extent. The EAO concluded that residual and cumulative adverse federal effects to Indigenous peoples' current use of lands and resources for traditional purposes and to the health, social, and economic conditions of Indigenous peoples are significant to a low extent.

In considering the purposes of the Act, the EAO evaluated whether Tilbury Phase 2 would promote sustainability by protecting the environment, fostering a sound economy, and supporting the well-being of British Columbians and their communities.

From an environmental perspective, the assessment concluded that potential adverse effects can be effectively mitigated through the proposed Certificate conditions, additional regulatory requirements, KMMs and project-specific mitigation measures. While cumulative air quality concerns exist in the region, the Project's incremental contribution to those effects is expected to be limited in magnitude and frequency.

Tilbury Phase 2 also has the potential to foster a sound economy by supporting continued and new employment, contracting, and training opportunities, generating regional economic activity, and contributing tax revenue to local governments and the Province.

Finally, the Project has the potential to contribute to the well-being of British Columbians and their communities, including First Nations communities, through energy system resiliency, economic opportunities, and continued engagement with Indigenous nations regarding potential effects on their interests.

Based on the overall findings of the environmental assessment, the EAO is of the view that Tilbury Phase 2 is consistent with the promotion of sustainability as defined under the Act.

## 0.0 PURPOSE OF THIS ASSESSMENT REPORT

This Assessment Report (Report) provides the findings and recommendations of the environmental assessment conducted by the Environmental Assessment Office (EAO) for the Tilbury Phase 2 LNG (Liquified Natural Gas) Expansion Project (Tilbury Phase 2 or The Project) Application for an Environmental Assessment Certificate (Application) submitted by FortisBC Holdings Inc. with its natural gas subsidiary FortisBC Energy Inc., (collectively referred to as FortisBC or the Proponent) on November 29, 2024.

This Report is provided to the provincial Ministers who are responsible for making the decision on Tilbury Phase 2 under Section 29 of the *Environmental Assessment Act* (the Act). For Tilbury Phase 2, the deciding provincial Ministers are the Minister of Environment and Parks and the Minister of Energy and Climate Solutions (together referred to as ‘the Ministers’).

This Report is also submitted to the federal Minister of Environment, Climate Change, and Nature to inform their decision-making, fulfilling the requirements of both the federal [Impact Assessment Act](#) (2019) (IAA), the Act, and the conditions for substitution outlined in the [Notice of Substitution Approval](#) under the IAA.

### 0.1 Reader’s Guide to this Report

This Report describes:

- An overview of Tilbury Phase 2 ([Section 1.0](#)) and context of the region ([Section 2.0](#));
- The EAO’s environmental assessment process ([Section 3.0](#)) including other assessment matters based on [Impact Assessment Act](#) requirements including those outlined in the [Notice of Substitution Approval](#) ([Appendix 15.0](#));
- The engagement undertaken with all advisors and stakeholders, including the Technical Advisory Committee (TAC), Community Advisory Committee (CAC), the public, and local governments ([Section 4.0](#));
- The engagement with Indigenous peoples, including the EAO’s efforts to seek consensus with participating Indigenous nations, participating Indigenous nations notice of consent or lack of consent, and a summary of the effects to these Indigenous peoples including Métis Nation British Columbia on behalf of Canada ([Section 5.0](#));
- The predicted effects of Tilbury Phase 2 ([Section 6.0](#));
- The key concerns raised during the environmental assessment ([Section 7.0](#));
- The proposed Environmental Assessment Certificate (Certificate) conditions ([Section 8.0](#))
- Federal Key Mitigation Measures (KMM) and Follow-Up Programs under the IAA ([Appendix 2](#))
- The contribution of Tilbury Phase 2 to sustainability in B.C. ([Section 9.0](#)); and,
- The EAO’s conclusions ([Section 10.0](#)).

This Report does not replicate the content presented in the Proponent’s Revised Application for an Environmental Assessment Certificate (Revised Application). In the preparation of this Report, the following information has been considered:

- The Proponent’s [Revised Application](#), which includes supplemental information provided by the Proponent during the Application Review phase of the assessment; and
- Advice and comments provided by the TAC, CAC, Indigenous People, local governments, and the public on the Application, Revised Application, supplemental information, and a draft of this Report.

## 0.2 The Purposes of the Environmental Assessment Office

The [\*purposes of the Environmental Assessment Office\*](#) are to carry out its responsibilities under the Act, to promote sustainability by protecting the environment and fostering a sound economy and the well-being of British Columbians and their communities (sustainability purpose), and to support reconciliation with Indigenous peoples in B.C. (reconciliation purpose). Through its work with Indigenous peoples, the EAO is committed to advancing reconciliation by implementing the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP).

This Report and the environmental assessment process for Tilbury Phase 2 are intended to support the fulfillment of these purposes of the EAO specific to this project.

## 1.0 PROJECT OVERVIEW

### 1.1 Proponent Description

FortisBC Holdings Inc. (FHI), a subsidiary of Fortis Inc., and FortisBC Energy Inc. (FEI), a subsidiary of FHI, are British Columbia (B.C.) companies. FEI is based and headquartered in Surrey, B.C. and is the primary provider of natural gas for domestic use in the province of B.C. FEI has an obligation under the *Utilities Commission Act* to provide adequate, safe, and efficient natural gas service to its customers. FHI and FEI (together, FortisBC) have proposed the Tilbury Phase 2 Liquefied Natural Gas (LNG) Expansion Project (Tilbury Phase 2 or the Project) which is an expansion of FEI's existing LNG facility located on Tilbury Island in the city of Delta (Delta), B.C.

The principal points of contact for FortisBC for Tilbury Phase 2 are:

## 1.2 Project Description and Schedule

Figure 1: Concept image of Tilbury Phase 2 Project

FortisBC proposes to construct, operate and decommission an expansion to its Tilbury LNG Facility that has been in operation since 1971. Tilbury Phase 2 is an expansion (without a change in footprint) beyond the existing phase 1A and future phase 1B. This will include the construction of a new LNG storage tank with a working volume of 142,400 cubic metres ( $\text{m}^3$ ), 3.5 petajoule (Storage Tank) and up to 7,700 tonnes per day (t/d) of LNG liquefaction (Liquefaction Capacity), natural gas receiving facilities, as well as supporting infrastructure. The double-walled LNG Storage Tank will include LNG pumps, a closed loop Boil-Off Gas (BOG) management system, including gas compressors, insulated piping, stairways, a rooftop crane and safety systems. The total Project Site LNG storage volume could be up to 216,000  $\text{m}^3$  when combining the capacity of the Storage Tank, Base Plant storage tank, and Phase 1A storage tank. The total Project Site LNG working storage will be up to 188,000  $\text{m}^3$ . The Liquefaction component of the project is expected to be built in phases contingent on market demand and will include electric-drive refrigerant compressors, air cooling systems, nitrogen generator systems and other associated LNG system infrastructure for a total additional installed capacity of up to 7,700 t/d. The liquefaction capacity of the Project will increase the production of LNG at the Project Site from below 3,000 t/d to up to approximately 10,500 t/d, including Base Plant liquefaction. The following infrastructure will be installed for the lifecycle of the proposed LNG Storage Tank and liquefaction facilities and will include, control rooms, site grading, roadways, lighting, as well as Liquid hydrocarbon or chemical storage and handling facilities.

Figure 2: Tilbury LNG (current facility)

The Tilbury site is located on Lot 1 District Lot 135 Group 2 New Westminster District Plan and occupies the northern portion of the 7651 Hopcott property. Tilbury Phase 2 will be constructed entirely within the existing Tilbury LNG Facility site and will not require expansion of the facility footprint onto previously undeveloped lands.

Neighbouring properties are mostly industrial with the closest residential area being approximately 3 kilometres (km) away from the facility. Proximal businesses include a Seaspan Ferry Terminal, Riverside Funeral Home and Crematorium and the Delta Community Animal Shelter. Public access to the Project Site is restricted. There is no land-based recreational access to the Project Site, but some recreational activities do occur in the surrounding area both on and off land. Construction Laydown and storage areas will be located either within the Project Site or alternatively on previously disturbed areas including adjacent industrial sites.

Construction of the Project is anticipated to span two to three years for the LNG storage tank and an additional 2 years for the supplementary Liquefaction Facilities. The operational lifespan of the Project is anticipated to be a minimum 40 to 60 years, starting in 2027 or 2028 (i.e., in operation until at least 2067 - 2068) with a decommissioning expected to last 2 years.

The Proponent has provided the following estimated schedule for the phases of Tilbury Phase 2's Construction, Operation and Decommissioning, described in Table 1.

Table 1: Project Activities and Anticipated Schedule

| Project Phases and Activities                                                                                                               | Anticipated Duration | Anticipated Start               | Anticipated End               |
|---------------------------------------------------------------------------------------------------------------------------------------------|----------------------|---------------------------------|-------------------------------|
| Permitting                                                                                                                                  | 9 years              | 2019                            | 2027                          |
| Management plan development                                                                                                                 | 2 years              | 2026                            | 2027                          |
| Construction <ul style="list-style-type: none"> <li>LNG Storage Tank</li> <li>LNG Liquefaction Facilities</li> <li>Commissioning</li> </ul> | 3-6 Years            | 2027<br>2027<br>2029<br>Q2 2030 | 2033<br>2030<br>2033<br>2031+ |
| Operation                                                                                                                                   | 40 Years             | 2030                            | 2070+                         |
| Decommissioning                                                                                                                             | 2 Years              | 2070                            | 2072                          |

Figure 3: Tilbury Phase 2 LNG Project Footprint

### 1.3 Purpose and Need for the Designated Project

Paragraph 22(1)(d) of the *Impact Assessment Act* (IAA) specifies that the assessment of a designated project must take into account the purpose and need for the designated project. FortisBC has identified this facility as a key element in its utility operations and business strategy, specifically to:

- strengthen resiliency by providing instantaneous backup gas supply to FortisBC customers, primarily in the Lower Mainland, in the event of a supply emergency; and,
- provide a clean-burning, lower-carbon fuel alternative for local and global markets to meet the growing demand.

FortisBC has identified that the Tilbury Phase 2's storage capacity is critical to its role as a regulated utility in ensuring a stable supply of natural gas to its customers primarily in the Lower Mainland. Gas supplies to the Lower Mainland are primarily dependent on the Westcoast pipeline which is primarily owned by Enbridge and suffered a pipeline rupture in 2018. The disruption of the pipeline's normal operations would, in the absence of a sufficient stored natural gas or alternative gas delivery options, present a risk to normal utility operations. FortisBC also identified that storage capacity is needed in cases of peak demand or other short term supply issues.

The B.C. Utilities Commission (BCUC) issued a Certificate of Public Convenience and Necessity in October 2025 for the Tilbury LNG Storage Expansion Project, which includes the LNG Storage Tank that is subject to this Environmental

Assessment (EA). The BCUC assessed the benefits of the LNG storage tank to the public, Indigenous Nation and stakeholder feedback in its determination. Information on the BCUC process is included in [Section 2.3.2](#) of this Report.

FortisBC also states in the Revised Application that secondary purpose of the Project is to “provide a clean-burning, lower-carbon fuel alternative for local and global markets to meet the growing demand” (Section 1.7 of the Revised Application). This section outlines FortisBC’s rationale that there are both domestic and international markets for LNG as a fuel that has a lower carbon footprint than alternatives, and that there is a current and growing demand for LNG as a marine fuel.

1.4 Alternatives to the Project

Paragraph 22(1)(f) of the IAA requires the assessment take into account any alternatives to the designated project that are technically and economically feasible and are directly related to the designated project. Subsection 1.2 above discusses the purpose and need for Tilbury Phase 2 to:

- Develop the infrastructure required to support increased LNG storage capacity and expand the facility’s liquefaction capabilities. The proponent intends to increase both production and storage at the facility to strengthen the resilience of its Lower Mainland gas system; and,
- Increase the LNG the storage capacity at the Tilbury LNG facility to enhance its ability to operate as a “peak-shaving” resource during periods of high energy demands in the Lower Mainland. The facility has previously provided backup energy supply for six consecutive days in December 2021 and again in 2023, following disruptions on the Westcoast Energy pipeline that serves the region.

The Proponent evaluated a range of alternatives to determine the most effective and feasible approach for enhancing gas system resilience in the Lower Mainland. The Proponent’s assessment concluded that expanding the existing Tilbury LNG facility, already connected to the regional gas distribution system and located close to end users, is the most appropriate option, because the redevelopment of the brownfield site would minimize new land disturbance, leverage existing infrastructure, and reduce the risk of supply disruptions between storage and demand centres.

Alternatives were examined to test their ability to meet the Project’s resilience objectives, including load management, pipeline diversification, and various storage configurations. While some options could reduce certain risks or improve operational flexibility, they were generally limited by continued exposure to upstream constraints or an inability to supply gas during extended no-flow events. Several storage alternatives were also constrained by feasibility considerations or higher relative cost and infrastructure requirements, including geological limitations, continued reliance on upstream systems, or the need for new greenfield development.

The alternatives to the Project were considered based on feedback collected through ongoing engagement, early engineering and technical feasibility, financial considerations, and potential environmental impact.

For an assessment of alternatives considered, refer to [Section 1.7 of the Revised Application](#), and Table 2 below. Overall, no other technically or economically feasible alternative was identified that could achieve the required improvements in system resilience.

Table 2: Alternatives to the Proposed Project Considered.

| Resiliency Element | Alternative(s) | Discussion                                                                                                                                                                                                                                                                                                         |
|--------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Load management    | AMI            | AMI remote shutoff capability would add resiliency by reducing the potential for an uncontrolled shutdown but is best viewed as a complementing supply-side solution. Without additional supply in case of a “no-flow” event, large-scale load shedding would be required, leaving many customers without service. |

| Resiliency Element                 | Alternative(s)                                                                                                                       | Discussion                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Diversified pipeline supply</b> | T-South pipeline expansion                                                                                                           | Expansion in this corridor would still leave the Lower Mainland gas supply at risk of a single point of failure, such that new storage would still be required to provide resiliency.                                                                                                                                                                        |
|                                    | Expansion to Northwest Pipeline's gorge capacity                                                                                     | Expansion would add little resiliency. Even if the gorge expansion was constructed, new storage would still be required to meet the resilience requirements.                                                                                                                                                                                                 |
|                                    | SCP expansion to Kingsvale, B.C. (that is, interconnecting with the T-South system 172 km north of FortisBC's Lower Mainland system) | A new regional pipeline would add resiliency by reducing single point of failure risk north of Kingsvale on the T-South system. However, even with this alternative constructed, new storage would still be required to address single point of failure risk for the 172 km of pipeline south of Kingsvale to Huntingdon.                                    |
|                                    | SCP expansion to Huntingdon, B.C.                                                                                                    | A new regional pipeline would add resiliency by diversifying supply into the Lower Mainland. Some gas would still be available if there was a failure on one pipeline system (T-South or expanded SCP). However, even if constructed, additional storage would still be required to supplement remaining pipeline flows and avoid significant load shedding. |
| <b>Storage</b>                     | Additional off-system storage contract                                                                                               | Contracting additional off-system storage would still leave the Lower Mainland subject to single point of failure risk because supply would remain dependent on the T-South system to access the storage resource.                                                                                                                                           |
|                                    | On-system underground storage                                                                                                        | This alternative is not feasible within the Lower Mainland due to the regional geology.                                                                                                                                                                                                                                                                      |
|                                    | On-system storage at a new site                                                                                                      | This alternative would provide resiliency but is more costly than expansion at an existing site, and it would require of pipeline construction, liquefaction, storage, and regasification.                                                                                                                                                                   |

The alternatives screening and selection process also considered the environmental implications of the technologies and development choices. The Proponent evaluated the following alternatives in design and methodology alternatives in carrying out the Project, assessing project components including:

- LNG driver technology;
- Cooling system;
- Flare technology; and,
- Construction material delivery.

Refer to Appendix 13 - Alternative Means of Carrying out The Project for further information on the assessment of alternatives related to primary project components and activities.

## 1.5 Project Anticipated Expenditures

The anticipated expenditures associated with the construction of Tilbury Phase 2 are currently estimated at between \$3 to \$3.5 billion. This estimate includes construction expenses, the cost of all structures, engineering, machinery and equipment as well as the associated professional services involved with Tilbury Phase 2. The annual operating costs are anticipated to be approximately \$250 million. This figure is exclusive of cost of feed gas. When the facility is at the end of its operational life costs of Decommissioning are estimated at \$210 million with the assumption that the project site be

used for industrial purposes. Alternate uses such as conversion to natural riparian and/or upland forested habitat would likely increase this cost. The facility is expected to be in operation for a minimum of 40 years.

## 2.0 REGIONAL AND REGULATORY CONTEXT

The purpose of this section is to provide the reader with high-level information about the region where Tilbury Phase 2 is proposed.

### 2.1 First Nations

Tilbury Phase 2 is proposed within or near the territory of the following First Nations:

- Chawathil First Nation;
- Cheam First Nation;
- Katzie First Nation;
- Kwantlen First Nation;
- kʷikʷə́łəm First Nation;
- Leq'á:mel First Nation;
- Malahat First Nation;
- Matsqui First Nation;
- xʷməθkʷəyám (Musqueam Indian Band);
- Pauquachin First Nation;
- Popkum First Nation;
- Quw'ustun Nation (Cowichan Tribes, Halalt First Nation, Lyackson First Nation, Penelakut Tribe and Stz'uminus First Nation);
- Semiahmoo First Nation;
- S'ólh Téméxw Stewardship Alliance members (Aitchelitz First Nation, Kwaw-kwaw-Apilt First Nation, Seabird Island Band, Semá:th (Sumas) First Nation, Shxwhá:y Village, Shxw'ōwhámél First Nation, Skowkale First Nation, Skwah First Nation, Soowahlie First Nation, Sq'ewá:lxw (Skawahlook) First Nation, Sq'éwlets (Scowlitz) First Nation, Squiala First Nation, Tzeachten First Nation, Yakweakwioose First Nation, and Yale First Nation);
- Snuneymuxw First Nation;
- Sk̓wx̓wú7mesh Úxwumixw (Squamish First Nation);
- SṪÁUTW First Nation;
- Tsartlip First Nation;
- Tsawwassen First Nation;
- Tseycum First Nation;
- Tsleil-Waututh Nation (TWN); and,
- Ts'uubaa-asatx.

Throughout this document, the use of the term ‘territory’ refers to the asserted territories of First Nations unless the territories are established treaty lands or otherwise established by law or recognized by B.C. and Canada. The environmental assessment process is not a Rights-determining process. Through the environmental assessment process, the Environmental Assessment Office (EAO) seeks to understand what Tilbury Phase 2 effects would be on each First Nation and its asserted or established Aboriginal rights or Treaty rights, as recognized and affirmed by Section 35 of the *Constitution Act, 1982* (Section 35 rights). Engagement with these First Nations is described in [Section 16](#) of this Assessment Report (Report).

The assessment area includes a region where the B.C. Supreme Court, in *Cowichan Tribes v. Canada (Attorney General)*, 2025 BCSC, declared that Quw’ustun Nation hold Aboriginal title to a portion of the south arm of the Fraser River on Lulu Island; however, the Project Footprint itself is not within the title area. Quw’ustun Nation refer to the Aboriginal title area as *Tl’uq̓tinus*. Other First Nations assert overlapping territorial interests in this region and use other variations of this name such as *Łəq̓tinās*, *Tl’ektines*, or *Tl’eq̓tines*. The court decision is currently under appeal, including by the provincial and federal governments, local governments, local property owners and businesses, Union of BC Municipalities, and First Nations with appellate proceedings ongoing. Recognizing the ongoing divergences in views in relation to this area, for the purposes of this assessment report, a neutral geographic descriptor - “Historic Indigenous Village Site” - is used as the primary reference, while acknowledging the BCSC decision and the perspectives of other First Nations with interests in the area.

## 2.2 Communities

The Project would be located in the Tilbury Industrial Park in Delta, B.C. While its footprint and most direct impacts are within Delta, some effects—particularly those related to air quality and economic activity—may also be felt in neighbouring communities such as the City of Richmond (Richmond), as well as more broadly across Metro Vancouver.

### *Metro Vancouver*

Metro Vancouver Regional District is a regional district that is comprised of 21 municipalities, 1 Treaty First Nation, and 1 electoral area. It is home to around 2.7 million people. Metro Vancouver collaboratively plans for and delivers regional-scale services to its members including water supply, sewer systems, wastewater treatment, and solid waste management. Metro Vancouver also provides services, and has certain authorities, relating to air pollution control and air quality management under the *Environmental Management Act (EMA)*. Metro Vancouver borders Washington State, United States of America (USA) to the south, the Fraser Valley to the east, Squamish-Lillooet to the north, and Vancouver Island to the west. The

region's diverse landscape includes mountains such as the Coast and Cascade Mountains, valleys including the Fraser Valley, and coastal areas supporting a rich variety of ecosystems. The major economic sectors in Metro Vancouver include trade, tourism, film and TV, technology, and construction.

### *City of Delta*

Delta has a population of 108,455 and a population density of 603.7 people per square kilometer (km<sup>2</sup>) (2021). Delta is a vibrant area comprised of three thriving communities: Ladner, Tsawwassen, and North Delta. The City's economy is diverse, with roots in agriculture, construction, and retail, and a growing business sector. The industrial lands at Tilbury and Annacis Island are among the largest in Metro Vancouver. Tilbury Island is a key industrial hub, particularly for transportation and warehousing, with a strong focus on

manufacturing and distribution. It is also a significant area for energy storage. The island's strategic location facilitates barge access via the Fraser River and offers good road and rail connections, making it ideal for businesses in the transportation and warehousing sectors.

*City of Richmond*

Richmond currently has an estimated population of 241,375. The city is a culturally diverse, growing, and dynamic urban center characterized by a unique mix of residential and commercial properties, agricultural lands, industrial parks, waterways, and natural areas. Located at the confluence of the Fraser River and the Pacific Ocean, Richmond features numerous parks, trails, recreation facilities, and programs that contribute to a healthy and active community. Richmond's diverse economy encompasses various sectors, including services, retailing, tourism, technology industries, light manufacturing, airport services and aviation, agriculture, fishing, and government.

*City of Vancouver*

The City of Vancouver is the largest city in B.C., with a population of 631,486. Vancouver occupies the western half of the Burrard Peninsula. The city is bounded to the north by English Bay and the Burrard Inlet, to the south by the Fraser River, to the east by the City of Burnaby (Burnaby), and to the west by the Strait of Georgia. Vancouver. Its main industries include technology, film and TV, tourism, natural resources, trade and logistics. The Port of Vancouver facilitates the city's trade with Asia, and its numerous beaches, parks, and cultural sites make it a popular destination for tourists and residents.

## 2.3 Geography and Ecology

The Tilbury Phase 2 project is located within the existing LNG facility on Tilbury Island, Delta, B.C. The approximate coordinates of the location are latitude 49°08'28"N and longitude 123°01'57"W, with an elevation of approximately 1 metre above sea level (masl). The Project is bounded to the northwest by the Fraser River and to the southeast by the Tilbury Slough.

Figure 4: Project site of the Tilbury Phase 2 LNG Expansion Project

Figure 5: Tilbury Slough

The Fraser River, on Figure 4, and Tilbury Slough, on Figure 5 provide habitats for migratory birds, waterfowl, and raptors. The Fraser River, which flows into the Salish Sea between the mainland and Vancouver Island, provides habitat for 78 different species of fish, including salmon, eulachon, and white sturgeon. First Nations rely on the Fraser River and its surrounding lands as a vital means of transportation and for harvesting, trading, and other economic and cultural purposes. The river's main navigational channel is utilized by various vessels, including deep-sea cargo ships, tugs with barges and log booms, and commercial fishing vessels.

Figure 6: Riparian vegetation and adjacent mudflat shoreline along Tilbury Island

The terrain of the Project site is relatively flat, with river sediment-based soil consisting primarily of silt and sand. The Project site is currently characterized by concrete surfaces, graveled and paved areas, existing infrastructure, and equipment laydown areas, resulting in limited to negligible habitat value for wildlife.

Ecologically, the area is in proximity to parks and sensitive areas, including Burns Bog Ecological Conservation Area, Deas Island, Fraser River Islands and Boundary Bay regional parks, Delta Nature Reserve, George C. Reifel Migratory Bird Sanctuary, Alaksen National Wildlife Area, and a wetland habitat indicated by the presence of *Typha latifolia*. The native vegetation includes *Pseudotsuga menziesii* (Douglas fir), *Thuja plicata* (western redcedar), and *Tsuga heterophylla* (western hemlock). The area holds significance in terms of traditional territories and historical use, as well as culturally significant vegetation.

## 2.4 Regulatory Environment

### 2.4.1 B.C. Environmental Assessment and Federal Impact Assessment

Tilbury Phase 2 is an expansion of an existing LNG facility and subject to a provincial EA pursuant to the following section of the [Reviewable Projects Regulation](#) (B.C. Reg. 243/2019; O.C. 607/2019).

- **Part 4** (Petroleum and Natural Gas Projects), applies because construction of the Tilbury Phase 2 expansion on the existing Tilbury LNG facility would constitute a modification of that facility. This modification represents an increase in the capability of the Project to store one or more energy resources, other than electricity, by an amount that can yield  $\geq 3$  Petajoule(s) of energy through combustion or, for LNG, an increase of  $\geq 136,000$  cubic meters ( $\text{m}^3$ ).

Tilbury Phase 2 is considered a designated project under the IAA as it meets the threshold of certain sections of the [Physical Activities Regulation](#) (SOR/2019-285). The applicable section is:

- **Section 37(g)** (Oil, Gas, and Other Fossil Fuels), applies because Tilbury Phase 2 involves modifying an existing facility used for liquefaction, storage or regasification of LNG. Under this provision, a project meets the criteria when it is a new or modified LNG facility with a processing capacity of 3,000 tonnes per day (t/day) or more or a storage capacity of  $136,000 \text{ m}^3$  or more. An impact assessment is required because the expansion would increase the facility's LNG processing or storage capacity by 50% or more, resulting in a total LNG processing capacity of 7,700 tonnes per day (t/day) or a total LNG storage capacity of  $142,400 \text{ m}^3$  or more, as the case may be.

The former federal Minister of Environment and Climate Change substituted the federal impact assessment to B.C., with the understanding that the assessment must meet the requirements of the IAA and would be conducted by the EAO in accordance with the Impact Assessment Cooperation Agreement between Canada and British Columbia (Cooperation Agreement). Substitution results in a single assessment process designed to support the separate decisions by provincial and federal decision makers and also supports Indigenous peoples' decision making. This means that the EAO has prepared this assessment report on behalf of B.C. and Canada, and each government makes their own decisions whether to grant approval of the Project based on the considerations defined in each of their respective Acts as noted in the [Notice of Substitution Approval](#).

During the Environmental Assessment, in October 2023, the Supreme Court of Canada opined that the IAA was partially unconstitutional. The Government of Canada worked to issue guidance on the interim administration of the IAA to provide continuity for Projects in the impact assessment process and worked to introduce targeted and meaningful proposed legislative amendments to the IAA. On June 20, 2024, the amended IAA came into force. The amendments addressed the Supreme Court of Canada's concerns by focusing on the decision-making provisions and the definition of effects within federal jurisdiction and responded to the need to exercise cooperative federalism. On August 14, 2024, the Impact Assessment Agency of Canada (IAAC) transitioned Tilbury Phase 2 to the amended IAA by reposting the Minister of Environment and Climate Change's decision on substitution, deeming any steps completed before the amended IAA came into force to have been taken under the amended IAA. The [Notice of Transition to the Amended Impact Assessment Act](#) and the [Notice of Substitution Approval](#) under the IAA were posted to the Canadian Impact Assessment Registry.

Both Canada and B.C. retain their duty to consult and, where appropriate, accommodate Indigenous peoples.

#### 2.4.2 B.C. Utilities Commission Review

A Certificate of Public Convenience and Necessity (CPCN) from the [B.C. Utilities Commission \(BCUC\)](#) is required for any new facility or modifications to existing facilities providing public services (including utilities). The BCUC regulates B.C.'s energy utilities, the Insurance Corporation of B.C. (ICBC)'s basic automobile insurance rates, common carrier pipeline operations and rates, and the reliability of the electrical transmission grid. The BCUC ensures customers have access to safe, reliable energy services at just and reasonable rates, while allowing the utility the opportunity to earn a fair return on its investment.

The Revised Application identifies that a CPCN is required for the LNG storage tank as it is needed to provide resiliency to the FortisBC's natural gas supply system. The BCUC issued Order [C-6-25](#) granting a CPCN for the Tilbury LNG Storage Expansion Project (TLSE) on October 27, 2025. The Order provides restrictions on the use of the proposed LNG storage tank to system resiliency purposes and is not intended to permit FortisBC to "use LNG from the TLSE storage tank for LNG transportation service customers, export or other related purposes unless otherwise approved by the BCUC." Records of the [BCUC process](#) are available [here](#).

#### 2.4.3 Regulatory Coordination

In addition to provincial environmental assessment and federal impact assessment approvals, Tilbury Phase 2 would need various authorizations required issued by federal and provincial governments directly, or on a delegated basis.

The primary provincial permits or authorizations applicable to Tilbury Phase 2 are considered under the:

- [Energy Resource Activities Act](#) (ERAA) which regulates energy resource activities in B.C., including natural gas processing plants, such as Tilbury Phase 2, through permits, authorizations, orders and regulations. Regulations under ERAA outline technical standards and requirements that must be met throughout the lifecycle of LNG facilities and are supported by manuals published by the BC Energy Regulator (BCER). Applicable regulations include the [Liquefied Natural Gas Facility Regulation](#) (LNGFR) which contains requirements to restrict flaring and venting as well as the [Emergency Management Regulation](#) which sets requirements (including technical requirements as

well as how permit holders must consult with First Nations and stakeholders) for an emergency response program and emergency response plan, as well as requires regular emergency management exercises.

- [Environmental Management Act](#) (EMA) which is B.C.'s primary legislation for regulating pollution and waste to protect the environment and human health. Under EMA, Metro Vancouver has been delegated authority for managing air discharges within Metro Vancouver. Metro Vancouver exercises this authority through the Greater Vancouver Air Quality Management Bylaw NO. 1082, 2008 (as amended). This authority includes a permitting regime, air quality monitoring, and setting air quality guidelines.

The EAO prepared a [Joint Permitting/Regulatory Coordination Plan](#) and [Regulatory Coordination Issues Tracking Table](#) that contain information about these and other federal and provincial authorizations required for the Tilbury Phase 2.

#### 2.4.4 Land Use Plans

The following land use plans are relevant to Tilbury Phase 2's geographic setting:

##### Provincial Government Land Use Plans

- Lower Fraser Sustainable Resource Management Plan (2013): This plan applies to the Fraser Valley South Landscape Unit and is intended primarily for Crown land. The Project Footprint and majority of the assessment area are located on private land on Tilbury Island, with limited overlap with provincial Crown lands. As a result, the plan does not directly apply to the Project but provides general guidance for resource use;

##### Local Government and Port Authority Land Use Plans

- Metro Vancouver's Regional Growth Strategy (RGS: 2025): The Regional Growth Strategy is a high-level plan guiding land use and growth within the region. Tilbury Island is designated as Industrial Land, which supports industrial activities and services required for regional growth;
- Delta's Official Community Plan (OCP) (Bylaw No. 8400: 2024): The OCP provides long-term land use direction for Delta, including Industrial Lands. The Project site is located within an area designated for industrial use, and nearby Agricultural Land Reserve areas are situated south of the Project Footprint;
- Delta Zoning Bylaw No. 7600 (2017): This bylaw establishes permitted land uses within Delta. The Project Footprint is zoned "High Impact Industrial Use," which permits uses including natural gas and petroleum-related facilities;
- Vancouver Fraser Port Authority's (VFPA) Land Use Plan (2020): This plan outlines land and water use direction within the Vancouver Fraser Port Authority jurisdiction. The Project site is located within Planning Area 7 on the Fraser River, where industrial and port terminal uses are anticipated;

##### First Nations Land Use Plans

- x̱m̱əθḵəy̱əm's Comprehensive Sustainable Community Development Plan (2018): This plan provides a community-driven framework for x̱m̱əθḵəy̱əm's social, cultural, and economic priorities. While the Project is not located within x̱m̱əθḵəy̱əm reserve lands, the plan informs x̱m̱əθḵəy̱əm's interests related to land and resource use in the region;
- Qu'wutsun Nation's (Cowichan Tribes, Lyackson First Nation, Stz'uminus First Nation, Penelakut Tribe and Halalt First Nation) Declaration for Reconciliation: This declaration articulates shared principles for reconciliation and land stewardship among the signatory Nations. The declaration provides high-level guidance regarding Indigenous perspectives on land and resource use;

- Hul'qumi'num Treaty Group - Shxunutun's Tu Suleluxwts: In the Footsteps of Our Ancestors: Issued by the Hul'qumi'num Treaty Group, whose membership at the time of publication included Cowichan Tribes, Stz'uminus First Nation, Penelakut Tribe, Lyackson First Nation, Halalt First Nation, and Ts'uubaa-asatx, this document sets out resource management goals, objectives, and strategies reflecting Hul'qumi'num relationships to land and water, including Tl'uqtnus. The document provides high-level guidance on Indigenous land and resource stewardship relevant to the region;
- Ts'uubaa-asatx First Nation – South Arm of the Fraser River and Approaches Policy and Vision, Goals and Objectives (2018): These are policy documents that articulate priorities related to re-establishing traditional use and occupancy in the Lower Mainland and set out objectives for environmental protection and healthy ecosystems. The documents provide high-level guidance on Indigenous land and resource interests relevant to the Project area;
- Declaration for Reconciliation and Shxunutun's Tu Suleluxwts: In the footsteps of our Ancestors: These documents acknowledge the Quw'utsun Nation's objective to re-establish a permanent presence on Tl'uqtnus lands and articulate shared principles related to reconciliation and Indigenous land stewardship. The documents provide high-level guidance on Quw'utsun Nation's land-use priorities relevant to the broader region;
- S'ólh Téméxw Stewardship Alliance's S'ólh Téméxw Use Plan and Policy (2018): This plan guides land and resource use within S'ólh Téméxw, including direction for economic development and the protection of culturally significant areas, and designates the Fraser River as a Sensitive Waterway. The plan provides regional guidance relevant to Indigenous land and water stewardship;
- Tsawwassen First Nation Land Use and Governance Documents: Tsawwassen First Nation has established several interrelated land use, strategic, and governance documents, including the *Land Use Plan* (2009), *Neighbourhood Plan* (2011), *Strategic Plan* (2018–2023), *Final Agreement* (2010), and *Harvest Agreement* (2010). Together, these documents provide direction for land use, community development, transportation, environmental protection, land stewardship, and the exercise of Treaty rights within Tsawwassen First Nation lands and adjacent areas of the Fraser River. The Local Assessment Area (LAA) surrounds Tsawwassen lands, and these documents provide context for Tsawwassen interests related to land use, governance, and resource management;
- The Tseil-Waututh Nation Land Use Plan (2018): This plan outlines TWN's long-term land use goals, including environmental protection, climate change considerations, economic development, and community planning within TWN territory. The plan provides context for Indigenous stewardship responsibilities related to land, water, and air; and,

#### Other Land Use Plans

- Fraser River Estuary Management Program – A Living, Working River: The Estuary Management Plan for the Fraser River (2003): This plan was developed to provide a framework for integrating the management of human and natural activities within the Fraser River estuary. Although the Fraser River Estuary Management Program was dismantled in 2013, the plan's categories and information continue to provide planning context for land and shoreline use along the river.

#### 2.4.5 Other Projects in the Region

Within the Project site, the existing Tilbury LNG facility and its previously-approved expansion including associated storage and liquefaction capacity are already in place. Adjacent to the Project area are the Tilbury Marine Jetty (TMJ) project and Seaspans Ferry Terminal. TMJ is a planned LNG transportation and bunkering facility, while the Seaspans Ferry Terminal supports an average of ten ferry round trips per day.

Also located on Tilbury Island is the proposed Delta Grinding Facility Project that would include the manufacturing of supplementary cementitious material adjacent to an existing cement production facility. This project includes a new marine terminal, stockpile areas, mill system, truck loadout facility and related infrastructure.

Section 6.7 of the [Application Information Requirements](#) (AIR) outlines the requirements for Cumulative Effects Assessments (CEAs) for the Revised Application. This included requirements for identifying reasonably foreseeable future projects and developments, including a list of other Projects which at a minimum must be considered. In the Revised Application twenty-four (24) current and reasonably foreseeable future projects and developments within the region were considered in the context of the CEAs. As shown in Figure 7, these projects were categorized into: oil and gas developments, utilities and energy transmission, mineral resources, settlement and rural and urban development, and transportation and infrastructure.

Figure 7: The Project Footprint and Other Future Projects in the Region

### 3.0 THE ENVIRONMENTAL ASSESSMENT PROCESS

The Act and its regulations establish the legal framework for the EA process for proposed major projects in B.C. The Act requires that projects, including both new and modifications to existing projects, that exceed thresholds defined in the

[Reviewable Projects Regulation](#) and must undergo an EA and obtain an Environmental Certificate (Certificate) before proceeding.

The EA process as defined by the Act includes eight phases, as shown in Figure 8. Table 3 lists the major milestones for each of the phases of the EA process. See [Appendix 1](#) for an overview of the phases of the EA process.

Figure 8: Overview of the B.C. Environment Assessment Process

Table 3: Major Milestones of the Environmental Assessment

| Dates             | Milestones                                                                                            |
|-------------------|-------------------------------------------------------------------------------------------------------|
| Early Engagement  |                                                                                                       |
| February 11, 2020 | Proponent submits Initial Project Description and Engagement Plan to the EAO ( <a href="#">link</a> ) |
| February 11, 2020 | Proponent submits Initial Project Description to IAAC                                                 |
| March 5, 2020     | The EAO requests substitution should a federal impact assessment be required ( <a href="#">link</a> ) |

| Dates                                     | Milestones                                                                                                                                                                   |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| October 31, 2024                          | First Nations identify if they wish to be participating Indigenous nations                                                                                                   |
| August 14, 2020                           | The EAO and IAAC issue a Joint Summary of Issues and Engagement document, which also identifies a list of participating Indigenous nations ( <a href="#">link</a> )          |
| September 7, 2021                         | The Proponent submits a Detailed Project Description to the EAO and IAAC ( <a href="#">link</a> )                                                                            |
| January 4, 2022                           | The Proponent submits an updated Detailed Project Description to the EAO and IAAC ( <a href="#">link</a> )                                                                   |
| <b>Readiness Decision</b>                 |                                                                                                                                                                              |
| January 4, 2022                           | The EAO posts the Detailed Project Description ( <a href="#">link</a> )                                                                                                      |
| January 12, 2022                          | The EAO issues a Notice of Decision and posts reasons for decision ( <a href="#">link</a> )                                                                                  |
| <b>Process Planning</b>                   |                                                                                                                                                                              |
| January 10, 2022                          | Proponent submits the Detailed Project Description to IAAC ( <a href="#">link</a> )                                                                                          |
| January 10, 2022                          | IAAC posts the Notice of Impact Assessment Decision with Reasons, stating that a federal Impact Assessment is required for Tilbury Phase 2 ( <a href="#">link</a> )          |
| January 20, 2022                          | IAAC posts the Notice of Substitution Approval under the IAA, granting substitution of the conduct of the Impact Assessment to the Province of B.C. ( <a href="#">link</a> ) |
| June 13, 2022                             | The EAO issues the Process Order to the Proponent ( <a href="#">link</a> )                                                                                                   |
| <b>Application Development and Review</b> |                                                                                                                                                                              |
| November 29, 2024                         | Proponent submits Application ( <a href="#">link</a> )                                                                                                                       |
| May 5, 2024                               | The EAO amended the Process Order ( <a href="#">link</a> )                                                                                                                   |
| May 28, 2024                              | The EAO issues a Notice to Proponent respecting the Application ( <a href="#">link</a> )                                                                                     |
| February 11, 2026                         | The Proponent submits the Revised Application to the EAO ( <a href="#">link</a> )                                                                                            |
| March 27, 2026                            | The EAO accepts the Revised Application ( <a href="#">link</a> )                                                                                                             |
| <b>Effects Assessment</b>                 |                                                                                                                                                                              |
| August 27, 2026                           | The EAO refers decision materials to provincial Ministers for a decision on whether to issue a Certificate                                                                   |
| August 27, 2026                           | The EAO submits a final Assessment Report to the federal Minister to inform the federal decision                                                                             |

## 4.0 ENGAGEMENT

### 4.1 Technical Advisory Committee

The EAO established a Technical Advisory Committee (TAC), made up of federal, provincial, and local government staff or representatives with the mandates and expertise relevant to the review of Tilbury Phase 2, as well as representatives of

the participating Indigenous nations. The purpose of the TAC was to advise the EAO and participating Indigenous nations on technical matters related to the assessment and review the Application, Revised Application, and any supplemental materials.

As per the Cooperation Agreement and the Notice of Substitution Approval under the IAA, the EAO agreed to provide federal authorities with the opportunity to participate in the EA. The list of groups represented on the TAC is available in [Appendix 4](#) - List of Parties on the Technical Advisory Committee.

The EAO sought and considered advice from the TAC to understand and assess any potential effects associated with Tilbury Phase 2. TAC members were responsible for providing timely advice to the EAO and to participating Indigenous nations throughout the assessment.

The EAO reviewed the adequacy of FortisBC (the Proponent)'s responses to all comments received from TAC members and participating Indigenous nations and held various meetings with TAC members and participating Indigenous nations to discuss outstanding issues and concerns. In the development of this Report, recommended provincial conditions, and the EAO's identified, and in some cases recommended, Key Mitigation Measures (KMM) and Follow-Up Programs under the IAA ([Appendix 2](#)), the EAO considered all comments and issues raised during the EA. The EAO also developed the [Regulatory Coordination Issues Tracking Table](#) that describes the key topics and issues that were raised during the assessment and how these were addressed in the assessment, or would be addressed by a subsequent permitting process, other regulatory process, or government initiative. The document will be provided to the statutory decision makers to show how issues have been addressed and where they are being carried forward to another regulatory process.

The full set of comments and resolution of issues is provided in the [Application Review Issues Tracking Table](#). The key concerns are described in each of the Valued Component (VC) assessments detailed in [Appendix 6](#).

## 4.2 Community Advisory Committee

The EAO has the option to establish a Community Advisory Committee (CAC) for EAs, where there is sufficient public interest, to provide insight and advice to the EAO on potential effects of a project on nearby communities. Also, Paragraph 22(1)(m) of the IAA specifies that the assessment of a designated project must take into account community knowledge.

The EAO determined that there was sufficient community interest to establish a CAC based, including people that expressed interest directly to the EAO or IAAC. The [CAC's Terms of Reference](#) were posted on EPIC during Process Planning. CAC members were invited to:

- Review and familiarize themselves with the information provided to them by the EAO on the project and the EA process; and,
- Provide input on the draft Process Order, Application, Revised Application, draft Report and the draft Certificate, including proposed conditions and project description as part of the public comment period.

These opportunities and the role of the CAC are also described in the Tilbury Phase 2 Assessment Plan. Information and advice received from the CAC was considered in the EA.

## 4.3 Public

Public consultation is an important aspect of the EA process. Public participation in the EA process helps ensure that community values and public goals are considered in project planning and decision-making. Public comments also help the EAO ensure that all potential adverse effects of a project are captured and appropriately assessed. The IAA also specifies that the assessment of a designated project must take into account comments received from the public.

The EAO conducts its own public consultation but also requires additional public consultation from proponents. The EAO required FortisBC to prepare a [Public Engagement Plan](#). The plan laid out FortisBC's consultation objectives and activities. Through the course of the EA, FortisBC submitted multiple Public Consultation Reports to the EAO. The first [Public Engagement Report](#) was submitted following the Application Review public comment period, and the second [Public Engagement Report](#) was submitted following the Effects Assessment public comment period.

The EAO held four public comment periods for Tilbury Phase 2 that included virtual and/or in-person open houses as shown in Table 4. The virtual open houses each included a presentation by the EAO on the current and upcoming phases of the EA process, a presentation by FortisBC on Tilbury Phase 2, as relevant to the current phase, and an opportunity to ask questions online to the EAO and FortisBC. The in-person open houses included poster boards with relevant technical experts for the public to have discussions with as well as a panel discussion with the EAO and FortisBC. During public consultation, the EAO made efforts to engage diverse subgroups of the community in supporting the collection of information needed to complete the Gender Based Analysis (GBA) Plus.

Table 4: Public Comment Periods and Open Houses

| Phase              | Comment Period Dates           | Number of Commenters | Date of Open Houses                      | Number of Attendees |
|--------------------|--------------------------------|----------------------|------------------------------------------|---------------------|
| Early Engagement   | June 1, 2020 - July 16, 2020   | 527                  | June 18, 2020 – Virtual<br>16:00-17:30   | 150                 |
|                    |                                |                      | June 23, 2020 – Virtual<br>17:30-19:00   | 100                 |
| Process Planning   | Feb. 24, 2022 - April 10, 2022 | 89                   | March 3, 2022 – Virtual<br>13:00-14:30   | 43                  |
|                    |                                |                      | March 9, 2022 – Virtual<br>17:00-18:30   | 39                  |
| Application Review | Jan. 14, 2025 – March 3, 2025  | 272                  | Jan. 21, 2024 – Virtual<br>17:00-19:20   | 37                  |
|                    |                                |                      | Jan. 23, 2024 – In Person<br>16:00-20:00 | 26                  |
| Effects Assessment | Jun. 25, 2026 – July 27, 2026  | 628                  | July 8, 2026 – Virtual<br>18:00-19:30    | 99                  |

Issues raised during Public Comments Periods informed the EAO's assessment, including [Section 7, Key Concerns Identified in the EAO's Assessment of Effects](#) which describes the key concerns raised overall during the Environment assessment.

The following issues were raised during public engagement:

- Project's incompatibility with addressing climate change and Greenhouse Gas Emissions

The main public concern was the Project's contribution to the climate change, and the potential impacts of climate change on communities in and outside of British Columbia. The EAO heard repeated claims that expanding infrastructure for fracked methane gas is not compatible with climate reduction targets due to high greenhouse gas (GHG) emissions. Some respondents reject the description of LNG as "low carbon fuel", insisting that investing in LNG slows the necessary transition to renewable energy. There were also requests for assessment of full life cycle emissions of the Project by considering upstream and downstream impacts.

The EAO considered how to assess GHG emissions as part of the Application Information Requirements, and subsequently in its analysis in this report and when developing draft Condition 11: Greenhouse Gas Emissions and Net-Zero Plan. Flaring, venting and fugitive emission are subject to requirements under the LNG Facility Regulation, while methane emission can also be regulated by Metro Vancouver.

- **Environmental and ecological effects**

The facility's location near the Fraser River estuary and Salish Sea was cited by members of the public as a significant threat to critical marine ecosystems and wildlife. Concerns were heard about increased noise from ship traffic associated with LNG exports that would jeopardize the endangered Southern Resident Killer Whale (SRKW) population and endangered salmon, with noise interference potentially impacting the Orcas' echo location necessary for hunting. Concerns for the Fraser River and estuary also include potential pollution from surface run-off, accidental leaks, and thermal discharge caused by increased industrial activity and tankers. Additional concerns were heard regarding drilling of new fracking wells on Treaty 8 territories, a process they argued is tied to groundwater pollution from contaminated water, land degradation, and induced seismic activities.

The EAO notes that there is no shipping or dredging as part of this project. The EAO considered bio-physical effects of Tilbury Phase 2 as part of its assessment and has recommended draft conditions related to water and air quality, wildfire, and other potential impacts. Emergency management requirements will be further considered by the BC Energy Regulator should a permit application be submitted.

- **Human Health and Air Quality**

The EAO heard concerns regarding increased local air pollution through flaring, facility operations, and shipping. Members of the public voiced concerns that flaring in particular can be harmful to human health, exacerbating respiratory illnesses like asthma and increasing cancer risk.

The EAO has proposed draft Condition 14: Air Quality Management Plan to complement permitting by Metro Vancouver, which is the primary air quality regulator for projects within Metro Vancouver, and by the BC Energy Regulator as flaring and venting are activities that it must consider as part of its adjudication of LNG Facility Permits and are subject to requirements under the LNG Facility Regulation.

- **Public safety and accident risks**

The EAO heard concerns over the potential for industrial accidents given the Project's proximity to densely populated communities like Richmond, Delta, and Steveston Village. There was widespread concern heard that an LNG accidental release, especially if it were to ignite, could lead to a catastrophic accident or explosion capable of injuring or killing humans and causing extensive damage. Some members of the public questioned the project's ability to withstand major hazards, given the site is in an active earthquake zone where seismic events or dike failure during a flood could compromise the LNG plant.

The EAO assessed accidents and malfunctions in [Appendix 7 Section 18](#) and potential changes to the project caused by the environment in [Appendix 14 Section 25](#) this Report, and considered them when drafting conditions. Both are further considered by BCER as part of permitting, which includes requirements associated with emergency management.

- **Socio-economic and financial concerns**

The EAO heard claims from the public that the Project prioritizes corporate profit over public welfare and sound economic planning. Others expressed concerns over increased costs for consumers, citing examples from Australia and the United States (U.S.) where exporting LNG raised domestic gas prices. Others pointed to the long-term risks of the Project becoming a costly stranded asset given the municipal shift toward electrification and away from gas heating.

The EAO assessed effects to employment and the economy in [Appendix 6 Section 17.9](#) of this Report.

- **Indigenous Rights**

The public raised concerns about the failure of the project to respect Indigenous rights. They criticized the Project for fracking on Treaty Lands, violating Indigenous rights, ignoring the concerns of affected Nations, and potentially disrupting traditional fishing rights associated with the Fraser River.

Consultation and collaboration with First Nations and Indigenous organizations is foundational to environmental assessments, and the EAO is satisfied that it has met the constitutional duty to consult. The effects to First Nations and indigenous groups are assessed in [Appendix 5, Section 16](#) of this Report.

- **Process and transparency concerns**

The EAO heard concerns from the public about noted flaws in the EA process, criticizing the process as cumbersome, complex and too technical for public review. They also expressed distrust that the public input will be taken seriously.

- **Support for the Project**

The EAO received comments from the public that expressed support for the Project, citing anticipated economic and energy security benefits. Supporters noted that the Project would contribute to provincial and national economic growth through job creation during Construction and Operation, increased tax revenues, and broader business activity in surrounding communities. Some respondents emphasized the importance of reliable natural gas supply for the Lower Mainland and described the expansion as necessary infrastructure to ensure energy security and protect public health and safety in the event of supply disruptions. Others argued that LNG development would strengthen Canada's fiscal position and support long-term economic stability.

The full text of all public submissions received during Application Review and Effects Assessment public comment periods are available on the [EAO's Project Information Centre Engagement site](#), and public comments during Early Engagement and Process Planning along with submission form organizations are available on the [EAO's Project Information Centre project page](#).

On [September 16, 2020](#) IAAC posted a notification that Participant Funding was available to assist the participation of the public in the federal impact assessment of the proposed Tilbury Phase 2, the EAO also posted a notification on behalf of IAAC on [December 9, 2024](#). IAAC provided public participation funding to one group for the Planning Phase and to three groups for the Application Review and Effects Assessment Phases of the EA.

IAAC considers the public comments on the draft potential federal conditions submitted during EAO's Effects Assessment public comment period in federal decision-making for Tilbury Phase 2.

#### 4.4 Local Governments

Because several local governments either host key project infrastructure (Metro Vancouver and the City of Delta) or are located near the project (Richmond, and City of Vancouver), the EAO invited these jurisdictions to participate in the TAC

and kept them informed of project reviews and major milestones. The EAO also made itself available to meet with them on specific issues as needed.

Paragraph 22(1)(o) of the IAA specifies that the assessment of a designated project must take into account comments from jurisdictions received during consultation. The EAO provided each local government with updates on milestones in the EA of Tilbury Phase 2 and provided opportunities to review and provide feedback on key project documents. Key interests raised during the EA are outlined below.

Metro Vancouver:

- Potential effects of the Project to air quality, including how effects to air quality will be managed; and,
- Potential impacts to regional GHG emissions.

City of Delta:

- Potential impacts to infrastructure, including effects to transportation infrastructure (including parking), watermain capacity, trail access; and,
- Effects to nearby organizations, such as the Delta Community Animal Shelter (e.g. from acoustic effects).

City of Richmond:

- Richmond raised concerns related to the Project's proximity to Richmond, noting Council's opposition to the Project in 2020 and the importance of adequately assessing potential effects on Richmond residents and municipal interests. Richmond's comments focused on the following matters:
  - The adequacy of public engagement, noting that no in-person open house was held in Richmond during the environmental assessment;
  - Cumulative effects of the Project in combination with other major regional projects, particularly on the Fraser River estuary, sensitive ecosystems, flood resilience, and regional transportation systems;
  - Potential effects related to air quality, GHG emissions, and LNG transport and storage;
  - Potential effects on traffic, local infrastructure, and community conditions during construction and operations;
  - Potential effects on the Fraser River and adjacent ecological values, including water quality, habitat, and wildlife; and,
  - The adequacy of climate resilience measures.

These effects, proposed mitigation measures, and conclusions are described in more detail [Appendix 6.01, Section 17.01](#) (Air Quality), [Appendix 8](#) (Human Health and Community Well-Being), [Appendix 6.09, Section 17.09](#) (Employment and Economy), and [Appendix 12](#) (Greenhouse Gas Emissions).

## 5.0 INDIGENOUS NATION ENGAGEMENT AND SUMMARY OF EFFECTS

The Governments of B.C. and Canada have a constitutional duty to consult and, where appropriate, accommodate First Nations where they have Section 35 rights that may be adversely impacted by provincial and federal government decisions. [Section 25\(1\)](#) of the Act also requires that the effects of a project on Indigenous Nations and their Section 35 rights (collectively, "Indigenous Interests") must be assessed in every assessment. In addition, the EAO conducted consultation with Indigenous peoples identified by IAAC for consultation consistent with the [Notice of Substitution Approval](#) under the IAA, and provided IAAC the opportunity to participate in consultation. As per the Cooperation Agreement, Canada and B.C. each retain the responsibility to ensure that the duty to consult and, where appropriate,

accommodate has been satisfied, including determining the Indigenous peoples to be consulted and determining the scope, content and adequacy of consultation, and that their respective treaty obligations have been satisfied and complied with in respect of the EA.

## 5.1 Proponent-Led Engagement Activities with First Nations

As part of the [Assessment Plan](#) re-issued as Attachment A to the Amended Process Order, the EAO directed FortisBC (the Proponent) to undertake certain procedural aspects of consultation during the EA with First Nations. The Assessment Plan also required FortisBC to develop and share drafts of the Indigenous Engagement and Collaboration Plan and Reports with First Nations at prescribed milestones during the EA. These documents were reviewed by First Nations and revised by FortisBC based on input received from and concerns expressed by First Nations prior to being submitted to the EAO. These documents enabled the EAO to:

- Understand FortisBC's engagement and consultation plan and subsequent efforts and the perspectives of the First Nations related to those efforts;
- Understand any issues and concerns identified by First Nations to FortisBC and how FortisBC has made efforts to respond to or address these issues;
- Evaluate FortisBC's consultation and engagement plan for subsequent consultation activities required with First Nations during Application Review; and,
- Direct FortisBC to take additional measures to satisfy the EAO and/or First Nation concerns/questions, when applicable.

FortisBC engaged with First Nations to complete Indigenous Knowledge studies and other reports specific to Tilbury Phase 2. FortisBC received studies from the following First Nations:

- xʷməθkʷəy̓əm (Musqueam Indian Band): xʷməθkʷəy̓əm provided the xʷməθkʷəy̓əm Knowledge and Use Study (Tam et al. 2018);
- Quw'utsun Nation: provided FortisBC with Traditional Knowledge reports, specific reports with Indigenous Knowledge, cultural use studies;
- Chawathil First Nation: provided information in the form of primary Indigenous Knowledge to FortisBC regarding its views on how Indigenous laws, governance, philosophies, or customs historically or currently apply in relation to the Project;
- S'ólh Téméxw Stewardship Alliance (STSA): did not provide FortisBC with specific, standalone Indigenous Knowledge studies or reports; however, the STSA did provide Indigenous Knowledge, and perspectives that were incorporated primarily through a collaborative and co-drafting process for relevant sections of the Revised Application;
- Tsleil-Waututh Nation (TWN): provided a traditional use study which included an ethnohistoric report; and,
- Tsawwassen First Nation: FortisBC incorporated information from various Tsawwassen First Nation Management Plans, Reports, Studies, Acts and assessments.

FortisBC engaged directly with First Nations throughout the EA process for the purposes of information sharing and issues resolution. FortisBC engaged with Indigenous Nations according to their preferences. Examples of FortisBC's engagement activities with First Nations included:

- Providing regularly scheduled project updates, conference calls and meetings with First Nation administrative staff, consultants, elders, and other parties as requested by the First Nation leadership or technical staff;
- Conducting community meetings, open houses and workshops where requested;

- Providing printed and digital materials to be shared with community members, where requested;
- Facilitating opportunities to participate in collecting existing information, as well as review and input into the information; and,
- Maintaining a website with Project information and contact information for how to request in-person meetings.

FortisBC recognized that each First Nation is best positioned to identify and engage with their memberships, and Tilbury Phase 2 attempted to reflect those nation-specific efforts within the Revised Application.

The Revised Application assessed a combination of the following effects that varied on a nation-by-nation basis:

- Harvesting and Subsistence Activities;
- Cultural Use Sites and Areas;
- Social and Economic Conditions;
- Indigenous Health and Well-being;
- Cultural Continuation;
- Indigenous Governance Systems;
- Healthy Culture – Strong Stewardship;
- Healthy Relationships;
- Healthy Future for Future Generations; and,
- Aboriginal and Snuneymuxw Sarlequun Treaty of 1854 Rights.

## 5.2 EAO-Led Engagement Activities

For all Indigenous Nations potentially affected by Tilbury Phase 2, the assessment of potential effects of Tilbury Phase 2 on Section 35 rights as well as on any broader interests related to a First Nation (collectively, “Indigenous Interests”). Further details on the assessment of effects to Indigenous interests for each First Nation can be found in [Appendix 5](#) of this Report.

EAO-led engagement activities supported the reconciliation purposes of the Act and to fulfill the Crown’s duty to consult. Participating Indigenous nations and the EAO collaborated throughout the EA process to seek to achieve consensus on key issues and documents, supporting decision-making by participating Indigenous nations as well as provincial and federal authorities.

Approaches to consensus seeking with the EAO differed across participating Indigenous nations. For some, this included scheduling check-ins aligned with key EA milestones and developing a consensus tracking tool to document and communicate issue resolution activities and outcomes.

The EAO worked collaboratively with First Nations on their First Nation assessments, as identified in the Assessment Plan and issues raised during the Application Development and Review Phase.

- The EAO drafted Sections in the EAO’s Report for: Cheam First Nation, Katzie First Nation, Semiahmoo First Nation, Sk̓wx̓wú7mesh Úxwumixw (Squamish Nation), Leq’á:mel First Nation, Matsqui First Nation, Pópkw’em First Nation, W̓SÁNEĆ Nations (Malahat, Pauquachin, Tsartlip, Tseycum), and Lummi Nation with opportunities for the nations to review and provide input on the draft referral materials;
- The EAO co-drafted First Nation assessments with opportunities for iterative review and input with the following First Nations: the Chawathil First Nation, k̓w̓ik̓w̓əł̓əm First Nation, the STSA (on behalf of Kwaw-Kwaw-

Apilt First Nation, Sq'ewlets (Scowlitz) First Nation, Sq'ewá:lw (Skawahlook) First Nation, Shxw'ōwhámél First Nation, Skwah First Nation, Seabird Island Band, Semá:th (Sumas) First Nation, Yale First Nation, Aitchelitz First Nation, Shxwhá:y Village, Skowkale First Nation, Soowahlie First Nation, Squiala First Nation, Tzeachten First Nation, and Yakweakwioose First Nation), Snuneymuxw First Nation, Ts'uubaa-asatx, and Kwantlen; and

- The following five First Nations drafted their own assessments under Section 19(4) of the Act: Tsleil-Waututh Nation, S̓TÁUTW First Nation, Tsawwassen First Nation, x̓w̓məθk̓w̓əyám, and Quw'utsun Nation (Cowichan Tribes, Halalt First Nation, Lyackson First Nation, Penelakut Tribe, and Stz'uminus First Nation).

The EAO and IAAC provided the following nations with grants/funding for their involvement in the EA:

- Cheam First Nation
- Chawathil First Nation
- Katzie First Nation
- k̓w̓ik̓w̓əḷám First Nation
- Kwantlen First Nation
- Leq'á: mel First Nation
- Lummi Nation
- Malahat First Nation
- Métis Nation British Columbia (MNBC)
- Pauquachin First Nation
- Pópkw'em First Nation
- Quw'utsun Nation (Cowichan Tribes, Halalt First Nation, Lyackson First Nation, Penelakut Tribe, and Stz'uminus First Nation)
- S̓TÁUTW First Nation
- S'ólh Téméxw Stewardship Alliance (on behalf of Kwaw-Kwaw-Apilt First Nation, Sq'ewlets (Scowlitz) First Nation, Sq'ewá:lw (Skawahlook) First Nation, Shxw'ōwhámél First Nation, Skwah First Nation, Seabird Island Band, Semá:th (Sumas) First Nation, Yale First Nation, Aitchelitz First Nation, Shxwhá:y Village, Skowkale First Nation, Soowahlie First Nation, Squiala First Nation, Tzeachten First Nation, and Yakweakwioose First Nation)
- Snuneymuxw First Nation
- Tsawwassen First Nation
- Tsleil-Waututh Nation
- Ts'uubaa-asatx
- x̓w̓məθk̓w̓əyám (Musqueam Indian Band)

### 5.3 Participating Indigenous Nations

Any First Nation for which there is a reasonable possibility of adverse effects on the First Nation or its Section 35 rights as a result of a project may provide notice under Section 14(1) of the Act to participate in the EA process as a participating Indigenous nation. Per 14(1.1.) of the Act, a United States tribe may not provide notice under 14(1). The scope of engagement with each participating Indigenous nation is identified in the Process Order and Amended [Process Order](#), and includes specific information necessary to assess effects of Tilbury Phase 2 on the participating Indigenous nation's Indigenous interests, the level of involvement of each participating Indigenous nation on the TAC and its sub-committees, the timing and nature of specific engagement activities, and whether a participating Indigenous nation intended to

conduct certain aspects of the effects assessment to their Indigenous interests. A goal of this engagement was to build a shared understanding of the participating Indigenous nation's history, culture, traditions and connection to the land and resources. This included how the participating Indigenous nation has determined its priorities, vision, governance, and land use planning aspirations into the future.

The following First Nations were the participating Indigenous nations for the Tilbury Phase 2 EA:

- Chawathil First Nation;
- Cheam First Nation;
- Kwantlen First Nation;
- kʷikʷə́łəm First Nation;
- xʷməθkʷəyám (Musqueam Indian Band);
- Quw'utsun Nation (Cowichan Tribes, Halalt First Nation, Lyackson First Nation, Penelakut Tribe and Stz'uminus First Nation);
- Snuneymuxw First Nation;
- S'ólh Téméxw Stewardship Alliance (on behalf of Kwaw-Kwaw-Apilt First Nation, Sq'éwlets (Scowlitz) First Nation, Sq'ewá:lwx (Skawahlook) First Nation, Shxw'ōwhámél First Nation, Skwah First Nation, Seabird Island Band, Semá:th (Sumas) First Nation, Yale First Nation, Aitchelitz First Nation, Shxwhá:y Village, Skowkale First Nation, Soowahlie First Nation, Squiala First Nation, Tzeachten First Nation, and Yakwekwioose First Nation);
- Ts'uubaa-asatx;
- S̓ĀUTW First Nation;
- Tsawwassen First Nation;
- Tsleil-Waututh Nation;

EAO-led engagement with participating Indigenous nations included the following:

- Participation in the TAC;
- Government-to-government meetings;
- Opportunities to identify Indigenous interests that may be adversely affected by Tilbury Phase 2 and to discuss potential measures to avoid, mitigate, address or otherwise accommodate potential adverse effects on Indigenous interests, as appropriate;
- Opportunities to participate in issue/topic-specific TAC sessions with the EAO;
- Opportunities to review and comment on draft key documents, including: the Initial Project Description (IPD), Detailed Project Description (DPD), Readiness Decision Report, Process Order, Tilbury Phase 2 Application, supplemental materials and topic-specific memos, Revised Application, Assessment Report, the draft Certificate schedules A and B: Project Description, and Table of Conditions;
- Opportunity for participating Indigenous nations to draft the assessment on their Interests within the EAO's Assessment Report as per Section 19(4) of the Act;
- Consensus-seeking opportunities at each phase of the EA;
- Opportunity for participating Indigenous nations to submit a document outlining their views on the Assessment Report, Project Description and Table of Conditions to be included in referral materials to Ministers; and,
- Opportunity for participating Indigenous nations to submit a notice of consent or lack of consent in relation to the issuance of a Certificate to be included in referral materials to provincial Ministers.

The following is a summary of each participating Indigenous nation.

### 5.3.1 Chawathil First Nation

Chawathil First Nation is a distinct member of the broader Stó:lō Nation, which is a part of the Coast Salish Peoples. They have been living within their traditional territory, S'ólh Téméxw, since time immemorial, maintaining strong cultural, spiritual, ceremonial, and physical connections, including Section 35 Rights and Title to their core areas. The core territory is located in and around present-day Hope, B.C., and encompasses the Fraser River. As Stó:lō Peoples, they also use the entirety of the S'ólh Téméxw territory that extends through the Fraser Valley to the Pacific Ocean.

FortisBC has engaged Chawathil First Nation since 2020 to support their participation, assess potential impacts on their Indigenous interests, and inform the Revised Application, and provided two rounds of capacity funding to enable their full involvement in the Tilbury Phase 2 assessment.

The EAO engaged with Chawathil First Nation throughout Early Engagement and Process Planning through regular meetings to understand their interests, information needs, and concerns related to stewardship, fisheries, cultural practices, and cumulative effects. During the Readiness Decision phase, the Nation did not provide new comments but continued to rely on issues previously raised during Early Engagement.

The key concerns raised by Chawathil First Nation were about the lack of consultation surrounding further development of LNG infrastructure facilities that are close to their core territory, concerns surrounding the Nation's Aboriginal Rights related to fish and fish habitat, and the desire for the Nation to benefit economically from the development of Tilbury Phase 2. FortisBC responded to these concerns with a commitment to continue their engagement efforts with Chawathil First Nation, removal of all in-water works related to the Project's Construction phase to minimize impacts to the fish and fish habitat, and they provided a presentation on workforce development and employment/training opportunities that would be available to Chawathil First Nation citizens. The EAO engaged with Chawathil First Nation on proposed provincial conditions for the ministers' decision, and IAA engaged with the nation on proposed federal conditions for the minister's decision based on the KMMs.

Refer to [Appendix 5](#) for a detailed assessment for Chawathil First Nation.

### 5.3.2 Cheam First Nation

Cheam First Nation (Xwchíyò:m) is a Stó:lō First Nation and part of the Coast Salish Peoples, with a core territory located in the Upper Fraser Valley near present-day Rosedale, B.C.

Cheam First Nation has lived within S'ólh Téméxw since time immemorial and maintains strong cultural, spiritual, ceremonial, and subsistence connections to the Fraser River and its salmon, which are central to the Nation's Aboriginal rights, identity, and way of life. As Stó:lō peoples, Cheam First Nation asserts Aboriginal rights throughout S'ólh Téméxw, including downstream areas of the Fraser River extending to the Salish Sea.

Cheam First Nation engaged as a participating Indigenous nation in the EA for Tilbury Phase 2. Engagement occurred through Early Engagement, Process Planning, and Application Development and Review phases, and included the provision of project information, opportunities to review and comment on assessment materials, and participation in discussions regarding potential effects to Cheam's Indigenous interests.

Key concerns raised by Cheam First Nation included potential effects to Fraser River salmon and fish habitat, cumulative effects from existing and proposed industrial development along the Fraser River, and implications for the exercise of Aboriginal fishing rights. To address these concerns, FortisBC engaged with Cheam First Nation on avoidance and mitigation measures, including removal of in-water works, implementation of environmental management plans, and

commitments to continued engagement. The EAO engaged with Cheam First Nation on proposed provincial conditions for the ministers' decision, and IAA engaged with the nation on proposed federal conditions for the minister's decision based on the KMMs.

Refer to [Appendix 5](#) for a detailed assessment for Cheam First Nation.

### 5.3.3 Kwantlen First Nation

q̓'a:ḥáḥ (Kwantlen) First Nation is a Halq'eméylem-speaking Stó:lō Nation whose traditional territory encompasses the lower Fraser Valley, including areas extending from Mission to New Westminster and south to Tsawwassen. Kwantlen has occupied and stewarded this territory since time immemorial and maintains strong cultural, spiritual, and subsistence connections to the Fraser River. The Fraser River remains central to Kwantlen identity, governance, and Aboriginal rights, particularly their right to fish for food, social, and ceremonial purposes. Tilbury Phase 2 is located within Kwantlen's asserted traditional territory, approximately 34 km west of Kwantlen's main residential reserve at McMillan Island 6.

Kwantlen First Nation participated as a participating Indigenous nation in the EA for Tilbury Phase 2 beginning in 2020. Kwantlen engaged through Early Engagement, Process Planning, and Application Development and Review phases, including participation on the TAC, joint work planning with the EAO, and co-drafted their section of this report.

Key concerns raised by Kwantlen included potential effects to the Fraser River and salmon, cumulative effects from industrial development, adequacy of assessment scope and temporal boundaries, and long-term implications for cultural continuity and stewardship responsibilities. To address these concerns, FortisBC engaged with Kwantlen on avoidance and mitigation measures, including removal of in-river works, and implementation of environmental management plans. The EAO engaged with Kwantlen First Nation on proposed provincial conditions for the ministers' decision, and IAA engaged with the nation on proposed federal conditions for the ministers' decision based on the KMMs.

Refer to [Appendix 5](#) for a detailed assessment for Kwantlen First Nation.

### 5.3.4 k̓'ik̓wə́ḥəm (kwikwetlem) First Nation

The k̓'ik̓wə́ḥəm First Nation has stewarded their traditional territory for thousands of years, with deep connections to the Coquitlam River Watershed, the lower Fraser River, and surrounding lands. Their identity is closely tied to the land, water, and living beings, reflected in their traditions, language, governance, and environmental stewardship. Most members remain connected to their territory, with many residing on Coquitlam Indian Reserve No. 1 (slakəyánc). k̓'ik̓wə́ḥəm participated in the EA as a participating Indigenous nation.

k̓'ik̓wə́ḥəm First Nation has participated at a high level in the EA for Tilbury Phase 2, providing broad concerns related to environmental protection, cumulative effects, and impacts to fish and habitat. Due to capacity constraints, the Nation did not provide project specific information, and the assessment proceeded using preliminary Indigenous interests identified early in the process. FortisBC engaged with k̓'ik̓wə́ḥəm on avoidance and mitigation measures, including removal of in-river works, implementation of environmental management plans, and commitments to continued engagement, and the Nations comprehensive community plan, while the EAO developed proposed provincial conditions to mitigate potential effects.

Key concerns include potential effects on the Fraser River and upstream areas, respect for other Nations' rights, and cumulative impacts from historical development on their traditional territory. The EAO engaged with k̓'ik̓wə́ḥəm First Nation on proposed provincial conditions for the minister's decision, and IAA engaged with the nation on proposed federal conditions for the ministers' decision based on the KMMs.

Refer to [Appendix 5](#) for a detailed assessment for kʷikʷə́łəm First Nation.

### 5.3.5 xʷməθkʷəyám (Musqueam Indian Band)

The Musqueam Indian Band (xʷməθkʷəyám) is a traditionally hənq̓əminəm'-speaking First Nation whose territory includes part of the Lower Mainland area in B.C., including sections of the Fraser River and the Strait of Georgia. They have a proven Aboriginal Right to fish, as established in the SCC Sparrow and Powley decisions. The xʷməθkʷəyám identity and livelihood are intrinsically linked to their territory, and their core teaching reflects stewardship responsibilities. xʷməθkʷəyám translates to "Place of məθkʷəy," a plant once abundant in the Fraser River delta. Their oral tradition establishes ancestral connections to these lands and waters since time immemorial, and their territory is known through a matrix of over 125 place names.

The xʷməθkʷəyám has been actively engaged in the assessment of Tilbury Phase 2 since 2019. Their engagement has been multifaceted, involving various activities and feedback mechanisms. They participated in an Indigenous Knowledge workshop and met with the FortisBC for a boat tour of the Fraser River and the Project site, allowing xʷməθkʷəyám to teach FortisBC about potential impacts. The EAO engaged with xʷməθkʷəyám on proposed provincial conditions for the minister's decision, and IAA engaged with the nation on proposed federal conditions for the ministers' decision based on the KMMs.

xʷməθkʷəyám completed an assessment under Section 19(4) of the Act which is a detailed assessment of the project on their interests which is part of [Appendix 5](#).

### 5.3.6 Quw'utsun Nation

Quw'utsun Nation is composed of the Cowichan Tribes, Halalt First Nation, Lyackson First Nation, Penelakut Tribe, and Stz'uminus First Nation. The Cowichan (Quw'utsun Mustimuhw) were an Indigenous people comprised of 11 local groups prior to and at the time of European contact in the early 1790s, and at the time the British Crown asserted sovereignty in British Columbia at 1846 and thereafter.<sup>1</sup> The members of the Cowichan Tribes, Stz'uminus First Nation, Penelakut Tribe, Halalt First Nation, and Lyackson First Nation are descendants of the historic Cowichan people and the 11 local groups, and the five bands are the modern-day successor groups to the Cowichan as an Indigenous people. The Quw'utsun Nation, as a continuation of the historic Cowichan Nation, also represents a separate governance structure for interests held in common by the Quw'utsun Nation member communities. It is in the process of rebuilding its governance structures, which includes participation as the Quw'utsun Nation on matters of mutual interest to the five member communities, particularly in respect of matters involving the South Arm of the Fraser River, where it remains engaged in Aboriginal Title litigation, currently at the appellate courts of British Columbia.

Quw'utsun Nation participated as a participating Indigenous nation throughout the environmental assessment process and completed an Indigenous-Led Assessment pursuant to section 19(4) of the *Environmental Assessment Act*. The Indigenous-Led Assessment evaluated Project effects on Quw'utsun Nation, its rights, title, interests, governance responsibilities, future use, and relationship to lands and waters associated with Tl'uq̓tinus, Shnuwiih, Xupí'xunum (Tilbury Island), and the South Arm of the Fraser River.

A detailed list and summary of the FortisBC's engagements with Quw'utsun Nation can be found in [Section 11.04](#) of the Revised Application. Throughout the assessment, Quw'utsun Nation consistently raised concerns regarding:

- impacts to Aboriginal title and fishing rights;
- restoration of Tl'uq̓tinus, Shnuwiih, Xupí'xunum (Tilbury Island), and the South Arm of the Fraser River;
- re-establishment of residence, access, harvesting, and culturally integral practices;

<sup>1</sup> Cowichan Tribes v. Canada (Attorney General) 2025 BCSC 1490 at paras. 463, 498.

- cumulative effects arising from historic and ongoing industrial development;
- future use and stewardship responsibilities;
- mitigation certainty; and
- accommodation; and whether the assessment record provided a sufficient foundation for decision-making.

These concerns were not raised as a collection of discrete issues, but as interconnected concerns regarding Quw'utsun Nation's rights, title, responsibilities, future use, and relationship to place.

Through its Indigenous-Led Assessment, Quw'utsun Nation concluded that the Project would adversely affect Quw'utsun rights, title, interests, responsibilities, and future use, including by creating or exacerbating barriers to restoration and rights-based objectives associated with Tl'uqtinus, Shnuwiih, Xupi'xunum (Tilbury Island), and the South Arm of the Fraser River; re-establishment of residence and access; harvesting and culturally integral practices; exercise of Aboriginal title and fishing rights; and other rights-based objectives. Quw'utsun Nation further concluded that the proposed mitigation and accommodation measures did not provide sufficient certainty that these impacts would be adequately avoided, reduced, managed, or accommodated.

The EAO and IAAC reached a different conclusion. They concluded that proposed provincial conditions, federal Key Mitigation Measures, follow-up programs, management plans, regulatory requirements, and accommodation measures are sufficient to avoid, reduce, manage, or otherwise accommodate Project effects.

The EAO engaged with Quw'utsun Nation on proposed provincial conditions for Ministers' decision, and IAAC engaged with Quw'utsun Nation on proposed federal conditions based on the recommended federal Key Mitigation Measures.

Refer to [Appendix 5, Section 16.7](#) for Quw'utsun Nation's Indigenous-Led Assessment and additional information regarding Quw'utsun Nation's assessment of Project effects.

### 5.3.7 Snuneymuxw First Nation

Snuneymuxw First Nation are Coast Salish people with deep ancestral and cultural ties to their traditional territory, which spans southern Vancouver Island, the Gulf Islands, and into the Fraser River and Salish Sea. As descendants of the Sarlequun Tribe, they are signatories to the *Sarlequun Snuneymuxw Treaty of 1854*, a pre-Confederation agreement that affirmed their rights to land, resources, and cultural practices. Despite the treaty's legal status, it was never fully implemented, leading to significant land dispossession. Today, Snuneymuxw continue to uphold their cultural traditions and maintain strong connections to their lands and waters.

Snuneymuxw First Nation provided notice of their intent to be a participating Indigenous nation in the EA for the Tilbury Phase 2 during the Early Engagement phase. As members of the TAC, they participated in the technical review of the Revised Application, provided comments and collaboratively co-authored their section of the EAO's Assessment Report. While a Section 19(4) assessment was initially planned under an agreement with FortisBC, it did not proceed due to capacity challenges. Snuneymuxw instead focused on actively engaging in the process and collaborated with FortisBC to develop the Snuneymuxw section of the Revised Application.

Snuneymuxw First Nation raised several key concerns regarding Tilbury Phase 2, rooted in the ongoing impacts to their Aboriginal rights and the unfulfilled commitments of the *Snuneymuxw Sarlequun Treaty of 1854*. They highlighted risks to fisheries, harvesting areas, and culturally important sites within their traditional territory, including concerns over cumulative environmental effects from related projects. The Nation also expressed that diminished access to land and ecological changes have disrupted cultural practices and intergenerational knowledge transfer. Additionally, Snuneymuxw emphasized the need for meaningful inclusion in decision-making, noting limited capacity to fully participate due to chronic underfunding. While recognizing potential economic benefits, they cautioned that broader industrial pressures could negatively affect small Indigenous businesses and community well-being.

To address the concerns raised by Snuneymuxw First Nation, FortisBC added the avoidance and mitigation measures, including removal of in-water works from the scope of the Project. The EAO engaged with Snuneymuxw First Nation on proposed provincial conditions for the ministers' decision, and IAA engaged with the nation on proposed federal conditions for the ministers' decision based on the KMMs.

Refer to [Appendix 5](#) for a detailed assessment for Snuneymuxw First Nation.

### 5.3.8 S'ólh Téméxw Stewardship Alliance

The S'ólh Téméxw Stewardship Alliance (STSA) is a collective of Stó:lō First Nations representing title-holding communities across S'ólh Téméxw (Halq'eméylem word for 'our world'/'our land'), the Stó:lō traditional territory centred on the lower Fraser River. The STSA participated as a participating Indigenous nation in the Tilbury Phase 2 EA.

A detailed list and summary of the Proponent's engagement with the STSA is provided in [Section 11.08](#) of the Revised Application. The STSA engaged throughout Early Engagement, Process Planning, and Application Development and Review, including regular meetings with the EAO to assess the effects on their Indigenous interests.

Key concerns raised by the STSA included potential effects on salmon relied upon for food, social and ceremonial (FSC) purposes; cumulative air quality effects on health and traditional food practices; impacts to cultural and spiritual activities; and the need to assess Tilbury Phase 2 within the context of cumulative industrial pressures on the Fraser River.

To address these concerns, FortisBC engaged the STSA on mitigation measures and project design changes, and the EAO engaged the STSA on proposed provincial conditions to inform ministers' decision-making. Mitigation and accommodation measures include avoidance of in-river works, implementation of construction and operational environmental management plans, air quality and acoustic management plans, monitoring and follow-up requirements, and a community feedback process during Construction and Operation phases.

The STSA has consistently emphasized concerns regarding cumulative effects within S'ólh Téméxw. At the conclusion of the EA, the EAO and the STSA determined that potential adverse effects of Tilbury Phase 2 on the STSA's interests had been adequately avoided, minimized, or otherwise accommodated, and that the provincial Crown's duty to consult had been fulfilled.

Refer to [Appendix 5](#) for a detailed assessment for the STSA.

### 5.3.9 Ts'uubaa-asatx

Ts'uubaa-asatx are a Hul'q'umi'num-speaking Central Coast Salish group whose membership has ancestry from Ditidaht and Hul'q'umi'num' ancestors. They also speak diitiid?aatx. Part of the broader Coast Salish Peoples, they have strong kinship ties with other First Nations on the Pacific coast. Their community is currently based on a single reserve on the northeastern shore of Cowichan Lake. Led by a hereditary Chief Councillor and an elected council, the Ts'uubaa-asatx are part of the Hul'q'umi'num Treaty Group and identify a traditional territory that includes parts of southeastern Vancouver Island, the southern Gulf Islands, a portion of the Lower Mainland, and the Salish Sea.

A detailed list and summary of FortisBC's engagements with Ts'uubaa-asatx can be found in Section 11.11 of the Revised Application. The EAO collaborated with Ts'uubaa-asatx to assess and conclude on the following Indigenous interests: harvesting and subsistence activities, cultural use sites and areas, social and economic conditions, and Indigenous health and well-being. The key concern raised by Ts'uubaa-asatx through the course of the EA included the potential effects of truck traffic on fish and fish habitat due to the emerging tire contaminant 6-PPD quinone (6-PPDQ).

To address potential effects to Ts'uubaa-asatx's interests and concerns, FortisBC engaged with Ts'uubaa-asatx on proposed mitigation measures, the EAO engaged Ts'uubaa-asatx on proposed provincial conditions for ministers' decision, and IAAC engaged Ts'uubaa-asatx on proposed federal conditions for ministers' decisions based on the KMMs.

Refer to [Appendix 5](#) for a detailed assessment for Ts'uubaa-asatx.

### 5.3.10 STÁUTW First Nation

STÁUTW First Nation is a Coast Salish Nation and one of five villages that constitute the W̱SÁNEĆ peoples. STÁUTW territory extends from southern Vancouver Island to mainland B.C. — in particular, regions around the south arm of the Fraser River and Boundary Bay — and includes all the islands in between. They have lived in this territory for thousands of years, owning and occupying village sites and utilizing resource areas for hunting, fishing, berry gathering, and ritual and ceremonial activities.

STÁUTW First Nation was being engaged as a Notification Nation during the early phases of the EA until mid way through the Application Development and Review phase where they requested to become a participating Indigenous nation. On May 5, 2025, STÁUTW First Nation officially became a participating Indigenous nation for the remainder of the EA for Tilbury phase 2.

A detailed list and summary of the Proponent engagements with STÁUTW First Nation can be found in [Section 11.18](#) of the Revised Application. STÁUTW First Nation completed an assessment under Section 19(4) of the Act, which is a detailed assessment of the project on their interests and can be found in [Appendix 5](#) of this Report. STÁUTW identified the following concerns as part of its 19(4) assessment: cumulative effects, breach of their Douglas Treaty rights, impacts to intended future exercise of rights, which require fisheries revitalization).

To address potential effects to STÁUTW First Nation's interests and concerns, FortisBC engaged with STÁUTW First Nation on proposed mitigation measures, the EAO engaged STÁUTW First Nation on proposed provincial conditions for ministers' decision, and IAAC engaged STÁUTW First Nation on proposed federal conditions for ministers' decisions based on the KMMs.

### 5.3.11 Tsawwassen First Nation

TSAWWASSEN FIRST NATION  
s̓əwəθən məsteyəxʷ

Tsawwassen First Nation (TFN) confirms its continued occupation of its traditional territory since time immemorial, an area stretching from watersheds feeding into Pitt Lake and the Fraser River, across the Salish Sea to include Galiano, Salt Spring, Pender, and Saturna Islands, and the Point Roberts Peninsula. Traditionally and presently, the TFN's resources are fundamentally based on fish, with salmon, sturgeon, crab, and eulachon serving as primary

food sources that remain a key part of their cultural identity and lifestyle. On April 3, 2009, the Tsawwassen People ratified the first urban First Nations Treaty in B.C., which restored their right to self-government, provided municipal, provincial, and federal types of jurisdiction over a 724-hectare land base, and initiated a period of physical, economic, and cultural revival.

The Proponent initiated engagement with the TFN in 2019. This engagement resulted in the execution of Capacity Funding and an Indigenous-led Assessment Agreement to ensure the TFN's values and perspectives were reflected throughout the process. Through collaborative discussions, the Proponent and TFN adopted a unique approach centered on the TFN's core concept that "Culture is the context" for evaluating potential effects. This collaboration also led to revising the presentation of background information and developing a specific Tsawwassen Schedule and workplan for the Indigenous Engagement and Collaboration Plan (IECP).

Guided by TFN's input, Indigenous interests were reframed around four Treaty Objectives: Healthy Rights-Healthy Rivers, Healthy Culture-Strong Stewardship, Healthy Relationships, and Healthy Future for Future Generations. This reframing

also included discussions aimed at moving past transactional engagement towards collaborative issue resolution and reflecting on cultural learnings.

A detailed list and summary of the Proponent engagements with Tsawwassen First Nation can be found in [Section 11.09](#) of the Revised Application. The EAO collaborated with Tsawwassen First Nation to assess and conclude on the following Indigenous interests: harvesting and subsistence activities, cultural use sites and areas, social and economic conditions, and Indigenous health and well-being.

The key concern raised by Tsawwassen First Nation through the course of the EA included cumulative effects of industrial development on the Fraser River, which they argued degrade the environment and impair the exercise of their Treaty rights and traditional practices. They were concerned that the proponent's assessment focused too narrowly on biophysical effects, overlooking how Treaty rights are inseparable from cultural connections, sense of place, and vital knowledge transfer to future generations.

To address potential effects to Tsawwassen First Nation's interests and concerns, FortisBC engaged with Tsawwassen First Nation on proposed mitigation measures, the EAO engaged Tsawwassen First Nation on proposed provincial conditions for ministers' decision, and IAAC engaged Tsawwassen First Nation on proposed federal conditions for minister's decisions based on the KMMs.

Tsawwassen First Nation completed an assessment under Section 19(4) of the Act, which is a detailed assessment of the project on their interests and can be found in [Appendix 5](#) of this Report.

### 5.3.12 Tsleil-Waututh Nation

Tsleil-Waututh Nation (TWN) is a distinct Coast Salish people residing in the Pacific Northwest. The eastern Burrard Inlet served as the principal settlement area for the TWN; however, their traditional seasonal rounds also encompassed the Lower Fraser River throughout the spring and late summer seasons. Drawing on an abundance of natural resources, their ancestors' survival relied upon a "seasonal round" involving hunting, harvesting, preserving foods, and trade. The annual cycle required them to catch and dry preferred types of salmon (such as sockeye, pink, and chum) at the Fraser and other rivers, gather large volumes of berries, and produce goods like wood carvings and blankets woven from mountain-goat wool. Today, the Nation is highly focused on stewardship,

working to restore and heal their lands while balancing ethical land and business development with asserting their Indigenous rights and title.

FortisBC has been engaging with the TWN regarding the Project since July 2019, including providing regular project updates, sharing draft EA documents, and signing a Capacity Funding Agreement. During this engagement, TWN raised concerns about potential negative effects from proposed waterborne activities on Indigenous interests, such as fishing, cultural practices, and the Southern Resident Killer Whale population. In response to these concerns, the Proponent adopted an avoidance measure by removing all waterborne activities, including the use of cargo vessels, barges for deliveries, and the Material Offloading Facility (MOF), thus addressing potential effects on water-related valued components (VC) and Indigenous interests.

A detailed list and summary of the Proponent engagements with TWN can be found in [Section 11.10](#) of the Revised Application. The EAO engaged TWN on proposed provincial conditions for ministers' decision, and IAAC engaged TWN on proposed federal conditions for ministers' decisions based on the KMMs.

TWN completed an assessment under Section 19(4) of the Act, which is a detailed assessment of the project on their interests and can be found in [Appendix 5](#) of this Report.

## 5.4 First Nations and Other Indigenous Groups

The following is a summary of each First Nations and Indigenous group engaged in the EA, and who were identified as Notification Nations, in the Assessment Plan for Tilbury Phase 2.

### 5.4.1 Katzie First Nation

Katzie First Nation has lived in its traditional territory for thousands of years and continues to maintain strong cultural and spiritual connections to the land and waterways, including rivers, sloughs, creeks, and wetlands. At the centre of their territory lies s'qáycəyaʔ ʔácaʔ, now known as Pitt Lake, which remains a central feature of their identity and heritage. Other modern names such as Pitt Meadows, Maple Ridge, Surrey, Langley, and Delta have replaced the original ones, Katzie retains and promotes its ancestral place names to preserve cultural continuity. Katzie First Nation is comprised of about 648 members, with roughly half living off-reserve but maintaining strong ties to their traditional lands and community. All of the Tilbury Phase 2 components are within Katzie First Nation's traditional territory.

During the Readiness Decision phase, EAO engaged with Katzie First Nation who indicated that their primary concerns included cumulative effects, marine use of the Fraser River during construction, accidents and malfunctions impacting the Fraser River, and GHG emissions. Following the Readiness Decision, Katzie First Nation had limited involvement in the EA for Tilbury Phase 2, providing some input during process planning phase. Katzie was invited to attend TAC meetings and provide comments or share their concerns on the Revised Application.

The EAO engaged Katzie First Nation on the proposed provincial conditions to support ministers' decisions, and IAAC engaged Katzie First Nation on the proposed federal conditions, based on the KMMs, to support federal minister's decisions.

A detailed assessment of Katzie First Nation's interests can be found in [Appendix 5](#).

### 5.4.2 Semiahmoo First Nation

Semiahmoo First Nation (Semiahmoo) are Coast Salish peoples located near White Rock B.C., sharing a boarder with the United States border along Boundary Bay. Semiahmoo's traditional territory includes sections of Point Roberts, Washington, and includes the Serpentine and Nicomekl Rivers, and Lake Terrell. Semiahmoo is a transboundary nation that has historically inhabited and used areas of the Lower Mainland of B.C. and the Salish Sea. Semiahmoo people have deep connections to the land and resources in and around their traditional territory and continue to have close ties with the Lummi and Nooksack Peoples in the state of Washington. Semiahmoo is comprised of about 151 members, with roughly 71 members living within Semiahmoo Reservation. All of the Tilbury Phase 2 components are within Semiahmoo's traditional territory.

EAO provided documents to Semiahmoo such as project updates, the draft IPD and DPD, and Process Planning documents for their review. EAO worked collaboratively with Semiahmoo throughout the assessment process. As part of the TAC, Semiahmoo participated in technical meetings throughout the EA. During the Process Planning phase, Semiahmoo and the EAO agreed that the EAO would conduct an assessment of project effects on Semiahmoo Indigenous interests with Semiahmoo input and review. Semiahmoo was invited to attend TAC meetings and provide comments or share their concerns on the Revised Application.

The EAO engaged Semiahmoo on proposed provincial conditions to support Ministers' decision, and IAAC engaged Semiahmoo on proposed federal conditions, based on the KMMs, to support federal Ministers' decisions.

A detailed assessment of Semiahmoo's interests can be found in [Appendix 5](#).

### 5.4.3 Sk̓wx̓wú7mesh Úxwumixw (Squamish Nation)

Sk̓wx̓wú7mesh Úxwumixw (Squamish Nation) is a distinct group of Coast Salish Peoples with ancestors dating back many millennia. The traditional territory spans a large area including Vancouver, Burnaby, New Westminster, North Vancouver, West Vancouver, and Squamish, which includes waters such as Burrard Inlet, English Bay, False Creek, and Howe Sound. The Squamish Nation has 24 reserves within their traditional territory, totalling 2,120 hectares.

The Proponent and the EAO engaged and consulted with Sk̓wx̓wú7mesh Úxwumixw beginning in 2019 by providing project updates and offering opportunities to meet and discuss Tilbury Phase 2 during the development of the IPD, the DPD, the Draft AIR and provided drafts of the Indigenous Knowledge and secondary sources sections of the Revised Application. Despite these efforts by both the Proponent and the EAO, Sk̓wx̓wú7mesh Úxwumixw did not provide any comments to Tilbury Phase 2. However, in January of 2025, Sk̓wx̓wú7mesh Úxwumixw stated in its [Climate Legacy Strategy](#), Sk̓wx̓wú7mesh Úxwumixw does not support new industrial fossil fuel projects in the Sk̓wx̓wú7mesh Aysáych (territory). As such, Sk̓wx̓wú7mesh Úxwumixw indicated that it does not support the Tilbury Phase 2 LNG Expansion and would not be providing further review or comment.

A detailed assessment of Sk̓wx̓wú7mesh Úxwumixw's (Squamish Nation's) interests can be found in [Appendix 5](#).

### 5.4.4 Leq'á:mel First Nation

Leq'á:mel First Nation (Leq'á:mel) is a member of the Stó:lō Nation and a member of the Coast Salish Peoples, located in Deroche, B.C., 22 km east of Mission, B.C., in the Fraser Valley region. Leq'á:mel assert rights and title over territory south to the Nooksack River, east to the Harrison knob, northwest to the north shore of Stave Lake, southwest to the northern shores of the Alouette Lake and down the west side of Silver Creek.

Leq'á:mel participated in the EA for Tilbury Phase 2 through engagement with the EAO and the Proponent. During the Early Engagement Phase, Leq'á:mel did not identify as a participating Indigenous nation. In the Assessment Plan, the EAO committed to notifying Leq'á:mel of five key milestones: receipt of FortisBC's Application, public comment periods required, acceptance of a revised Application, referral to Ministers for decision on an EA Certificate, and issuance of any legal orders issued under the Act in relation to Tilbury Phase 2. The EAO provided documents, project updates, the draft IPD and DPD, and Process Planning documents for review. During Application Review Leq'á:mel submitted a technical memo outlining concerns that Tilbury Phase 2, especially when linked with the Tilbury Marine Jetty, has proceeded without meaningful Leq'á:mel involvement and will worsen already stressed fish populations, harm critical habitat, increase marine and vehicle traffic, and further limit access to important cultural and harvesting areas, all while overlooking Leq'á:mel stewardship responsibilities, cultural values, and traditional economies.

A detailed assessment of Leq'á:mel's interests can be found in [Appendix 5](#).

### 5.4.5 Matsqui First Nation

Màthexwi First Nation (Matsqui) is a Stó:lō First Nation located in the central Fraser Valley and a member of the Stó:lō Nation. Matsqui has lived within S'ólh Téméxw since time immemorial and maintains strong cultural, spiritual, and subsistence connections to the Fraser River, particularly related to salmon harvesting and stewardship. Tilbury Phase 2 is located within the Stó:lō Nation's asserted territory.

Matsqui First Nation participated in the EA for Tilbury Phase 2. The EAO provided project information, funding support, and opportunities for review throughout the assessment process. Key concerns related to potential effects on harvesting and subsistence activities, cultural use sites and areas, social and economic conditions, and Indigenous health and well-being, particularly in the context of cumulative industrial development along the Fraser River. These concerns were addressed through avoidance measures, proponent mitigation measures, and proposed provincial conditions.

A detailed assessment of Matsqui's interests can be found in [Appendix 5](#).

#### 5.4.6 Pópkw'em First Nation

Pópkw'em (Popkum First Nation) is a Stó:lō community located along the Fraser River in the Upper Fraser Valley region, approximately 30 km west of Hope and 30 km east of Chilliwack. First Nation is an Upper Stó:lō Nation and a member of the Stó:lō Nation, located in the Upper Fraser Valley near present-day Hope, B.C. Pópkw'em has lived within S'ólh Téméxw since time immemorial and maintains deep cultural, spiritual, and physical connections to the Fraser River and surrounding lands. As Stó:lō peoples, Pópkw'em shares responsibility for the stewardship of S'ólh Téméxw and asserts Aboriginal rights throughout the Stó:lō Nation's shared territory, including downstream areas of the Fraser River. The Nation's identity, culture, and governance are closely tied to the river, salmon, and the broader land and water systems that sustain their way of life.

Pópkw'em participated in the EA for Tilbury Phase 2 through engagement with the EAO and the Proponent. Pópkw'em was provided with project information, draft assessment materials, and opportunities to review and provide input at key stages of the assessment, including Application Review. The assessment of potential effects on Pópkw'em's Indigenous interests was informed by information provided by the Nation, the Proponent's Revised Application, and conclusions from relevant VC assessments, with detailed findings documented in the assessment appendices.

A detailed assessment of Pópkw'em's interests can be found in [Appendix 5](#).

#### 5.4.7 Malahat First Nations

Malahat Nation is a Coast Salish Indigenous community and one of the five W̱SÁNEĆ (Saanich) Nations, located between Victoria and Mill Bay, B.C. The Nation's reserves are situated along the western shore of the Saanich Inlet beneath the Malahat mountain range, a place of deep cultural and spiritual significance. Malahat maintains strong kinship ties with other W̱SÁNEĆ Nations and cultural connections with neighbouring Coast Salish peoples, including the Quw'utsun. The Nation places a strong emphasis on cultural revitalization, stewardship of marine resources, and economic development.

Malahat Nation has been engaged by the EAO and Proponent since 2019 in the Tilbury Phase 2 EA, including through information sharing and review of assessment materials. The EAO and the Agency provided funding support and shared project updates, draft project descriptions, and process planning documents. Malahat provided information on its interests during the assessment, which informed the EAO's assessment of potential effects on W̱SÁNEĆ Nations' Indigenous interests.

A detailed assessment of Malahat First Nation's interests can be found in [Appendix 5](#).

#### 5.4.8 Pauquachin First Nation

Pauquachin First Nation is a W̱SÁNEĆ Nation located on southern Vancouver Island. The Nation's name reflects its connection to the coastal landscape, including cliffs and bluffs that characterize its territory. Pauquachin is governed by an elected Chief and Council under the *Indian Act* and pursues economic development initiatives supported by regional partnerships, while maintaining strong cultural and territorial connections within the W̱SÁNEĆ homeland.

Pauquachin First Nation did not identify as a participating Indigenous nation during Early Engagement for Tilbury Phase 2. The EAO and the Agency provided funding support, project updates, and assessment materials for review. Pauquachin's interests were considered as part of the EAO's assessment of W̱SÁNEĆ Nations' Indigenous interests, informed by available information and conclusions from relevant VC assessments.

A detailed assessment of Pauquachin First Nation's interests can be found in [Appendix 5](#).

#### 5.4.9 Tsartlip First Nation

Tsartlip First Nation is a W̱SÁNEĆ Nation whose primary reserve is located in Brentwood Bay on the Saanich Peninsula. Tsartlip has strong cultural, spiritual, and subsistence ties to the Salish Sea, Southern Gulf Islands, and surrounding marine

and terrestrial environments. The Nation's identity and governance are closely connected to stewardship of these lands and waters, including culturally significant marine species and sacred sites.

Tsartlip First Nation did not participate directly as a participating Indigenous nation in the EA for Tilbury Phase 2. The EAO and the Agency provided project information, funding support, and opportunities for review. Tsartlip's Indigenous interests were assessed collectively as part of the WSÁNEĆ Nations assessment, drawing on available information, engagement records, and conclusions from relevant VC assessments.

A detailed assessment of Tsartlip First Nation's interests can be found in [Appendix 5](#).

#### 5.4.10 Tseycum First Nation

Tseycum First Nation is a WSÁNEĆ Nation located on the Saanich Peninsula near Patricia Bay on southern Vancouver Island. The Nation maintains strong cultural, economic, and governance ties to the Salish Sea and surrounding lands. Tseycum continues to pursue opportunities to strengthen community well-being, including land base expansion, economic partnerships, and member services.

Tseycum First Nation did not identify as a participating Indigenous nation during Early Engagement for Tilbury Phase 2. The EAO and the Agency provided project information, funding support, and opportunities to review assessment materials throughout the process. Tseycum's Indigenous interests were considered as part of the EAO's assessment of WSÁNEĆ Nations' Indigenous interests, informed by available information and conclusions from relevant VC assessments.

A detailed assessment of Tseycum First Nation's interests can be found in [Appendix 5](#).

#### 5.4.11 Lummi Nation

Lummi Nation (Lummi) describe themselves as a Self-Governing Nation within the U.S., the third largest tribe in Washington State, serving over 5,000 members. Lummi manages nearly 13,000 acres of tidelands on the Lummi Reservation. The Lummi Reservation is situated to the west of Bellingham and to the south of Ferndale, Washington. The Lummi describe their traditional territory as centered around the Salish Sea and extending west and north across the Gulf Islands and into the Province of B.C.

Lummi was consulted in accordance with the June 27, 2024, Order under the *Environment and Land Use Act*, the July 3, 2024, letter from the EAO to Lummi, and the Process Order (as amended on May 5, 2025). This included notifying Lummi of key EA milestones, sharing information, and responding to issues and concerns raised.

A detailed assessment of Lummi's interests can be found in [Appendix 5](#).

#### 5.4.12 Métis Nation British Columbia (MNBC)<sup>2</sup>

MNBC is the Métis governing body in B.C. that represents the interests of Métis citizens in B.C. Métis people are one of the three Indigenous Peoples of Canada recognized under Section 35(2) of the *Constitution Act, 1982*, with deep historical and contemporary connections throughout the province, including the Lower Mainland. Tilbury Phase 2 is located within MNBC Region 2 – Lower Mainland, where Chartered Communities such as the North Fraser Métis Association and the Surrey Delta Métis Association are located. While MNBC identifies areas of cultural interest across B.C., there is no legally

<sup>2</sup> In accordance with the substitution conditions and the Cooperation Agreement, the EAO delivered the procedural aspects of consultation with Métis Nation British Columbia on behalf of the Government of Canada and directed the Proponent to undertake specific consultation activities with Métis Nation British Columbia to meet the federal requirements of the Cooperation Agreement. Any consultation activities conducted by B.C. with Métis or organizations representing Métis within B.C. under a substituted impact assessment should be understood to have been conducted on behalf of the Government of Canada and should not be construed in any way as an acknowledgement by B.C. that it owes a duty of consultation or accommodation to Métis within B.C. under Section 35 of the *Constitution Act*.

recognized Métis traditional territory in the province, and engagement in the EA on behalf of the Government of Canada occurs on the basis of Métis cultural interests and community presence.

The EAO notified MNBC of key milestones throughout the assessment process, including the Readiness Decision, issuance of the Process Order, and submission of the Application, and provided opportunities to review and comment during the Application Review phase. The Proponent and the EAO engaged and consulted with MNBC beginning in 2019, however MNBC did not participate during Early Engagement and did not provide comments during the EAO’s assessment. The EAO’s assessment of potential effects on MNBC Indigenous interests was informed by the Proponent’s Revised Application and publicly available information.

A detailed assessment of MNBC’s Indigenous interests can be found in [Appendix 5](#).

5.5 Indigenous Knowledge

The Act establishes that one of the purposes of the EAO is to use the best available science, Indigenous Knowledge<sup>3</sup> and local knowledge in decision-making under the Act. The IAA also requires the consideration of Indigenous Knowledge provided with respect to the designated project. To meet the requirements of the Act and paragraph 22(1)(g) of the IAA, the EAO required that the best available science, Indigenous Knowledge and local knowledge be considered and integrated throughout the assessment process. Refer also to [Appendix 15.7](#) for Indigenous knowledge provided with respect to Tilbury Phase 2.

The EAO recognizes that First Nations are best positioned to identify the sources of information, including Indigenous knowledge, appropriate for the use in the assessment of Tilbury Phase 2. Indigenous Knowledge is the subset of a First Nation’s knowledge that the First Nation decides, through representatives chosen by themselves in accordance with their own procedures, is appropriate to be used in an EA. The Application described how scientific, Indigenous, and local knowledge was used in the assessment. During all phases of the EA, the EAO provided opportunities for the inclusion of Indigenous knowledge from First Nations and has integrated it throughout the assessment.

6.0 PREDICTED EFFECTS OF TILBURY PHASE 2

The EAO completed a detailed assessment of effects on the VCs, Indigenous interests, and other assessment matters, as described under [Section 25](#) of the Act. The matters, or topics, to be assessed were determined by the EAO, in consultation with the TAC, First Nations, Indigenous groups and the public, and through consensus seeking with the participating Indigenous nations, through the [Application Information Requirements](#) set out by the EAO for Tilbury Phase 2. These assessments incorporated information submitted by FortisBC, advice from the TAC and CAC, local information and concerns raised by the public, and Indigenous knowledge provided by the participating Indigenous nations. A list of the factors assessed and where to find more detailed information is provided below in Table 5. The assessment and conclusion for federal effects are found in [Appendix 15](#).

Table 5: Valued Components, Indigenous Interests, and Other Assessment Factors Assessed

|                                                                                                |                                                                                       |
|------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| <b>Environmental Effects</b><br><i>Air Quality (<a href="#">Appendix 6, Section 17.01</a>)</i> | <b>Health Effects</b><br><i>Acoustics (<a href="#">Appendix 6, Section 17.02</a>)</i> |
|------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|

<sup>3</sup> Within the context of environmental assessments, Indigenous Knowledge is a unique way of knowing that is held by Indigenous Knowledge holders that pertains to the area within which a project may occur, including how that project may interact with the environment and people in the region. Indigenous Knowledge not only informs how projects should be delivered and their relationship to the land but also informs Indigenous decision-making. [The EAO’s Guide to Indigenous Knowledge in Environmental Assessments](#) provides further detail on the EAO’s approach to the consideration of Indigenous Knowledge.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

The EAO identified Tilbury Phase 2 project-specific (residual) adverse effects for 10 of the 14 valued components after FortisBC's proposed mitigations, provincial conditions, federal Key Mitigation Measures and applicable regulatory frameworks are applied. The EAO concluded that there would not be a significant adverse residual effect from the incremental changes for any of the valued components as a result of the Project. The EAO's conclusions for each valued component are outlined in Table 6, and more detail on each is included in [Appendix 6](#).

Table 6 Predicted Residual Effects and Conclusions on the Identified Valued Components

| Valued Component              | Adverse Residual Effect                                                                  | Conclusion [i.e., significance <sup>4</sup> ] | Project's Contribution to Cumulative Effects |
|-------------------------------|------------------------------------------------------------------------------------------|-----------------------------------------------|----------------------------------------------|
| Air Quality                   | Increase in ambient NO <sub>2</sub> , concentrations during Operation.                   | Not significant                               | Not significant                              |
|                               | Increase in SO <sub>2</sub> concentrations during Operation.                             | Not significant                               | Not significant                              |
|                               | Increase in CO, PM, VOCs concentrations during Operation.                                | Not significant                               | Not significant                              |
|                               | Increase in short-term CAC emissions during Project Site preparation and Construction    | Not significant                               | Not significant                              |
|                               | Increase in short-term CAC concentrations during abnormal operating conditions (flaring) | Not Significant                               | Not significant                              |
| Acoustic                      | Increase in noise levels during Construction                                             | Not significant                               | Not significant                              |
|                               | Increase in vibration levels during Construction                                         | Not significant                               | Not significant                              |
|                               | Increase in noise levels during Operation                                                | Not significant                               | Not significant                              |
| Human Health                  | Inhalation of Contaminants of Potential Concern (COPCs)                                  | Not significant                               | Not significant                              |
|                               | Health and well-being effects from shift work                                            | Not significant                               | Not significant                              |
| Land and Resource Use         | Change to use of tenures and licensed resource uses                                      | Not significant                               | Not significant                              |
|                               | Change to visual quality of the landscape                                                | Not significant                               | Not significant                              |
| Vegetation                    | Introduction or spread of invasive plant species                                         | Not significant                               | Not significant                              |
| Wildlife and Wildlife Habitat | Loss or Alteration of Wildlife Habitat                                                   | Not significant                               | Not significant                              |
|                               | Increased wildlife health and mortality risk                                             | Not significant                               | Not significant                              |
| Infrastructure and Services   | Effects to domestic water supply                                                         | Not significant                               | Not significant                              |
|                               | Effects to landfill and recycling facilities                                             | Not significant                               | Not significant                              |
|                               | Effects to transportation infrastructure and safety                                      | Not significant                               | Not significant                              |

Table 7 below outlines the predicted positive effects of Tilbury Phase 2. The analysis that led to these conclusions can be found in [Appendix 6](#).

Table 7 Predicted positive effects of Tilbury Phase 2

| Valued Component       | Predicted Positive Effects                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Human Health           | The <a href="#">Revised Application, Section 7.15</a> identified that Project activities during construction, operation, and decommissioning may affect human health and well-being by altering population health status through changes in employment rates and regional economic activities, and through changes to land and resource use. This includes indirect positive effects to population health status through increased access to employment, improved employment/ income inequity, and elevated household income. |
| Employment and Economy | As noted in above the <a href="#">Revised Application, Section 7.15</a> identifies that indirect positive effects from employment and economy can improve population health status.<br><br>Positive effects of employment and economy were identified in the <a href="#">Revised Application, Section 7.10</a> and considered by the EAO in <a href="#">Appendix 6</a> of the Assessment Report.                                                                                                                              |

|  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <p>The EAO also acknowledges that Tilbury Phase 2 would contribute to a number of positive effects to employment and economy in the region, including:</p> <ul style="list-style-type: none"> <li>• Increased direct, indirect, and induced employment;</li> <li>• Increased income resulting from employment opportunities;</li> <li>• Enhancement of workforce;</li> <li>• Increased contracting and procurement opportunities;</li> <li>• Changes to opportunities for traditional economic activities;</li> <li>• Increase in government revenues;</li> <li>• Economic benefits to the B.C. economy; and,</li> <li>• Positive change to business revenue.</li> </ul> <p>In addition to the above effects, increase in government revenue also supports construction and maintenance of public infrastructure, and the delivery of government services.</p> <p>The Proponent also identified in the <a href="#">Revised Application, Section 1.7</a> that the purposes of the project have positive effects. These purposes are:</p> <ul style="list-style-type: none"> <li>• Strengthen resiliency by providing instantaneous backup gas supply to FortisBC customers, primarily in the Lower Mainland, in the event of a supply emergency; and,</li> <li>• Provide a clean-burning, lower-carbon fuel alternative for local and global markets to meet the growing demand.</li> </ul> |
|--|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Table 8 below outlines the conclusions on the other assessment matters. The analysis that led to these conclusions can be found in Appendices 7 to 14. These conclusions consider the information and analysis presented in the respective section; the views of the technical advisory committee, First Nations, and Proponent; as well as the proposed conditions identified in the provincial Table of Conditions; and federal Key Mitigation Measures and Follow-up Programs under the IAA, where relevant to areas within federal jurisdiction (Appendix 2).

Table 8 Predicted Effects and Conclusions on the Other Assessment Matters

| Other Assessment Matters                                                                                  | Conclusion                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Risks and uncertainties associated with effects, including the results of any interaction between effects | Risks and uncertainties associated with residual effects are assessed within each VC section. Where residual effects on a VC were predicted and the valued component was also considered a pathway for other potential effects on other VC, as outlined in Table 5.1–1 of the Revised Application, the EAO considered the linkages between these VCs.                                                                                                                                                                                                                                                                                                                           |
| Risk of Accidents and Malfunctions                                                                        | The EAO is of the view that the potential for severe and high-risk effects due to accidents and malfunctions associated with Tilbury Phase 2 have been appropriately reduced and/or managed for this environmental assessment.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Human and Community Well-Being                                                                            | After considering identified KMM and follow-up programs, Certificate conditions (which would become legally binding if a Certificate is issued), and federal and provincial regulatory requirements, the EAO concludes that significant adverse effects on overall human and community well-being are unlikely, certain diverse sub-populations may remain at heightened risk, highlighting the need for ongoing attention to equity, inclusion, and culturally responsive mitigation and monitoring efforts. This conclusion considers the information and analysis presented in this and related sections, as well as the views of the TAC, First Nations, and the Proponent. |

| Other Assessment Matters                                       | Conclusion                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alternative Means of Carrying out Tilbury Phase 2              | The EAO concludes that the Proponent has adequately assessed alternative means for Tilbury Phase 2 and components of Tilbury Phase 2 design.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Effects on Current and Future Generations                      | The EAO concludes Tilbury Phase 2 will provide positive employment, training, and economic opportunities for current and future generations. Project design, electrification, and a Net-Zero Plan will minimize greenhouse gas emissions (GHGs), though cumulative climate change remains a global concern. Regarding Indigenous interests, while some Nations view any additional impact as significant, the EAO considers residual effects on rights and cultural practices to be not significant. Mandatory conditions for engagement, benefit-sharing, and cultural awareness aim to reduce these impacts. Overall, with the implementation of all measures and conditions, the project is unlikely to result in significant adverse effects on current and future generations. |
| Consistency with Land Use Plans                                | The EAO has considered the consistency of Tilbury Phase 2 with the Land Use Plans and the potential of Tilbury Phase 2 to affect the objectives of the land use plans, strategies and management programs of Metro Vancouver, City of Delta, City of Richmond, Vancouver Fraser Port Authority (VFPA), First Nation Land Use Plans, and the Fraser River Estuary Management Program (FREMP). Tilbury Phase 2 is not expected to have an adverse effect on the overall objectives of these plans.                                                                                                                                                                                                                                                                                    |
| Contribution to Sustainability                                 | The EAO concludes that Tilbury Phase 2 is consistent with the promotion of sustainability in B.C., as provincial conditions and permitting will minimize environmental impacts while fostering a sound economy through employment, training, and tax revenue for the Province and Indigenous Nations. Although the project may contribute to localized adverse health effects if air contaminant objectives are exceeded nearby, it is expected to support the overall well-being of British Columbians. While the EAO notes some uncertainty regarding specific mitigation interactions, it maintains that the project's positive contributions outweigh these factors, provided there is ongoing regulatory oversight through certificate and permit requirements.                |
| Effects on Biophysical Factors that Support Ecosystem Function | The EAO concludes that there would be a low magnitude of effects on biophysical factors that support ecosystem function. The EAO is satisfied that effects on these factors would be appropriately mitigated and minimized to the extent possible for the Project.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Potential Changes to the Project Caused by the Environment     | EAO concludes the effects of the environment would not cause significant adverse effects on Tilbury Phase 2 during construction and operations due to the engineering design requirements for Tilbury Phase 2 to withstand the types of extreme weather, flooding, and seismic events occurring nearby during the life of the project under current and future climate conditions.                                                                                                                                                                                                                                                                                                                                                                                                  |
| Greenhouse Gas Emissions                                       | The EAO is satisfied that Tilbury Phase 2 would not have significant adverse effects on Greenhouse Gas (GHG) emissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Requirements of the /AA                                        | EAO evaluated effects within federal jurisdiction under the /AA and determined that Tilbury Phase 2 is unlikely to result in significant adverse federal effects. The EAO concluded that adverse residual and cumulative effects are not significant for fish and fish habitat, as all in-water works were removed from the project scope and strict upland mitigations will                                                                                                                                                                                                                                                                                                                                                                                                        |

| Other Assessment Matters | Conclusion                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <p>protect aquatic species. Regarding the acoustic environment, while regional cumulative noise may be moderate, the project’s specific contribution is negligible to low and not significant. Regarding GHG emissions, the EAO found effects are not significant based on the project’s exceptionally low emission intensity (0.021 Metric tonne(s) of carbon dioxide equivalent (tCO2e/tonne)) and a credible Net-Zero Plan aligned with the federal Strategic Assessment of Climate Change. Regarding migratory birds and species at risk, the EAO determined that because the project is located on a highly disturbed brownfield site with limited habitat value, incremental contributions to cumulative effects are negligible to low and not significant.</p> <p>With respect to Indigenous peoples, the EAO acknowledges that some Nations view any additional industrial activity as a significant barrier to cultural restoration; however, the EAO concluded that residual federal effects on the current use of lands and resources, health, and socio-economic conditions are not significant. Overall, the EAO is of the view that Tilbury Phase 2 will not hinder Canada’s ability to meet its environmental obligations or climate change commitments.</p> |

7.0 KEY CONCERNS IDENTIFIED IN THE EAO’S ASSESSMENT OF EFFECTS

The matters, or topics, to be assessed were determined by the EAO, in consultation with the TAC, First Nations and the public, and through consensus seeking with the participating Indigenous nations, through the [Application Information Requirements](#) set out by the EAO for Tilbury Phase 2. These assessments incorporate the factors set out in subsection 22(1) of the IAA and effects within federal jurisdiction, information submitted by FortisBC, advice from the TAC and CAC, local information and concerns raised by the public, and Indigenous knowledge provided by the participating Indigenous nations. Key concerns, such as assessment matters, including how to identify, assess and manage potential environmental, economic, social, cultural and health effects, were considered following EAO’s [Effects Assessment Policy](#) guidance.

The remainder of this section summarizes the key themes that, due to their complexity and the level of concern from the TAC, CAC, participating Indigenous nations and/or the public, became the main focus of the Tilbury Phase 2 EA.

[Appendix 6](#) provides the detailed assessment of potential effects of Tilbury Phase 2 on each of the key concerns, identifies mitigation measures, including the KMMs and Follow-Up Program under the IAA, discusses the key issues raised, and reaches conclusions on the significance of residual effects on each valued component (VC) and other required assessment matters, as required by [Section 25](#) of the Act and the factors set out in subsection 22(1) of the IAA.

7.1 Greenhouse Gas Emissions

The Proponent assessed GHG emissions associated with Tilbury Phase 2 across construction, operation, and decommissioning phases. The assessment focused on project-level emissions, including direct emissions from on-site activities and indirect emissions associated with energy use. Upstream GHG emissions, including fugitive methane emissions, were assessed in accordance with the Strategic Assessment of Climate Change and associated technical guidance, using prescribed methods and data from the Government of Canada and Environment and Climate Change Canada (ECCC). Results of the upstream assessment are provided in [Appendix M, Upstream Greenhouse Gas Assessment Technical Data Report](#), of the Revised Application.

Members of the TAC, participating Indigenous nations, and the public raised concerns regarding greenhouse emissions and climate change generally to be important considerations for decisions related to the Project. This included raising questions relating to the need of the Project, ability to meet GHG targets, and the scope of the assessment.

Comments about the GHG assessment, included the consideration of upstream and downstream emissions, and the characterization of natural gas and LNG as a low-carbon or lower-carbon fuel. The EAO notes that downstream emissions from end-use combustion are not required to be assessed under the Act or the IAA, and that this approach is consistent with standard carbon accounting practices for industrial facilities. While the Proponent provided an analysis describing how the Project could contribute to global emissions reductions, the EAO did not rely on this analysis due to uncertainty associated with displacement assumptions and global market dynamics. Instead, the EAO focused its assessment on project-level emissions that can be measured and regulated.

Reviewers also raised concerns regarding the Project's ability to meet GHG reduction targets and to operate as a net-zero LNG facility, including questions related to the availability of electricity, implementation of Best Available Technologies (BAT) and Best Environmental Practices (BEP), use of renewable natural gas, acquisition of B.C. Offset Units, and the long-term credibility and adaptability of the Net-Zero Plan. The Proponent committed to securing sufficient grid electricity, implementing BAT and BEP, acquiring renewable natural gas from commercially available sources, and purchasing B.C. Offset Units for any residual emissions to meet net-zero requirements.

The EAO has proposed Condition 11 (Greenhouse Gas Emissions and Net-Zero Plan), which would require the implementation and periodic updating of a credible Net-Zero Plan. Updates to the Net-Zero Plan would be required every five years to reflect changes in technology and regulatory requirements and must be completed in consultation with First Nations, Ministry of Energy and Climate Solutions, ECCC, and Metro Vancouver. The EAO notes that GHG emissions from LNG facilities in B.C. are also subject to mandatory reporting and third-party verification under the *Greenhouse Gas Industrial Reporting and Control Act* (GIRCA) and its regulations.

The EAO concludes that, with the implementation of proposed conditions and applicable regulatory requirements, GHG emissions from Tilbury Phase 2 have been adequately addressed for the purposes of the EA.

For further details on the assessment of effects to GHG, see [Appendix 12 Greenhouse Gas Emissions](#) of this Report.

## 7.2 Effects to Air Quality and Human Health

The Proponent assessed air quality and human health effects from Tilbury Phase 2 emissions during construction, commissioning, operation, and flaring events (including start-up, shutdown, upset conditions, and potential grid power outages). Decommissioning-related effects were assessed using construction activities as a conservative proxy, as decommissioning is expected to involve similar or lower emission sources over a shorter duration.

The assessment focused on air contaminants, including Nitrogen Dioxide (NO<sub>2</sub>), Sulphur Dioxide (SO<sub>2</sub>), and particulate matter (PM), and their potential effects on human health and the environment. Air dispersion modelling was initially completed using a conservative, unmitigated scenario, followed by additional modelling incorporating proposed emission controls. Results indicate that the Project would contribute a relatively small incremental increase in NO<sub>2</sub> concentrations compared to existing background levels; however, in some worst-case scenarios, with the most conservative weather conditions, combined Project and background levels could exceed the applicable threshold, with the exceedance occurring within approximately 50 metres of the Project location.

Participating Indigenous nations, Metro Vancouver, regional health authorities, local governments, and members of the public raised concerns that, while the Project's individual emissions are relatively low in magnitude, its potential contribution to cumulative air quality conditions, under reasonably foreseeable cumulative development scenarios, remains an important consideration within an already industrialized airshed. Under these cumulative scenarios, modelled concentrations may exceed health-based screening thresholds, assuming full build-out of identified projects and

continuation of existing sources. The Proponent noted that predicted concentrations are based on conservative assumptions and that actual impacts may be lower once final design, mitigation, and operating conditions are confirmed.

Additional concerns were raised regarding flaring emissions, which are predicted to exceed health-based thresholds by up to five times during temporary events, including one-time commissioning activities and infrequent start-up, shutdown, and upset conditions. These events are expected to be limited in duration, ranging from several hours to several days.

The EAO is of the view that potential project-related air quality and human health effects have been adequately assessed and can be addressed through applicable permitting requirements and proposed conditions, including Condition 14 (Air Quality Management Plan) which would require operation emissions and flaring monitoring, reporting and requirements for adaptive management and Condition 18 (Regional Cumulative Effects Initiatives). The extent to which air quality effects will be managed through permitting remains subject to future regulatory decisions.

For further details on the assessment of effects to air quality and human health, see [Appendix 6, Section 17.01](#) (Air Quality) and [Appendix 6, Section 17.14](#) (Human Health).

### 7.3 Project Scope and Aquatic Effects

First Nations and members of the public raised concerns about potential effects on fish, marine mammals (including Southern Resident Killer Whales), the Fraser River, and the Salish Sea. Many of these concerns focused on increased vessel traffic and related impacts. These issues largely stemmed from the association between the Tilbury Phase 2 Project and the separately assessed Tilbury Marine Jetty (TMJ), which includes a shipping component.

Tilbury Phase 2 does not include operational shipping in its project description. As a result, an operational shipping assessment was not undertaken for this project. Early in planning, and as reflected in the DPD and the Process Order, the Project included a proposed upgrade to the existing MOF and the movement of modules to the Project Site by marine vessels from Sand Heads lighthouse.

Following extensive engagement with First Nations, including concerns regarding in-river works and vessel activity in the Fraser, FortisBC refined the Project design and removed the MOF upgrade, barge delivery, and all associated in-river works from the Project. In accordance with the Process Order requirement to describe changes to project components since the DPD, the Revised Application identifies these changes. With these elements avoided, and to enable a focused assessment of Project-related effects, the EAO directed the Proponent to limit the Revised Application to effects unrelated to barge delivery or in-river construction. The EAO's assessment reflects this refined scope.

Construction materials for Tilbury Phase 2, including large components such as tanks or large prefabricated components, may arrive in B.C. through established commercial supply chains using existing port facilities. These activities do not involve project-specific marine infrastructure, do not introduce project-controlled vessel movements in the Fraser River or Salish Sea, and therefore are not considered Project components or associated works within the meaning of the Process Order. Should the Proponent in the future propose any marine-based construction access, barge delivery to the site, or in-river works, this would constitute a change to the Project and would be subject to EAO review and any additional regulatory approvals.

In response to concerns that Tilbury Phase 2 could drive increased shipping through the Tilbury Marine Jetty (TMJ) the EAO notes that the Jetty's federal Decision Statement caps LNG vessel traffic at 365 vessels per year, including up to 68 export carrier calls. It also limits vessels using crude-oil-based fuels to 13 calls annually and imposes a 10-knot speed restriction in the South Arm of the Fraser River. Any change to these limits would require a federal amendment.

The Proponent assessed potential Project effects on fish and fish habitat and water quality in the Revised Application. The EAO identified these areas of concern: potential contamination and resedimentation from hydrostatic testing of the LNG

storage tank, potential contamination of surface water during Operation and potential effects of 6PPD-Quinone (6-PPDQ), a tire wear chemical known to affect fish.

In response to these concerns, Condition 12 (Construction Environmental Management Plan (CEMP)) would require a hydrostatic testing plan developed in consultation with First Nations and technical experts. It would also formalize the restriction on delivering construction materials by barge or constructing a MOF as part of Tilbury Phase 2. Condition 13 (Operations Environmental Management Plan (OEMP)) would require addressing potential contaminants that could enter surface water during Operation. In addition, Condition 17 (Dry Street Sweeping Study) would require a report evaluating whether dry sweeping could help reduce 6-PPD-quinone reaching nearby waterways.

## 8.0 THE EAO'S PROPOSED CONDITIONS

As part of the recommendations of the CEAO to the Ministers, the EAO developed a draft Certificate. This Certificate, if issued, would allow Tilbury Phase 2 to proceed to permitting and other authorizations. If the Ministers decide to issue a Certificate, it will include a Certified Project Description and Table of Conditions. The Certified Project Description outlines the components and activities of a project that are approved by the Certificate. The Table of Conditions sets out legally binding requirements (or, conditions) to which the Certificate Holder (Holder) must adhere throughout the life of Tilbury Phase 2. These conditions describe 'how' a project must be implemented. Some of the conditions are procedural requirements common to all certified projects; others are project-specific and intended to prevent or reduce adverse effects. Conditions were developed following the [EAO's Certificate Policy](#).

If a Certificate is issued, the Holder must design, build, operate and decommission Tilbury Phase 2 in accordance with the Certificate. The B.C. Compliance and Enforcement Agency (BC-CEA) would then become responsible for the verification and enforcement of the requirements in the Tilbury Phase 2 Certificate. The BC-CEA conducts compliance inspections and, where required, uses enforcement to ensure that projects are compliant with the certificate conditions. For more information on compliance and enforcement, see the [EAO's website](#).

For Tilbury Phase 2, the EAO has proposed the 10 standard conditions which are common to all certified projects (see box at the end of this section) and 8 project-specific conditions to prevent or reduce adverse effects identified through the environmental assessment (EA). The following are Tilbury Phase 2 specific conditions and their purpose (full details will be included in the Certificate, if issued):

- **Condition 9 (Public Information):** This condition would require the Holder to share information regarding Tilbury Phase 2 with the public through a dedicated Project website, a phone line, and newspaper notice, or other equally effective media, if appropriate. Through these mediums, the Holder would share information such as contact information, project updates and engagement opportunities, notice of planned flaring events, information about safety, and instructions for how to provide a complaint or comment.
- **Condition 10 (Community Feedback Process):** This condition would require the Holder to enable and collect public feedback, and to create a process for managing and responding to public comments and questions, and to develop reports in consultation with First Nations and Local Governments summarizing community feedback and engagement statistics and data which would be shared with specified groups and agencies
- **Condition 11 (Greenhouse Gas Emissions and Net-Zero Plan):** This plan would require the Holder to implement its plan for achieving net-zero energy emissions by 2030 and update the plan every five years in consultation with the Ministry of Energy and Climate Solutions, First Nations, ECCC, and Metro Vancouver.
- **Condition 14 (Air Quality Management Plan):** This plan would require the Holder to produce and implement a plan to manage the effects of Tilbury Phase 2 on air quality. The plan would describe how the Holder would implement mitigation measures related to air quality, include a process for selecting emissions control

technologies, and require monitoring of ambient air quality as well emissions from regular operations and flaring. The plan would be developed in consultation with First Nations, Metro Vancouver, ECCC, Health Authorities, Health Canada, and BC Energy Regulator (BCER).

- **Condition 15 (Chance Find Protocol):** This condition would require the Holder to submit and implement a Chance Find Protocol (CFP) for archaeological finds throughout the life of Tilbury Phase 2. The Protocol would be developed in consultation with First Nations, and BCER.
- **Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan):** This plan would require the Holder to produce a plan supporting the economic participation of First Nations and local communities in the Project. The plan would describe employment and contracting strategies and training practices, including on the job training and apprenticeships. The plan will also outline how reporting on employment and contracting outcomes will occur, and be developed in consultation with First Nations, Ministry of Jobs and Economic Growth (JEG), Local Governments, and the Ministry of Post-Secondary and Future Skills (PSFS).
- **Condition 17 (Dry Street Sweeping Report):** This condition would require the Holder to submit develop and submit a Report on the effectiveness of Dry Street Sweeping to mitigate the effects of 6PPD-Quinone (6-PPDQ) on fish within eighteen months of a Certificate being issued. If Dry Street Sweeping is an effective mitigation measure, the Holder would be required to describe how it would be implemented as an additional mitigation measures would be implemented by updating the CEMP in consultation with First Nations and agencies.
- **Condition 18 (Regional Cumulative Effects Initiatives):** This condition requires the Holders to participate, if directed, in any cumulative effects management committees to address regional socioeconomic and environmental issues.

***The following conditions are standard in most Certificates and proposed for inclusion in the Tilbury Phase 2 Certificate:***

**Document Review:** sets out timelines for EAO document reviews and requirements for plan implementation.

**Document Updates:** allows the Holder or the EAO to require the Holder to make changes to any document if it is not meeting objectives, intended effects or to be consistent with changes in industry best practice or technology.

**Document Development:** requires all documents to include purpose, roles and responsibilities, schedules, plans for evaluating mitigation effectiveness, schedules for reporting, schedules for document updates, and adaptive management.

**Consultation:** sets out the details of what consultation entails. This includes providing a written record of comments received and explanation of how they have been considered and addressed. This condition also includes ongoing consultation requirements for the Holder with First Nations and Local Governments throughout the life of the Project.

**Compliance Verification and Reporting:** allows the EAO to request information for the purposes of compliance inspection and verification and sets out requirements for compliance self-reports for Holders.

**Project Status Notification:** requires the Holder to provide project status notification, primary contact details, and notice when primary contact for Tilbury Phase 2 changes.

**Compliance Notification:** requires the Holder to notify the EAO in the event of any instances where it has not fully complied with the Certificate.

**Independent Environmental Monitor:** requires an Independent Environmental Monitor; includes a terms of reference that sets out the expectations and requirements for the Independent Environmental Monitor. This monitor could be an Indigenous monitor.

**Construction Environmental Management Plan (CEMP):** addresses standard issues with the potential to cause impacts to the environment during construction, including topics such as dust management, visual quality, an LNG Storage Tank Hydrostatic Testing Plan, a Transportation Management Plan, surface water quality and quantity management, and erosion and sediment control, among other topics.

**Operations Environmental Management Plan (OEMP):** addresses standard issues with the potential to cause impacts to the environment during Operation, including topics such as management of waste, surface water quality and quantity management, visual quality, and erosion and sediment control, among other topics.

## 9.0 TILBURY PHASE 2'S CONTRIBUTION TO SUSTAINABILITY

### 9.1 Introduction

Under Section 29 of the Act, the EAO must consider whether a project is consistent with the promotion of sustainability and include a recommendation to Ministers on this topic. This analysis supports the EAO in meeting its purpose under Section 2 of the Act to 'promote sustainability through protecting the environment and foster a sound economy and the well-being of British Columbians and their communities'.

In addition to the provincial assessment requirements, [Appendix 15 Section 26.8](#) assesses the extent to which Tilbury Phase 2 contributes to sustainability, as required under paragraph 22(1)(h) of the federal IAA.

### 9.2 Protecting the Environment

Tilbury Phase 2 is located on fee simple property zoned for industrial use and is not expected to cause significant changes to the environment based on project activities and potential effects.

Project activities are expected to interact with biophysical factors that support ecosystem function, including effects on Wildlife and Wildlife Habitat VC and Vegetation VC. The main potential interactions with wildlife and wildlife habitat are loss and alteration of habitat from both direct and indirect effect pathways, as well as changes in wildlife health and mortality risk. Residual effects on Vegetation VC are expected to be the introduction or spread of invasive species. These effects interactions are unlikely to have a significant effect, particularly when considering the location of the Project which is a highly industrial area with minimal vegetation or wildlife. The EAO does not expect the Project to have a measurable effects on ecosystem function or its susceptibility to change.

The Project has the potential to influence local and regional air quality through both construction and long-term operational activities, interacting with existing conditions in the Lower Mainland. To reduce potential air quality effects raised by technical advisors, First Nations and regulators, FortisBC has committed to regular inspection and maintenance programs, an idle-reduction policy for vehicles, continued engagement with First Nations and technical advisors on emissions control technologies, and operating within the emission limits set by Metro Vancouver through permitting, if an EAC is issued.

The EAO also considered potential effects on fish and fish habitat. Direct interactions between Tilbury Phase 2 and the marine environment are limited as the Project involves no in-water works, no shipping, and no direct flows into the Fraser River or Tilbury Slough. However, other indirect pathway interactions were considered, related to water discharged through the City of Delta's stormwater system, that released stormwater into the Tilbury Slough, including from the hydrostatic testing of the LNG storage tank, and concerns about effects from truck traffic during Construction to and from

the site impacting the health of fish related to 6PPD-Q. Technical advisors and First Nations raised potential risks from 6PPD-Q from vehicle tires entering stormwater and the potential to reach fish habitat. This potential indirect pathway was therefore considered as part of the assessment.

GHG emissions remain a significant concern for the public, local government, technical reviewers, and First Nations. The EAO notes FortisBC has outlined a credible plan to reach net-zero carbon emissions by 2030 through electrification, fugitive emission reductions, use of renewable fuels, managing entrained CO<sub>2</sub>, procuring lower-carbon electricity, and acquiring offsets to manage any residual emissions. The plan's effectiveness depends on how these commitments are implemented throughout Construction and Operation. Under proposed Condition 11 (Greenhouse Gas Emissions and Net-Zero Plan), FortisBC would be required to maintain and update the plan at least every five years in consultation with First Nations, Ministry of Energy and Climate Solutions, ECCC, and Metro Vancouver.

Through the proposed Certificate conditions, the Proponent would be required to develop management plans with the purpose of mitigating monitoring and adaptively managing the effects of the Project to the environment, including to the air, water, vegetation, wildlife and wildlife habitat, and fish and fish habitat. The EAO is proposing several Certificate conditions to help manage effects to the environment, including Condition 12 (CEMP), Condition 13 (OEMP), Condition 14 (Air Quality Management Plan), and Condition 16 (Dry Street Sweeping Report).

Tilbury Phase 2 is subject to regulatory approvals from both the provincial and federal governments. As a part of the substituted environmental assessment, the EAO and IAAC developed the [Joint Permitting/Regulatory Coordination Plan](#) to support an effective regulatory path for the project by including key federal and provincial regulatory instruments including permits, licenses and authorizations that may be required.

While Tilbury Phase 2 is not expected to result in significant residual environmental effects, both the Province and the federal government recognize concerns have been expressed about cumulative effects in the South Fraser Arm. This includes concerns raised by First Nations and those related to projects directly connected to TP2, such as the Tilbury Marine Jetty. Both levels of government remain committed to meaningfully addressing these concerns in partnership with First Nations through the various collaborative initiatives currently underway.

Examples of existing collaborative initiatives include the B.C. Coastal Marine Strategy, which will invest more than \$2.5 million in Indigenous-led marine stewardship initiatives focused on habitat restoration, pollution prevention, and environmental monitoring, and the British Columbia Salmon Restoration and Innovation Fund, which invested \$128.6 million in 97 projects between 2019 and 2024 to support salmon restoration, habitat recovery, sustainable fisheries, climate resilience, and Indigenous participation.

Federally, through the Oceans Protection Plan, the Government of Canada has also invested \$1.5 billion to improve marine safety, protect coastal ecosystems, and strengthen Indigenous partnerships, including through the Cumulative Effects of Marine Shipping (CEMS) Initiative that assesses cumulative effects of marine shipping. In 2022, the Government of Canada committed an additional \$2 billion to continue some of the existing Ocean Protection Plan initiatives. This includes establishing 15 new measures to expand ocean protection initiatives to more regions and improve marine safety. As part of the [Spring Economic Update 2026: Canada Strong For All](#), the [Government of Canada committed more than \\$258 million](#) over five years to renew and enhance funding for protection of whales and their habitats. Of the \$258 million, \$163.8 million over five years has been allocated to continue the important work of the Whales Initiative, ensuring immediate and comprehensive action to protect whales. This funding will support measures to address threats facing endangered whale species, including the Southern Resident killer whale and the North Atlantic right whale. An additional \$95 million over five years, plus \$16.5 million annually thereafter, has been allocated to enhance protections specifically for Southern Resident killer whales, building on the strong management measures implemented to date.

Relevant sections: [Appendix 12](#) (Greenhouse Gas Emissions), [Appendix 6, Section 17.01](#) (Air Quality), [Appendix 6, Section 17.08](#) (Fish and Fish Habitat), [Appendix 6, Section 17.07](#) (Wildlife and Wildlife Habitat), [Appendix 6, Section 17.06](#) (Vegetation), and [Appendix 5](#) (Detailed Indigenous Nation Assessments).

### 9.3 Fostering a Sound Economy

To understand how the Project contributes to fostering a sound economy, the EAO considered FortisBC's assessment along with feedback from technical reviewers and First Nations, the positive regional and national effects to employment and economy generated, the proposed mitigation and enhancement measures, the draft Certificate conditions, and KMMs in [Appendix 2](#).

FortisBC indicated that the Project aligns with sustainability objectives and is intended to support the well-being of current and future generations, as the project will address energy demands of the growing population, as well as contribute to the economy of the region by providing a resilient energy supply in the Lower Mainland. The project's storage component is designed to reduce the risk of natural gas supply disruptions, which could otherwise result in impacts for both FortisBC transmission system and its customers. This includes financial costs (e.g. restarting gas supplies, costs for customers that use gas for businesses) as well as impacts from not being able to use gas for domestic purposes (e.g. heating, stoves).

FortisBC predicts that Tilbury Phase 2 would provide direct, indirect and induced jobs, delivering 13,300 jobs at \$1.2 billion during the construction phase and 600 jobs at \$122 million annually during the forty plus years of estimated operations phase. FortisBC expects the Project will increase tax revenues, alongside contributions to GDP through economic activities, construction and operation. GDP contributions are estimated at \$1.7 billion during the construction phase and \$499.5 million annually. Total tax revenues are forecasted at \$308.9 million during the construction phase and \$208.6 million annually during the operation phase.

An important part of the Province's commitment to reconciliation, reflected in the Declaration Act Action Plan for 2022 to 2027, is supporting First Nations in accessing economic opportunities and benefiting from the lands and resources in their territories. The Action Plan includes a theme focused on social, cultural and economic well-being, which emphasizes Indigenous peoples' ability to fully exercise their rights, including maintaining and developing cultural heritage, traditional knowledge, languages, and food systems. These commitments are supported by initiatives that promote connection, capacity, and participation in B.C.'s economy. TP2 supports these provincial objectives by creating opportunities for Indigenous participation in project planning, construction, contracting, employment, training, and long-term economic development associated with the Project. In line with this, FortisBC has committed to policies and practices aimed at enhancing positive socio-economic outcomes and reducing adverse impacts, developed in collaboration with First Nations, the Province, local governments and other partners.

To promote equitable distribution of Project benefits, FortisBC has committed to implement policies, programs, and practices to support First Nation contracting, and the employment of members of First Nations and traditionally underrepresented groups. FortisBC has also committed to implementing a cultural awareness program for employees and contractors working on the Project.

In addition to this, the EAO is proposing Condition 16: First Nation and Local Economic Inclusion and Monitoring Plan, to ensure implementation, and monitoring the effectiveness, of measures to strengthen First Nations and local participation in Tilbury Phase 2.

Relevant sections: [Appendix 6, Section 17.09](#) (Employment and Economy), [Appendix 8](#) (Human and Community Well-Being), [Appendix 10](#) (Effects on Current and Future Generations), [Appendix 11](#) (Consistency with Land Use Plans), and [Appendix 5](#) (Detailed Indigenous Nation Assessments).

## 9.4 The Well-being of British Columbians and Their Communities

Four primary potential project effects have been identified that relate to the well-being of British Columbians and their communities, including;

- changes to equitable access to employment and procurement opportunities;
- risk that the Project may contribute to disagreement, conflict, or polarization among community members;
- altering visual and sensory impacts associated with land and resource use;
- affecting human health impacts which are associated primarily with air quality; and,
- positive contributions to community well-being through employment, training, procurement opportunities, and increased regional energy resiliency.

The economic and employment benefits, as well as the contribution to regional energy resiliency outlined above, are expected to support the well-being of local communities by providing jobs, opportunities, and services that help British Columbians support their families and communities. The project is anticipated to create 6,200 full-time equivalent direct jobs over a potential three-to-six-year construction period, peaking at 600 onsite workers. When considering mitigation measures, the EAO does not expect significant residual adverse effects on infrastructure, services, or cultural resources. This is because the labour force is expected to be drawn largely from Metro Vancouver, minimizing incremental pressures on housing and local services. In addition, access changes to and use of lands and waters near the Project site are expected to be negligible.

Positive effects for workers, including Indigenous workers, are anticipated through increased employment and training opportunities, as well as and a potential improvement of social conditions associated with employment and training. Employment income, education and skills training, procurement opportunities, and government revenue are anticipated as positive effects. Indigenous Nation members who hold a trades certificate, have relevant experience, or are interested in training or gaining experience in the construction sector would be most likely to benefit from direct employment with the Project. However, increased Indigenous participation in wage-based economies may reduce participation in traditional subsistence and non-wage economic activities. Workers engaged in Project construction might otherwise be engaged in resource harvesting or related economic activities, resulting in lost opportunity.

Overall, EAO expects economic opportunities to positively benefit workers and their families by providing improved income security. FortisBC does not anticipate other adverse impacts to labour market, opportunities for traditional economic activities, business revenues, property values, cost of living, or impacts to regional transportation networks by truck traffic.

While Project lighting is required for site safety and security, FortisBC plans to mitigate visual impacts associated with land and resource use by designing project lighting in a manner that is consistent with BCER's Light Control Best Practices Guideline, the International Commission on Illumination's Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations, and the City of Delta's municipal zoning bylaws. It would also be required under the LNG Facility Regulation for the Project to not cause excessive emanation of light on human and wildlife receptors.

The construction of new fossil fuel related infrastructure is a topic of active public discussions. Concerns were raised that that as new fossil fuel infrastructure the Project could contribute to intensified social divisions in local communities, that is, increased disagreement or tension between people who view the Project positively for its economic benefits and those who oppose it due to concerns related to climate change and environmental impacts.

FortisBC has committed to continuing to engage the public and other interested parties throughout the remaining phases of the project to seek input, answer questions, and address potential concerns. Should the Project proceed, ongoing work

will take place with First Nations, local government, and government agencies to continue dialogue, ensure compliance with conditions from authorizations needed for the Project, and to address feedback related to managing effects and operational issues.

First Nations, technical reviewers, and the public also raised concerns regarding the Project's impacts on the surrounding environment, including how those changes could affect its use and enjoyment, as well as implications for public health and air quality.

EAO's analysis indicated that background concentrations of NO<sub>2</sub> are already close to Metro Vancouver Ambient Air Quality Objectives. With the addition of emissions from Tilbury Phase 2, NO<sub>2</sub> levels would increase and could infrequently exceed these objectives at locations near to the Project site and over the Fraser River.

There is currently no flaring on Tilbury Island, and flaring associated with Tilbury Phase 2 would occur only during specific operational events. While adverse health effects of flaring are not expected to be significant, the Human Health Risk Assessment predicted that short-term flaring scenarios could result in estimated NO<sub>2</sub> exposures of up to approximately five times Metro Vancouver's Ambient Air Quality Objectives at the Project property line. Concentrations are expected to diminish with increasing distance from the source, though exceedances may occur beyond the property boundary.

Short-term exceedances could contribute to localized respiratory and cardiovascular health effects, particularly for sensitive people living, working, or recreating near the Project Site. With application of certificate conditions, including ambient air quality monitoring, permitting by Metro Vancouver (including its regulatory air emissions permitting, monitoring, reporting, and compliance requirements), design requirements under the LNG Facility Regulation (including requirements governing LNG facility design and operation related to flaring), the EAO expects air-quality-related health risks to remain manageable and localized.

First Nations identified concerns relating to the ability to participate in traditional activities, residual effects to harvesting and subsistence activities, cultural use areas, and the overall impacts to Indigenous health and well-being. To help mitigate impacts associated with the Project, FortisBC will be implementing a range of policies and management plans to help mitigate impacts associated with the Project, many of which will be developed in collaboration with First Nations and other levels of government. In addition to this the EAO is proposing Condition 9 (Public Information), Condition 10 (Community Feedback Process), Condition 11 (Greenhouse Gas Emissions and Net-Zero Plan), Condition 12 (CEMP), Condition 13 (OEMP), Condition 14 (Air Quality Management Plan) and Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan) see summaries in [Section 8](#).

The interaction of Tilbury Phase 2 with 31 land use plans by local government, First Nations, Port Authorities, and other organizations have been considered. FortisBC considered the consistency of Tilbury Phase 2 with these plans as part of the Revised Application. The EAO notes that the Project site is located on privately owned land zoned by the City of Delta for industrial use, which permits the manufacturing, processing, finishing, and storage of natural gas and has concluded that Tilbury Phase 2 is not expected to have an adverse effect on the overall objectives of these plans as currently ratified.

Relevant sections: [Appendix 6, Section 17.09](#) (Employment and Economy), [Appendix 6, Section 17.11](#) (Infrastructure and Services), [Appendix 8](#) (Human and Community Well-Being), [Appendix 6, Section 17.14](#) (Human Health), [Appendix 10](#) (Effects on Current and Future Generations), [Appendix 11](#) (Consistency with Land Use Plans), and [Appendix 5](#) (Detailed Indigenous Nation Assessments).

## 9.5 The EAO's Sustainability Conclusion

Considering the above principles, the EAO is of the view that:

- Tilbury Phase 2 is located on fee simple property zoned for industrial use and provincial requirements for the Project established through proposed Certificate conditions and subsequent permitting processes would minimize adverse effects on the environment;
- Tilbury Phase 2 would foster a sound economy by providing continuing and new employment, contracting, and training opportunities, by generating higher wages in the region, increasing tax revenue, and would contribute to the Local Government and First Nations near the project area, and the Province;
- Existing NO<sub>2</sub> levels in the region are close to, and at times exceed air quality objectives. Tilbury Phase 2 would result in a small increase in ambient NO<sub>2</sub> concentrations during normal operations, with larger short-term increases during infrequent flaring events. These effects can be managed through proposed conditions and permitting requirements, and do not change EAO's conclusion that the Project remains consistent with the promotion of sustainability; and
- Tilbury Phase 2 has the potential to contribute to the well-being of British Columbians and their communities, including First Nations communities.

The EAO has administered the Tilbury Phase 2 environmental assessment to allow for a clear understanding of Tilbury Phase 2's contribution to the promotion of sustainability. The EAO notes that, while Tilbury Phase 2 is overall expected to have a positive contribution to sustainability, there are potential for adverse residual effects and some uncertainty related to some mitigation measures and interactions between value components. Considering all the factors outlined in this report, the EAO recommends that Tilbury Phase 2 is consistent with the promotion of sustainability in B.C.

## 10.0 CONCLUSIONS

Based on:

- Information contained in FortisBC (the proponent)'s Revised Application, as well as supplemental information provided by Indigenous peoples, TAC, and CAC during review of the Application;
- FortisBC, the EAO's and IAAC's consultation and engagement with First Nations, Indigenous peoples, provincial, and local government agencies, as well as the public;
- Comments received during the Tilbury Phase 2 EA made by First Nations and Indigenous peoples (including 24 First Nations and organizations<sup>5</sup>), including provincial, federal, and local government agencies as members of the EAO's TAC, as well as FortisBC and the EAO's responses to those comments;
- Comments received during the Tilbury Phase 2 public comment periods and from members of the CAC, and FortisBC's responses to those issues;
- Issues raised by Indigenous peoples regarding the potential effects of Tilbury Phase 2 on their Indigenous interests, as well as FortisBC's response and best effort to address those issues;
- The design of Tilbury Phase 2 as specified in the EAO's proposed Certified Project Description (Schedule A of the Certificate, if issued) which authorizes Tilbury Phase 2 components and activities that may occur;

<sup>5</sup> Chawathil First Nation; Xwchíyò:m (Cheam) First Nation; Katzie First Nation; ǵʷa:ńǵəń (Kwantlen) First Nation; kʷikʷəǵəm (Kwikwetlem) First Nation; Leq'á:mel First Nation; Malahat First Nation; Mǵthexwi (Matsqui) First Nation; xʷmǵθkʷəyǵm (Musqueam Indian Band); Pauquachin First Nation; Pǵpkw'em (Popkum First Nation); Quw'utsun Nation (Cowichan Tribes, Halalt First Nation, Lyackson First Nation, Penelakut Tribe, and Stz'uminus First Nation); Semiahmoo First Nation; S'ólh Téméxw Stewardship Alliance members; Snuneymuxw First Nation; Skwxwú7mesh Úxwumixw (Squamish Nation); S7ÁUTW (Tsawout) First Nation; Tsartlip First Nation; Tsawwassen First Nation; Tseycum First Nation; Tsleil-Waututh Nation; and Ts'uubaa-asatx, Métis Nation British Columbia, and Lummi Nation.

- Mitigation measures identified in the EAO's proposed Table of Conditions (Schedule B of the Certificate, if issued) to be implemented by FortisBC during all phases of Tilbury Phase 2;
- The EAO's identified KMMs and Follow-up Programs under the IAA intended to inform federal conditions that would be implemented by FortisBC during all phases of Tilbury Phase 2; and
- Permitting and other regulatory requirements that Tilbury Phase 2 would be subject to if it receives a Certificate.

Considering Indigenous peoples' views of Tilbury Phase 2 including that:

- Indigenous Nations<sup>5</sup> had opportunities to participate and provide comments throughout all phases of the Tilbury Phase 2 EA;
- Participating Indigenous nations including Treaty Nations have an opportunity to provide a notice of consent or lack of consent;
- Chawathil First Nation, k'w'ik'w'əłəm First Nation, x'w'məθk'w'əyám (Musqueam Indian Band), Snuneymuxw First Nation, and Ts'uubaa-asatx Nation have provided consent for Tilbury Phase 2 proceeding as it is described in the EAO's Certified Project Description (Schedule A of the Certificate, if issued), provided that commitments, mitigation measures, and Certificate conditions are implemented, and ongoing engagement related to the Project.
- Kwantlen First Nation, Quw'utsun Nation (Cowichan Tribes, Halalt First Nation, Lyackson First Nation, Penelakut Tribe and Stz'uminus First Nation), S'ÁUTW First Nation have stated they do not consent to Tilbury Phase 2 receiving a Certificate.
- Tsawwassen First Nation withdrew its previous notice of non-consent and advised that it does not oppose issuance of the EA Certificate.

The EAO is satisfied that:

- The EA process has adequately identified and assessed potential adverse environmental, economic, social, cultural and health effects of Tilbury Phase 2, having regard to the proposed conditions set out in the Table of Conditions (Schedule B to the Certificate, if issued);
- Tilbury Phase 2 is expected to result in net positive residual effects to regional employment, regional business and regional economy and these positive effects have been maximized to the extent possible;
- Other assessment matters have been adequately assessed including: risks and uncertainties associated with effects, interactions between effects, the risks of malfunctions and accidents, disproportionate effects on distinct human populations, effects on biophysical factors that support ecosystem functions, effects on current and future generations, contributions to sustainability, consistency with land use plans, GHG emissions, alternative means for carrying out Tilbury Phase 2, and potential changes to Tilbury Phase 2 that may be caused by the environment;
- Consultation with provincial and federal departments, local governments and the public has been adequately carried out;
- Issues identified by the TAC and CAC as well as members of the public that were within the scope of this EA, were adequately and reasonably addressed during Application Review;
- The Project would result in adverse residual effects and contribute to cumulative effects on environmental, social, cultural, and health components. With mitigation measures and legally binding conditions in place, these effects are not expected to be significant.

- Practical means have been identified to prevent or reduce adverse effects, and these are included as appropriate in the Table of Conditions (Schedule B to the Certificate, if issued);
- The collaborative engagement and consensus seeking efforts and the EAO's process of seeking to understand potentially outstanding issues and impacts with participating Indigenous nations have been carried out in good faith;
- The potential for adverse effects on the Section 35 rights of First Nations that are within the scope of this EA, have been adequately avoided, minimized or otherwise accommodated;
- On matters within the scope of this EA, the provincial Crown has fulfilled its legal duty to consult potentially affected First Nations related to the issuance of a Certificate for Tilbury Phase 2; and,
- The EAO has delivered the procedural aspects of consultation with MNBC on behalf of IAAC according to the requirements of the Cooperation Agreement.

## 11.0 NOTIFICATIONS OF CONSENT OR LACK OF CONSENT BY PARTICIPATING INDIGENOUS NATIONS

One of the EAO's purposes is to support reconciliation with Indigenous peoples in B.C. by recognizing the inherent jurisdiction of First Nations and their right to participate in decision making in matters that would affect their rights, through representatives chosen by themselves. In fulfillment of this purpose, it is an objective of the EA process that participating Indigenous nations have the opportunity to make informed decisions regarding consent in relation to a Project in accordance with their own laws and traditions. This is an expression of their right to self-determination and self-government.

Under the Act, a participating Indigenous nation may choose to provide a notification of consent or lack of consent to the issuance of a Certificate and reasons for that consent or lack of consent. Provincial decision-makers are required by the Act to consider these notifications of consent or lack of consent alongside recommendations made by the CEAO when making a decision on whether or not to issue a Certificate.

The EAO received the following Notices of Consent from participating Indigenous nations regarding the issuance of a Certificate for Tilbury Phase 2:

- Chawathil First Nation: in an August 17, 2026, email, Chawathil First Nation stated its consent;
- k'w'ik'w'əłəm First Nation: in a July 22, 2026, email, k'w'ik'w'əłəm stated its consent;
- x'w'məθk'w'əyəm (Musqueam Indian Band): in a letter dated July 16, 2026, stated its consent;
- Snuneymuxw First Nation: in a letter dated July 23, 2026, Snuneymuxw stated its consent; and
- Ts'uubaa-asatx Nation: in a letter dated July 30, 2026, Ts'uubaa-asatx stated its consent.

The EAO received the following Notices of non-Consent from participating Indigenous nations regarding the issuance of a Certificate for Tilbury Phase 2:

- Kwantlen First Nation: in an August 21, 2026, letter, stated it does not consent;
- Quw'utsun Nation (Cowichan Tribes, Halalt First Nation, Lyackson First Nation, Penelakut Tribe, and Stz'uminus First Nation): in a letter dated July 27, 2026, stated it does not consent; and,
- S'ÁUTW First Nation: in a letter dated July 27, 2026, stated it does not consent.

Tsawwassen First Nation, in a letter dated August 26, 2026, stated it withdrew its previous notice of non-consent and advised that it does not oppose issuance of the EA Certificate.

## 12.0 APPENDIX 1 THE ENVIRONMENTAL ASSESSMENT PROCESS

### 12.1 Early Engagement

The Early Engagement phase is the first phase of the provincial environmental assessment process and is an important preparatory stage during which meaningful conversations can begin about a proposed project Tilbury Phase 2 with FortisBC, Indigenous peoples, the public, local governments, provincial and federal government agencies, and other stakeholders to identify potential interests, issues and concerns early on in the process. The information gathered during the Early Engagement phase informs the development of the IPD and DPD and may also inform subsequent phases of the EA. IAAC and the EAO worked cooperatively in a coordinated process for the initial phase of the Project's review in accordance with the Cooperation Agreement, and in support of the principle of "one project, one assessment."

The Tilbury Phase 2 [Initial Project Description and Engagement Plan](#) was submitted by FortisBC to the EAO on February 11, 2020, under the Act. On March 5, 2020, B.C. requested to substitute the conduct of the federal impact assessment should a federal impact assessment be required under the IAA.

During the Early Engagement phase, IAAC and the EAO requested input from the public, potentially affected First Nation, Indigenous peoples, and technical advisors from provincial and federal government agencies, local governments, and health authorities to understand their preferred means of engagement and to gather their initial interests, concerns, questions, feedback, and knowledge regarding the Project. As part of the [public comment period](#), IAAC also invited comments from the public and Indigenous peoples, First Nation peoples on B.C.'s request that the conduct of the federal impact assessment be substituted to the province. Comments received in relation to the substitution request were considered by the federal Minister of Environment and Climate Change in making the substitution decision. To support engagement and feedback on the Initial Project Description, the EAO hosted two virtual open houses (in response to the COVID-19 emergency) and held virtual meetings and teleconferences with technical advisors and potentially affected Participating Indigenous Nations, First Nations) prior to and during the Early Engagement phase. IAAC posted a summary of the Initial Project Description in [English](#) and [French](#) to the *Canadian Impact Assessment Registry*.

Pursuant to Section 13(5) of the Act, the EAO and IAAC's [Joint Summary of Issues and Engagement](#) was provided to FortisBC on August 14, 2020, setting out a summary of comments received on the approved Initial Project Description, a description of the public comment period including a summary of what the EAO heard during the Early Engagement Phase from the public, a list of technical advisors, and a list of the First Nations who submitted notice under Section 14(1) of the Act to be Participating Indigenous Nations.

Following IAAC's [Guide to Preparing an Initial Project Description and a Detailed Project Description](#) and the EAO's [Early Engagement Guide](#), FortisBC provided a draft DPD including a response to the Joint Summary of Issues and Engagement, that met both federal and provincial requirements for the Project on September 7, 2021. This was reviewed by the EAO, IAAC, Participating Indigenous Nations, First Nations, local governments and provincial government agencies, and comments were provided to FortisBC. On January 4, 2022, FortisBC filed a final [Detailed Project Description](#) with the EAO which formally began the Readiness Decision Phase. On January 10, 2022, FortisBC submitted the final [Detailed Project Description](#) to IAAC so that IAAC could make a decision on whether or not an impact assessment is required for the Project. On January 20, 2022, IAAC accepted the DPD and response to Joint Summary of Issues and Engagement.

### 12.2 Readiness Decision

Under Section 16 of the Act, the CEAO determines whether a project should proceed to an EA that evaluates the effects of the project or should be referred to the Minister of Environment and Climate Change Strategy with a recommendation

that the Project be exempt from the requirement to obtain a Certificate, that the assessment be conducted by another assessment body (such as a review panel) or that it not proceed as proposed. This is referred to as the “Readiness Decision.” There are four options for this decision: a requirement to revise the DPD, the exemption of the project from the requirement to obtain a Certificate, the termination of the project, or the project can proceed to an environmental assessment.

The EAO sought advice from the technical advisors, including local governments, health authorities and provincial government agencies, on the sufficiency of the DPD and the recommendation of the EAO on the Readiness Decision. The EAO sought consensus on the recommendation for the Readiness Decision with the Participating Indigenous Nations. On January 12, 2022, the CEO determined that Tilbury Phase 2 could proceed to an environmental assessment. This decision was documented in the [Readiness Decision](#), including a report and reasons.

On January 10, 2022, IAAC decided that an impact assessment is required in accordance with Subsection 16(1) of IAA for Tilbury Phase 2 and posted the [Notice of Impact Assessment Decision with Reasons](#) to the Canadian Impact Assessment Registry.

On March 5, 2020, the EAO [requested](#) from IAAC that B.C. conduct a single environmental assessment for Tilbury Phase 2 that meets the legislative requirements of both B.C. and Canada.

On January 20, 2022, the former federal Minister of Environment and Climate Change [approved](#) EAO’s request for substitution. IAAC provided guidance and information directly to the EAO regarding the substituted process and federal requirements under the IAA.

### 12.3 Process Planning

The Readiness Decision to proceed to an environmental assessment initiated the legislated 120-day Process Planning phase of the environmental assessment for Tilbury Phase 2. During Process Planning, the EAO established a TAC (see [Section 4.1](#)), established a CAC (see [Section 4.2](#)) and developed the following documents that set the scope, procedures, methods, and timelines for the environmental assessment of Tilbury Phase 2:

- The Process Order, including the project scope, Assessment Plan and AIR; and,
- The Joint Permitting/Regulatory Coordination Plan.

During Process Planning, the EAO sought feedback on these draft process planning documents from Participating Indigenous Nations, the TAC, and the public through a 30-day [public comment period](#), which also included two virtual open houses. The EAO then collected all the feedback received on the draft process planning documents, sought consensus with Participating Indigenous Nations, and issued the [Process Order](#) on June 13, 2022, to FortisBC. The EAO also developed a [Summary of Engagement – Process Planning Phase](#) that was published on July 13, 2022, with more details.

The Process Order was [subsequently amended](#) by EAO on May 5, 2025, during the Application Development and Review phase. This included changes to the [Assessment Plan](#) to reflect changes to 19(4) Assessments conducted by Participating Indigenous Nations and consultation obligations.

### 12.4 Application Development and Review

During Application Development, FortisBC sought input from environmental assessment participants, including Indigenous peoples, to develop the Application with the intention to resolve issues early in the process. The TAC and Participating Indigenous Nations First Nations, and MNBC had the opportunity to review early information, including existing conditions reports, technical reports and modelling plans by FortisBC. The TAC and Participating Indigenous Nations had an opportunity to provide early comments to FortisBC regarding information that would be

included in the Application. The matters, or topics, to be assessed during the environmental assessment were determined by the EAO, in consultation with the TAC and the public, and with consensus with the Participating Indigenous Nations, through the AIR set out by the EAO for the Project.

FortisBC submitted the Application to the EAO on November 29, 2024. During Application Review, the EAO, IAAC, Participating Indigenous Nations, First Nations, MNBC, the TAC, and the CAC reviewed the [Application](#). Multiple rounds of review of the Application were completed, including additional technical memos from FortisBC. A 45-day [public comment period](#) was held from January 14, 2025, to March 3, 2025, that included one virtual and one in person open house. FortisBC submitted a [Public Engagement Report](#) on April 11, 2025.

Following the 180-day legislated time period for Application Review, on May 28, 2025, the EAO provided a [Notice Regarding Application Review](#), which included an overview of the key issues raised during Application Review and direction from the EAO to FortisBC regarding additional information or revisions to include in the Revised Application.

FortisBC then continued to work on the resolution of issues raised during Application Review with the TAC and Participating Indigenous Nations. On February 11, 2026, FortisBC submitted the Revised Application. The EAO reviewed the Revised Application, sought consensus with the Participating Indigenous Nations, and then [accepted the Revised Application](#) on March 27, 2026, for assessment.

## 12.5 Effects Assessment and Recommendation

Following the EAO's acceptance of the Revised Application the Effects Assessment phase began. During this phase, the EAO completed its assessment and developed a draft Assessment Report. This assessment considered the potential effects to all matters listed under [Section 25](#) of the Act, effects within federal jurisdiction set out in [Section 2](#) of the IAA and the factors set out in [Section 22\(1\)](#) of the IAA. The EAO also developed a proposed Certificate with conditions for the Ministers' consideration when deciding whether to issue a Certificate. The EAO coordinated with IAAC during this phase so that IAAC could develop draft potential federal conditions to be considered for the federal Decision Statement. All the EAO documents have considered the input received through engagement with Participating Indigenous Nations, First Nations, MNBC, the TAC, the public, and the CAC.

The EAO completed a detailed assessment of effects on the valued components, Indigenous interests, and other assessment matters, as described under [Section 25](#) of the Act. The matters, or topics, to be assessed had been determined by the EAO, in consultation with the TAC and the public, and through consensus seeking with the Participating Indigenous Nations, through the [Application Information Requirements](#) set out by the EAO for Tilbury Phase 2 during the Process Planning Phase. These assessments incorporated information submitted by FortisBC, advice from the TAC and CAC, local information and concerns raised by the public, and Indigenous knowledge and other information provided by the Participating Indigenous Nations, First Nations and Métis Nation British Columbia. The EAO also held a public comment period and virtual information session on the draft Assessment Report, proposed Certificate and draft potential federal conditions.

The EAO sought consensus with the Participating Indigenous Nations on this draft Assessment Report and the proposed Certificate with certificate conditions and project description. During the final public comment period, Participating Indigenous Nations also had the opportunity to provide notice of their consent or lack of consent to issuing the Certificate and reasons for that consent or lack of consent. The results of the consensus-seeking and provision of consent or lack of consent is described in [Section 11.1](#).

In keeping with the *Cooperation Agreement*, the EAO assessed Tilbury Phase 2 consistent with the requirements and associated conditions in the [Notice of Substitution Approval](#) under the IAA. Specifically, the EAO considered the effects within federal jurisdiction set out in [Section 2](#) of the IAA and the factors set out in [Section 22\(1\)](#) of the IAA, provided opportunities for the public to meaningfully participate in the environmental assessment, conducted consultation with

Indigenous peoples that may be affected by the Project and provided opportunities for IAAC to participate in consultation, and will provide an Assessment Report to the federal Minister of Environment and Climate Change that includes the findings and conclusions of the environmental assessment with respect to those factors.

## 12.6 Decision

For substituted assessments, both the provincial Ministers and federal Minister of Environment, Climate Change and Nature (or Governor in Council) retain the responsibility to make a decision on whether a project may proceed. The Tilbury Phase 2 Report, proposed Certificate, recommendations of the CEAO, and any notices of consent or lack of consent received from Participating Indigenous Nations will be referred to the Ministers for decision. The Ministers must consider these materials and any other public interest considerations and decide to issue (with conditions) or refuse a Certificate. The Ministers must then publish reasons for their decision. The EAO will provide the Tilbury Phase 2 Assessment Report to the federal Minister of Environment, Climate Change, and Nature that includes the findings and conclusion of the environmental assessment with respect to [Section 22\(1\)](#) factors, for their decision-making under the IAA. The federal Minister (or Governor in Council) will then consider the final Assessment Report in determining whether Tilbury Phase 2 is likely to cause significant adverse effects within federal jurisdiction, and the extent to which these effects are significant, after proposed mitigation measures are applied, and whether any significant adverse effects within federal jurisdiction are in the public interest. The federal Minister will then issue a Decision Statement under the IAA.

## 12.7 Post-Certificate

If a Certificate is issued, this phase will include all post-certificate activities for Tilbury Phase 2, including mitigation effectiveness reports, audits, certificate amendments, certificate extensions, and certificate transfers. IAAC will also work with FortisBC on the development and implementation of the federal conditions from the Decision Statement required for Tilbury Phase 2 (see [Appendix 2](#)).

The Compliance and Enforcement branch of the EAO conducts compliance inspections and, where required, uses enforcement to ensure that projects are compliant with the Certificate conditions. For more information on compliance and enforcement, see the [EAO's website](#).

## 13.0 APPENDIX 2 KEY MITIGATION MEASURES AND FOLLOW-UP PROGRAMS UNDER THE IAA

The Key Mitigation Measures and Follow-up Programs identified under the IAA and listed in Table 9 inform the development of potential federal conditions. Following the impact assessment, the federal Minister must make a determination under Section 60(1) of the IAA regarding the significance and justification of adverse effects within federal jurisdiction. If the Minister determines that the Project may proceed, the Minister will issue a Decision Statement, pursuant to Section 65(1) of the IAA, that includes legally binding conditions the proponent must comply with. These conditions are distinct from the Key Mitigation Measures and Follow-up Programs, which are not legally binding unless incorporated into the Decision Statement.

The substituted assessment process for Tilbury Phase 2 incorporated reliance on provincial mechanisms, such as conditions, permits, and authorizations, to address certain adverse effects within federal jurisdiction. The intent of this is to reduce duplicative conditions and streamline regulatory requirements for IAAC, the EAO, the proponent, and the parties that would be consulted. Subsection 64(1) of the IAA requires that the federal Minister establish any conditions that they consider appropriate in relation to the adverse federal effects within federal jurisdiction indicated in the Report. Paragraph 64(4)(a) of the IAA requires that the conditions established by the federal Minister include the implementation of mitigation measures, other than those the implementation of which the Minister is satisfied will be ensured by another jurisdiction. The EAO worked with IAAC and provincial permitting agencies during the Effects Assessment and Recommendation phase to identify and describe how provincial mechanisms can address adverse effects within federal jurisdiction, and identify which Key Mitigation Measures can be implemented through provincial mechanisms.

A full list of anticipated permits, authorizations, and regulatory requirements is outlined in the [Joint Permitting / Regulatory Coordination Plan](#), and the [Regulatory Coordination Issues Tracking Table](#). In Table 9, two primary pieces of provincial legislation are referenced as part of a suite of provincial regulatory instruments for the petroleum and natural gas sector:

- The [Energy Resource Activities Act](#) (ERAA) regulates energy resource activities in B.C., including facilities and/or natural gas processing plants, through permits, authorizations, orders and regulations. Regulations under ERAA outline technical standards and requirements that must be met throughout the lifecycle of LNG facilities and are supported by manuals published by the BC Energy Regulator (BCER). Applicable regulations include the [Liquefied Natural Gas Facility Regulation](#) (LNGFR) which provides requirements that must be met by LNG facilities as part of LNG Facility Permit, the primary permit required for LNG facilities. Additional information is provided in BCER's [Liquefied Natural Gas Facility Permit Application and Operations Manual](#), which provides a reference document for applicants that wish to construct and operate a LNG facility in B.C; and,
- The [Environmental Management Act](#) (EMA) is B.C.'s primary legislation for regulating pollution and managing waste to protect the environment and human health. The EMA sets requirements for pollution prevention and waste management. It defines what constitutes "waste" and "pollution" and focuses on the prevention, mitigation, or reduction of risk associated with waste discharges. Under EMA, Metro Vancouver has been delegated authority for managing air discharges within Metro Vancouver. Metro Vancouver exercises this authority through the Greater Vancouver Air Quality Management Bylaw NO. 1082, 2008 (as amended). This authority includes a permitting regime, air quality monitoring, and setting air quality emissions limits that must be at least as stringent as those set by the Ministry of Environment and Parks. Permits applications associated with liquid effluent from LNG facilities are adjudicated by BCER.

FortisBC intends to apply for new permits or amendments to the LNG Facility Permit for "FORTIS TILBURY 2 C-061-H/092-G-03 001" and Metro Vancouver Air Quality Permit GVA1215 to allow for the development and operation of Tilbury Phase 2. The EA Act specifies that no new permits, or permit amendments, may be granted prior to a decision on the EAC. The permitting processes include extensive technical review by experts, and new and revised permit conditions, should a permit be granted. Permitting processes, technical review, and condition development are subject to consultation and collaboration with Indigenous groups regarding the potential impacts on their interests and means to mitigate impacts to their rights.

For those Key Mitigation Measures in Table 9 below where a related mechanism was identified, the mechanism and how it addresses the adverse effects within federal jurisdiction has been described. The EAO considers provincial regulatory requirements on FortisBC to provide reasonable assurance that effects within federal jurisdiction will be addressed, as described below and within Schedule B Table of Conditions as part of Tilbury Phase 2's draft Environmental Assessment Certificate (EAC). In some instances, the EAO recommends that IAAC consider whether federal conditions may also be applied, in addition to provincial regulatory mechanisms, to ensure that effects within federal jurisdiction are addressed. The EAO's valued component (VC) or assessment factor for each Key Mitigation Measure has also been identified.

Section 13.1 below summarizes the comments received on the reliance of related mechanisms for Key Mitigation Measures and Follow-up Programs to address adverse effects within federal jurisdiction.

Table 9: Key Mitigation Measures and Follow-up Programs

| BC EAO VC                                                                                                                          | Key Mitigation Measure(s) or Follow-Up Program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Related Mechanisms and EAO Recommendations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                     | exhaust systems. Provincial standards are consistent with the National Safety Code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Air Quality              | Implement measures to reduce fugitive dust emissions within the Project area taking into account <i>Best Practices for the Reduction of Air Emissions from Construction and Demolition Activities (2005)</i> prepared for Environment and Climate Change Canada. As part of these measures: apply water, or any alternative dust suppressant on Project roads and other areas that may generate dust when dust generation is expected or occurring. | The EAO has proposed EAC Condition 12.7(h): Construction Environmental Management Plan, which includes these key mitigation measures by requiring the Holder to implement dust management measures while taking into account Best Practices for the Reduction of Air Emissions from Construction and Demolition Activities (2005) prepared for Environment and Climate Change Canada.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Air Quality              | Minimize the quantity of vented and flared gas and the duration of venting or flaring events to the minimum required for emergency or maintenance purposes.                                                                                                                                                                                                                                                                                         | <p>The LNGFR and LNG facility permits restrict and regulate flaring and venting.</p> <p>The applicant of an LNG facility permit must submit a summary of the flaring, incinerating, venting and relief system design basis and philosophy. The summary should provide sufficient information for BCER to understand the guidelines to be followed, the alternatives considered to minimize flaring, incinerating, and venting, and the design elements required to meet measurement and reporting requirements.</p> <p>Under Section 18, an LNG facility permit holder must not flare gas from the LNG facility unless flaring is required for emergency purposes except for maintenance or if permission is granted in the LNG facility permit. The holder must also ensure that the duration of flaring and the quantity of gas that is flared is minimized. A permit holder must notify BCER of gas flaring events and report monthly flaring volumes. Under Section 17, the holder must not vent gas unless the gas heating value, volume or flow rate is insufficient to support stable conditions and other conditions apply.</p> <p>BCER consults with First Nations and may include additional conditions in the LNG facility permits related to flaring, such as notifications, or design/operations measures implemented to reduce flaring.</p> <p>The EAO has proposed EAC Condition 14.4(e): Air Quality Management Plan in relation to reporting and adaptive management provisions for minimizing the use of the flare.</p> |
| Acoustic and Air Quality | Develop and implement measures to mitigate adverse effects within federal jurisdiction from the Project on human health as a result of changes to the acoustic environment, and air quality. As part of these measures: enclose all compressors in sealed structures during operation to reduce noise and air emissions.                                                                                                                            | <p>Subsections 4 (1) (c) and (e) of the LNGFR require that the engineering design and siting for the LNG facility take into consideration the effects of noise and light associated with the normal operation of the LNG facility. Permit holders should ensure that mitigation measures are built into the design and operating procedures using the <a href="#">BC Noise Control Guidelines</a> which outlines study requirements and expected best practices, including for Low Frequency Noise.</p> <p>Under Section 15 of the LNGFR, the permit holder must ensure that construction and normal operations of the LNG facility do not cause excessive noise or emanation of light on human and wildlife receptors.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

In addition, for incidents that involve the release of a reportable volume / product, as defined under the <a href="#">Spill Reporting Regulation</a> (a regulation under EMA), a Dangerous Goods Incident Report must be obtained from the Ministry of Emergency Management and Climate Readiness.</p> <p>The LNGFR requires safety and risk assessment studies to be carried out at appropriate stages of the Project. These studies should follow a process of hazard identification, risk assessment, mitigation and monitoring. The BCER's approach to decisions regarding the management of risk to the public, environment, and facility is to require the design, construction and operation of the LNG facility to be conducted in a manner that results in a facility's risks to be as low as reasonably practicable.</p> |
| Malfunctions and Accidents | <p>In the event of an accident or malfunction with the potential to cause adverse federal effects, including fires, emergency flaring, and the release of LNG and other substances, submit a report to IAAC within 60 days, describing:</p> <ul style="list-style-type: none"> <li>the accident or malfunction and its adverse federal effects, including effects on Indigenous groups;</li> <li>the measures taken to mitigate the adverse federal effects;</li> <li>the views of Indigenous groups and advice from relevant authorities received with respect to the accident or malfunction, its adverse federal effects, and the measures taken by the Proponent to mitigate those effects;</li> <li>any residual adverse federal effects;</li> <li>any modified or additional mitigation or monitoring measures; and,</li> <li>the steps taken to prevent recurrence.</li> </ul> | <p>The EAO recommends that IAAC consider if federal conditions should be required to ensure that IAAC is notified in the event of an accident or malfunction with the potential to cause adverse federal effects.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Malfunctions and Accidents | <p>Develop, in consultation with Indigenous groups and relevant authorities, and implement and maintain, an accidents and malfunctions response plan in relation to each phase of the Project. The accidents and malfunctions response plan must include:</p> <ul style="list-style-type: none"> <li>a description of the types of accidents and malfunctions that may cause adverse federal effects during any phase of the Project, including fires and the release of LNG and other substances;</li> </ul>                                                                                                                                                                                                                                                                                                                                                                         | <p>Under the <a href="#">Emergency Management Regulation</a> when an emergency occurs, the permit holder must notify Indigenous nations as soon as possible, after the permit holder has taken any immediate actions necessary for public safety, or to minimize immediate environmental impacts.</p> <p>Prior to the submission of an Emergency Response Plan, the permit holder must provide information to local Indigenous nations that includes a description of site-specific hazards and risks of the energy resource activity, how emergency response may impact the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| BC EAO VC                  | Key Mitigation Measure(s) or Follow-Up Program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Related Mechanisms and EAO Recommendations                                                                                                                                                                                                                                                                                                                                                         |

If the permit holder receives a response when providing information, it must consider the response as part of the preparation of the plan.</p> |
| Malfunctions and Accidents | <p>In the event of an accident or malfunction with the potential to cause adverse federal effects, including fires and the release of LNG and other substances:</p> <ul style="list-style-type: none"> <li>notify Indigenous groups as soon as feasible, and no later than 24 hours after the accident or malfunction, and notify IAAC within 24 hours, of: <ul style="list-style-type: none"> <li>the date, time, and location of the accident or malfunction;</li> <li>a summary of the accident or malfunction;</li> <li>any substance and quantities potentially released into the environment as a result of the accident or malfunction; and,</li> <li>the relevant authorities notified and involved in the response.</li> </ul> </li> </ul>                                        | <p>To complement the reporting to First Nations requirement under the <i>Emergency Management Regulation</i> as part of proposed Conditions 12 and 13: Construction and Operations Environmental Management Plans, the Holder would be required develop and implement an emergency communications protocol with First Nations.</p>                                                                 |
| Malfunctions and Accidents | <p>Develop, in consultation with Indigenous groups, an Indigenous communication plan for accidents and malfunctions in relation to the Project and implement and maintain it during all phases of the Project. The plan must include:</p> <ul style="list-style-type: none"> <li>the geographic areas of possible accidents and malfunctions where Indigenous groups would like to receive notifications;</li> <li>the types and thresholds of accidents and malfunctions that would trigger notification of Indigenous groups;</li> <li>the information to be included in notifications to support community preparedness and response; and,</li> <li>the method and frequency of notifications, including opportunities for Indigenous group involvement in response efforts.</li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                    |

### 13.1 Comments Raised on Related Mechanisms for Key Mitigation Measures

Tsleil-Waututh Nation, Quw'utsun Nation, xʷməθkʷəy̓əm (Musqueam Indian Band), and kʷikʷəḷəm First Nation expressed their disagreement with reliance on provincial mechanisms for addressing effects within federal jurisdiction, identifying it as a deference to the province, including impacts on the health, social, and economic conditions of Indigenous peoples, and effects on Indigenous peoples' physical and cultural heritage. They expressed their views that the key mitigation measures are not consistently secured through enforceable, legally binding measures in the decision materials, and recommend clearer requirements and stronger provisions. Lummi Nation, which identifies as a self-governing nation in the U.S. and asserts section 35 rights in Canada, expressed similar concerns, noting the need to detail Indigenous consultation for every potential federal condition, including with Lummi Nation.

Tsleil-Waututh Nation, Quw'utsun Nation, k'wík'wəłəm First Nation, x'wəθk'əyəm (Musqueam Indian Band), Kwantlen First Nation, as well as SṪÁUTW First Nation expressed concerns about the reliance on EAO's proposed conditions requiring future management plans and adaptive management to address potential effects in federal jurisdiction. They raised that the conditions cannot effectively avoid or mitigate the project's impacts, including potential impacts on their rights and interests, and particularly within the context of high cumulative effects in the area.

x'wəθk'əyəm (Musqueam Indian Band) raised concerns with the reliance on provincial mechanisms and environmental management plans to address potential effects of the Project to fish, fish habitat, and Indigenous fishing rights under the *Fisheries Act* and its regulations which are matters within federal jurisdiction. The EAO and IAAC facilitated discussions on the conclusions to fish and fish habitat, the provincial mechanisms to address potential project effects, and compliance and enforcement by Environment and Climate Change Canada under the pollution prevent provisions of the *Fisheries Act* in the event of any deleterious substances affecting water quality.

The EAO and IAAC acknowledge these concerns and recognize the importance of ensuring that key mitigation measures relied upon in the assessment are clearly reflected in the regulatory and conditions framework. In response to these concerns, the EAO and IAAC have reviewed the relationship between the assessment conclusions, proposed provincial conditions, and key mitigation measures to provide additional clarity or refinement where warranted.

The EAO and IAAC acknowledge the concerns that residual effects conclusions rely, in part, on future management plans that are not drafted at the time of decision, permitting processes, adaptive management measures, and regulatory frameworks. The provincial environmental assessment framework considers proposed conditions, mitigation measures, management plans, monitoring requirements, adaptive management provisions, and applicable regulatory requirements as part of the overall mitigation package supporting residual effects conclusions. When documents (e.g. management plans, monitoring programs, etc.) are submitted to the EAO they are then reviewed against conditions in certificates, to ensure that the intent and requirements of the conditions are fulfilled. Prior to documents submission to the EAO, a certificate Holder must consult with First Nations, technical advisors, and local government as outlined in a certificate condition and submit consultation logs to the EAO. Requirements in documents are inspected against the certificate conditions, and non-compliance can lead enforcement actions. The EAO also relies on the expertise and statutory mandates of other regulatory authorities responsible for detailed technical review, permitting, compliance, and enforcement. The EAO and IAAC are satisfied that these mechanisms provide sufficient certainty regarding the implementation and enforceability of the mitigation measures relied upon in the assessment.

IAAC employs a similar framework to propose key mitigation measures, in addition to permitting and/or monitoring requirements from other federal authorities. Under the IAA, the federal Minister may rely on another jurisdiction's mechanisms to address effects within federal jurisdiction, which includes EAO's proposed conditions, management plans, monitoring requirements, adaptive management provisions, and applicable regulatory requirements. Paragraph 64(4)(a) of the IAA requires that the federal Minister establish any conditions they consider appropriate in relation to the adverse effects within federal jurisdiction that are indicated in this Report, other than those the implementation of which the Minister is satisfied will be ensured by another jurisdiction. In considering whether reliance on another jurisdiction's mechanisms is appropriate, IAAC assessed the proposed provincial conditions, associated management plans, compliance and enforcement mechanisms, and applicable regulatory requirements, and is satisfied that the implementation of the relevant mitigation measures will be ensured by the Province through these mechanisms.

## 14.0 APPENDIX 3 RESIDUAL EFFECTS CHARACTERIZATION DEFINITIONS

Residual effects are usually described using standard criteria: context, magnitude, extent, duration, reversibility and frequency. These criteria, as well as likelihood, are summarized in the following tables for characterizing effects to Value Components; Table 10, and First Nation Interest and Rights; Table 11.

Table 10: Valued Component Residual Effects Characterization Definitions

| Criteria  | General Description                                                                                                                                                                                                                                                                                                                                                                                     | Assessment Definitions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Context   | Consideration of context draws heavily on the description of existing conditions (the environmental, economic, social, cultural and/or health setting) of the valued component, which reflect cumulative effects of other projects, and activities that have been carried out, and especially information about the effect of natural and human-caused trends in the condition of the valued component. | <p><b>Low:</b> the receiving environment or population has low resilience to imposed stresses and will not easily adapt to the potential residual effect.</p> <p><b>Moderate:</b> the receiving environment or population has a moderate resilience to imposed stresses and may be able to respond and adapt to the potential residual effect.</p> <p><b>High:</b> the receiving environment or population has high natural resilience to imposed stresses and can respond and adapt to the potential residual effect.</p>                                                        |
| Magnitude | Magnitude refers to the expected size or severity of the residual effect. When evaluating magnitude of residual effects, consider the proportion of the Valued component affected within the spatial boundaries and the relative effect (e.g., relative to natural annual variation in the magnitude of the valued component or other relevant characteristic).                                         | <p><b>Negligible:</b> no detectable change from existing conditions.</p> <p><b>Low:</b> the potential residual effect will slightly alter or change the valued component without changing its role or function.</p> <p><b>Medium:</b> the potential residual effect will alter or change the nature, role, or function of a valued component but will not affect its integrity.</p> <p><b>High:</b> the potential residual effect will substantially alter or change the nature, role, or function of a valued component and may jeopardize the valued component's integrity.</p> |
| Extent    | The spatial scale over which the residual effect is expected to occur.                                                                                                                                                                                                                                                                                                                                  | <p><b>Limited:</b> the potential residual effect is restricted to the project footprint.</p> <p><b>Local:</b> the residual effect will be within the local assessment area.</p> <p><b>Regional:</b> the potential residual effect will be within the Regional Assessment Area (RAA).</p> <p><b>Beyond Regional:</b> the potential residual effect will be beyond the RAA.</p>                                                                                                                                                                                                     |

| Criteria                           | General Description                                                                                                                                                                                                                                                                          | Assessment Definitions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Duration                           | The period during which the potential effect persists and acts upon the valued component. This may be longer than the duration of the physical work or activity that produced the potential residual effect.                                                                                 | <p><b>Short-term:</b> the anticipated potential residual effect will be felt temporarily during Construction or Decommissioning phase only. It also applies to any effect that will occur for less than two years in Operation.</p> <p><b>Medium-term:</b> the anticipated potential residual effect will be felt for a limited period of time greater than two years, generally corresponding to the Operation and Decommissioning phase.</p> <p><b>Long-term:</b> the anticipated potential residual effect will be felt beyond decommissioning.</p> |
| Reversibility                      | Whether or not the residual effect on the valued component can be reversed once the physical work or the activity causing the effects stop or mitigation measures take effect to eliminate the effect.                                                                                       | <p><b>Fully reversible:</b> may fully recover and return to its pre-project state.</p> <p><b>Partially reversible:</b> may partially recover from project effects.</p> <p><b>Irreversible:</b> will not recover and return to its pre-project state.</p>                                                                                                                                                                                                                                                                                               |
| Frequency                          | How often or how many times the anticipated residual effect may occur.                                                                                                                                                                                                                       | <p><b>Once:</b> the effect is confined to one discrete event.</p> <p><b>Regular:</b> the effect occurs at consistent intervals.</p> <p><b>Irregular:</b> the effect occurs at sporadic intervals.</p> <p><b>Continuous:</b> effects occur constantly.</p>                                                                                                                                                                                                                                                                                              |
| Affected Populations               | A subset of the population being affected disproportionately by certain valued components. Examples of affected populations could include different groups within the Indigenous nation who may experience the effects in a different way, such as youth, Elders, or women.                  | <p><b>Even:</b> the potential effect is experienced by any or all sub-populations.</p> <p><b>Disproportionate:</b> the potential effect is experienced only by certain populations or experienced more acutely by certain sub-populations.</p>                                                                                                                                                                                                                                                                                                         |
| Risk (likelihood and consequences) | The likelihood (probability) of an event (incident) occurring and its consequences. Likelihood is whether a residual effect is likely to occur. It may be influenced by a variety of factors, such as the likelihood of a causal disturbance occurring or the likelihood of mitigation being | <p><b><u>Likelihood</u></b></p> <p><b>Low:</b> less than 40 percent chance of effect occurring</p> <p><b>Medium:</b> 40 to 80 percent chance of effect occurring</p> <p><b>High:</b> more than 80 percent chance of effect occurring</p> <p><b><u>Consequence</u></b></p> <p>Can be assessed as minor, moderate or major based on the combination of magnitude and extent.</p>                                                                                                                                                                         |

| Criteria    | General Description                                                                                                                                                                                                                                                                                                         | Assessment Definitions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |          |       |              |  |  |       |          |       |            |      |      |          |     |        |      |          |     |     |          |     |     |

|             | successful. The consequences are the residual effect, positive or negative. The magnitude and extent of the residual effect provides information on the consequence, which in conjunction with likelihood, informs the understanding of risk.                                                                               | <p><b>Risk</b> is consequence multiplied by likelihood.</p> <table><tr><th colspan="2" rowspan="2">Risk</th><th colspan="3">Consequences</th></tr><tr><th>Major</th><th>Moderate</th><th>Minor</th></tr><tr><th rowspan="3">Likelihood</th><th>High</th><td>High</td><td>Moderate</td><td>Low</td></tr><tr><th>Medium</th><td>High</td><td>Moderate</td><td>Low</td></tr><tr><th>Low</th><td>Moderate</td><td>Low</td><td>Low</td></tr></table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Risk     |       | Consequences |  |  | Major | Moderate | Minor | Likelihood | High | High | Moderate | Low | Medium | High | Moderate | Low | Low | Moderate | Low | Low |

| Uncertainty | The natural variation in complex biophysical environments or the statistical variation in data sets and models that arises from the imperfection of unknown information. Where uncertainty is unable to be reduced, how it affects valued components needs to be described so that it can be considered in decision making. | <p><b>Low:</b> there is a good understanding of the cause-effect relationship between the project and the valued component, and sufficient data are available to support the assessment. The effectiveness of the selected mitigation measures is moderate to high. There is a low degree of uncertainty associated with data inputs and/or modelling techniques, and variation from the predicted effect is expected to be low.</p> <p><b>Moderate:</b> the cause-effect relationships between the project and a valued component are not fully understood (e.g., several unknown external variables or data for the project area are incomplete). The effectiveness of mitigation measures may be moderate or high. Modelling predictions are relatively confident.</p> <p><b>High:</b> the cause-effect relationships between the project and a valued component are poorly understood. There may be several unknown external variables and/or data for the project area that are incomplete. The effectiveness of the mitigation measures may not yet be proven. Modelling results may vary considerably given the data inputs. There is a high degree of uncertainty in the conclusions of the assessment.</p> <p>To consider when determining confidence: the reliability of data inputs and analytical methods used to predict project effects, the confidence regarding the effectiveness of mitigation measures, and the certainty of the predicted outcome.</p> |          |       |              |  |  |       |          |       |            |      |      |          |     |        |      |          |     |     |          |     |     |
| Importance  | Have any issues been identified as an interest/priority by potentially affected First Nations, local governments, provincial and federal government agencies, or stakeholders.                                                                                                                                              | <p><b>Low:</b> previously identified by some individuals, but not by First Nations, community members, or government agencies.</p> <p><b>Moderate:</b> previously identified as an interest by First Nations, community members, the public, local governments, and/or provincial and federal government agencies, but not stated as a top interest.</p> <p><b>High:</b> identified repeatedly as a top interest by First Nations, community members, the public, local governments, and/or provincial or federal government agencies.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |          |       |              |  |  |       |          |       |            |      |      |          |     |        |      |          |     |     |          |     |     |

Table 11: Residual Effects Characterization Definitions for Effects on Indigenous Interests

| Characterization | General Description                                                                                                                                                                                               | Indigenous Interest Assessments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Context</b>   | How sensitive or resilient the Indigenous Interest is to the potential residual effect caused by the Project.                                                                                                     | <p><b>Low resilience:</b> the Indigenous Interest has low resilience to imposed stresses and will not easily adapt to the potential residual effect</p> <p><b>Medium resilience:</b> the Indigenous Interest has a neutral resilience to imposed stresses and may be able to respond and adapt to the potential residual effect</p> <p><b>High resilience:</b> the Indigenous Interest has high resilience to imposed stresses and can respond and adapt to the potential residual effect</p>                                                                                                                                                       |
| <b>Magnitude</b> | The intensity or severity of the anticipated change. Considers the amount the Indigenous Interest is affected (e.g., relative to natural annual variation in the magnitude of change to the Indigenous Interest). | <p><b>Negligible:</b> no detectable change from existing conditions</p> <p><b>Low:</b> the potential residual effect will slightly alter or change existing conditions but is within historic norms and within the system's capacity to respond</p> <p><b>Medium:</b> the potential residual effect will alter or change the nature, role, or function of existing conditions but is within historic norms and within the system's capacity to respond</p> <p><b>High:</b> the potential residual effect will substantially alter or change the nature, role, or function of existing conditions and is beyond the system's capacity to respond</p> |
| <b>Extent</b>    | The spatial scale over which the residual effect is expected to occur.                                                                                                                                            | <p><b>Site-specific</b> – the potential residual effect is restricted to the project area</p> <p><b>Local</b> – the residual effect will be within the local assessment area</p> <p><b>Regional:</b> the potential residual effect will be within the RAA</p> <p><b>Beyond Regional:</b> the potential residual effect will be beyond the RAA</p>                                                                                                                                                                                                                                                                                                   |
| <b>Duration</b>  | The period during which the potential effect persists and acts upon the Indigenous Interest. This may be longer than the duration of the physical work or activity that                                           | <p><b>Short-term:</b> the anticipated potential residual effect will be felt temporarily during the Construction or Decommissioning phases only. It also applies to any effect that will occur for less than two years in Operation</p> <p><b>Medium-term:</b> the anticipated potential residual effect will be felt for a limited period of time greater than two years, generally corresponding to Operation and Decommissioning</p> <p><b>Long-term:</b> the anticipated potential residual effect will be felt beyond Decommissioning</p>                                                                                                      |

Extent of significance for adverse effects within federal jurisdiction is defined in [Appendix 15](#).

| Characterization                   |        | General Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Indigenous Interest Assessments                                                                                                                                                                                                                                                                                                                                                               |       |  |      |  |              |  |  |       |          |       |            |      |      |          |     |        |      |          |     |     |          |     |     |
|------------------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|--|------|--|--------------|--|--|-------|----------|-------|------------|------|------|----------|-----|--------|------|----------|-----|-----|----------|-----|-----|
|                                    |        | produced the potential residual effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                               |       |  |      |  |              |  |  |       |          |       |            |      |      |          |     |        |      |          |     |     |          |     |     |
| Frequency                          |        | How often or how many times the anticipated residual effect may occur.                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Single/Rare:</b> the residual effect is confined to one discrete event or rarely occurs<br><b>Frequent/Regular:</b> the residual effect occurs at consistent intervals<br><b>Irregular:</b> the residual effect occurs at sporadic intervals<br><b>Continuous:</b> the residual effect occurs constantly                                                                                   |       |  |      |  |              |  |  |       |          |       |            |      |      |          |     |        |      |          |     |     |          |     |     |
| Reversibility                      |        | Whether or not the residual effect on the Indigenous Interest can be reversed once the physical work or the activity causing the effects stop or mitigation measures take effect to eliminate the effect.                                                                                                                                                                                                                                                                                   | <b>Fully Reversible:</b> the residual effect is fully reversible<br><b>Partially Reversible:</b> the residual effect is partially reversible<br><b>Irreversible:</b> the residual effect is irreversible                                                                                                                                                                                      |       |  |      |  |              |  |  |       |          |       |            |      |      |          |     |        |      |          |     |     |          |     |     |
| Affected Populations               |        | The distribution of the effect amongst the population of affected First Nations.                                                                                                                                                                                                                                                                                                                                                                                                            | <b>Even:</b> the potential effect is experienced by any or all sub-populations<br><b>Disproportionate:</b> the potential effect is experienced only by certain populations or experienced more acutely by certain sub-populations                                                                                                                                                             |       |  |      |  |              |  |  |       |          |       |            |      |      |          |     |        |      |          |     |     |          |     |     |
| Risk (likelihood and consequences) |        | The likelihood (probability) of an event (incident) occurring and its consequences. Likelihood is whether a residual effect is likely to occur. It may be influenced by a variety of factors, such as the likelihood of a causal disturbance occurring or the likelihood of mitigation being successful. The consequences are the residual effect, positive or negative. The magnitude and extent of the residual effect provides information on the consequence, which in conjunction with | <u>Likelihood</u><br><b>Low:</b> less than 40 percent chance of effect occurring<br><b>Medium:</b> 40 to 80 percent chance of effect occurring<br><b>High:</b> more than 80 percent chance of effect occurring<br><u>Consequence</u><br>Can be assessed as minor, moderate or major based on the combination of magnitude and extent.<br><b>Risk</b> is consequence multiplied by likelihood. |       |  |      |  |              |  |  |       |          |       |            |      |      |          |     |        |      |          |     |     |          |     |     |

## 15.0 APPENDIX 4 LIST OF PARTIES ON THE TECHNICAL ADVISORY COMMITTEE

### PROVINCIAL GOVERNMENT, INCLUDING HEALTH AUTHORITIES

- BC Energy Regulator;
- Fraser Health Authority;
- Ministry of Agriculture and Food;
- Ministry of Energy and Climate Solutions;
- Ministry of Forests;
- Ministry of Housing and Municipal Affairs;
- Ministry of Indigenous Relations and Reconciliation;
- Ministry of Jobs and Economic Growth;
- Ministry of Post-Secondary Education and Future Skills;
- Ministry of Transportation and Transit;
- Ministry of Water, Land and Resource Stewardship; and,
- Vancouver Coastal Health Authority.

### FEDERAL GOVERNMENT

- Crown Indigenous Relations and Northern Affairs Canada;
- Employment and Social Development Canada;
- Environmental and Climate Change Canada;
- Fisheries and Ocean Canada;
- Health Canada;
- Indigenous Services Canada;
- Innovation, Science and Economic Development Canada;
- Natural Resources Canada;
- Transport Canada;
- Women and Gender Equality Canada; and,
- Public Safety Canada.

### LOCAL GOVERNMENTS AND PORT AUTHORITIES

- City of Delta;
- City of Richmond;
- City of Vancouver;
- Metro Vancouver; and,
- Vancouver Fraser Port Authority.

**FIRST NATIONS**

- Chawathil First Nation;
- Cheam First Nation;
- Katzie First Nation;
- Kwantlen First Nation;
- kʷikʷə́ləm (Kwkwetlem) First Nation;
- xʷməθkʷəyəm (Musqueam Indian Band);
- Quw'utsun Nation representing: Cowichan Tribes, Halalt First Nation, Lyackson First Nation, Penelakut Tribe and Stz'uminus First Nation;
- Semiahmoo First Nation;
- S'ólh Téméxw Stewardship Alliance representing: Aitchelitz First Nation, Kwaw-kwaw-Apilt First Nation, Seabird Island Band, Semá:th (Sumas) First Nation, Shxwhá:y Village, Shxw'ōwhámél First Nation, Skowkale First Nation, Skwah First Nation, Soowahlie First Nation, Sq'éwá:lxw (Skawahlook) First Nation, Sq'éwlets (Scowlitz) First Nation, Squiala First Nation, Tzeachten First Nation, Yakweakwioose First Nation, and Yale First Nation;
- Snuneymuxw First Nation;
- SṪÁUTW (Tsawout) First Nation;
- Tsawwassen First Nation;
- Tsleil-Waututh Nation; and,
- Ts'uubaa-asatx.

**WASHINGTON STATE<sup>7</sup>**

- Washington State Department of Ecology

---

<sup>7</sup> The Washington State Department of Ecology is invited to be part of the TAC consistent with the Memorandum of Understanding between the Washington State Department of Ecology and the EAO.

## 16.0 APPENDIX 5 DETAILED INDIGENOUS NATION ASSESSMENTS

### 16.1 Chawathil First Nation

#### 16.1.1 Community Profile

Chawathil First Nation (Chowéthel or Chawathil) is a Stó:lō First Nation and a signatory member of the STSA, a collective of 17 Stó:lō First Nations that work together to guide land and resource decision-making in S'ólh Téméxw. Chawathil's main community resides on the Chawathil 4 Reserve on the north side of the Fraser River, approximately 11 km west of Hope, B.C., with additional members living on Schkam 2 (3.6 km north of Hope) and in other areas across their traditional territory. As of April 2023, the Nation had 657 registered members, with 45.7% living on their own reserve, 12.8% on other reserves, and 41.6% off reserve; census data recorded 244 residents on Chawathil 4 and Schkam 2 in 2021, reflecting only the population physically living on those reserve parcels.

Chawathil's core interest area, including its inherent asserted Aboriginal title lands, is centered in and around present-day Hope and encompasses the Fraser River upstream and downstream of the community and the surrounding mountain ranges. As Stó:lō Peoples, Chawathil members also use the broader S'ólh Téméxw, the Stó:lō traditional territory, for hunting, fishing, gathering, and spiritual and ceremonial practices. This territory spans the Fraser Valley from the Hope area to the Pacific Ocean.

#### 16.1.2 Chawathil First Nation Involvement in the Environmental Assessment

During the Early Engagement phase, Chawathil confirmed its intent to be involved as a participating Indigenous nation. The nation informed the EAO that Tilbury Phase 2 is within S'ólh Téméxw, where Chawathil holds title and governance responsibilities, and raised concerns about impacts on stewardship, culture, fisheries, health, land rights, and socio-economic conditions. Early meetings focused on meaningful involvement, capacity funding, clarifying interests, identifying information needs for the DPD, and establishing consultation and decision-making expectations for the EA process.

During the Readiness Decision phase, in the development of the [Readiness Decision Report](#), Chawathil did not provide additional comments beyond those submitted during Early Engagement, where they emphasized concerns about Tilbury Phase 2's potential effects on their fishing rights and priority salmon species.

During the Process Planning phase, the EAO continued engagement with Chawathil to further understand these interests in relation to Tilbury Phase 2. Chawathil met with the EAO and the IAAC to express concerns about Tilbury Phase 2. They highlighted potential effects on salmon and other migratory fish, cumulative industrial pressures from the lower Fraser River to Hope, and impacts on harvesting, cultural practices, and access to traditional plants and medicines.

Participation funding was committed by the EAO and Impact Assessment Agency of Canada. The Proponent has engaged with Chawathil since 2020, and provided capacity funding for that engagement, as summarized in Table 11.16-6 of the Revised Application.

The EAO used the following sources in drafting the assessment of Tilbury Phase 2 effects on the Chawathil:

- FortisBC's (Proponent) Revised Application;
- Information submitted during the EA by the Proponent and Chawathil;
- Conclusions from the EAO's assessment of VCs; and
- [Section 11.02](#) of the Revised Application, along with the Proponent's [Indigenous Engagement Report](#), that provides a summary of the Proponent's engagement with Chawathil.

### 16.1.3 Assessment Boundaries

All Tilbury Phase 2 components are within Chawathil's traditional territory.

The spatial assessment boundaries for each Indigenous interest were based on the overlap between Chawathil traditional territory with the combined Local and Regional Assessment Areas (RAAs) identified for linked VCs. Refer to Figure 11-2-1 in Section 11 of the Revised Application (Indigenous Interests and Tilbury Phase 2 Location Figure). The LAA for each Indigenous interest reflects the combined LAAs of the VCs linked to that interest. The RAA is defined the same way, using the combined RAAs of the linked VCs. In general, the LAA is used to assess direct and indirect Tilbury Phase 2 effects, while the RAA supports the assessment of cumulative effects.

The assessment of potential effects related to Tilbury Phase 2 considered three distinct phases:

- Construction phase, with an estimated duration of three to six years;
- Operation phase, expected to last more than forty years; and
- Decommissioning phase, anticipated to take approximately two years.

### 16.1.4 Regional Context

Chawathil's core interest area centres on the Fraser River and surrounding mountain ranges near present-day Hope, with the main settlement located at Chawathil 4 Reserve approximately 11 km west of Hope and roughly 140 km upstream of Tilbury Phase 2. As river people, Chawathil's cultural and subsistence practices, fishing, hunting, plant gathering, travel, and ceremony, are inseparable from the Fraser River, which functions as an ecological and cultural corridor linking their community to the estuary and to other Stó:lō Nations throughout the watershed.

Although Tilbury Phase 2 is located far downstream on Tilbury Island, the Project area lies within S'ólh Téméxw and along the migration pathway of salmon and other culturally important species that travel from the Pacific Ocean past the Project site and upstream to Chawathil territory. The nation's regional context is further shaped by longstanding kinship networks among Coast Salish peoples across the Lower Mainland, Vancouver Island, Washington State, and Oregon, as well as by their participation in regional Stó:lō governance structures such as the Stó:lō Tribal Council.

As per the Revised Application and based on the information available during the time of writing the EAO's Report, it is the EAO's understanding that Chawathil members do not currently use the south arm of the lower Fraser River or the industrial lands adjacent to Tilbury Phase 2 to fish, hunt, gather plants, or access cultural sites or areas.

The existing Tilbury LNG facility consists of gravel and paved areas, existing infrastructure, and equipment laydown areas supporting little plant life with very little to no habitat value for wildlife. The vegetation within Tilbury Phase 2 is mostly limited to ditch lines and spoil piles and is dominated by non-native and invasive plant species. Public access to Tilbury Phase 2 is limited, although there is currently public use of the dike to the north of Tilbury Phase 2 along the Fraser River.

### 16.1.5 Indigenous Interests

The EAO engaged Chawathil during the Early Engagement phase in the development of the [Joint Summary of Issue and Engagement for the Tilbury Phase 2 LNG Expansion Project](#). The EAO summarized an initial understanding of Chawathil's interests to be:

- Impacts to governance and self-determination rights in the Project area;
- Impacts to rights to implement Indigenous laws, customs and protocols;
- Impacts to stewardship rights and responsibilities, including ongoing conservation efforts targeted at restoring important fish species and habitat;
- Impact to the lands and resources, and rights to clean air, waters and lands;

- Impacts to rights to determine and develop strategies for the development or use of our territory, and the water, lands and resources therein;
- Impacts to rights to fish for food, ceremonial, social and trade purposes, gathering rights and traditional medicine including the conservation of medicinal plants, animals and minerals;
- Impacts to cultural and spiritual rights, including protection and access areas of cultural and spiritual importance;
- Impacts to rights to revitalize, develop and transmit to future generations histories, oral traditions and place names relating to the Project area;
- Impacts to economic development and socio-economic rights and ability to improve current conditions; and,
- Impacts to passing on traditional knowledge to future generations.

During the Readiness Decision phase in the development of the [Readiness Decision Report](#), EAO engaged with Chawathil. It was also indicated that salmon are a priority species for Chawathil, who are currently working on restoration projects for salmon spawning habitat to bring salmon back to their community. This information was used in drafting the [Tilbury Phase 2- Schedule C – Application Information Requirements](#); see Proposed Preliminary List of Indigenous Interests (Table 6).

The Proponent has identified Chawathil's Indigenous interests to be assessed in the Revised Application through:

- Reviewing requirements and guidance from the EAO, including the AIR; and
- Conducting engagement efforts with Chawathil to gather information on their Indigenous interests, as outlined in Section 11.2.3 Summary of Engagement of the Chawathil section in the of the Revised Application.

The EAO attempted to engage with Chawathil during the development of this Report. As no comments were received on their section, the EAO relied on the preliminary list of Indigenous interests identified in the AIR, which include:

- Harvesting and subsistence activities;
- Cultural use sites and areas;
- Social and economic conditions;
- Indigenous health and well-being;
- Cultural continuation; and
- Indigenous governance systems.

The assessment of Chawathil's Indigenous interests in this section uses these categories. The EAO's assessment includes describing the Indigenous interest, the current context, potential effects, applicable mitigation, and the resulting effects analysis. If there is an adverse residual effect a characterization of effects and cumulative effects assessment is also completed. Indigenous governance systems and cultural continuation were not assessed as stand-alone interests, but were assessed as components of other Indigenous interests, with core analysis placed in the Cultural Use Sites and Areas section.

### 16.1.6 Harvesting and Subsistence Activities

#### Background

As Stó:lō Peoples, Chawathil members have harvested throughout S'ólh Téméxw since time immemorial, relying on the Fraser River and surrounding lands for food, medicine, trade, and cultural survival. Harvesting is governed by Indigenous laws, hereditary systems, and stewardship obligations that guide how resources are accessed, shared, and protected. These practices are integral to Chawathil governance, reinforcing responsibilities to uphold balance within the territory, safeguard culturally important species, and ensure the sustainable use of lands and waters for future generations.

The Fraser River remains foundational to Chawathil identity and harvesting rights. Salmon, sturgeon, eulachon, deer, elk, bear, waterfowl, and culturally important plant species are keystone resources that support food security, ceremonial obligations, and community well-being. Fishing techniques, seasonal knowledge, and river-based lifeways are embedded within Halq'eméylem, which includes extensive terminology, over 147 identified words, relating to fishing, processing, and stewardship practices. Through harvesting activities, this linguistic and cultural knowledge is actively transmitted, making harvesting a primary mechanism of cultural continuation.

Traditional governance overfishing sites and seasonal rounds continue to inform harvesting practices. Historically, Stó:lō Peoples travelled seasonally throughout the Fraser River system, using dip nets, gaff hooks, weirs, and drying racks to harvest and preserve salmon. These activities were conducted within governance systems that emphasized respect, reciprocity, and restraint, and were reinforced through ceremonies such as the First Salmon Ceremony, which affirms spiritual relationships with salmon and collective responsibilities for their care.

Plant gathering occurs throughout the year, with fall and winter being important periods for collecting berries, roots, and medicines for food, healing, and ceremonial use. Hunting for mountain goats, elk, deer, and bear provides nourishment as well as materials for tools, regalia, and cultural items. Seasonal movement between harvesting locations, and the teachings shared through these activities, support cultural identity, intergenerational knowledge transfer, and the continuity of Indigenous laws and resource governance systems.

Today, Chawathil's harvesting practices continue both within core areas near Hope and across broader areas of S'ólh Téméxw, shaped by ecological conditions, regulatory constraints, and the ongoing exercise of stewardship responsibilities. Harvesting remains a cornerstone of cultural continuity, governance authority, and community sustenance.

#### Current Context

Chawathil currently experiences reductions in the quality and availability of traditional resources due to industrial development, urban expansion, habitat loss, pollution, and regulatory restrictions. The Fraser River estuary supports 78 fish species, including salmon, white sturgeon, and several species at risk; however, declining fish stocks and habitat degradation have reduced opportunities for contemporary harvesting. Primary foods, social, and ceremonial fishing areas for salmon and eulachon are located between Mission, B.C., and Sawmill Creek, approximately 60 to 170 km east of the Project site.

Several traditional waterways used for fishing and travel have been lost or degraded due to diking, urbanization, and industrial activities, resulting in endangered or permanently altered habitats. Land-based harvesting continues for species such as mountain goat, elk, deer, bear, and culturally important plants used for food, medicine, and ceremonial purposes. Plant gathering remains focused especially during fall and winter for ceremonial use, though concerns persist regarding contamination and reliable access to intact areas.

Hunting continues to provide materials for tools, regalia, and ceremonial items, but existing development has fragmented habitats, reduced wildlife and plant availability, and limited harvesting opportunities within the harvesting and subsistence activities LAA. As part of their current governance practices, Chawathil maintains stewardship responsibilities and decision-making roles related to land, water, and resource management across S'ólh Téméxw. Reduced availability of traditional resources also affects cultural continuation, as contemporary salmon fishing, plant gathering, and participation in traditional harvesting activities are essential pathways for intergenerational knowledge transfer and cultural identity. Chawathil continues to undertake habitat restoration and conservation initiatives and remains committed to protecting fish, wildlife, and culturally important plants within their territory.

#### Potential Project Effects

The EAO identified the following pathways of effects, prior to the application of mitigation measures, along with the associated VCs outlined in [Appendix 6](#), that may affect Chawathil's harvesting rights during the Construction, Operation, and Decommissioning Phases of Tilbury Phase 2:

- **Changes to the experience and preferences regarding the practice of harvesting rights and potential effects on the quality, quantity, and availability of resources** may occur where Tilbury Phase 2 activities result in loss or alteration of habitat that supports harvested wildlife, fish, bird, and plant species, including culturally and medicinally important species. Increased noise, vibration, odour, dust, emissions, and changes in the visual landscape (acoustic, air quality, soil, groundwater, and land and resource use VCs) may reduce the cultural acceptability or desirability of harvesting in nearby areas, influencing the experience of practicing harvesting rights. Changes to surface water quality or quantity, including turbidity and hydraulic alterations (surface water VC), may affect fish habitat and the quality, availability, and distribution of harvested aquatic species. Disturbance to vegetation communities and potential introduction or spread of invasive species (vegetation VC) may reduce plant availability and alter preferred gathering locations. Collectively, these interactions may influence the accessibility, predictability, and perceived safety of harvesting and may shift Chawathil's preferences or patterns of use within the broader Fraser River system;
- **Potential Effects on Chawathil First Nation's Rights to fish, harvest, and hunt for food, social and ceremonial (FSC) purposes** may occur where Project activities alter harvesting methods, timing, or seasonality, or where sensory disturbances (air quality and acoustic VCs) affect the predictability and success of harvesting. Changes to habitat relied on by fish, wildlife, birds, and medicinal plants (fish and fish habitat, wildlife and wildlife habitat, vegetation VCs) may influence the availability, distribution, and abundance of species harvested for FSC purposes. As migratory fish populations move from the Pacific Ocean past the Project site and upstream into Chawathil's core areas, changes in water quality, hydraulic conditions, or localized habitat fragmentation (surface water and groundwater VCs) may affect the quality and quantity of harvested species. Alterations to current use areas, access restrictions associated with the Project footprint, and perceived contamination risks (soil, surface water, and land and resource use VCs) may increase the time, effort, and cost required to harvest, and reduce opportunities for gathering plants, animals, and minerals relied upon for cultural, medicinal, and food security purposes. These changes may also influence harvesting-based livelihoods and reduce the frequency or success of FSC harvesting activities where sensory or ecological conditions make preferred areas less accessible, less productive, or less culturally acceptable for continued use;

- **Changes to the current use of lands and resources for traditional purposes:** Potential effects include changes to harvesting methods and practices, such as timing, seasonality, or preferred locations, as well as increased effort required to access or use traditional areas. These pathways may be influenced by changes in habitat quality and species availability, distribution, and abundance, along with sensory disturbances such as noise, air emissions, and vibration during Construction and Operation. Additional effects may include temporary restrictions on travelways or access to culturally important areas due to construction activities and surface water alterations (vegetation, wildlife and wildlife habitat, fish and fish habitat, acoustic, air quality, surface water, and land and resource use VCs); and
- **Potential effects to the accessibility and availability of traditional lands and resources** may occur where Project activities result in changes to the ability of Chawathil members to travel to or through current use areas, or where Construction and Operation introduce new access restrictions around the Project footprint. Expanded industrial infrastructure, including access roads, restricted zones, and operational facilities (land and resource use VC), may limit the availability of travelways historically used to reach harvesting, gathering, or cultural areas. Navigation along the Fraser River and adjacent marine environment may also be affected where Project-related activities alter travel patterns, increase vessel traffic, or introduce localized sensory disturbances (air quality, surface water, and acoustic VCs). These spatial and navigational changes may reduce the predictability and ease of accessing preferred areas, influence the timing or feasibility of traditional practices, and affect the broader availability of traditional lands and resources within the lower Fraser River system.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures that FortisBC has proposed in response to potential Tilbury Phase 2-related effects on harvesting and subsistence activities, as mentioned in the section above. A full table of Proponent Mitigations can be found in [Appendix A](#) of the Revised Application. Below is a summary of mitigation measures, how they address effects on the relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air-quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Chawathil's harvesting and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during construction and operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Chawathil's harvesting and cultural practices;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm-sewer system. These protections support water quality and fish habitat relied on to support Chawathil's harvesting and cultural practices;
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat and vegetation important to Chawathil's harvesting and cultural practices;
- **Soil (Section 7.6)** Soil management measures—such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by Chawathil for harvesting and cultural practices;

- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by Chawathil for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to Chawathil's harvesting and cultural practices;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the health and availability of salmon and other fish species central to Chawathil's FSC harvesting and cultural practices; and
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used for harvesting or cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions to help reduce potential impacts on Chawathil's harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting rights [see also Section x of this Report]

- **Condition 10 (Community Feedback Process)** creates a clear way for Chawathil to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of Chawathil's harvesting and cultural practices;
- **Condition 12 (CEMP):** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to Chawathil's harvesting and cultural practices;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to Chawathil's harvesting and cultural practices;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emission-control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and overall ecosystem health, this plan helps protect the environmental conditions that support Chawathil's harvesting and cultural practices; and,
- **Condition 17 (Dry Street Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project-related roads, which may lower potential impacts on salmon and other fish important to Chawathil's harvesting and cultural practices.

In addition to the Proponent's mitigations and the provincial conditions the EAO and Chawathil identified the following federal Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to harvesting and subsistence activities:

**Federal Consideration for Migratory Bird Protections;** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Chawathil's harvesting practices and broader ecosystem conditions important to their way of life.

### The EAO's Analysis and Conclusions

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Chawathil's harvesting rights and interests:

- Effects on Chawathil's Rights to fish, harvest, and hunt for FSC purposes; and,
- Changes to the current use of lands and resources for traditional purposes.

Chawathil and the EAO's characterization of the residual effects of Tilbury Phase 2 LNG Expansion on harvesting and subsistence Rights are summarized in the table below.

Table 12: Summary of residual effects and rationale on Chawathil First Nation and its harvesting and subsistence Rights

| Residual Effect                                                                                                                                                                                                                  | Assessment Rating                                                                                                                                                                                                                                                               | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Harvesting and subsistence activities</p> <p>-Effects on Chawathil First Nation's Rights to fish, harvest, and hunt for FSC purposes.</p> <p>-Changes to the current use of lands and resources for traditional purposes.</p> | <p>Context (Resilience): Low</p> <p>Magnitude: Negligible</p> <p>Extent: Local</p> <p>Duration: Medium-term</p> <p>Reversibility: Fully reversible</p> <p>Frequency: Continuous</p> <p>Affected Populations: Disproportionate</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><b>Context:</b> The interest is rated as having low resilience due to longstanding cumulative pressures on in S'ólh Téméxw, including industrial development, habitat degradation, declining salmon stocks, and loss of traditional waterways throughout the lower Fraser River. While Chawathil continues harvesting in upstream areas, the Fraser River corridor near Tilbury is already environmentally stressed and less able to absorb additional change without influencing the quality, reliability, or cultural experience of harvesting.</p> <p><b>Magnitude:</b> The magnitude is considered negligible, as Project residual effects are not anticipated to detectably influence the availability, quality, of culturally important species. There is no evidence of Chawathil fishing or harvesting near the Project site, where impacts could be felt. Negligible to low magnitude residual effects for related VC's including; vegetation, wildlife, fish, and their habitat, as well as; surface water, air quality, acoustics, and land and resource use may affect the perceived quality of harvesting but are not expected to detectably limit access, opportunities, or resource availability for Chawathil.</p> <p><b>Extent:</b> Rated local as residual effects are primarily limited to the Tilbury Island area and the adjacent Fraser River corridor. Although localized, this area holds cultural meaning for Chawathil, and even geographically contained changes may carry disproportionate cultural significance.</p> <p><b>Duration:</b> Rated as medium-term, with construction-related disturbances being concentrated in early phases, while operational sensory effects (e.g., noise, air emissions) may persist through the operational life of the Project but are not expected to permanently alter long-term harvesting patterns upstream.</p> <p><b>Reversibility:</b> Is assessed as fully reversible, as residual sensory and environmental changes are expected to diminish following decommissioning or through ongoing mitigation, with no permanent limitations on the ability to exercise harvesting rights.</p> <p><b>Frequency:</b> Rated as continuous, with some effects occurring seasonally or periodically in alignment with harvesting and traditional land use activities, and during certain operational activities at Tilbury Phase 2, but some effects (noise, light disturbance) would occur continuously.</p> <p><b>Affected Populations:</b> Rated as disproportionate, since Chawathil members relying on the Fraser River system, especially Elders, food providers, and cultural knowledge holders, may be disproportionately affected mainly due to past and existing long-standing cumulative effects and limited remaining areas with intact ecological conditions.</p> |

| Residual Effect                                                                                                                          | Assessment Rating | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                          |                   | <p><b>Risk:</b> The likelihood of residual effects occurring is low given the effectiveness of proposed mitigation measures, including the removal of waterborne deliveries, the absence of in-river works, and controls for air quality and acoustics. With a low magnitude, fully reversible effects, and impacts confined to a local extent, any consequences for harvesting experience or perceived resource availability are expected to be minor. Therefore, the risk is rated low.</p> <p><b>Uncertainty:</b> Rated as moderate due to limited site-specific information on contemporary Chawathil harvesting activities near the Project footprint and challenges in quantifying cultural and experiential impacts despite biophysical mitigation.</p> |
| <p>* Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a></p> |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Cumulative Effects

As described in the Background and Current Context section, the historical and ongoing environmental degradation and impacts due to climate change across S'ólh Téméxw has already affected Chawathil's ability to meaningfully practice harvesting and subsistence activities. Existing development pressures, such as urbanization, industrial activity, and restricted access, have reduced the availability and quality of plants, wildlife, and fish species traditionally harvested for food, social, and ceremonial purposes.

In addition to these historic pressures, the Revised Application identifies two reasonably foreseeable projects expected to proceed concurrently with or prior to Tilbury Phase 2 Construction: the T1B Expansion Project (T1B) and the Tilbury Marine Jetty Project (TMJ). Both are expected to increase LNG production and shipping along the Fraser River. These future developments are anticipated to contribute additional sensory disturbances (e.g., noise, light, and vibration), habitat fragmentation, and aquatic ecosystem degradation; further limiting the quality, confidence, and accessibility of culturally important harvesting areas relied on by Chawathil. The removal of vegetation and disturbance to the foreshore by these projects may also affect local wildlife and plant species of cultural importance, as well as migratory fish populations central to Chawathil's cultural and subsistence practices.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, FortisBC's proposed mitigation measures, EAO's Table of Conditions and the federal Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 would have negligible effects on Chawathil's harvesting and substance activities.

### 16.1.7 Cultural Use Sites and Areas

#### Background

Cultural use sites for Chawathil form a connected cultural landscape rather than isolated locations. The Fraser River is identified in the S'ólh Téméxw Use Plan as a Sensitive Waterway, supporting both ecological and spiritual relationships and home to sacred beings such as *stl'álegem* and *s'ó:lmexw*. Within the broader lower Fraser region, cultural areas, including the *stl'álegem* transformer site on Burnaby Island and the historic Qiqá:yt cranberry-picking camp, reflect longstanding Stó:lō occupation, seasonal movement, and cultural practice. These locations are tied to ceremonial life, intergenerational teaching, and the maintenance of identity and place-based knowledge.

Cultural landscapes also structure cultural continuation. Chawathil identifies cultural and land-based activities, such as travelling river corridors, preparing traditional foods, gathering plants, and participating in seasonal cycles, as essential to maintaining oral traditions, histories, place names, and Halq'eméylem language knowledge. Knowledge transmission is inseparable from being on the land and water: Elders and Knowledge Holders teach stories, law, and cultural protocols through practice in specific places. The Fraser River and adjoining cultural sites support oral histories such as *sxwōxwiyám* (ancient narratives) and *sqwélqwel* (true family histories), reinforcing connection to ancestors and shared identity.

The lower Fraser River is also a central cultural travelway linking communities, camps, and resource areas. Continued access to these areas supports community cohesion, cultural responsibilities, and governance practices rooted in stewardship and respect for S'ólh Téméxw. Chawathil emphasizes that Indigenous governance systems—including responsibilities of self-determination, stewardship, and the application of Indigenous laws and protocols—depend on maintaining relationships with the cultural landscape. These responsibilities are both legal and spiritual obligations carried forward for future generations.

#### Current Context

Chawathil continues to maintain deep cultural, spiritual, and ceremonial relationships with S'ólh Téméxw, particularly the Fraser River and its associated cultural landscapes. These areas support cultural practices such as preparing traditional foods, gathering medicines, conducting ceremonies, and transmitting stories and language tied to named places and ancestral teachings. Traditional travel corridors along the lower Fraser River, which overlap the Project Area adjacent to the south arm of the Fraser River, continue to play a role in cultural learning, movement, and community connection. Although Chawathil's main community at Chawathil 4 Reserve lies approximately 140 km upstream and the closest shared reserve, Pekw'xé:yles, is about 70 km upstream, these lower-river landscapes remain part of the cultural geography through which teachings, stories, and seasonal practices are understood.

Cumulative industrialization, land alienation, shoreline modification, and urban development in the lower Fraser have reduced access to cultural use areas and disrupted the continuity of cultural practices. Traditional gathering locations, travelways, and river-based cultural activities have been constrained by habitat degradation, infrastructure development, and loss of natural features. These changes have created barriers for intergenerational knowledge transfer, as opportunities to learn through land-based practice are increasingly limited.

Language continuity is similarly challenged. The near extinction of the Upriver Halq'eméylem dialect, including place names and culturally specific terms linked to land and water, heightens concern about the long-term preservation of cultural identity. The cumulative degradation of cultural landscapes, combined with reduced opportunities to gather resources for cultural and ceremonial purposes, has contributed to cultural stress within Chawathil community life.

## Potential Project Effects

The EAO has identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#), that may affect Chawathil's cultural use sites and areas during the Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- **Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance:** Tilbury Phase 2 may interact with cultural heritage features linked to Chawathil, including storied places, historic habitation areas, named places, and archaeological sites along the South Arm of the Fraser River, Tilbury Island, and Lulu Island (archaeological and heritage resources VC). Although no cultural or archaeological sites were identified within the Project Footprint, Construction and ground disturbance still create a pathway for accidental discovery or alteration of previously undocumented materials. Project activities, such as clearing, excavation, and increased human presence, may alter cultural settings important for teachings, practices, and historical associations (culture VC). Sensory disturbances, including noise, vibration (acoustic VC), odour, dust, air emissions (air Quality VC), and changes to visual resources, may qualitatively affect the experience of being in culturally meaningful areas and influence participation in communal and ceremonial activities. Project works may also affect travelways and access routes traditionally used to move through the lower Fraser cultural landscape (Land and Resource Use VC). Changes to navigation, accessible pathways, or restricted areas may limit access to places connected to oral histories, Indigenous laws, and governance practices. Even without physical disturbance to known sites, sensory and experiential changes may influence how Chawathil members relate to cultural landscapes and exercise associated cultural practices;
- **Loss of access to, and disenfranchisement from cultural sites including access to cultural sites:** Tilbury Phase 2 activities may affect access to cultural sites and cultural landscapes by creating or modifying access restrictions, altering travel corridors, or influencing navigation on the lower Fraser River. Cultural use for Chawathil depends on movement along the river and adjacent areas, including travel to seasonal harvesting sites, communal gathering areas, and locations tied to oral histories, legal traditions, and the transmission of Halq'eméylem place-based knowledge (land and resource use VC). Project-related disturbances, such as noise, odour, dust, air emissions (air quality and acoustic VCs), and visual changes, may reduce the experiential quality of these locations and disrupt activities associated with cultural learning, stewardship responsibilities, and ceremonial practices (culture VC). While physical disturbance to known cultural sites is unlikely within the Project Footprint, changes to access and sensory conditions may still influence the ability of Knowledge Holders, Elders, and community members to meaningfully use culturally important areas. These effects may interact with longstanding travelway degradation, shoreline modification, and habitat loss throughout the lower Fraser region; and,
- **Effects on cultural and spiritual practices caused by changes to, or loss of access to, cultural sites and areas:** Tilbury Phase 2 activities may influence cultural and spiritual practices that depend on access to cultural sites and culturally meaningful areas along the lower Fraser River. Chawathil cultural identity, ceremonial life, and cultural learning rely on the ability to visit, use, and engage with these cultural landscapes, which support oral histories, cultural protocols, communal gatherings, and transmission of Halq'eméylem knowledge (culture, land and resource use, and archaeological and heritage resources VCs). While no cultural or archaeological sites were identified within the Project Footprint, changes to access routes, travelways, and navigation along the Fraser River may limit the ability of Elders, Knowledge Holders, and community members to reach culturally important areas. Sensory disturbances, including noise and vibration (acoustic VC), odour, dust, air emissions (air quality VC), and visual changes (culture VC), may alter the cultural setting in which ceremonies, teachings, harvesting-related cultural practices, and communal activities occur. Reduced experiential quality may affect the practice of cultural protocols, participation in

seasonal gatherings, and opportunities for intergenerational knowledge transfer tied to specific cultural sites and landscapes.

#### Mitigation Measures

The Revised Application summarizes relevant mitigation measures proposed by FortisBC to address potential Tilbury Phase 2 related effects on cultural use sites and areas, including:

- **Air Quality (Section 7.2)** The air-quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Chawathil's cultural practices;
- **Acoustics (Section 7.3)** Noise-reduction measures during Construction and Operation, including idle-reduction policies, equipment muffling, enclosures, and engineered noise controls, help limit disturbance to culturally important areas and activities. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of cultural knowledge by Chawathil;
- **Land and Resource Use (Section 7.11)** Traffic-management planning, noise and lighting controls, and communication regarding project activities help reduce disruptions to access and use of culturally important areas. These measures support Chawathil's ability to safely access and continue cultural practices within their traditional territory;
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance-find procedures, site protection, and early notification to Indigenous nations, help protect culturally important sites, features, and landscapes. These measures support Chawathil's ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connections to territory; and,
- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support Chawathil's ability to access, use, and maintain culturally important areas, including places of teaching, ceremony, and connection to land and water.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects to Indigenous cultural use sites and areas:

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance;
- **Condition 10 (Community Feedback Process)** establishes a clear and structured mechanism for Chawathil to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of culturally important landscapes and areas, supporting Chawathil's continued access to and use of cultural sites during project Construction;

- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, lighting, wildlife interactions, and spills during project Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by Chawathil;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emission-control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and overall ecosystem health, this plan helps protect the environmental conditions that support Chawathil's harvesting and cultural practices; and,
- **Condition 15 (Chance Find Protocol)** requires the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If Chawathil historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

#### The EAO's Analysis and Conclusions

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Chawathil's harvesting rights and interests:

- Loss of access to, and disenfranchisement from, cultural sites including access to cultural sites;
- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural value; and,
- Effects on cultural and spiritual practices caused by changes to, or loss of access to, cultural sites and areas.

The EAO's characterization of the residual effects of Tilbury Phase 2 on cultural use sites and areas are summarized in the table below.

Table 13: Summary of residual effects and rationale on Chawathil First Nation and its cultural use sites and areas

| Residual effect                                                                                                                                                                                                                                                                                                                                                                                   | Assessment Rating*                                                                                                                                                                                                                       | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cultural use sites and areas<br>-Loss of access to, and disenfranchisement from, cultural sites including access to cultural sites<br>-Effects on cultural and spiritual practices caused by changes to, or loss of access to, cultural sites and areas<br>- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural value | Context (resilience): Low<br>Magnitude: Negligible<br>Extent: Local<br>Duration: Medium-term<br>Reversibility: Fully reversible<br>Frequency: Continuous<br>Affected Populations: Disproportionate<br>Risk: Low<br>Uncertainty: Moderate | <p><b>Resilience:</b> Rated low because Chawathil's cultural use in the lower Fraser corridor already occurs within a heavily industrialized, fragmented landscape with longstanding access restrictions and habitat loss. These cumulative pressures reduce the territory's ability to absorb additional change without further constraining cultural renewal and use.</p> <p><b>Magnitude:</b> is rated as negligible as the project does not directly disturb known Chawathil cultural heritage sites and no sites were identified within the Project Footprint.</p> <p><b>Extent:</b> is rated local because residual effects are expected to be confined to the Project Footprint on Tilbury Island, immediately adjacent foreshore, and nearby portions of the South Arm of the Fraser River within the LAA. While Chawathil's cultural narratives and connections are regional, the measurable changes from Tilbury Phase 2 are geographically limited.</p> <p><b>Duration:</b> is rated as Medium-term, as most effects will occur during Construction and persist through Operation (&gt;2 years) but are expected to diminish or cease following Decommissioning and site restoration. No permanent alteration to known cultural sites is anticipated.</p> <p><b>Reversibility:</b> Rated fully reversible because the residual effects are primarily sensory and access-related within an already disturbed setting. If Tilbury Phase 2 were halted or decommissioned, associated</p> |

| Residual effect                                                                                                                   | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p>noise, light, traffic, and visual disturbances would cease, and no permanent constraints on access to known Chawathil cultural sites are expected.</p> <p><b>Frequency</b> rated as continuous, as effects are expected to occur regularly, associated with Construction periods, routine Operation, and ongoing industrial presence near the Project.</p> <p><b>Affected populations:</b> rated disproportionate because impacts would most affect those Chawathil members who remain actively engaged in cultural practices, ceremonial use, and intergenerational teaching linked to the Fraser River, including Elders, Knowledge Holders, and land-based practitioners. Members less directly involved in land-based practices are less likely to experience these effects.</p> <p><b>Risk:</b> the likelihood of residual effects is low given proposed mitigation, the absence of known cultural sites in the Project Footprint, and the already industrial character of the area. Consequences are expected to be minor, magnitude is expected to be low and largely qualitative (setting/experience), rather than involving direct damage to sacred or archaeological sites; therefore, the risk is rated low.</p> <p><b>Uncertainty:</b> rated moderate due to limited site-specific information on contemporary Chawathil cultural use in the immediate LAA and the inherently qualitative nature of changes to cultural setting, acceptability, and experience. Sensory pathways (noise, air, visual) are well understood technically, but their cultural implications are harder to quantify.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Cumulative Effects

Cultural Use Sites and Areas within S'ólh Téméxw have already been heavily affected by urbanization, industrial expansion, railway development, logging, and shoreline modification along the lower Fraser River, resulting in reduced access, fragmented travel corridors, and fewer opportunities for intergenerational cultural teaching. Although Tilbury Phase 2 does not directly interact with known Chawathil cultural sites, it is located in an already industrialized area where cultural settings have been substantially altered. Project-related sensory disturbances, such as noise, vibration, air emissions, dust, and visual changes, may further influence the quality and experience of nearby cultural landscapes, while access limitations associated with the industrial site may reinforce existing constraints on cultural presence and movement along the lower Fraser corridor.

These potential contributions would occur alongside other existing and reasonably foreseeable industrial developments in the area, including the T1B and TMJ projects, which collectively increase industrial activity and sensory disturbance on Tilbury Island and adjacent river environments.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

## Conclusion

Considering the above analyses, including proposed proponent mitigations, EAO's conditions, and based on the Project specific effects of Tilbury Phase 2, the EAO concludes that the Project will have a negligible effect on Chawathil's cultural use sites and areas.

### 16.1.8 Social and Economic Conditions

#### Background

Chawathil, a member of the Stó:lō Nation, maintains longstanding social and economic ties to S'ólh Téméxw grounded in land stewardship, river-based livelihoods, and community governance. Traditional economic activities such as fishing, plant gathering, and intercommunity trade historically supported social cohesion, cultural continuity, and household economies. These practices continue to shape community values and governance priorities today, including decisions related to land use, resource management, and culturally aligned economic development.

Chawathil's governance systems emphasize stewardship, self-determination, and protection of culturally important areas and resources. Participation in broader Stó:lō governance structures and the Framework Agreement on First Nation Land Management has strengthened Chawathil's ability to exercise jurisdiction over reserve lands and pursue long-term economic strategies anchored in cultural values. Cultural continuation remains foundational to social and economic life, as land-based activities and language revitalization support intergenerational knowledge transfer and contribute to community resilience. The Project could provide positive contributions through employment, skills training, and procurement opportunities aligned with these goals. See sections on *Cultural Use Sites and Areas* and *Harvesting and Subsistence Activities* for additional context.

Historic land loss, regulatory barriers, and industrialization across the lower Fraser River region have reduced access to traditional economic resources and constrained economic autonomy. These long-term pressures form an important context for understanding Chawathil's current social and economic conditions and priorities.

#### Current Context

Chawathil's present social and economic conditions reflect both ongoing development pressures across S'ólh Téméxw and community-driven efforts to support self-determination and economic stability. The nation has approximately 657 members, with about 45.7% living on reserve and a notably young demographic profile—over 24% are under age 15. Limited housing availability and aging infrastructure pose challenges for community growth, with approximately 88% of on-reserve homes requiring repairs as of 2021.

Employment among Chawathil members spans service industries, education, trades, and construction, though average incomes remain below provincial levels. The nation continues to prioritize training, language revitalization, and workforce development to expand economic opportunities that align with cultural and community goals. Participation in the Framework Agreement on First Nation Land Management supports stronger local governance over land-based economic initiatives, providing a foundation for future development grounded in Chawathil values.

Chawathil has expressed concern that cumulative industrialization across the lower Fraser River corridor has constrained opportunities for culturally aligned economic activities, reduced access to land and resources important for community livelihoods and created barriers to long-term economic self-sufficiency. While Tilbury Phase 2 is not expected to directly affect Chawathil reserve lands or current economic development projects, Chawathil emphasizes that cumulative landscape change influences their ability to improve socio-economic conditions and pursue development consistent with their cultural and governance priorities.

#### Potential Project Effects

The EAO has identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#), that may affect Chawathil's social and economic conditions during the Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- **Changes to employment opportunities, Indigenous businesses, procurement opportunities, and Indigenous government revenue;** Tilbury Phase 2 may create short-term construction employment and procurement opportunities that Chawathil members and Indigenous businesses could access (employment and economy VC). Increased employment income and training opportunities may support skill development and labour force participation, particularly in trades and construction. Opportunities for Chawathil-owned businesses may arise through contracting, procurement, and participation in the Project's Indigenous employment strategy. However, participation depends on barriers such as certifications, training levels, and proximity to the Project site. While Project-related economic benefits could support Chawathil's goals for economic self-determination, effects remain positive, indirect, and temporary, with benefits diminishing once Construction ends. Relevant linkages include culture, infrastructure and services, land and resource use, fish and fish habitat, wildlife and wildlife habitat, and vegetation VCs, as these may shape access to training, employment, and culturally aligned economic initiatives;
- **Effects on Chawathil First Nation's future aspirations for sites or areas surrounding Tilbury Phase 2;** Tilbury Phase 2 is located in a highly industrialized part of S'ólh Téméxw where Chawathil does not currently pursue economic development or land-use initiatives. As such, the Project is not expected to directly interfere with Chawathil's future aspirations for the immediate area. The nation's long-term goals related to language revitalization, cultural renewal, land stewardship, and community economic development occur primarily near Hope and broader areas upstream along the Fraser River. Given the absence of overlapping land-use plans or development proposals in the Tilbury area, no interaction is expected between the Project and Chawathil's land-use or economic aspiration;
- **Effects on Chawathil First Nation's ability to improve social and economic conditions;** Although the Project will not occur near Chawathil's reserves or active economic development sites, changes to the cultural landscape or resource conditions in S'ólh Téméxw may indirectly influence Chawathil's ability to pursue culturally aligned economic development. Governance, land stewardship, and cultural continuity are central to Chawathil's socio-economic well-being, and potential Project-related effects on air quality, noise, vegetation, wildlife, or fisheries (air quality, acoustics, vegetation, wildlife and wildlife habitat, fish and fish habitat VCs) may influence broader territorial conditions under which economic self-determination is exercised. While no direct interference with ongoing economic initiatives is anticipated, perceived or incremental degradation of the lower Fraser may influence Chawathil's confidence in regional development processes and may affect long-term efforts to rebuild land-based economies. Enhancement measures under employment and economy, land and resource use, and culture VCs may support indirect positive effects by improving access to training, employment, and culturally aligned opportunities;
- **Effects on commercial and non-commercial fishing, hunting, trapping, gathering, and cultural or ceremonial activities;** No interaction has been identified for social and economic conditions. Chawathil's active harvesting for FSC purposes occurs 60–170 km upstream, outside the Tilbury LAA, and no Project activities will alter fish availability, access to harvesting sites, or the economic value of non-commercial harvest (fish and fish habitat, wildlife and wildlife habitat, vegetation VCs). The Project also does not affect travel routes used by Chawathil for harvesting or ceremonial purposes. As a result, no effects on harvesting effort, success, or trade in harvested materials are anticipated; and,
- **Effects on infrastructure and services;** No interaction has been identified. Tilbury Phase 2 will not affect access to or demand for healthcare, education, recreational facilities, emergency services, or transportation infrastructure used by Chawathil members (infrastructure and services VC). The Project is located far from Chawathil communities, will not contribute to local service capacity pressures, and does not alter infrastructure relied on by the nation. Therefore, no effects on infrastructure or service availability are expected.

## Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that Fortis has proposed in response to potential Tilbury Phase 2 related effects on social and economic conditions. These include the following:

- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures, site protection, and early notification to Indigenous nations, help protect culturally important sites, features, landscapes, and the conditions that support culturally based livelihoods and economic self-determination. These measures support Chawathil's ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connections to territory;
- **Air Quality (Section 7.2):** The air quality measures, such as idle reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat and the environmental conditions that support culturally based livelihoods and economic self-determination. They help protect salmon, wildlife, vegetation, and surface water that support Chawathil's cultural practices;
- **Acoustics (Section 7.3):** Noise reduction measures during Construction and Operation, including idle reduction policies, equipment muffling, enclosures, and engineered noise controls, help limit disturbance to culturally important areas, activities, and the conditions that support culturally based livelihoods and economic self-determination. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of cultural knowledge by Chawathil;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to Chawathil's social and economic conditions;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting Chawathil's cultural and social continuity, and nutritional well-being;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports Chawathil's food security, cultural identity, by safeguarding salmon and other species essential to FSC harvesting;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for Chawathil members and businesses to participate economically in the project, supporting improved social conditions and community well-being;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm-sewer system and maintain the environmental conditions that support culturally based livelihoods and economic self-determination. These protections support water quality and fish habitat relied on to support Chawathil's harvesting and cultural practices;
- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat, vegetation, and the conditions that support culturally based livelihoods and economic self-determination relied on by Chawathil for harvesting and cultural practices;

- **Land and Resources VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting Chawathil's long-term aspirations for land and water restoration and reducing stressors that can affect social and economic conditions;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socio-economic impacts on Chawathil and supporting social and economic interests and community stability;
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat, vegetation, and the conditions that support culturally based livelihoods and economic self-determination important to Chawathil's harvesting and cultural practices; and,
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Chawathil's social and economic interests.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on Chawathil social and economic conditions:

- **Condition 10 (Community Feedback Process)** provides Chawathil with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting ongoing social and economic interests;
- **Condition 12 (CEMP)** requires mitigation measures to manage dust, noise, traffic, spills, surface water, erosion, and wildlife interactions during Construction. These measures help minimize construction-related disturbances that could affect community and social well-being of Chawathil members;
- **Condition 13 (OEMP)** requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation. By limiting long-term environmental disturbances, this condition supports stable environmental conditions that protect Chawathil's social and economic interests;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality mitigates sensory disturbances, such as dust and odors, and prevents particulate deposition that may impact traditional resources. This supports the social and economic conditions of Chawathil by preserving the cultural acceptability and integrity of harvested species, ensuring harvesting does not become more difficult or costly to access;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If Chawathil historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated social harm; and,
- **Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support the Chawathil First Nation's socio-economic well-being through increased access to jobs, skills development, and business opportunities associated with Tilbury Phase 2.

After applying the EAO's residual effects methodology and considering the mitigation measures, conditions and effect pathways described above, the EAO concludes that Tilbury Phase 2 is not expected to result in any adverse residual effects on Chawathil's social and economic conditions. No interactions were identified with reserve lands, housing, infrastructure, or current economic development areas, and the Project does not limit Chawathil's ability to pursue future economic opportunities. The Project is expected to result in positive residual effects, primarily through

short-term employment, training, and procurement opportunities during Construction. As no adverse residual effects were identified, a residual effects characterization is not required for this Indigenous interest.

### 16.1.9 Indigenous Health and Well-being

#### Background

Chawathil understands Indigenous health and well-being as holistic, rooted in shxwelí, the life force that connects all beings, and expressed through relationships with land, water, culture, and community. Well-being encompasses physical, mental, emotional, spiritual, and cultural dimensions, inseparable from stewardship responsibilities and the ability to practice Indigenous governance according to Chawathil laws and traditions.

The Fraser River is central to health and well-being, supporting access to country foods, cultural teachings, ceremonial practices, language, and intergenerational knowledge transfer. Cultural continuation, learning on the land, harvesting, engaging in ceremony, and transmitting oral histories, is integral to wellness. Disruptions to these relationships through environmental degradation, pollution, or development can affect both individual and collective well-being. Colonial impacts, including displacement and loss of access to traditional resources, continue to shape Chawathil's health determinants, reinforcing the nation's emphasis on clean air, water, land, and culturally grounded practices as essential components of well-being.

#### Current Context

Chawathil identifies Indigenous health and well-being as a core interest influenced by long-standing cumulative effects in S'ólh Téméxw. Industrial development, habitat degradation, and reduced access to traditional resources have limited opportunities to harvest country foods, gather medicinal plants, practice ceremony, and transmit cultural knowledge—all key determinants of well-being. These cumulative pressures contribute to cultural stress, reduced food security, and diminished opportunities for land-based healing and cultural learning.

Environmental degradation in the lower Fraser River has also affected ecosystem health, influencing confidence in the safety, quality, and availability of traditional foods and medicines. Sensory disturbances and industrial presence near culturally important landscapes may further disrupt spiritual practices, cultural continuity, and cultural identity, factors closely linked to holistic well-being.

Chawathil's health outcomes are further shaped by socio-economic determinants such as limited access to culturally safe health services, barriers to education and training, and the legacies of colonial policies. Although specific health data for Chawathil is limited, the nation continues to advance wellness initiatives, including stewardship, language revitalization, and youth cultural programming, as essential components of long-term well-being. While Project-related employment may offer some short-term benefits, Chawathil emphasizes that sustained well-being depends on protecting land, water, traditional food systems, and cultural practices for future generations.

#### Potential Project Effects

The EAO has identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#) that may affect Chawathil health and well-being during the Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Effects on the quality, quantity, and availability of harvested country foods:** Tilbury Phase 2 activities may interact with environmental conditions that support traditional food systems relied upon by Chawathil, including plants, wildlife, fish, and medicines that contribute to holistic well-being (harvesting and subsistence activities, vegetation, wildlife and wildlife habitat, fish and fish habitat, surface water, and groundwater VCs). Although no in-river works are proposed, Construction and Operation could introduce air emissions, dust, noise, vibration, and vegetation disturbance that may subtly influence the perceived or actual quality of country foods or medicinal plants. Changes to visual resources and sensory conditions (air quality, acoustics, culture VCs) may also alter the experience of harvesting or land-based healing practices that are central to maintaining physical, cultural, and spiritual health. Indirect pathways such as altered confidence in resource safety, reduced access to gathering sites, or diminished sensory conditions may influence well-being even where biophysical changes are low;
- **Effects on air quality, noise, and water quality:** Tilbury Phase 2 may generate changes to air emissions, noise, and surface and groundwater conditions that intersect with Chawathil's rights to clean air, water, and land, key determinants of Indigenous health (air quality, acoustic, surface water, groundwater, and human health VCs). Project activities could introduce localized increases in Criteria Air Contaminants (CAC)s, odour, dust, or noise that influence comfort, cultural acceptability, and perceived safety when practicing land-based activities. Changes to water quality, while predicted to be negligible after mitigation, remain an important consideration for well-being because Chawathil's health practices, including ceremonial use and the preparation of traditional foods, depend on confidence in the integrity of the Fraser River system. These pathways represent potential interactions with both environmental and cultural determinants of health through impacts on sensory environments and resource conditions; and,
- **Effects on health and well-being from changes to traditional ways of life and cultural sites:** Tilbury Phase 2 activities may influence Chawathil's ability to practice cultural traditions, travel through S'ólh Téméxw, and maintain connections to culturally important areas—an essential foundation of Indigenous well-being (culture, land and resource use, archaeological and heritage resources, human health VCs). Sensory disturbances (noise, odour, dust, air emissions, vibration) and visual changes may alter the quality of cultural settings where ceremonies, teachings, and land-based healing occur. Project activities may also reinforce existing barriers to movement along the Fraser River corridor or limit access to culturally important areas through construction presence, safety restrictions, or navigation constraints. Disruptions to cultural practices, stewardship responsibilities, and intergenerational knowledge transfer can influence mental, spiritual, emotional, and social well-being even in the absence of direct physical disturbance. These pathways reflect the interdependence of health, culture, identity, and land-based practice for Chawathil.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on Indigenous health and well-being. These include the following:

- **Air Quality (Section 7.2)** Air emission controls help protect respiratory health and prevent contamination of country foods, supporting Chawathil's physical well-being and confidence in harvesting;
- **Acoustics (Section 7.3)** Noise reduction measures limit sensory disturbance to people, wildlife, and harvesting areas, reducing stress and supporting Chawathil's comfort, well-being, and connection to land and water;
- **Surface Water (Section 7.4)** Managing runoff, erosion, and sediment helps maintain water quality in the lower Fraser, supporting Chawathil's cultural and nutritional reliance on healthy salmon and aquatic ecosystems;

- **Groundwater (Section 7.5)** Protecting groundwater from contamination helps maintain the quality of ecosystems that support fish, plants, and wildlife relied on for Chawathil's subsistence and health;
- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by Chawathil health and well-being;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to Chawathil's physical health;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting Chawathil Alliance's nutritional well-being;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports Chawathil's food security, and health by safeguarding salmon and other species essential to FSC harvesting;
- **Land and Resources VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting Chawathil's long-term aspirations for land and water restoration and reducing stressors that can affect well-being;
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures and early notification to Indigenous nations, help protect culturally important sites and landscapes that support the spiritual and emotional well-being of Chawathil;
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Chawathil's well-being; and,
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect Chawathil members' physical, cultural, and mental health.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on Indigenous health and well-being:

- **Condition 10 (Community Feedback Process)** provides Chawathil with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting Indigenous health and well-being;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)** requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with Chawathil to be developed by the Holder in consultation with the nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;

- **Condition 16 (Indigenous and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support socio-economic well-being;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting Chawathil's physical health and overall well-being; and,
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If Chawathil historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated cultural or emotional harm, supporting Indigenous health and well-being.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Well-being:

- Accidents and Malfunctions Reporting would support mitigation of potential impacts on the Nation's interests by ensuring timely responses, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

#### The EAO's Analysis and Conclusions

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Chawathil's Indigenous health and well-being:

- Effects on the quality, quantity, and availability of harvested country foods;
- Effects on air quality, noise, and water quality; and,
- Effects on health and well-being from changes to traditional ways of life and cultural sites.

The EAO's characterization of the residual effects of Tilbury Phase 2 on Indigenous health and well-being are summarized in the table below.

Table 14: Summary of residual effects and rationale on Chawathil First Nation and its Indigenous health and well-being

| Indigenous Interest                                                                                                                                                                                                                                                        | Assessment Rating*                                                                                                                                                                                                                                                                            | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (Indigenous health and well-being)<br>-Effects on the quality, quantity, and availability of harvested country foods<br>-Effects on air quality, noise, and water quality<br>-Effects on health and well-being from changes to traditional ways of life and cultural sites | <b>Context (resilience):</b> Medium<br><b>Magnitude:</b> Negligible<br><b>Extent:</b> Local<br><b>Duration:</b> Medium-term<br><b>Reversibility:</b> Fully reversible<br><b>Frequency:</b> Irregular<br><b>Affected Populations:</b> Even<br><b>Risk:</b> Low<br><b>Uncertainty:</b> Moderate | <b>Context:</b> rated as medium, as Chawathil maintains strong cultural resilience through stewardship and spiritual practice, but cumulative effects have reduced the ecological and territorial supports essential for holistic well-being.<br><b>Magnitude:</b> assessed as low. Tilbury Phase 2 activities have a negligible to low magnitude effect on air quality, water quality, with no impact to traditional foods. Remaining sensory effects (noise, odour, visual change) are not expected to detectably influence cultural experience, for those close to the sight, and are not anticipated to cause significant physical or holistic well-being outcomes.<br><b>Extent:</b> rated as local, as most measurable impacts are confined to areas near the Project site, though emotional and cultural connections to those areas may extend further. Any sensory or experiential changes would occur only near Tilbury Island within a limited portion of the lower Fraser River and not across Chawathil's broader territory.<br><b>Duration:</b> rated as medium-term duration, with the Construction phase effects potentially persisting into early Operation, especially for emotional or cultural impacts tied to disrupted access or practices. Construction effects are short- |

| Indigenous Interest                                                                                                               | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p>term; operational effects are irregular and limited. No long-term changes to health determinants are expected.</p> <p><b>Reversibility:</b> impacts are fully reversible since sensory effects end when Construction ceases or Operation stops; no persistent changes to environmental health determinants or cultural-health practices are anticipated.</p> <p><b>Frequency:</b> rated as irregular because the anticipated effects—such as dust, odour, noise, and vibration—are expected to occur primarily during active Construction periods, specific operational activities, or discrete Tilbury Phase 2 phases. These effects will not be constant but will arise at intervals tied to Tilbury Phase 2 schedules, site preparation, equipment use, or traffic increases. As such, while noticeable when present, they are not expected to persist continuously across the Tilbury Phase 2's lifespan.</p> <p><b>Affected Populations:</b> rated as even since any minor experiential effects would be experienced evenly by community members who travel through or use areas near Tilbury Island; no disproportionate impact on specific groups is expected.</p> <p><b>Risk:</b> is assessed as low, because residual effects on Indigenous health and well-being are unlikely to persist after mitigation is applied, resulting in a low likelihood of occurrence. Related effects are negligible to low in magnitude and local in extent, meaning any consequences would not result in measurable, lasting, or population-level impacts on health, access to traditional foods, or holistic well-being, resulting in a minor consequence rating.</p> <p><b>Uncertainty:</b> is rated as moderate, due to gaps in disaggregated health data and challenges in predicting spiritual and emotional responses to cumulative or perceptual changes.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Cumulative Effects

Chawathil's Indigenous health and well-being is influenced by long-standing cumulative effects across S'ólh Téméxw, including industrialization, urban expansion, habitat alteration, and reduced access to cultural practices and traditional resources. These regional conditions have eroded opportunities for land-based learning, spiritual practice, and harvesting activities that contribute to holistic well-being and cultural renewal.

Tilbury Phase 2 is not expected to directly affect country foods, surface water, fish, or medicinal plant availability, and mitigation measures for air quality, noise, water protection, and cultural values limit potential health-related pathways. Residual effects from Tilbury Phase 2 are assessed as negligible, with sensory changes remaining localized within an already industrial setting. While these sensory effects may contribute incrementally to regional pressures experienced by Chawathil members, their magnitude and spatial extent mean they will not materially influence overarching health and well-being outcomes. Other reasonably foreseeable projects—such as the T1B and the TMJ—may add further industrial activity in the region. Both TMJ and T1B have the potential to add to cumulative effects associated with decreased air quality and associated health impacts.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

#### Conclusion

Considering the above analyses, FortisBC's proposed mitigation measures, and EAO's Table of Conditions, the EAO concludes that Tilbury Phase 2 would have negligible effects on Chawathil's health and well-being interests.

#### 16.1.10 Positive Effects of Tilbury Phase 2

According to the Revised Application, Tilbury Phase 2 Project is anticipated to generate several positive residual effects for Chawathil, primarily within social and economic conditions during the Construction phase. These include increased employment opportunities for Chawathil members—particularly those with trades skills or certifications—and expanded Indigenous business and procurement opportunities for nation-owned or affiliated enterprises. The Project may also contribute positively to Chawathil government revenue and enhance the community's capacity to improve social and economic conditions through increased income and related quality-of-life benefits. These positive effects are expected to be most meaningful during the 3-to-6-year Construction phase, when labour demand is highest. FortisBC anticipates that these benefits may also strengthen socio-economic determinants of health, such as employment, education, and income, thereby indirectly supporting improvements in overall community well-being.

#### 16.1.11 Conclusions

Considering the above analyses, the EAO's and FortisBC's engagement with Chawathil, FortisBC's commitments in Appendix A of the Revised Application, and the EAO's table of provincial conditions, identifying and where applicable recommending Key Mitigation Measures to inform federal conditions under the IAA 2019, the EAO concludes that Tilbury Phase 2 is anticipated to have the following impacts on Chawathil's Indigenous interests:

- Negligible residual effects to Chawathil First Nation's harvesting and subsistence activities;
- Negligible residual effects to Chawathil First Nation's cultural use sites and areas; and
- Negligible residual effects to Chawathil First Nation's Indigenous health and well-being.

Considering the above analyses, the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on Chawathil's interests has been adequately avoided, minimized, or otherwise accommodated. Based on the engagement undertaken with Chawathil on Tilbury Phase 2, as outlined above in Section 16.1.2, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with Chawathil.

## 16.2 Cheam First Nation

### 16.2.1 Community Profile

Cheam First Nation (Cheam)(Xwchíyò:m) are Stó:lō People who have lived in the Rosedale area of the Upper Fraser Valley in B.C. for thousands of years. Their name means "wild strawberry place," reflecting the local growth of wild strawberries. The traditional language of Cheam is Halq'eméylem, spoken by Upriver Stó:lō communities (Cheam First Nation n.d.). Halq'eméylem is part of the Coast Salish language group. They are a self-governing community with strong cultural, linguistic, and genetic ties to other Coast Salish Peoples, particularly the Pélhoxwlh (Pilalt) Tribe.

Cheam is a member of the Stó:lō Tribal Council and the STSA. The Stó:lō Tribal Council negotiates land and resource agreements outside the B.C. treaty process, while the STSA supports Stó:lō First Nation members in making stewardship decisions. However, Cheam has chosen to participate in the environmental assessment for Tilbury Phase 2 independent of the S'ólh Téméxw Stewardship Association.

Cheam's primary reserves (Cheam 1 and Tseatah 2) are located near Rosedale, B.C., in the Upper Fraser Valley, approximately 100 km east of the Tilbury LNG facility on Tilbury Island in Delta upstream along the Fraser River.

Cheam also shares the Pekw'xé:yles reserve, located in Mission, B.C. (Mission), with 21 other Stó:lō communities. This site is approximately 60 km east of the site. While the reserves are not in the immediate vicinity of Tilbury Phase 2, the Fraser River, which connects all these locations, is of central cultural, economic, and spiritual importance to Cheam, and the river itself is a key conduit for migratory salmon and traditional practices that link these areas.

### 16.2.2 Cheam First Nation Involvement in the Environmental Assessment

During the Early Engagement Phase, Cheam identified as a participating Indigenous nation for the Tilbury Phase 2 EA. The [Assessment Plan](#) outlines consultation expectations with potentially affected Indigenous nations. Cheam identified several key issues requiring focussed analysis, including potential effects on salmon relied on for FSC purposes, and impacts to their Aboriginal rights associated with salmon fisheries.

Cheam actively participated in the Process Planning Phase by reviewing the [Process Order](#), [Assessment Plan](#), and [Tilbury Phase 2- Schedule C – Application Information Requirements](#) materials, providing updated secondary-source information, and emphasizing that cumulative industrial and climate impacts on the Fraser River must be assessed holistically through a Stó:lō worldview. The EAO and the IAAC provided funding to support Cheam engagement in the environmental assessment process. The EAO provided documents, project updates, the draft Initial Project Description and DPD, and Process Planning documents for review.

Through discussions with Cheam during the Process Planning and Application Development and Review phases, it was initially agreed that the EAO would assess Tilbury Phase 2 effects on Cheam's Indigenous interests with input and iterative review from Cheam. However, in July 2025, Cheam communicated to the EAO that capacity constraints limited their ability to engage further on the assessment of Tilbury Phase 2. As a result, the EAO conducted the assessment of Tilbury Phase 2 effects on Cheam's Indigenous rights and interests and sought consensus on this Report with the nation during Effects Assessment.

The EAO used the following sources in drafting the assessment of Tilbury Phase 2 effects on Cheam Indigenous rights and interests:

- FortisBC's (Proponent) Revised Application;
- Information submitted during the environmental assessment by the Proponent and Cheam;
- Conclusions from the EAO's assessment of VCs; and,
- [Section 11.03](#) of the Revised Application, along with the Proponent's [Indigenous Engagement Report](#), provides a summary of the Proponent's engagement with Cheam.

### 16.2.3 Assessment Boundaries

All Tilbury Phase 2 components are within Stó:lō traditional territory.

The spatial assessment boundaries for each Indigenous interest are based on the overlap between Stó:lō traditional territory and the combined LAAs and RAAs for specific Value Components (VCs). Refer to Figure 11.3-1 in Section 11.03 of the Revised Application (Cheam Territory, and Reserve Site Figure). The LAA for each Indigenous interest reflects the combined LAAs of the VCs linked to that interest. The RAA is defined the same way, using the combined RAAs of the linked VCs. In general, the LAA is used to assess direct and indirect Tilbury Phase 2 effects, while the RAA supports the assessment of cumulative effects.

The assessment of potential effects related to Tilbury Phase 2 considered three distinct Phases:

- Construction phase, with an estimated duration of three to six years;
- Operation phase, expected to last more than forty years; and,
- Decommissioning phase, anticipated to take approximately two years.

#### 16.2.4 Regional Context

Tilbury Phase 2 intersects with Stó:lō traditional territory, known as S'ólh Téméxw, which means “our world” or “our land” in Halq'eméylem (STSA 2018). Cheam asserts inherent Aboriginal title and rights within S'ólh Téméxw. Members of the STSA have highlighted that in their worldview, Lets'emó:t means “one mind,” reflecting the unity between the human and natural worlds. Additionally, Shxwelí, the life force of all things, is a crucial aspect of the Stó:lō People's worldview, forming the basis of their connection to the natural environment. The Stó:lō People have emphasized that their spiritual connection, Aboriginal rights, and land use practices related to the river do not diminish with distance from individual reserves. They maintain a relational connection with the entire Fraser River (STSA 2022).

The existing Tilbury LNG facility consists of gravel and paved areas, existing infrastructure, and equipment laydown areas supporting little plant life with very little to no habitat value for wildlife. The vegetation within Tilbury Phase 2 is mostly limited to ditch lines and spoil piles and is dominated by non-native and invasive plant species. Public access to Tilbury Phase 2 site is limited, although there is currently public use of the dike to the north of Tilbury Phase 2 site along the Fraser River.

#### 16.2.5 Indigenous Interests

The EAO engaged Cheam during the Early Engagement phase in the development of the [Joint Summary of Issue and Engagement for the Tilbury Phase 2 LNG Expansion Project](#). The EAO summarized an initial understanding of Cheam's interests including:

- Potential effects to salmon and their habitat;
- Potential effects to Cheam's way of life; and,
- Potential effects to Aboriginal Rights in the Fraser River.

The Proponent has identified Cheam's Indigenous interests to be assessed in the Revised Application through:

- Reviewing requirements and guidance from the EAO, including the AIR; and
- Conducting engagement efforts with Cheam to gather information on their Indigenous interests, as outlined in [Section 11.8.3](#) of the Revised Application - Summary of Engagement of Cheam section.

The EAO engaged with Cheam during all phases of the EA for Tilbury Phase 2, including during the development of the Report. Through these discussions and based on the preliminary list of Indigenous interests identified in the AIR, the following interests were considered:

- Harvesting and subsistence activities;
- Cultural use sites and areas;
- Social and economic conditions; and,
- Indigenous health and well-being.

The assessment of Cheam's Indigenous interests in this section uses these categories. The EAO's assessment includes describing the Indigenous interest, the current context, potential effects, applicable mitigation, and the resulting effects analysis. If there is an adverse residual effect, a characterization of effects and cumulative effects assessment is also completed. Indigenous governance systems were not assessed as stand-alone interests, but were assessed as components of other Indigenous interests, with core analysis placed in the cultural use sites and areas sections.

## 16.2.6 Harvesting and Subsistence Activities

### *Background*

Cheam, as part of the larger Stó:lō People, has a deep-rooted and enduring relationship with the lower Fraser River and its surrounding landscapes. For thousands of years, the Fraser River has formed the foundation of Cheam's food systems, spirituality, culture, and economy. Traditional harvesting activities have included fishing for salmon, sturgeon, trout, and eulachon, as well as gathering plants for food, medicines, and ceremonial purposes. Hunting in the forests, valleys, and subalpine regions of S'ólh Téméxw, particularly in identified use zones like the Canyon Heritage Area<sup>8</sup> provided additional sustenance and materials, with deer, elk, waterfowl, and marine mammals forming a crucial part of the traditional diet. A wide variety of traditional methods such as dip netting, torch lighting, and dry-rack fishing, used especially in the Fraser Canyon, reflect the specialized knowledge passed through generations.

For Cheam, fishing is not merely a source of subsistence but a core expression of identity, spirituality, and intergenerational knowledge transfer. The salmon cycle aligns with traditional rhythms of life, and ceremonies such as the First Salmon Ceremony highlight the sacred connection to the river. The land and water have long supported cultural practices, including the seasonal round that connected winter villages with harvesting and trade camps through a complex network of travel corridors. Spiritual practices, such as the placement of regalia, cleansing rituals, and oral histories tied to place, are deeply intertwined with specific landscapes and waterways. Cultural use sites across the region include sacred landscapes, ceremonial areas, archaeological features, and locations tied to traditional place names. While some of these sites are documented through archaeological records, others are preserved through oral tradition and remain vital to Cheam's cultural continuity, even without physical evidence.

Despite the continued importance of these practices, Cheam faces ongoing challenges to their ability to harvest and maintain cultural connections due to industrial development, habitat loss, pollution. Members have raised concerns about declining fish stocks, increasingly narrow fishing windows, and the broader cultural erosion that comes from reduced access to traditional lands and waters. Nevertheless, Cheam remains committed to its role as caretaker of the land and water, emphasizing the importance of stewardship, knowledge transmission, and the protection of plant and fish resources for future generations. This commitment reflects the enduring relationship between Cheam, the Fraser River, and the natural world, and is a relationship that remains central to the nation's cultural survival and identity.

### *Current Context*

Tilbury Phase 2 is situated on Tilbury Island in Delta, B.C., within a highly disturbed industrial site along the south arm of the Fraser River. The area has been extensively altered from its natural state having been cleared of native forest, stripped of natural soils, and largely covered in gravel or pavement. Vegetation is minimal and dominated by invasive species, providing little ecological or wildlife value. While the land is zoned for industrial and commercial use, it lies within S'ólh Téméxw, the traditional territory of the Cheam and other Stó:lō Peoples. Despite its degraded condition and distance from their reserves, the area remains part of a broader cultural and spiritual landscape to which Cheam maintains a strong connection and relational responsibility to protect its health and flow.

Although the Revised Application states that Cheam has not identified any current subsistence or cultural use, such as fishing, hunting, or plant gathering, within the immediate Project area, the nation emphasizes that this absence does not negate the importance of the site or the potential for impacts. Cheam pointed out that salmon are a migratory species and travel through the lower Fraser River past the Tilbury site before reaching Cheam fishing areas upstream. Cheam has expressed concern that limiting the assessment to active use within Tilbury Phase 2 fails to capture the cumulative and migratory impacts on salmon populations and, by extension, on their fishing rights.

---

<sup>8</sup> The Canyon Heritage Area is a designated cultural landscape within the S'ólh Téméxw Use Plan developed by the S'ólh Téméxw Stewardship Alliance. This area supports traditional activities such as hunting, plant gathering and spiritual practices, however, is outside the Project's RAA.

Spiritual and ceremonial practices, such as fasting, bathing, and the First Salmon Ceremony, require healthy, private natural settings and continue to be practiced today. These cultural activities remain vital to Cheam's identity and rely on the integrity of the broader Fraser River ecosystem.

Past and ongoing industrial development, including urban expansion, port growth, rail infrastructure, and pollution, has steadily eroded Cheam's access to traditional lands and resources. Even when cultural use sites are no longer actively used or have been physically altered, they continue to hold cultural, historical, and spiritual value. Cheam members have raised concerns about the cumulative effects of development, including Tilbury Phase 2, which they believe further limit their ability to exercise Aboriginal rights and uphold stewardship responsibilities. Despite these challenges, Cheam continues to assert its role as caretaker of the Fraser River and its surroundings, advocating for the protection of cultural practices and the regeneration of access to land and water central to their way of life.

#### *Potential Project Effects*

The EAO identified the following pathway of effects, prior to the application of mitigation measures, along with the associated VCs outlined in [Appendix 6](#), that may affect Cheam's harvesting activities and interests during the Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources** from loss or alteration of habitat supporting harvested wildlife, fish, bird, or plant species of cultural or medicinal importance (wildlife, fish and fish habitat and vegetation VCs). Changes to salmon and salmon habitat (fish and fish habitat VC) correlated with impacts to Cheam way of life, and surface water quality and quantity and effects from increased sensory disturbances such as dust, noise, odour, visual landscape (air quality, acoustics, land and resource use VCs);
- **Effects to Cheam First Nation Rights to fish for food, social and ceremonial (FCS) purposes** from habitat loss, (wildlife, fish and fish habitat, vegetation VCs), increased mortality risks to fish, birds, and marine mammals (fish and fish habitat, wildlife and wildlife habitat VCs), and changes in their behavior, including migration patterns, due to sensory disturbances (acoustics, air quality VCs). Additionally, contamination risks to fish habitat in Tilbury Slough (surface water, groundwater VCs) may further impact traditional harvesting and cultural practices; and,
- **Effects on the accessibility and availability of traditional lands and resources** may occur as a result of altered land or water based travel routes, access restrictions, or safety considerations, including changes to navigability and the usability of established travel corridors (land and resource use and surface water VCs), as well as indirect effects from sensory disturbances such as noise, dust, lighting, or visual changes that may discourage travel through otherwise accessible areas (air quality, acoustics, and land and resource use VCs).

#### *Mitigation Measures*

The Revised Application includes a summary of relevant mitigation measures that the Proponent has proposed in response to potential Tilbury Phase 2-related effects on harvesting and subsistence activities, as mentioned in the section above. A full table of Proponent mitigations can be found in [Appendix A](#) of the Revised Application. Below is a summary of mitigation measures, how they address effects on the relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Cheam's harvesting and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during construction and operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and

nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Cheam's harvesting and cultural practices;

- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm-sewer system. These protections support water quality and fish habitat relied on to support Cheam's harvesting and cultural practices;
- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by Cheam for harvesting and cultural practices;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by Cheam for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife-protection measures, such as timing construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to Cheam's harvesting and cultural practices;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill-prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the health and availability of salmon and other fish species central to Cheam's FSC harvesting and cultural practices;
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used for harvesting or cultural practices; and,
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat and vegetation important to Cheam's harvesting and cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions to help reduce potential impacts on Cheam's harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting activities (see [Section 8](#) of this Report):

- **Condition 10 (Community Feedback Process)** creates a clear way for Cheam to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of Cheam's harvesting and cultural practices;
- **Condition 12 (CEMP)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to Cheam's harvesting and cultural practices;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to Cheam's harvesting and cultural practices;

- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emissions-control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and overall ecosystem health, this plan helps protect the environmental conditions that support Cheam's harvesting and cultural practices; and,
- **Condition 17 (Dry Street Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project-related roads, which may lower potential impacts on salmon and other fish important to Cheam's harvesting and cultural practices.

In addition to the Proponent's mitigations and the provincial conditions the EAO identified the following federal Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to harvesting and subsistence activities:

- **Federal Consideration for Migratory Bird Protections:** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Cheam's harvesting practices and broader ecosystem conditions important to their way of life.

#### *The EAO's Analysis and Conclusions*

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Cheam's harvesting practices and interests:

- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources;
- Effects to Cheam First Nation Aboriginal rights to fish for FSC purposes; and,
- Effects on the accessibility and availability of traditional lands and resources.

The EAO's characterization of the residual effects of Tilbury Phase 2 on harvesting and subsistence activities are summarized in the table below.

*Table 15: Summary of residual effects and rationale on Cheam First Nation and its harvesting and subsistence activities*

| Residual Effects                                                                                                                                                                                                                                                                                                                               | Assessment Rating*                                                                                                                                                                                                                 | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Harvesting and subsistence activities<br>- Changes to the experiences and preferences around the practice of harvesting rights and effects on the quality, quantity and availability of resources<br>- Effects to Cheam's right to fish for FSC purposes<br>- Effects on the accessibility and availability of traditional lands and resources | Context (resilience): moderate<br>Magnitude: Negligible<br>Extent: local<br>Duration: medium-term<br>Reversibility: reversible<br>Frequency: continuous<br>Affected Populations: disproportionate<br>Risk: low<br>Uncertainty: low | <p><b>Context:</b> Broadly speaking this interest is considered moderately resilient, meaning it is understood to generally withstand some imposed stresses. However, due to the already industrialized state of the area, this resilience may drop to low, as the interest may not easily adapt to further potential effects. It is understood that Cheam would have traditionally used the area for a variety of harvesting and subsistence activities, but that urbanization, pollution and restricted access has eroded Cheam's ability to practice their rights in the area.</p> <p><b>Magnitude</b> of impact is considered negligible. Project activities are not expected to cause detectable indirect effects on salmon or other fish migrating past the Project site to Cheam's upstream fishing areas in the Fraser River. Sensory disturbances associated with the Project (i.e. noise, light and air quality) are negligible to low in magnitude and are not expected to extend to area where Cheam harvests or fishes. No active harvesting occurs in the project area and residual effects on valued components such as surface water quality, fish and fish habitat are assessed as negligible in magnitude.</p> <p><b>Extent:</b> These effects are rated local in extent, since the spatial scale of residual effects to applicable VC's is limited, the impact on harvesting is expected to remain local, primarily within the immediate project area.</p> |

| Residual Effects                                                                                                                  | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p><b>Duration:</b> is considered medium-term, as effects to harvesting activities persist only while the facility is operational.</p> <p><b>Reversibility:</b> Most effects, particularly sensory disturbances like noise and light, are fully reversible upon decommissioning.</p> <p><b>Frequency:</b> Rated as continuous as effects would be most prominent during construction, but some effects (noise, light disturbance) would occur continuously.</p> <p><b>Affected Populations:</b> Tilbury Phase 2's impacts will primarily affect Cheam members who actively harvest, though indirect effects may also be felt by those who refrain from harvesting due to perceived environmental degradation in the highly developed area.</p> <p><b>Risk:</b> The likelihood of these effects occurring is low given effectiveness of mitigation measures, with negligible magnitude and limited extent, the overall consequences are expected to be minor. Therefore, the risk is rated as low.</p> <p><b>Uncertainty:</b> With reasonably well-understood pathways and expectation of effective mitigation measures, the level of uncertainty is low, supporting the conclusion of negligible impact.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### Cumulative Effects

As described in the Background and Current Context section, the lower Fraser River and Tilbury Island area have undergone longstanding industrial development, as well as impacts due to climate change, resulting in existing pressures on environmental conditions and on Cheam's harvesting and subsistence activities.

The Revised Application identifies several reasonably foreseeable projects that may affect Cheam's harvesting and subsistence interests. These include T1B, which would increase LNG production, and the TMJ Project, which would introduce additional vessel traffic in the Fraser River and further development of the foreshore area. Both T1B and TMJ could contribute additional sensory disturbances (noise, light, vibration) and impact air quality in areas used by Cheam for harvesting. TMJ could further alter fish habitat and water quality in areas where Cheam assert harvesting and subsistence rights.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, including FortisBC's proposed mitigation measures, EAO's Table of Conditions and KMMs, the EAO concludes that Tilbury Phase 2 would have a negligible effect on Cheam's harvesting and substance activities.

## 16.2.7 Cultural Use Sites and Areas

### *Background*

Cheam, part of the Stó:lō People and Coast Salish cultural group, has deep ancestral ties to S'ólh Téméxw ("our land"), with the Fraser River central to its cultural identity, spiritual practices, and stewardship responsibilities. Fishing, especially salmon harvesting, has shaped Cheam's traditions, ceremonies such as the First Salmon Ceremony, and intergenerational knowledge transfer. Historically, cultural use areas included fishing sites, plant gathering locations, and sacred landmarks linked by river travel corridors. Today, industrialization and cumulative effects have reduced access to these areas, impacting cultural continuity and plant medicine practices.

### *Current Context*

Cheam continues to maintain cultural connections to the Fraser River and surrounding landscapes despite extensive industrialization in the lower Fraser region. Traditional cultural use areas historically supported fishing, plant gathering, and spiritual practices; however, access to these areas has been increasingly constrained by development, habitat loss, and regulatory restrictions. While Tilbury Phase 2 is located within an industrialized zone and Cheam has not identified specific cultural sites in or adjacent to the site, the nation emphasizes the importance of safeguarding salmon passage and river health to sustain cultural practices and spiritual relationships tied to the Fraser River. These concerns reflect broader challenges to cultural continuity and intergenerational knowledge transfer within S'ólh Téméxw.

### *Potential Project Effects*

The EAO has identified the following pathway of effects, prior to the application of mitigation measures, along with associated VCs outlined in [Appendix 6](#), which may affect Cheam's cultural use sites and areas during Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Loss of access to and disenfranchisement from cultural sites;** While Tilbury Phase 2 is not currently accessible for cultural activities like hunting or plant gathering and will remain restricted, Cheam has emphasized the vital importance of travelways in connecting cultural sites and areas throughout S'ólh Téméxw, particularly along the lower Fraser River and would likely use Tilbury Phase 2 site if there was the opportunity.  
Specific cultural use sites have not been identified to date within Project Footprint or the LAA; however, an absence of physical evidence does not equate to a lack of use or significance of the area for the Stó:lō Peoples. Sensory disturbances (noise, air quality, visual landscape) are predicted to affect the quality of experience for people engaged in activities on surrounding lands and waters and therefore could alter the experience of Cheam members using traditional travelways or cultural areas in the (acoustic, air quality, culture, land and resource use VCs); and,
- **Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas;** The predicted levels of visual and sensory disturbance may impact and deter Cheam members from engaging in their cultural and spiritual practices (Culture VC) at their preferred locations close to Tilbury Phase 2 site. Risks to fish habitat (See Harvesting and Subsistence section above) from contamination in the Tilbury Slough or changes in fish distribution or behaviour from sensory disruptions could impact traditional cultural practices related to salmon.

### *Mitigation Measures*

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed to potential Tilbury Phase 2 related effects on cultural use sites and areas. These include the following:

- **Acoustics (Section 7.3)** Noise reduction measures during construction and operation, including idle-reduction policies, equipment muffling, enclosures, and engineered noise controls, help limit disturbance to culturally important areas and activities. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of cultural knowledge by Cheam;
- **Soil (Section 7.6)** Soil management measures, including erosion control, spill-prevention protocols, and careful handling and disposal of contaminated soils, help prevent the migration of pollutants into nearby cultural areas and waterways. Maintaining soil stability and quality supports the protection of culturally important places and landscapes used by Cheam;
- **Land and Resource Use (Section 7.11)** Traffic management planning, noise and lighting controls, and communication regarding project activities help reduce disruptions to access and use of culturally important areas. These measures support Cheam's ability to safely access and continue cultural practices within their traditional territory;
- **Infrastructure and Services (Section 7.12)** Measures to manage traffic, workforce accommodation, emergency response, and waste help limit indirect pressures on local lands, waters, and access routes. By managing congestion and pressures on community services, these measures help maintain safe access to culturally important areas and manage disturbance to cultural landscapes relied on by Cheam;
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures, site protection, and early notification to Indigenous nations, help protect culturally important sites, features, and landscapes. These measures support Cheam's ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connections to territory; and,
- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support Cheam's ability to access, use, and maintain culturally important areas, including places of teaching, ceremony, and connection to land and water.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions conditions that would mitigate potential effects to Indigenous cultural use sites and areas (see also [Section 8](#) of this report):

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance;
- **Condition 10 (Community Feedback Process)** establishes a clear and structured mechanism for Cheam to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of culturally important landscapes and areas, supporting Cheam's continued access to and use of cultural sites during project Construction;

- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, lighting, wildlife interactions, and spills during project Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by Cheam;
- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emissions control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites by Cheam; and,
- **Condition 15 (Chance Find Protocol)** requires the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If Cheam historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

### *The EAO's Analysis and Conclusions*

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Cheam's cultural use sites and areas rights and interests:

- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance;
- Effects of various Tilbury Phase 2 activities on cultural values and spiritual activities; and, Loss of access to or disenfranchisement from cultural sites.

The EAO's characterization of the residual effects of Tilbury Phase 2 on Cultural Use Sites and Areas are summarized in the table below.

Table 16: Summary of residual effects and rationale on Cheam First Nation and its cultural use sites and areas

| Residual Effects                                                                                                                                                                                                         | Assessment Rating*                                                                                                                                                                                                                                                          | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Cultural use sites and areas<br><br>-Loss of access to and disenfranchisement from cultural sites<br><br>-Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas | Context (resilience): Low Resiliency<br><br>Magnitude: Negligible<br><br>Extent: Local<br><br>Duration: Medium-term<br><br>Reversibility: Partially Reversible<br><br>Frequency: Continuous<br><br>Affected Populations: Even<br><br>Risk: Low<br><br>Uncertainty: Moderate | <p><b>Context:</b> rated as having low resiliency. Although Cheam has demonstrated cultural resilience in the face of historical and ongoing challenges the persistence of cumulative disturbances in the Fraser River corridor, including habitat alteration, sensory impacts, and reduced access to key cultural areas, has likely diminished overall capacity to absorb additional adverse effects. This rating reflects a balanced assessment acknowledging both cultural resilience and the challenges posed by the highly modified setting.</p> <p><b>Magnitude:</b> Tilbury Phase 2 could have negligible magnitude effect to Cheam's Cultural Use Sites and Areas. Tilbury Phase 2 may cause a negligible to low magnitude sensory disturbance (acoustic, air quality, visual) that could be detected by Cheam members taking part in cultural practices; however, no cultural sites were identified close to the Project site.</p> <p><b>Extent:</b> rated as local, as the anticipated residual effects are geographically confined to Tilbury Phase 2 vicinity and immediate surrounding areas. While Cheam members continue to maintain connections across the lower Fraser, the predicted effects are unlikely to extend far Project site.</p> <p><b>Duration:</b> is rated as medium-term as residual effects related to Tilbury Phase 2 will likely cease after decommissioning phases.</p> <p><b>Reversibility:</b> while the potential for cultural impacts is recognized—particularly in relation to continuous frequency for sensory disturbances and the loss of access to culturally important sites—these are largely</p> |

| Residual Effects                                                                                                                  | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p>reversible post-decommissioning, except for disruptions to traditional practices, which may be irreversible.</p> <p><b>Frequency:</b> rated as <b>continuous</b> for restrictions on access to Tilbury Phase 2, which is an ongoing condition. Sensory disturbances (e.g., noise, odour, visual changes) may be continuous during Operation but variable during Construction depending on activity type.</p> <p><b>Affected Populations:</b> Direct impacts would disproportionately affect any Cheam members actively practicing cultural activities close to the Project site.</p> <p><b>Risk:</b> the likelihood of some negative cultural impacts occurring is rated low, given the limited use of the area by Cheam and therefore limit causal link to members, consequence is expected to be minor due to the negligible to low magnitude of Tilbury Phase 2-related effects, application of mitigation measures and regional extent. Therefore, risk is characterized as low.</p> <p><b>Uncertainty:</b> is rated moderate to acknowledge the inherent complexity in assessing cultural impacts, which are often subjective and deeply personal, and difficult to predict with certainty. EAO is also not aware of any specific cultural sites in the area.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Cumulative Effects

The historical context of environmental degradation and land-use changes has already affected Cheam's cultural use sites and areas, as detailed in the background and Current Context section above. These effects have steadily reduced the availability, quality, and accessibility of sites central to Cheam's cultural identity, spirituality, and traditional practices. Settlement expansion, railway development, pollution, and the growth of infrastructure, particularly around the Fraser River and the Salish Sea, have contributed to the fragmentation of important landscapes and travelways that connect cultural use areas. Many of these sites, deeply rooted in oral traditions and generational knowledge, are not always represented in physical or archaeological records, making them especially vulnerable to being overlooked in environmental assessments and land planning.

As stated in the Revised Application, FortisBC notes that two foreseeable projects, T1B and TMJ, are expected to modify the Tilbury Island foreshore prior to construction of Tilbury Phase 2. TMJ would also introduce additional vessel traffic in the Fraser River. These developments are expected to introduce additional sensory disturbance (noise, light, vibration) affecting nearby cultural site access and use. T1B could remove vegetation, impacting culturally important plants and wildlife habitat, while TMJ shipping activities may increase aquatic disturbance, with potential effects on fish populations and cultural connections to the Fraser River.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

*Conclusion*

Considering the above analyses, including proposed proponent mitigations, EAO's conditions, KMMs, and based on the Project specific effects of Tilbury Phase 2, the EAO concludes that the Project will have a negligible effect on the cultural use sites and areas of Cheam.

**16.2.8 Social and Economic Conditions and Indigenous Health and Well-being***Background*

Historically, the social and economic foundations of Cheam and other Stó:lō communities in the Lower Fraser River region have been deeply tied to a land-based economy centered on salmon fishing. The Fraser River has long served as a vital source of food, trade, and cultural expression. Fishing, especially for salmon, was not only a subsistence activity but also shaped spiritual traditions, social systems, and stewardship responsibilities. Seasonal cycles of harvesting, gathering, and trading formed the backbone of a sustainable and interconnected economy that linked communities across S'ólh Téméxw through kinship networks and shared responsibilities.

Cheam's traditional economy extended beyond fishing to include the gathering of plants for food, medicine, teas, and cultural purposes, as well as the use of travel corridors to reach seasonal camps and regional trade routes. Access to clean water, healthy ecosystems, and abundant natural resources were essential to community well-being. However, colonial land policies, environmental degradation, and restrictive government regulations have disrupted these traditional systems. These changes have limited access to key resources and undermined the self-sustaining nature of Cheam's land-based economy. Despite these challenges, Cheam continues to uphold cultural and economic practices such as food-social-ceremonial fisheries and knowledge sharing, while also pursuing new opportunities through self-governance, partnerships, and economic development initiatives.

Traditionally, Cheam maintained a holistic and place-based system of health and well-being, rooted in their reciprocal relationship with the land and waters of S'ólh Téméxw. Physical, mental, and spiritual wellness was supported by seasonal harvesting, salmon fishing, the use of traditional medicines, and a way of life grounded in intergenerational knowledge, ceremony, fasting, and storytelling. Strong kinship ties and active engagement with the land fostered a resilient and balanced community, where well-being was not seen simply as the absence of illness, but as harmony between individuals, the collective, and the natural world. Although modern pressures have impacted access to land and resources, Cheam continues to prioritize community wellness by strengthening cultural identity, stewarding traditional knowledge, and advocating for the protection of their ancestral territory.

*Current Context*

The current social and economic conditions of Cheam have been shaped by the impacts of colonial policies, environmental degradation, and industrial development in the Lower Fraser River region. These historic and ongoing pressures have affected the exercise of Section 35 Rights and traditional land-based practices, while also influencing key socio-economic indicators such as housing, infrastructure, education, and employment. Cheam has a relatively young and growing population, with members residing both on- and off-reserve near the Fraser River. The local economy remains closely tied to traditional activities such as salmon fishing and gathering, while also incorporating efforts to diversify through workforce training, procurement, and business development associated with regional industrial projects. Balancing the continuation of traditional economic activities with participation in the modern economy remains a key challenge, particularly in the context of ongoing development pressures in S'ólh Téméxw.

In response to increasing demand for consultation and resource management oversight, Cheam established a Lands Department in October 2024. This department is now the main point of contact for project engagement and manages referrals related to land use and environmental assessments. It plays a central role in ensuring that proposed projects are assessed in alignment with Cheam's cultural values, environmental stewardship responsibilities, and governance objectives.

While industrial development has already impacted Cheam's ability to meaningfully exercise their rights and maintain cultural practices, Cheam has identified potential for positive economic outcomes if Tilbury Phase 2 can offer equitable employment, contracting, and procurement opportunities. However, Cheam has also noted potential barriers, including limited capacity among smaller Indigenous businesses and competition for skilled labour, which could limit the realization of these benefits.

Community health and well-being within Cheam continue to be affected by the loss of access to traditional lands and the degradation of local ecosystems. The Revised Application recognizes that historic land dispossession and environmental impacts, such as pollution and habitat loss, have disrupted access to traditional foods, medicines, and clean water, all of which are foundational to Cheam's health, culture, and identity. These disruptions have contributed to ongoing health disparities between Indigenous and non-Indigenous populations, including higher rates of chronic illness, addiction, and reduced life expectancy. These outcomes are compounded by systemic issues such as intergenerational trauma, racism, poverty, and limited access to culturally appropriate healthcare services. Despite these challenges, Cheam continues to prioritize wellness by delivering health programs on-reserve and working in collaboration with regional Stó:lō organizations and the First Nations Health Authority to provide comprehensive medical, dental, and community-based health services.

Traditional land and water-based practices, such as salmon fishing, plant harvesting, and ceremonial use of the land, remain integral to Cheam's vision of health and well-being. However, the cumulative effects of industrial activity have made the practice of these traditions increasingly difficult. Cheam has expressed concern that ongoing development in the Lower Fraser region further constrains their ability to maintain cultural health practices and fulfill stewardship responsibilities. The nation continues to advocate for the protection and restoration of culturally important lands and waters, emphasizing their importance not only for cultural continuity, but also for improving community health outcomes for present and future generations.

#### *Potential Project Effects*

The EAO identified the following pathway of effects, prior to the application of mitigation measures, along with the associated VCs in [Appendix 6](#), that may affect Cheam's social and economic conditions and Indigenous health and well-being during Construction, Operation and Decommissioning Phases of Tilbury Phase 2:

- **Effects to Cheam First Nation's employment opportunities, Indigenous businesses, procurement opportunities, and Cheam First Nation revenue:** Tilbury Phase 2 could positively affect Cheam's employment and business opportunities, depending on member participation and access to contracts (employment and economy VC). Indigenous workers are also more likely to be in construction-related jobs. However, smaller Indigenous businesses, including those linked to Cheam, may face challenges competing for workers or meeting Tilbury Phase 2 demands;
- **Effects to Cheam First Nation's future aspirations for sites or areas surrounding Tilbury Phase 2:** Potential residual effects both real and perceived from Tilbury Phase 2 could affect Cheam's aspirations for land and water restoration in the lower Fraser region (land and resource use VC);
- **Effects to Cheam First Nation's ability to improve social and economic conditions:** Tilbury Phase 2 may support Cheam's efforts to improve social and economic conditions by creating employment, training, and business opportunities. Increased demand for skilled workers could also boost interest in trades training (employment and economy VC);
- **Effects on the quality, quantity, and availability of harvested country foods:** This potential effect relates directly to the VCs of vegetation, wildlife and wildlife habitat, and fish and fish habitat. Cheam members currently maintain salmon fisheries upstream from Tilbury Phase 2. As per EAO's assessment report, there is expected to be a negligible interaction between Tilbury Phase 2 activities and Cheam harvesting and subsistence activities related to the quality, quantity, and availability of resources;
- **Effects on the value and perceived quality of country foods:** This potential effect pertains to Human Health and various VCs linked to contamination: air quality, acoustic, surface water, groundwater, and soil. The EAO

predicts negligible impacts on the quality, quantity, or availability of plants, wildlife, or fish, and notes that while residual effects are negligible, they are not entirely avoidable. Recognizing that perceptions can affect harvesting, the EAO anticipates minimal interaction between Tilbury Phase 2 and perceived impacts on country food quality, citing minimal biophysical effects, the area's existing industrial nature, and the cessation of waterborne deliveries;

- **Effects on air quality, noise and water quality:** These effects are directly linked to the VCs of air quality, acoustic, surface water, and groundwater. EAO predicts that some Cheam members could be minimally affected by Tilbury Phase 2's land-based activities, including construction, increased truck traffic and links to air quality and noise. Air quality effects are expected to be negligible, with low magnitude SO<sub>2</sub> emissions not anticipated to noticeably impact Indigenous interests. Noise effects are also predicted to be low in magnitude and only detectable to people near the site; and,
- **Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites:** This overarching effect relates to human health, culture, harvesting and subsistence activities, and cultural use sites and areas. EAO acknowledges Cheam's view that practicing traditions supports health and well-being and concludes that Tilbury Phase 2 will have negligible (but not non-existent) interaction with traditional activities or access to cultural sites. As such, minimal effects on health and well-being tied to traditional practices are anticipated. EAO also notes potential positive effects on socio-economic health determinants through increased employment and economic opportunities for Cheam members.

#### *Mitigation Measures*

The Revised Application includes a summary of relevant mitigation measures identified that FortisBC has proposed in response to potential Tilbury Phase 2 related effects on social and economic conditions and Indigenous health and well-being. These include the following:

- **Land and Resource Use VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting Cheam's long-term aspirations for land and water restoration and reducing stressors that can affect well-being;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for Cheam members and businesses to participate economically in the project, supporting improved social conditions and community well-being;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socio-economic impacts on Cheam and supporting health and community stability;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports Cheam's food security, cultural identity, and health by safeguarding salmon and other species essential to FSC harvesting;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting Cheam's cultural continuity and nutritional well-being;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to Cheam's physical health and cultural practices;
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Cheam's well-being;

- **Groundwater (Section 7.5)** Protecting groundwater from contamination helps maintain the quality of ecosystems that support fish, plants, and wildlife relied on for Cheam's subsistence and health;
- **Surface Water (Section 7.4)** Managing runoff, erosion, and sediment helps maintain water quality in the lower Fraser, supporting Cheam's cultural and nutritional reliance on healthy salmon and aquatic ecosystems;
- **Acoustics (Section 7.3)** Noise reduction measures limit sensory disturbance to people, wildlife, and harvesting areas, reducing stress and supporting Cheam's comfort, well-being, and connection to land and water;
- **Air Quality (Section 7.2)** Air emission controls help protect respiratory health and prevent contamination of country foods, supporting Cheam's physical well-being and confidence in harvesting; and,
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect Cheam members' physical, cultural, and mental health.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on social and economic conditions and Indigenous health and well-being:

- **Condition 10 (Community Feedback Process)** provides Cheam with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting Indigenous health and well-being;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)** requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with Cheam to be developed by the Holder in consultation with the Nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting Cheam's physical health and overall well-being;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If Cheam historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated cultural or emotional harm, supporting Indigenous health and well-being;
- **Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support Cheam First Nation's socio-economic well-being through increased access to jobs, skills development, and business opportunities associated with Tilbury Phase 2; and,
- **Condition 17 (Dry Street Sweeping Report)** requires FortisBC to submit a Report on the effectiveness Dry Street Sweeping to mitigate the effects of 6-PPDQ on fish within eighteen months of a Certificate being issued. By informing measures to protect downstream aquatic environments, this condition supports Cheam's health and well-being by helping maintain confidence in environmental quality and minimizing potential concerns related to contamination of culturally important fish and waterways.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Well-being:

- Accidents and Malfunctions Reporting would support mitigation of potential impacts on the Nation's interests by ensuring timely responses, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

#### *The EAO's Analysis and Conclusions*

After considering the EAO's conclusions on the linked VCs, and proposed mitigation measures, the EAO concludes that Tilbury Phase 2 is not expected to result in residual adverse effects on Cheam's social and economic conditions. While the nation has encountered systemic challenges directly impacting access to housing, infrastructure, employment and culturally important lands, these are primarily the result of the ongoing legacy of regional industrial development, and not directly attributable to Tilbury Phase 2. Although there may be interactions with Cheam's aspirations for stewardship and regional restoration, there is also the potential for positive social and economic outcomes, such as direct or indirect employment, and contracts or procurement opportunities, which may strengthen the nation's economic conditions. These potential positive effects combined with the proposed mitigation measures, are expected to result in some offset of any negative impacts with a reasonable degree of certainty. After applying proposed mitigation measures and EAO conditions, the EAO concludes that Tilbury Phase 2 is not expected to result in residual adverse effects on Social and Economic Conditions; therefore, no effects characterization or cumulative effects assessment was conducted.

In contrast, the EAO determined that the Project could result in the following residual adverse effects on Cheam's Indigenous health and well-being:

- Effects on the quality, quantity, and availability of harvested country foods;
- Effects on the value and perceived quality of country foods;
- Effects on air quality, noise and water quality; and
- Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites.

The EAO's characterization of the residual effects of Tilbury Phase 2 on Indigenous health and well-being are summarized in the table below.

*Table 17: Summary of residual effects and rationale on Cheam First Nation and its Indigenous health and well-being*

| Residual Effects                                                                                                                                                                                                                                                                                                                                                         | Assessment Rating*                                                                                                                                                                                                                           | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Residual effects to fish and fish habitat VC is rated as negligible in magnitude, and noise and air quality predicted to be negligible to low in magnitude after mitigation and concentrated around the Project site. Country food availability is not anticipated to be impacted by the Project.</p> <p><b>Extent:</b> Potential effects are Local. While some economic linkages (e.g., fish species or harvesting practices) connect to broader networks, measurable socio-economic effects would be concentrated near Tilbury Phase 2.</p> <p><b>Reversibility:</b> although some effects—particularly sensory disturbances and perceived environmental degradation—may persist throughout Tilbury Phase 2's entire Operational Phase, these are largely reversible post-decommissioning resulting in a partially reversible rating.</p> |

| Residual Effects                                                                                                                  | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p><b>Frequency:</b> some stressors may be continuous, others will be intermittent, and the perception of environmental change may contribute to ongoing impacts on well-being.</p> <p><b>Affected Populations:</b> Cheam members engaged in traditional practices near the Project site or those with existing health vulnerabilities may be disproportionately affected.</p> <p><b>Risk:</b> the overall likelihood of risk is considered low due to the low likelihood of significant adverse outcomes with mitigation measures in place and the presence of offsetting benefits. Consequences of residual effect occurring are minor, due to mitigations and conditions, and low to negligible residual effects from the Project that could impact cultural sites, or practices.</p> <p><b>Uncertainty:</b> a moderate level of uncertainty remains, given the challenges in quantifying cultural and perceptual impacts on health, but this does not alter the conclusion of a negligible overall effect.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### Cumulative Effects

Tilbury Phase 2 is located within an area that has been subject to extensive historical and ongoing industrial development, and Cheam's health and well-being have already been affected by cumulative impacts associated with pollution, habitat degradation, and reduced access to traditional lands and resources.

Furthermore, the Revised Application identifies other reasonably foreseeable projects in the vicinity that could contribute to cumulative effects: T1B and the TMJ Project, expected to introduce sensory disturbances and result in impacts to plant and wildlife habitat as well as aquatic life and habitat from shipping activities. Both TMJ and T1B have the potential to add to cumulative effects associated with decreased air quality and associated health impacts. The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project-specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, FortisBC's proposed mitigation measures, and EAO's Table of Conditions, the EAO concludes that Tilbury Phase 2 would have negligible effects on Cheam's health and well-being interests.

### 16.2.9 Positive Effects of Tilbury Phase 2

According to the Revised Application, Tilbury Phase 2 is anticipated to generate employment opportunities, particularly during construction, create potential benefits for Indigenous businesses through contracting and procurement, and support long-term skills development for First Nations, including Cheam members. These opportunities may also contribute to improved social and economic conditions for the community.

The anticipated positive effects of Tilbury Phase 2 will depend on the degree of participation and access that Cheam members and businesses have to the opportunities created. Based on the current information, direct benefits to Cheam interests are expected to be limited relative to existing conditions.

### 16.2.10 Conclusions

Considering the above analyses and the EAO's engagement with Cheam, Cheam's engagement with FortisBC, mitigation measures, cumulative effects, the EAO's recommended Table of Conditions and identified Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 is anticipated to have the following impacts on Cheam's Indigenous interests:

- Negligible residual effects on harvesting and subsistence activities;
- Negligible residual effects on cultural use sites and areas; and
- Negligible residual effect on Indigenous health and well-being.

Considering the above analysis, the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on the Indigenous interests of Cheam has been adequately avoided, minimized, or otherwise accommodated. Based on the engagement undertaken with Cheam on Tilbury Phase 2, as outlined above in Section 16.2.2, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with Cheam.

## 16.3 Katzie First Nation

### 16.3.1 Community Profile

Katzie First Nation (Katzie) have lived and thrived in their territory for thousands of years. To this day Katzie maintain deep connections to our lands and the rivers, sloughs, creeks, and wetlands that run like veins through the heart of their territory. At the centre of Katzie territory is sḡáyčəyaʔł̓ ḡacaʔ (The lake of the Katzie) now known as Pitt Lake.

Though now called Pitt Meadows, Maple Ridge, City of Surrey (Surrey), City of Langley (Langley) and Delta, Katzie have ancient names for the many places where their ancestors lived and worked, and places where powerful transformations occurred. These names live on and Katzie are working to ensure that the names continue to be spoken by present and future generations.

Katzie territory also encompasses what the government has allocated as wilderness and parklands including portions of Pinecone Burke, Golden Ears, and Garibaldi Provincial Parks. Katzie are working hard to ensure that these areas are managed according to Katzie principles so that they remain healthy.

Katzie has a community of approximately 648 members. While around half reside off reserve, many continue to live within Katzie's traditional territory, maintaining strong cultural and community ties.

### 16.3.2 Katzie First Nation Involvement in the Environmental Assessment

Katzie has had minimal involvement in the environmental assessment for Tilbury Phase 2 Liquid Natural Gas (LNG) Expansion Project (Tilbury Phase 2 or The Project). Katzie was offered capacity funding to take part in the Application Review and Effects Assessment Phases of the EA for Tilbury Phase 2 but has not accepted these funds.

The EAO has attempted to include Katzie in all phases of the EA for Tilbury Phase 2, with some input provided during process planning phase and then nothing during the remaining two phases. During the Application Review phase, Katzie was invited to attend TAC meetings and provide comment on the Revised Application.

The EAO used the following sources in drafting the assessment of Tilbury Phase 2 effects on their Indigenous interests:

- FortisBC's (Proponent) Revised Application;
- Information submitted during the EA by the Proponent and Katzie;
- Conclusions from the EAO's assessment of VCs; and
- A summary of the Proponent's engagement with Katzie is provided in [Section 11.05](#) of the Revised Application and the Proponent's [Indigenous Engagement Report](#).

### 16.3.3 Assessment Boundaries

All Tilbury Phase 2 components are within Katzie's traditional territory.

The spatial assessment boundaries for each Indigenous interest were based on the overlap between Katzie's traditional territory with the combined Local and RAAs identified for linked VCs. Refer to Figure 11.5-1 in Section 11.05 of the Revised Application (Indigenous Interests and Tilbury Phase 2's Location). The LAA for each Indigenous interest reflects the combined LAAs of the VCs linked to that interest. The RAA is defined the same way, using the combined RAAs of the linked VCs. In general, the LAA is used to assess direct and indirect Tilbury Phase 2 effects, while the RAA supports the assessment of cumulative effects.

The assessment of potential effects related to Tilbury Phase 2 considered three distinct phases:

- Construction phase, with an estimated duration of three to six years;
- Operation phase, expected to last 40 plus years; and
- Decommissioning phase, anticipated to take approximately two years.

### 16.3.4 Regional Context

Areas impacted by Tilbury Phase 2 have been important sources of Katzie's rights since time before contact with Europeans and continue to be relied upon by Katzie members for the exercise of rights, including self-governance and knowledge transmission to new generations. Katzie has faced, and is facing, extensive industrial development in the lands and waters of its traditional territory. The cumulative effects of existing and proposed industrial developments on the environment are impacting the ability of where and how Katzie members practice their rights.

It is the Proponent's understanding from information available at the time of writing the Revised Application that Katzie does not currently use the south arm of the lower Fraser River adjacent to Tilbury Phase 2 to fish, gather plants, hunt, or access cultural sites or areas.

Katzie is committed to protecting their waters, fish, and sacred sites. The impacts of European contact and industrialization, including contamination, have extensively affected their traditional harvesting areas. Their cultural and historical ties to this region remain strong, shaping their ongoing relationship with the land and waters.

The existing Tilbury LNG facility consists of gravel and paved areas, existing infrastructure, and equipment laydown areas supporting little plant life with very little to no habitat value for wildlife. The vegetation within Tilbury Phase 2 is mostly limited to ditch lines and spoil piles and is dominated by non-native and invasive plant species. Public access to Tilbury Phase 2 is limited, although there is currently public use of the dike to the north of Tilbury Phase 2 along the Fraser River.

### 16.3.5 Indigenous Interests

The EAO engaged Katzie during the Early Engagement phase in the development of the [Joint Summary of Issue and Engagement for the Tilbury Phase 2 LNG Expansion Project](#), where EAO summarized an initial understanding of Katzie's interests to be:

- Cultural and environmental stewardship, including protection of archaeological sites, cultural values, and aquatic habitats;
- Continued access to and use of the Fraser River for navigation and fishing; and
- Respect for Aboriginal rights, title and knowledge. Interest in economic development and capacity building, and a meaningful assessment of cumulative effects on environmental and cultural resources.

During the Readiness Decision phase in the development of the [Readiness Decision Report](#), the EAO engaged with Katzie who indicated that their primary concerns regarding Tilbury Phase 2 include: cumulative effects, marine use of the Fraser River during Construction, accidents and malfunctions impacting the Fraser River, and GHG emissions.

This information was used in drafting the [Tilbury Phase 2- Schedule C – Application Information Requirements](#); see Proposed Preliminary List of Indigenous Interests (Table 6).

The Proponent's identified Katzie Indigenous interests to be assessed in the Revised Application through:

- Reviewing requirements and guidance from the EAO and AIR; and
- Conducting engagement efforts with Katzie to gather information on their Indigenous interests, as outlined in [Section 11.5.3](#) of the Revised Application - Summary of Engagement of the Katzie section.

The EAO attempted to engage with Katzie during the development of this Report. As no comments were received on their section, the EAO relied on the preliminary list of Indigenous interests identified in the AIR, which include:

- Harvesting and subsistence activities;
- Cultural use sites and areas;
- Social and economic conditions;
- Indigenous health and well-being; and
- Indigenous governance systems.

The assessment of Katzie's Indigenous interests in this section uses these categories. The EAO's assessment includes describing the Indigenous interest, the current context, potential effects, applicable mitigation, and the resulting effects analysis. If there is an adverse residual effect a characterization of effects and cumulative effects assessment is also completed. Indigenous governance systems were not assessed as a stand-alone interest, but were assessed as components of other Indigenous interests, with core analysis placed in the Cultural Use Sites and Areas section.

### 16.3.6 Harvesting and Subsistence Activities

#### *Background*

Katzie peoples lived in and travelled through their traditional territory since time immemorial, maintaining deep connections to their lands, rivers, sloughs, creeks, and wetlands. They traditionally travelled through their territory on a seasonal round which means that they used the lower Fraser River area during the winter dance season and remained there until after the spring eulachon run. As water levels in the lower Fraser River rose, they would move deeper into their territory to fish for sturgeon. In late summer and mid-fall, they would return to the lower Fraser River to harvest berries, dig wapato (a semi-aquatic plant with edible tubers), and catch late-run salmon. The lower Fraser River, its tributaries, and foreshore have historically provided, and continue to provide cultural, social, economic, and spiritual resources.

Fishing has always been foundational to Katzie members, influencing their stewardship and protection of land, and marine resources. They have stated that they used the lower Fraser River, its tributaries, and shores for their resources for thousands of years, and continue to do so. Key fish resources included salmon (spring, chum, sockeye, Chinook, and coho), trout, steelhead, white sturgeon, eulachon, amphibians, and marine mammals. Fish camps were common along the lower Fraser River, from its mouth to the Fraser Canyon, during summer and fall salmon runs. Important historical fishing locations included villages and camps along the lower Fraser River, and areas near Pitt Lake, Sturgeon Slough, the Alouette River, and Widgeon Creek.

According to the Revised Application, Katzie people hunted along the foreshore and lower Fraser River where wildlife was abundant. Species hunted included deer, elk, black bear, small fur-bearing animals (such as beaver, rabbits, and marmots), and water mammals (like seals).

#### *Current Context*

FortisBC's Revised Application noted that Katzie did not provide specific current use site information near Tilbury Phase 2, leading FortisBC to understand that Katzie does not currently use the adjacent lower Fraser River south arm for fishing, gathering, hunting, or accessing cultural sites. However, fishing remains critical as a spiritual, ceremonial,

and subsistence practice passed down for millennia, despite the historically important land disturbance and development that has cumulatively impacted Katzie's traditional territory, people, culture, and lifeways.

Katzie members are licensed to fish for salmon (Chinook, sockeye, chum) and eulachon for food, social, and ceremonial (FSC) purposes upstream of the Port Mann Bridge (approximately 20 km upriver from Tilbury Phase 2), and often up to and including Kanaka Creek/Derby Reach. This includes traditional fishing locations around Barnston Island (approximately 25 km upstream from Tilbury Phase 2) and chum salmon specifically in the Pitt River, all within the harvesting and subsistence activities RAA.

Katzie has identified white sturgeon rearing areas along the Tilbury Island shoreline and Tilbury Slough, and active eulachon spawning grounds in the lower Fraser River, as well as potential amphibian presence in Tilbury Slough, as areas of concern related to environmental stewardship, although they have not indicated current use of these specific areas for FSC purposes.

Access to fishing areas in the lower Fraser River has been restricted for Katzie members due to extensive land development and water resource degradation. Fishery closures for salmon conservation and limited openings severely restrict access to fish resources. Declines in coho, Chinook, and sockeye salmon, as well as steelhead trout populations, have occurred due to past and existing industrial development. Indigenous groups, including Katzie, have noted declining salmon spawning populations and smaller fish, increasing fishing effort and making adequate harvests during limited openings critical for their FSC and commercial fisheries.

Katzie members continue to gather a variety of plants seasonally for sustenance, medicinal, and ceremonial uses within the harvesting and subsistence activities RAA. However, Tilbury Phase 2 is primarily industrial land, heavily disturbed, and supports little plant life, mostly non-native and invasive species. FortisBC has no information indicating current Katzie use of public areas within Tilbury Phase 2 or the harvesting and subsistence activities LAA for plant gathering.

Katzie's governance system is rooted in cultural traditions and stewardship responsibilities that guide the sustainable use of lands and waters. Governance interests related to harvesting and subsistence activities include the authority to manage and protect fish and wildlife resources with their traditional territory. Hunting opportunities are now limited to a few remaining safe areas within Katzie traditional territory due to development. The majority of wildlife habitat in Tilbury Phase 2 wildlife and wildlife habitat LAA has been altered by industrial development. The area is more suitable for species tolerant of urban environments, such as coyotes, raccoons, rabbits, and waterfowl. Culturally important species like green-winged teal, lesser scaup, Canada goose, mallard, bald eagle, and beaver have been observed. FortisBC notes that firearms cannot be discharged in or adjacent to Tilbury Phase 2 in Delta, B.C.

#### *Potential Project Effects*

The EAO identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#), that may affect Katzie's harvesting rights during the Construction, Operation, and Decommissioning Phases of the Tilbury Phase 2:

- **Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources;** Increased noise, light, and air pollution (acoustics, air quality, soil, groundwater, land and resource use VCs) may deter Katzie members from accessing preferred harvesting areas near Tilbury Phase 2 site. Changes in fish distribution and abundance (fish and fish habitat VC) and the introduction of invasive plant species (vegetation VC) may further reduce the experience and preference of the practicing of harvesting rights. While Katzie does not currently fish or harvest close to Tilbury Phase 2, they have historically and could in the future if the site was decommissioned to a more natural state;

- **Effects to Katzie Rights to fish for food social and ceremonial (FSC) purposes;** from habitat loss, (wildlife, fish, vegetation VCs), increased mortality risks to fish, -birds, and wildlife (wildlife and wildlife habitat VCs), and changes in their behavior due to sensory disturbances (acoustics, air quality VCs). Additionally, contamination risks to fish habitat in Tilbury Slough (surface water VC) and Fraser River downstream, as well as contamination accidents (soil VC) that could impact important plant species, may further impact traditional harvesting and cultural practices; and
- **Effects on the accessibility and availability of traditional lands and resources** may occur as a result of altered land or water based travel routes, access restrictions, or safety considerations, including changes to navigability and the usability of established travel corridors (land and resource use and surface water VCs), as well as indirect effects from sensory disturbances such as noise, dust, lighting, or visual changes that may discourage travel through otherwise accessible areas (air quality, acoustics, and land and resource use VCs).

### *Mitigation Measures*

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on harvesting and subsistence activities, as mentioned in the section above. A full table of Proponent mitigations can be found in Section XX of the Revised Application. Below is a summary of mitigation measures, how they address effects on the relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air-quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Katzie's harvesting and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during Construction and Operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Katzie's harvesting and cultural practices;
- **Surface Water (Section 7.4)** Erosion and sediment-control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm-sewer system. These protections support water quality and fish habitat relied on to support Katzie's harvesting and cultural practices;
- **Soil (Section 7.6)** Soil-management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by Katzie for harvesting and cultural practices;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by Katzie for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife-protection measures, such as timing Construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to Katzie's harvesting and cultural practices;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill-prevention measures help protect fish habitat and water quality used by salmon migrating through the

lower Fraser. These actions support the health and availability of salmon and other fish species central to Katzie's FSC harvesting and cultural practices;

- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used for harvesting or cultural practices; and
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat and vegetation important to Katzie's harvesting and cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions to help reduce potential impacts on Katzie's harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting rights (see [Section 8](#) of this Report):

- **Condition 10 (Community Feedback Process)** creates a clear way for Katzie to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of Katzie's harvesting and cultural practices;
- **Condition 12 (CEMP)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to Katzie's harvesting and cultural practices;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to Katzie's harvesting and cultural practices;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emissions-control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support Katzie's harvesting and cultural practices; and
- **Condition 17 (Dry Street Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project-related roads, which may lower potential impacts on salmon and other fish important to Katzie's harvesting and cultural practices.

In addition to the Proponent's mitigations and the provincial conditions the EAO identified the following federal Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to harvesting and subsistence activities:

**Federal Consideration for Migratory Bird Protections:** The EAO recommends that the IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Katzie's harvesting practices and broader ecosystem conditions important to their way of life.

#### *The EAO's Analysis and Conclusions*

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Katzie's harvesting rights and interests:

- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources;
- Effects to Katzie Aboriginal rights to fish for FSC purposes; and
- Effects on the accessibility and availability of traditional lands and resources.

The EAO's characterization of the residual effects of Tilbury Phase 2 on harvesting and subsistence activities are summarized in the table below.

Table 18: Summary of residual effects rationale on Katzie and its harvesting and subsistence activities

| Residual Effect                                                                                                                                                                                                                                                                                                                                                                                                             | Assessment Rating*                                                                                                                                                                                                                                                                 | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Harvesting and subsistence activities</p> <ul style="list-style-type: none"> <li>- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources</li> <li>- Effects to Katzie Aboriginal rights to fish for FSC purposes</li> <li>- Effects on the accessibility and availability of traditional lands and resources</li> </ul> | <p>Context (resilience): Medium</p> <p>Magnitude: Negligible</p> <p>Extent: Local</p> <p>Duration: Medium-term</p> <p>Reversibility: Fully reversible</p> <p>Frequency: Continuous</p> <p>Affected Populations: Disproportionate</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><b>Context:</b> The interests is rated as having a medium resiliency. Katzie harvesters historically frequented Tilbury Phase 2 site and surrounding areas for traditional harvesting before extensive industrial development. While current activity is reduced due to existing development pressures, the community remains reasonably resilient to additional environmental stresses. If barriers were reduced, harvesting activity would likely increase.</p> <p><b>Magnitude:</b> Based on the negligible magnitude residual effects on fish, fish habitat, and surface water after mitigation, the magnitude is assessed as negligible. Other key potential residual effects are rated as negligible to low. Historically, fishing and harvesting activities near Tilbury Phase 2 have been limited, with no current fishing activity reported. The only known ongoing harvesting may be minimal plant gathering along the site's edge.</p> <p><b>Extent:</b> Rated as local, since the spatial scale of residual effects to applicable VC's is limited, the impact on harvesting is expected to remain local, primarily within the immediate Tilbury Phase 2 area.</p> <p><b>Duration:</b> The effects on harvesting will persist for as long as the Tilbury Phase 2 facility remains operational, making them medium-term.</p> <p><b>Reversibility:</b> Most effects, particularly those related to sensory disturbances such as noise and light, would cease if Tilbury Phase 2 were halted or upon Decommissioning, making them fully reversible.</p> <p><b>Frequency:</b> Rated as continuous as effects would be most prominent during Construction, but some effects (noise, light, changes to experiences and preferences) would occur continuously.</p> <p><b>Affected Populations:</b> Tilbury Phase 2's effects will primarily affect Katzie members who actively harvest, though indirect effects may also be felt by those who refrain from harvesting due to perceived environmental degradation in the highly developed area.</p> <p><b>Risk:</b> The likelihood of these effects occurring is low given effectiveness of mitigation measures, including removal of in-river works, environmental management plans, and air and acoustic controls. With negligible magnitude and limited extent of effects, the overall consequences are expected to be minor. Therefore, the risk is rated as low.</p> <p><b>Uncertainty:</b> The pathways of effects—such as noise, light, vibration, and impacts on harvesters—are well understood. While mitigation is expected to be moderately to highly effective, some uncertainty remains regarding its ability to fully address harvesters' experiences and perceptions. Therefore, the level of uncertainty is rated as moderate.</p> |
| <p>* Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a></p>                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### *Cumulative Effects*

As described in the Background and Current Context sections, Katzie's harvesting and subsistence activities have already been affected by historical environmental degradation, as well as impacts due to climate change. The FortisBC Revised Application identifies several reasonably foreseeable projects, T1B and TMJ projects. The projects are expected to introduce additional vessel traffic in the Fraser River and further development of the Tilbury Island foreshore prior to Construction of Tilbury Phase 2. Both T1B and TMJ could contribute additional sensory disturbances (noise, light, vibration), degrade habitat and water quality, and impact culturally important plant and wildlife resources.

The EAO notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### *Conclusion*

FortisBC's proposed mitigation measures, EAO's Table of Conditions and the federal Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 would have a negligible effect on Katzie's harvesting and substance activities.

## **16.3.7 Cultural Use Sites and Areas**

### *Background*

Katzie peoples maintained deep connections to their lands, rivers, sloughs, creeks, and wetlands, which they describe as running like veins through the heart of the traditional territory. The lower Fraser River, its tributaries, and foreshore have historically provided cultural, social, economic, and spiritual resources to Katzie.

The Coast Salish Peoples, including the Katzie, share a sacred duty to protect and care for their water, land, air, and resources for future generations, fulfilling their stewardship responsibilities. They possess clear concepts of water, land, and resource ownership, governance, and stewardship by birthright. The landscape is considered sacred and filled with meaning that informs Katzie members identity and relationships to cultural landscapes and sense of place. Wetland environments along the Fraser River shoreline and the complex aquatic food chain have sustained their way of life since time immemorial. The Lower Fraser Fisheries Alliance (LFFA), of which Katzie is a member, states that their members build spiritual strength and knowledge from the water and land, engaging with supernatural beings called *st'áleqem/sx'álélaqam*. They believe that transformed ancestors are present in the landscape, such as in stones and mountains, and that all beings in the lower Fraser River possess a life force (*shweli/sx'wəli*), connecting LFFA members to their ancestors and cultural keystone species.

Katzie members used the lower Fraser Valley for spiritual ceremonies and rituals, including the masked dance, salmon ceremony, funeral rites, naming ceremonies, and puberty ceremonies. The Fraser River is also seen as a water body where supernatural fish, "sekwoiam," live.

### *Current Context*

The arrival of Europeans in the region, including the Simon Fraser expedition in 1808, led to the exploitation of resources and the establishment of settlements like Fort Langley in 1827. This period was marked by devastating smallpox epidemics, which facilitated large-scale land expropriation and the forcing of Indigenous nations onto reserves, leading to overcrowded housing and inadequate sanitation. The expansion of agricultural areas through diking and draining further encroached on Indigenous lands.

These historical and ongoing resource and industrial developments have had profound and far-reaching effects on Indigenous peoples, with the loss of land being a primary factor contributing to cultural stress and environmental dispossession. Katzie states that its traditional territory has been subject to extensive land disturbance and development activities, cumulatively impacting their people, culture, and lifeways.

Katzie's governance systems incorporate cultural laws and protocols that regulate access to and protection of cultural sites. The nation's governance systems maintain the authority to safeguard archeological and heritage resources within their traditional territory and work to maintain their cultural continuity to ensure opportunities for ceremonies and knowledge transmission continue for years to come. Katzie raised concerns regarding cultural stewardship and potential impacts on archeological and cultural resources within their traditional territory. They further identified several cultural sites of concern that have been used historically for plant gathering. However, FortisBC stated in the Revised Application that there is no current information indicating that the cultural sites within the RAA and LAA are currently utilized by Katzie.

#### *Potential Project Effects*

The EAO identified the following pathway of effects, prior to the application of mitigation measures, along with associated VCs outlined in [Appendix 6](#), that may affect Katzie's cultural use sites and areas during Construction, Operation and Decommissioning phases of the Tilbury Phase 2:

- **Effects to cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance;** Tilbury Phase 2 could affect cultural use sites and areas through Construction activities that disturb culturally important places, such as archeological sites, due to ground disturbances, accidental spills of deleterious substances, or other construction-related interaction (culture, soil, and archaeological and heritage resources VC's);
- **Loss of access to and disenfranchisement from cultural sites;** Katzie harvesters could experience direct adverse effects to cultural and spiritual practices if access to cultural sites is altered or lost due to closure or modification of trails, parking areas, or access points between Tilbury Phase 2 and the Fraser River for safety or construction purposes (land and resource use VC). Changes in sensory effects (acoustic, air quality, culture, and land and resource use VC's) could change the experience of Katzie members using cultural sites, such as harvesting areas along the south arm of the Fraser River and Burns Bog; and
- **Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas;** Access to cultural sites could be affected (land and resource use VC) by Tilbury Phase 2. Adverse effects to culture (culture VC) which are connected to potential effects on wildlife, habitat, and vegetation (See Harvesting and Subsistence section above) could influence the ability or desire to access these sites.

#### *Mitigation Measures*

The Revised Application summarizes relevant mitigation measures proposed by the Proponent to address potential Tilbury Phase 2 related effects on cultural use sites and areas, including:

- **Air Quality (Section 7.2)** The air quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Katzie's cultural practices;
- **Acoustics (Section 7.3)** Noise reduction measures during Construction and Operation, including idle-reduction policies, equipment muffling, enclosures, and engineered noise controls, help limit disturbance to culturally important areas and activities. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of cultural knowledge by Katzie;

- **Soil (Section 7.6)** Soil management measures, including erosion control, spill-prevention protocols, and careful handling and disposal of contaminated soils, help prevent the migration of pollutants into nearby cultural areas and waterways. Maintaining soil stability and quality supports the protection of culturally important places and landscapes used by Katzie;
- **Land and Resource Use (Section 7.11)** Traffic-management planning, noise and lighting controls, and communication regarding project activities help reduce disruptions to access and use of culturally important areas. These measures support Katzie's ability to safely access and continue cultural practices within their traditional territory;
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance-find procedures, site protection, and early notification to Indigenous nations, help protect culturally important sites, features, and landscapes. These measures support Katzie's ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connections to territory; and
- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support Katzie's ability to access, use, and maintain culturally important areas, including places of teaching, ceremony, and connection to land and water.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on cultural use sites and areas (see also [Section 8](#) of this Report):

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance.
- **Condition 10 (Community Feedback Process)** establishes a clear and structured mechanism for Katzie to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of culturally important landscapes and areas, supporting Katzie's continued access to and use of cultural sites during project Construction;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, lighting, wildlife interactions, and spills during project Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by Katzie;
- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emissions-control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites by Katzie; and

- **Condition 15 (Chance Find Protocol)** requires the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If Katzie historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

#### *The EAO's Analysis and Conclusions*

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Katzie's cultural use sites and areas:

- Loss of access to and disenfranchisement from cultural sites; and
- Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas.

The EAO's characterization of the residual effects of Tilbury Phase 2 on cultural use sites and areas are summarized in the table below.

Table 19: Summary of residual effects and rationale on Katzie First Nation and its cultural use sites and areas.

| Residual Effect                                                                                                                                                                                                            | Assessment Rating*                                                                                                                                                                                                                                                           | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cultural use sites and areas<br><br>- Loss of access to and disenfranchisement from cultural sites<br><br>- Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas | Context (resilience): Low<br><br>Magnitude: Negligible<br><br>Extent: Local<br><br>Duration: Medium-term<br><br>Reversibility: Partially reversible<br><br>Frequency: Continuous<br><br>Affected Populations: Disproportionate<br><br>Risk: Low<br><br>Uncertainty: Moderate | <p><b>Context:</b> Rated as having low resiliency, acknowledging that while the nation has shown cultural resilience in the face of historical impacts, it is difficult to quantify the community's capacity to absorb additional adverse effects. Cultural strength may have been greater in the absence of cumulative disturbances, and potential links between cultural impacts and community health further complicate assessment. Given these historical and ongoing challenges, this rating reflects a conservative estimate.</p> <p><b>Magnitude</b> is assessed as negligible, based on the negligible magnitude impact to on fish, fish habitat, and surface water. Other connected VC potential residual effects are rated as negligible to low magnitude and are of local extent. Tilbury Phase 2 site is located on fee simple land, with no public access.</p> <p><b>Extent:</b> Rated as local, as most impacts to cultural use will be confined to the Tilbury Phase 2 site and immediately surrounding area. While Katzie Members reside throughout the Lower Mainland, it is unlikely that cultural effects will extend beyond the immediate Tilbury Phase 2 area.</p> <p><b>Duration:</b> Rated as medium-term, as residual effects will likely cease after the Decommissioning Phase.</p> <p><b>Frequency:</b> Rated as continuous, particularly for loss of site use for cultural purposes, which is an ongoing effect. Sensory disturbances (e.g., noise, light) may be either continuous or irregular, depending on Tilbury Phase 2 activities and phases.</p> <p><b>Reversibility:</b> Most sensory-related disturbances (e.g., noise, light) would be fully reversible following Tilbury Phase 2 Decommissioning. However, cultural impacts linked to the loss of access or disruption to traditional practices may be irreversible.</p> <p><b>Affected Populations:</b> Direct impacts would disproportionately affect those actively practicing or seeking to practice their culture; however, indirect effects could extend to all members due to the interconnected nature of Katzie cultural identity.</p> <p><b>Risk:</b> The likelihood of negative cultural impacts occurring is low as Katzie members are not known to frequent the LAA and the overall consequence is expected to be minor, given the negligible to low magnitude of direct Tilbury Phase 2-related effects and the application of mitigation measures. Risk is therefore rated as low.</p> <p><b>Uncertainty:</b> Rated as moderate, as cultural effects are inherently challenging to quantify and may be subject to individual and community-specific experiences that are difficult to predict with certainty.</p> |

\* Note: Criteria and assessment ratings are defined in [Appendix 3 - Residual Effects Characterization Definitions](#)

### *Cumulative Effects*

The Katzie's cultural use sites have already been extensively impacted by historical environmental degradation and land-use changes, as outlined in the Existing Conditions section. These impacts have limited the nation's ability to use culturally important areas and have disrupted the transmission of Indigenous Knowledge.

As stated in the Revised Application, FortisBC notes that two foreseeable projects, T1B and TMJ, are expected to modify the Tilbury Island foreshore prior to construction of Tilbury Phase 2. TMJ would also introduce additional vessel traffic in the Fraser River. These developments are expected to introduce additional sensory disturbance (noise, light, vibration) affecting nearby cultural site access and use. T1B could remove vegetation, impacting culturally important plants and wildlife habitat, while TMJ shipping activities may increase aquatic disturbance, with potential effects on fish populations and cultural connections to the Fraser River.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### *Conclusion*

Considering the above analyses, including proposed proponent mitigations, EAO's conditions, and KMMs, and based on the Project specific effects of Tilbury Phase 2, the EAO concludes that the Project will have a negligible effect on the cultural use sites and areas of Katzie

## **16.3.8 Social and Economic Conditions**

### *Background*

Katzie has experienced, and continues to experience, the severe and detrimental effects of colonialism, which has profoundly affected their social and economic well-being, as well as their health. This includes a system that has discriminated against and oppressed them, leading to pervasive and persistent adverse social and economic conditions relative to non-Indigenous Canadians. These systemic disparities contribute to shorter life expectancies, higher rates of chronic disease and communicable illness, higher rates of addiction, higher infant mortality rates than non-Indigenous Canadians. As such, health inequalities are due to physical and geographic barriers, racial discrimination, negligence, and cultural insensitivity within the healthcare system.

There is a general lack of equal employment opportunities which severely impacts physical and mental health due to its association with household income, access to healthcare, and resources necessary for health, such as housing and nutrition. Indigenous peoples, particularly on reserve, consistently face lower employment rates compared to non-Indigenous Canadians.

### *Current Context*

Ongoing development, industrialization, and environmental degradation have extensively affected Katzie's access to culturally and economically important areas, including those around Tilbury Island. This has disrupted traditional fishing and harvesting activities and contributed to declines in community health, limited housing options, and barriers to education and employment. Many members now live off-reserve and rely on off-reserve economic partnerships. Despite these systemic challenges, members continue to seek opportunities for education, employment, and cultural revitalization.

Katzie's governance systems related to social and economic conditions include their authority to pursue economic development opportunities that are consistent with Katzie's land use plan and cultural values so that there is equitable access to employment and procurement opportunities.

See Cultural Use Sites and Areas and Harvesting and Subsistence Activities sections for additional context.

#### *Potential Project Effects*

The EAO identified the following pathway of effects, along with the associated VCs in [Appendix 6](#), that may affect Katzie's social and economic conditions during Construction, Operation and Decommissioning Phases of the Tilbury Phase 2:

- **Effects on infrastructure and services:** Tilbury Phase 2 may add pressure on services if out-of-region workers are used, but according to the Revised Application effects are expected to be limited and not distinguishable from existing conditions (land and resource use, employment and economy, infrastructure services VC's);
- **Effects to Katzie First Nation's employment opportunities, Indigenous businesses, procurement opportunities, and Katzie First Nation revenue:** Tilbury Phase 2 could positively affect Katzie's employment and business opportunities, depending on member participation and access to contracts (employment and economy VC). Indigenous workers are also more likely to be in construction-related jobs. However, smaller Indigenous businesses, including those linked to Katzie, may face challenges competing for workers or meeting Tilbury Phase 2 demands (culture VC);
- **Effects to Katzie First Nation's future aspirations for sites or areas surrounding the Tilbury Phase 2:** Potential residual effects from Tilbury Phase 2 could affect Katzie's aspirations for land and water restoration, and their continued use of the Fraser River amid growing regional development (fish and fish habitat, wildlife and wildlife habitat, vegetation VC and see Cultural Use Sites and Areas and Harvesting and Subsistence Activities sections);
- **Effects to Katzie First Nation's ability to improve social and economic conditions:** Tilbury Phase 2 may support Katzie's efforts to improve social and economic conditions by creating employment, training, and business opportunities. Increased demand for skilled workers could also boost interest in trades training. (infrastructure and services, and employment and economy VCs); and
- **Effects to Katzie First Nation's commercial and non-commercial fishing, gathering, and cultural or ceremonial activities and practices:** Potential residual effects from Tilbury Phase 2 could affect Katzie's ability to benefit from commercial and non-commercial fishing and gathering due to the collapse of salmon supply, whereby the loss of traditional economy. Furthermore, there is a loss to their ability to practice their cultural or ceremonial activities in Tilbury Phase 2 area (fish and fish habitat, wildlife and wildlife habitat, vegetation VCs and see Cultural Use Sites and Areas, and Harvesting and Subsistence Activities sections).

#### *Mitigation Measures*

The Revised Application includes a summary of relevant mitigation measures identified that FortisBC has proposed in response to potential Tilbury Phase 2 related effects on social and economic conditions. These include the following:

- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for Katzie members and businesses to participate economically in the project, supporting improved social conditions and community well-being;
- **Land and Resource Use VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting Katzie's long-term aspirations for land and water restoration and reducing stressors that can impact economic development and community well-being;

- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socio-economic impacts on Katzie and supporting economic development and community stability;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports Katzie's food security, cultural identity, and local economy by safeguarding salmon and other species essential to FSC harvesting;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting Katzie's cultural continuity, social cohesion, and ongoing participation in land-based economic and stewardship activities;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods, help sustain traditional harvesting practices, protect culturally significant resources, and support the social and economic activities tied to Indigenous knowledge, land use, and stewardship; and
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Katzie's social and economic interests.

In addition to the Proponent's mitigation measures the EAO has developed further conditions that would mitigate potential effects to social and economic conditions:

- **Condition 10 (Community Feedback Process)** provides Katzie with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting ongoing social and economic conditions;
- **Condition 12 (CEMP)** requires mitigation measures to manage dust, noise, traffic, spills, surface water, erosion, and wildlife interactions during Construction. These measures help minimize construction-related disturbances that could affect community and social well-being of members;
- **Condition 13 (OEMP)** requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation. By limiting long-term environmental disturbances, this condition supports stable environmental conditions that protect Katzie's social and economic interests;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality mitigates environmental degradation that could impact aquatic and terrestrial ecosystems, supporting Katzie First Nation's social and economic conditions by protecting the traditional economy and advancing long-term aspirations for land and water restoration within the Fraser River corridor;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If Katzie historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated social harm; and
- **Condition 16 (First Nations and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support Katzie First Nation's socio-economic well-being through increased access to jobs, skills development, and business opportunities associated with Tilbury Phase 2.

*The EAO's Analysis and Conclusions*

After consideration of the EAO's conclusions on the linked VCs, and proposed mitigation measures, the EAO concludes that Tilbury Phase 2 is not expected to result in residual adverse effects on Katzie's social and economic conditions.

While the nation continues to experience extensive systemic challenges - including limited access to housing, employment, and culturally important lands - these are primarily the result of historic and ongoing regional industrial development, and not directly attributable to Tilbury Phase 2.

Tilbury Phase 2 is situated in an already industrialized area with limited current access or use by Katzie members, and any additional demands on local services are expected to be negligible compared to existing pressures.

Although Tilbury Phase 2 may interact with aspirations for land and water restoration, or for re-establishing cultural practices in the area, the potential for employment, training, and contracting benefits may also support the nation's efforts to strengthen their economic conditions. On balance, the potential for positive effects, alongside the lack of material new barriers introduced by Tilbury Phase 2, supports the EAO's conclusion of no residual effect on social and economic conditions and therefore no characterization of effects or cumulative effects assessment was undertaken.

### 16.3.9 Indigenous Health and Well-being

*Background*

The Katzie's concept of health and well-being is holistic, deeply tied to their land, resources, and cultural traditions. It extends beyond physical health to include mental, spiritual, and emotional well-being.

*Current Context*

Katzie experience shorter life expectancies, higher rates of chronic diseases, communicable illnesses, addiction, and infant mortality rates compared to non-Indigenous Canadians. These disparities are largely attributed to pervasive and persistent adverse social and economic conditions that serve as social determinants of health, which include the enduring effects of intergenerational trauma and racism, challenges related to lone-parent households and childcare responsibilities, and limited education with high rates of poverty, which create barriers to educational and employment opportunities.

Katzie understand Indigenous governance through their authority to protect environmental determinants of health, such as water quality, fish habitat, and air quality. Therefore, Katzie maintains an active role in participating in decisions that affect their traditional lifeways, including access to cultural sites and harvesting areas. Their stewardship responsibilities for maintaining ecological integrity are a foundational step for community health and well-being by integrating cultural values and practices into health planning and environmental management.

An important factor is the lack of employment opportunities, directly impacting household income, access to healthcare, housing, and nutrition. Within the healthcare system itself, Indigenous peoples, including the Katzie, face physical and geographic barriers, racial discrimination, negligence, and cultural insensitivities.

*Potential Project Effects*

The EAO identified the following pathway of effects, along with associated VCs outlined in [Appendix 6](#), that may affect Katzie's Indigenous health and well-being during Construction, Operation and Decommissioning phases of the Tilbury Phase 2:

- **Effects on the quality, quantity, and availability of harvested country foods;** Land, water or air-based contamination from Tilbury Phase 2 could adversely affect country foods such as fish and traditional plants. See Harvesting and Subsistence section above;

- **Effects on the value and perceived quality of country foods;** Quality, quantity or availability of plants or wildlife could be impacted from Tilbury Phase 2. Country foods could become contaminated. (See list of potential project effects above). Community perceptions with respect to the quality of country foods have the potential to interact with Katzie members' participation in harvesting and subsistence activities and cultural and spiritual practices even in the absence of adverse effects (land and resource use and culture VCs);
- **Effects on air quality, noise and water quality;** Tilbury Phase 2 activities have the potential to contribute contaminants of concern to air and water, and increased noise levels in proximity to the facility property line (air quality, acoustics, surface water, land and resource use, health VCs); and
- **Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites;** Tilbury Phase 2 may interact with Katzie's health and well-being through changes to traditional practices, access to cultural sites, and socio-economic factors. Katzie has identified the loss of traditional food sources and harvesting access as contributing to chronic health issues and limiting intergenerational knowledge transfer. Effects on traditional ways of life due may still influence health outcomes indirectly. Positive effects may include increased income and employment opportunities for members, while potential adverse effects relate to shift work and family stress.

#### *Mitigation Measures*

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on Indigenous health and well-being. These include the following:

- **Land and Resource Use VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting Katzie's long-term aspirations for land and water restoration and reducing stressors that can affect well-being;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for Katzie members and businesses to participate economically in the project, supporting improved social conditions and community well-being;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socio-economic impacts on Katzie and supporting health and community stability;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports Katzie's food security, cultural identity, and health by safeguarding salmon and other species essential to FSC harvesting;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting Katzie's cultural continuity and nutritional well-being;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to Katzie's physical health and cultural practices;
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Katzie's well-being;
- **Groundwater (Section 7.5)** Protecting groundwater from contamination helps maintain the quality of ecosystems that support fish, plants, and wildlife relied on for Katzie's subsistence and health;

- **Surface Water (Section 7.4)** Managing runoff, erosion, and sediment helps maintain water quality in the lower Fraser, supporting Katzie's cultural and nutritional reliance on healthy salmon and aquatic ecosystems;
- **Acoustics (Section 7.3)** Noise reduction measures limit sensory disturbance to people, wildlife, and harvesting areas, reducing stress and supporting Katzie's comfort, well-being, and connection to land and water;
- **Air Quality (Section 7.2)** Air emission controls help protect respiratory health and prevent contamination of country foods, supporting Katzie's physical well-being and confidence in harvesting; and
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect Katzie members' physical, cultural, and mental health.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects to Indigenous health and well-being:

- **Condition 10 (Community Feedback Process)** provides Katzie with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting Indigenous health and well-being;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)**, requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with Katzie to be developed by the Holder in consultation with the Nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting Katzie's physical health and overall well-being;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If Katzie historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated cultural or emotional harm, supporting Indigenous health and well-being; and
- **Condition 17 (Dry Street Sweeping Report)** requires FortisBC to submit a report on the effectiveness of Dry Street Sweeping to mitigate the effects of 6-PPDQ on fish within eighteen months of a Certificate being issued. By informing measures to protect downstream aquatic environments, this condition supports Katzie's health and well-being by helping maintain confidence in environmental quality and minimizing potential concerns related to contamination of culturally important fish and waterways.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Well-being:

- **Accidents and Malfunctions Reporting** would support mitigation of potential impacts on the Nation's interests by ensuring timely responses, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

#### *The EAO's Analysis and Conclusions*

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Katzie's Indigenous health and well-being:

- Effects on the quality, quantity, and availability of harvested country foods;
- Effects on the value and perceived quality of country foods;
- Effects on air quality, noise and water quality; and
- Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites.

The EAO's characterization of the residual effects of Tilbury Phase 2 on Indigenous health and well-being are summarized in the table below.

Table 20: Summary of residual effects and rationale on Katzie First Nation and its Indigenous health and well-being.

| Residual Effect                                                                                                                                                                                                                                                                                                                                                                                                                      | Assessment Rating*                                                                                                                                                                                                                                                                               | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Indigenous health and well-being</p> <ul style="list-style-type: none"> <li>- Effects on the quality, quantity, and availability of harvested country foods</li> <li>- Effects on the value and perceived quality of country foods</li> <li>- Effects on air quality, noise and water quality</li> <li>- Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites</li> </ul> | <p>Context (resilience): Medium</p> <p>Magnitude: Negligible</p> <p>Extent: Local</p> <p>Duration: Medium-term</p> <p>Reversibility: Partially reversible</p> <p>Frequency: Continuous/Irregular</p> <p>Affected Populations: Disproportionate</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><b>Context:</b> The Katzie First Nation has experienced extensive environmental and social challenges, reducing their resilience to further adverse effects. However, their efforts to maintain cultural connections and recent improvements, such as gaining access to clean drinking water, indicate a medium capacity for resiliency.</p> <p><b>Magnitude:</b> Rated as negligible because as anticipated changes to health and well-being, such as minor sensory disturbances or temporary uncertainty about country food safety, are not expected to result in a measurable change to Indigenous health outcomes. Tilbury Phase 2 may have negligible to low magnitude effects on key health and well-being VC's, such as air quality, human health and surface water quality. Katzie members are not known to frequent the Project site, where impacts, while negligible to low, will be felt the strongest. Additionally, Tilbury Phase 2 has the potential to positively impact socio-economic determinants of health by increasing employment and economic opportunities.</p> <p><b>Extent:</b> The residual effects are expected to occur at a local scale. Direct impacts, such as noise and air quality disturbances, will be primarily localized near Tilbury Phase 2. Indirect effects on well-being are unlikely to extend beyond the local Project area.</p> <p><b>Duration:</b> Potential effects, including environmental changes and perceptual impacts, are expected to persist throughout the Tilbury Phase 2's 40 plus years of operation, making them medium-term. While sensory disturbances may end after Decommissioning, impacts on cultural well-being could have lasting effects.</p> <p><b>Frequency:</b> The frequency of effects is both continuous and irregular. Some stressors, such as noise and visual changes, may be continuous throughout the Operation phase, while others, particularly those during Construction, may be irregular. Additionally, the perception of environmental degradation could result in continuous effects on well-being.</p> <p><b>Reversibility:</b> The effects are considered partially reversible. Sensory disturbances, such as noise and light, are expected to be fully reversible after Decommissioning. However, impacts on human health and cultural well-being, including loss of connection to traditional practices and perceived environmental degradation, may be irreversible or require a long time to recover.</p> <p><b>Affected Populations:</b> While positive economic effects may benefit a broad range of Katzie members, those engaged in traditional harvesting and cultural practices or with pre-existing health vulnerabilities could be disproportionately impacted by negative environmental changes or perceived risks.</p> <p><b>Risk:</b> The likelihood of a negative effect occurring is low as members are not known to frequent the area and the consequences are minor due to</p> |

|                                                                                                                                   |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------------------------|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |  | negligible to low magnitude impacts to associated VCs and potential for some positive effects and mitigations measures, therefore the risk is low.<br><br><b>Uncertainty:</b> The assessment of potential effects on the Katzie's Indigenous health and well-being carries a moderate degree of uncertainty primarily due to the inherent challenges in quantifying cultural effects and their subsequent impacts on well-being. These impacts can vary extensively based on individual and community-specific experiences, making precise predictions difficult. |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### *Cumulative Effects*

Tilbury Phase 2 is located within an area that has been subject to extensive historical and ongoing industrial development.

The Revised Application identifies other reasonably foreseeable projects in the vicinity that could contribute to cumulative effects: T1B and the TMJ Project, expected to introduce sensory disturbances and result in impacts to plant and wildlife habitat as well as aquatic life and habitat from shipping activities. Both TMJ and T1B have the potential to add to cumulative effects associated with decreased air quality and associated health impacts. The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project-specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### *Conclusion*

Considering the above analyses, FortisBC's proposed mitigation measures, and EAO's Table of Conditions, the EAO concludes that Tilbury Phase 2 would have negligible effects on Katzie's health and well-being interests.

#### **16.3.10 Positive Effects of Tilbury Phase 2**

According to the Revised Application, Tilbury Phase 2 is expected to create job opportunities, particularly in Construction, benefit Indigenous businesses through contracting and procurement, and potentially increase revenue for the Katzie, while improving social and economic conditions, and providing long-term skills training opportunities for Katzie members.

The positive effects of Tilbury Phase 2 depend on the level of participation and access Katzie members and businesses have to the opportunities generated. Based on current information, direct positive effects on Katzie interests are expected to be limited relative to existing conditions.

#### **16.3.11 Conclusions**

Considering the above analyses, EAO's engagement with Katzie, their comments, the Proponent's proposed mitigation measures, provincial conditions, and Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 is anticipated to have the following impacts on Katzie Indigenous interests:

- Negligible residual effects to harvesting and subsistence activities;
- Negligible residual effects to cultural use sites and areas;
- Negligible residual effects to Indigenous health and well-being; and
- Negligible residual effects to Indigenous governance systems.

Considering the above analyses the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on Katzie interests has been adequately avoided, minimized or otherwise accommodated. Based on engagement undertaken with Katzie on Tilbury Phase 2, as outlined above in Section 16.3.2, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with Katzie.

## 16.4 ǵʷa:ńłǵǵ (Kwantlen) First Nation

This section of the Report was co-drafted by the EAO and Kwantlen First Nation (Kwantlen).

### 16.4.1 Community Profile

ǵʷa:ńłǵǵ (Kwantlen) First Nation is part of the Halq'eméylem-speaking Peoples who have occupied the lower Fraser Valley region since time immemorial. Kwantlen's traditional territory extends westward to New Westminster, B.C., southward to Tsawwassen, B.C., eastward to Mission, B.C., and northward to Stave

Lake, B.C (see Revised Application, Figure 11.6-1). Kwantlen has stated that the Fraser River has been, and continues to be, important for Kwantlen due to the location of traditional village sites, as well as for travel and trade between Kwantlen and other Stó:lō communities, and for harvesting resources for FSC purposes. Kwantlen has stated that fishing and the Fraser River are very important to their culture<sup>9</sup>.

Of the seven Kwantlen reserves, McMillan Island 6 is the largest, as well as their main residential reserve and current administrative centre. Historically, Kwantlen had two reserves Indian Reserve 7 and Indian Reserve 8 in Surrey that were expropriated in the mid 1900s. The Project footprint is downstream from former Kwantlen ancestral villages sǵʷeyəmǵ and qiqéyt, as well as the former expropriated Indian Reserves in New Westminster and Surrey. As of April 2025, Kwantlen had a total registered population of 417 members<sup>10</sup>.

### 16.4.2 Kwantlen involvement in the environmental assessment

On August 12, 2020, Kwantlen's Lands Resources and Stewardship identified Kwantlen as a participating Indigenous nation,<sup>11</sup> which afforded Kwantlen certain procedural rights under the Act, as outlined in [Section 5.3](#) of this Report. As a member of the TAC, Kwantlen participated in technical meetings throughout the EA for Tilbury Phase 2. Kwantlen and the EAO collaborated closely, engaging in joint work planning, consensus-seeking, and co-authoring this section of the EAO's Assessment Report. The EAO and IAAC provided funding to support Kwantlen's involvement in the EA process.

As described in Section 1.6.3.2 of the Revised Application, Kwantlen expressed preliminary concerns about potential effects from the Project to its Indigenous interests through its notice of intent to participate under Section 14(1) of the Act.<sup>11</sup> Kwantlen also shared feedback on the DPD and identified several issues pertaining to Tilbury Phase 2's potential effects on Kwantlen's Indigenous interests, including concerns pertaining to the temporal boundary and scope of assessment by FortisBC. FortisBC responded by updating the draft DPD to include Kwantlen's feedback, sharing updated information, and committing to ongoing engagement with Kwantlen through the assessment processes. Table 11.6-8 of the Revised Application summarizes the key issues raised by Kwantlen during Application Development and FortisBC's response.

The Revised Application noted that FortisBC and Kwantlen have signed a capacity funding agreement to support Kwantlen's participation and that FortisBC sought input from Kwantlen on information to understand Kwantlen's use of the Project Footprint, LAAs, and RAAs. However, as FortisBC did not receive information, the Revised Application

<sup>11</sup> Kwantlen Lands, Resources, and Stewardship. Notice of intent to participate under Section 14(1) of the Act as an Indigenous nation for the Tilbury Phase 2 environmental assessment. August 12, 2020. <https://www.projects.eao.gov.bc.ca/api/public/document/627c0e3cf395580022ccc72d/download/Fortis%20LNG%20Expansion%20Letter%20signed.pdf>

relied on secondary data and sources external to Kwantlen. Kwantlen has stated, through engagement on the Project, that “the Indigenous Knowledge that FortisBC has is nothing compared to the Indigenous Knowledge that used to exist due to loss of elders, loss of language, etc.” Kwantlen Indigenous Knowledge may therefore not be fully represented in this subsection.

[Section 11.06](#) of the Revised Application includes a summary of FortisBC’s engagement with Kwantlen, who have been involved in the process since July 2019. That subsection was co-developed with Kwantlen through regular meetings and joint drafting. The Revised Application also includes tables summarizing engagement activities with Kwantlen, which are further detailed in the [Indigenous Engagement Report](#).

The EAO and Kwantlen used the following sources in drafting the assessment of Tilbury Phase 2 effects on their Indigenous interests:

- The Proponent’s Revised Application;
- Information submitted during the EA by the Proponent and Kwantlen; and
- Conclusions from the EAO’s assessment of VCs (see [Appendix 6](#)).

### 16.4.3 Assessment Boundaries

The boundaries of the Indigenous interests assessment have been based on the potential for Tilbury Phase 2 to interact with, and result in, an effect on the Indigenous interests of Kwantlen. The spatial assessment boundaries for each Indigenous interest were identified based on the overlap of LAAs and the combined RAAs identified for linked VCs, see Figure 11.6-1 in the Revised Application. The LAA of each Indigenous interest consists of the combined LAAs of VCs that are linked to the Indigenous interest, whereas the RAA of each Indigenous interest consists of the combined RAAs of VCs that are linked to the Indigenous interest.

FortisBC noted that its assessment of potential effects of Tilbury Phase 2 on Indigenous interests applies to all members of Kwantlen First Nation living, working, or exercising Indigenous interests within the LAA of the Indigenous interests. Also, for the purpose of population demographics FortisBC used McMillan Island 6 Census data as standalone data, as information pertaining to Kwantlen reserves is inconsistent or lacking information, thereby limiting the ability to aggregate information or to provide statistics for Kwantlen reserves other than McMillan Island 6. According to the Revised Application, the data provided in Table 11.6-3 represented enumerated totals and do not reflect the registered population<sup>12</sup> or the population of the total membership of Kwantlen First Nation, many of whom live off McMillan Island 6 reserve.

While the temporal boundaries applied by FortisBC in [Section 11.6.5](#) of the Revised Application included Construction (3-6 years), Operation (40 plus years) and Decommissioning (2 years) phases, the EAO heard from Kwantlen consideration of the multi-generational effects of the projects up to seven generations is important to understanding potential long-term outcomes to the nation.

### 16.4.4 Regional Context

The Project is located within Kwantlen traditional territory, and in an area where Kwantlen assert Rights and Title<sup>11</sup> based on oral histories<sup>14</sup>, ethnographic works, and the extensive archaeological record of the area. Kwantlen has stated that it has a deep gratitude for, and spiritual connection to, the lands of their Traditional Territory<sup>9</sup> and that

Accessed by FortisBC May 10, 2022. <https://www12.statcan.gc.ca/census-recensement/2021/dp-pd/prof/details/page.cfm?%20Lang=E&SearchText=McMillan%20Island%206%2C%20&DGUIDlist=2021A00055915816&GENDERlist=1,2,3&STATISTIClist=1,4&HEADERlist=0>

they used the Lower Fraser River as a travelway and as a resource located within the heart of their Territory<sup>13,14</sup>. Kwantlen has also stated that the Lower Fraser River and its tributaries were so critical to the culture of Kwantlen that many of the villages were situated along them<sup>9</sup>.

According to the Revised Application, the Project area has been heavily disturbed by prior industrial activities, resulting in limited native soils and altered riparian zones. The existing Tilbury LNG facility consists of gravel and paved areas, existing infrastructure, and equipment laydown areas supporting little plant life with very little to no habitat value for wildlife. The vegetation within the Project Footprint is mostly limited to ditch lines and spoil piles and is dominated by non-native and invasive plant species. Public access to the site is limited, although there is some use of a nearby dike to the north of the Project site along the Fraser River.

Kwantlen First Nation has stated that ongoing development and resulting cumulative effects throughout Delta, B.C., Metro Vancouver, and along the Lower Fraser River have greatly affected their ability to exercise Aboriginal Rights and Title to the extent that was historically feasible<sup>9,15</sup>. As described in [Section 11.6.5.2](#) of the Revised Application, industrial development and urbanization of Kwantlen's Traditional Territory has been further exacerbated by laws and policies implemented by the Crown, which according to Kwantlen have had a negative effect on their ability to govern resources and implement stewardship and cultural values and teachings in relation to the environment<sup>9</sup>.

#### 16.4.5 Indigenous Interests

The EAO engaged Kwantlen during the Early Engagement Phase in the development of the Joint Summary of Issues and Engagement for the Tilbury Phase 2 LNG Expansion Project, in which the EAO summarized an initial understanding of Kwantlen's interests including Aboriginal rights to Tilbury Island and surrounding area and general impacts to this area.

FortisBC identified Indigenous interests to be assessed in the Revised Application through:

- Reviewing guidance from the EAO, as well as requirements set out in the AIR Schedule C, including Table 6; and
- Conducting engagement efforts with Kwantlen to gather information on their Indigenous interests, including an opportunity to review the draft Revised Application Section 11.6, as outlined in [Section 11.6.3](#) of the Revised Application - Summary of Engagement with Kwantlen.

Based on the Revised Application, the assessment scope for Kwantlen outlined in Table 4 of Schedule B, Assessment Plan for Tilbury Phase 2<sup>16</sup> and information shared by Kwantlen, the following Indigenous interests have been identified as having the potential to be affected by Tilbury Phase 2:

- Harvesting and subsistence activities;
- Cultural use sites and areas;

<sup>16</sup> B.C. Environmental Assessment Office. June 13, 2022 (re-issued: May 5, 2025). Schedule B, Assessment Plan – Tilbury Phase 2 LNG Expansion. <https://www.projects.eao.gov.bc.ca/api/public/document/6818dedc886bd00022e563b0/download/250505 TP2-Assessment%20Plan-BINAL.pdf>

- Social and economic conditions;
- Indigenous health and well-being;
- Cultural continuation; and
- Indigenous governance systems

The assessment of Kwantlen's Indigenous interests in this section of the Report uses the following categories:

- 1) harvesting and subsistence activities (Section 16.4.5);
- 2) cultural use sites and areas (Section 16.6.6); and
- 3) social and economic conditions, Indigenous health and well-being, and cultural continuation under "Kwantlen's other Indigenous Interests" (Section 16.6.7 of this section) and Indigenous governance systems (Section 16.6.8).

The EAO's and Kwantlen's assessment of Kwantlen's Indigenous interests includes describing each interest as well as the relevant background, current context, potential effects, mitigation, and effects analysis. If there is an adverse residual effect to an Indigenous interest, then a characterization of effects and cumulative effects assessment is also conducted.

### 16.4.6 Harvesting and Subsistence Activities

#### Background

Kwantlen historically used the lands and waters throughout their Traditional Territory for a variety of cultural purposes since time immemorial, including harvesting and subsistence activities (plant-gathering, trapping, hunting, and fishing), transportation and travel, trade (furs, salmon, and plants), spiritual/ceremonial activities, and self-governance<sup>9</sup>. The waterways throughout Kwantlen's Traditional Territory, especially the Lower Fraser River, but also the Pitt and Salmon rivers, were the key resources within the territory, sustaining Kwantlen Peoples with salmon, sturgeon, and other fish. Furthermore, these rivers not only provided Kwantlen Peoples with food, but also allowed them to trade with other communities<sup>9</sup>. The ability to access these once abundant resources provided Kwantlen the opportunity to have an elevated and sustainable quality of life.

According to the EAO's Assessment Report for Tilbury Marine Jetty (TMJ), Kwantlen is a community that relies on salmon, eulachon, and other species that historically have been abundant in the Fraser River and local tributaries. Kwantlen has extreme concerns about the loss of any habitat on the Fraser River given the state of biodiversity loss, climate change, and the ever-declining abundance of Fraser River salmon. With several flora and fauna on the *Species at Risk Act* (SARA), and several more listed as 'Endangered', Kwantlen is frustrated by the continued expansion of fossil fuel industries that destroy habitat not only along the Fraser River, but along the entire supply chain including northeastern B.C. where the gas is extracted<sup>15</sup>. See also [Appendix 12](#) of this Report regarding scoping of upstream GHG emissions and climate change for Tilbury Phase 2 LNG.

The Project area is within part of the traditional hunting, trapping, and gathering areas of Kwantlen<sup>1314</sup> noting that historically, hunting by Kwantlen within Metro Vancouver, including the Project Area on Tilbury Island, involved harvesting deer, elk, duck, goose, grouse, beaver, and marten<sup>14</sup>. According to Section 11.6.5.2 of the Revised Application, the South Arm of the Fraser River and the estuary are known as important areas for waterfowl habitat, and waterfowl, such as geese and ducks, which were harvested by First Nations. Kwantlen also historically harvested a variety of plants, such as wapato, berries, and medicines, along the Lower Fraser River and its shoreline, and throughout their Traditional Territory. Refer to [Section 11.1.13](#), Indigenous Interests Assessment Methods, and [Section 7.7](#) Vegetation of the Revised Application, for information on culturally important plants relevant to Kwantlen in the Vegetation VC LAA and RAA for Tilbury Phase 2.

### Current Context

The Project Footprint is located on private property owned by FortisBC (the Property). The Property is within an existing Tilbury LNG facility on Tilbury Island, in the Tilbury Industrial Park, adjacent to the Fraser River in Delta, B.C., which has been zoned for industrial use. Also, the adjacent areas along the South Arm of the Fraser River in Delta, and across the river in Richmond, are regionally designated for light and heavy industrial and commercial uses. According to Table 11.6-5 of the Revised Application, Kwantlen has stated through engagement that Tilbury Phase 2 may create changes to ecosystem health particularly for medicinal plants.

Kwantlen previously reported that hunting and trapping activities took place throughout the Lower Mainland and Fraser Valley, which were a main source of sustenance for their ancestors and current members of Kwantlen<sup>15</sup>. Kwantlen has also stated that unfortunately, the abundance of birds and game that used to exist in abundance locally have been wiped out due to rapid urban expansion that eliminated this practice.

Given the importance of the Lower Fraser River watershed and the history of Kwantlen in the Delta, B.C., and Metro Vancouver area, Kwantlen is working to enhance and re-establish traditional harvesting within the Fraser River, as well as increase resource harvesting activities, including plant and waterfowl harvesting, and food, social, and ceremonial (FSC) fishing opportunities throughout their Traditional Territory<sup>15</sup>. Kwantlen has stated that industrial development, urbanization, government laws, and policies have affected wildlife and wildlife habitat and have reduced opportunities for Kwantlen to participate in hunting on its Traditional Territory<sup>14</sup>.

The EAO understands that Kwantlen's Right to fish is heavily regulated and restricted by Department of Fisheries and Oceans (DFO). Kwantlen members continue to harvest salmon (for FSC purposes) for an approximately 42 km stretch of the Fraser River, starting from about 6 km upstream of the Pattullo Bridge up towards Mission<sup>15</sup>. Traditionally fishing practices were strong within the Lower Fraser River but due to strict DFO regulations, Kwantlen can no longer access these areas within the LAA.

### Potential Project Effects

The EAO and Kwantlen have identified the following pathway of effects, prior to the application of mitigation measures, along with the associated VCs outlined in [Appendix 6](#), that may affect Kwantlen's harvesting rights and subsistence activities during Construction, Operation, and Decommissioning phases of the Tilbury Phase 2 project. See also Table 11.1-4 of the Revised Application, which summarizes identified linkage between potential effects on the air quality, acoustic, surface water, groundwater, soil, vegetation, wildlife and wildlife habitat, fish and fish habitat, and land and resources VCs, and Indigenous interests.

- **Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources** from increased noise, light, and air pollution (acoustics, air quality, soil, groundwater, land and resource VCs), which may deter Kwantlen members from accessing preferred harvesting areas near the Tilbury Phase 2 Footprint. Changes in fish distribution and abundance (fish and fish habitat VC) and the introduction of invasive plant species (vegetation VC) may further reduce the experience and preference of practicing of harvesting rights. While Kwantlen does not currently fish or harvest close to the project site, they have historically and could in the future if the site was decommissioned to a more natural state;
- **Effects to Kwantlen Rights to fish, harvest and hunt for FSC purposes** from habitat loss (wildlife and wildlife habitat, fish and fish habitat, and vegetation VCs), increased mortality risks to fish, birds, and wildlife (wildlife and wildlife habitat VCs), and changes in their behavior due to sensory disturbances (acoustics and air quality VCs). Additionally, contamination risks to fish habitat in Tilbury Slough (surface water VC) and Fraser River downstream, as well as contaminated soil (soil VC) could impact important plant species, which may further impact traditional harvesting and cultural practices; and

- **Effects on the accessibility and availability of traditional lands and resources** may occur as a result of altered land or water based travel routes, access restrictions, or safety considerations, including changes to navigability and the usability of established travel corridors (land and resource use and surface water VCs), as well as indirect effects from sensory disturbances such as noise, dust, lighting, or visual changes that may discourage travel through otherwise accessible areas (air quality, acoustics, and land and resource use VCs). While the area is an industrially zoned privately-owned site with restricted access, Kwantlen considers that their harvesting rights continue from a pre-contact baseline.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures that the Proponent has proposed in response to potential Tilbury Phase 2-related effects on harvesting and subsistence activities, as mentioned in the section above. A full table of Proponent mitigations can be found in [Appendix A](#) of the Revised Application. Below is a summary of mitigation measures, how they address effects on the relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air quality measures, such as idle reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Kwantlen's harvesting and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during Construction and Operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Kwantlen's harvesting and cultural practices;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm-sewer system. These protections support water quality and fish habitat relied on to support Kwantlen's harvesting and cultural practices;
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat and vegetation important to Kwantlen's harvesting and cultural practices.
- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by Kwantlen for harvesting and cultural practices;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by Kwantlen for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to Kwantlen's harvesting and cultural practices;

- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the health and availability of salmon and other fish species central to Kwantlen's FSC harvesting and cultural practices; and
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used for harvesting or cultural practices.

In addition to the Proponent's mitigation measures, the EAO and Kwantlen identified the following Project-specific proposed provincial conditions that would mitigate potential effects to Indigenous harvesting and subsistence activities interests (see also [Section 8](#) of this Report):

- **Condition 10 (Community Feedback Process)** creates a clear way for Kwantlen to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of Kwantlen's harvesting and cultural practices;
- **Condition 12 (CEMP)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to Kwantlen's harvesting and cultural practices;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to Kwantlen's harvesting and cultural practices;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emissions-control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and overall ecosystem health, this plan helps protect the environmental conditions that support Kwantlen's harvesting and cultural practices; and
- **Condition 17 (Dry Street Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on Project-related roads, which may lower potential impacts on salmon and other fish important to Kwantlen's harvesting and cultural practices.

In addition to the Proponent's mitigations and the provincial conditions, the EAO and Kwantlen identified the following federal Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to harvesting and subsistence activities:

- **Federal Consideration for Migratory Bird Protections;** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Kwantlen's harvesting practices and broader ecosystem conditions important to their way of life.

#### Kwantlen's and the EAO's Analysis and Conclusions

This section presents the EAO's and Kwantlen's analysis and conclusions on the residual adverse effects of Tilbury Phase 2 on Kwantlen's harvesting and subsistence activities, which includes fishing, hunting, and gathering rights recognized and affirmed under Section 35 of the *Constitution Act, 1982*. After consideration of the potential effects and proposed mitigation measures described above, the EAO and Kwantlen identified the following residual effects on Kwantlen's harvesting and subsistence activities:

- Changes to the experience and preferences around the practice of harvesting rights; and

- Changes to the quality, quantity, and availability of resources for Kwantlen's harvesting, hunting, and fishing rights.

The EAO's and Kwantlen's characterization of the residual effects of Tilbury Phase 2 on Kwantlen's harvesting and subsistence activities are summarized in the table below.

Table 21: Summary of residual effects and rationale on Kwantlen's harvesting and subsistence activities.

| Residual Effect                                                                                                                                                                                                                                                                                                        | Assessment Rating*                                                                                                                                                                                                                                                                                                                                             | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Harvesting and subsistence activities:</p> <ul style="list-style-type: none"> <li>- Changes to the experience and preferences around the practice of harvesting rights</li> <li>- Changes to the quality, quantity, and availability of resources for Kwantlen's harvesting, hunting, and fishing rights</li> </ul> | <p>Context (resilience): Low</p> <p>Magnitude: Negligible-to-minor</p> <p>Extent: Local</p> <p>Duration: Medium-term (40 plus years operation)</p> <p>Reversibility: Fully reversible</p> <p>Frequency: Continuous</p> <p>Affected Populations: Disproportionate (Elders, knowledge holders, and harvesters)</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><b>Context:</b> Despite Kwantlen's strong stewardship values, resilience is low due to cumulative degradation of species and habitat, loss of access, and weakened intergenerational transmission of harvesting knowledge. It is understood that Kwantlen would have traditionally used the area for a variety of harvesting and subsistence activities, but that urbanization, pollution and restricted access has eroded Kwantlen's ability to practice their rights in the area.</p> <p><b>Magnitude:</b> impact is considered negligible, as Project activities are not anticipated to result in detectable indirect effects on salmon or other important fish species that may pass the Project site on route to Kwantlen fishing areas located upstream of the Project. Sensory disturbances associated with the Project (i.e. noise, light and air quality) are negligible to low in magnitude and are not expected to extend to area where Kwantlen harvests or fishes. No active harvesting occurs in the project area and residual effects on VCs such as surface water quality, fish and fish habitat are assessed as negligible in magnitude.</p> <p><b>Extent:</b> Rated as local, since the spatial scale of the residual effects to applicable VCs is limited, the impact on harvesting is expected to remain local, primarily within the immediate Project area.</p> <p><b>Duration:</b> The effects on harvesting will persist for as long as the Tilbury Phase 2 facility remains operational, making them medium-term (40 plus years of operation).</p> <p><b>Reversibility:</b> Effects would be fully reversible since small, short-term changes, such as localized sensory disturbances, would cease once project activities stopped or upon decommissioning, and no permanent impacts to harvesting practices or resources would be anticipated.</p> <p><b>Frequency:</b> Rated as continuous as while certain effects would be most prominent during Construction, some effects (noise, light disturbances) would occur continuously.</p> <p><b>Affected Populations:</b> Disproportionately affected populations would be those community members who actively engage in harvesting and subsistence practices, including Elders, knowledge holders, and harvesters reliant on traditional resources or teaching practices.</p> <p><b>Risk:</b> The risk rating is low because the likelihood of direct impacts would be low, and the consequences of indirect or perceived effects on harvesting practices would be low due to the minimal nature of sensory impacts.</p> <p><b>Uncertainty:</b> The uncertainty rating is moderate due to gaps in site-specific Indigenous Knowledge.</p> |
| <p>* Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a></p>                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### *Cumulative Effects*

As described in the Background and Current Context section, the Lower Fraser River and Tilbury Island area have experienced decades of industrial activity. These existing pressures have already affected environmental conditions and in turn Kwantlen's harvesting and subsistence interests by reducing availability of culturally important resources and altering how members access and use the area.

The Revised Application identifies several foreseeable projects that may adversely affect Kwantlen's harvesting and subsistence interests. These include T1B, which would increase LNG production, and the Tilbury Marine Jetty (TMJ) project, which would introduce additional vessel traffic on the Fraser River and further modify the foreshore next to the Project site. After mitigation and conditions have been implemented, the residual effects would be minimally disrupted from current conditions. Both T1B and TMJ could contribute additional sensory disturbances (noise, light, vibration), and impact air quality in areas used by Kwantlen for harvesting. TMJ could further alter fish and fish habitat, vegetation and vegetation habitat as well as water quality in areas used by Kwantlen for harvesting. Climate change is also expected to continue influencing vegetation, wildlife, and fish resources relied upon by Kwantlen.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

### **Conclusion**

Considering the above analyses, including FortisBC's proposed mitigation measures, EAO's Table of Conditions, and federal Key Mitigation Measures, and based on the Project specific effects of Tilbury Phase 2, the EAO and Kwantlen concludes that the Project will have a minor effect on Kwantlen's harvesting and subsistence activities

The EAO and Kwantlen acknowledge uncertainty around the precise degree to which the overall seriousness of impacts on an Indigenous interest is increased from cumulative effects due to the complexities in understanding conditions needed for meaningful practice of rights and availability of resources for Kwantlen. See Section 16.4.3 on assessment boundaries above, the EAO does not conduct territory-wide assessments for EAs, so the EAO and Kwantlen are not concluding on the current conditions or degree of cumulative effects throughout Kwantlen's entire Territory or how Tilbury Phase 2 might interact with these, nor does the EAO require comprehensive regional cumulative effects assessment on all the various existing constraints and pathways of impact, which is considered beyond the reasonable scope of a project-specific EA.

## **16.4.7 Cultural Use Sites and Areas**

### **Background**

Kwantlen's cultural sites and use within the region include village sites, trade, named places, archaeological sites, and spiritual use areas. Kwantlen continues to use areas within Delta B.C., and the Metro Vancouver area for cultural purposes and has done so since time immemorial<sup>13,14,15,17</sup>. Such practices include cultural and spiritual ceremonies, as well as gathering of traditional medicines from the land<sup>9</sup>.

Kwantlen identify the South Arm of the Fraser River, including the historic Indigenous village site<sup>18</sup> at Lulu Island and Tilbury Island, as an area of cultural importance. In addition to one valued cultural site on Lulu Island (located 4.5 km

<sup>17</sup> Brown, Jack. n.d. "Surrey History – Kwantlen of the Coast Salish: A Halkomelem Tribe." Accessed by FortisBC September 16, 2020. <https://surreyhistory.ca/kwantlen.html>. (site discontinued).

See Section 3.1 for naming and jurisdictional context regarding the Historic Indigenous Village Site

east of the Project Footprint), the Revised Application identified two Kwantlen ancestral village sites that are recorded as archaeological sites, *sx̣ẉeyəm̓əl* (DhRr-74) and *q̓iq̓éyt* (DhRr-2) located approximately 12 km east of the Project Footprint, which are also within the cultural use sites and areas LAA.

#### Current Context

As previously noted, the Project Footprint would be located on the property within a pre-existing LNG facility in the Tilbury Island industrial area. The EAO is not aware of the presence of any specific Kwantlen cultural use sites and areas located within the Project Footprint<sup>11,14,15</sup>, noting that the Revised Application stated that Kwantlen did not identify any known cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance within the Project Footprint. Kwantlen expressed the following:

The intentional colonial policies of the Federal and Provincial government that perpetuated cultural genocide made a significant impact on Kwantlen's ability to retain and share traditional knowledge, especially with the Potlach Ban and Residential School System imposed under the *Indian Act* of Canada. Kwantlen is not confident that historical information provided or referenced are meaningfully captured due to these systematic colonial practices. Kwantlen does not share Traditional or Cultural knowledge willingly especially for past experience of our own knowledge being used against our Rights and Title.

We are also frustrated by previous decisions that disregarded the impact to Kwantlen's Rights and Title based on limited understanding of Kwantlen's history, land-use and occupancy in order to approve projects, for example, TMJ.

Kwantlen has identified disenfranchisement from specific areas within their Territory as a result of existing development, including the historic Indigenous village site<sup>19</sup> at Lulu Island, the South Arm of the Fraser River and other important areas identified by Kwantlen within the cultural use sites and areas LAA<sup>14</sup>. Also Kwantlen has stated that its members must travel a greater distance to gather traditional medicines due to development in their Territory, as these practices require pristine (isolated and uncontaminated) lands and environmental conditions<sup>9</sup>.

FortisBC reported that, during the time of writing the Revised Application, that Kwantlen does not currently use the South Arm of the Lower Fraser River adjacent to the Project Footprint, including cultural sites or areas<sup>11</sup>. However, Kwantlen's lack of current use of the South Arm of the Fraser River by community members is more accurately a reflection of the restrictions in place by federal DFO regulations that inhibit Kwantlen's ability to exercise their inherent rights to fish, hunt, harvest or participate in cultural or traditional practices.

#### Potential Project Effects

The EAO and Kwantlen identified the following pathways of effects, prior to the application of mitigation measures, along with the associated VCs outlined in [Appendix 6](#), that may affect Kwantlen's cultural use sites and areas during the Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Effects to cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance;** Tilbury Phase 2 could affect cultural use of areas and sites through activities that disturb culturally significant places, such as archaeological sites, due to ground disturbance, accidental spills, or other construction-related interactions (culture, soil, archaeological and heritage resources VCs);
- **Loss of access to and disenfranchisement from cultural sites;** Kwantlen community members could experience direct adverse effects to cultural and spiritual practices if access to cultural sites is altered or lost due to closure or modification of trails, parking areas, or access points between the project site and the Fraser River for safety or construction purposes (land and resource VC). Temporary changes in sensory effects (acoustic, air quality, culture, land and resource VC) could alter the experience of Kwantlen members

---

See Section 3.1 for naming and jurisdictional context regarding the Historic Indigenous Village Site

using cultural sites such as a historic fishing village and harvesting areas along the South Arm of the Fraser River or near Burns Bog. See also Cultural Continuation section below; and

- **Effects to cultural and spiritual practices caused by changes to, or loss of, access to cultural sites and areas;** Adverse effects to Indigenous cultural practices (culture VC), which are connected to fish, wildlife, habitat, and vegetation (see harvesting and subsistence activities section above) could influence the ability or desire to access these sites (land and resource use VC). See also Indigenous Health and Well-being and Cultural Continuation sections below.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures that the Proponent has proposed in response to potential Tilbury Phase 2-related effects on Kwantlen's cultural use sites and areas. These include the following:

- **Land and Resource VC (Section 7.11)** Traffic management planning, noise and lighting controls, and communication regarding project activities help reduce disruptions to access and use of culturally important areas. These measures support Kwantlen's ability to safely access and continue cultural practices within their traditional territory;
- **Culture VC (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support Kwantlen's ability to access, use, and maintain culturally important areas, including places of teaching, ceremony, and connection to land and water;
- **Soil VC (Section 7.6)** Soil management measures, including erosion control, spill prevention protocols, and careful handling and disposal of contaminated soils, help prevent the migration of pollutants into nearby cultural areas and waterways. Maintaining soil stability and quality supports the protection of culturally important places and landscapes used by Kwantlen;
- **Acoustic (Section 7.3)** Noise reduction measures during Construction and Operation, such as idle reduction policies, equipment muffling, enclosures, and engineered noise controls, help limit disturbance to culturally important areas and activities. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of knowledge by Kwantlen;
- **Air Quality (Section 7.2)** The air quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Kwantlen's harvesting and cultural practices; and
- **Archaeological and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials—including chance-find procedures, site protection, and early notification to Indigenous nations—help protect culturally important sites, features, and landscapes. These measures support Kwantlen's ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connections to territory.

In addition to the Proponent's mitigation measures, the EAO developed further conditions that would mitigate potential effects to Indigenous cultural use sites and areas (see [Section 8](#) of this Report):

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance;
- **Condition 10 (Community Feedback Process)** to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, light, or disturbances near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (CEMP):** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of the culturally important landscapes and areas, supporting Kwantlen's continued access to and use of cultural sites during project Construction;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by Kwantlen;
- **Condition 14 (Air Quality Management Plan)** ensures that selection and implementation of effective emissions control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan maintains conditions suitable for access to, and use of culturally important areas and sites used by Kwantlen; and
- **Condition 15 (Chance Find Protocol)** requiring the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If the Kwantlen historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

In addition to the Proponent's mitigation measures and provincial conditions, the EAO and Kwantlen also identified the following federal Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to cultural use sites and areas:

- **Federal Consideration for Migratory Bird Protections;** The EAO recommends that the IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Kwantlen's harvesting practices and broader ecosystem conditions important to their way of life.

#### The EAO and Kwantlen's Analysis and Conclusions

After considering the proposed mitigation measures, the EAO and Kwantlen concludes that Tilbury Phase 2 could result in the following residual effects to Kwantlen's cultural use sites and areas:

- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural value;
- Changes to the experience and preferences around the cultural use of sites and areas; and
- Potential for continued or future disenfranchisement from harvesting and cultural use sites in the area (Tilbury Island and Lulu Island).

The EAO's and Kwantlen's characterization of the residual effects of Tilbury Phase 2 on Kwantlen's cultural use sites and areas are summarized in the table below.

Table 22: Summary of residual effects and rationale on Kwantlen's cultural use of sites and areas.

| Residual Effect                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Assessment Rating*                                                                                                                                                                                                                                                                                                                                             | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Cultural use sites and areas</p> <ul style="list-style-type: none"> <li>- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural value.</li> <li>- Changes to the experience and preferences around the cultural use of sites and areas</li> <li>- Potential for continued or future disenfranchisement from cultural sites in the area (Tilbury Island and Lulu Island).</li> </ul> | <p>Context (resilience): Low</p> <p>Magnitude: Negligible-to-minor</p> <p>Extent: Local</p> <p>Duration: Medium-term (40 plus years Operation)</p> <p>Reversibility: Fully reversible</p> <p>Frequency: Continuous</p> <p>Affected Populations: Disproportionate - Elders, knowledge holders, and harvesters</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><b>Context:</b> The Interest is rated as having low resilience due to cumulative impacts from colonization, industrialization, and restricted land and water access. Cultural practices are highly sensitive to disturbance and already disrupted.</p> <p><b>Magnitude:</b> The magnitude of impact is rated as negligible based on the Project's negligible magnitude residual effects on fish, fish habitat, surface water VC's, which underpin many cultural activities. Other connected VC residual effects, including those to wildlife, vegetation, air quality, acoustics, and land and resource use, are expected to be negligible to low in magnitude and of local extent. The Tilbury Phase 2 sites are located on fee simple industrial land, where access to cultural use is already restricted.</p> <p><b>Extent:</b> Rated as local, as the anticipated residual effects are geographically confined to Tilbury Phase 2 vicinity and immediate surrounding areas. Kwantlen's access to the Fraser River and cultural use sites and areas would not be expected to change because of Tilbury Phase 2. While incremental changes may be detectable, these are unlikely to alter cultural site access or have negative effects on cultural practices.</p> <p><b>Duration:</b> The effects on cultural use sites and areas are rated as medium-term. The residual effects, particularly sensory disturbances and restricted access, would persist throughout Construction and Operation but are expected to cease following Decommissioning.</p> <p><b>Reversibility:</b> Effects would be fully reversible since small, short-term changes, such as localized sensory disturbances, would cease once project activities stopped or upon decommissioning, and no permanent impacts to harvesting practices or resources would be anticipated.</p> <p><b>Frequency:</b> Sensory disturbances such as noise, vibration, and air emissions would occur with regular consistency throughout construction and operation. While sensory impacts like noise and visual changes would occur predictably during operation, these effects would not necessarily be at maximum levels continuously. Access restrictions would be effectively continuous, but do not represent a new barrier compared to existing conditions.</p> <p><b>Affected Populations:</b> Disproportionately affected populations would be those community members who actively engage in traditional and cultural practices, including Elders, knowledge holders, and harvesters reliant on traditional resources or teaching practices.</p> <p><b>Risk:</b> The risk rating is low because the likelihood of direct project-related disturbances within known Kwantlen cultural use sites and areas would be low and the consequences of indirect effects, such as noise, vibration, and visual disturbance would be minor due to the minimal nature of sensory impacts. Therefore, overall risk is rated at low.</p> <p><b>Uncertainty:</b> The uncertainty rating is moderate due to limited site-specific data and incomplete understanding of how cumulative sensory impacts affect cultural experience. While general effects are known, reliance on secondary sources and gaps in localized input reduce confidence in the assessment.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a>                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### Cumulative Effects

The historical context of environmental degradation and land-use changes has already affected Kwantlen's cultural use sites and areas, as detailed in the Background and Current Context section above. Kwantlen experiences limited access and altered ecological conditions along the Fraser River, and the degraded state of sites like Tilbury Island due to industrial development. The past and present impacts have reduced the ability of Kwantlen members to fully utilize culturally important locations and have hindered the transmission of Indigenous knowledge.

As stated in the Revised Application, FortisBC notes two reasonably foreseeable projects, T1B and TMJ, are expected to modify the Tilbury Island foreshore prior to Construction of Tilbury Phase 2. These developments are expected to introduce additional sensory disturbances (noise, light, vibration) affecting nearby cultural site access and use. T1B could remove vegetation, impacting culturally important plants and wildlife habitat, while TMJ shipping activities may increase disturbances, with potential effects on fish populations and cultural connections to the Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

### Conclusion

Considering the above analyses, including FortisBC's proposed mitigations, EAO's Table of Conditions, and based on the Project specific effects of Tilbury Phase 2, the EAO concludes that the Project will have a minor effect on Kwantlen's cultural use sites and areas.

The EAO and Kwantlen acknowledge uncertainty around the precise degree to which the overall seriousness of impacts on an Indigenous interest is increased from cumulative effects due to the complexities in understanding conditions needed for meaningful practice of rights and cultural use, and the availability of cultural use areas and resources for Kwantlen. See Section 16.4.3 on assessment boundaries above, the EAO does not conduct territory-wide assessments for EAs, so the EAO and Kwantlen are not concluding on the current conditions or degree of cumulative effects throughout Kwantlen's entire Territory or how Tilbury Phase 2 might interact with these, nor does the EAO require comprehensive regional cumulative effects assessment on all the various existing constraints and pathways of impact, which is considered beyond the reasonable scope of a project-specific EA.

### 16.4.8 Kwantlen's other Indigenous Interests

#### Background

The Revised Application identified that the health and well-being of Kwantlen Peoples may be affected by potential effects on socio-economic determinants of health, including employment, education, income, socio-economic status, and other indicators. In addition to socio-economic conditions, FortisBC also assessed potential effects to Kwantlen's Indigenous health and well-being, noting that Kwantlen had previously identified issues related to Indigenous health and well-being relevant to Tilbury Phase 2, including quality of water discharges, increased GHG emissions, and potential cumulative effects from infrastructure development.

Kwantlen expressed concern about increased GHG emissions in our microclimate within the Lower Mainland or provincially from extraction sites in northeastern B.C. can lead to increased variability in regional weather systems and climate trends that significantly impact air quality, water levels, water temperature, surface temperature, and intensity of storms that cause destruction to the natural and built environment. Kwantlen also stated they are extremely vulnerable due to their federally designated reservations that are situated along the Fraser and Stave River, including their primary residential reserve on McMillan Island that is in the middle of the Fraser River. Changes

to our weather systems and regional climate have generational effects on the plants and animals within our traditional territory and their ability to survive.

Through ongoing engagement of and submissions to other project EAs in the South Arm of the Fraser River, Kwantlen has identified cultural continuation as an interest<sup>9</sup>. Specifically, Kwantlen stated a concern that changes to Kwantlen knowledge translation may result from adverse effects to fish populations in the Fraser River. The EAO is aware that cultural continuation is a key goal of Kwantlen, and although it is distinct from fishing, harvesting, and the biophysical environment, these elements are inherently connected to, and dependent on, each other<sup>9</sup>. During Application Development, FortisBC updated its Revised Application to include Indigenous interests related to cultural continuation and Indigenous governance systems to address Kwantlen's provided feedback regarding temporal boundaries and noted that Kwantlen First Nation also looks at multi-generations and what the potential effects of projects will be 100 years from now.

Kwantlen's wholly owned subsidiary Səyérh provides services in the areas of contracting (construction, excavation, earthworks, security, and flagging), resource management (archaeology, fisheries, forestry), and on and off reserve development. Kwantlen First Nation recently signed a Clean Energy Business Fund Revenue Sharing Agreement with the Government of B.C. related to the Trethewey Creek and Big Silver Creek hydroelectric projects that will last the lifetime of the power projects<sup>20</sup>. Table 11.6-4 in FortisBC's Revised Application summarizes some of the agreements with other governments to which Kwantlen is a signatory.

#### Current context

[Section 11.6.2.7](#) of the Revised Application presents information about Kwantlen's health and wellness, including emergency services, education, housing, infrastructure, employment, and economic development. FortisBC acknowledged that the statistics provided need to be viewed in context, when comparisons are made between Kwantlen and non-Indigenous populations. The Revised Application noted that across Canada, Indigenous populations have experienced, and continue to experience, the severe and detrimental effects of colonialism, which have affected their social and economic well-being, as well as their health.

The Revised Application reported the largest area of employment by industry for both male and female Kwantlen Peoples on the McMillan Island 6 reserve was "other services," followed by health and education, manufacturing and construction, and transportation and warehousing according to 2016 Census data<sup>21</sup>. Sales and service was the dominant type of occupation for Kwantlen Peoples, followed by social sciences and government, and then trades and related occupations<sup>21</sup>. The dominant occupation type for Kwantlen Peoples identifying as females was sales and service, whereas, while for those identifying as males it was equally distributed between sales and service and trades and related occupations<sup>21</sup>.

In the areas of business development and opportunities, Kwantlen engages in business management, resources, development, land development, and construction through the Səyérh that was created by Kwantlen in 2011. Kwantlen Lands, Resources and Stewardship (KLRS) was established in 2020 to oversee all matters relating to Kwantlen Rights and Title, implementing the Kwantlen Land Code, Heritage and Land Management on and off reserve.

Kwantlen has previously stated that reducing the effects of the climate emergency are a top priority. Rising sea levels have an impact on cultural and heritage resources that have been protected or not found yet<sup>15</sup>. Kwantlen considers

that increasing water temperatures are having an impact on fish ecosystems and migratory patterns, while, the climate crisis has the potential to raise water levels in the river and create inhospitable areas on Kwantlen reserve lands, including the main reserve IR6. This also includes severe weather systems such as extreme heat/drought or atmospheric rivers.

### Potential Project Effects

The EAO and Kwantlen have identified the following pathways of effects, prior to the application of mitigation measures, along with the associated VCs outlined in [Appendix 6](#), that may affect Kwantlen's other Indigenous interests during the Construction, Operation, and Decommissioning phases of Tilbury Phase 2.

Table 23: Summary of residual effects and rationale on Kwantlen's other Indigenous interests.

| Social and Economic Conditions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Indigenous Health and Well-being                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Cultural Continuation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Effects on Infrastructure and Services</b> due to added pressure on community infrastructure or public services if out-of-region workers are used, but effects would be limited and indistinguishable from existing conditions (Land and resource use, employment and economy, and infrastructure services VCs).</p> <p><b>Changes to employment, Indigenous businesses, procurement opportunities, and Kwantlen revenue;</b> the extent of positive effects on Kwantlen's employment and business opportunities depends on member participation and access to contracts (employment and economy VC). Indigenous workers are more likely to be in construction jobs, but smaller Indigenous businesses may face challenges finding workers or meeting project demands (culture VC).</p> <p><b>Effects on ability to improve social and economic conditions;</b> Tilbury Phase 2 may support Kwantlen's efforts to improve social and economic conditions by creating employment, training, and business opportunities. Increased demand for skilled workers could also boost interest in trades training (employment and economy VC).</p> <p><b>Effects on the future aspirations for sites or areas surrounding the Project Footprint;</b> Tilbury Phase 2 would not be expected to affect Kwantlen's long-term community aspirations related to economic development, land use, language and cultural revitalization, and reclamation initiatives, or have any other identified effects on Kwantlen First Nation economic development planning. See also the section on Indigenous governance systems in the section below.</p> <p><b>Effects on commercial and non-commercial fishing, gathering, trading and cultural or ceremonial activities and practices;</b> Potential changes to Kwantlen's ability benefit from commercial and non-commercial harvesting is not expected because Tilbury Phase 2 would be located in an industrialized area (land and resource use VC), with limited interaction with cultural use or harvesting</p> | <p><b>Effects on Human Health</b> due to low likelihood of adverse effects to respiratory health through changes in ambient air-borne contaminants from Tilbury Phase 2 (Air Quality VC). Interactions with Kwantlen's members health are not anticipated due to the short-term potential exposures, with sensitive sub-groups directly adjacent to the Tilbury Phase 2 Footprint having greatest risk (Human Health VC).</p> <p><b>Effects on the quality, quantity and availability of harvested country foods</b> due to adverse effects on the fish, wildlife and plants (Vegetation, Fish and Fish Habitat, and Wildlife and Wildlife Habitat VCs). Kwantlen has identified the loss of traditional food sources as contributing to chronic health issues.</p> <p><b>Effects on the quality and perceived value of country foods</b> due to increased risks of contamination (Air Quality, Soil, Groundwater, Surface Water, and Health VC) or shifts in community members' perceptions about the value or quality of country foods. This could have negative impacts on Kwantlen members' participation in harvesting and subsistence activities and cultural and spiritual practices, even in the absence of adverse effects (see land and resource use, and culture VCs).</p> <p><b>Effects on traditional ways of life and cultural sites</b> from changes to traditional practices, access to cultural sites, and socio-economic factors (human health, community health and well-being, and culture VCs). Potential adverse effects on socio-economic determinants of health are limited to effects of shift work and family stress (human health VC). Tilbury Phase 2 is not expected to</p> | <p><b>Effects on the ability to revitalize, develop, and participate in intergenerational cultural transmission</b> due to changes in the experiences of being on the land or water (Air Quality, Visual Quality, and Acoustic VCs), or from changes to current and future availability and quality of country foods (Fish and Fish Habitat, Wildlife and Wildlife Habitat, Vegetation, and Health VCs). Kwantlen has identified the loss of traditional food sources and harvesting access as limiting intergenerational knowledge transfer.</p> <p><b>Disconnection from cultural heritage</b> due to changes in sense of place and identity as a result of changes in accessibility (Land and Resource Use VCs), effects on cultural sites (Archaeological and Heritage Resources), sensory disturbances (Air Quality, Visual Quality, and Acoustic VCs), changes in abundance or distribution of country foods, or any real or perceived risks of environmental contamination by Kwantlen's community members. Kwantlen also has concern for further disenfranchisement from the site, and Tilbury and Lulu Islands. See also the Harvesting and Subsistence Activities, Cultural Use Site and Areas, Indigenous Health and Well-being assessments above, and the section on Indigenous governance systems below).</p> <p><b>Effects on the ability to act as stewards of the land for future generations to come</b> through the interaction with Kwantlen's conservation and stewardship efforts, Tilbury Phase 2-related adverse and cumulative effects, and ongoing industrialization of the Tilbury Island and South Arm of the</p> |

| Social and Economic Conditions                                                                                                                                                                                                                                                        | Indigenous Health and Well-being                                                                                                                                                                        | Cultural Continuation                                                                                                                                                                                                             |

| sites (see Cultural Use Sites and Areas and Harvesting and Subsistence Activities sections above). Also, Tilbury Phase 2 is not anticipated to change incomes derived from non-commercial harvests, nor Kwantlen community members' participation in intertribal relations and trade. | alter Kwantlen's harvesting or cultural site access or have negative effects on cultural practices. See also the Harvesting and Subsistence Activities and Cultural Use Sites and Areas sections above. | Lower Fraser River. Tilbury Phase 2 would not be expected to affect Kwantlen's long-term community aspirations related to reclamation initiatives. See also the assessment on Indigenous governance systems in the section below. |

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed to potential Tilbury Phase 2-related effects on Kwantlen's other Indigenous interests. These include the following:

Table 24: Summary of FortisBC's proposed mitigation measures relevant to Kwantlen's other Indigenous interests.

| Social and Economic Conditions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Indigenous Health and Well-being                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Cultural Continuation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| transfer linked to Kwantlen's well-being. | <p>security, cultural identity, and health by safeguarding salmon and other species essential to FSC harvesting;</p> <ul style="list-style-type: none"> <li>• <b>Land and Resource Use (Section 7.11)</b> Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting Kwantlen's long-term aspirations for land and water restoration and reducing stressors that can affect well-being;</li> <li>• <b>Culture (Section 7.14)</b> Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Kwantlen's well-being; and</li> <li>• <b>Human Health (Section 7.15)</b> Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect Kwantlen members' physical, cultural, and mental health.</li> </ul> |                       |

Additional mitigation measures proposed by Kwantlen and FortisBC are provided in Table 11.6-12 of the Revised Application. Kwantlen proposed mitigations measures related to plant gathering and cultural continuation that FortisBC provide a response to, which included that the Proponent was open to considering a wide range of mitigation measures and legacy projects that could be potential options to be developed.

In addition to the Proponent's mitigation measures, the EAO developed further conditions that would mitigate potential effects of Tilbury Phase 2 on Kwantlen's other Indigenous interests:

- **Condition 10 (Community Feedback Process)** provides Kwantlen with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting Kwantlen's other Indigenous interests;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)** requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with Kwantlen to be developed by the Holder in consultation with the Nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality mitigates sensory disturbances, such as dust and odors, and prevents particulate deposition that may impact traditional resources. This supports Kwantlen's other Indigenous interests by preserving the cultural acceptability, integrity of harvested species, ensuring harvesting does not become more difficult or costly to access, protects respiratory health, reduce concerns related to environmental safety, and supports Kwantlen's other Indigenous interests;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archeological or cultural materials discovered during project activities. If Kwantlen historically used the area, this condition helps prevent disturbances of cultural materials and avoids associated cultural or emotional harm, supporting Kwantlen's health and well-being; and

- **Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support Kwantlen's socio-economic well-being.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Well-being:

- **Accidents and Malfunctions Reporting** would support mitigation of potential impacts on the Nation's interests by ensuring timely responses, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

In addition to the Proponent's mitigations and the provincial conditions the EAO and Kwantlen identified the following federal Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to Kwantlen's other Indigenous interests (excluding social and economic conditions):

- **Federal Consideration for Migratory Bird Protections;** The EAO recommends that the IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Kwantlen's harvesting practices and broader ecosystem conditions important to their way of life.

#### *The EAO and Kwantlen's Analysis and Conclusions*

This section presents Kwantlen's and the EAO's analysis and conclusions on the potential residual effects from Tilbury Phase 2 on Kwantlen's other Indigenous interests.

#### **Social and Economic Conditions:**

Tilbury Phase 2 may result in positive socio-economic effects through direct, indirect, and induced employment and procurement opportunities during Construction and Operation (employment and economy VC). Indigenous workers and businesses could also potentially benefit from training, skill development, and culturally aligned contracting, which would support Indigenous government revenues and community programs.

Considering these potential benefits, the EAO's conclusions on the linked VCs, and proposed mitigation measures, KMM's and conditions, and the lack of any substantial new barriers that would be introduced by Tilbury Phase 2, the EAO and Kwantlen have determined that there would be no residual effect on social and economic conditions, with the following key considerations:

- No direct residual effects to fish and fish habitat, and surface water VCs were identified after mitigation measures to protect aquatic ecosystems that underpin traditional and mixed economies;
- Residual effects to employment and economy, infrastructure and services, land and resource use, culture, air quality, acoustics, vegetation, wildlife and wildlife habitat, and soil were assessed as negligible to low in magnitude and mostly limited to the local area. These effects would not be expected to disrupt or eliminate opportunities for Indigenous participation in wage-based or harvesting economies;
- No direct interactions between Kwantlen's harvesting and subsistence activities and Tilbury Phase 2 expected because Kwantlen community members no longer use the Project Footprint or harvesting and subsistence activities LAA for harvesting or cultural purposes due to the existing level of cumulative effects from industrialization, restricted land and water access, and sensory disturbances. Kwantlen has advised that if these cumulative effects were addressed, Kwantlen members would resume harvesting and subsistence activities; and

- Tilbury Phase 2 would not affect identified plans or agreements about economic development on public lands within Kwantlen's traditional territory or have any other identified effects on Kwantlen economic development planning.

Consequently, no additional characterization of effects or cumulative effects assessment was conducted for this Indigenous interest.

After considering the proposed mitigation measures, the EAO and Kwantlen concludes that Tilbury Phase 2 could result in the following residual adverse effects to Kwantlen's other Indigenous interests (excluding social and economic conditions) as follows:

#### Indigenous Health and Well-being:

- Potential sensory disruption and psychological stress when using lands and resources for traditional purposes;
- Potential effects on members' confidence in country food safety resulting in avoidance of area or changes in harvesting practices; and
- Potential effects on traditional ways of life and cultural sites resulting in adverse effects to health and well-being;

#### Cultural Continuation:

- Potential effects on intergenerational cultural transmission due to sensory disturbances, changes in availability and distribution of resources, and behavioural changes due to real or perceived risks;
- Disconnection from cultural heritage from loss of sense of place, or further disenfranchisement from the site, Tilbury Island, and Lulu Island; and
- Potential effects on abilities to manage and protect lands for future generations.

The EAO's characterization of the residual effects of Tilbury Phase 2 on Kwantlen's other Indigenous interests are summarized in the table below.

Table 25: Summary of residual effects and rationale on Kwantlen's other Indigenous interests.

| Residual Effect                                                                                                                                                                                                             | Assessment Rating*                                                                                                                                                                                                                                                                                                  | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Indigenous health and well-being<br>- Sensory disruption and psychological stress<br>- Reduced confidence in country food safety and harvesting practices<br>- Effects to traditional ways of life or use of cultural sites | Context (resilience): High<br>Magnitude: Negligible-to-minor<br>Extent: Local<br>Duration: Medium-term<br>Reversibility: Partially reversible<br>Frequency: Continuous<br>Affected Population: Even, except for the effects to social determinants of health from shift work.<br>Risk: Low<br>Uncertainty: Moderate | <p><b>Context:</b> Indigenous health and well-being have high resilience because, while cumulative industrial and colonial impacts have placed strain on health and cultural practices, Kwantlen's efforts to continue to adapt and sustain cultural integrity indicates a high-level of resilience to the predicted localized and negligible-to-low level Tilbury Phase 2-related disturbances.</p> <p><b>Magnitude:</b> Rated as low because the Project is expected to have negligible to low magnitude impact on air quality and human health VC's and Kwantlen do not regularly use the area close to the Project site. Additionally, the project is anticipated to positively impact socio-economic determinants of health by increasing employment and economic opportunities.</p> <p><b>Extent:</b> The potential effects are rated as local since effects would be limited to areas directly surrounding Tilbury Island and its immediate zone of influence on the Fraser River. They are not expected to spread across the wider territory or affect regional cultural or health systems.</p> <p><b>Duration:</b> Environmental monitoring would confirm air and water quality parameters remain within the established guidelines for the protection of aquatic ecosystem and human health.</p> <p><b>Reversibility:</b> While continuous sensory disturbances would be expected throughout Construction and Operation, noise, vibration, and dust would cease</p> |

| Residual Effect                                                                                                                                                                                                                                                               | Assessment Rating*                                                                                                                                                                                                                                                                 | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                    | <p>after Decommissioning, but the impacts on cultural well-being could be partially reversible due to potential for lasting impacts.</p> <p><b>Frequency:</b> Potential effects, including environmental changes and perceptual impacts, would be expected to persist during Construction, Operation and Decommissioning, making them medium-term.</p> <p><b>Affected Populations:</b> Affected populations would be continuous as effects are expected to be experienced generally across the community in a relatively uniform manner except for the negative effects to social determinants of health from shift work (e.g., family stress, mental health concerns, substance use), which would be disproportionate for Indigenous, female, or lower-educated shift workers, and their families/households.</p> <p><b>Risk:</b> The risk rating is low because residual effects on Indigenous health and well-being would be localized, and unlikely to persist after mitigation is applied, meaning such consequences would not be expected to result in measurable or lasting health impacts to Indigenous people.</p> <p><b>Uncertainty:</b> Limited availability of community-specific health data, and the partial integration of Indigenous health frameworks were identified as contributing to a moderate uncertainty rating for this interest.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p>Cultural continuation</p> <ul style="list-style-type: none"> <li>- Loss or disruption of cultural continuity and inter-generational knowledge transfer</li> <li>- Disconnection from culture</li> <li>- Changes in ability to steward the land, waters, and air</li> </ul> | <p>Context (resilience): Medium</p> <p>Magnitude: Negligible-to-minor</p> <p>Extent: Local</p> <p>Duration: Medium-term</p> <p>Reversibility: Partially reversible</p> <p>Frequency: Continuous</p> <p>Affected Population: Even</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><b>Context:</b> Kwantlen has experienced significant environmental, social and Indigenous Knowledge transmission, reducing their resilience to further adverse effects. However, their efforts to maintain strong connection to culture indicate a medium capacity resiliency.</p> <p><b>Magnitude:</b> Negligible to low environmental stressors (including dust, odour, or visual quality) may reduce participation in harvesting and cultural practices, which could then negatively influence health and well-being indicators related to cultural continuity and intergenerational knowledge transfer.</p> <p><b>Extent:</b> Effects would be local and limited to areas directly surrounding Tilbury Island and its immediate zone of influence on the Fraser River.</p> <p><b>Duration:</b> Potential effects, including environmental changes and perceptual impacts, would be expected to persist throughout Tilbury Phase 2's 40 plus years of operation, making them medium-term. While sensory disturbances may end after decommissioning, impacts on cultural well-being could have lasting effects.</p> <p><b>Reversibility:</b> While sensory disturbances occurring regularly throughout Construction and Operation would cease after Decommissioning, the impacts on cultural well-being could be partially reversible due to potential for lasting impacts.</p> <p><b>Frequency:</b> While continuous sensory disturbances would be expected during Construction and Operation, these effects would be noise, vibration, and dust would cease once Construction is complete, such that any changes in members' confidence in country foods or traditional practices would be expected to return once temporary project-related disturbances resolve.</p> <p><b>Affected Populations:</b> No potential for disproportionately affected populations as the effects would be experienced evenly across the community in a relatively uniform manner.</p> <p><b>Risk:</b> The risk would be low because residual effects on Indigenous health and well-being are unlikely to persist after mitigation is applied and the predicted consequences would not be expected to lead to measurable or lasting health impacts.</p> <p><b>Uncertainty:</b> Moderate uncertainty is acknowledged due to complexities in understanding the conditions and availabilities of cultural resources needed for</p> |

| Residual Effect                                                                                                                   | Assessment Rating* | Rationale                         |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|-----------------------------------|
|                                                                                                                                   |                    | Kwantlen's cultural continuation. |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                   |

### Cumulative Effects

The EAO and Kwantlen acknowledge uncertainty around the precise degree to which the overall seriousness of impacts on an Indigenous interest is increased from cumulative effects due to the complexities in understanding conditions needed for meaningful practice of rights and cultural use, and the availability of cultural use areas and resources for Kwantlen. See Section 16.4.3 on assessment boundaries above, the EAO does not conduct territory-wide assessments for EAs, so the EAO and Kwantlen are not concluding on the current conditions or degree of cumulative effects throughout Kwantlen's entire Territory or how Tilbury Phase 2 might interact with these, nor does the EAO require comprehensive regional cumulative effects assessment on all the various existing constraints and pathways of impact, which is considered beyond the reasonable scope of a project-specific EA.

Tilbury Phase 2 is located within an area that has been subject to extensive historical and ongoing industrial development, and Kwantlen's health and well-being have already been affected by cumulative impacts associated with pollution, habitat degradation, and reduced access to traditional lands and resources.

The Revised Application identifies reasonably foreseeable projects in the vicinity that could contribute to cumulative effects: T1B and the TMJ Project, expected to introduce sensory disturbances and result in impacts to plant and wildlife habitat as well as aquatic life and habitat from shipping activities. Both TMJ and T1B have the potential to add to cumulative effects associated with decreased air quality and associated health impacts. The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project-specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, FortisBC's proposed mitigation measures, and EAO's Table of Conditions, the EAO concludes that Tilbury Phase 2 would have minor effects on Kwantlen's health and well-being interests.

## 16.4.9 Indigenous Governance Systems

### Background

Kwantlen is an independent nation and manages all matters related to governance, consultation, land management, community services, and economic development. Kwantlen integrates both hereditary systems and an appointed council<sup>15,22</sup>, whom work closely with both the Kwantlen Lands Advisory Committee (LAC) and the Elders Advisory Committee (EAC) to obtain direction and make decisions on various community initiatives. The LAC was created when Kwantlen voted in a referendum in 2015 to pass the community's Land Code under the *First Nation Land Management Act*. This replaces land laws under the *Indian Act* with Kwantlen's own laws through the community-created Land Code.

<sup>22</sup> Crown-Indigenous Relations and Northern Affairs Canada (CIRNAC). "Kwantlen First Nation Reserves/Settlements/Villages." Fact sheet; resource list. Accessed by FortisBC for the Tilbury Phase 2 LNG Application May 3, 2022. [https://fnppn.aadnc30.aandc.gc.ca/fnp/Main/Search/FNMain.aspx?BAND\\_NUMBER=564&lang=eng](https://fnppn.aadnc30.aandc.gc.ca/fnp/Main/Search/FNMain.aspx?BAND_NUMBER=564&lang=eng).

As detailed in Kwantlen's 2019 Land Use and Occupancy Report for the TMJ, Kwantlen Indigenous governance is grounded in long-standing occupation and use of their traditional territory, including lands, waters, and related resources. Tilbury Island falls within Kwantlen traditional territory and Kwantlen "asserts title to lands, waters and related resources within their territory," including rights related to freshwater resources such as salmon, eulachon or sturgeon. This authority is tied to responsibility for protecting cultural heritage sites and for determining how lands and waters are used and cared for, reflecting inherent jurisdiction that predates and continues alongside colonial systems.

Also outlined in the 2019 Kwantlen Lands and Occupation Report for TMJ, the Fraser River is described as central to Kwantlen culture, providing resources and serving as a transportation corridor. This report also identifies villages, boundary markers, plant-gathering areas, and shared use areas in the South Arm of the Fraser River as culturally significant. It also documents that parts of the region were shared with other First Nations and that territorial boundaries fluctuated over time, reflecting Indigenous systems of territorial governance and inter-nation relationships. These practices are described as maintaining cultural significance to a living community, demonstrating that Kwantlen governance and stewardship responsibilities are ongoing rather than historical.

Finally, as outlined in Kwantlen's 2019 Land Use and Occupation Report for TMJ, decision-making authority and governance responsibilities are described as ongoing and necessary where activities affect Kwantlen territory. The report concludes that because Tilbury Island is within the western boundary of Kwantlen territory, the Kwantlen First Nation "should be included in decision-making meetings and planning" related to proposed developments. It further notes that development without Kwantlen consent has cumulative effects on their territory and interests, particularly where projects may impact cultural heritage sites and traditional resources. This framing reflects governance responsibilities that include participation in planning, protection of traditional resources, and oversight of activities that may affect the land and river.

#### Current context

Kwantlen's Lands Resources and Stewardship (KLRS), formerly under the Səyém, has separated to become its own entity, manages all consultation, accommodation, and on-reserve lands management, including all matters related to the Land Code, permitting, leasing, and cultural heritage and environmental management.

Səyém is the economic development arm of Kwantlen that provides employment for members in areas such as archaeological monitoring, environmental monitoring or cultural monitoring. Səyém provides services in the areas of contracting (construction, excavation, earthworks, security, and flagging), resource management (archaeology, fisheries, forestry), and on and off reserve development. Table 11.6-4 in FortisBC's Revised Application summarizes some of the agreements with other governments to which Kwantlen is a signatory.

Today, Kwantlen is upholding their important connection to Tilbury Island and surrounding areas by advocating for environmental stewardship practices which take into consideration the cumulative effects of land alienation and rapid development within Kwantlen territory without the consent of the Kwantlen First Nation<sup>15</sup>. Kwantlen has stated that, with the potential for profound impacts on fish and fish habitat, Kwantlen would like to see all necessary steps taken to ensure that Kwantlen First Nation's interests in traditional resources are protected.

#### Potential Project Effects

The EAO and Kwantlen identified the following pathway of effects, prior to the application of mitigation measures, along with the associated VCs outlined in [Appendix 6](#) that may affect Kwantlen's Indigenous governance systems during the Construction, Operation, and Decommissioning phases of Tilbury Phase 2. This assessment did not find potential for adverse effects from Tilbury Phase 2 on Kwantlen's use or occupation of the site or ability to derive economic benefits. For more information, see the sections above on Kwantlen's Harvesting and Subsistence Activities, Cultural Use Site and Areas, and Other Indigenous Interests, including social economic conditions, Indigenous health and well-being and cultural continuity.

Following mitigation measures, the EAO and Kwantlen identified the following potential impacts on Kwantlen's Indigenous governance systems from potential effects of Tilbury Phase 2 LNG on:

- Use of tenures and licensed resource (linked to the land and resource use VC);
- Kwantlen's ability to manage and make decision about how lands are used, including future aspirations for sites or areas surrounding the Project's Footprint (see section on Kwantlen's Social and Economic Conditions above);
- Kwantlen's ability to act as stewards of the land for future generations to come (see section on Kwantlen's Cultural Continuity above); and
- Disconnection by Kwantlen from their cultural heritage (see section on Kwantlen's Cultural Continuity above).

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures that the Proponent has proposed in response to potential Tilbury Phase 2 related effects to Kwantlen's Indigenous governance systems. A full table of Proponent mitigations can be found in [Appendix A](#) of the Revised Application. Below is a summary of KMMs, how they address effects on relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air-quality measures, such as idle reduction, dust control, electrification, equipment maintenance, and emissions controls, support Kwantlen's governance and stewardship responsibilities within its traditional territory. By limiting emissions that may affect land, waters, and ecological conditions on and adjacent to Tilbury Island, these measures help maintain environmental conditions necessary for Kwantlen to exercise its inherent authority over land and resource management;
- **Surface Water (Section 7.4)** Erosion and sediment-control measures, along with containment and treatment of contact water, support Kwantlen's governance and stewardship responsibilities for water within its traditional territory. By preventing sediment or contaminants from entering Tilbury Slough and the Delta storm-sewer system, these measures help maintain water quality and aquatic conditions necessary for Kwantlen to exercise its governance systems;
- **Vegetation (Section 7.7)** Avoidance of the MOF footprint supports Kwantlen's governance and stewardship responsibilities by preventing disturbances to riparian areas and culturally important plant species relied on by Kwantlen members. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support Kwantlen's ability to exercise its inherent authority over land management, environmental oversight, and planning decisions affecting lands and ecosystems;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, supports Kwantlen's governance and stewardship responsibilities for wildlife and ecosystems within its traditional territory. By maintaining habitat conditions and ecological integrity, these measures assist Kwantlen in exercising its inherent authority over land and resource management;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures supports Kwantlen's governance and stewardship responsibilities for fish and aquatic ecosystems within its traditional territory. By protecting fish habitat and maintaining water quality for salmon migrating through the Lower Fraser River, these measures help sustain ecological conditions necessary for Kwantlen to exercise its inherent authority over land and water management;
- **Land and Resource Use: (Sections 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities support Kwantlen's governance and stewardship responsibilities by reducing disruptions to land-use patterns and activities within its traditional territory. These measures help

maintain conditions necessary for Kwantlen to exercise its inherent authority over land and resource management;

- **Employment and Economy (Section 7.10)** Employment, training, and procurement measures support Kwantlen's governance systems by strengthening institutional capacity, economic self-determination, and community-led decision-making. By creating opportunities for Kwantlen members and Kwantlen-owned businesses to participate in project-related economic activity, these measures enhance Kwantlen's ability to support governance functions, administer lands and resources, and deliver community services in a manner consistent with Kwantlen's governance systems;
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors support Kwantlen's governance and stewardship responsibilities by helping maintain environmental and social conditions within its traditional territory. By limiting project-related stressors and supporting Kwantlen's ability to manage and oversee activities affecting community well-being, these measures assist Kwantlen in exercising its inherent authority over land management, environmental oversight, and planning processes that influence the health and sustainability of its community; and
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity supports Kwantlen's governance and stewardship responsibilities for cultural heritage within its traditional territory. By maintaining the integrity of culturally important places and landscapes, these measures help enable Kwantlen to exercise its inherent authority over the identification, protection, and management of cultural sites and areas, consistent with Kwantlen's governance systems.

In addition to the Proponent's mitigation measures, the EAO developed further conditions that would mitigate potential effects of Tilbury Phase 2 on Kwantlen's Indigenous governance systems:

- **Condition 15 (Chance Find Protocol)** requiring the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. The condition helps to maintain Kwantlen's governance authority and cultural heritage management process; and
- **Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan)** requiring the development and implementation of a plan supporting economic participation of First Nations, and local communities, that would describe employment and contracting strategies and training practices. This plan supports Kwantlen's governance systems through the strengthening of economic self-determination, institutional capacity, and community-directed decision-making.

#### Kwantlen's and the EAO's analysis and conclusions

After considering the mitigation measures and potential effects described above, the EAO and Kwantlen concluded that the conclusions on the linked VCs, and proposed mitigation measures, KMM's and conditions, and the lack of any substantial new barriers that would be introduced by Tilbury Phase 2, there would be no residual effect on Kwantlen's Indigenous governance systems, with the following key considerations:

- Kwantlen governance is rooted in longstanding occupation and use of their traditional territory, with the Fraser River and South Arm central to culturally significant villages, resource areas, and shared use spaces;
- The Tilbury Phase 2 development area is on privately owned industrial land and is not expected to alter Kwantlen's current land and resource use practices, including harvesting, subsistence activities, or cultural sites;
- No archaeological or heritage resources have been identified within the Tilbury Phase 2 Project Footprint or the LAA, and contingency measures would be implemented if any such resources are discovered; and

- Tilbury Phase 2 is not expected to affect Kwantlen's economic development plans, governance responsibilities, or long-term community aspirations, though ongoing Kwantlen involvement in planning and decision-making remains important given the project's location within their territory.

Consequently, no additional characterization of effects or cumulative effects assessment was conducted for this Indigenous interest.

#### 16.4.10 Positive Effects of Tilbury Phase 2

FortisBC expects Tilbury Phase 2 would create job opportunities, particularly in construction during a 3-to-6-year period, noting that the greatest demand would be for skilled and semi-skilled workers with a trades certificate and experience in the construction sector. Other potential economic benefits include increased Indigenous business opportunities through contracting and procurement, increased Indigenous government revenues, and long-term skills and training opportunities for Indigenous peoples that would be directly or indirectly employed by the Project.

Positive changes to employment opportunities, Indigenous businesses, procurement opportunities, and Indigenous revenues would have the potential to positively affect Kwantlen's abilities to improve social and economic conditions, however this largely depends on whether Kwantlen's members would be employed by Tilbury Phase 2, and whether Kwantlen businesses, such as those run through the Səyərŋ, would be able to access contracting and procurement opportunities offered by FortisBC. According to 2016 census data, around 12 % of Kwantlen members held an apprenticeship, trades certificate, or diploma, with men being more represented in trades-related fields compared to women. Also, Indigenous workers (not specific to Kwantlen First Nation) are around twice as likely to be employed in construction-related occupations than non-Indigenous workers in the Lower Mainland region.

To enhance employment and economic opportunities for First Nations, FortisBC has committed to implementing measures that would boost Indigenous employment, training, and procurement opportunities associated with Tilbury Phase 2 (see the EAO's proposed Condition 16 for a First Nation and Local Economic Inclusion and Monitoring Plan), which would be developed in consultation with Kwantlen, and the other participating Indigenous nations. This plan would also support economic participation of First Nations, and local communities by including a description of employment and contracting strategies and training practices to target groups that are traditionally underrepresented in the construction labour force. See also [Appendix 6, Section 17.09](#) (Employment and Economy) in this Report.

Positive effects to Kwantlen's Indigenous health and well-being because of Tilbury Phase 2 would also be expected for social determinants of health indicators, such as employment, education, income, and socio-economic status (see [Section 11.6](#) of the Revised Application) depending on whether Kwantlen's members were directly or indirectly employed by the Project. While higher incomes would have a positive impact one's quality of life as well as their family members', Tilbury Phase 2 would also have potential for residual effects to social determinants of health from shift work, which would be negligible to low, but disproportionate for some shift workers (and their families), including females, Indigenous people, or lower-educated workers (see the Indigenous health and well-being assessment section above). To reduce potential for adverse effects of shift work, FortisBC has proposed implementing human resource policies through the CEMP (Condition 12) and OEMP (Condition 13), requiring FortisBC to offer support for employees suffering from substance use, arrange shift schedules taking into consideration the health and safety implication, and provide educational resources to understand health and safety implications for their workforce.

#### 16.4.11 Conclusions

Considering the above analyses, the EAO's and FortisBC's engagement with Kwantlen, FortisBC's commitments in Appendix A of the Revised Application, and the EAO's table of provincial conditions and identified Key Mitigation Measures to inform federal conditions under the IAA 2019, the EAO and Kwantlen concludes that Tilbury Phase 2 is anticipated to have the following impacts on Kwantlen's Indigenous interests:

- Minor residual effects to harvesting and subsistence activities;
- Minor residual effects to cultural use sites and areas;
- Minor residual effects to cultural continuity; and
- Minor residual effects to Indigenous health and well-being.

Considering the above analyses, the EAO and Kwantlen have concluded that the potential for adverse effects of Tilbury Phase 2 on Kwantlen First Nation's interests has been adequately avoided, minimized or otherwise accommodated. Based on the engagement undertaken with Kwantlen First Nation on Tilbury Phase 2, as outlined above in Section 16.4.2 the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with Kwantlen First Nation.

## 16.5 kʷikʷə́łəm First Nation

### 16.5.1 Community Profile

kʷikʷə́łəm First Nation (kʷikʷə́łəm) has lived in and cared for their traditional lands for thousands of years, maintaining a profound connection to the Coquitlam River and Coquitlam Lake, where sockeye salmon are central to their culture, diet, and identity. Their traditional territory spans the Coquitlam River Watershed, Pitt Lake, Mossum Creek, and the Fraser River's north arm, extending as far south as Barnston and Annacis Islands. Their territory does not include the South Arm of the Fraser River where Tilbury Phase 2 is located. Tilbury Phase 2 lies entirely outside but directly adjacent to kʷikʷə́łəm's traditional territory, and the LAA and RAA for Indigenous interests overlap with their territory, which is the basis for evaluating potential effects.

Today, kʷikʷə́łəm members, many of whom live on Coquitlam Indian Reserve #1 (slakəyánc), continue to uphold their cultural practices and responsibilities through language revitalization, governance, and environmental stewardship. They actively work to protect their lands, waters, and cultural heritage, ensuring the teachings and voices of their ancestors guide future generations.

### 16.5.2 kʷikʷə́łəm First Nation Involvement in the Environmental Assessment

kʷikʷə́łəm has had limited involvement in the EA for Tilbury Phase 2. During Early Engagement, the nation identified as a participating Indigenous nation and participated in initial information-sharing meetings with the EAO. At this time, kʷikʷə́łəm raised broad concerns related to safeguarding the Fraser River, climate change, cumulative industrial impacts, and effects to salmon, salmon habitat, and species that use their territory. They emphasized that rising water temperatures, altered flows, and existing ecological pressures should be central considerations in the assessment. However, the nation did not provide detailed information about cultural use sites, harvesting locations, or Tilbury Phase 2-specific interests.

During the Readiness Decision Phase in the development of the [Readiness Decision Report](#) kʷikʷə́łəm did not provide specific comments. The EAO engaged kʷikʷə́łəm during the Process Planning Phase regarding their Indigenous interests in relation to Tilbury Phase 2.

During the Process Planning Phase, the EAO sought further input regarding kʷikʷə́łəm's Indigenous interests in relation to the Project. Due to capacity constraints, the nation continued to provide only high-level concerns and no detailed information. As a result, the EAO and FortisBC relied on the preliminary list of Indigenous interests in the AIR to define the scope of assessment. Participation funding was committed by the EAO and IAAC, and the Proponent has engaged with kʷikʷə́łəm since 2020, and provided capacity funding for that engagement, as summarized in Table [11.16-6](#) of the Revised Application.

### 16.5.3 Assessment Boundaries

The Tilbury Phase 2 Project Area is outside kʷikʷə́łəm's traditional territory but is directly adjacent to it. The spatial assessment boundaries for each Indigenous interest were defined based on the overlap of kʷikʷə́łəm's traditional territory with the combined LAA and combined RAA identified for linked VCs, see figure 11.16-1 of the kʷikʷə́łəm's section in the Revised Application. The LAA of each Indigenous interest consists of the combined LAA of VCs that are linked to the Indigenous interest, whereas the RAA of each Indigenous interest consists of the combined RAAs of VCs that are linked to the Indigenous interest. The LAA is used for assessing direct or indirect project effects, while the RAA is for assessing cumulative effects.

The assessment of potential effects related to the proposed Project considered three distinct phases:

- Construction phase, with an estimated duration of three to six years;
- Operation phase, expected to last more than forty years; and
- Decommissioning phase, anticipated to take approximately two years.

#### 16.5.4 Regional Context

kʷikʷə́łəm's traditional territory is centered on the Coquitlam Watershed, including Coquitlam Lake and the upper and lower Coquitlam River, and extends east to Pitt Lake, west to Port Moody and Sapperton Heights, and south across the Fraser River from Barnston Island to Annacis Island. Kʷikʷə́łəm has lived in and cared for the Coquitlam Watershed since time immemorial, guided by ancestral teachings and a deep responsibility as stewards of the land, waters, and all living things. Kʷikʷə́łəm First Nation affirms its rights and title have never been ceded, surrendered, or abandoned.

While the Project Footprint is entirely outside but adjacent to their traditional territory, there's important overlap between the assessment areas (LAA/RAA) and kʷikʷə́łəm's traditional territory, and the Nation has raised concerns about potential effects on the Fraser River and upstream and about respecting other nations' rights.

Kʷikʷə́łəm have experienced lasting impacts from historical developments, such as the near extinction of sockeye salmon from the Coquitlam Dam and continue to face cumulative effects on cultural use sites from colonization, industrialization, and urban growth. Kʷikʷə́łəm's access to harvesting and hunting has been affected by past projects, including vegetation loss from large developments, reduced access to controlled burning areas, and barriers to gathering traditional medicines.

Historically, the Lower Fraser River corridor adjacent to the Project area formed part of kʷikʷə́łəm's broader harvesting landscape, where members fished for sockeye, eulachon, steelhead, and sturgeon; hunted seals, deer, and waterfowl along the South Fraser shoreline; gathered food and medicinal plants in upland areas such as Fraser Heights and Surrey Bend; and travelled the river as a central cultural and transportation route linking the Coquitlam Watershed to the lower river.

It is the Proponent's understanding from information available at the time of writing the Revised Application that kʷikʷə́łəm does not currently use the south arm of the Lower Fraser River adjacent to the Project Footprint to fish, hunt, gather plants, or access cultural sites or areas.

Kʷikʷə́łəm has indicated that the absence of current harvesting activity, particularly for sturgeon and salmon, reflects longstanding stewardship decisions and regulatory constraints in response to population declines, rather than a lack of cultural importance or interest. Sturgeon remains a culturally significant species for kʷikʷə́łəm.

The existing Tilbury LNG facility consists of gravel and paved areas, existing infrastructure, and equipment laydown areas supporting little plant life with little to no habitat value for wildlife. The vegetation within the Project Footprint is mostly limited to ditch lines and spoil piles and is dominated by non-native and invasive plant species. Public access to the Project site is limited, although there is currently public use of the dike to the north of the Project site along the Fraser River.

#### 16.5.5 Indigenous Interests

The EAO engaged kʷikʷə́łəm during the Early Engagement Phase in the development of the [Joint Summary of Issue and Engagement for the Tilbury Phase 2 LNG Expansion Project](#). However, kʷikʷə́łəm did not provide comment.

The EAO drafted the [Tilbury Phase 2- Schedule C – Application Information Requirements](#) Table 6, which outlines the Proposed Preliminary List of Indigenous Interests based on conversations with other First Nations involved in the project and a preliminary understanding of Project effects and how they may impact First Nation interests.

The Proponent identified kʷikʷə́łəm's Indigenous interests to be assessed in the Revised Application through:

- Reviewing requirements and guidance from the EAO, including the AIR; and
- Conducting engagement efforts with kʷikʷə́łəm to gather information on their Indigenous interests, as outlined in Section 11.16.3 Summary of Engagement of the kʷikʷə́łəm section of the Revised Application.

The EAO attempted to engage with kʷikʷə́łəm during the development of the Report. As no comments were received on their section, the EAO relied on the preliminary list of Indigenous interests identified in the AIR, which include:

- Harvesting and subsistence activities;
- Cultural use sites and areas;
- Social and economic conditions and
- Indigenous health and well-being.

The assessment of kʷikʷə́łəm's Indigenous interests in this section uses these categories.

The EAO's assessment of kʷikʷə́łəm's Indigenous interests includes describing the Indigenous interest, current context, potential effects, mitigation, and effects analysis. If there is an adverse residual effect a characterization of effects and cumulative effects assessment is also completed.

In addition to the EAO's assessment of effects to kʷikʷə́łəm Indigenous interests, kʷikʷə́łəm provided their position on how Tilbury Phase 2 will affect kʷikʷə́łəm's Indigenous interests to EAO.

### 16.5.6 Harvesting and Subsistence Rights

#### Background

Kʷikʷə́łəm has expressed that it maintains a deep and enduring relationship with the Fraser River and its surrounding ecosystems. This relationship supports the well-being of kʷikʷə́łəm members holistically—that is, physically, mentally, spiritually, and emotionally. Kʷikʷə́łəm affirms its inherent responsibility to protect and steward the waters, fish and fish habitat, wildlife, and vegetation within its traditional territory. These resources are central to the nation's cultural identity, way of life, and long-term sustainability.

#### Current Context

kʷikʷə́łəm maintains a deep cultural, spiritual, and subsistence relationship with the Lower Fraser River, where traditional practices such as fishing, hunting, plant gathering, and resource stewardship remain foundational to community well-being. Members continue to fish for salmon and other culturally important species, such as eulachon, sturgeon, trout, and freshwater shellfish, along the South Arm of the Fraser River between the Pattullo Bridge and the Golden Ears Bridge. This area lies within the harvesting and subsistence activities RAA and overlaps with the LAAs and RAAs used to evaluate potential effects on Indigenous harvesting. These fishing locations occur approximately 13–15 km upstream from the Project site at the Pattullo Bridge and extend to roughly 22–24 km upstream at the Golden Ears Bridge.

Plant gathering also remains an important cultural practice for kʷikʷə́łəm, with members traditionally collecting medicinal and food plants along riparian zones, wetlands, and forested areas of the lower Fraser River corridor. While these gathering areas are located within the broader regional landscape encompassed by the RAA, no suitable plant-harvesting habitat exists within the Project site itself, which is an active industrial facility with more than 98% of the footprint classified as non-vegetated. Access to the site will remain restricted for the life of the Project. Opportunities for hunting or trapping within the immediate LAA are similarly limited due to long-standing industrial disturbance, fragmented habitat, and the predominance of urban-adapted wildlife species in degraded riparian environments.

Kʷikʷə́łəm identifies as a fishing community, but members have reported declining access, reduced fish quality, and ongoing impacts to cultural practices due to cumulative pressures along the Fraser and Coquitlam rivers, including pollution, habitat degradation, changing water temperatures, and industrial activity. Although the Project Footprint lies outside their traditional territory, the nation has expressed concern regarding the cumulative ecological effects in the Lower Fraser River and the implications for long-term harvesting opportunities and cultural continuity.

#### Potential Project Effects

The EAO has identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#), that may affect Kʷikʷə́łəm's harvesting rights and subsistence activities during the Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- Changes to the experience and preferences around the practice of asserted harvesting rights and effects on the quality, quantity, and availability of resources:** Potential effects include loss or alteration of habitat supporting harvested wildlife, fish, bird, and plant species, including species of cultural and medicinal importance (vegetation, wildlife and wildlife habitat, fish and fish habitat VCs). Changes to surface water quality and quantity may affect downstream habitat and species availability (surface water, and groundwater VCs). Sensory disturbances such as noise and vibration (acoustic VC), odour and air emissions (air quality VC), dust (soil VC), and visual changes (Land and Resource VC) may influence the experience and preferences around the practice of harvesting. Additional pathways include changes to the availability, distribution, abundance, and quality of harvested species that support harvesting activities (vegetation, wildlife and wildlife habitat, fish and fish habitat, and land and resource use VCs);
- Effects on asserted Aboriginal Rights to fish, harvest, and hunt for Food Social and Ceremonial (FSC) purposes:** Pathways include increases in harvesting effort, including the time, expense, or difficulty required to reach harvesting areas, and changes in harvesting success due to alterations in habitat quality and quantity, species availability, distribution, abundance, and the quality of harvested species (land and resource use, vegetation, wildlife and wildlife habitat, and fish and fish habitat VCs). Sensory disturbances such as noise and vibration (acoustic VC), odour, dust, and reduced air quality (air quality, soil, and groundwater VCs) and changes to surface water quality or quantity (surface water VC) may further influence FSC practices. Temporary access restrictions or altered travelways may also affect the ability to reach FSC sites (land and resource use VC);
- Changes to the current use of lands and resources for traditional purposes:** Potential effects include changes to harvesting methods and practices, such as timing, seasonality, or preferred locations, as well as increased effort required to access or use traditional areas. These pathways may be influenced by changes in habitat quality and species availability, distribution, and abundance, along with sensory disturbances such as noise, air emissions, and vibration during Construction and Operation. Additional effects may include temporary restrictions on travelways or access to culturally important areas due to construction activities and surface water alterations (vegetation, wildlife and wildlife habitat, fish and fish habitat, acoustic, air quality, surface water, and land and resource use VCs); and
- Effects to the accessibility and availability of traditional lands and resources:** Potential effects include changes in the ability to travel to or through areas traditionally used for subsistence or cultural purposes, as well as temporary access restrictions or reduced accessibility of travelways needed to reach these areas. Disruption to navigation on the Fraser River and adjacent marine environment may also affect the availability of and access to traditional lands and resources. These pathways may be influenced by construction- and operation-related sensory disturbances such as noise (acoustic VC), air emissions and dust (air quality, soil, and groundwater VCs), and changes to surface water quality or quantity (surface water VC), as well as habitat changes affecting species relied upon for traditional uses (vegetation, wildlife and wildlife habitat, fish and fish habitat, and land and resource use VCs).

The Revised Application includes a summary of relevant mitigation measures that the Proponent has proposed in response to potential Tilbury Phase 2-related effects on harvesting and subsistence activities, as mentioned in the section above. A full table of Proponent mitigations can be found in [Appendix A](#) of the Revised Application. Below is a summary of Key Mitigation Measures, how they address effects on the relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air quality measures, such as idle reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Kʷikʷə́łəm's harvesting and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during construction and operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Kʷikʷə́łəm's harvesting and cultural practices;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm sewer system. These protections support water quality and fish habitat relied on to support Kʷikʷə́łəm's harvesting and cultural practices;
- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by Kʷikʷə́łəm for harvesting and cultural practices;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by Kʷikʷə́łəm for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to Kʷikʷə́łəm's harvesting and cultural practices;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat and water quality used by salmon migrating through the Lower Fraser River. These actions support the health and availability of salmon and other fish species central to Kʷikʷə́łəm's FSC harvesting and cultural practices;
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used for harvesting or cultural practices; and
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat and vegetation important to Kʷikʷə́łəm's harvesting and cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions to help reduce potential impacts on Kʷikʷə́łəm's harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting rights (see [Section 8](#) of this Report):

- **Condition 10 (Condition Community Feedback Process)** creates a clear way for Kʷikʷə́łəm to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of Kʷikʷə́łəm's harvesting and cultural practices;
- **Condition 12 (CEMP)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to Kʷikʷə́łəm's harvesting and cultural practices;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to Kʷikʷə́łəm's harvesting and cultural practices;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emissions control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support Kʷikʷə́łəm's harvesting and cultural practices; and
- **Condition 17 (Dry Street Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project related roads, which may lower potential impacts on salmon and other fish important to Kʷikʷə́łəm's harvesting and cultural practices.

In addition to the Proponent's mitigations and the provincial conditions the EAO identified the following federal Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to harvesting and subsistence activities:

- **Federal Consideration for Migratory Bird Protections:** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Kʷikʷə́łəm's harvesting practices and broader ecosystem conditions important to their way of life.

#### The EAO's Analysis and Conclusions

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Kʷikʷə́łəm's harvesting rights and interests:

- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources;
- Effects on Aboriginal rights to fish, harvest, and hunt for FSC purposes; and
- Effects to the accessibility and availability of traditional lands and resources.

The EAO's characterization of the residual effects of Tilbury Phase 2 on harvesting and subsistence activities are summarized in the table below.

Table 26: Summary of residual effects and rationale on K'w'ik'w'əłəm and its harvesting and subsistence rights.

| Residual Effect                                                                                                                                                                                                                                                                                                                                                                                                                         | Assessment Rating*                                                                                                                                                                                                                                                  | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Harvesting and subsistence activities</p> <ul style="list-style-type: none"> <li>- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources</li> <li>- Effects on Aboriginal rights to fish, harvest, and hunt for FSC purposes</li> <li>- Effects to the accessibility and availability of traditional lands and resources</li> </ul> | <p>Context (resilience): Low</p> <p>Magnitude: Negligible</p> <p>Extent: Local</p> <p>Duration: Medium-Term</p> <p>Reversibility: Fully reversible</p> <p>Frequency: Continuous</p> <p>Affected Populations: Even</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p>Resilience is rated as low despite K'w'ik'w'əłəm's strong stewardship values, reflecting the ongoing degradation of species and habitat, loss of access to traditional lands, and historical disruptions to intergenerational knowledge exchange, alongside ongoing and increasing efforts by the nation to revitalize harvesting knowledge within the community.</p> <p><b>Magnitude:</b> the effect is rated as negligible, based on the absence of direct residual effects on fish, fish habitat, or surface water within the LAA, and no known overlap with historic or current harvesting or trading locations.</p> <p><b>Extent:</b> the effect is rated as local as effects are mostly confined to the LAA, with minor indirect influence on adjacent local areas. The Project lies outside K'w'ik'w'əłəm's traditional territory, and no adverse interactions with harvesting areas are anticipated after mitigation measures are implemented.</p> <p><b>Duration:</b> rated as medium-term, although Tilbury Phase 2 will operate for decades, the related residual effects would cease following Decommissioning, and no permanent impacts to harvesting practices or resources are anticipated.</p> <p><b>Reversibility:</b> rated as fully reversible because the Project is located outside the nation's traditional territory in an already industrialized area, and negligible magnitude effects on fish, fish habitat, surface water, were identified after mitigation. Any minor, short-term changes, such as localized sensory disturbances, would cease once project activities stopped or upon Decommissioning.</p> <p><b>Frequency:</b> effect is rated as continuous because sensory disturbances such as noise, vibration, and air emissions are expected to occur consistently throughout the Construction and Operation phases.</p> <p><b>Affected populations:</b> rating is disproportionate because residual effects, while negligible overall, would be most directly experienced by community members actively engaged in harvesting and subsistence practices. elders, knowledge holders, and harvesters reliant on traditional resources or teaching practices are more likely to be affected by even minor sensory disturbances or ecological changes near the Project area. These groups may experience greater cultural and practical impacts than the broader community, which is less dependent on direct harvesting activities.</p> <p><b>Risk:</b> rating is low – the likelihood of direct Project-related impacts is low, and the consequences of indirect or perceived effects on harvesting practices are minor due to the negligible to low magnitude sensory impacts.</p> <p><b>Uncertainty:</b> rating is moderate due to gaps in site-specific Indigenous knowledge.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a>                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### Cumulative Effects

As described in the Background and Current Context section, the lower Fraser River and Tilbury Island area have undergone longstanding industrial development, as well as impacts due to climate change, resulting in existing pressures on environmental conditions and on Kʷikʷə́łəm's harvesting and subsistence activities.

The Revised Application identifies several reasonably foreseeable projects that may affect Kʷikʷə́łəm's harvesting and subsistence interests. These include T1B, which would increase LNG production, and the TMJ Project, which would introduce additional vessel traffic in the Fraser River and further development of the foreshore area. Both T1B and TMJ could contribute additional sensory disturbances (noise, light, vibration) and impact air quality in areas used by Kʷikʷə́łəm for harvesting. TMJ could further alter fish habitat and water quality in areas where Kʷikʷə́łəm assert harvesting and subsistence rights. The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Nations in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, FortisBC's proposed mitigation measures, EAO's Table of Conditions and the federal Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 would have negligible effects on Kʷikʷə́łəm's harvesting and substance activities.

## 16.5.7 Cultural Use Sites and Areas

### Background

Kʷikʷə́łəm maintains a deep cultural and spiritual connection to their traditional territory, particularly the Fraser River and Coquitlam Watershed. These areas support well-being, governance, and contain numerous archaeological and important cultural sites. Members have expressed concerns about cumulative impacts from colonization, industrialization, and urbanization on cultural use sites within the Project RAA. Access to these sites—and the ability to carry out traditions—relates directly to affirmed Aboriginal rights, which are recognized and affirmed under Section 35 of the *Constitution Act, 1982*. For a description of culturally important harvesting practices, see the Harvesting and Subsistence Activities section above.

### Current Context

Current access to cultural sites is limited by industrialization, urban development, and pollution, which have reduced opportunities for traditional harvesting, ceremonies, and cultural continuity. The Fraser River remains vital to Kʷikʷə́łəm identity, despite cumulative pressures on water quality, fish habitat, and cultural landscapes.

The Revised Application identifies Kʷikʷə́łəm cultural use areas including the Coquitlam River, a spiritually important waterway with numerous ancestral archaeological sites; Lower Fraser River archaeological sites containing fire-altered rock, lithics, and a fish weir, none located within the Project Footprint or cultural use sites and areas LAA; and Fraser River cultural sites that remain spiritually important though no Kʷikʷə́łəm-specific sites are documented near the Tilbury site.

### Potential Project Effects

The EAO has identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#), that may affect Kʷikʷə́łəm's cultural use sites and areas during the Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural value:** Potential effects include disturbance or alteration of cultural heritage features and archaeological resources during construction activities such as excavation, grading, and ground disturbance (archaeological and heritage Resources VC). These effects may extend to storied places, habitation sites, and archaeological sites along the south arm of the Fraser River, Tilbury Island, and Lulu Island. Additional effects could arise from sensory disturbances such as noise and vibration (acoustic VC), odour and air emissions (air quality VC), dust, and visual changes (Land and Resource Use VC), which may affect the integrity or condition of cultural heritage resources;
- **Loss of access to and disenfranchisement from cultural sites:** Potential effects include changes to physical, cultural, or spiritual sites or areas (culture, and archaeological and heritage resources VCs), along with disruption or alteration of trails, travelways, navigable waterways, and other routes relied upon to access cultural sites (Land and Resource Use VC). Additional pathways include areas with temporary access restrictions or reduced accessibility due to construction activities, safety requirements, or Project-related navigation changes on the Fraser River and adjacent marine environment. Sensory disturbances such as noise and vibration (acoustic VC), odour and air emissions (air quality VC), dust, and visual changes (Land and Resource VC) may further limit the ability to access, use, or meaningfully engage in cultural sites and could affect participation in communal activities and cultural practices linked to these areas (culture VC); and
- **Effects to cultural and spiritual practices caused by damage or loss of access to cultural sites and areas:** Potential effects include disruptions to cultural and spiritual practices that rely on access to culturally important places, where damage to cultural sites or reduced ability to reach them may limit participation in these activities (culture, and archaeological and heritage resources VCs). Sensory disturbances such as noise and vibration (acoustic VC), odour, dust, and reduced air quality (air quality VC), along with visual changes (land and resource use VC), may alter the experience of exercising cultural and spiritual practices. These pathways could influence participation in communal activities and culturally based practices that depend on the accessibility and integrity of cultural sites (culture, and land and resource use VCs).

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the proponent has proposed in response to potential Tilbury Phase 2 related effects on cultural use sites and areas. These include the following:

- **Acoustics (Section 7.3)** Noise reduction measures during Construction and Operation, including idle reduction policies, equipment muffling, enclosures, and engineered noise controls, help limit disturbance to culturally important areas and activities. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of cultural knowledge by Kʷikʷəḷəm;
- **Air Quality (Section 7.2)** The air quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Kʷikʷəḷəm's harvesting rights and cultural practices;
- **Land and Resource Use (Section 7.11)** Traffic management planning, noise and lighting controls, and communication regarding project activities help reduce disruptions to access and use of culturally important areas. These measures support Kʷikʷəḷəm's ability to safely access and continue cultural practices within their traditional territory;
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures, site protection, and early notification to Indigenous nations, help protect culturally important sites, features, and landscapes. These measures support

Kw'ikwəłəm's ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connections to territory; and

- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support Kw'ikwəłəm's ability to access, use, and maintain culturally important areas, including places of teaching, ceremony, and connection to land and water.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects to Indigenous cultural use sites and areas (see also [Section 8](#) of this Report):

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance.
- **Condition 10 (Community Feedback Process)** establishes a clear and structured mechanism for Kw'ikwəłəm to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of culturally important landscapes and areas, supporting Kw'ikwəłəm's continued access to and use of cultural sites during project Construction;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, lighting, wildlife interactions, and spills during project Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by Kw'ikwəłəm;
- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emissions-control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites by Kw'ikwəłəm; and
- **Condition 15 (Chance Find Protocol)** the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If Kw'ikwəłəm historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

#### The EAO's Analysis and Conclusions

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Kw'ikwəłəm's cultural use sites and areas rights and interests:

- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural value;
- Loss of access to and disenfranchisement from cultural sites; and
- Effects to cultural and spiritual practices caused by damage or loss of access to cultural sites and areas.

EAO's characterization of the residual effects of Tilbury Phase 2 on Kw'ikwəłəm cultural use sites and areas are summarized in the table below.

Table 27: Summary of residual effects and rationale on Kʷikʷə́łəm and its cultural use sites and areas.

| Residual Effect                                                                                                                                                                                                                                                                                                                                                                                                             | Assessment Rating*                                                                                                                                                                                                                                                                  | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Cultural use sites and areas</p> <ul style="list-style-type: none"> <li>- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural value.</li> <li>- Loss of access to and disenfranchisement from cultural sites</li> <li>- Effects to cultural and spiritual practices caused by damage or loss of access to cultural sites and areas</li> </ul> | <p>Context (resilience): Low</p> <p>Magnitude: Negligible</p> <p>Extent: Local</p> <p>Duration: Medium-term</p> <p>Reversibility: Partially reversible</p> <p>Frequency: Continuous</p> <p>Affected Populations: Disproportionate</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p>Kʷikʷə́łəm's cultural use sites and areas have low resilience due to cumulative impacts from colonization, industrialization, and restricted land and water access. Cultural practices are highly sensitive to disturbance and already disrupted.</p> <p><b>Magnitude:</b> rated as negligible because the Project does not directly disturb identified cultural sites, does not prevent access, and is not expected to result in any detectable changes to the experience of cultural use. Sensory conditions such as noise, air emissions, and visual effects are anticipated to remain within existing industrial baselines and are unlikely to influence cultural activities or spiritual connection to place.</p> <p><b>Extent:</b> of the effect is rated as local as the impacts are confined primarily to the Project Footprint and nearby lands; there is no overlap with known Kʷikʷə́łəm cultural sites.</p> <p><b>Duration:</b> rated medium-term. No enduring disruption to cultural practices or access is expected after Decommissioning of the Project.</p> <p><b>Reversibility:</b> The effects are partially reversible as some sensory effects (e.g., noise, emissions, activity) would diminish and largely return to baseline following Decommissioning; however, certain visual changes, industrial landscape conditions, and culturally important experiential qualities may not fully recover.</p> <p><b>Frequency:</b> rated as continuous because sensory impacts like noise and visual changes would occur regularly during Operation, though not necessarily at maximum levels continuously. Access restrictions are effectively continuous, but do not represent a new barrier compared to existing conditions.</p> <p><b>Affected populations:</b> rating is disproportionate as elders and cultural knowledge holders may be more acutely impacted due to reliance on traditional experiences.</p> <p><b>Risk:</b> rated as low due to the low likelihood of direct Project-related disturbances within known Kʷikʷə́łəm cultural use sites and the minor consequences of indirect effects, such as noise, vibration, and visual disturbance. While these impacts may influence the quality of cultural experience in nearby areas, they are unlikely to cause lasting disruption to site function or prevent cultural use, particularly given the current lack of overlap with identified sites and the implementation of mitigation measures.</p> <p><b>Uncertainty:</b> rated as moderate due to limited site-specific data and incomplete understanding of how cumulative sensory impacts affect cultural experience. While general effects are known, reliance on secondary sources and gaps in localized input reduce confidence in the assessment.</p> |
| <p>* Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a></p>                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### Cumulative Effects

The Revised Application notes that future developments, such as the T1B, which may remove culturally valued vegetated habitat, and TMJ, which would increase shipping, noise, and light, could cumulatively affect culturally important areas throughout the Fraser River corridor where Kʷikʷə́łəm has historically fished, hunted, and practiced ceremony.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions

### Conclusion

Considering the above analyses, including proposed proponent mitigations, EAO's conditions, and KMMs, and based on the Project specific effects of Tilbury Phase 2, the EAO concludes that the Project will have a negligible effect on the cultural use sites and areas of Kʷikʷə́łəm.

## 16.5.8 Social and Economic Conditions

### Background

Kʷikʷə́łəm's identity and well-being are rooted in their ancestral connection to the Coquitlam Watershed, where fishing, hunting, and plant gathering historically sustained cultural, social, and economic life. Their Coast Salish kinship system fostered intercommunity cooperation, and these relationships persist today despite lasting colonial impacts on land, governance, and health. The near extinction of sockeye salmon following construction of the Coquitlam Dam disrupted critical food sources and cultural practices, while historic land alienation and industrialization contributed to cultural stress and economic constraints.

Maintaining and restoring traditional practices, improving social conditions, and pursuing economic development remain priorities for Kʷikʷə́łəm. The Project could provide positive contributions through employment, skills training, and procurement opportunities aligned with these goals. See sections on cultural use sites and areas and harvesting and subsistence activities for additional context.

### Current Context

Kʷikʷə́łəm's current social and economic conditions reflect both resilience and systemic challenges. Community health programs integrate traditional and western medicine, with growing emphasis on emergency planning and self-governance. Housing at Coquitlam 1 has improved, with most dwellings in good condition as of 2021, and education outcomes exceed provincial averages for trades and non-university certificates. Economically, members work in diverse sectors, primarily trades and service, but continue to face employment barriers and persistent income gaps compared to non-Indigenous populations. While Canada's Community Well-being Index shows improvements, disparities remain, compounded by limited reserve land and industrial development that restrict cultural and economic opportunities. The loss of access to traditional resources, particularly salmon, continues to affect health, food security, and cultural continuity, while industrialization and urbanization have further altered landscapes and reduced opportunities for cultural practices and harvesting.

### Potential Project Effects

The EAO has identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#) that may affect Kʷikʷə́łəm's social and economic conditions during the Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- **Changes to employment opportunities, Indigenous businesses, procurement opportunities, and kʷikʷəłəm revenue:** Potential effects include changes to access to Project-related employment, training, and procurement opportunities that may influence employment income, labour force participation, and Indigenous business development for kʷikʷəłəm members (employment and economy VC). Kʷikʷəłəm has indicated interest in Project-related roles, including archaeology, monitoring, and procurement opportunities, as avenues to support community well-being across economic, social, cultural, and spiritual dimensions. Local and regional Indigenous businesses, including those owned or affiliated with kʷikʷəłəm, may benefit from contracting opportunities created by Tilbury Phase 2, while smaller businesses may face limitations related to capacity or competitiveness. These changes may influence economic equity and the nation's ability to generate revenue through participation in economic activities associated with Tilbury Phase 2 (culture, infrastructure and services, land and resource use, and vegetation VCs);
- **Effects on Indigenous Nations' future aspirations for sites or areas surrounding the Project:** Potential effects include alignment or conflict between Project activities and kʷikʷəłəm's aspirations for economic development, land use, language revitalization, cultural continuity, and environmental reclamation (culture VC). Project-related changes may influence land-based economic opportunities, cultural programming, and stewardship objectives within the surrounding region (employment and economy, land and resource use, fish and fish habitat, wildlife and wildlife habitat, vegetation, and infrastructure and services VCs).
- **Effects on kʷikʷəłəm's ability to improve social and economic conditions:** Potential effects include how Project activities align or conflict with kʷikʷəłəm's plans for economic development, land use, language revitalization, cultural sustainability, and environmental reclamation (culture, and employment and economy VC). These pathways may influence nation-led strategies to enhance community well-being and economic resilience, including access to employment, procurement, and business development opportunities. Project-related changes to land use, infrastructure, and ecological conditions may also affect kʷikʷəłəm's aspirations for long-term stewardship and regional development (land and resource use, infrastructure and services, fish and fish habitat, wildlife and wildlife habitat, and vegetation VCs);
- **Effects on commercial and non-commercial fishing, hunting, trapping, and gathering and cultural or ceremonial activities and practices:** Potential effects include changes in harvesting effort, such as increased time, expense, or difficulty required to travel to harvesting locations, as well as changes in harvesting success related to the frequency or quantity of harvested species or materials available for community use (fish and fish habitat, wildlife and wildlife habitat, and vegetation VCs). Project-related changes to resource availability and habitat quality may influence individual, household, or communal income derived from non-commercial harvesting practices and affect participation in cultural or ceremonial activities linked to harvesting. Additional pathways include potential changes to intercommunity participation and the type, amount, or frequency of harvested materials traded between communities. Sensory disturbances such as noise and odour (acoustic, and air quality VCs) and broader changes to land use, infrastructure, and cultural conditions may further influence these activities (land and resource use, infrastructure and services, culture, and employment and economy VCs);
- **Effects on intercommunity relations and trade:** Potential effects include changes in harvesting effort—such as increased time, expense, or difficulty required to travel for harvesting—as well as changes in harvesting success due to alterations in habitat quality and species availability (fish and fish habitat, wildlife and wildlife habitat, and vegetation VCs). These effects may influence the individual, household, or communal financial value of non-commercial harvesting and participation in intercommunity activities. Project-related changes to resource availability may also affect the amount, type, or frequency of harvested materials traded between communities, with implications for reciprocal sharing practices and intercommunity relationships (culture, employment and economy, land and resource use, and infrastructure and services VCs); and
- **Effects on infrastructure and services:** Potential effects include increased demand or pressure on community services and infrastructure during Project Construction and Operation (infrastructure and services VC). These

pathways may influence access to and the quality of health care and social services, emergency response capacity, community recreational facilities, educational services, and transportation infrastructure (culture, employment and economy, and land and resource use VCs). Project-related changes to land use and environmental conditions may also affect the infrastructure and service systems relied upon by kʷikʷə́łəm members (fish and fish habitat, wildlife and wildlife habitat, and vegetation VCs).

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on social and economic conditions. These include the following:

- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to kʷikʷə́łəm's physical health and cultural practices;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting kʷikʷə́łəm's cultural continuity and nutritional well-being
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports kʷikʷə́łəm's food security, cultural identity, and health by safeguarding salmon and other species essential to FSC harvesting;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for kʷikʷə́łəm members and businesses to participate economically in the project, supporting improved economic and social conditions;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socioeconomic impacts on kʷikʷə́łəm and supporting community stability;
- **Land and Resources VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting kʷikʷə́łəm's long-term aspirations for land and water restoration and reducing stressors that can impact economic development and community well-being; and
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to kʷikʷə́łəm's social and economic interest.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects to Indigenous social and economic conditions (see [Section 8](#) of this Report):

- **Condition 10 (Community Feedback Process)** provides kʷikʷə́łəm with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting on-going social and economic interests;
- **Condition 12 (CEMP)** requires mitigation measures to manage dust, noise, traffic, spills, surface water, erosion, and wildlife interactions during Construction. These measures help minimize construction related disturbances that could affect community and social well-being of kʷikʷə́łəm members;

- **Condition 13 (OEMP)** requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation. By limiting long-term environmental disturbances, this condition supports stable conditions that protect Kwikwā'xam's social and economic interests;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality mitigates sensory disturbances, such as odour, and protects habitat quality, supporting the social and economic conditions of Kwikwā'xam by preserving the integrity of harvested resources and ensuring that stewardship activities and non-commercial harvesting do not become more difficult or costly to access;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If Kwikwā'xam historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated social harm; and
- **Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support Kwikwā'xam First Nation's socio-economic well-being through increased access to jobs, skills development, and business opportunities associated with Tilbury Phase 2.

#### The EAO's Analysis and Conclusions

After applying mitigation measures, the EAO does not expect any residual adverse effects on Kwikwā'xam's social and economic conditions. The Project could potentially provide positive outcomes through employment. While Kwikwā'xam faces ongoing social and economic challenges, such as limited access to land, housing, and cultural spaces, these arise from historic and regional factors like colonization and industrialization, not from the Project. The Project lies outside Kwikwā'xam's traditional territory on a heavily industrialized site with no known current use by nation members. Design measures, including removing waterborne deliveries and eliminating the MOF, avoid potential effects on fish, wildlife, and cultural practices. In contrast, the Project may provide positive employment, training, and contracting opportunities supporting Kwikwā'xam's economic goals. Overall, the absence of new barriers and the potential for positive outcomes support the EAO's conclusion that no residual adverse effects on Kwikwā'xam's social and economic conditions are expected, and no further characterization or cumulative effects assessment was required.

### 16.5.9 Indigenous Health and Well-being

#### Background

Kwikwā'xam's well-being is inseparable from the health of the natural world they have occupied since time immemorial, reflecting a holistic relationship in which environmental, cultural, and community conditions are deeply interconnected. Their wellness relies on healthy ecosystems and continued access to cultural landscapes that sustain identity, resilience, and self-determination, supported by traditional foods such as salmon and sturgeon that provide nutrition, food security, and cultural continuity. Cultural and spiritual practices, rooted in specific places along the Fraser River and Coquitlam Watershed, foster mental wellness and community cohesion. Stewardship responsibilities, guided by Indigenous laws and ancestral teachings, further reinforce well-being through the continued care of land and water.

#### Current Context

Kwikwā'xam emphasizes that the health of the Coquitlam River is fundamental to the health and well-being of its members. The river has long provided country foods and served as a cultural and spiritual anchor for the community. However, cumulative effects from industrial development, urbanization, and the Coquitlam Dam have degraded water quality, disrupted salmon populations, and reduced access to traditional foods. This has contributed to a loss

of cultural practices, diminished opportunities for intergenerational knowledge transfer, and negative impacts on community wellness.

Members describe the inability to fish, swim, and gather along the river as a source of cultural and emotional harm, linking these changes to spiritual stress and broader health challenges. While community-led cleanup efforts have sought to restore river health, pollution and siltation remain concerns. These conditions reflect broader systemic pressures that have affected Indigenous health and well-being for generations, even as kʷikwə́łəm continues to prioritize cultural continuity, food security, and ecological restoration as pathways to improved health.

#### Potential Project Effects

The EAO has identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#), that may affect kʷikwə́łəm's Indigenous health and well-being during the Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- **Effects on the quality, quantity, and availability of harvested country foods:** Potential effects include changes to the health, abundance, and distribution of fish, wildlife, and traditional plants relied upon as country foods (fish and fish habitat, wildlife and wildlife habitat, and vegetation VCs). Project-related alterations to surface water and groundwater quality may affect aquatic species and plant-growing conditions, while atmospheric emissions and dust deposition may influence the quality or perceived safety of harvested foods (surface water, groundwater, and air quality VCs). These pathways could affect the availability and nutritional reliability of country foods if habitat conditions or environmental quality are altered within areas traditionally used for harvesting (land and resource use, and human health VCs);
- **Effects on the value and perceived quality of country foods:** Potential effects include changes to the perceived safety, cleanliness, and overall quality of harvested country foods due to Project-related emissions, dust deposition, and changes to air and water conditions (air quality, surface water, and groundwater VCs). Alterations to fish health, wildlife condition, or the integrity of traditional plants may influence confidence in consuming or sharing country foods, which can affect their household, communal, and cultural value (fish and fish habitat, wildlife and wildlife habitat, and vegetation VCs). Even where environmental changes are limited, concerns about contamination or habitat disturbance may reduce willingness to harvest, trade, or use country foods, thereby affecting their practical, nutritional, and social importance within the community (land and resource use, and human health VCs);
- **Effects on air quality, noise, and water quality:** Project activities may contribute contaminants of concern to air and water and increase noise and vibration levels within the LAA. Potential pathways include changes to ambient air quality from criteria air contaminant and nitrogen dioxide emissions (air quality VC), alterations to surface and groundwater quality that may affect drinking and recreational water conditions (surface water, and groundwater VCs), and elevated noise and vibration during Construction and Operation (acoustic VC). These pathways are linked to human health, land and resource use, and fish and fish habitat VCs and may indirectly influence the ability to gather safe and sufficient traditional foods; and
- **Effects on health and well-being from changes to traditional ways of life and cultural sites:** Potential effects include reduced participation in harvesting, subsistence activities, and cultural or spiritual practices that are closely tied to culturally important places and traditional land- and water-based use (harvesting and subsistence activities, and culture VCs). These pathways may be influenced by sensory disturbances such as noise and vibration (acoustic VC), odour, dust, and reduced air quality (air quality VC), as well as by changes in surface water and groundwater conditions that support cultural site use and access (surface water, groundwater, and fish and fish habitat VCs). Reduced accessibility to cultural sites or traditional-use areas, including limitations along travelways or on the Fraser River and adjacent marine routes, may further affect participation in communal activities, cultural practices, customs, and values associated with these places (land and resource use VCs, and social and economic conditions section). Together, these factors may

influence physical, mental, emotional, and spiritual health and overall community well-being (human health VC).

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on Indigenous health and well-being. These include the following:

- **Surface Water (Section 7.4)** Managing runoff, erosion, and sediment helps maintain water quality in the lower Fraser, supporting kʷikʷəłəm's cultural and nutritional reliance on healthy salmon and aquatic ecosystems;
- **Acoustics (Section 7.3)** Noise reduction measures limit sensory disturbance to people, wildlife, and harvesting areas, reducing stress and supporting kʷikʷəłəm's comfort, well-being, and connection to land and water;
- **Air Quality (Section 7.2)** Air emission controls help protect respiratory health and prevent contamination of country foods, supporting kʷikʷəłəm's physical well-being and confidence in harvesting;
- **Surface Water (Section 7.4)** Managing runoff, erosion, and sediment helps maintain water quality in the lower Fraser, supporting kʷikʷəłəm's cultural and nutritional reliance on healthy salmon and aquatic ecosystems;
- **Groundwater (Section 7.5)** Protecting groundwater from contamination helps maintain the quality of ecosystems that support fish, plants, and wildlife relied on for kʷikʷəłəm's subsistence and health;
- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by kʷikʷəłəm's health and well-being;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for kʷikʷəłəm members and businesses to participate economically in the project, supporting improved social conditions and community well-being;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socioeconomic impacts on kʷikʷəłəm and supporting health and community stability;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports kʷikʷəłəm's food security, cultural identity, and health by safeguarding salmon and other species essential to FSC harvesting;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting kʷikʷəłəm's cultural continuity and nutritional well-being;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to kʷikʷəłəm's physical health and cultural practices;
- **Land and Resources VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting kʷikʷəłəm's long-term aspirations for land and water restoration and reducing stressors that can affect well-being;

- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures and early notification to Indigenous nations, help protect culturally important sites and landscapes that support the spiritual and emotional well-being of K'w'ik'w'əłəm;
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to K'w'ik'w'əłəm's well-being; and
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect K'w'ik'w'əłəm members' physical, cultural, and mental health.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on Indigenous health and well-being:

- **Condition 10 (Community Feedback Process)** provides K'w'ik'w'əłəm with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting Indigenous health and well-being;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)** requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with K'w'ik'w'əłəm to be developed by the Holder in consultation with the Nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting K'w'ik'w'əłəm's physical health and overall well-being;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If K'w'ik'w'əłəm historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated cultural or emotional harm, supporting Indigenous health and well-being; and
- **Condition 16 (Indigenous and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support socio-economic well-being.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Well-being:

- **Accidents and Malfunctions Reporting** would support mitigation of potential impacts on the Nation's interests by ensuring timely responses, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

*The EAO's Analysis and Conclusions*

After considering the EAO's conclusions on the linked VCs, and proposed mitigation measures, the EAO concludes that Tilbury Phase 2 is not expected to cause adverse effects on kʷikʷə́łəm's Indigenous health and well-being. While kʷikʷə́łəm continues to experience long-standing impacts from regional industrial development, such as degraded water quality in the Coquitlam River and reduced access to traditional foods, these issues are unrelated to Tilbury Phase 2. Tilbury Phase 2 is located outside kʷikʷə́łəm's traditional territory, does not involve in-river works, and includes mitigation measures to manage air quality, noise, and water runoff. These actions effectively address the potential pathways of impact identified during the assessment. Although there may be minor sensory changes during Construction, these are not expected to affect health, cultural practices, or food systems. Overall, Tilbury Phase 2 introduces no new barriers and, through potential employment and contracting opportunities, may provide some positive contributions to community well-being and no further characterization or cumulative effects assessment was required.

**16.5.10 Positive Effects of Tilbury Phase 2**

According to the Revised Application, Tilbury Phase 2 is expected to generate Construction phase employment and procurement opportunities that could benefit kʷikʷə́łəm members and Indigenous businesses and may contribute to increased nation revenue and long-term skills development. These opportunities include training, monitoring roles, and contracting potential aligned with kʷikʷə́łəm's interests in community growth and capacity building.

The extent of positive effects will depend on the degree to which kʷikʷə́łəm members and businesses are able to access these opportunities, and Tilbury Phase 2 benefits may remain limited relative to broader existing social and economic conditions in the kʷikʷə́łəm community.

**16.5.11 Conclusions**

Considering the above analyses, EAO's engagement with kʷikʷə́łəm, their comments, the Proponent's proposed mitigation measures, provincial conditions, and Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 is anticipated to have the following impacts on kʷikʷə́łəm Indigenous interests:

- Negligible residual effects to kʷikʷə́łəm harvesting and subsistence activities; and
- Negligible residual effects to kʷikʷə́łəm cultural use sites and areas.

Considering the above analyses the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on kʷikʷə́łəm interests has been adequately avoided, minimized or otherwise accommodated. Based on engagement undertaken with kʷikʷə́łəm on Tilbury Phase 2, as outlined above in Section 16.5.2, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with kʷikʷə́łəm.

# 1. Introduction

## 1.1 xʷməθkʷəy̓əm's Relationship to the Territory

xʷməθkʷəy̓əm's relationship to the territory started with the creation of the estuary itself. xʷməθkʷəy̓əm has been here for as long as there has been land to live upon, and when the delta was only water, xʷməθkʷəy̓əm fished those waters. xʷməθkʷəy̓əm first existed at a time when the Fraser River delta was completely covered with water and Point Roberts was an isolated island (Musqueam Indian Band n.d.).

xʷməθkʷəy̓əm oral histories demonstrate not only xʷməθkʷəy̓əm being here since time immemorial but the breadth of xʷməθkʷəy̓əm territory and connections. Changes within the territory and waterways and to the evolving landscape have both natural and supernatural origins, meaning that some aspects of the changes have been brought about through transformation by x̣e:ls (the transformer) or other supernatural acts – which are evidenced in xʷməθkʷəy̓əm teachings and language.

Our oral history is also supported by western science, with sedimentation models and archaeology confirming a physical manifestation of our presence in midden, village and burial sites originating some 8,000+ years ago, a time when the delta was only water and Point Roberts was, indeed, an island. Changes in the delta are reflected in Musqueam oral histories and their many names across the landscape. These 120+ place names within and beyond the territory serve as storehouses for snəwəy̓əł and place-based knowledge.

## 1.2 Purpose

This Musqueam (xʷməθkʷəy̓əm) Section 19(4) Assessment ("the 19(4) Assessment") intends to present a transparent assessment of the potential residual effects on xʷməθkʷəy̓əm rights resulting from the proposed FortisBC Holdings Inc. (FortisBC or "the Proponent") Tilbury Phase 2 Liquefied Natural Gas Expansion Project (LNG Expansion or "the Project"). While this 19(4) Assessment is not a cumulative effects assessment, it also considers the Tilbury Marine Jetty (TMJ) Project, which underwent its own Impact Assessment (IA) process and received an Environmental Assessment Certification (EAC) in March 2024 and a Decision Statement under Section 54 of the *Canadian Environmental Assessment Act* in July 2024. xʷməθkʷəy̓əm, in a separate submission to Ministers on August 15, 2022, expressed support for the issuance of the EAC but raised concerns about the TMJ's contribution to cumulative effects within their territory, particularly its potential impact on Cultural Continuity, Sense of Place and Identity, and Fishing.

The physical works associated with the TMJ Project are assessed separately from the LNG Expansion Project in this 19(4) Assessment to ensure methods and conclusions are comparable to the assessments undertaken by the Proponent and the British Columbia Environmental Assessment Office (BC EAO). The TMJ Project is also assessed due to its close proximity to the LNG Expansion Project and its connection to the LNG Expansion Project. The TMJ Assessment Report (2022) described how both projects would be dependent on one another, with the TMJ Project transferring LNG from the LNG Expansion Project to vessels. However, in the TMJ Project's EAC, the BC EAO clarified that the LNG Expansion Project is a separate project and that the TMJ Project is not dependent on it.

This Assessment considers the Project residual effects that are anticipated to persist after all mitigations and offsetting measures identified by the Proponent in their draft Application have been considered. The primary purpose of this report is to present findings for discussion with FortisBC to identify preferred mitigation measures. As such, the analysis and reporting was conducted primarily in 2024, before FortisBC revised their Application for submission to the EAO in February 2026. Importantly, this Assessment includes the April 8, 2024, decision by the Proponent to include the following as mitigation measures:

- exclude all waterborne vessel delivery of modules and bulk construction materials during construction
- exclude all in-water works and the proposed Material off-loading Facility (MOF) described in the Detailed Project Description.

x̱m̱əθḵw̱əy̱əm requested that the above mitigations be integrated into the body of the Application's project description of the Application, so that the impact analysis could be undertaken that was more reflective of the actual proposed activities and works. However, this update was not provided prior to x̱m̱əθḵw̱əy̱əm's Assessment drafting. What was updated in May 2026 was the addition of the Proponent's new mitigation measures so that FortisBC's Revised Application and x̱m̱əθḵw̱əy̱əm's Assessment are comparable.

This 19(4) Assessment does not signify the end of the Crown consultation and accommodation process or the engagement process with the Proponent. Rather, its conclusions will be used to guide further engagement with the Proponent and Crown consultation regarding accommodations beyond the formal IA process pursuant to the *Impact Assessment Act* (IAA) and British Columbia's *Environmental Assessment Act* (EAA). These additional accommodations are required to meet the Crown's legal duty to consult and accommodate but are beyond the scope of this 19(4) Assessment. Rather, the specific purpose of this 19(4) Assessment is to inform x̱m̱əθḵw̱əy̱əm, the Proponent, BC EAO, and key stakeholders of the potential adverse effects on x̱m̱əθḵw̱əy̱əm rights resulting from the Project.

**All descriptions of x̱m̱əθḵw̱əy̱əm rights presented into this report are for the purposes of assessing potential adverse effects on those rights by the proposed Project. Descriptions of x̱m̱əθḵw̱əy̱əm rights in this report should neither be considered comprehensive nor exhaustive and should only be interpreted in a manner intended to uphold x̱m̱əθḵw̱əy̱əm's existing Aboriginal Rights recognized and affirmed under section 35 of the *Constitution Act, 1982*, and not to abrogate or derogate from them.**

### 1.2.1 Assessing Impacts to Rights

The Crown's duty to consult and accommodate has been clarified by past jurisprudence which indicates that the Crown must seek to understand the potential impacts<sup>1</sup> of a project on a right itself and not only on the environment in which that right is exercised. Federal and provincial requirements, as set out in IAA and EAA, are as follows:

1. The effects of a project on Indigenous nations and rights recognized and affirmed by section 35 of the *Constitution Act, 1982* must be evaluated for every assessment; and

---

<sup>1</sup> The terms "impact" and "effect" are used interchangeably throughout the 19(4) Assessment.

2. The impact assessment of a designated project, whether it is conducted by the BC EAO as a substituted IA or by the Impact Assessment Agency of Canada (IAAC) or a review panel must take into account the impact that the designated project may have on any Indigenous group and any adverse impact that the designated project may have on the rights of Indigenous peoples as recognized and affirmed by section 35 of the *Constitution Act*, 1982.

This 19(4) Assessment is intended to provide a reasonable opportunity for xʷməθkʷəy̓əm to become informed regarding the potential effects on their rights and to identify and engage with the Crown on proposed accommodation measures. The goal of this 19(4) Assessment is to provide information for xʷməθkʷəy̓əm to determine whether to provide or withhold consent regarding the proposed Project. Both provincial and federal impact assessment acts point to implementation of the *United Nations Declaration on the Rights of Indigenous Peoples* (UNDRIP), including Article 32.2 requiring states to consult and cooperate in good faith with Indigenous peoples to obtain their free, prior and informed consent (FPIC) before approving any project affecting their lands or territories and other resources (EAA 2018; IAA 2019). To live up to this commitment, this 19(4) Assessment must be completed before the Crown makes its decision regarding a given project to ensure xʷməθkʷəy̓əm is adequately informed prior to making a consent or no-consent decision.

### 1.3 Sparrow Fishing Right

In 1990, the Supreme Court of Canada recognized and affirmed xʷməθkʷəy̓əm's Aboriginal right to fish for food, social, and ceremonial (FSC) purposes.<sup>2</sup> Ronald Edward Sparrow, a member of xʷməθkʷəy̓əm, was charged with fishing in šxʷiicəm (Canoe Pass) in the south arm of the Fraser River in 1984. Sparrow maintained he was exercising his Aboriginal Right to fish; the Supreme Court unanimously agreed in accordance with section 35(1) of the *Constitution Act*, 1982.

The salmon fishery “has always constituted an integral part of [Musqueam’s] distinctive culture”.<sup>3</sup> The Supreme Court not only affirmed this but also imposed limits on the federal authority to regulate xʷməθkʷəy̓əm's fishing rights. Specifically, the Court imposed a justification test on the Crown when deciding what may constitute a *prima facie* infringement on an Aboriginal Right. This includes decisions that may infringe upon xʷməθkʷəy̓əm's right to fish for FSC purposes and on other xʷməθkʷəy̓əm rights. The decision does not require evidence that the Crown's conduct has reduced xʷməθkʷəy̓əm's fish catch below that needed for reasonable FSC purposes. Rather, the threshold of a *prima facie* infringement begins at the point when Crown conduct is shown to have the potential to adversely affect the *efficiency* of xʷməθkʷəy̓əm's ability to fish in preferred locations, at preferred times, and with preferred means.

In addition, the Court ruled that after conservation measures have been implemented, xʷməθkʷəy̓əm's FSC fishery takes priority over other fisheries.

## 2. Methodology

This Section outlines the approach taken to assess impacts and identify residual effects of the proposed Project on x̱m̱əθḵw̱əy̱əm Rights and Title, which is presented alongside a general assessment of impacts of the TMJ Project. This 19(4) Assessment is adapted from the *Methodology for x̱m̱əθḵw̱əy̱əm Rights Impact Assessment* (“the Methodology”) developed in 2017. For information only, the guiding methods are attached as **Appendix A**. The methods used in this assessment are presented in this Section.

### 2.1 Overview of Scope of the x̱m̱əθḵw̱əy̱əm Section 19(4) Assessment for Purpose of the Assessment

The LNG Expansion Project Site (“the Project Site”) is located entirely within x̱m̱əθḵw̱əy̱əm’s core territory as set out by the x̱m̱əθḵw̱əy̱əm Declaration of 1976 (“the 1976 Declaration”). This territory includes “the lands, lakes and streams defined and included by a line commencing at Harvey Creek in Howe Sound including the Fraser River, across to the south or left bank of the Fraser River and proceeding downstream taking in the left bank of the mainstream and the south area to the sea”.

#### 2.1.1 Aboriginal Rights

x̱m̱əθḵw̱əy̱əm has Aboriginal Rights throughout its territory as set out in the 1976 Declaration, including, but not limited, to the proven right to harvest marine resources outlined in Section 1.3 above. This is supported by x̱m̱əθḵw̱əy̱əm oral and written histories, ethnographic records, material evidence, and ongoing x̱m̱əθḵw̱əy̱əm practices.

For x̱m̱əθḵw̱əy̱əm, the *Sparrow* decision confirms x̱m̱əθḵw̱əy̱əm’s constitutionally protected right to fish throughout the full extent of its territory. This view is supported by the Supreme Court of Canada’s 2014 *Tsilhqot’in*<sup>4</sup> decision which found that a narrow, site-specific approach to Aboriginal Title, and by extension Aboriginal Rights, is without merit. In recent years, both Canada and British Columbia (BC) have announced the adoption of legislation to support the implementation of UNDRIP; BC enacted the *Declaration on the Rights of Indigenous Peoples Act* (“BC Declaration Act”) in November 2019. BC’s *Declaration Act* and corresponding Action Plan enables the Crown to enter into agreements with Indigenous governing bodies, including joint or consent-based decision-making agreements that aspire to respect the principle of FPIC (British Columbia 2019). Similarly, Canada has committed to implementing the *United Nations Declaration on the Rights of Indigenous Peoples Act*, 2020 and associated Action Plan, which includes a commitment to develop guidance on federal Crown consultation and cooperation in good faith with Indigenous peoples and seeks to obtain FPIC prior to the approval of any project affecting those people’s lands, territories, and resources (Canada 2023, 8).

In addition to x̱m̱əθḵw̱əy̱əm’s established FSC fishing rights laid out by *Sparrow* (see Section 1.3), x̱m̱əθḵw̱əy̱əm has strong *prima facie* claims to Aboriginal Rights to harvest marine and terrestrial resources throughout areas potentially impacted by the Project. This includes areas potentially impacted by marine shipping activities proposed by the TMJ Project and the LNG

---

<sup>4</sup> *Tsilhqot’in Nation v. British Columbia*, 2014 SCC

Expansion Project (before mitigation), including in the south arm of the Fraser River extending to Sands Head Lighthouse in the Salish Sea.

xʷməθkʷəy̓əm's connection to the Fraser River should not be interpreted as having a lesser connection to the terrestrial lands in xʷməθkʷəy̓əm territory. xʷməθkʷəy̓əm identity and culture developed in relation to the unique landscape of xʷməθkʷəy̓əm core territory and the resources it contains; this relationship has existed since time immemorial. Culture is the umbrella that everything else is done under for xʷməθkʷəy̓əm. Culture permeates xʷməθkʷəy̓əm's entire way of life and living and cannot be looked at in isolation. For example, xʷməθkʷəy̓əm culture is inseparable from xʷməθkʷəy̓əm territory and language; s̓q̓iq̓əs m̓ə kʷ stəʔe ʔə t̓həʔ ʔiʔ s̓kʷey kʷ s xʷəsθəlθəleq (they are knotted together and impossible to separate).

The Project Site and surrounding lands and waters are areas where xʷməθkʷəy̓əm continue to practice culture. However, the ability to do so depends on the continued existence of sustainable, safe, and accessible resources and landscapes. Therefore, xʷməθkʷəy̓əm's approach to assessing potential impacts to xʷməθkʷəy̓əm culture is focused on culture and rights. When this 19(4) Assessment refers to "xʷməθkʷəy̓əm rights", this should be read as being inclusive of xʷməθkʷəy̓əm rights and of xʷməθkʷəy̓əm culture, which is part of xʷməθkʷəy̓əm's entire way of life.

### *2.1.2 Aboriginal Title*

xʷməθkʷəy̓əm holds Aboriginal Title to its territory as set out in the 1976 Declaration. xʷməθkʷəy̓əm's Aboriginal Title is supported by xʷməθkʷəy̓əm oral and written histories, ethnographic records, material evidence, and ongoing xʷməθkʷəy̓əm practices.

## **2.2 Categories of Rights to be Assessed**

This 19(4) Assessment considers the potential impacts of the Project on six categories of xʷməθkʷəy̓əm rights described below. For each right, a sub-component of that right is defined for the specific purposes of this 19(4) Assessment in Section 5.

These categories are based on the important fact that xʷməθkʷəy̓əm historically had access to all areas in xʷməθkʷəy̓əm territory. xʷməθkʷəy̓əm's whole territory was part of the xʷməθkʷəy̓əm lived experience. Any current limitation on or past infringement of a right is a result of colonial law and not past xʷməθkʷəy̓əm practice and does not justify a current or future infringement. For example, restrictions are currently imposed on xʷməθkʷəy̓əm by the Department of Fisheries and Oceans Canada (DFO) on where and when xʷməθkʷəy̓əm members are permitted to fish. However, before colonization, xʷməθkʷəy̓əm members would access resources in situ in the territory according to xʷməθkʷəy̓əm's own protocols and were not constrained by any imposed colonial restrictions.

Additionally, these categories emerge out of xʷməθkʷəy̓əm's understanding and lived experience that culture permeates xʷməθkʷəy̓əm's entire way of life and cannot be looked at in isolation. Culture is the essence of who xʷməθkʷəy̓əm is and informs how xʷməθkʷəy̓əm members understand the world around them. xʷməθkʷəy̓əm culture also goes to the core of their being. Culture is reflected in how xʷməθkʷəy̓əm members live out every aspect of their lives and how they relate to non-xʷməθkʷəy̓əm people, both indigenous and non-indigenous alike. For this reason, these categories are all related, so changing a conclusion in one category will change a conclusion in another.

- xʷməθkʷəy̓əm Title (governance and ownership)
  - Right to decide how lands and waters will be used;
  - Right to economic benefits derived from lands and waters; and
  - Right to proactively use and manage lands and waters including managing access through kinship protocols and permissions.
- Fishing
  - Right to access, harvest, and process fish for sustenance, social cohesion, spiritual/ceremonial, and economic purposes; and
  - Sufficiency of resources for food, social, and ceremonial purposes.
- River Shoreline and Terrestrial Plant Harvesting
  - Right to access, harvest, and process river shoreline and terrestrial foods and materials for sustenance, social cohesion, and spiritual/ceremonial purposes; and
  - Sufficiency of resources for food, social, and ceremonial, and economic purposes.
- Hunting
  - Right to access hunting locations for sustenance, social cohesion, and spiritual/ceremonial purposes; and
  - Sufficiency of resources for food, social, and ceremonial purposes.
- Cultural Continuity
  - Right to continue transmission of knowledge across generations, including place-based knowledge through practice, language, and sharing of oral histories and traditions;
  - Right to maintain territorial integrity, including the integrity of cultural landscapes, riverscapes, and seascapes; and
  - Right to continue to safely access and use places for spiritual purposes under preferred timing and conditions.
- Health
  - Right to maintain holistic wellness, including mental, physical, emotional, and spiritual health; and
  - Right to social cohesion and community wellbeing.

## 2.3 Information Sources

The primary, xʷməθkʷəy̓əm-led data sources informing the identification of xʷməθkʷəy̓əm rights and the conduct of this 19(4) Assessment include:

- Gillian Gregory, Jordan Tam, Rachel Olson, The Firelight Group, and Musqueam Indian Band. 2017. “Musqueam Indian Band Knowledge and Use Study for BHP Billiton’s Proposed Potash Export Facility Project”. Report prepared and authored by Gillian

Gregory, Jordan Tam, Rachel Olson, The Firelight Group, and Musqueam Indian Band for Musqueam Indian Band;

- Jordan Tam, Rachel Olson, Firelight Research Inc., and Musqueam Indian Band. 2018. “Musqueam Indian Band Knowledge and Use Study for Wespac Midstream’s Proposed LNG Marine Jetty Project”. Report prepared and authored by Jordan Tam, Rachel Olson, Firelight Research Inc., and Musqueam Indian Band for Musqueam Indian Band;
- Musqueam Band Council. 1984. “Musqueam Comprehensive Land Claim”. Presented to the Office of Native Claims by the Musqueam Band Council; and
- Nelitz, M., Stimson, H., Semmens, C., Ma, B., and Robinson, D. 2018. “Impacts of marine vessel traffic on access to fishing opportunities of the Musqueam Indian Band”. Prepared for the Musqueam Indian Band by ESSA Technologies Ltd.

The 2018 Knowledge and Use Study for Wespac Midstream’s Proposed LNG Marine Jetty Project listed above is considered in this 19(4) Assessment when assessing the current conditions and context of impacts for all rights, discussed in Section 4 below.

## 2.4 Spatial and Temporal Boundaries

The spatial and temporal boundaries for this 19(4) Assessment are the same as those used in the Knowledge and Use Study for the TMJ Project (Tam et al. 2018). These boundaries are used to present and organize information on current context and trajectory of change and analysis of adverse impacts.

### 2.4.1 Spatial Boundaries

Impacts on xʷməθkʷəy̓əm rights are assessed using the following spatial boundaries:

- Local Study Area (LSA): Tilbury Island with a 1km buffer width of the south arm of Fraser River from 1km above (upstream of) Tilbury Island downstream to Sands Head Lighthouse station.
- Regional Study Area (RSA): entire xʷməθkʷəy̓əm core territory as defined by the 1976 Declaration, including the shipping route extending out to mid-point of Salish Sea.
- Project Site: extends 250m from the spatial extent of the Project physical works (not including shipping or road transportation).

The Project Site, LSA, and RSA are collectively referred to as the Study Area.

The TMJ Project Site extends 250m from the spatial extent of the proposed TMJ physical works (not including shipping). The LSA and RSA also apply to the TMJ portions of this 19(4) Assessment.

While each of the LNG Expansion and TMJ Projects are assessed separately, the term “Project Site” is used to refer to the use values identified in Tam et al. (2018) for both the LNG Expansion Project Site and the TMJ Project Site. This is due to the reliance on Tam et al. (2018) to describe use values for both projects in this 19(4) Assessment (see Limitations of Assessment in Section 2.8). Since the actual footprints for these two projects are so similar, there is no effect on the conclusions made in this 19(4) Assessment.

Figure 1 below is a map of the proposed LNG Expansion Project Site and LSA in relation to x̣ṃəθḳẉəỵəm core territory. Figure 2 is a regional map of the proposed LNG Expansion Project Site, showing the proposed Study Area as a whole, including the RSA, in relation to x̣ṃəθḳẉəỵəm core territory.

Figure 1: Tilbury LNG Phase 2 Expansion Project Site and LSA map

Figure 2: Tilbury LNG Phase 2 Expansion Project RSA map

The Knowledge and Use Study for the TMJ Project (Tam et al., 2018) used the same LSA as this 19(4) Assessment. In that study, x̣ẉṃə̣θ̣ḳẉə̣ỵəm members reported:

- 35 values within the TMJ Project Site (see Figure 1); and
- 608 values within the LSA, which includes the marine shipping route (see Figure 2).

The values identified in Tam et al. (2018) were mapped according to five categories (Activity Classes):

- Habitation values (including temporary, occasional, seasonal, and permanent camps and cabins);
- Cultural and spiritual values (including teaching areas, burial sites, ceremonial areas, and community gathering areas);
- Subsistence values (including harvest, hunting, and fishing sites, and plant collection areas);
- Environmental feature values (including specific, highly valued habitat for salmon, sturgeon, and ducks, etc.); and
- Transportation values (including trails, water routes, and navigation sites).

All sites are considered important to x̣ẉṃə̣θ̣ḳẉə̣ỵəm. Sites identified by participants represent where the value or resource is for x̣ẉṃə̣θ̣ḳẉə̣ỵəm members. These locations can change over time depending on many environmental and social factors. As stated in the study, the sites and values identified in Tam et al. (2018) are non-exhaustive; where a site or value may not have been identified, this does not mean that it does not exist.

#### *2.4.2 Temporal Boundaries*

The temporal boundaries for the 19(4) Assessment extend from the pre-contact period (prior to 1800) to a future period after the anticipated decommissioning date of the Project (2088 and onwards).

## **2.5 Indicators for Rights**

The indicators used to assess categories of x̣ẉṃə̣θ̣ḳẉə̣ỵəm rights and their sub-components for the Project are presented in Table 1 below. They reflect x̣ẉṃə̣θ̣ḳẉə̣ỵəm's understanding of the interaction between these rights and the Project.

It is important to note that the sub-components and indicators below are interconnected and are not separate reflecting x̣ẉṃə̣θ̣ḳẉə̣ỵəm culture and way of understanding the world. For example, Cultural Continuity requires access to and availability of a resource, and opportunities for teaching in order to transmit knowledge. The absence of a resource can lead to loss in language associated with a resource, losing x̣ẉṃə̣θ̣ḳẉə̣ỵəm knowledge forever.

As such, these criteria set out the resources or conditions that provide minimally sufficient opportunity for rights to be practiced.

This 19(4) Assessment does not capture the totality of x̣ẉṃə̣θ̣ḳẉə̣ỵəm values likely to be adversely affected by the Project and cumulatively, nor are effects of the Project captured in complete form. This 19(4) Assessment has prioritized specific indicators, information sources,

spatial and temporal boundaries in order to highlight the most important effects to meet the purpose set out in Section 1.1 of this 19(4) Assessment.

*Table 1: Indicators for each Category of Right and Right Sub-component*

| Category of Right                                | Right Sub-component                                                                                                                                           | Indicators for Rights                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x̣ṃəθḳẉəỵəm Title                            | Right to decide how the lands and waters will be used.                                                                                                        | Ability to exercise x̣ṃəθḳẉəỵəm decision-making authority, both in respect to the Project and within and over x̣ṃəθḳẉəỵəm territorial lands and waters, including the Study Area.                                                                                                             |
|                                                  | Right to derive economic benefits from the lands and waters.                                                                                                  | Ability to derive economic and other benefits from infrastructure development in x̣ṃəθḳẉəỵəm territory.                                                                                                                                                                                           |
|                                                  | Right to proactively use and manage the lands and waters including managing access through kinship protocols and permissions.                                 | Ability to proactively govern and control access to and use of x̣ṃəθḳẉəỵəm territorial lands and waters.                                                                                                                                                                                          |
| Fishing                                          | Right to access, harvest, and process fish for sustenance, social cohesion, spiritual/ceremonial, and economic purposes.                                      | <p>Ability to safely access harvesting areas</p> <p>Sense of safety and security on the water which includes not avoiding an area due to perceived risk.</p> <p>Adequate duration and quality of time spent in fishing areas.</p> <p>Opportunity for fishing and processing (current and future).</p> |
|                                                  | Sufficiency of resources for food, social, and ceremonial, and economic purposes.                                                                             | Quantity and quality of fish and fish habitat.                                                                                                                                                                                                                                                        |
| River Shoreline and Terrestrial Plant Harvesting | Right to access, harvest, and process river shoreline and terrestrial foods and materials for sustenance, social cohesion, and spiritual/ceremonial purposes. | <p>Ability to safely access harvesting areas.</p> <p>Sense of safety and security on the shoreline and land.</p> <p>Opportunity for harvest and processing (current and future).</p> <p>Adequate duration and quality of time spent in harvesting areas.</p>                                          |

| Category of Right   | Right Sub-component                                                                                                                                                        | Indicators for Rights                                                                                                                                                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     | Sufficiency of resources for food, social and ceremonial purposes.                                                                                                         | Quantity and quality of plant harvest.                                                                                                                                                                                                             |
| Hunting             | Right to access hunting locations for sustenance, social cohesion, and spiritual/ceremonial purposes.                                                                      | <p>Ability to safely access hunting areas.</p> <p>Sense of safety and security on the land and water.</p> <p>Opportunity for hunting and processing (current and future).</p> <p>Adequate duration and quality of time spent in hunting areas.</p> |
|                     | Sufficiency of resources for food, social, and ceremonial purposes.                                                                                                        | Quantity and quality of wildlife harvest.                                                                                                                                                                                                          |
| Cultural Continuity | Right to continue transmission of knowledge across generations, including place-based knowledge, through practice, language, and sharing of oral histories and traditions. | Ability to continue cultural practices and transmission.                                                                                                                                                                                           |
|                     | Right to maintain territorial integrity, including the integrity of cultural landscapes, riverscapes, and seascapes.                                                       | Access to teaching cultural areas and spiritual locations.                                                                                                                                                                                         |
|                     | Right to continue to safely access and use places for spiritual purposes under preferred timing and conditions.                                                            | Sense of safety and security and overall sensory experience.                                                                                                                                                                                       |
| Health              | Right to maintain holistic wellness, including mental, physical, emotional, and spiritual health.                                                                          | <p>Ability to nurture mental &amp; spiritual wellness through use of cultural areas.</p> <p>Ability to nurture physical wellness through the harvest of traditional foods and medicines.</p>                                                       |
|                     | Right to maintain social cohesion and community wellbeing                                                                                                                  | Ability to gather on the lands and waters for social and ceremonial purposes without disruption, including continuity                                                                                                                              |

| Category of Right | Right Sub-component | Indicators for Rights                                                                                                                                                             |
|-------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   |                     | <p>of intergenerational teaching and sharing practices.</p> <p>Ability to carry out and implement wellness and healing practices that rely on access to the lands and waters.</p> |

## 2.6 x̣ẉṃə̣θ̣ḳẉə̣ỵəm Approach for Characterizing Adverse Impacts to Rights

Six criteria are used to characterize adverse impacts to rights, as presented in Table 2 below. The first criterion is Context, which relies on the cumulative effects information presented in Section 4. Information in Section 5 is then used to rate the remaining five criteria as they are focused on project-specific effects. Table 4 shows the results of the assessing the severity of adverse impacts that applies these criteria to each rights category and indicator, prior to mitigation.

*Table 2: Criteria and ratings used for assessing severity of adverse impacts to rights.*

| Criterion      | Definition                                                                                                                                                                          | Rating                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Context</b> | Current condition of the opportunity to exercise and/or benefit from the right, with consideration of the historical context, current stressors on the right, trajectory of change. | <b>Highly Resilient</b><br><br>Ability to derive benefit and freely exercise right has not appreciably declined in historical period (i.e., 1800-2020) and is not currently in decline. | <b>Moderately Impacted</b><br><br>Ability to derive benefit and freely exercise right has appreciably declined in historical period (i.e., 1800-2020). However, a majority of community members can continue to exercise their right in a way that resembles past practice. The right is not currently in decline or is moderately in decline. | <b>Highly Sensitive</b><br><br>Ability to derive benefit and freely exercise rights has severely declined in historical period (i.e., 1800-2020) and/or the right is not currently being exercised due to inadequate access or resources. The condition of the right is either in a steep trajectory of decline or has fallen below the threshold where the right can be exercised in a manner that derives meaningful benefit or enjoyment. The level of erosion of the right means that any further impact, even a minor one, may constitute/contribute |

| Criterion                | Definition                                                                                                                                                                                                       | Rating                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Magnitude</b>         | Degree of the change the impact will likely cause relative to an established baseline as described in Section 4.2 current context. Considers context and territorial capacity to withstand additional stressors. | <b>Negligible to Low</b><br>No to little change in quality or quantity of resources, locations, conditions, and other factors required for the exercise of rights, relative to an established baseline. Impact is considered by x̣ẉṃə̣θ̣ḳẉə̣ỵəm (rights holders) to be of a minor degree. | <b>Moderate</b><br>Changes in the quality, quantity, and accessibility of resources, locations, conditions, and other factors that affect the ability or willingness to exercise the right, such as limitations on access to areas used to practice a right, in the preferred manner and locations are considered by the Indigenous Nation (rights holders) to be of degree relative to an established baseline. | <b>High</b><br>Changes in the quality, quantity, and accessibility of resources, locations, conditions, and other factors, such as change in quality and quantity of habitat required to practice the right, such that the right can or will no longer be exercised in the preferred manner and locations and the impacts are considered by the Indigenous Nation (rights holders) to be of high/critical degree relative to an established baseline. |
| <b>Geographic Extent</b> | Area over which impact is expected to occur. This may differ from the physical footprint of the change.                                                                                                          | <b>Site Specific</b><br>Impacts limited to the Project Site, little impact on interconnectedness.                                                                                                                                                                                              | <b>Local</b><br>Impacts extend beyond the Project Site, may affect valued areas, disrupts interconnectedness.                                                                                                                                                                                                                                                                                                    | <b>Regional</b><br>Impacts which extend beyond the LSA, especially valued areas, disrupts interconnectedness.                                                                                                                                                                                                                                                                                                                                         |

| Criterion            | Definition                                                                                                                                                                                                                | Rating                                                                                                            |                                                                                                                                    |                                                                                        |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Reversibility</b> | Ability to return to established baseline (Section 4.2). Considers both the reversibility of the impact pathway and the reversibility of the impact to the exercise of rights.                                            | <b>Reversible</b><br>Easily reversible                                                                            | <b>Partially Reversible</b><br>Reversible but requires significant effort and cost or will take a long time via natural processes. | <b>Irreversible</b><br>Permanent or persistent alteration.                             |
| <b>Duration</b>      | How long an impact is predicted to last.                                                                                                                                                                                  | <b>Short-term</b><br>Short-term, only a year or two.                                                              | <b>Medium-term</b><br>Lasts for more than a year or two but less than one generation.                                              | <b>Long-term</b><br>Persists beyond one generation.                                    |
| <b>Likelihood</b>    | An estimate of the probability that a potential impact on the exercise of rights will occur because of the Project. Considers the evidence available and level of certainty to characterize the likelihood of occurrence. | <b>Low</b><br>A potential impact on the exercise of rights has a low probability and is unlikely but could occur. | <b>Moderate</b><br>A potential impact on the exercise of rights is probable and likely but may not occur.                          | <b>High</b><br>A potential impact on the exercise of rights is highly likely to occur. |

Given the amount of existing, often Crown-sanctioned, damage to x̣ẉṃə̣θ̣ḳẉə̣ỵəm lands, waters, culture, and resources in many areas of x̣ẉṃə̣θ̣ḳẉə̣ỵəm territory, new projects could easily result in further diminishing already severely diminished conditions required for x̣ẉṃə̣θ̣ḳẉə̣ỵəm to exercise their rights. Historical context provides critical information for assessors as any project-direct contribution to total cumulative effects, however small, may further exacerbate an already strained threshold. In most cases, conditions for the practice of some rights may no longer be able to be fully exercised, meaning that any project-direct contributions to total cumulative effects may further inhibit these rights, or reduce the likelihood that these rights can be meaningfully practiced again in the future.

x̣ẉṃə̣θ̣ḳẉə̣ỵəm's Assessment framework presented herein represents a high standard and reflect a state where a given right may be exercised collectively. This 19(4) Assessment considers both positive and negative potential effects of the Project. It includes potential positive contributions to the reduction of cumulative stressors and the restoration of resilient habitats, effects which would support the restoration of those conditions necessary to exercise a right in a meaningful way.

The context of cumulative effects is described for each category of right in Section 4 of this 19(4) Assessment, along with the trajectory of change. Section 4 also considers restoration and rehabilitation projects independent of the Project that may affect this context. Specifically, each category of right is assessed for:

- Whether the conditions for the exercise of a given category of right are already diminished and are therefore highly sensitive project-specific effects; and
- The trajectory of change in the conditions that support a category of rights.

These conclusions are brought forward into Section 5 to inform the assessment of the severity of impacts of the proposed Project. The same approach is also applied to assess the TMJ Project, but in a more generalized manner.

## 2.6 Evaluation of Mitigation Measures

Residual effects on x̣ṃəθḳẉəỵəm rights are assessed by identifying any mitigations committed to in the Environmental Assessment (EA) Application materials by the Proponent that could lessen the potential effects of the project on each x̣ṃəθḳẉəỵəm category of right<sup>5</sup>. For each mitigation, potential effectiveness is evaluated based on several considerations: monitoring design, proven measures from previous projects, and level of uncertainty in success (e.g., insufficient information on proposed measures to ensure high confidence of success).

This 19(4) Assessment was revised to identify the removal of in-water works as a mitigation measure in the same way as the Proponent's EA Application, so it was easier to compare conclusions with this Assessment.

## 2.7 Severity Determination

The residual effects associated with each category of right are identified in Section 7 and carried forward for further analysis and characterization. For each residual effect carried forward, the effect is characterized to determine the overall severity of residual project effects after mitigation.

Severity is determined for each category of right sub-component. These criteria set out the resources or conditions that provide minimally sufficient opportunity for rights to be practiced (see Table 1 above). Each of these subcomponents already describe the point at which conditions will not allow for the exercise of a right. A high level of severity occurs when that right can no longer be collectively exercised in a meaningful manner as a result of the Project. This contrasts with conditions under which the exercise of a given right produces meaningful social and economic benefit for the whole community while sustaining and enriching the transmission of x̣ṃəθḳẉəỵəm culture and collective identity at a high level. In the assessment of the severity of impacts to x̣ṃəθḳẉəỵəm rights, the following categories are used:

### High level of severity

---

<sup>5</sup> Note that any non-EA mitigations will be excluded from the initial analysis but may be included in future iterations of this Assessment informing final conclusions after discussion between x̣ṃəθḳẉəỵəm, the Proponent, and relevant government agencies.

*Where project-specific effects on a xʷməθkʷəy̓əm right have surpassed the point at which that right can be exercised in a meaningful way. In this category of severity, an impact would generally be of moderate or high magnitude, partially reversible or irreversible, of medium- or long-term duration, and of high likelihood.*

**Moderate** level of severity

*Where project-specific effects on a xʷməθkʷəy̓əm right have caused moderate constraints on the ability to exercise that right in a meaningful way. In this category of severity, an impact would generally be local or site-specific, of moderate or low magnitude, partially or fully reversible, of short- or medium-term duration, and of high likelihood.*

**Low** level of severity

*Where project-specific effects on a xʷməθkʷəy̓əm right have caused moderate constraints on the ability to exercise rights in a meaningful way. In this category of severity, an impact would generally be local or site-specific, of moderate or low magnitude, reversible, and of short- or medium-term duration.*

## 2.8 Limitations of Assessment

First, this 19(4) Assessment is missing information on xʷməθkʷəy̓əm use and knowledge at the Project Site due to a significant change in the Proponent's Project mitigations while this was being drafted. Much of the xʷməθkʷəy̓əm data in this Assessment is derived from the Traditional Use Study for the TMJ Project that focuses largely on interactions with the Fraser River (Tam et al. 2018) because the original residual project interactions for this Project overlapped largely with the TMJ Study Areas. For this and other reasons, *xʷməθkʷəy̓əm did not collect new information for this Project*. As a result, this analysis presents information on project-specific and cumulative interactions expected to occur from the Project primarily in the Fraser River prior to mitigation from a study focused on the nearby TMJ Project.

Second, the Proponent notified the BC EAO of their intention to abandon the use of waterborne deliveries of modular components and construction materials to the Project Site while this report was being drafted. At that time, the Proponent included this change as an avoidance mitigation measure. Since this Assessment was originally intended to inform discussions with FortisBC, the project description is based on this original process design: full project with in-water construction barges and MOF, and removal of these activities and works as a mitigation measure. xʷməθkʷəy̓əm acknowledges that the Proponent's revised Application shared in February 2026 includes a revised description of the project that excludes all waterborne delivery transportation and the MOF during construction. However, this assessment was drafted prior to this change.

While this Assessment considers the Project with these in-water construction activities and works, then removes them as an avoidance mitigation measure, and the Proponent and EAO consider the project without these in-water works and activities, and the residual effects from all of these assessments (FortisBC's Revised Application, EAO's Assessment Report, and xʷməθkʷəy̓əm's Assessment). Importantly, though, this Assessment does include FortisBC's updated mitigation measures, but does not include BC EAO's draft conditions, also shared in February 2026 after this Assessment was drafted.

Third, a fulsome cumulative effects assessment has not been undertaken despite the fact that x̣ṃəθḳẉəỵəm has identified several likely cumulative effects. Further, the BC EAO noted in the TMJ Assessment Report that it would be reasonable to assume that cumulative interactions could occur between both projects if the timelines for the construction phase overlapped (BC EAO 2022a, 251). In its assessment of effects on Valued Components (VCs), the BC EAO indicated that, should residual effects be predicted for the Tilbury LNG Expansion Project, a cumulative effects assessment that considers the TMJ Project's effects could be undertaken (BC EAO 2022a, 95). To fully understand the implications of the proposed Project on x̣ṃəθḳẉəỵəm rights, a fulsome cumulative effects analysis is needed. This work was not completed by x̣ṃəθḳẉəỵəm for several reasons. This issue is magnified by the fact that vessel traffic has been proposed for other projects that have received EACs but for which effects have yet to be observed, felt, measured, or fully understood, such as the Robert Banks Terminal II project and others. As highlighted in Section 2, the existing effects assessments conducted do not adequately capture these cumulative effects and neither does this 19(4) Assessment.

### 3. Context of x̣ṃəθḳẉəỵəm Title

x̣ṃəθḳẉəỵəm's Aboriginal Title is a fundamental aspect of x̣ṃəθḳẉəỵəm identity and culture. x̣ṃəθḳẉəỵəm has not signed a treaty nor has x̣ṃəθḳẉəỵəm surrendered or ceded its Aboriginal Title. x̣ṃəθḳẉəỵəm retains possession and ownership across all lands and waters (including the riverbed, seabed and foreshore) within x̣ṃəθḳẉəỵəm's territory, as described in the 1976 Declaration:

*We, the Musqueam people openly and publicly declare and affirm that we hold Aboriginal title to our land, and Aboriginal Rights to exercise use of our land, the sea and fresh waters, and all their resources within that territory occupied and used by our ancestors ...*

x̣ṃəθḳẉəỵəm's past and present knowledge holders, based on the teachings of their own late Elders, demarcated x̣ṃəθḳẉəỵəm's core territory in the 1976 Declaration. These boundaries were drawn with respect for x̣ṃəθḳẉəỵəm relations in mind and included only what they knew to be x̣ṃəθḳẉəỵəm's core territory for which x̣ṃəθḳẉəỵəm exercised exclusive control. These boundaries did not seek to include lands known to belong to other nations, for which x̣ṃəθḳẉəỵəm would seek kinship-based protocol to access, as is x̣ṃəθḳẉəỵəm's way.

x̣ṃəθḳẉəỵəm's Title lands include:

*The lands, lakes and streams defined and included by a line commencing at Harvey Creek in Howe Sound and proceeding Eastward to the height of land and continuing on the height of land around the entire watershed draining into English Bay, Burrard Inlet and Indian Arm; South along the height of land between Coquitlam River and Brunette River and proceeding downstream taking in the left Bank of the main stream and the South Arm to the sea, including all those intervening lands, islands and waters back along the sea shore to Harvey Creek; and, the sea, its reefs, flats, tidal lands and islands adjacent to the above described land and out to the centre of the Georgia Strait.*

This description includes Tilbury Island and the surrounding waters where the Project is proposed, as can be seen in Figure 2.

At the core of x̣ṃəθḳẉəỵəm's Aboriginal Title is the right to proactive governance and control over x̣ṃəθḳẉəỵəm lands and resources — in short, the right to choose how x̣ṃəθḳẉəỵəm Title

lands will be used, the right to manage xʷməθkʷəy̓əm Title lands, and the right to the economic benefits of xʷməθkʷəy̓əm Title lands. This is also captured in the 1976 Declaration.

As with any major infrastructure project in xʷməθkʷəy̓əm territory, xʷməθkʷəy̓əm has expressed its expectation that the Crown seek xʷməθkʷəy̓əm's consent to the project and accommodate the impacts to xʷməθkʷəy̓əm's proven and asserted Aboriginal Rights and Title. The Supreme Court of Canada's decision in *Tsilhqot'in* reaffirmed the Crown's duty to consult and accommodate Indigenous nations like xʷməθkʷəy̓əm. Adequate consultation by the Crown would include seeking and obtaining the consent of xʷməθkʷəy̓əm for the Project. The Court in *Tsilhqot'in* also noted that "the right to control the land conferred by Indigenous Title means that governments and others seeking to use the land must obtain the consent of the Indigenous title holders".

xʷməθkʷəy̓əm's Title rights, and other categories of rights, have also been affected over time through negative effects of poor Crown consultation. xʷməθkʷəy̓əm's territory is highly developed and making decisions affecting rights have been done in a way that overextends xʷməθkʷəy̓əm and reduces frequency of harvesting in favour of navigating bureaucratic processes.

The Project Site is a unique and critical area of xʷməθkʷəy̓əm Title lands that was and continues to hold value for xʷməθkʷəy̓əm. The Project Site and the surrounding LSA was and continues to be accessed by xʷməθkʷəy̓əm for harvesting resources but has been severely impacted by historical and recent developments, as set out in Tam et al. (2018) and in this 19(4) Assessment. The importance of this part of xʷməθkʷəy̓əm territory is far reaching, including as it pertains to governance and control to ensure maintenance of cultural activities such as access for harvesting resources which is described in Section 4.

## 4. Context of xʷməθkʷəy̓əm Rights

Historical context is essential to understanding trajectories of change over time for each of the categories of rights and understanding the sufficiency of resources required for xʷməθkʷəy̓əm to exercise its rights. Section 4 of this 19(4) Assessment first describes trends for each category of right and those resource characteristics from the time period ranging from prior to colonization to early settlement and industrial change to the territory. This historical context is critical to understand relative importance placed by xʷməθkʷəy̓əm on these resources necessary to exercise the right.

### 4.1 Historical Baseline and Trajectories of Change for xʷməθkʷəy̓əm Rights

#### 4.1.1 General

The xʷməθkʷəy̓əm people have occupied, used, and managed its territory since time immemorial. The territory is in a temperate climate and has varied forest, marsh, estuarine, intertidal, mountainous, and open water features that "previously contained an abundance of resources" (Kew 1970; Ham 2014; North, Dunn, and Teversham 1979; Roy 2010 quoted in Tam et al. 2018, 16). xʷməθkʷəy̓əm's territory includes the Fraser River delta and is deeply entwined with xʷməθkʷəy̓əm oral histories, cultural identity, and position in historical trade networks (Musqueam Band Council 1984).

xʷməθkʷəy̓əm ancestors have a continuous history of salmon fishing and mammal harvesting, which dates back at least 8,000 years, and the present-day village has been occupied for 3,000-3,500 years and other settlements for at least 4,500 years ago (Musqueam Band Council 1984, 19). xʷməθkʷəy̓əm exercised rights over resource harvesting sites in xʷməθkʷəy̓əm territory, including salmon, eulachon, and sturgeon fishing, sealing, cranberry, wapato, eggs, waterfowl, and other wildlife harvest. Specific protocols were in place to control xʷməθkʷəy̓əm's access to these sites (Musqueam Band Council 1984; Suttles 1984 quoted in Gregory et al. 2017, 15).

Seasonal resource sites and the implements used to exploit them were owned exclusively; however, it was understood that these were to be shared across families or communities (Tam et al. 2018, 65).

Starting around 1850, settlement occurred in xʷməθkʷəy̓əm lands while commercial logging and salmon fishing commenced. From this time, the effects of urbanization were felt. Factors such as reduced access to traditional harvesting sites, resource degradation from pollution, and declining abundance of harvested resources. Other activities like sports fishing, recreational boating, and marine shipping in Canada and the USA caused more restriction in xʷməθkʷəy̓əm's ability to access to resources in the Fraser River and surrounding areas (Tam et al. 2018, 45). These pressures on the riparian ecosystem and the fish stocks it sustains were further compounded by cannery operations routinely dumping fish waste into the Fraser River. All of these changes have led to the loss and deterioration of aquatic and terrestrial habitats and areas, making the remaining intact foreshore, waterways and terrestrial areas critical to protect (Musqueam Band Council 2016; Tam et al. 2018).

xʷməθkʷəy̓əm-defined protocols determining access to lands and resources continue to be used by xʷməθkʷəy̓əm and other nations today (Woolman 2014 in Gregory et al. 2017). This includes a moratorium on fishing sturgeon despite its importance to xʷməθkʷəy̓əm culture (Tam et al. 2018, 75) and a xʷməθkʷəy̓əm requirement for other First Nations seeking access to waterways and resources in the territory to apply for permission through the xʷməθkʷəy̓əm Fisheries Department. At the same time, harvesting access restrictions imposed by DFO, such as fishing quotas, timing windows, and gear restrictions, limit xʷməθkʷəy̓əm access to fish resources (Tam et al. 2018) and DFO licencing requirements circumvents and often undermines xʷməθkʷəy̓əm access protocols. As noted in Section 3, xʷməθkʷəy̓əm Title rights to govern and control xʷməθkʷəy̓əm territory are constrained by the diminished conditions of xʷməθkʷəy̓əm's other categories of rights presented in this Section.

#### 4.1.2 *Fishing*

Resource harvesting, including salmon and other fish harvesting, are central to xʷməθkʷəy̓əm rights. Fishing has been exercised throughout the lower Fraser River with strategically placed year-round and seasonal settlements and established management protocols (Gregory et al. 2017, 21). Access to fishing sites and other resources in xʷməθkʷəy̓əm territory by other First Nations is still managed by xʷməθkʷəy̓əm based on relationships and protocols that continue to be used today (Gregory et al. 2017). Fraser River fisheries are central to xʷməθkʷəy̓əm economic and cultural well-being and although xʷməθkʷəy̓əm continues to exercise its right to fishing, as well as the right to trade and benefit economically from fishing, the ability of xʷməθkʷəy̓əm members to do so has been negatively impacted (Musqueam Band Council 1984). Non-Indigenous settlement, resource exploitation, industrialisation, colonialization, and other land, river, and marine use changes surrounding the Fraser River have resulted in dramatic cumulative changes over the past 150 years, including displacement and dispossession of the xʷməθkʷəy̓əm people from most of its territories, fishing sites, and fish

processing locations. These changes have also led to drastic declines in fish and fish habitat quality and quantity for all five salmon species, eulachon, sturgeon and other fish species, despite the importance of these species to x̣ṃəθḳẉəỵəm. The following specific, non-exhaustive, changes since non-Indigenous settlement began in x̣ṃəθḳẉəỵəm territory affecting x̣ṃəθḳẉəỵəm fishing in the Fraser River were identified by x̣ṃəθḳẉəỵəm members and documented in Tam et al. 2018:

- Loss of valuable habitat to development, river dredging, foreshore armouring, log booms and transportation, sedimentation, and pollution (46);
- Dredging is frequently seen as a cause of severe impacts to migratory fish habitats especially in combination with water temperature, water level, and water velocity changes (46; 75);
- Non-point sources of pollution from agricultural and residential runoff (89);
- Development on shorelines such as spits, jetties, and infilling (52);
- Decline of fish stocks due to overfishing and mismanagement (91);
- Implementation of restrictive fishing regulations for x̣ṃəθḳẉəỵəm members regarding when, where, and how fishing takes place (92) and restrictions on selling fish for economic benefit; and
- Increase in marine traffic, specifically large vessel, causing safety concerns for smaller fishing boats and leading to avoidance of these areas by x̣ṃəθḳẉəỵəm members (56).

Other changes include loss of critical fish habitat such as eelgrass and salt marshes, transmission of diseases from farmed to wild salmon, lack of safety and security due to conflict and tension between commercial fishers and other fishing groups and increases in small and large marine vessel traffic, and water hazards from logging and other developments (e.g., debris, snags, etc.).

The changes to the Fraser River, the Fraser estuary, and its surrounding existing and lost waterways and shorelines as well as regulations and policy intended to manage river, marine, and land uses has affected x̣ṃəθḳẉəỵəm's access to harvesting areas and led to the decline in all five salmon species, eulachon, and sturgeon populations which had been sustainably managed for millennia by x̣ṃəθḳẉəỵəm prior to settlement (Musqueam Band Council 1984; LFFA 2015 and Cohen 2012 quoted in Gregory et al. 2017, 24; Musqueam Indian Band and Firelight Research Inc. 2016, 68). A more detailed discussion of the changes observed in key fish populations is provided below.

#### 4.1.2.1 *Salmon*

Salmon is a highly valued species for x̣ṃəθḳẉəỵəm as a food source and a culturally significant species, playing a role in ceremony, community cohesion, oral histories, and the transfer of knowledge (Gregory et al. 2017, 72; 79). x̣ṃəθḳẉəỵəm members have harvested all five species of salmon: chinook, sockeye, pink, coho, and chum throughout the territory and, notably, the Fraser River where multiple fishing sites are identified by members (Gregory et al. 2017; Tam et al. 2018). For example, qiqéyt is a former village site located along the southern shore of the Fraser River (northeast of where the Pattullo Bridge is now located) and was described as an area where large quantities of salmon have been fished and dried (Point 1967 quoted in Gregory et al 2017, 19). Oral histories as supplemented by archeological and geological records of these fishing sites along with historical documents all demonstrate the

central role salmon and salmon fishing plays in xʷməθkʷəy̓əm life economically, culturally, and socially (Gregory et al. 2017, 68; Ham 2014 and Suttles 2004 in Gregory et al. 2017).

Since colonization began in xʷməθkʷəy̓əm territory, salmon stocks in the Fraser River have declined significantly. Restrictions imposed by government has played an important role in this declining trajectory. For xʷməθkʷəy̓əm members, reduced access to the fishery and declines in catch rates are the result of population declines and restrictions imposed on xʷməθkʷəy̓əm by the Crown on harvest (e.g., restricted access to fishing licences and the equipment necessary to engage in the commercial fishery) (Musqueam Band Council 1984, 50-51). The Hell's Gate slide of 1914 resulted in dramatic declines in salmon numbers and led to the imposition of a distinct food fishery, separate from the commercial fishery. Despite appeals to change the system, xʷməθkʷəy̓əm members were denied the ability to sell fish under these licences to generate wealth or benefit economically (Musqueam Band Council 1984). These systems also place restrictions on xʷməθkʷəy̓əm's salmon harvest times and sites, introduced short harvesting windows, quotas, and gear restrictions that continue to be implemented by DFO and the Province of BC to this day (Tam et al. 2018). The fisheries management system and associated restrictions have severely impacted xʷməθkʷəy̓əm members ability to use salmon for economic, cultural, and social well-being.

Such impacts resulting from historic colonial policies and regulations, and other evidence (e.g., Harris 2002) demonstrate their unjust and racist qualities. These policies and regulations resulted in significant land and resource dispossession including from salmon and other fisheries (Harris 2002). Current policies continue to be widely viewed by xʷməθkʷəy̓əm, other coastal First Nations in BC and elsewhere in Canada, and many others as unjust and an infringement on their rights (e.g., Claxton 2019). xʷməθkʷəy̓əm was resistant to these regulations. In 1997, the *Sparrow* decision found federal fisheries regulations, and the priority given to the commercial and sports fisheries, to be an infringement on xʷməθkʷəy̓əm's right to fish. The *Sparrow* decision is one example of xʷməθkʷəy̓əm's countless efforts to maintain and strengthen Rights and Title of xʷməθkʷəy̓əm territory and remains foundational for xʷməθkʷəy̓əm's current work in seeking this recognition today. Despite dramatic impacts on salmon as described in further detail below, salmon remains central to xʷməθkʷəy̓əm culture and way of life.

Despite these efforts by xʷməθkʷəy̓əm and others, sockeye salmon runs have been declining, with a major crash in 2009 that resulted in a mere 3,600 caught by xʷməθkʷəy̓əm harvesters. xʷməθkʷəy̓əm catch in more recent years for different populations of sockeye have also been at unacceptably low levels, with only 16,000 caught in 2015. Compounding this serious decline in abundance, xʷməθkʷəy̓əm fishers have not had sufficient opportunities to harvest salmon in recent years, and where openings occur, they are limited in hours. In general, the sub-dominant and off-cycle sockeye runs have declined to the point where few if any openings are being authorized, and the only opportunities to harvest are occurring every four years during the dominant return (i.e., in the last decade, these years have been 2010, 2014, 2018, and 2022). These declines and seasonal fishing restrictions are a barrier for xʷməθkʷəy̓əm to rebuild its once much higher level of participation in the salmon fishery.

#### 4.1.2.2 *Salmon populations in a declining trajectory*

Fraser River salmon stocks have been declining since colonization with exploitation of salmon for the salt salmon export fishery began in late 1820s upstream from the Project in Fort Langley. The establishment of commercial fisheries in the 1870s contributed to additional pressure on the salmon stocks and xʷməθkʷəy̓əm access. This was due to the export of salmon regionally and

internationally, which required much larger quantities of fish compared to traditional trade that took place within Indigenous relationships. As commercial fishing was introduced, Crown regulations and practices were introduced, such as unfair licensing and fishing net restrictions being implemented. As highlighted above, these rules caused a dramatic reduction in xʷməθkʷəy̓əm's access to the fishery (Musqueam Band Council 1984, 32; Tam et al. 2018, 44-45).

Industrialization and urbanization along the Fraser River that have also negatively impacted valuable habitat and increases in fishing activities and vessel traffic are all factors that have impacted the salmon population for all five species.

Dredging along the Fraser River has significantly altered the Fraser River and its estuary, with the removal of approximately 140 million cubic metres (m<sup>3</sup>) of material since the 1950s required for large vessel navigation (McLean et al. 2006 in Nelitz et al. 2018). Dredging in the South Arm of the Fraser River has lowered the channel bed elevation by three metres in 30 years, increasing the velocity of the water and making much of the river no longer usable by salmon and other species (Johannes et al. 2011 and Tam et al. 2017 in Nelitz et al. 2018).

The first decade of the 20th century was the last of the big sockeye runs in the Fraser River. This decline was already evident by the end of the 19<sup>th</sup> century, with Charlie Capilano remarking to the BC Fishery Commission in 1892 that the salmon “are nothing now to what they were when he was a boy (Caplin, interview by B.C. Fisheries Commission in 1892 in Wilmont 1892, 131).” The Hell’s Gate slide worsened the situation and almost destroyed the sockeye run when it occurred during a dominant run. The commercial catch of Fraser River sockeye was greatly reduced from 20 million pre-slide to less than 2 million (Musqueam Band Council 1984, 50-51). In 2022, for example, the Pacific Salmon Commission recorded 1.4 million sockeye salmon in the catch data (Pacific Salmon Commission 2022). Indeed, DFO recognizes the negative impacts facing Pacific salmon from climate change, habitat loss, and fishing pressures with many populations “on the verge of collapse”, a fact that is underlined by the \$650 million investment in the Pacific Salmon Strategy Initiative (DFO 2021a). More recently, the Pacific Salmon Foundation reported (2025):

*spawner abundance has crept above the long-term average in 2023 but a poor return in 2024 put total abundance well-below the long-term average and below the 2009 levels that triggered a federal inquiry, known as the Cohen Commission. An unexpected surge of sockeye in 2025... may offer a hopeful sign for Fraser sockeye. While these recent increases are encouraging, the potential for high levels of pre-spawn mortality as sockeye migrate to their spawning grounds (up to 90% in some years) necessitates cautious optimism for 2025.*

Annual sockeye catch numbers during non-cycle years are extremely low for xʷməθkʷəy̓əm, with catch numbers of 3,600 in 2009, 84,000 in 2011, and 16,000 in 2015 when compared to cycle years when the catch rates are higher, 158,000 in 2014 (Musqueam Band Council 2016). Responses to a 2016 household census carried out among the xʷməθkʷəy̓əm membership, showed that not a single member found that the quantity of salmon harvested in the previous year had met the FSC purposes (Musqueam Indian Band 2017). This not only limits xʷməθkʷəy̓əm members' ability to pass important cultural knowledge to future generations but has serious health and economic impacts. A 2022 Scientific Advisory report also identified the threat to the Fraser River sockeye as “extreme” with a prediction that a 71-100% population decline is anticipated over the next three sockeye salmon generations (DFO 2022a).

The effects of climate change are expected to impose greater challenges on the resilience and survival of salmon at various life cycles, with some species more sensitive than others (Crozier et al. 2021; 2023). Combined with existing cumulative effects, climate change is also expected to negatively affect salmon's ability to access spawning areas to sustain populations in the Fraser River. Additionally, rising sea temperatures are causing increased concerns that sea lion and seal territories are expanding further north into cooler waters, increasing the predation pressure in xʷməθkʷəy̓əm territory on already declining salmon populations (Walters et al. 2020).

Sockeye salmon have been found to spend less time in habitats that have been altered by human development and have been negatively impacted by the changes occurring along the Fraser River (Nelitz et al. 2018). Other salmon populations have experienced similar effects to the sockeye in the Fraser River, with xʷməθkʷəy̓əm members noting that pink salmon populations have dropped significantly, while DFO and other government bodies observing declines in Fraser River coho and chinook populations (Nelitz et al 2018, 16).

The declining trajectory of Fraser River salmon population change over this long historical temporal period, combined with ongoing land, river, and marine use changes, and the continued unjust fisheries management practices, will continue to impact xʷməθkʷəy̓əm access to and catch rates for salmon, including species like sockeye, at fishing sites and times in the future (Musqueam Band Council 1984).

#### 4.1.2.3 *Eulachon*

Eulachon is a rich, oily smelt that spawns in the Fraser River gravel bars that used to occur more abundantly across the riverbed (Golder Associated Ltd. 2021, 24). The species is culturally, socially, and economically significant for xʷməθkʷəy̓əm. In fact, fishing camps along the mouth of the Fraser River were used specifically for eulachon harvesting, drying, and smoking (Gregory et al. 2017). The species was once so plentiful that many members describe how you could easily pick them out of the water with baskets (Gregory et al. 2017, 86).

The Fraser River eulachon population has been declining since at least the 1960s — a concern raised to the Crown as early as the 1950s and 1960s (Lower Fraser Fisheries Alliance 2015, 29). Commercial harvesting of eulachon began in the 1870s with annual average catches of 20 tonnes per year from 1980 to 1990 (DFO 2022c). Since then, the Fraser River eulachon population has declined significantly with DFO reporting overall stock biomass declining from 302 tonnes in 1995 to only 66 tonnes in 2014, a reduction of nearly 80% (Musqueam Band Council 2016). xʷməθkʷəy̓əm members observed these declines and beginning in the late 1980s, reduced the catch and later introduced a moratorium on fishing eulachon (Musqueam Indian Band and the Firelight Group 2022). DFO closed the commercial fishery in 1997 due to low population levels (DFO 2022c).

Overharvesting, harvesting of other species where eulachon is bycatch, climate change, forestry, industrial and dredging activities, as well as pollution entering the Fraser River have caused the removal and destruction of eulachon habitat used for spawning, egg, and larval stages in the Fraser River (Musqueam Indian Band and Firelight Research Inc. 2016; COSEWIC 2011). Many types of activities, including industrialization and urbanization along the Fraser River have contributed to these stressors. The above-mentioned population changes and ongoing threats led the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) to declare Fraser River eulachon population as Endangered in 2011. These factors and others are identified by COSEWIC as threats and limiting factors affecting the eulachon population in

the Fraser River, noting that this more southern population is the most severely affected by climate change impacts. The species is also preferred by many predator species such as seals, sea lions, bald eagles, and other fish. And, as these species are starting to rebound, the likelihood of x̣ẉṃə̣θ̣ḳẉə̣ỵəm being able to re-build the fishery for member participation remains uncertain (see also DFO 2025).

The decline of eulachon populations in the river has resulted in x̣ẉṃə̣θ̣ḳẉə̣ỵəm members rarely having access to eulachon for food or ceremonial purposes. Many x̣ẉṃə̣θ̣ḳẉə̣ỵəm members have not had the opportunity to harvest eulachon due to these declines. The reduction of availability has affected knowledge transmission about this species and fishing and drying methods, and a loss of the significant social gatherings that the eulachon spring migrations once brought to the community (Gregory et al. 2017, 42). x̣ẉṃə̣θ̣ḳẉə̣ỵəm members have observed only a few places remain along the Fraser River where you will find eulachon, including Canoe Pass downstream of Tilbury Island (Musqueam Indian Band and Firelight Research Inc. 2016).

#### 4.1.2.4 *Sturgeon*

Sturgeon was historically an important food for x̣ẉṃə̣θ̣ḳẉə̣ỵəm and, today, continues to have a strong cultural importance for members (Musqueam Indian Band and Firelight Research Inc. 2016). When fishing for sturgeon, x̣ẉṃə̣θ̣ḳẉə̣ỵəm members refer to them as ʔeləx, meaning “sibling” or “cousin of the opposite sex”. Sturgeon was once so abundant in the Fraser River that excess harvest was used for trade, meaning that the species played a key role in x̣ẉṃə̣θ̣ḳẉə̣ỵəm’s society and economy (Gregory et al. 2017, 68-69). For example, x̣ẉṃə̣θ̣ḳẉə̣ỵəm would trade sturgeon for shellfish or scallop shells as these were not as abundant in x̣ẉṃə̣θ̣ḳẉə̣ỵəm territory as in other territories. For x̣ẉṃə̣θ̣ḳẉə̣ỵəm members, a sturgeon represents more than just a fish; they are a gateway to x̣ẉṃə̣θ̣ḳẉə̣ỵəm language, territory, health, technology, and society. In a recent x̣ẉṃə̣θ̣ḳẉə̣ỵəm-led study, members shared their knowledge on the important roles that sturgeon plays in x̣ẉṃə̣θ̣ḳẉə̣ỵəm, including in knowledge transfer — even the act of eating sturgeon with an Elder promotes the sharing of knowledge to future generations (Musqueam Indian Band and Firelight Research Inc. 2016, 152). A break in practice will negatively affect knowledge, which may result in a permanent impact where knowledge is lost forever. x̣ẉṃə̣θ̣ḳẉə̣ỵəm used several sites for sturgeon harvest according to oral history and archaeological evidence, including the qiqéyt village near today’s Pattullo Bridge; in fact, qiqéyt village is considered a once prime sturgeon fishing spot by x̣ẉṃə̣θ̣ḳẉə̣ỵəm members (Gregory et al. 2017, 73). x̣ẉṃə̣θ̣ḳẉə̣ỵəm members have also speared sturgeons in various places across the Fraser River (Lord 1866). Areas closer to Tilbury Island have been identified as sturgeon habitat due to the presence of back eddies which provide calmer waters where fish will rest and aggregate (Nelitz et al. 2018; Tam et al. 2018, 88).

Sturgeon exploitation began in the late 1820s in Fort Langley at the same time as the salt fishery. Sturgeon populations declined significantly in the 1900s in the Fraser River, when overharvesting by non-Indigenous fisherman and industrialization took place. In a 1902 letter from x̣ẉṃə̣θ̣ḳẉə̣ỵəm to the Minister of Marine and Fisheries, x̣ẉṃə̣θ̣ḳẉə̣ỵəm noted that “the sturgeon have now been destroyed in the Fraser” (Musqueam Indian Band 1902). White sturgeon continue to face threats due to habitat alteration or removal resulting from construction of dikes, dredging, gravel mining, commercial fisheries by-catch, mortality from catch-and-release fisheries, introduced species, and a decline in eulachon and other food species that juvenile sturgeon prey upon (COSEWIC 2012; DFO 2022b; Musqueam Band Council 1984; Gregory et al. 2017; Tam et al. 2018). In a 1922 letter to Indian Affairs, x̣ẉṃə̣θ̣ḳẉə̣ỵəm, Katzie, Langley and Coquitlam First Nations all noted that one fisher’s use of cross-lines in the Fraser River caused such a severe impact that “in a year, there was no sturgeon to be seen”

(Coquitlam First Nation et al. 1922). This decline is particularly pronounced in the Lower Fraser River population in x̣ṃəθḳẉəỵəm territory's lower Fraser Valley where the species occurs in a small number of locations (COSEWIC 2012). A moratorium, led by x̣ṃəθḳẉəỵəm in the 1990s, was placed on sturgeon harvesting in the Lower Fraser River and continues to be upheld by x̣ṃəθḳẉəỵəm, which is intended to rebuild the population so that a sustainable x̣ṃəθḳẉəỵəm harvest will occur in the future (Tam et al. 2018, 75; DFO 2022b). The Lower Fraser River white sturgeon population was also listed as a threatened species under the federal *Species at Risk Act* in 2012 (COSEWIC 2012). And while the DFO does not permit recreational or commercial take fisheries, they have restricted recreational fishing of sturgeon to catch and release starting in 1990, which x̣ṃəθḳẉəỵəm does not support (COSEWIC 2012; DFO 2022b). Catch and release is identified by COSEWIC (2012) as an activity that threatens species recovery.

The impacts from the sturgeon population declines are deeply felt by x̣ṃəθḳẉəỵəm members, and have resulted in a greater dependence on salmon, eulachon and other food sources to address nutritional and other needs (Tam et al. 2018; 71). However, as noted above, there are also declines in salmon and eulachon (and moratoriums). Many x̣ṃəθḳẉəỵəm members today have never harvested sturgeon, and members are concerned the traditional knowledge on these species will be lost if future generations are unable to harvest sturgeon (Musqueam Indian Band and Firelight Research Inc. 2016). Despite the drastic impacts this has had on x̣ṃəθḳẉəỵəm, sturgeon remains an extremely important species to x̣ṃəθḳẉəỵəm culture. Recovery measures continue to be implemented with the intent of enabling future generations to rebuild this important part of the x̣ṃəθḳẉəỵəm way of life.

#### 4.1.3 River Shoreline and Terrestrial Plant Harvesting

Plant harvesting is an important practice for x̣ṃəθḳẉəỵəm, not only as a food source, but also for artistic, ceremonial, cultural, and medicinal purposes. Plant harvesting has also been identified by x̣ṃəθḳẉəỵəm as an important social activity in which knowledge and oral histories are passed down (Musqueam Indian Band and Firelight Research Inc. 2016). Common plants harvested by x̣ṃəθḳẉəỵəm members along the Fraser River include blueberries, mosses, salmonberries, bog cranberries, cattails, huckleberry, wapato, seaweeds and kelp, medicinal plants, crab-apples, various tree species such as yew, alder, and Western red cedar (Musqueam Band Council 1984, 34-35). ṣc̣əlex̣ẉq̣əñ is a x̣ṃəθḳẉəỵəm campsite located near Ladner which has been used for harvesting cattails that thrive in the boggy environment the Fraser River foreshore provides (Musqueam Indian Band and Firelight Research Inc. 2016, 125).

Many of these resources can no longer be harvested by x̣ṃəθḳẉəỵəm members, such as cranberries. Other resources, such as seaweed, wapato, and kelp can be found but are not harvested by x̣ṃəθḳẉəỵəm members due to perceived or real contamination, sense of safety, lack of intergenerational knowledge transfer, among other factors. Because there are so few remaining plants and medicines that are accessible and considered safe for harvest, these areas are very important to x̣ṃəθḳẉəỵəm.

x̣ṃəθḳẉəỵəm families managed their own productive plant grounds to harvest from highly productive berry plants, fern roots, and wapato. Stewardship practices provide opportunity for future generations, demonstrating the importance of these foods not only for Musqueam diets but also for social organization and land management (Musqueam Band Council 1984, 35). Currently, x̣ṃəθḳẉəỵəm is in the process of revitalizing Burns Bog's harvested resources so that the area can be used for teaching purposes.

The strong cultural connection to plants is also found in the etymology of the word “xʷməθkʷəy̓əm” or “Musqueam”, which translates to “place of məθkʷəy̓”. məθkʷəy̓ is a river plant that once grew abundantly in the Fraser River delta and tidal flats, was often used by xʷməθkʷəy̓əm members, and appears in a xʷməθkʷəy̓əm origin story (Gregory et al. 2017, 15).

šxʷiçəm (Canoe Pass) is not only an important xʷməθkʷəy̓əm fishing area, but it is also important for xʷməθkʷəy̓əm plant harvest. The place name comes from the practice of cutting rushes to let salmon pass through.

xʷməθkʷəy̓əm members knew which areas were good for harvesting and which ones to avoid to protect against overharvest. This knowledge was put in practice and passed down through generations and used when relations would visit from other places. Though this knowledge and practice, xʷməθkʷəy̓əm managed plant harvesting, fulfilling their stewardship responsibilities.

Important plant species and harvesting locations used and managed by xʷməθkʷəy̓əm have drastically declined over time. The following provides a non-exhaustive list of changes since non-Indigenous settlement began in xʷməθkʷəy̓əm territory affecting river shoreline and terrestrial plant harvesting:

- Erosion, destruction, and hardening of beaches, marshes and other coastal features due to infrastructure on shorelines (Gregory et al. 2017, 15);
- Changes to river and riparian features and habitats by river training, armouring, and dredging;
- Draining of bogs and changing of water quality of bogs by infrastructure and other development, including from run off from streets;
- Crowding out native species and associated introduction of new pests and changes to ecosystems by introduction and establishment of invasive plants (Musqueam Indian Band and Firelight Research Inc. 2016);
- Contamination of medicinal plants by marine and terrestrial pollution including ongoing water vessel and road traffic (Tam et al. 2019);
- Overharvesting (Gregory et al. 2017, 102); and
- Access restrictions (Gregory et al. 2017, 15).

Shorelines at the mouth of the south arm of the Fraser River and village sites near Tilbury Island have been highlighted by xʷməθkʷəy̓əm members as some of the last remaining natural areas where they are still able to harvest plants for food, medicine, art, and ceremonial purposes (Tam et al. 2019, 19; Musqueam Band Council 1984, 34-35). Some of the plants found in these increasingly rare environments in xʷməθkʷəy̓əm territory, such as stinging nettles, are medicinal and cultural plants for xʷməθkʷəy̓əm members (Musqueam Indian Band and Firelight Research Inc. 2016, 125,130). However, the quality and quantity of available plants in this area are considered insufficient for practicing xʷməθkʷəy̓əm rights, in part because harvestable plants occur on private lands where xʷməθkʷəy̓əm members do not have access or are in areas that may be contaminated, which discourage many xʷməθkʷəy̓əm members from harvesting medicinal plants from these shorelines (Tam et al. 2018, 93). In fact, many xʷməθkʷəy̓əm members indicate that they are limited to harvesting berries in Burns Bog within the LSA. The long history of urbanization and land use changes in xʷməθkʷəy̓əm territory has required members to rely more heavily on aquatic resources, such as salmon (Tam et al. 2019). xʷməθkʷəy̓əm has experienced substantial losses in the ability to practice plant harvesting

rights, a fact that highlights the importance of the few remaining natural areas along the Lower Fraser River for x̣ṃəθḳẉəỵəm.

#### 4.1.4 *Hunting*

The Fraser River delta is part of the Pacific flyway and is an area where x̣ṃəθḳẉəỵəm hunt and trap birds, including mallard, widgeon, pintail, teal, murres, grebes, loons, scoters, scaups and harlequins (Musqueam Band Council 1984, 36), as well as Canadian geese, snow geese, swans, brandt, blackduck, grouse, pheasant<sup>6</sup>, and duck and gull eggs (Musqueam Band Council 1984, 36). Harvesting areas include riverbanks, marshes, and meadows throughout the Fraser River delta (Musqueam Band Council 1984, 51).

Harvest of ducks and geese provide feathers for community feasts and ceremonies and is a key ingredient in duck soup, a featured dish in gatherings. This dish not only feeds everyone at these events, but the act of sharing it with the community is an important social practice and pays respect and acknowledges the family host (Musqueam Indian Band and Firelight 2016, 104).

x̣ṃəθḳẉəỵəm hunters once harvested large land mammals like deer, elk and bear in the forests behind village sites and along local streams (Musqueam Band Council 1984; Tam et al. 2018), including bog habitat that hosted, deer, bear (Musqueam Indian Band and Firelight 2016). Hunting also occurred for marine mammal species like whales (Tam et al. 2018), as well as trapping smaller furbearers like muskrat (Musqueam Band Council 2016).

x̣ṃəθḳẉəỵəm historically maintained complex trade networks up and down the coast and into the interior. x̣ṃəθḳẉəỵəm's mastery of controlling trading terms was noted by early colonial powers, such as in 1838 when James Douglas noted his frustration of a less prosperous fur trade market than usual for himself due to x̣ṃəθḳẉəỵəm control diverting where the fur was traded (University of British Columbia n.d.).

Even in areas that continue to be hunted today, x̣ṃəθḳẉəỵəm faces harvesting restrictions and a dramatic decline in the species quantity and quality available. Elk, for example, were once present throughout x̣ṃəθḳẉəỵəm territory, but killed off throughout the 1900s. The animal was later reintroduced in the 1990s to the Coquitlam and Indian watersheds. However, x̣ṃəθḳẉəỵəm members can only obtain one elk license out of the Indian watershed. Due to these historic and ongoing impacts, x̣ṃəθḳẉəỵəm is no longer able to harvest large game in x̣ṃəθḳẉəỵəm territory.

The loss of hunting in x̣ṃəθḳẉəỵəm territory has forced x̣ṃəθḳẉəỵəm members to travel to other territories to harvest large game. This change represents a loss of resilience where x̣ṃəθḳẉəỵəm members must rely on their relationship with outside neighbours. This change also represents a loss of cultural continuity by limiting opportunities to teach hunting practices and has direct effects on health and wellbeing (see the following sections of this 19(4) Assessment). Today, only a handful of x̣ṃəθḳẉəỵəm members continue to know how to process meat for consumption and other uses. These losses experienced by the x̣ṃəθḳẉəỵəm remains within the living memory of certain members, particularly among the older generations.

---

<sup>6</sup> Pheasants were introduced but were hunted following introduction.

As a result, x̣ẉṃə̣θ̣ḳẉə̣ỵəm has turned to harvesting birds with greater frequency, and this bird hunting practice has also changed.

The following provides a non-exhaustive list of changes since non-Indigenous settlement began in x̣ẉṃə̣θ̣ḳẉə̣ỵəm territory affecting hunting, primarily bird hunting:

- Complete loss of hunting large game in x̣ẉṃə̣θ̣ḳẉə̣ỵəm territory;
- Loss of bird habitat to a range of developments related to transportation and infrastructure, logging, and other industries;
- Access restrictions to hunting areas due to industrial, agricultural, and residential developments;
- Scarcity of areas that can support hunting activities;
- Government restrictions on hunting that were historically built on discriminatory policies, including general firearm restrictions, as well as specific restrictions in populated areas;
- Pollution, including noise and light pollution, changing bird behavior and habitat; and
- Concerns of pollution are affecting the willingness of x̣ẉṃə̣θ̣ḳẉə̣ỵəm community members to harvest waterfowl and other species.

These pressures have led to drastic declines in the ability for x̣ẉṃə̣θ̣ḳẉə̣ỵəm members to exercise the right to hunt in x̣ẉṃə̣θ̣ḳẉə̣ỵəm lands and a reduction in the condition of the resources, which has been experienced by some within their lifetimes (Tam et al. 2018, 103-104). Despite these pressures, x̣ẉṃə̣θ̣ḳẉə̣ỵəm members continue to hunt waterfowl within the Lower Fraser Hunting Area, including areas near Tilbury Island (BC MFLNRO 2015) as outlined in the next Section. This change in hunting has also resulted in a dramatic change from a diet primarily comprised of wild game and fish to store-bought produce, and reduction in materials for feasts and ceremonies (Tam et al. 2018). Increasing development in the Lower Fraser Hunting Area raises concerns among x̣ẉṃə̣θ̣ḳẉə̣ỵəm members that there will be more restrictions on hunting in the area.

#### *4.1.5 Cultural Continuity, including Sense of Place and Identity*

Culture is a way of life and composed of practices and beliefs such as knowledge, language, norms, and protocols; it is central to every part of a x̣ẉṃə̣θ̣ḳẉə̣ỵəm member's life, including social relationships, sense of identity and purpose, spirituality, and ceremonies. Opportunities to practice and pass on x̣ẉṃə̣θ̣ḳẉə̣ỵəm's unique culture have declined over time. x̣ẉṃə̣θ̣ḳẉə̣ỵəm has occupied the Lower Fraser River for thousands of years and is documented in oral histories. Old villages and camp sites are collective representations of x̣ẉṃə̣θ̣ḳẉə̣ỵəm's ancestral ties to the territory and cannot be viewed in isolation. Over 8,500 years ago, the village of səẉq̣ẉeqsən was located under what is now the Alex Fraser Bridge, immediately upstream from Tilbury Island, where the mouth of the Fraser River was situated before the delta expanded. This site is associated with burial grounds and other evidence of human habitation and use (Gregory et al. 2017, 57). Further upstream, evidence shows continuous presence of x̣ẉṃə̣θ̣ḳẉə̣ỵəm ancestors from 8,000 to 9,000 years ago around, for example, St. Mungo's cannery known as q̣ẉəq̣ẉəʔapəp, at what is now the closed Glenrose Cannery site (Gregory et al. 2017, 17). sc̣ələx̣q̣əñ is a x̣ẉṃə̣θ̣ḳẉə̣ỵəm camping site in the Ladner area, near the south bank of the Fraser River's south arm and a seasonal fishing village close to a major cattail harvesting area (Musqueam Indian Band and Firelight Research Inc. 2016, 125). Old village and camp sites and place names are all interconnected and demonstrate x̣ẉṃə̣θ̣ḳẉə̣ỵəm ancestral ties to the territory

and are spaces that connect xʷməθkʷəy̓əm to their heritage. In another example, the named site of ʔəqtinəs (or “long shore”), located across the Fraser River from the Project Site, contributes to sense of place and identity through their meaning to contemporary xʷməθkʷəy̓əm, and by tying together the past, present, and the territory. In addition, an old village site known as səwq̓wəqsən is located approximately five kilometers upstream of the Project Site, providing a window into evidence of extensive historical use of the area (BC EAO 2022a, 41). Many xʷməθkʷəy̓əm people consider sites such as ʔəqtinəs to be sacred or spiritually relevant and were used by members to fish sturgeon. As such, xʷməθkʷəy̓əm members believe that these sites are not to be disturbed.

The pressures of the timber industry were felt by xʷməθkʷəy̓əm by 1861, when land grants for lumber operations encroached upon and surrounded the xʷməθkʷəy̓əm reserve. The addition of other industrial pressures of canneries and urban expansion in the 1870s led to “profound displacement of the xʷməθkʷəy̓əm people from their traditional territory” (Gregory et al. 2017, 22). These and other losses, like the destruction of wild salmon streams throughout the region, have had “immense impacts on xʷməθkʷəy̓əm’s cultural identity and persistence”, leading to large gaps in knowledge and language transmission (Musqueam Indian Band and Firelight Research Inc. 2016, 181-182). Government policies and programs have contributed to further change, such as: establishment of reserve lands and control over xʷməθkʷəy̓əm movement and use of lands, enforcement of the *Indian Act* on access to lawyers and voting rights, and residential schools. These and more resulted in a serious deterioration of cultural continuity, sense of place and identity, governance, with entire generations losing the language (Musqueam Indian Band and Firelight Research Inc. 2016).

More recent effects of increased river users and shipping traffic, changes to the river morphology, the smell and look of the river, and elimination of landing sites from urban expansion and industrial developments results in decreased enjoyment on the river, and the reduction in travel within the territory using preferred means like a canoe; not only is it not safe, but landing sites at the few remaining harvesting locations are no longer available (Gregory et al. 2017; Musqueam Indian Band and Firelight Research Inc. 2016). Specifically, the increase in tug traffic along the Fraser River has also made travelling more dangerous, as tug vessels frequently ignore speed limits which creates hazardous conditions for xʷməθkʷəy̓əm members attempting to travel to hunting locations. Each new development along the river increases tug traffic, which creates more restrictions to xʷməθkʷəy̓əm’s ability to access the few remaining harvesting areas.

Beyond impacting the ability of xʷməθkʷəy̓əm members to travel to harvesting sites, recreational and cultural practices such as canoe racing and general river use have also been negatively affected by the increase in tug traffic in the river.

Given the rate and scale of cultural loss and the limited availability of human capacity and natural resources that remain to support these practices, what remains is “invaluable to xʷməθkʷəy̓əm’s cultural continuity, documentation, and revitalisation efforts” (Musqueam Indian Band and Firelight Research Inc. 2016, 156). These are critical for social connection, identity, as well as livelihood. xʷməθkʷəy̓əm members continue to visit old village sites with their families to share knowledge of connection to the area (Gregory et al. 2017), and a large proportion of xʷməθkʷəy̓əm participates in cultural activities, including activities at the big house, weaving, and wood carving (Musqueam Band Council 1984) and fishing along the Fraser River (Musqueam Indian Band and Firelight Research Inc. 2016). Materials required to carry out these activities — like wood, feathers, shells, bullrushes and other items for dancers, cedar and spruce roots, and cedar and cherry bark for weavers, and cedar slabs for carvers — are

increasingly difficult to obtain (Musqueam Band Council 1984). The Fraser River as a whole is an area for transmission of xʷməθkʷəy̓əm fishing knowledge, including near the George Massey Tunnel immediately downstream from Tilbury Island (Musqueam Indian Band and Firelight Research Inc. 2016, 150-151). Fishing practices are inherently social, as families and friends gather to prepare and preserve fish, share and distribute fish, and feast, while some families practice a traditional ‘first salmon rite’ (Musqueam Band Council 1984). Other cultural practices like fishing, hunting, trapping, and plant gathering are discussed in other Sections.

#### 4.1.6 *Health*

Considering historical baseline, xʷməθkʷəy̓əm health has long been understood as a reflection of the holistic wellbeing of their people and the community as a whole. Unlike Western definitions that tend to define health primarily by the presence or absence of illness, xʷməθkʷəy̓əm understandings of health encompass physical, mental, emotional, spiritual, and cultural wellness, recognizing that these dimensions are interconnected and mutually reinforcing. Health is not treated in isolation from other components of life; rather, it is inherently relational and inseparable from culture, spiritual practice, the environment, and the broader social and political context.

Prior to colonization, xʷməθkʷəy̓əm people maintained a physically active, culturally rich, and socially cohesive way of life, supported by abundant access to nutrient-rich traditional foods harvested from their territory and through protocol the territory of their kin. The health and wellness of individuals and the population as a whole were sustained through cultural practices, intergenerational knowledge-sharing, and sustainable harvesting methods that reinforced social cohesion, nurtured spiritual integrity, and safeguarded the conditions for “good health with good longevity” across generations (First Nations Health Authority n.d.).

As described throughout this Assessment, xʷməθkʷəy̓əm diets included a wide range of seafood, birds, large land mammals, and a rich variety of harvested plants used for both food and medicine. The procurement of these foods required sustained physical activity through fishing, hunting, gathering, and food preparation practices that were embedded in daily life. As noted in the Human Health Chapter of the Proponent’s EAC Application, this “high level of physical exercise and the consumption of high nutritional value foods [...] resulted in a low level of chronic disease” (Doran 2004; Receveur et al. 1997). Beyond the physical value and nutritional sustenance that food procurement provided, participation in seasonal harvesting cycles also reaffirmed kin relations, enacted teachings, maintained ceremonies, and fulfilled responsibilities to community and territory. Nutrient-rich foods were thus obtained through practices that carried cultural and spiritual meaning while educating the next generation, such that nourishment was not only physical, but also relational and ceremonial.

Mental and spiritual health have likewise always been inseparable from the social, cultural, and ecological systems that sustain community life. Historically, psychological wellness was supported through strong kinship networks, active participation in cultural and harvesting activities, and the maintenance of reciprocal relationships with kin, the land, and waters. Participation in seasonal harvesting cycles provided more than physical sustenance; these practices reaffirmed kin relations, enacted teachings, maintained ceremonies, and fulfilled responsibilities to community and territory. Harvesting practices were integral to holistic systems of wellness, functioning as key vessels through which culture was practiced and sustained, intergenerational knowledge was transmitted, social cohesion was reinforced, and spiritual integrity was nurtured. Together, these practices contributed to multiple health-protective characteristics and supported long-term wellbeing (First Nations Health Authority n.d.). The

harvesting of key species such as salmon, sturgeon, and waterfowl provided high nutritional value while also fostering opportunities for cultural and spiritual practice (Musqueam Indian Band and Firelight Research Inc. 2016).

Through time, xʷməθkʷəy̓əm members have utilized the lands and waters of xʷməθkʷəy̓əm territory and developed and maintained kinship ties with neighbouring communities to ensure that all communities access the foods and medicines that were required to maintain holistic health. The lands and waters within xʷməθkʷəy̓əm territory provided seasonal and year-round food, medicines, and other resources (Kew 1970 in Musqueam Indian Band and Firelight Research Inc. 2016, 23). Combined with these resources and trade through kinship ties with neighbouring communities, xʷməθkʷəy̓əm members had the necessary resources to maintain holistic health. Fishing, in particular, has long been essential to xʷməθkʷəy̓əm survival, not only as a primary source of food but also as a social and ceremonial practice deeply tied to cultural continuity. Relationships with water and marine species have therefore encompassed intertwined physical, emotional, spiritual, and relational dimensions of health. The ability to fish—whether for food, social, or ceremonial purposes—is inseparable from community wellbeing, social cohesion, and the intergenerational transmission of knowledge, language, and culture.

Individual and collective wellbeing were further nurtured through highly developed social and kinship systems that emphasized collective responsibility to one another and to the land. xʷməθkʷəy̓əm society was shaped by nuanced social structures in which some animals, regarded as kin alongside human relations, played an essential role in sustaining community wellbeing. Food and trading systems were central to social cohesion, with the abundance of the Fraser River supporting complex trade networks and inter-village relationships (Suttles 1984 in Musqueam Indian Band and Firelight Research Inc. 2016, 18). These networks were reinforced through intermarriage, gifting, and ceremonies that embedded food sharing within cultural practice and governance. Such systems supported food security while simultaneously strengthening social and kinship relations, demonstrating that health and wellbeing were upheld collectively as well as individually (Musqueam Indian Band and Firelight Research Inc. 2016, 79).

The arrival of European explorers, and subsequent generations of colonization introduced a series of profound cumulative impacts that resulted in significant declines in xʷməθkʷəy̓əm health and wellbeing. Even prior to physical contact, European diseases decimated populations of Indigenous communities within the region (Harris 1994). Such epidemics, introduced by European explorers, trade, and settlement, continued in numerous subsequent waves for decades to come. This undermined physical health and weakened the community's ability to sustain traditional practices and food systems. These early impacts were compounded by colonial policies such as the reserve system under the *Indian Act*, which undermined all aspects of xʷməθkʷəy̓əm ways of life. Colonial institutions and policies, including Indian residential schools, Indian hospitals and sanatoriums, the Sixties Scoop, and the banning of ceremonies imposed colonial structures that forcibly and violently removed xʷməθkʷəy̓əm people from their cultural practices, kinship systems, and health-sustaining relationships with land and water. These policies created long-term social dislocation and trauma that has been and continues to be carried forward across generations.

This period also saw the imposition of Western healthcare systems that failed to serve Indigenous peoples in the same way they served non-Indigenous populations. In many cases, these systems acted as mechanisms of further harm, with Indigenous people removed from their communities and subjected to invasive or violent treatment in Indian hospitals and from

visiting western healthcare providers. Indigenous health systems were subsumed within Western frameworks that failed to recognize Indigenous approaches to health and healing. Racism and culturally unsafe health care practices persist within the mainstream healthcare system to this day.

Land dispossession further compounded these impacts. This complex and extensive process was wide-ranging, from imposition of permitting and other exclusionary restrictions on access to lands and resources, to dramatic physical alteration of ecosystems, landscapes, and riverscapes. Also, the enforcement of the reserve system reduced access to traditional food and medicine, forcing increasing reliance on store-bought and processed foods with lower nutritional value (Doran 2004). Poverty, overcrowded housing, poor sanitation, and lack of access to clean water intensified health challenges. Restrictions on fishing and other harvesting practices—whether for food, social, or ceremonial purposes—undermined nutrition, cultural continuity, intergenerational knowledge and language transmission, and social cohesion, resulting in material harm to community wellbeing.

The cumulative impacts of these colonial processes have been profound. The decline in health outcomes among xʷməθkʷəy̓əm people from pre-contact to the present day is expressed in physical, social, and emotional challenges, as well as systemic and intergenerational trauma. These impacts are reflected in disproportionately high rates of chronic illness, mental health challenges, substance use, and other health indicators, all of which are linked to structural determinants of health rooted in colonization.

Despite these harms, cultural practices, including fishing and continued cultivation of reciprocal relationships with land and water, remain central to xʷməθkʷəy̓əm concepts of health and healing. As such, impacts to land, waters, and the ability to carry out health-sustaining practices continue to have direct and far-reaching implications for community wellbeing today.

#### *4.1.7 xʷməθkʷəy̓əm Stewardship Efforts to Protect and Conserve Wild Fraser River Species*

xʷməθkʷəy̓əm stewardship of the territory, including the species that inhabit it, has always been a communal responsibility that is taken very seriously. Historically, families owned some harvesting areas while allowing for reciprocal use and access within the community along kinship lines. For example, family access and management of berry and fishing areas ensured sustainable harvest for future generations (Gregory et al. 2017; Musqueam Band Council 1984, 35). At the time of contact, the xʷməθkʷəy̓əm people exercised these rights and control over use and access within the territory. For example, families from outside communities wishing to access fish harvesting and other resource-harvesting areas in the territory were required to follow specific protocols based on kinship and inter-village ties, including at łəqtinəs (BC EAO 2022a, 41). Historic and traditional protocols determining access rights continue and are an exercise of xʷməθkʷəy̓əm's Aboriginal Right to fish. Today, xʷməθkʷəy̓əm requires other First Nations seeking access to waterways and resources in the territory to apply for permission through the xʷməθkʷəy̓əm Fisheries Department. This takes place, for example, for Vancouver Island Nations wishing to access the Fraser River.

Throughout history, xʷməθkʷəy̓əm has advocated for the conservation of Fraser River fish species. As early as 1892, Charlie Capilano raised concerns about declining fish populations when speaking to the BC Fisheries Commission (Caplin, interview by BC Fisheries Commission in 1892 in Wilmont 1892). Throughout the early 1900s, xʷməθkʷəy̓əm, along with neighboring communities, sent letters to federal and provincial governments highlighting that the use of

harmful fishing methods was causing the decline of salmon and sturgeon in the Fraser River (Musqueam Indian Band 1902; Coquitlam First Nation et al. 1922).

More recently, xʷməθkʷəy̓əm has taken steps to reduce the rate of decline in populations of wild salmon, eulachon, sturgeon and other species and habitats within the Fraser River. xʷməθkʷəy̓əm has made deliberate decisions to conserve and actively restore some affected areas where it has been possible to do so. These efforts continue despite the declining historical trajectory of the Fraser River resulting from agriculture, urban, and industrial development, and inadequate fisheries management practices as outlined in prior Sections.

The following presents several examples of relatively recent and current protection, conservation, and restoration efforts led by xʷməθkʷəy̓əm or in collaboration with other parties:

- Oversee management planning, research, stewardship recommendations, monitoring for compliance and enforcement, and rehabilitation measures through the Collaborative Management Agreement for the Fraser River Transition Area with the Province of BC (2017);
- Project-specific Indigenous monitoring;
- Collaborating with the DFO to develop new and innovative strategies for harvesting to limit impacts, such as the creation of an 8-inch minimum mesh size chinook gillnet in the 1990s and 2000s to minimize unnecessary bycatch and allow for smaller sockeye salmon to pass through and the use of shallow purse seine nets as a use of selective gear;
- The procurement of an oil spill response vessel;
- Musqueam Fisheries Habitat Restoration Project which included capacity and expertise building for project management and implementation of fisheries habitat restoration, planning and collaborative decision-making efforts (2020) (DFO 2021b);
- Development of an Aquatic Habitat Restoration Plan, outlining community priority projects to meet restoration and enhancement objectives for the Musqueam Creek Watershed and foreshore area (2015) (Musqueam Indian Band 2015);
- Various fisheries enhancement projects, including significant investment the Lower Fraser to enhance fisheries habitat, are expected to have a direct effect on fish and fish habitat and, in turn, create more opportunities for xʷməθkʷəy̓əm fishing rights to be exercised in the immediate vicinity of the Project;
- Ongoing engagements for rights recognition, where there are aspects of these activities in those discussions;
- Self-imposed moratoriums on the harvesting of certain culturally important species, notably eulachon and sturgeon; and
- Pursuing broader collaborative strategies to address cumulative effects in the area.

xʷməθkʷəy̓əm has been and continues to lead in this work in the Fraser River, making this list far from exhaustive. Despite this effort, xʷməθkʷəy̓əm continues to be excluded from managing

their own fisheries, lands and waterways. Fish populations and habitats in the Lower Fraser River continue to experience a declining trajectory of change.

#### 4.1.8 *Conclusions on Historical Context for the Exercise of xʷməθkʷəy̓əm Rights*

There are currently insufficient resources available for xʷməθkʷəy̓əm to meaningfully exercise rights. The fish, plants, and animal species which were once abundant in the territory have declined significantly. The diverse marine, riparian, and terrestrial habitats have been permanently altered. This reality, combined with social, economic, cultural, and other pressures, has severely restricted xʷməθkʷəy̓əm's right to use, exercise jurisdiction over, and benefit from the territory. In turn, xʷməθkʷəy̓əm's ability to maintain and continue their unique culture and identity of the xʷməθkʷəy̓əm people and address the health and wellbeing of their population are both currently under serious threat.

In summary, the historical context described in this Section demonstrates the severe limitations placed on the ability of xʷməθkʷəy̓əm members to exercise their rights, not only along the Fraser River, but throughout xʷməθkʷəy̓əm's territory. The key limitations facing xʷməθkʷəy̓əm in exercising their rights include those outlined below:

- xʷməθkʷəy̓əm access to Fraser River fisheries and quality and quantity of fish, as well as access to river shoreline harvesting locations, do not provide members with fish to satisfy food, social, and ceremonial purposes, let alone potential future economic requirements;
- Nations-led moratoria on sturgeon and eulachon harvests has suspended cultural practices integral to xʷməθkʷəy̓əm identity and access to/declines in salmon has had a similar effect;
- Destruction and alterations of wildlife habitat and imposed firearm restrictions has eliminated nearly all hunting activities in xʷməθkʷəy̓əm territory, save for some critical bird harvesting areas;
- Cultural and settlement areas, including those where xʷməθkʷəy̓əm members were able to engage in the economic aspects of the fishery (e.g., historic cannery), have been severely constrained;
- Transfer of knowledge from xʷməθkʷəy̓əm Elders to youth is limited due to increased use of the Fraser River and changes to the river morphology, leaving youth without the knowledge of how to sustainably manage and harvest resources, including salmon, sturgeon, eulachon, medicinal plants, marine and terrestrial mammals, etc. The loss of just one generation of knowledge can be an irrevocable loss of this knowledge, as the knowledge is complex and inter-connected to language, kinship, protocol, place, as well as resource;
- The cost of performing harvesting activities is no longer a viable source of income, requiring more time and money to be used to access fishing areas further away from the community and mammal hunting areas largely outside of xʷməθkʷəy̓əm territory, with lowered chances of harvesting resources;
- Safety implications due to increased barriers to accessing fishing and other resources. These barriers include increased vessel traffic, in-water project activities, and the

elimination of safe landing sites due to urban expansion. Current safety measures are not effective (e.g., no-wake zones are not enforced);

- Economic impacts of purchasing and adapting to use new fishing equipment and techniques in order to be responsive to the changing and increasingly industrialized environment;
- Crown licensing requirements circumvent xʷməθkʷəy̓əm's access protocol to the Fraser River fishery putting severe pressure on xʷməθkʷəy̓əm's ability to self-govern in the area; and
- There is also a social and cultural cost to the above limitations, as xʷməθkʷəy̓əm members are unable to engage in and maintain reciprocal relationships or protocol on a family-to-family or Nation-to-Nation basis.

The loss of xʷməθkʷəy̓əm access to their territory and the declining quality and quantity of these resources has a widespread impact on xʷməθkʷəy̓əm rights, cultural continuity and identity, and health and wellbeing. Further adverse impacts to the area, including the Fraser River and the downstream estuary, have the potential to make it impossible to meaningfully practice xʷməθkʷəy̓əm rights, including xʷməθkʷəy̓əm's proven *Sparrow* right, destroying one of the central pillars of what it means to be xʷməθkʷəy̓əm, and eliminate any returns on the substantial human and financial investment made by xʷməθkʷəy̓əm and others to restore the populations of culturally important (and commercially important) species in the Lower Fraser River.

## 4.2 Current Context and Trajectory of Change for xʷməθkʷəy̓əm Rights

### 4.2.1 Introduction

This Section identifies the current context for xʷməθkʷəy̓əm rights and the related indicators. Using information provided in the previous historical context Section, a summary of the current trajectory of change for each indicator is presented. The Methodology outlined in Section 2 is used.

### 4.2.2 xʷməθkʷəy̓əm Title

Building upon the description of xʷməθkʷəy̓əm Title described in Section 3, the entire Study Area (Section 2.4), including a large portion of the shipping route, is within xʷməθkʷəy̓əm territory. xʷməθkʷəy̓əm has been displaced from most of its territory and dispossessed from control over it and, in turn, xʷməθkʷəy̓əm culture and identity. In 1913, Chief Johnnie of xʷməθkʷəy̓əm was asked whether the xʷməθkʷəy̓əm reserve was sufficient to support its members, to which he replied, "This land is not enough" (xʷməθkʷəy̓əm Chief Johnnie, interview by Royal Commission of Indian Affairs in 1913 in Musqueam Indian Band 1913, 5). His response reflects the result of federal and provincial decisions, including through urban and industrial development. Protocols determining access to lands and resources continue to be used by xʷməθkʷəy̓əm today (Woolman 2014 in Gregory et al. 2017), including moratoria on fishing sturgeon and eulachon (Tam et al. 2018, 75).

xʷməθkʷəy̓əm protocols used to control, access, and make decisions about xʷməθkʷəy̓əm lands and resources have neither been respected by governments in the past, nor are they respected today. One illustrative example appears in 1902 when xʷməθkʷəy̓əm Chief Johnnie along with other Nations' Chiefs wrote to the Crown protesting the increase in the use of deep

nets. They were concerned that deep nets will lead to future impacts on salmon. In that letter, the Chiefs reminded the Crown of their previous warning about the fate of the decimated sturgeon stocks, concerned that the salmon would have the same fate (Musqueam Indian Band 1902). This message continued in 1913, when Chief Johnnie testified to the Royal Commission on Indian Affairs highlighting the restrictions placed on xʷməθkʷəy̓əm to manage and control their lands and resources:

*"I am pretty nearly deprived of my hunting and game matters... Before the whiteman came, the Indians used to have all kinds of game to live on, but since the arrival of the whiteman pretty nearly all the game has disappeared around here, even the fish in the waters are going the same way...it is the whiteman who came to this country that almost destroyed our game and fish. That is all I have to say - I want to be at liberty at all times to take and kill fish and game of all descriptions to support my family and for our own use. I don't want to be restricted by the whiteman's law." (Musqueam Indian Band 1913, 3).*

In consideration of the historic and current context, there is a **declining trajectory of change** for the conditions that support xʷməθkʷəy̓əm Aboriginal Title.

Tilbury Island and the LSA overall are an important part of xʷməθkʷəy̓əm Title lands, with the LSA holding one of the last remaining areas of Fraser River shoreline that is not fully developed or occupied by private, municipal, or industrial land users and associated infrastructure. And while xʷməθkʷəy̓əm is taking significant steps to regain control, use, and occupation over the territory, this is a long, ongoing process that faces many challenges. Increased development pressures along the lower Fraser River, and the delta (Roberts Bank Terminal II), marine shipping and recreational boaters, combined with lack of meaningful recognition by the Crown and industry of xʷməθkʷəy̓əm's rights to benefit economically and govern the territory, has contributed to these challenges. The context for xʷməθkʷəy̓əm Title has already been **severely diminished** and is **highly sensitive**.

#### 4.2.3 Fishing

The Study Area, including Tilbury Island and the LSA, is an area used by xʷməθkʷəy̓əm to harvest resources including salmon, eulachon, steelhead, and sturgeon as outlined in Section 4.2 and continues to be important. xʷməθkʷəy̓əm's preferred areas are no longer available and any remaining areas that xʷməθkʷəy̓əm can access are of critical importance to xʷməθkʷəy̓əm's fishing rights. The Fraser River provides good habitat for these species due to the calm waters and back eddies and the foreshore which provides spawning grounds (Nelitz et al. 2018). xʷməθkʷəy̓əm members identify the Project Site and nearby areas (Fraser Surrey Dock and the George Massey tunnel) as fishing locations that are used by salmon, sturgeon and eulachon as a holding area (i.e. areas of concentration for adult and juvenile salmon and eulachon) that are frequently fished when the ability to catch fish is reduced, or competition is high from marine mammals, in other areas (Tam et al. 2018, 71-72, 88; Musqueam Indian Band and the Firelight Group 2016, 88; Nelitz et al. 2018, 21-23).

The shallow areas of the riverbed around the Project Site makes it a productive salmon fishing area (BC EAO 2022a, 14). xʷməθkʷəy̓əm members continue to fish in the Project Site and use this part of the river. Notably, xʷməθkʷəy̓əm members deploy gillnets in this area, which involve small vessels setting the nets and monitoring the net and the catch. When gillnetting, the entire width of the river is taken up by a combination of gillnets and vessels. When the nets drift, fishers are needed to account for fish movement. These additional vessels are required especially during short openings. Since the whole width of the river is needed there are already

constraints facing this important x̣ṃəθḳẉəỵəm fishery from existing vessel traffic. Any additional reduction in access, particularly during fishing season, will only compound these existing constraints. x̣ṃəθḳẉəỵəm has observed in many parts of their territory that larger vessels have a more serious effect on x̣ṃəθḳẉəỵəm fishing due to sense of safety on the water, actual safety restrictions, noise and sensory disturbance, and duration of impact.

This area of the Fraser River is also used to access fishing areas upstream. However, declines in targeted species populations, historical and ongoing impacts in the LSA described at length in Section 4.1.2, including changes from industrialization and urbanization along the shoreline, increased number of small and large vessel traffic (particularly when fishing takes place), and river training including ongoing dredging along the riverbed have all impacted x̣ṃəθḳẉəỵəm's ability to access fish (Nelitz et al. 2018, 4). The increase in small and large vessel traffic has caused safety to be a growing concern when fishing in the river (BC EAO 2022a, 94).

While this study only presents a very small proportion of total x̣ṃəθḳẉəỵəm fishing use, knowledge, and x̣ṃəθḳẉəỵəm member participation, 35 fishing values were reported by x̣ṃəθḳẉəỵəm members in 2018 at Tilbury Island within the Project Site (Tam et al. 2018, 39). A holistic understanding is essential in interpreting the fishing values as they are highly interconnected to other values. Importantly, the shallow waters close to Tilbury Island were identified as great habitat for spawning eulachon and an area that was previously used for x̣ṃəθḳẉəỵəm for harvesting eulachon. These remaining shallow areas in the river are important as most of these areas have been removed through river training and dredging. x̣ṃəθḳẉəỵəm has a strong desire to resume harvesting eulachon in the future, once eulachon populations have recovered. x̣ṃəθḳẉəỵəm identified the site could potentially support other x̣ṃəθḳẉəỵəm fishing practices (i.e., fish weir, sturgeon fishing or beach seine). This is because the site features a continuous shallow sandy bottom, which is a feature rarely available elsewhere in x̣ṃəθḳẉəỵəm's territory in a location suitable for fishing. x̣ṃəθḳẉəỵəm stressed the importance of this site is linked to many factors, there is seasonal importance, but other factors contribute to the use of the site from year to year and this location can be, or could become, a critical access and use area. x̣ṃəθḳẉəỵəm expressed that Tilbury Island is intrinsically linked to x̣ṃəθḳẉəỵəm core stewardship, cultural continuity, and sense of place.

In the LSA, there are 396 fishing values identified in this area including fishing areas for various fish species, shellfish harvesting sites for crab, fish habitat (such as spawning and migratory routes), camping sites used by x̣ṃəθḳẉəỵəm members while fishing, and processing sites. The following specific fishing values were identified in the LSA:

- Fishing areas for a variety of species such as salmon, steelhead, sturgeon and eulachon;
- Valuable fish habitat such as spawning areas and holding areas for migratory fish;
- Water routes travelled to access fishing sites located upriver;
- Water routes travelled in order to patrol salmon gillnet fisheries;
- Previously used fishing camps;
- Valued habitat of various fish species;
- Spawning and migratory holding areas for salmon and eulachon;
- Water routes and sites for salmon, sturgeon and flounder harvesting; and
- Fish processing sites and temporary habitation sites.

#### 4.2.3.1 *Summary of Current Context and Trajectory of Change*

Increased industrialization and urbanization of the LSA, declines in habitat quantity and quality and quantity and quality of salmon, eulachon and sturgeon, safety concerns and exclusion from access to fishing sites due to small and large vessel traffic and construction and operation of marine terminals, water quality and flow changes due to development and dredging, and harvesting restrictions imposed on x̱m̱əθḵw̱əy̱əm fishing activities have contributed to a **declining trajectory of change** for the conditions (access and resource availability) that support the opportunity for x̱m̱əθḵw̱əy̱əm members to fish at locations and times, or benefit economically from fish harvested within the territory. In respect to the Project, x̱m̱əθḵw̱əy̱əm currently utilizes fishing sites located in the Project Site, LSA, and RSA for FSC fishing and economic development (e.g., allocation transfers and business partnerships). The current conditions for x̱m̱əθḵw̱əy̱əm's right to fish along the lower Fraser River have already been **severely diminished** and are **highly sensitive** to change. This conclusion is particularly important given that other categories of x̱m̱əθḵw̱əy̱əm rights are already far more limited (explained more below).

#### 4.2.4 *River Shoreline and Terrestrial Plant Harvesting*

The Study Area includes plant gathering sites used by x̱m̱əθḵw̱əy̱əm members as sources for food, medicinal and ceremonial resources. Specifically, shorelines within the LSA are some of the few remaining naturally vegetated sites along the Fraser River and contains medicinal resources, including cattail (Tam et al. 2019, 19; Musqueam Band Council 1984, 34-35). While x̱m̱əθḵw̱əy̱əm members continue to harvest plants within the LSA and in proximity to Tilbury Island, development of the shoreline, pollution, foreshore hardening that changes the natural shoreline by installing structures, and access restrictions to the remaining natural areas have led to the decline in the quality and quantity of the plants accessible to x̱m̱əθḵw̱əy̱əm (Tam et al. 2018, 93).

Site-specific rights-based use values were reported by x̱m̱əθḵw̱əy̱əm members in 2018 and described in the Traditional Use Study for the TMJ Project (Tam et al. 2018), including various plant harvesting sites within the Study Area. For detailed site-specific information, please refer to the maps in Section 4 and Figure 2 of that report. As highlighted in that report, results only represent a very small proportion of total x̱m̱əθḵw̱əy̱əm use and knowledge.

#### 4.2.4.1 *Summary of Current Context and Trajectory of Change*

Increased industrialization and urbanization of the shoreline surrounding the LSA, privatization of lands along the shoreline, pollution and lack of privacy when harvesting, and foreshore hardening have contributed to a **declining trajectory of change** for the conditions that support x̱m̱əθḵw̱əy̱əm members right to harvest plants. The current conditions for x̱m̱əθḵw̱əy̱əm's right to harvest plants along the lower Fraser River have already been **severely diminished** and are **highly sensitive** to change.

#### 4.2.5 *Hunting*

x̱m̱əθḵw̱əy̱əm has hunted historically throughout their territory, including in areas around the Fraser River such as the marshes in Richmond, including for waterfowl, seals, deer, elk, and ungulates (BC EAO 2022a, 30). x̱m̱əθḵw̱əy̱əm members are no longer able to harvest large game due to the historic and ongoing pressures noted above, as well as firearms restrictions (Gregory et al. 2017), though some smaller terrestrial mammals continue to be harvested in the

northern portions of core x̣ṃəθḳẉəỵəm territory and can access large game through arrangements to hunt in other territories (Tam et al. 2018, 23). Harvesters are now limited to harvesting waterfowl such as dabbling ducks, geese, grouse and swans mainly in the Fraser River estuary including in the vicinity of Tilbury Island (BC EAO 2022a, 27). Importantly, while hunting has seriously diminished over time, it is “no less important” and remains entwined with other rights-based practices (Tam et al. 2018, 17). Indeed, the remaining hunting sites are critical to ensuring hunting rights can continue.

Values were reported by x̣ṃəθḳẉəỵəm members in 2018 and described in the Traditional Use Study for the TMJ Project. Reports include hunting and trapping sites across the Study Area, including at the Project Site. For detailed site-specific information, please refer to maps in Section 4 and Figure 2 of that study. As highlighted in that study, results only represent a very small proportion of total x̣ṃəθḳẉəỵəm use and knowledge.

#### 4.2.5.1 *Summary of Current Context and Trajectory of Change*

The conditions that support x̣ṃəθḳẉəỵəm opportunities to hunt within the RSA (i.e., x̣ṃəθḳẉəỵəm’s core territory), including access and resource quality and availability, has declined over time such that x̣ṃəθḳẉəỵəm members are no longer able to hunt or trap in the core portions of the territory, reflecting a **declining trajectory of change** for the conditions that support x̣ṃəθḳẉəỵəm members right to hunt and trap. This is the result of increased urbanization and industrialization and regulation in the Study Area, including physical hardening of the shorelines and elimination of habitat that was once used by harvested species including birds, as well as government-imposed firearm restrictions. For these reasons, it is concluded that these cumulative changes in the conditions necessary for x̣ṃəθḳẉəỵəm to exercise hunting rights have already been **severely diminished** and, therefore, the context for hunting and trapping is **highly sensitive**.

#### 4.2.6 *Cultural Continuity, including Sense of Place and Identity*

x̣ṃəθḳẉəỵəm relies on the Fraser River to maintain and restore sense of identity, place, and cultural practices. Indeed, the Fraser River system and flow defines the way x̣ṃəθḳẉəỵəm understands direction and navigation, while many historic village sites, burial grounds, navigation routes, and camping sites occur along the Fraser River in the Study Area, described in Section 4.2. These areas, resources, and knowledge that rely on a healthy Fraser River continue to hold significance for x̣ṃəθḳẉəỵəm members today. These places also hold intangible value (i.e., sense of place and identity in just knowing these sites are there). For some members, these sites are visited to share stories and knowledge with the next generation. Due to the cumulative changes described in Section 4.1.5, x̣ṃəθḳẉəỵəm members are unable to freely transmit knowledge with younger generations. Tilbury Island and the surrounding waters are important for continuation of cultural activities such as fishing (Tam et al. 2018, 38). Plant harvesting occurs throughout x̣ṃəθḳẉəỵəm territory, including at village sites on the Fraser River, such as qiqéyt and on islands at the mouth of the south arm of the Fraser River (Tam et al. 2019, 19).

x̣ṃəθḳẉəỵəm’s sense of place and culture is deeply connected to animals, such as q̣əł̣ṭaḷəməc̣ən (orcas), specifically southern resident killer whales (SRKW) due to their cultural significance as the species is a tool for teaching x̣ṃəθḳẉəỵəm’s culture and language (BC EAO 2022a, 33). Also, their role in the territory’s marine ecosystem has a tangible effect on x̣ṃəθḳẉəỵəm. SRKW influence the timing of fish running up the Fraser River, as well as have an influence on the abundance of fish in the territory for x̣ṃəθḳẉəỵəm fishers (BC EAO 2022a,

34). This can influence the availability of fishing locations along the Fraser as well as the timing of x̣ṃəθḳẉəỵəm's fishing opportunities (BC EAO 2022a, 34).

Despite the displacement of x̣ṃəθḳẉəỵəm members from use and occupation of the territory, and the destruction of wild fisheries and habitat, waterfowl and mammal habitat, and plant harvesting sites along the Fraser River, x̣ṃəθḳẉəỵəm members continue to be intimately tied to the Fraser River. The continuation of x̣ṃəθḳẉəỵəm cultural activities also depends on the availability of resources, the practices tied to them, and the places where these practices take place (BC EAO 2022a, 34). x̣ṃəθḳẉəỵəm's unique and vibrant culture continues with only a few remaining parts of the territory available for x̣ṃəθḳẉəỵəm to maintain social cohesion, transmit intergenerational knowledge, maintain a sense of place and connection to the land and water, continue to practice ceremonial and cultural practices, maintain protocols between families and other nations, and exercise rights.

Several rights-based cultural use values were reported by x̣ṃəθḳẉəỵəm members along the Fraser River in 2018 and described in the Traditional Use Study for the TMJ Project also situated on the Tilbury Island (Tam et al. 2018) and within the Study Area. As highlighted in that report, results only represent a very small proportion of total x̣ṃəθḳẉəỵəm use and knowledge. The Study Area includes various teaching sites for transmission of intergenerational knowledge within the Project Site and wider LSA. Within the LSA, the following rights-based cultural use values were identified:

- Sites used both historically and continuously for the inter-generational transmission of knowledge;
- Culturally significant sites and travel routes to pass generational teachings such as harvesting;
- Gathering sites where x̣ṃəθḳẉəỵəm members received teaching on oral histories and traditions;
- Shoreline areas where x̣ṃəθḳẉəỵəm heritage and belonging are taught;
- Camping sites, spiritual sites, water routes used for access to travel through x̣ṃəθḳẉəỵəm territory;
- Habitation sites such as old village sites and camping areas, rich archaeological evidence, harvesting camps for plants and salmon, burial sites, canneries where many x̣ṃəθḳẉəỵəm members worked and lived;
- Spiritual and ceremonial sites and place names, water routes used to travel throughout x̣ṃəθḳẉəỵəm territory;
- Locations of current docking and camping areas; and
- Water routes used historically and currently to access x̣ṃəθḳẉəỵəm territory.

#### 4.2.6.1 *Summary of Current Context and Trajectory of Change*

Increased non-Indigenous settlement, agriculture, commercial fishing, and industrialization of x̣ṃəθḳẉəỵəm territory, along with the associated decline in and barriers to x̣ṃəθḳẉəỵəm fisheries, waterfowl harvest, and plant harvest have contributed to a **declining trajectory of change** for the conditions (access and resource quality and availability) that support x̣ṃəθḳẉəỵəm cultural continuity. Access to sites near Tilbury Island and the Fraser River such

as ancient village and camping sites, burial grounds, fishing sites and natural areas for plant harvesting represent some of the few remaining places where x̣ṃəθḳẉəỵəm intergenerational knowledge can still be transmitted. The ongoing urbanization of x̣ṃəθḳẉəỵəm's territory has nearly eliminated members' access to terrestrial hunting and plant harvesting grounds which has placed a greater reliance on fisheries for the x̣ṃəθḳẉəỵəm people to be able to continue cultural practices (Tam et al. 2018, 91). However, historic and ongoing declines in wild fisheries along the Fraser River, and the exclusion from the river by large and small marine vessels, continue to severely restrict x̣ṃəθḳẉəỵəm members' ability to access fishing sites and secure sufficient fish to satisfy minimal food, social and ceremonial purposes let alone pass on knowledge of species (e.g., sturgeon) and fishing practices. In sum, x̣ṃəθḳẉəỵəm's ability to simply continue x̣ṃəθḳẉəỵəm way of life has diminished so severely, that any remaining areas accessible for x̣ṃəθḳẉəỵəm to engage in rights-based practices have become extremely important. The current conditions for x̣ṃəθḳẉəỵəm's right to cultural continuity have already been **severely diminished**, meaning that this right is **highly sensitive** to change.

#### 4.2.7 *Health*

As highlighted in Section 4.1.6, health and wellbeing for x̣ṃəθḳẉəỵəm people must be understood holistically, encompassing mental, physical, emotional, and spiritual wellness, and rooted in the community's relationships to the land, waters, resources, and one another. The present-day context of x̣ṃəθḳẉəỵəm health reflects a complex accumulation of impacts, including the enduring effects of colonial policies, environmental degradation, and systemic barriers to culturally safe healthcare and traditional wellness practices. As a result, all conditions necessary for x̣ṃəθḳẉəỵəm to exercise the community health and wellbeing category of rights have been severely impacted by the cumulative effects of colonization, the imposition of colonial programs and policies, and large-scale industrial development along the Fraser River. For the future, however, community members stress that territory-based activities, ceremonies, and undisturbed spaces along the Fraser River corridor and beyond are integral to restoring balance and spiritual wellness (Musqueam Indian Band 2018, 50, 53).

An Indigenous Determinants of Health (IDOH) framework provides an effective lens for understanding the current health conditions facing the x̣ṃəθḳẉəỵəm community, recognizing colonization as the primary driver of health inequities. An IDOH framework centres Indigenous ways of knowing and emphasizes the importance of Indigenous knowledge transmission, the ability to maintain ancestral relationships with land and resources, and community access to traditional foods, medicines, and ceremonial spaces (Carroll et al. 2022). These determinants are deeply interwoven with other rights addressed throughout this 19(4) Assessment, all of which directly influence the health of individuals and the community as a whole.

##### 4.2.7.1 *Land access, traditional practices, and physical wellness*

Industrial development, urbanization, and land privatization across x̣ṃəθḳẉəỵəm territory have contributed to the degradation of, and loss of access to, many of the places and resources that support health and wellness. The ability to harvest and consume traditional foods and medicines is not only a matter of nutrition; it is also a vital means through which community members sustain cultural connections, engage in intergenerational knowledge transmission, and support their health through physical activity, ceremony, and relationship with the land. Ongoing constraints to land and water access therefore have direct and cascading implications for physical, mental, spiritual, and collective wellbeing.

The integrity of traditional food systems has been particularly impacted cumulative environmental and industrial pressures. As detailed in earlier sections of this 19(4) Assessment, key species such as salmon, eulachon, and sturgeon have experienced serious population declines. Similarly, the quantity, quality, and accessibility of many terrestrial plants and large game animals critical for nutrition, medicine, and ceremonial purposes have diminished significantly, with some resources now largely unavailable. These changes have driven a profound dietary shift, from a diet based on wild game and seafood to one increasingly reliant on processed and store-bought foods, reducing both nutritional value and cultural continuity.

Food security has been identified as a central priority for the community today. As noted in the x̣ẉṃə̣θ̣ḳẉə̣ỵəm Comprehensive Community Plan (CCP), “access to healthy, nourishing food is an issue for many of our members,” and “central to this issue is access to traditional foods [...] Harvesting and consuming our traditional resources gives our community members a way to establish connections with our culture and improves health and wellbeing” (Musqueam Indian Band 2018, 50). Survey results from the 2016 Musqueam First Nation Monitoring and Evaluation Report, hereafter referred to as the x̣ẉṃə̣θ̣ḳẉə̣ỵəm 2016 Census, reflect the impacts of this dislocation: 39% of respondents reported never preparing traditional foods, while 46% reported never participating in harvesting (Musqueam Indian Band 2017, 15). While many members continue to rely on country foods where possible, safety concerns while accessing harvesting sites and declining resource availability further constrain access (Musqueam Indian Band and Firelight Research Inc. 2016, 89–92). As a result, 62% of respondents agreed or strongly agreed that food access is an issue for the community (Musqueam Indian Band 2017, 41).

#### *4.2.7.2 Mental and spiritual health, trauma, and cumulative effects*

Alongside nutritional and territorial disruptions, x̣ẉṃə̣θ̣ḳẉə̣ỵəm members continue to carry the psychological burdens associated with cumulative and intergenerational trauma. The legacies of residential and day schools, the Sixties Scoop, the banning of ceremonies, systemic racism within healthcare, and broader processes of cultural suppression have produced enduring health inequities that remain evident today. Importantly, these harms cannot be understood in isolation from the ongoing loss of access to land, resources, and cultural practices; rather, they interact with and exacerbate one another, compounding impacts on mental, emotional, and spiritual wellbeing.

These conditions are reflected in higher rates of chronic illness, mental health challenges, addictions, and barriers to accessing appropriate care (Boksa et al. 2015; Earle 2013). As noted in the x̣ẉṃə̣θ̣ḳẉə̣ỵəm 2016 Census, addictions, substance use, and related social problems are a significant concern within the community. Mental health has been identified as a pressing issue for x̣ẉṃə̣θ̣ḳẉə̣ỵəm people today—one that community members emphasize is best addressed through traditional approaches that honour cultural knowledge and spiritual care (Musqueam Indian Band 2018, 50).

The mental and spiritual health of x̣ẉṃə̣θ̣ḳẉə̣ỵəm people is particularly vulnerable to additional stressors introduced by new projects or disturbances, which must be understood within – and as compounding – the broader cumulative impacts described above. New disturbances do not occur in isolation; rather, their effects on the mental and spiritual wellbeing are amplified by the layered and ongoing losses and traumas imposed by generations of cumulative dislocation from territory and cultural practice. Traditional and territory-based wellness practices are widely recognized as essential to healing; however, access to safe, undisturbed areas for these practices is increasingly limited within the Study Area and surrounding region, especially along

the Fraser River corridor where industrial and marine activity has intensified. These barriers contribute to heightened stress and anxiety and can act as a source of re-traumatization, reinforcing the long-lasting legacies of colonial dispossession and exclusion from territory-based practices.

In addition to the cumulative impacts impacting x̣ṃəθḳẉəỵəm ability to engage in economic activities and livelihoods described throughout Section 4, the health challenges articulated above also have direct implications for economic participation. Health-related issues are identified as a major factor preventing individuals from finding or retaining employment, and overall improvement of health and wellbeing has been identified as one of the highest priorities for the community (Musqueam Indian Band 2017).

Community members have consistently expressed that many social and health challenges—such as addictions, violence, and disrupted family relationships—are directly linked to unresolved and intergenerational trauma rooted in colonial violence, family separation and inter-family conflict, and systemic harm. As one x̣ṃəθḳẉəỵəm 2016 Census participant shared: “The social issues are connected to deeper rooted unaddressed inter-generational trauma. If there is no long term [solution], the issue will continue to affect the next generation. There needs to be a multi-dynamic approach to dealing with alcohol & violence, sexual abuse & mental health, parenting and child abuse...” (Musqueam Indian Band 2017, 40). This perspective reflects a widely held understanding within the community that healing requires a comprehensive, culturally grounded approach — one that addresses both historical roots and present-day realities of trauma, and that is fundamentally tied to restoring and protecting relationships with land, water, and cultural practice.

The health of x̣ṃəθḳẉəỵəm today cannot be disentangled from the legacies of colonial violence, the continuing impacts of colonial policies, or from the strength of ongoing cultural resurgence, which is enabled by and contingent upon safe and unencumbered access to their territory for cultural practices.

#### 4.2.7.3 *Health, fishing, and the Sparrow decision*

The centrality of health to x̣ṃəθḳẉəỵəm rights is reflected in the Supreme Court of Canada’s *Sparrow* decision, which recognized the Aboriginal Right to fish for FSC purposes. It also affirmed x̣ṃəθḳẉəỵəm’s Aboriginal Right to fish for FSC purposes. The Court’s reasoning situates FSC fishing as essential to the survival and wellbeing of the x̣ṃəθḳẉəỵəm community, even though it does not apply the language of “health” in their analysis.

In *Sparrow*, the Court emphasized that Aboriginal Rights must be interpreted generously, that ambiguities must be resolved in favour of Indigenous peoples, and that rights must be understood within their Indigenous context. In doing so, the Court rejected narrow or static interpretations of Aboriginal Rights that would freeze them in time or reduce them to discrete Western legal categories. Instead, the decision affirms that FSC fishing must be understood as a living practice that sustains Indigenous communities in social, cultural, and material terms.

Importantly, the Court recognized that FSC fishing is not merely a cultural preference, but a practice fundamental to community survival. This recognition reflects an implicit understanding that fishing supports far more than physical nourishment alone. As described above, fishing for x̣ṃəθḳẉəỵəm sustains nutrition, social cohesion, intergenerational knowledge transmission, cultural identity, and spiritual connection to land and water.

In the present-day context, however, the conditions that *Sparrow* identified as essential to community survival have been increasingly compromised. Ongoing constraints on fishing access, declining fish populations, degraded aquatic habitats, and cumulative industrial impacts along the Fraser River continue to erode the health-supporting practices that the Sparrow decision sought to protect. These pressures intersect with broader legacies of colonization, systemic inequities, and environmental change, intensifying risks to Musqueam physical, mental, spiritual, and collective wellbeing.

#### 4.2.7.4 *Community healing, resurgence, and the importance of the Fraser River*

In recent generations, xʷməθkʷəy̓əm people, like many Indigenous communities, have taken powerful steps toward decolonization, cultural resurgence, and healing. Efforts to revitalize language, reassert sovereignty, and invest in intergenerational knowledge transmission through ceremonial and territory-based practices have been deeply meaningful and have contributed positively to community wellness (e.g., Tsuji et al. 2023). These efforts reflect a holistic understanding of health rooted in ancestral ways of knowing, where wellness is measured not only by the absence of physical and spiritual illness, but by the presence of strong cultural identity, social cohesion, and spiritual connection—each of which requires free and autonomous access to a healthy land base.

Despite long-standing cumulative impacts, the Lower Fraser River continues to be highly valued as a place that supports xʷməθkʷəy̓əm health and wellbeing. xʷməθkʷəy̓əm are stewards of the Fraser River, bringing a sense of purpose and belonging. Members have identified the Fraser River as providing tangible benefits, including nutrition and physical activity through harvesting, as well as intangible benefits through emotional, psychological, and spiritual connection (Musqueam Indian Band and Firelight Research Inc. 2016). Traditional practices, including stewardship activities, along the river therefore remain central to supporting mental and spiritual wellbeing and to rebuilding community relationships.

Access to land and cultural practices is also seen as essential to future healing. Community members stress that territory-based activities, ceremonies, and undisturbed spaces along the Fraser River corridor and beyond are integral to restoring balance and spiritual wellness, and that ensuring opportunities for these practices will be necessary to support xʷməθkʷəy̓əm mental and spiritual health (Musqueam Indian Band 2018, 50, 53). While xʷməθkʷəy̓əm is actively working to restore territory-based practices, expand community-based health services, and increase economic opportunities, members continue to experience disproportionate challenges in economic security and overall wellbeing compared to the broader Lower Mainland population. This current condition and trajectory of change make it difficult for xʷməθkʷəy̓əm to recover the conditions necessary to fully exercise the community health and wellbeing category of rights.

#### 4.2.7.5 *Summary of Current Context and Trajectory of Change*

The present-day context of health for xʷməθkʷəy̓əm reflects a **declining trajectory of change** resulting from cumulative environmental impacts — combined with ongoing barriers to land and water-based practices, systemic racism in mainstream health systems, loss of traditional food sources, and unresolved intergenerational trauma. The current conditions for xʷməθkʷəy̓əm's right to health have been **severely diminished**. xʷməθkʷəy̓əm's ability to maintain health and wellbeing in accordance with its own knowledge systems and rights frameworks has been significantly compromised. As a result, the conditions that support xʷməθkʷəy̓əm's right to health are now **highly sensitive** to further change.

#### 4.2.8 Conclusion

The table below provides a summary of the *trajectory of change* and *context* for each category of xʷməθkʷəy̓əm right.

*Table 3: Summary of context and trajectories of change for xʷməθkʷəy̓əm rights.*

| Category of Right                                          | Trajectory of Change | Context          |
|------------------------------------------------------------|----------------------|------------------|
| xʷməθkʷəy̓əm Title                                         | Declining            | Highly Sensitive |
| Fishing                                                    | Declining            | Highly Sensitive |
| River Shoreline and Terrestrial Plant Harvesting           | Declining            | Highly Sensitive |
| Hunting                                                    | Declining            | Highly Sensitive |
| Cultural Continuity, including Sense of Place and Identity | Declining            | Highly Sensitive |
| Health                                                     | Declining            | Highly Sensitive |

Notably, for each category, the trajectory of change is **declining**, while the context is **highly sensitive**. In other words, the condition of each right is **severely diminished** from historical baseline.

## 5. Potential Adverse Impacts

This Section summarizes the potential Project-specific impacts to xʷməθkʷəy̓əm rights, as identified by xʷməθkʷəy̓əm. This 19(4) Assessment draws upon those impacts identified in documents drafted by the BC EAO and IAAC in the Application Information Requirements Tilbury Phase 2 (June 2022), as well as the Proponent's EA Application (FortisBC 2024). Potential impacts from the TMJ Project on xʷməθkʷəy̓əm rights are also considered and summarized at the end of each subsection. The impact pathways and potential impacts on xʷməθkʷəy̓əm rights are presented in this section as they are anticipated to occur *before* mitigation and offsetting measures are applied or considered.

### 5.1 xʷməθkʷəy̓əm's Approach to Assessing Impacts

This 19(4) Assessment follows the Methodology set out in Section 2, including a description of the categories of rights assessed. The Assessment builds upon the historical context and current condition for these xʷməθkʷəy̓əm Rights and Title presented in Sections 3 and 4. These Sections clearly demonstrate that rights occur throughout xʷməθkʷəy̓əm territory, including the LNG Expansion Project Site and entire Study Area (inclusive of the TMJ Project). This information is critical to characterize before assessing potential adverse impacts since "historical context is essential to a proper understanding of the seriousness of the potential impact" (*West Moberly First Nation v. British Columbia (Chief Inspector of Mines)*, 2011 British Columbia Court of Appeal 247).

In Section 4, each xʷməθkʷəy̓əm right is assessed for the direction of the trajectory of change and sensitivity to summarize this context. Table 3 summarizes the analysis. This 19(4) Assessment has underlined the high importance placed on the Fraser River, including Tilbury Island and its surroundings, by xʷməθkʷəy̓əm. The LNG Expansion Project Site and Study Area is core xʷməθkʷəy̓əm territory and continues to be important for fishing, hunting, cultural continuity, stewardship, plant harvesting, and health. Opportunities to practice rights throughout other portions of xʷməθkʷəy̓əm territory have been greatly diminished, particularly for terrestrial plant harvesting and hunting and trapping, so that fishing remains a core rights-based activity that continues to this day in the LSA (also see Musqueam Indian Band and the Firelight Group, 2022). Importantly, parts of the Tilbury Island shoreline are the few remaining natural shoreline areas in all xʷməθkʷəy̓əm territory available for habitat and terrestrial shoreline harvest, particularly in this part of the territory. As such, Tilbury Island and the surrounding area of the Fraser River have a greater importance for maintaining and strengthening xʷməθkʷəy̓əm rights and Title. It is also one of the last remaining areas where these rights can be protected (at the bare minimum) and re-built or strengthened.

This approach to characterizing baseline in consideration of cumulative effects means that xʷməθkʷəy̓əm is seeking to reach a higher standard in this Assessment than those undertaken by the Province of BC. However, xʷməθkʷəy̓əm believes this should be the shared objective of the Crown, BC, the Proponent and xʷməθkʷəy̓əm. xʷməθkʷəy̓əm is seeking to enhance and restore aquatic and foreshore habitat and working towards a positive trajectory of change. The work xʷməθkʷəy̓əm does in the Lower Fraser intends to have a positive impact on xʷməθkʷəy̓əm fishing rights. However, Section 4 of this Assessment has found a declining trajectory of change on this right and related rights and Section 5 presents the anticipated adverse impacts resulting from the proposed Project and the TMJ Project. Indeed, this higher standard is being sought through significant financial and time investment by xʷməθkʷəy̓əm, which is expected to have a direct positive impact on fish and fish habitat and, in turn, create more opportunities for xʷməθkʷəy̓əm fishing rights to be exercised.

This unique and sensitive historical context (Section 4.1) and the declining trajectory of change resulting from historic and ongoing adverse impacts (Section 4.2) are carried over to this section and used to assess impacts to xʷməθkʷəy̓əm rights and Title in the Study Area.

**This Section, Section 5, presents expected Project and TMJ Project impacts prior to mitigations,** with short introductions that summarize the current context. Sections 6 and 7 present the analysis of mitigation and offsetting measures and residual effects for both the LNG Expansion Project and the TMJ Project, including the removal of in-water related project activities and components for the LNG Expansion Project.

xʷməθkʷəy̓əm is following FortisBC's approach by applying a mitigation measure introduced in mid-2024 that has far-reaching implications for the impact analysis (see Limitations of Assessment in Section 2.8). At that time, FortisBC revised their Project components and activities, removing all direct in-water works during construction and replaced this entirely with on road vehicle transportation. This change is characterized by the Proponent as a mitigation measure. While xʷməθkʷəy̓əm does not agree that this should be framed as a mitigation measure, as it represents a significant change to the proposed Project, this 19(4) Assessment follows the same approach for ease of comparing conclusions.

## 5.2 Description of Project Components and Activities Before Mitigation

The main LNG Expansion Project components considered in this section are identified in the Proponent's draft Application (FortisBC 2024):

- The Tilbury Phase 2 LNG Expansion Project Detailed Project Description (2022); and
- Updated information provided in meetings with x̣ẉṃə̣θ̣ḳẉə̣ỵəm on January 18, 2023, and September 23, 2024.

It is critical to note that this was written prior to the final Application submitted to the EAO in February 2026. This Assessment was drafted when FortisBC identified the following as mitigation measures only:

- exclude all waterborne vessel delivery of modules and bulk construction materials during construction
- exclude all in-water works and the proposed Material off-loading Facility (MOF) described in the Detailed Project Description.

Residual effects will not include these and other pathways expected to result from these activities and works. See Section 1.2 Purpose and Section 2.8 Limitations for further explanation on reasoning for this approach.

The following Project components are considered to pose the greatest risk of adverse impact on x̣ẉṃə̣θ̣ḳẉə̣ỵəm Aboriginal Rights and Title:

- Approximately 50 large barges will bring construction material to site and additional smaller barges to deliver gravel, steel, and other more finished materials during construction phase for the 3-to-6-year construction period. Vessels are expected to travel from Sand Heads along the shipping channel of the south arm of the Fraser River to the Project Site;
- LNG Expansion facility Project Site to take up 13.1 hectares (ha) on site that will be operational for more than 60 years; and
- Flare technology which may be used when necessary during Project operations.

The TMJ Project is also being assessed in a more general way, as outlined in Section 2. The following components of the TMJ Project are considered to pose the greatest risk of adverse impacts on x̣ẉṃə̣θ̣ḳẉə̣ỵəm Aboriginal Rights and Title:

- Construction of the jetty, along with supporting infrastructure, and the temporary floating bunker berth with a footprint of up to 23 ha, and result in the removal of 460,000 m<sup>3</sup> of sediment from the Fraser River;
- Berthing, loading, departing, and associated activities of LNG carriers and bunkering vessels using the TMJ Project once in operation; and
- Light emissions occurring from both on-site fixed lighting and vessel lighting.

## 5.3 Identified Adverse Impacts and Impact Pathways

### 5.3.1 x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ Title

Several expected Project impacts with x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ Title are identified. x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ's Aboriginal Title category of right is defined by the ability to govern land use and decision-making across x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ territory, including the decision to locate where industrial projects should be permitted and not permitted. This Aboriginal Right to govern is central to the integrity of x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ's culture and identity and would, in turn, enable x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ to derive economic benefits from development on its lands and waters, including within the Study Area described in Section 2.4 within the boundaries of the 1976 Declaration.

A very significant portion of x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ territory is no longer accessible to x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ to exercise these rights, which has significantly restricted the ability to exercise all rights, including title rights. Access has been lost to Tilbury Island due to prior development and other change along the south arm of the Fraser River and across much of Tilbury Island. Despite this, the area remains important for x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ to exercise stewardship authority and responsibility for plant and animal harvesting, fishing, and other land and water uses.

The Project will contribute to the existing changes in the LSA including Tilbury Island. While x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ is largely alienated from this part of the core territory, x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ will be restricted from exercising the right to make decisions for how the LSA will be used, including for potential future economic benefit or restoration/stewardship of the LSA.

If constructed, the Project Site could permanently alienate x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ from use of more than 13.1 ha of the LSA and Tilbury Island. Alienation is expected to occur for (at minimum) the duration of the Project operations, until 2088 when it is proposed for decommissioning. It is likely that, following decommissioning, the same area may be used for similar industrial purposes, beyond 2088. Since the area of x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ core territory is already heavily impacted and x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ largely alienated from this area, the additional impact of the proposed Project on x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ Title is considered moderate.

x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ understands the requirement of FortisBC to site the Project in proximity to the existing LNG facility. It is important to underline that the original proponents of the plant at Tilbury Island did not consult with x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ, seek their consent, or discuss locations or other alternatives. To repeat, the process by which the original proponent selected the proposed Project location did not include x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ and therefore did not recognize x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ's inherent right, as stated in the 1976 Declaration, to governance, stewardship, and decision making within x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ's core territory:

*Our ancestors aboriginal and our aboriginal right, is to live up and travel over our aboriginal lands, seas and water without foreign control or restriction, to utilize, trade and consume all the resources and products of those lands, water and seas.*

*It is our right to govern ourselves and our communities, to up-hold and determine our own customs, beliefs and laws.*

The process followed by the federal Crown and Proponent effectively excluded x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ from making decisions related to the uses of the Fraser River and shoreline of Tilbury Island (e.g., reclamation, economic development, etc.). Financial and other losses caused by the

Project to x̣ṃəθḳẉəỵəm resulting from restricted access to marine economic opportunities at Tilbury Island, include, but are not limited to:

- Commercial harvest of sockeye salmon and other salmon species;
- Tourism from marine guide opportunities (i.e., fishing and cultural guiding); and
- Trade harvested resources with other Nations and other non-commercial economic values.

#### 5.3.1.1 *TMJ Project Interactions with x̣ṃəθḳẉəỵəm Title*

The construction and operation of the TMJ Project will negatively impact the ability of x̣ṃəθḳẉəỵəm to restore access and habitats to support rights-based activities in the future. This includes impediments to x̣ṃəθḳẉəỵəm's efforts to restore fish populations (Tam et al. 2018) and habitats along the Fraser River as well as barriers to x̣ṃəθḳẉəỵəm's intention to restore opportunities to hunt, trap, and gather in x̣ṃəθḳẉəỵəm territory (BC EAO 2022a, 30).

The Project will contribute to existing cumulative impacts in the LSA. While x̣ṃəθḳẉəỵəm is already alienated from much of this part of the core territory, x̣ṃəθḳẉəỵəm will continue to be restricted from exercising the right to make decisions on how the LSA will be used, including the area of the Fraser River that is likely to be directly and indirectly impacted by the TMJ Project and marine shipping components. The addition of the TMJ will restrict navigational access to those times when large construction vessels and operational LNG vessels are not using the navigable part of the river. This will effectively create an access and navigational closure for any potential future x̣ṃəθḳẉəỵəm use of this part of the Fraser River when large vessels are using the area. Similar effects are expected from loading and off-loading during construction and operation of the Project.

The TMJ Project will interact not only with the Project, but with existing pressures experienced by ongoing industrial and recreational activities taking place at the Study Area, including the LSA along the Fraser River.

#### 5.3.2 *Fishing*

As outlined in detail in Section 4, x̣ṃəθḳẉəỵəm have since time immemorial managed the Fraser River lands and waters and resources including fisheries for salmon, eulachon, sturgeon and other fish species through strong and clear legal protocols. x̣ṃəθḳẉəỵəm families lived in year-round and seasonal settlements along the river where they harvested and processed fish. These settlements were strongly connected to x̣ṃəθḳẉəỵəm economic, cultural, and social life. Fishing continues to play a central role in x̣ṃəθḳẉəỵəm life and plays an even more important role than in the past, due to limits placed on other rights by Crown-sanctioned activities. These ongoing exclusions means that fishing may no longer be a central part of all member's daily lives, despite the strong desire for fishing to be central to x̣ṃəθḳẉəỵəm life once again. Despite the importance of fishing, all salmon species, eulachon and sturgeon populations, and number of fish harvested has declined dramatically in the area. This fact, combined with severely restricted habitat, access, pollution, and safety on the water, has severely impacted x̣ṃəθḳẉəỵəm's ability to harvest fish.

The Project will further negatively impact x̣ṃəθḳẉəỵəm Fishing values by the following potential Project impacts:

*i. Avoidance of fishing during construction caused by increased disruption, exclusion and safety risks posed to xʷməθkʷəy̓əm fishers by construction activities, including increased volume of marine vessel traffic in the LSA and RSA;*

- Increased risks to xʷməθkʷəy̓əm fishers' safety and loss of gear while fishing and traveling on the water, due to increased volume of marine vessel traffic on the Fraser River;
- Disruption and exclusion from fishing activities, including water routes used for patrolling salmon gillnet fisheries, due to Project construction activities, including the increase of marine traffic, notably large barges and smaller vessels for the 3–6-year construction period;
- Disruption to xʷməθkʷəy̓əm fishers' ability to fish, particularly when the tide is coming in, due to overlapping vessel traffic creating wakes that creates safety risks;
- Interference with fishing activities from existing and increasing marine traffic due to Project construction activities, resulting in the loss of fishing equipment, reduced times spent fishing, and a decreased sense of enjoyment for xʷməθkʷəy̓əm members when fishing;
- Deterioration or loss of fishing areas and potential future fishing restoration sites within the LSA due to destruction of fish habitat, effects of increased marine traffic, noise, movement, dredging, and pollution associated with construction activities;
- Reduced duration and quality of time spent by xʷməθkʷəy̓əm fishers in fishing areas due to riverscape and landscape changes from Project infrastructure and the increase in marine vessel traffic; and
- Avoidance of fishing areas due to contamination of fishing resources from construction activities and increased marine vessel traffic.

*ii. Loss of use of fishing areas due to avoidance related to perceived deterioration of harvesting conditions, as well as fish and fish habitat, during construction;*

- Increased avoidance of fishing grounds upstream and downstream of Tilbury Island within the LSA due to perception of deteriorated ecological values during construction and operations to an extent that undermines the efficacy of harvesting at that location, with impacts likely to extend beyond the LSA for salmon species.

*iii. Displacement of xʷməθkʷəy̓əm current and future harvesters by the Project;*

- Changes to the Fraser River shoreline and landscape through Project construction activities (i.e., river training) will change current and future fishing grounds used by xʷməθkʷəy̓əm members.

### **5.3.2.1 TMJ Project Interactions with Fishing**

The proposed TMJ Project will further negatively impact xʷməθkʷəy̓əm Fishing values. **All of the expected impacts identified from the proposed Project outlined above, are also expected to occur because of the TMJ Project and are not repeated below.** Rather than

repeat these impacts, only those impacts and impact pathways unique to the TMJ Project are identified and described in the bullets below.

- i. *Avoidance of fishing during operations caused by increased disruption, exclusion and safety risks posed to xʷməθkʷəy̓əm fishers by the operational jetty and marine traffic in the LSA and RSA;*
  - Long-term avoidance of fishing due to deterioration, disruption, and loss of fishing areas for salmon, eulachon, steelhead, sturgeon and other species around the marine jetty and LSA due to ongoing presence of the jetty and marine shipping operations;
  - Increase in vessel traffic associated with the TMJ Project and the narrower navigational access around the jetty, alongside vessel sensory impacts and wakes, are expected to reduce sense of safety on the water within the LSA and project footprint;
- ii. *Loss of use of fishing areas due to avoidance related to perceived deterioration of harvesting conditions during construction and operations;*
  - Long-term avoidance of fishing areas around the marine jetty due to concerns about the TMJ Project's contribution to the cumulative deposition of contaminants that could affect the quality of harvested foods and the ecosystem (BC EAO 2022a, 528), including as a result of dredging of up to 21 ha area of sediment for the TMJ Project; and
  - Permanent loss of fishing area, and related fish spawning habitat and holding areas in the Project Site due to Project construction.
- iii. *Disruption and/or interruption of migration and shoreline movement of fish species, with resulting effects on quantity and quality of resource and health for supporting the exercise of xʷməθkʷəy̓əm current and future rights within the Project Site with implications for the RSA (i.e., xʷməθkʷəy̓əm territory).*
  - Disruption of salmon migration routes and lifecycles along shoreline at valuable spawning areas and holding areas in the TMJ Project Site from the construction, operation, and physical barriers imposed by the jetty (BC EAO 2022a, 704);
  - Disruption of eulachon migration route in the Fraser River from construction, operation and barriers imposed by the marine jetty proposed in the TMJ Project and marine shipping (BC EAO 2022a, 26);
  - Disruption of white sturgeon movement and feeding along the Fraser River including spawning areas and hold areas around the marine jetty proposed in the TMJ Project used during migration from construction, operation and barriers imposed by the marine jetty infrastructure and marine shipping (BC EAO 2022a, 26);
  - The increase in large vessel traffic from construction and operations activities for the TMJ Project will disturb species such as sturgeon and springs that are attracted to slow-moving shoreline habitats around the marine jetty, which could result in avoidance of this area which could negatively impact their spawning activities (BC EAO 2022a, 26); and

- Concerns related to activities such as pile-driving and dredging, which could cause vibration, noise, sedimentation, and riverine changes, could affect fish behaviour and mortality (BC EAO 2022a, 26; Tam et al. 2018).

iv. *Avoidance effects during operations caused by increased disruption, exclusion and safety risks posed to xʷməθkʷəy̓əm fishers by increased volume of marine vessel traffic associated with the TMJ Project on the Fraser River;*

- Increased risks to xʷməθkʷəy̓əm fishers' safety and loss of gear while fishing and traveling on the water, due to increased volume of marine vessel traffic on the Fraser River, vessel transit route, and introduction of larger vessel sizes and types (LNG carrier);
- Increased avoidance by xʷməθkʷəy̓əm fishers of certain fishing techniques (i.e., driftnets) due to increased volume of marine vessel traffic on the Fraser River, vessel transit route, and introduction of larger vessel sizes and types;
- The increase of marine vessel traffic around the TMJ Project will conflict in space and time with xʷməθkʷəy̓əm fishing activities, including the use of water routes used by xʷməθkʷəy̓əm fishers for patrolling salmon gill net fisheries;
- Increased avoidance of areas around the TMJ Project and the marine vessel route on the Fraser River due to decrease fishing efficiency as a result of changes in fish quantity and behaviour caused by vessel traffic (Tam et al. 2018);
- Loss of fishing opportunities around the TMJ Project and on the Fraser River due to the increase of vessel traffic, noise, movement, light, pollution as well as any additional activities (e.g., anchoring or mooring while waiting to berth in Salish Sea); and
- Increased risk of accidents and malfunctions (i.e., vessel strike, grounding, accidental discharge, etc.) could result in xʷməθkʷəy̓əm fishers avoiding certain areas around the TMJ Project and in the Fraser River where vessel traffic occurs. It is important to note here that risk of accidents and malfunctions are commonly underestimated by proponents and the Crown who often place more weight on likelihood over magnitude in the risk equation. For xʷməθkʷəy̓əm, any high magnitude risk should be given greater weight.

v. *Changes in harvested resource populations by increased volume of marine vessel traffic associated with the TMJ Project on the Fraser River;*

- Decreased fish quantity and quality along the Fraser River due to pollution and potential accidents from marine vessel traffic to and from the marine jetty; and
- The potential impacts of TMJ-related shipping on SRKW, or ḡəłʔaləməcən, could lead to an increase in seal and sea lion populations, which could result in a reduction in salmon quantity (BC EAO 2022a, 19).

### 5.3.3 River Shoreline and Terrestrial Plant Harvesting

As outlined in detail in Section 4, plant harvesting is an important practice and resource for x̣ṃəθḳẉəỵəm members. Plants are central to ceremony, medicine, art, and culture, and provide a source of nutrition. Similar to management of fishing areas, productive berry picking areas were managed by x̣ṃəθḳẉəỵəm families to ensure sustainable harvest. Industrialization along the Fraser River shoreline and Tilbury Island has resulted in a loss of harvesting areas for x̣ṃəθḳẉəỵəm members, loss of access to remaining sites, and the quality and abundance of plant species declining.

The Project Site and immediate vicinity is already alienated from x̣ṃəθḳẉəỵəm river shoreline and terrestrial plant use. However, this area of the river is used for navigation and connects x̣ṃəθḳẉəỵəm to other areas used to harvest plant species. As such, the Project will further impact River Shoreline and Terrestrial Plant Harvesting values by the following expected Project impacts:

- i. *Loss of use of plant harvesting areas due to avoidance related to navigational risks and sense of safety concerns, during construction:*
  - Avoidance of plant harvesting sites upstream from Tilbury Island along the Fraser River due to sense of safety barriers resulting from construction activities;
  - Sense of deteriorating harvesting conditions and decline in the quality of x̣ṃəθḳẉəỵəm members experiences when harvesting; and
  - Increased sense of risk associated with harvesting due to potential for accidents and malfunctions (i.e., vessel strike, grounding, accidental discharge, LNG transfer, etc.).

#### 5.3.3.1 TMJ Project Interactions with River Shoreline and Terrestrial Plant Harvesting

The proposed TMJ Project will further negatively impact x̣ṃəθḳẉəỵəm River Shoreline and Terrestrial Plant Harvesting values. **All of the expected impacts identified from the proposed Project outlined above, are also expected to occur because of the TMJ Project and are not repeated below.** Rather than repeat these impacts, only those impacts and impact pathways unique to the TMJ Project are identified and described in the bullets below.

- i. *Loss of use of plant harvesting areas due to avoidance related to perceived or real navigational barriers and/or safety concerns, during operations:*
  - Avoidance of plant harvesting sites upstream from Tilbury Island along the Fraser River due to reduced boat access to harvesting sites and decreased sense of safety in the water;
  - Avoidance of plant harvesting sites upstream from Tilbury Island along the Fraser River due diminishing the quality of x̣ṃəθḳẉəỵəm members experiences when harvesting resulting from the increased sensory impacts from vessel traffic and jetty operations and increase in perceived risks to shoreline, sediment, and water contamination from operations; and
  - Increased risk of accidents and malfunction (i.e., vessel strike, grounding, accidental discharge, etc.) is likely to result in x̣ṃəθḳẉəỵəm harvesters avoiding shoreline

harvesting areas around the TMJ Project where vessel traffic occurs among other psycho-social impacts.

#### 5.3.4 Hunting

As outlined in detail in Section 4, the Fraser River delta is historically and currently an area for x̣ẉṃə̣θ̣ḳẉə̣ỵəm hunting and trapping, attracting a variety of game along the Pacific flyway, though impacts on birds due to pollution, government hunting restrictions, and habitat destruction have all contributed to reduction in harvesting these species. x̣ẉṃə̣θ̣ḳẉə̣ỵəm once harvested large land mammals in the Study Area, but these practices have been severely restricted due to the industrialization and urbanization of the territory.

The Project will further impact x̣ẉṃə̣θ̣ḳẉə̣ỵəm Hunting values by the following expected Project impacts:

- i. *Effects on availability of animals, abundance and health within the LSA caused by the construction and operation of the Project;*
  - Disruption of movement and other behavior from waterfowl from increased lighting and noise from the Project, such as noise from construction vessels, pile driving, and LNG transfer during operations associated with the Project leading to concerns in reduction in availability of harvested species in the LSA;
  - Risk of increased mortality of waterfowl from potential collisions with Project infrastructure and the increased lighting from the Project leading to concerns of reduction in abundance of hunted species in the RSA; and
  - Avoidance of hunting in the LSA due to reduced sense of safety and concerns about deterioration in quality of habitat, deterioration of health and abundance of waterfowl, and increased contamination in animal tissue.

##### 5.3.4.1 TMJ Project Interactions with Hunting

The proposed TMJ Project will further negatively impact x̣ẉṃə̣θ̣ḳẉə̣ỵəm Hunting values. **All the expected impacts identified from the proposed Project outlined above, are also expected to occur because of the TMJ Project and are not repeated below.** Rather than repeat these impacts, only those impacts and impact pathways unique to the TMJ Project are identified and described in the bullets below.

- i. *Displacement of x̣ẉṃə̣θ̣ḳẉə̣ỵəm current and future harvesters by the Project;*
  - Avoidance of hunting grounds due to diminished sensory experience and reduced enjoyment caused by construction activities and the physical footprint of the Project; and
  - Loss of boat access to hunting grounds due to diminished sense of safety on the water.

### 5.3.5 Cultural Continuity

As outlined in detail in Section 4, the Fraser River, and all x̣ṃəθḳẉəỵəm territory, is deeply entwined with x̣ṃəθḳẉəỵəm oral histories, cultural identity, and position in historical trade network. As stated previously, culture is the essence of who x̣ṃəθḳẉəỵəm is and informs how x̣ṃəθḳẉəỵəm members understand the world around them. Culture is reflected in how x̣ṃəθḳẉəỵəm members live out every aspect of their lives, and therefore any negative impact other rights will also likely have an impact on culture and, in turn, cultural continuity for x̣ṃəθḳẉəỵəm. x̣ṃəθḳẉəỵəm has a rich history in the territory, for example, multiple villages were once located along the shores of the Fraser River and used as seasonal and permanent harvesting camps, habitation areas and burial grounds and continue to be visited by members today. x̣ṃəθḳẉəỵəm has continuously used the river for fishing of salmon, eulachon, sturgeon, and other resources. Industrialization and urbanization along the Fraser River, including increases in vessel traffic, has made some historical harvesting knowledge no longer applicable, increasing concerns regarding sense of safety for harvesters, and changed sense of safety and availability in culturally important species. This all impacts x̣ṃəθḳẉəỵəm members' ability to not only exercise their harvesting rights, but also to pass on generational knowledge and alienate members from x̣ṃəθḳẉəỵəm territory by severing their sense of place and connection to the landscape and riverscape.

The Project will further impact x̣ṃəθḳẉəỵəm Cultural Continuity values by the following expected Project impacts:

- i. *Decline in knowledge transfer due to decreased sense of safety to access and use lands and waters critical to cultural continuity, including harvesting areas, and likely resulting x̣ṃəθḳẉəỵəm avoidance of the Project Site and likely the LSA during construction;*
  - Decline in use areas to transfer x̣ṃəθḳẉəỵəm knowledge due to decreased sense of safety in the Project Site and LSA due to the increase in construction-related vessel traffic and related sensory disturbance from traffic and on-land construction for entire duration of Project construction; and
  - Even a few years of disruption to knowledge transfer, including ceremonial and spiritual practices, may lead to longer term impacts on overall x̣ṃəθḳẉəỵəm cultural continuity.
- ii. *Indirect effects on continuity of food harvesting and processing knowledge from disruption and displacement from plant harvesting, navigation, food processing, and fishing areas for duration of Project construction;*
  - Disruption and constraint in accessing fish harvesting areas due to barriers to access, resource availability changes, and displacement due to vessel traffic during construction; and
  - Impacts on x̣ṃəθḳẉəỵəm members' ability to trade harvested plant and fish resources with other nations and the protocols and practices that are associated with trade for duration of Project construction, which may lead to longer term impacts on overall x̣ṃəθḳẉəỵəm cultural continuity.

#### 5.3.5.1 TMJ Project Interactions with Cultural Continuity

x̣ṃəθḳẉəỵəm Cultural Continuity values will be further impacted by the following potential interactions with the TMJ Project. **All the expected impacts identified from the proposed Project outlined above, are also expected to occur because of the TMJ Project and are not repeated below.** Rather than repeat these impacts, only those impacts and impact pathways unique to the TMJ Project are identified and described in the bullets below.

- i. *Decline in knowledge transfer for duration of Project construction and operations due to x̣ṃəθḳẉəỵəm avoidance of the Project Site and LSA);*
  - Decreased sense of safety on the water and perceived risks associated with quality and quantity of resources, resulting from increases in vessel traffic, physical constraints from the jetty, sensory disturbance and access restrictions from various activities, and concerns regarding risks of Project activities (e.g. LNG transfer) are expected to result in avoidance;
  - Loss of x̣ṃəθḳẉəỵəm knowledge transfer due to avoidance of x̣ṃəθḳẉəỵəm members to the TMJ Project Site and parts of the LSA (BC EAO 2022a, 438);
  - Decrease sense of safety and abundance in fish populations across the LSA is expected to result in further declines in x̣ṃəθḳẉəỵəm opportunities to teach the next generation about fishing on and off the river, which have already been severely affected by low populations of fish species (BC EAO 2022a, 438);
  - Disruption and constraint of ceremonial and spiritual practices that depend upon access to river resources, shoreline areas, and heritage sites such as village sites and camping areas;
  - Avoidance of x̣ṃəθḳẉəỵəm harvesters from areas around the TMJ Project Site and the LSA are due to concerns about the risks of accidents or malfunctions from TMJ Project activities, which would restrict the ability of x̣ṃəθḳẉəỵəm members to transfer knowledge (Tam et al. 2018); and
  - Impacts on x̣ṃəθḳẉəỵəm members' access to the TMJ Project Site will result in decreased knowledge transfer, with the presence of larger ships and construction activities deterring specifically younger generations from the area (B.C. EAO 2022a, 438). Where that chain of knowledge is broken, i.e. through the knowledge holder passing, that knowledge may never be recovered.
- ii. *Disruption of x̣ṃəθḳẉəỵəm cultural connection to cultural landscape and riverscape of the Project Site and LSA;*
  - Disruptions to x̣ṃəθḳẉəỵəm members' sense of place, identity, and spirituality due to displacement from Tilbury Island by the marine jetty, exclusion from portions of the LSA during fish harvesting times (i.e., during construction vessels movement and use, and when LNG vessels are at the site at the same tide cycle), exclusion from camping and old village sites and restrictions to traditionally used water routes to access x̣ṃəθḳẉəỵəm territory; and

- Disruptions to xʷməθkʷəy̓əm members' sense of place from the increase in noise from construction activities for the marine jetty (Tam et al. 2018), and likely resulting from other sensory disturbance.
- vi. *Impacts to SRKW from the TMJ-related vessel traffic in the Fraser River and in the Salish Sea will result in impacts to xʷməθkʷəy̓əm's members ability to transfer knowledge and oral histories;*
- Impacts from the TMJ Project on SRKW from increased vessel traffic has the potential to disrupt xʷməθkʷəy̓əm's cultural continuity as their absence will weaken the connection of xʷməθkʷəy̓əm members to their cultural identity due to SRKW holding a significant place in xʷməθkʷəy̓əm (BC EAO 2022a, 27); and
  - Impacts on SRKW from the increased vessel traffic associated with the TMJ Project will reduce the number of knowledge transfer opportunities for xʷməθkʷəy̓əm fishers by disrupting fishing practices in the LSA and RSA. As mentioned in section 4.3.6, SRKW influence the timing of fish runs in the Fraser River and any changes to the timing of fish runs will disrupt the transmission of traditional fishing knowledge (BC EAO 2022a, 27).

### 5.3.6 Health

As outlined in detail in Section 4, xʷməθkʷəy̓əm members understand health holistically – as encompassing biological, psychological, social, spiritual, and cultural dimensions, all of which are deeply rooted in relationships with land, water, culture, and community. As described earlier, this holistic and intersectional understanding of health is critical to the consideration of potential adverse health impacts from the Project. The potential interactions with all other categories of rights addressed in this 19(4) Assessment – in particular, those relating to food harvesting and cultural continuity – have direct and compounding implications for xʷməθkʷəy̓əm health and wellbeing both currently and into the future.

The integrity of these rights is therefore central to understanding the baseline conditions of xʷməθkʷəy̓əm health, how they have historically been affected, their current status, and how they stand to be affected by new developments on their territory. The ability to freely harvest, prepare, and share traditional foods, to access culturally safe healing and ceremonial spaces, and to maintain strong, culturally grounded social cohesion through autonomous and self-determining cultural practices are all vital contributors to collective community health. Generations of colonial policies and land dispossession through urbanization, industrialization, and the reserve system, have severely undermined the ability of xʷməθkʷəy̓əm people to freely express their inherent right to maintain holistic health through Indigenous wellness systems as discussed in Section 4.2.7.

It is anticipated that the Project will further impact xʷməθkʷəy̓əm Health values by the following expected Project impacts:

- i. *Impacts on mental, emotional, and psychological wellbeing from cumulative sensory disturbances, risks to health and safety, and interruptions to healing pathways in the RSA;*
- Increased stress, anxiety, and psychological burden due to changes in noise, air, smell, and visual landscapes from Project construction and operations that alter the sensory experience of being on the land and water;

- Disruption of the restorative and healing effects of land and water-based activities due to diminished integrity of the water and land;
  - Mental and emotional distress caused by both real and perceived risks to health and safety, including fears of contamination of fish, plants, and water, potential vessel accidents or spills, and long-term environmental degradation; and
  - Experiences of grief, loss, and re-traumatization associated with further disturbance of culturally significant places, reinforcing long-standing legacies of colonial exclusion from territory-based practices and undermining feelings of autonomy, safety, food sovereignty, and dignity while exercising rights.
- ii. *Reduced food security and negative impacts on nutrition and dietary health due to decreased access to traditional resources in the LSA and Project Site;*
- Loss of, or diminished availability of, key traditional foods such as salmon, sturgeon, eulachon, berries, and medicinal plants due to habitat degradation, reduced access, and avoidance of harvesting areas during construction and operation; and
  - Interference with the meaningful exercise of x̣ẉṃə̣θ̣ḳẉə̣ỵəm's Aboriginal Right to fish and hunt for FSC purposes, including impacts on the safety, accessibility, and quality of fishing experiences that support not only physical nourishment, but also social cohesion, cultural continuity, and holistic health.
- iii. *Negative impacts on community healing and recovery efforts due to constraints on territory-based healing practices, ceremonies, and wellness activities that are widely understood within the community as essential to addressing intergenerational trauma;*
- Reduced opportunities for youth and families to engage in harvesting and cultural practices that support identity formation, knowledge transmission, and long-term wellbeing; and
  - Increased difficulty reversing existing negative health trajectories, as ongoing disturbance and restrictions further limits the remaining spaces and conditions necessary for recovery, resurgence, and future resilience.

#### 5.3.6.1 TMJ Project Interactions with Health

x̣ẉṃə̣θ̣ḳẉə̣ỵəm Health values will be further impacted by the following potential interactions with the TMJ Project. **All the expected impacts identified from the proposed Project outlined above, are also expected to occur because of the TMJ Project and are not repeated below.** Rather than repeat these impacts, only those impacts and impact pathways unique to the TMJ Project are identified and described in the bullets below.

- i. *Indirect effects on food security from disruption and displacement from plant harvesting and fishing areas in the Project Site and LSA, with implications for the RSA;*
- Disruption and constraint of fish harvesting areas and restriction on x̣ẉṃə̣θ̣ḳẉə̣ỵəm fisher movement to access other harvesting areas on either side of the marine jetty and vessels associated with the TMJ Project due to barriers to access, resource availability changes, and displacement.
- ii. *Impacts on psychological and emotional well-being of x̣ẉṃə̣θ̣ḳẉə̣ỵəm members, diminishing feelings of enjoyment during participation in traditional and cultural activities;*

- Increased vessel traffic in the LSA is expected to surpass members' comfort threshold and reduce their feelings of safety when in the river, resulting in severe impacts for the quality of xʷməθkʷəy̓əm's experience while undertaking rights-based activities (BC EAO 2022a, 27);
- Increased vessel traffic is expected to further restrict access for xʷməθkʷəy̓əm fishers by limiting river access, heightening safety concerns, and causing emotional stress due to the uncertainty of potential accidents or malfunctions which could disrupt the protection, persistence, and living of xʷməθkʷəy̓əm šxwtəhim̓ (i.e., ways, manners, and customs) and snəwəyət̓ (i.e., teachings received since childhood, including identity and responsibilities) (B.C EAO 2022a, 27); and
- Increased vessel traffic is expected to reduce opportunities for the preparation and consumption of traditional foods, as well as for xʷməθkʷəy̓əm members to engage in other traditional activities, potentially leading to increased emotional and psychological stress (B.C EAO 2022a, 27).

5.4 Summary of Potential Adverse Interactions Between the Project and xʷməθkʷəy̓əm Rights

Table 4: Assessment of the severity of impacts on each xʷməθkʷəy̓əm right before mitigation measures are put in place.

| Category of Right  | Right Sub- Component                                                                                                                         | Indicators                                                                                                                                                                                                                                                              | Impact pathway                                                                                                                                                                                                                                                                                                    | Context for Practice of Right(s) | Magnitude | Geographic Extent | Reversibility        | Duration    | Likelihood | Overall Severity of Impact before Mitigation |

#### 5.4.1 Potential Effects from the LNG Expansion and TMJ Projects Combined

As demonstrated above, the LNG Expansion Project is predicted to have an overall high impact on x̣wməθḳwəỵəm Title, moderate impact to Cultural Continuity, River Shoreline and Terrestrial Plant Harvesting, Fishing, and Health, and a low impact on Hunting. However, when the LNG Expansion Project is viewed with the TMJ Project and in the RSA, these predicted impacts are underestimated. The overall impacts x̣wməθḳwəỵəm members will experience on their rights in

the future are expected to be higher, if both projects are to move ahead. Specifically, the marine vessel traffic is proposed to increase throughout the construction and operation phases of the TMJ Project, which will have a cumulative effect on Title, Fishing, River and Terrestrial Shoreline Harvesting, Hunting, Cultural Continuity, and Health. As xʷməθkʷəy̓əm members have already indicated, more vessels will be within the river system which can cause access constraints on members' ability to travel to harvesting areas at preferred times, and in turn impacts their ability to transfer knowledge.

As demonstrated, assessing the LNG Expansion and TMJ projects individually does not accurately reflect the severity of the potential impacts on xʷməθkʷəy̓əm rights. As noted above, xʷməθkʷəy̓əm believes that excluding the TMJ Project and the RSA from consideration when predicting impacts of the LNG Expansion leads to an underestimation of effects, as when considered interdependently, more substantial impacts are predicted to occur.

Additionally, with the increase in marine vessel traffic and shoreline development along the Lower Fraser and throughout the RSA when considering reasonably foreseeable developments, there is expected to be even further negative impacts to xʷməθkʷəy̓əm fishing within the Fraser River and Salish Sea, resulting from declines in sense of safety on the water, decrease in confidence in quality and quantity of harvested resources, and perceived risks of accidents and malfunctions. Such cumulative effects have not been systematically assessed in this Assessment, but xʷməθkʷəy̓əm remains seriously concerned about these impacts.

## 6. Evaluation of Effectiveness of Proposed Mitigation and Offsetting Measures

### 6.1 Approach to Evaluating Effectiveness of Proposed Mitigation and Offsetting Measures

This Section presents a set of draft mitigations and offsetting measures for each of the Project-specific effects identified in Section 5. The purpose of this Section is to determine the level of certainty in the effectiveness of proposed mitigation and offsetting measures for reducing predicted levels of adverse Project-specific effects on xʷməθkʷəy̓əm rights. Where there is uncertainty in respect to the likelihood of the effectiveness in proposed mitigation and offsetting measures, the analysis assumes a reduction in the estimated effectiveness of the proposed measures.

Specifically, the approach used to determine confidence considered the following factors:

- The degree of information and evidence provided to demonstrate efficacy of a proposed mitigation or offsetting measure in similar environments for similar project impacts and general expert and community support for these measures to justify the selection;
- The level of detail about the measures outlined in any plan (e.g. a plan for a plan is considered to have low confidence);
- The level of resourcing committed to implement the mitigation or offsetting measure;
- The effectiveness of a monitoring program to identify and measure a potential project effect; and

- The linkage between the monitoring results and commitment to adapt/update a measure in circumstances where effects are identified.

This approach is keeping with the following observations from the Federal Court of Appeal in *Taseko v. Minister of Env 2017 FCA*:

*It was reasonable for the Panel not to accept Taseko’s “vague assurances” that it would engage in adaptive management in order to deal with adverse environmental effects. The Panel sought information on environmental effects and mitigation measures, and Taseko refused to provide this information. It was entirely reasonable, and in line with the Panel’s (reasonable) interpretation of the precautionary principle, for the Panel to conclude that the concentration of water quality variables in Fish Lake (Teztan Biny) and Wasp Lake would likely be a significant adverse environmental effect. Indeed, acceptance of vague adaptive management schemes in circumstances such as these would, in my view, tend to call into question the value of the entire review panel process – if all such decisions could be left to a later stage, then the review panel process would simply be for the sake of appearances.<sup>7</sup> (emphasis added)*

The proposed Proponent mitigation measures for the Project are drawn from Appendix A – Summary of Mitigation Measures of the Environmental Assessment Certificate Application (FortisBC 2026). It is critical to note that this was written prior to the final Application submitted to the EAO in February 2026. This Assessment was drafted to include Appendix A mitigations and these mitigation measures:

- exclude all waterborne vessel delivery of modules and bulk construction materials during construction
- exclude all in-water works and the proposed Material off-loading Facility (MOF) described in the Detailed Project Description.

As noted in Section 2.8 Limitations, this Assessment does not include BC EAO’s draft conditions shared in February 2026. See Section 2.8 for further reasoning.

xʷməθkʷəy̓əm has an agreement with FortisBC with respect to this Project. This is not considered a mitigation measure in this Assessment.

For the TMJ Project, the BC EAO Assessment Report (BC EAO 2024a), Schedule B of the EAC #T24-01 (BC EAO 2024b), and the Decision Statement Issued under Section 54 of the Canadian Environmental Assessment Act, 2012 (Impact Assessment Agency of Canada 2024) are incorporated.

Table 6 identifies the related percentages for the qualitative descriptors used to estimate the likely effectiveness of proposed mitigation and follow up measures to eliminate or reduce predicted impacts in Table 7 and have been carried over to Table 8.

*Table 6: Qualitative descriptors used in Table 7 and 8.*

| Percentage | Qualitative Descriptors |

The estimated likelihood that proposed mitigation measures for the LNG Expansion Project identified in Table 6 will reduce or eliminate the predicted impacts for each category of right was found to be negligible for xʷməθkʷəy̓əm Title, high for Fishing, moderate for River Shoreline and Terrestrial Plant Harvesting, moderate for Hunting, moderate for Cultural Continuity, and moderate for Health. This is largely the result of measure to remove all waterborne deliveries of modular components or construction materials to the Project Site, and elimination of the proposed materials offloading facility. Direct in-water impacts from construction vessels has been removed. However, sensory disturbance, shoreline habitat removal, and perceived risk associated with Project construction and operations remain with few measures proposed that demonstrate likelihood of reducing or eliminating predicted impacts.

## 6.3 TMJ Mitigation Measures Evaluation

This Section provides an overview of the TMJ Project's mitigation measures, assessing them based on their level of confidence, and concludes by examining how these measures, in combination with the mitigation measures proposed for the LNG Expansion Project, aim to address and mitigate the potential effects of both projects. x̣ẉṃə̣θ̣ḳẉə̣ỵəm have included this as the artificial splitting of the projects does not align with the impacts and effects of the projects. The artificial splitting creates a false perspective of impacts.

### 6.3.1 x̣ẉṃə̣θ̣ḳẉə̣ỵəm Title

As discussed in Section 5.1.1.1, the TMJ Project would negatively interact with x̣ẉṃə̣θ̣ḳẉə̣ỵəm Title and the ability for x̣ẉṃə̣θ̣ḳẉə̣ỵəm to exercise the right to make decisions about the lands and waters in x̣ẉṃə̣θ̣ḳẉə̣ỵəm territory. No mitigation measures related to these effects were proposed as part of the TMJ IA Process.

Given that correspondingly, for the LNG Expansion Project, no mitigation measures were proposed, there is **high confidence** that effects to x̣ẉṃə̣θ̣ḳẉə̣ỵəm Title for both projects **will not be effectively mitigated**.

### 6.3.2 Fishing

Section 5.1.2.1 discusses TMJ Project interactions with x̣ẉṃə̣θ̣ḳẉə̣ỵəm Fishing. The following mitigation measures committed to by the Proponent that are most relevant to x̣ẉṃə̣θ̣ḳẉə̣ỵəm Fishing include:

- Develop a Marine Communication Management Plan that will include procedures for Proponent communication with Indigenous Groups and other marine users;
- Site Management, Erosion and Sediment Control Plan, which would include measures to prevent erosion, sedimentation and effects to the aquatic environment;
- In-water Works Management Plan, which would describe mitigation measures, including conducting in-water works during the DFO fisheries reduced-risk work window (16 July – 28 February) to the extent possible; however, in the event that in-water works extended beyond this window, the Proponent would consider additional mitigations (this would be done in a post-IA setting in consultation with Indigenous groups and DFO, to protect fish during sensitive life stages); the implementation of underwater noise mitigation, as well as water quality monitoring to reduce effects to water quality and aquatic life;
- Fish Habitat Offset Plan, to offset the harmful alteration, disruption or destruction of fish habitat of fish habitat (HADD) due to TMJ footprint disturbance;
- Dredging Management Plan, which would include water quality monitoring and dredging practices to ensure dredging practices minimize effects to the aquatic environment;
- Using side scan sonar for sturgeon detection and develop additional mitigations as a result of monitoring;

- Identifying acoustic and vibratory fish deterrent measures to reduce entrainment and harm risk for sturgeon;
- Seasonal restriction of hydraulic suction and clamshell dredging to avoid entrainment of juvenile salmonids and eulachon;
- Use of dredging practices that minimize the release of suspended sediments to the water column;
- Minimize underwater noise generation activities by using vibratory pile driving, ramp up techniques, and applying injury noise thresholds for fish;
- Develop a Vessel Traffic Management Plan for vessels calling at TMJ to follow the mitigations of maintaining a speed no greater than 10 knots within the Fraser River when safe to do so, follow established routes, regularly clean propellers; and
- Develop a CEMP, Operations Environmental Management Plan (OEMP), and Decommissioning Environmental Management Plan (DEMP) to identify how mitigation measures will be implemented for the following items: lighting management, noise and vibration management, surface water management, and scour protection management.

There is a moderate certainty that a Marine Communications Plan developed closely with xʷməθkʷəy̓əm will have the ability to reduce impacts on xʷməθkʷəy̓əm fishing. This is largely an untested mitigation and will have to be utilized practically by both parties on an ongoing basis in order to be fully effective. Similarly, there is moderate certainty regarding the In-Water Works Management Plan's effectiveness on reducing the impacts to fish and fish habitat particularly concerning the following of DFO fisheries reduced-risk work windows, as xʷməθkʷəy̓əm knowledge about fish behaviours may differ from DFO's established reduced-risk work windows. In addition, the remaining standard mitigation measures related to construction and ongoing operations on average would have a moderate effectiveness, given the inherent risks to fish and fish habitat, and the high potential for xʷməθkʷəy̓əm fishers to continue to avoid the TMJ Project area due to perceived risks.

Considering both the LNG Expansion and TMJ projects mitigations, **the effectiveness of mitigations proposed for Fishing is estimated to be moderate.**

### 6.3.3 River Shoreline and Terrestrial Plant Harvesting

The following mitigation measures are committed to by the Proponent:

- A Dredging Management Plan to mitigate potential adverse effects to the bed of the Fraser River caused by dredging during construction and operations;
- Develop a Vessel Traffic Management Plan for vessels calling at TMJ to follow the mitigations of maintaining a speed no greater than 10 knots within the Fraser River when safe to do so, follow established routes, regularly clean propellers;
- Develop a Marine Communication Management Plan that will include procedures for Proponent communication with Indigenous Groups and other marine users; and

- Vessels and other equipment involved in pile driving and construction activities will be positioned in a manner that will prevent damage to the riverbed and foreshore.

The mitigations proposed relate mainly to plans managing vessel traffic or activities within the Fraser River; however, as currently proposed would be estimated to have low effectiveness as x̣ẉṃə̣θ̣ḳẉə̣ỵəm members are likely to continue to avoid plant harvesting sites in the area due to declines in quality of experience and increase in perceived risk associated with Project construction and operations.

Considering both projects together, there is an estimated **low to moderate effectiveness of the combined mitigation measures** to reduce impacts on River Shoreline and Terrestrial Plant Harvesting.

#### 6.3.4 *Hunting*

For Hunting, the following most relevant mitigation measures are committed to by the Proponent:

- Develop light, noise and air quality management measures in the CEMP, OEMP, and DEMP to reduce visual impacts to experiential aspects of gathering, hunting and trapping at the TMJ; and
- Implement atmospheric monitoring programs for dust and stack emissions and noise monitoring.

Mitigations proposed for Hunting are estimated to have a low effectiveness, given inherent loss of habitat for and increase in marine traffic, and the potential for the continued disruption of waterfowl and other animals' movement and behaviours despite light, noise, and air quality management measures in the CEMP.

Considered jointly, the proposed mitigations for both projects would have a **low to moderate effectiveness** at reducing impacts to Hunting.

#### 6.3.5 *Cultural Continuity, including Sense of Place*

In Section 5.1.5.1, potential TMJ Project interactions are discussed. The following mitigation measures have been committed to by the Proponent in relation to Cultural Continuity:

- Timing construction activities to avoid commercial salmon fishery openings;
- Marine Communication Management Plan, developed in Crown consultation with Indigenous Groups, and include measures to reduce effects to marine navigation, marine access/ use, and commercial and recreational Indigenous fishers as well as traditional use activities, that include fishing for FSC or domestic purposes;
- Develop light, noise and air quality management measures in the CEMP, OEMP, and DEMP to reduce visual impacts to experiential aspects of gathering, hunting and trapping at the TMJ Project;
- Marine Mammal Management Plan, including measures to reduce underwater noise and monitoring at the TMJ Project;

- Develop a CEMP, OEMP, and DEMP to identify how mitigation measures will be implemented for the following items: lighting management, noise and vibration management;
- Develop a CEMP, OEMP, and DEMP to identify wildlife and wildlife habitat management and monitoring; and
- Develop a CEMP, OEMP, and DEMP to identify emergency response and spill prevention.

As many of the impact pathways on Cultural Continuity are intangible and relate to sense of place and are inherent to the project and its activities, the mitigations above for the TMJ Project are estimated to have low effectiveness.

In light of both the LNG Expansion and TMJ project's mitigations considered together, there is an estimated **low effectiveness** to reduce impacts on Cultural Continuity.

#### 6.3.6 Health

The following mitigation measures are committed to by the Proponent for Health:

- Develop an Air Quality Management Plan for Construction and Operations in the Marine Terminal Area;
- Timing construction activities to avoid commercial salmon fishery openings;
- Marine Communication Management Plan, developed in Crown consultation with Indigenous Groups, and include measures to reduce effects to marine navigation, marine access/ use, and commercial and recreational Indigenous fishers as well as traditional use activities, that include fishing for FSC or domestic purposes; and
- Develop light, noise and air quality management measures in the CEMP, OEMP, and DEMP to reduce visual impacts to experiential aspects of gathering, hunting and trapping at the TMJ.

Many of the impacts to health for the TMJ Project relate to psychological impacts and impacts to emotional wellbeing of x̣ṃəθḳẉəỵəm members, including feelings of enjoyment while on the lands and waters which the committed to mitigation measures only address peripherally. Therefore, considering the combined TMJ and LNG Expansion projects and their mitigation measures, a **low effectiveness** is estimated to reduce impacts to Health.

Overall, the evaluated likelihood of the TMJ Project mitigation measures to reduce or remove effects to the categories of x̣ṃəθḳẉəỵəm rights is as follows: Negligible for x̣ṃəθḳẉəỵəm Title, Moderate for Fishing, Low for River Shoreline and Terrestrial Harvesting, Low for Hunting, Low for Cultural Continuity, and Low for Health.

As noted in Section 2.8 Limitations, this Assessment does not include BC EAO's draft conditions shared in February 2026.

## 7. Residual Effects of the Project on x̣ṃəθḳẉəỵəm Rights

### 7.1 Residual Effects After Consideration of Proposed Mitigation and Offsetting Measures

This Section presents the potential residual adverse effects on x̣ṃəθḳẉəỵəm rights. These residual effects are those that remain after mitigation and offsetting measures either proposed or committed to by the Proponent. Table 8 presents a characterization of the residual effects for each category of right below, linking these residual effects with the impact pathways described in Section 5. As outlined in the Methodology in Section 2, for each category of right, subcomponents and associated indicators were identified. These indicators were used to assess the impacts in Sections 5 and the assess residual impacts, after mitigation, in this Section. Residual impacts are also characterized in the final columns of Table 8 below using the approach outlined in Section 2.6.

Note that the final summary of the severity of residual effects on the right is not necessarily an *average* of the assessment of the effects on the multiple right subcomponents and indicators. For example, where adverse effects on one of the indicators, such as access to a plant harvesting area, are characterized as “high”, the conclusion for the right to harvest in this area would be concluded to be high, even if the effects on other right subcomponents of the right, such as plant abundance or sensory experience, were characterized as “moderate” or “low”. The rationale for this is that the meaningful practice of a right requires that multiple conditions be in place, including in the case of plant harvesting, access, presence/abundance of the species, sensory experience, etc. If even one of these conditions are not in place, then the opportunity to meaningfully practice the right may have a low likelihood and therefore would be seriously impacted. Where the analysis finds residual Project impacts on rights, these will be carried forward into the Section 8 to determine overall severity for residual impacts for each category of right.

For the LNG Expansion Project, there are 35 use values documented by Tam et al. (2018) within the Project Site. The majority of these use values relate to Fishing because the participants in the study (Tam et al. 2018) were seriously concerned about in-water Project interactions from vessel traffic and in-water infrastructure. The Proponent introduced a new mitigation measure part-way through the development of this Assessment: the avoidance of in-water construction works, including vessel traffic and infrastructure. As a result of this Proponent decision, this Assessment has only collected very minimal information related to impacts from the proposed Project on-land construction and operations. This information gap is also identified in Section 2.8.

Table 8: Residual effects characterization table for xʷməθkʷəy̓əm rights with respect to the LNG Expansion Project.

| Category of Right                                | Right Sub-component                                                                                                                                          | Residual impact pathway summary                                                                                                                                                                                                                                                                                   | Severity of Potential Project Impact <i>before mitigation</i><br>(High, moderate, low) | Likely effectiveness of proposed mitigation and follow up measures to eliminate or reduce impacts <sup>8</sup> | Overall Severity of Residual Project Impact <i>after mitigation</i><br>(High, moderate, low) |

## 7.2 Summary of LNG Expansion and TMJ Project Combined Impacts

As characterized in Table 8 and summarized in Table 9 above, residual impacts of the LNG Expansion Project, after mitigation is considered, is expected to result in:

- High residual impacts on xʷməθkʷəy̓əm Title;
- Low/Moderate residual impacts on Fishing and Cultural Continuity; and
- Low residual impacts on River Shoreline and Terrestrial Plant Harvesting, Hunting, and Health.

When the TMJ Project is incorporated into the analysis, the seriousness of the impacts on xʷməθkʷəy̓əm categories of rights are increased. While a detailed assessment for the proposed TMJ Project was not undertaken, Section 5.4.1 describes how additional impacts of the TMJ Project are expected to be even more serious than the proposed Project. Section 6.3 shows clearly that available mitigation measures do not address these impacts, indeed, they offer little to reduce adverse effects particularly when compared to the mitigations offered by the proposed Project. It is therefore expected that the combined impacts of the LNG Expansion Project and TMJ Project will likely result in moderate to high residual impacts for all categories of rights.

## 7.3 Additional Mitigation and Offsetting Measures Required to Minimize Impacts to xʷməθkʷəy̓əm

Based on the overall findings of this 19(4) Assessment, summarized in Table 9 above, additional mitigation measures are required by xʷməθkʷəy̓əm to reduce impacts on xʷməθkʷəy̓əm from the Project. Table 10 below includes additional mitigation or offsetting measures that are recommended by xʷməθkʷəy̓əm, connected to impact pathway for each category of right.

*Table 10: Recommended Additional Mitigation and Offsetting Measures*

| Category of Right  | Impact pathway                                                                                                                                                                                                                                                                                                  | Severity of Residual Impact | Additional Mitigation Measure(s) or Offsetting Measure(s) Recommended by xʷməθkʷəy̓əm                                                                                                                                                                                                                                                            |

## 8. Conclusions

Using the methodology outlined in Section 2, this 19(4) Assessment provides an analysis of historical and current context of x̱m̱əθḵw̱əy̱əm rights (Section 3 and 4), breaking rights down by category. Each right and subcomponent was then assessed using the indicators described in Section 2.5 and a description of the proposed LNG Expansion Project impacts are presented in Section 5. Measures were then systematically analyzed for effectiveness for each impact in Section 6 and residual effects after measures are then characterized in Section 7. The proposed TMJ Project impacts are also assessed using the same steps but presented in a more generalized fashion in the same Sections.

The importance of Indigenous-led assessments such as this 19(4) Assessment cannot be overstated, as stewards of the land x̱m̱əθḵw̱əy̱əm is best equipped to understand the impacts of the project on our rights and title and the broader ecosystem. Further, x̱m̱əθḵw̱əy̱əm has significant concerns with the Crown's methodologies and processes for this assessment. Particularly, the EAO's assessment of the project's biophysical effects was narrowly confined to the project site itself, rather than evaluating the project within its broader ecological context. By siloing its analysis to a highly disturbed site, the EAO concluded that the project's contribution to cumulative effects would be negligible to low and therefore not significant. This approach is both inappropriate and inadequate because it fails to meaningfully assess how the project's impacts will interact with and compound the existing industrialization, habitat degradation, and ongoing environmental pressures in the surrounding area. Limiting the assessment to the immediate project footprint obscures the cumulative effects that arise from multiple existing, past, and reasonably foreseeable activities, while undermining a holistic evaluation of the project's true environmental consequences. Moreover, limiting the scope to the project's footprint increases jurisdictional complexity given the location of the project site and its proximity to waterways. Though federal bodies are confident in their provincial counterparts' ability to mitigate the impacts to federal jurisdiction, specifically marine impacts, x̱m̱əθḵw̱əy̱əm has concerns that unaddressed impacts from construction and operation pose a risk to fish and fish habitat. By not having a federal condition preventing these risks, the federal government can only intervene in the aftermath of an impact that violates federal legislation. To help mitigate such risks, x̱m̱əθḵw̱əy̱əm will remain heavily engaged on the project through communications with the Crown and the proponent. Not y

### 8.1 Conclusions on Severity of Likely Residual Effects

As characterized in Table 8 and summarized in Table 9 above, residual impacts of the LNG Expansion Project, after mitigation is considered, is expected to result in the following severity conclusions:

- **High residual impacts on x̱m̱əθḵw̱əy̱əm Title.** In summary, x̱m̱əθḵw̱əy̱əm's (a) ability to exercise x̱m̱əθḵw̱əy̱əm decision-making authority (with respect to the Project and territorial lands and waters), and (b) ability to derive economic and other benefits is modified by the Project. **This category of right has already declining and considered highly sensitive, prior to the Project, and will be severely diminished as a result of the Project. The proposed TMJ Project is expected to further diminish this right.**
- **Low/Moderate residual impacts on Fishing and Cultural Continuity.** In summary, the Project modifies x̱m̱əθḵw̱əy̱əm's Fishing right and right to Cultural Continuity such as: (a) right to access, harvest, and process fish and (b) sufficient resources for food,

social, ceremonial, as well as economic purposes, and (c) right to continue transmission of knowledge across generations. **These categories of rights have already declined and are considered highly sensitive, prior to the Project, and are expected to be reaching a diminished state. The Project is expected to result in low to moderate changes to the conditions required to meaningfully exercise these x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ rights.**

- **Low residual impacts on River Shoreline and Terrestrial Plant Harvesting, Hunting, and Health.** The Project modifies x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ's rights associated with all three of these categories, such as (a) right to sufficient waterfowl resources, (b) right to access and harvest river shoreline plant foods and materials, and (c) right to maintain social cohesion and community wellbeing. **These categories of rights have already declined and are considered highly sensitive, prior to the Project. The Project is expected to result in little change in the conditions required for the exercise of rights, relative to an established baseline.**

It is important to note that this 19(4) Assessment only considers Project-specific impacts and is not a cumulative effects assessment. x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ people are particularly vulnerable to additional stressors introduced by new projects or disturbances. This Project must be understood within – and as compounding – the broader cumulative impacts described in Section 4. New disturbances do not occur in isolation; rather, their effects on x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ rights combine and can interact in a synergistic way, amplifying existing layers of ongoing losses and traumas imposed by generations of cumulative dislocation from territory and cultural practice. Given the amount of existing damage to x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ lands, waters, culture, and resources in many areas of x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ territory (see Section 4), even low residual impacts on severely diminished conditions may have serious consequences for x̣ẉṃə̣θ̣ḳẉə̣ỵəṃ rights.

This Assessment considers the mitigation measures proposed by the Proponent, most notably the removal of all in-water works, to allow for an easier comparison between conclusions with this Assessment and those provided by the Proponent. It also means that if these or other mitigations are significantly changed, the Assessment may need to be updated to ensure conclusions are still accurate.

This 19(4) Assessment also includes a general assessment of the proposed TMJ Project. Even though these two projects would not exist without the other, the EAO and the Proponent have assessed them separately. This Assessment considers the TMJ Project impacts, mitigation measures, and residual effects and concludes that, with the TMJ Project, the severity of impacts described above would generally be more severe.

## APPENDIX A – METHODOLOGY FOR MUSQUEAM RIGHTS IMPACT ASSESSMENT

---

In the fall of 2017, Musqueam prepared a submission on its views on the Canadian Environmental Assessment Agency's ("the Agency") October 17, 2017, draft document, "Proposed Methodology for Assessing the Seriousness of Impacts on Rights." In this submission, Musqueam set out what it viewed as the appropriate methodology for the assessment of impacts to Musqueam rights. Central to this approach was Musqueam's recommendation that the Agency adopt an approach to the Rights Impact Assessment (RIA) that:

- provides Musqueam a key role in the determination of the severity of project-specific and cumulative infringements on our rights; and
- co-develops with Musqueam an infringement justification framework.

The methodology set out below builds upon Musqueam's 2017 submission to the Agency. It also has taken into consideration the *Methodology for Assessing Potential Impacts on the exercise of Aboriginal and Treaty Rights of the Proposed Frontier Oil Sands Mine Project* (CEAA and MCFN, 2018). Although this project did not proceed, the publication and distribution of this precedent-setting RIA methodology was widespread and became the basis of the guidance for RIA officially adopted by the Agency in 2020<sup>9</sup>.

This Musqueam methodology was used as general guidance during the development of the more detailed methodology used in this Section 19(4) Assessment of Impacts of the Tilbury Phase 2 LNG Expansion Project on x̣ẉṃə̣θ̣ḳẉə̣ỵəm Culture. For an accurate understanding of the methodology used in this 19(4) Assessment, please consult Section 2 in the main body of that Assessment.

## Key Principles

The principles below guide the overall approach to executing the methodology and to support technical staff with Musqueam and the Agency in 2017 to effectively collaborate throughout the process.

**Principle 1:** The methodology for the assessment of impacts on rights should be informed by or, where possible, developed in collaboration with the rights-holding Indigenous group

**Principle 2:** The assessment must consider the nature and scope of rights, as those rights are asserted, and how the rights might be impacted.

**Principle 3:** The focus of the 19(4) Assessment is on potential impacts to Musqueam rights, not on environmental effects

---

<sup>9</sup> Government of Canada, *Guidance: Assessment of Potential Impacts on the Rights of Indigenous Peoples, Impact Assessment Agency of Canada*, accessed December 9, 2024, <https://www.canada.ca/en/impact-assessment-agency/services/policy-guidance/practitioners-guide-impact-assessment-act/guidance-assessment-potential-impacts-rights-indigenous-peoples.html>.

**Principle 4:** Assessing new project-specific impacts on the exercise of Musqueam rights requires understanding the context of historical and contemporary cumulative effects in which rights are exercised. How conditions supporting the opportunity to exercise rights have changed over time must be evaluated in order to understand the potential severity of new project-specific effects on those rights.

**Principle 5:** The impacts of the Project on the exercise of Musqueam rights should be assessed in a broad sense, inclusive of any type of potential project effect on the conditions that support the continuity of rights and way of life.

**Principle 6:** The assessment must consider Musqueam's perspective and knowledge.

**Principle 7:** The assessment must consider Musqueam values, norms and laws, as provided by Musqueam.

**Principle 8:** Musqueam will lead the selection of methods and indicators for assessing impacts on Musqueam rights.

**Principle 9:** Thresholds and measures to understand the potential severity of effects of a project on the exercise of rights and culture are to be utilized where they have been defined by Musqueam.

**Principle 10:** The potential effectiveness of proposed mitigation and off-setting measures ("mitigation measures") must be determined through a collaborative analysis undertaken by Musqueam and the Agency, based on existing evidence and examples from current projects. Where a proposed mitigation measure is unprecedented, and/or where there is a high level of uncertainty as to its effectiveness, the assessment will include an estimation of its potential effectiveness to reduce residual effects.

**Principle 11:** Consideration of measures to avoid, reduce or offset impacts to rights will be limited to consideration of measures within the scope of the environmental assessment (EA). Non-EA forms of accommodation (e.g., financial compensation) that are not specific to protecting the reasonable opportunity to exercise Musqueam rights must not be included in the 19(4) Assessment. The 19(4) Assessment should be treated as the basis for arriving at a transparency assessment of what immitigable, residual effects on Musqueam rights result from a proposed project and inform discussions regarding what further non-EA forms of accommodation are required to meet the Crown's legal duty to consult and accommodate.

## Methodology

An eleven-step process is proposed to determine the severity of impacts on Musqueam rights as a result of proposed major projects. Details of each step are described in detail below.

*Table 1: Summary of Steps*

| <b>19(4) Assessment Steps</b>        |                                                                                         |
|--------------------------------------|-----------------------------------------------------------------------------------------|
| <b>Establish Context</b>             | 1. Identify potential impacted rights and study boundaries                              |
|                                      | 2. Establish historical context                                                         |
|                                      | 3. Establish current conditions                                                         |
|                                      | 4. Identify future condition and opportunities for future use                           |
|                                      | 5. Identify thresholds of acceptable change                                             |
| <b>Assess Project Effects</b>        | 6. Identify potential project-rights interactions and analyze potential project effects |
|                                      | 7. Identify mitigations and evaluate effectiveness                                      |
|                                      | 8. Identify project-specific residual effects on rights                                 |
|                                      | 9. Identify cumulative effects on rights                                                |
| <b>Determine Severity of Impacts</b> | 10. Characterize net residual impacts                                                   |
|                                      | 11. Determine severity of impacts                                                       |

### 1. Identify potential impacted rights and study boundaries

The first step to any 19(4) Assessment is to identify which rights should be assessed. The rights are identified because of the importance of these rights to Musqueam and the potential for these rights to be impacted by major projects in Musqueam territory.

Table 2 is not a comprehensive list of Musqueam rights, but rather a sub-set of rights prioritized for full assessment.

## Example Musqueam Rights

*Table 2: Example Musqueam Rights for Assessment*

| Right                                   | Description                                                                                                                                                                             | Indicator(s)                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Musqueam Title (Governance)             | Includes the right to decide how the lands/waters will be used; Right to the economic benefits of the lands/waters; and, Right to proactively use and manage the lands/waters           | <ul style="list-style-type: none"> <li>- Changes to Musqueam decision-making authority within and over Musqueam territorial lands and waters</li> <li>- Changes to ability to derive economic benefits from infrastructural development in Musqueam territory</li> <li>- Changes to ability to proactively govern and control Musqueam territorial lands and waters</li> </ul>                                        |
| Cultural Continuity                     | Includes the ability to continue transmission of knowledge across generations, including place-based knowledge through practice, language, and sharing of oral histories and traditions | <ul style="list-style-type: none"> <li>- Changes in access to key teaching cultural areas</li> <li>- Safety—changes in sense of personal and community safety impacting the ability to continue cultural practices and transmission as a result of the project</li> <li>- Physical, environmental and multisensory changes impacting the ability to practice and transmit cultural knowledge and practices</li> </ul> |
| Sense of Place and Identity             | Includes the ability to maintain territorial integrity, continue to access and use places for spiritual purposes safely under preferred timing and conditions                           | <ul style="list-style-type: none"> <li>- Change in access to spiritual locations</li> <li>- Change in quality of experience due to sensory disturbance</li> <li>- Change in sense of safety</li> <li>- Increased psychological and emotional stress from loss of spiritual landscape</li> </ul>                                                                                                                       |
| Marine Fishing and Estuarine Harvesting | Includes the right and ability to access, harvest, and process marine fish and other marine foods and materials for sustenance, social cohesion, and spiritual/ceremonial purposes.     | <ul style="list-style-type: none"> <li>- Change in access to harvesting areas due to physical, temporal, or administrative restrictions</li> <li>- Change in opportunity (current and future) due to impacts on abundance and/or quality</li> </ul>                                                                                                                                                                   |

| Right                  | Description                                                                                                                                                              | Indicator(s)                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                        |                                                                                                                                                                          | and perceived) of harvest (including reduction of suitable habitat to support abundance) <ul style="list-style-type: none"> <li>- Change in opportunity (current and future) due to decreased efficacy and/or increased competition</li> <li>- Change in cultural and sensory experience while marine harvesting</li> <li>- Change in ability to transfer marine harvesting knowledge intergenerationally</li> </ul> |
| Terrestrial Harvesting | Includes the ability to access, harvest and process terrestrial goods and materials for sustenance, social cohesion, and spiritual/ceremonial purposes.                  | - Similar to above                                                                                                                                                                                                                                                                                                                                                                                                   |
| Health                 | Includes the ability to maintain holistic wellness, including mental physical, emotional, and spiritual health.<br><br>Includes social cohesion and community wellbeing. | <ul style="list-style-type: none"> <li>- Change in ability to maintain holistic health and wellness</li> <li>- Change in social cohesion and community wellbeing</li> </ul>                                                                                                                                                                                                                                          |

## Study Boundaries

In any 19(4) Assessment impacts on Musqueam rights should be assessed in the context of the spatial and temporal boundaries. The following examples are proposed examples that should capture the extent of the likely project-specific and cumulative effects on Musqueam rights:

- Local Study Area (LSA): Project footprint plus a buffer around the project footprint and any relevant marine shipping route with 2km buffer
- Regional Study Area (RSA): within the any relevant marine shipping area and within a buffer of the Project footprint

To adequately address the context influencing the impacts of the project on Musqueam rights, the temporal boundary for any 19(4) Assessment should consider a range from the pre-contact period (e.g., prior to 1800) to a future development period (e.g. 2125 and onwards). Any temporal boundaries should be selected to characterize baseline conditions and trends over time with which the proposed major project is anticipated to interact.

## **2. Establish historical context**

For each Musqueam right selected in the Assessment (see Table 2 for examples), Musqueam should provide a description of the historical context of the exercise of the right as drawn from Musqueam knowledge and use studies and added to or supported by additional right-specific historical information. Establishing the historical context of Musqueam's exercise of each right illustrates the overall context within which the project is being proposed, allows for analysis for the trend in ability to exercise the right over time, and establishes the conditions necessary for Musqueam to exercise the right. Establishing the historical context also speaks to the relative importance of the location historically for the exercise of the right.

## **3. Establish current conditions**

To further establish context, Musqueam should describe the current condition of each right. Depending on availability, Musqueam may use quantitative and qualitative data, supported by reports and impressions shared by membership, of how Musqueam is exercising each right today. Establishing this current condition further informs the trend of the exercise of the right, as first established in the description of historical context, and include a description of territorial capacity (e.g. "what's left") for the reasonable expression of the right.

## **4. Identify future conditions and opportunities for future use**

To ensure a full examination of the context within which Musqueam rights are exercised and may be impacted by the proposed major project, any Musqueam 19(4) Assessment should describe high, medium- and low-development future scenarios related to potential constraints on the opportunity to exercise each right, as is permitted by available information and data. The future analysis includes a best estimation of the future trend of the right, as well as identification of future opportunities that could be facilitated and/or impacted by the project (e.g. habitat restoration initiatives, stock enhancement initiatives, etc.). The future condition also describes a description of Musqueam's desired future state of their right, against which project impacts can be measured.

## **5. Identify thresholds of acceptable change**

For each right, Musqueam's 19(4) Assessments should determine a defined threshold against which change in the condition of the right can be measured to support establishing context and determining severity. Thresholds may be qualitative or quantitative, depending on the right and its associated indicator(s), availability of information and the need for specificity to support conclusions.

For example, one option for addressing adverse impacts to the fishery and crab harvest is to adopt a "sufficiency of resources" approach, meaning that the threshold will be established with the underlying assumption that the full practice of Indigenous rights reasonably includes access to marine environments and resources in which the rights can be exercised. "Sufficient" refers not only to quantity but quality and is evaluated from the perspective of what is required to fulfill not only subsistence requirements, but also cultural needs of the Musqueam now and into the future.

However, there are other approaches to setting thresholds, that include:

- **Indigenous laws and norms** (Musqueam laws and standards apply set the threshold of acceptable change)
- **Rights infringement** (The meaningful opportunity to exercise the right sets the threshold of acceptable change)

## 6. Identify potential project-rights interactions and analyse potential project effects

Once context and thresholds have been established, Musqueam's 19(4) Assessments should identify how Musqueam rights and the project may interact, with specific potential effects identified. Data is drawn from all other aspects of the Impact Assessment (e.g. biophysical, socioeconomic impact assessments, etc.), as well as Musqueam knowledge and use studies and data established in the preceding context-setting steps. Musqueam makes efforts to focus on the key predicted project effects to maintain an efficient assessment and attempts to clearly delineate project effects in a summary format as suggested by the table template below.

| Right | Indicators | Project Interaction Pathways | Potential Effects |
|-------|------------|------------------------------|-------------------|
|       |            |                              |                   |
|       |            |                              |                   |

## 7. Identify mitigations and evaluate level of confidence in predicted effectiveness

For any 19(4) Assessment, Musqueam should examine impact assessment materials to determine if any mitigations are committed to that could lessen the potential effects of the project on each Musqueam right. For each mitigation, Musqueam evaluates the potential effectiveness and potential of that mitigation to adequately address the identified effects. Approaches to assessing potential effectiveness of mitigations can include, but not be limited to, considerations of time delays in effectiveness based on past project experience (e.g., offsetting projects), levels of confidence of success based on past experience with similar mitigations on similar projects, etc. Evaluating mitigations and levels of confidence in their predicted effectiveness, and subsequent steps, may need to be iterative and updated should new mitigations arise and/or conditions be developed in the latter stages of the assessment process.

**To note, for the purposes of any 19(4) Assessment, Musqueam does not include any non-EA related mitigations, such as First Nation-proponent accommodations or other complementary measures committed to by the proponent or government, that do not directly address the specific effect impacting a right. Considering such additional measures would only become relevant after an analysis of severity of residual effects is concluded (see "Next Steps" section).**

## **8. Identify project-specific residual effects on rights**

Once potential effects are identified, mitigations identified and effectiveness evaluated, Musqueam can identify the residual impacts on each right that may remain as a result of the proposed major project. Once identified, any residual project effect is be carried forward for further analysis and characterization in the final steps of the 19(4) Assessment.

## **9. Identify cumulative effects on rights**

Once residual project effects are identified and described, the effects will be analyzed within the consideration of past, present and reasonably foreseeable future projects and activities, i.e., the context(s) described in steps 2-5, and in the context of existing and future predicted trends, opportunities, and desired condition.

## **10. Characterize net residual impacts**

For each effect carried forward, the effect will be characterized using the following categories:

- Context and Comparison to Thresholds (using results of step 9 and summarized here)
- Magnitude
- Spatial Extent
- Duration and Reversibility
- Frequency
- Likelihood that the effect will occur
- Confidence that the assessed effect is accurate (aka, “certainty” of effect)

How potential effects on each right are characterized can be determined using a scale associated with the thresholds established for each right; or alternatively using a description of “high”, “medium”, or “low” or similar descriptor of level of impact (e.g. “reversible”/ “permanent” or “infrequent”/ “frequent”/ “continuous”). Ideally, category definitions and weighting are developed collaboratively and agreed upon by Musqueam and the Agency and/or the BC Environmental Assessment Office prior to final characterization to support transparency and agreement in final characterization outcomes.

## **11. Determine severity of impacts**

As a final step, Musqueam’s 19(4) Assessments should look at the characterization for each right across the categories described in Step 10 and determine the overall severity of impacts to the right. Description of severity rankings should be pre-developed and agreed upon by Musqueam and external parties like the Proponent and/or EA regulator before analysis to support transparency and agreement. Rankings may be as follows:

- **Minor:** ability to practice the Musqueam right is modified by the Project, but can continue at or near acceptable levels as determined by Musqueam.
- **Moderate:** ability to practice the Musqueam right is modified by the Project, and is reaching a threshold of acceptable change.
- **Severe:** ability to practice the Musqueam right is modified by the Project, and has or will surpass a threshold of acceptable change.

During the 19(4) Assessment work, Musqueam should determine more specific criteria based on input from harvesters, knowledge-holders and leadership.

## 12. Next Steps

As part of the iterative process, Musqueam, the EA regulators and the Proponent may wish to modify proposed mitigations (i.e., conditions) to address the predicted severity of adverse impacts and then revisit steps 7 through 11 and modify conclusions.

Once mitigations and/or conditions are finalized, the conclusions of the 19(4) Assessment should be carried forward to discussions between the parties (Musqueam, the Proponent and relevant government agencies and departments) regarding complementary measures and any additional accommodations that may be required. The parties should also develop commitments to monitor the impact on Musqueam rights and the effectiveness of mitigations and conditions, should the project proceed.

This information is then carried forward into the framework for analyzing the justification of infringements of Musqueam's *Sparrow* fishing right ("Justification Analysis").

Given the extensive legacy and cumulative effects within Musqueam territory stemming from prior development and land alienation, the justification of further infringements on Musqueam's *Sparrow* right, and the suitability of proposed accommodation measures to address immitigable impacts to Musqueam rights should consider the extent to which the measures contribute to reconciliation.

Finally, the results of the 19(4) Assessment and the Justification Analysis should be presented to Musqueam and decision makers to inform final conclusions on the project.

## 16.6.2 The EAO's Views

### xʷməθkʷəy̓əm's Assessment

Participating Indigenous nations have the opportunity under section 19(4) of the EAA to carry out an assessment with respect to the potential effects of the project on xʷməθkʷəy̓əm and its rights. xʷməθkʷəy̓əm completed an effects assessment under section 19(4), as agreed upon in the Assessment Plan of the Process Order.

The EAO acknowledges and respects that xʷməθkʷəy̓əm's section 19(4) assessment has been undertaken using its own laws, knowledge systems, and decision-making frameworks, and that the assessment reflects xʷməθkʷəy̓əm's perspectives on the nature and severity of potential effects on its Aboriginal rights and title. The EAO also acknowledges that xʷməθkʷəy̓əm's assessment methods may differ in some respects from EAO's assessment methods, and that any characterization of residual effects and determination of significance for this assessment is based on the methods that xʷməθkʷəy̓əm used.

### xʷməθkʷəy̓əm's Involvement and Engagement

xʷməθkʷəy̓əm identified as a participating Indigenous nation for the Project, which provided opportunities to participate in the environmental assessment process, including through development of the Process Order, Application Information Requirements, Assessment Plan, Fortis Application, EAO's Assessment Report and ongoing engagement with the EAO and Fortis.

The EAO worked collaboratively with xʷməθkʷəy̓əm throughout the environmental assessment process. xʷməθkʷəy̓əm participated in technical discussions and iterative engagement opportunities to review project information, identify potential effects on its rights, and provide input on identified mitigation and accommodation measures aiming to mitigate impacts to xʷməθkʷəy̓əm's rights. The EAO and xʷməθkʷəy̓əm maintained ongoing dialogue throughout the process, including regular meetings and discussions to understand, assess, and respond to issues as they arose.

Through engagement during the Process Planning phase, it was identified that xʷməθkʷəy̓əm would undertake an Indigenous led assessment of project effects on its rights and title under section 19(4) of the Act.

### Provincial Conditions and Federal Key Mitigation Measures

The EAO notes that xʷməθkʷəy̓əm recommended additional specific mitigations, and those recommendations were considered and responded to in the development of provincial and federal conditions.

Provincial conditions and federal Key Mitigation Measures were developed to address pathways through which Project effects on xʷməθkʷəy̓əm's rights and interests may occur, including effects on fishing, river and terrestrial plant harvesting, hunting, cultural continuity, and health. The following provincial conditions and federal Key Mitigation Measures also address matters assessed by xʷməθkʷəy̓əm in its section 19(4) assessment.

### xʷməθkʷəy̓əm Title (Governance and Ownership)

The EAO identified the following proposed provincial conditions that could help mitigate potential effects to xʷməθkʷəy̓əm Title (Governance and Ownership) with any management plans from these conditions be developed in collaboration with xʷməθkʷəy̓əm:

- Condition 3 (Document Development) requires plans and programs to include clear objectives, monitoring protocols, reporting requirements, and provisions for evaluating mitigation effectiveness using baseline information (including available Indigenous knowledge). It also requires adaptive management if monitoring shows predicted outcomes are not achieved. These requirements support transparency, accountability, and ongoing refinement of mitigation measures over the Project lifecycle;

- Condition 4 (Consultation) requires the Proponent to be available to meet with xʷməθkʷəy̓əm throughout all project phases and discuss issues or concerns that are related to the Project;
- Condition 15 (Chance Find Protocol) requires procedures to identify and protect archaeological or cultural materials discovered during project activities, to prevent additional cultural disturbance; and
- Condition 10 (Community Feedback Process) ensures a clear and responsive pathway for xʷməθkʷəy̓əm to raise and resolve concerns about project effects. By enabling early identification and timely resolution of issues such as noise, dust, light, or access disruptions, this allows xʷməθkʷəy̓əm more agency over these sensory concerns; and,
- Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan) requires the development and implementation of a plan supporting economic participation of First Nations, and local communities, that would describe employment and contracting strategies and training practices. This plan supports xʷməθkʷəy̓əm economic governance, ownership, and self-determination.

### Fishing, River Shoreline and Terrestrial Plant Harvesting, and Hunting

The EAO identified the following proposed provincial conditions that would help mitigate effects to Fishing, River Shoreline and Terrestrial Plant Harvesting, and Hunting with any management plans from these conditions be developed in collaboration with xʷməθkʷəy̓əm:

- Condition 10 (Community Feedback Process) creates a clear way for xʷməθkʷəy̓əm to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of harvesting and cultural practices;
- Condition 12 (Construction Environmental Management Plan) requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction by reducing disturbance and protecting the environmental conditions that support fish, wildlife, and plants, this condition helps maintain the ability to access, harvest, and experience culturally important areas;
- Condition 13 (Operations Environmental Management Plan) requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation. Maintaining stable and predictable environmental conditions over time helps preserve the integrity and character of the area, supporting ongoing relationships with the land and reinforcing identity tied to harvesting and stewardship practices;
- Condition 14 (Air Quality Management Plan) ensures the Project selects and applies effective emissions control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support harvesting and cultural practices; and,
- Condition 17 (Dry Street Sweeping Report) assesses whether dry street sweeping can reduce 6PPD quinone on project related roads, which may lower impacts on salmon and other fish important to xʷməθkʷəy̓əm.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to harvesting:

- Migratory Bird Protections would require protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting xʷməθkʷəy̓əm's harvesting practices and broader ecosystem conditions important to their way of life.

## Cultural Continuity, including Sense of Place and Identity

The EAO identified the following proposed provincial conditions that would help mitigate potential effects to cultural continuity, including sense of place and identity with any management plans from these conditions be developed in consultation with x̣ṃəθḳẉəỵəm:

- Condition 9 (Public Information and Flaring Notices) requires advance notice of planned flaring and timely notification of unplanned high volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance;
- Condition 10 (Community Feedback Process) establishes a clear and structured mechanism for x̣ṃəθḳẉəỵəm to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, helping maintain environmental conditions that support ongoing cultural use of the area;
- Condition 12 (Construction Environmental Management Plan) requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. By reducing disturbance and protecting the environmental conditions that support fish, wildlife, and plants, this condition helps maintain the ability to access and experience culturally important areas in ways that are consistent with x̣ṃəθḳẉəỵəm values, supporting continuity of cultural practices and connection to place;
- Condition 13 (Operations Environmental Management Plan) requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation. Maintaining stable and predictable environmental conditions over time helps reduce disturbances that could affect cultural use and connection to place;
- Condition 14 (Air Quality Management Plan) ensures the selection and implementation of effective emissions control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites; and
- Condition 15 (Chance Find Protocol) requires procedures to identify and protect archaeological or cultural materials discovered during project activities, to prevent additional cultural disturbance.

## Health

The EAO identified the following proposed provincial conditions that would help mitigate potential effects to health with any management plans from these conditions be developed in consultation with x̣ṃəθḳẉəỵəm:

- Condition 10 (Community Feedback Process) provides x̣ṃəθḳẉəỵəm with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance;
- Conditions 12 and 13 (Construction and Operations Environmental Management Plans), require an emergency communication protocol with x̣ṃəθḳẉəỵəm to be developed by the Holder in consultation with x̣ṃəθḳẉəỵəm. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;

- Condition 14 (Air Quality Management Plan) requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting physical health and overall well-being;
- Condition 15 (Chance Find Protocol) requires procedures to identify and protect archaeological or cultural materials discovered during project activities. This condition helps prevent disturbance to cultural materials and avoids associated cultural or emotional harm, supporting Indigenous health and well-being; and,
- Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan) requires the development and implementation of a plan to support economic participation of x̣ṃəθḳẉəỵəm. By outlining employment, contracting, and training strategies, this condition helps support socio economic well-being.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects on mental and emotional well-being:

- Accidents and Malfunctions Reporting; would support reduction of potential impacts on x̣ṃəθḳẉəỵəm's interests by ensuring timely response, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

## EAO Conclusion

Provincial conditions and federal Key Mitigation Measures were developed to address potential effects on x̣ṃəθḳẉəỵəm's section 35 rights, and the EAO is of the view that the seriousness of potential effects on those rights would be reduced through implementation of the proposed provincial conditions and federal Key Mitigation Measures.

In consideration of the above analyses and the proposed provincial conditions, federal Key Mitigation Measures and follow-up programs, the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on the interests of x̣ṃəθḳẉəỵəm has been adequately avoided, minimized or otherwise accommodated. Based on the engagement undertaken with x̣ṃəθḳẉəỵəm on Tilbury Phase 2, as outlined above, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult and accommodate x̣ṃəθḳẉəỵəm.

x̣ṃəθḳẉəỵəm expressed concerns with the EAO's methodologies, processes, and conclusions. Notably, x̣ṃəθḳẉəỵəm considered the EAO's assessment of the project's biophysical effects to be narrowly confined to the project site itself, rather than evaluating the project within its broader ecological context.

From x̣ṃəθḳẉəỵəm's perspective, the EAO's assessment was too narrowly focused on the highly disturbed Project footprint, resulting in a conclusion that the project's contribution to cumulative effects would be negligible to low. In x̣ṃəθḳẉəỵəm's view, this approach does not adequately capture how the project's impacts will interact with and compound the existing industrialization, habitat degradation, and ongoing environmental pressures in the surrounding area.

As x̣ṃəθḳẉəỵəm has demonstrated in its section 19(4) assessment, x̣ṃəθḳẉəỵəm has strong ties to the project site and surrounding areas. x̣ṃəθḳẉəỵəm provided additional mitigation measures that it considered would help offset or reduce the effects of the project on its Section 35 rights and remains concerned that these measures are not fully reflected in the assessment conclusions and draft conditions.

Though the EAO has concluded that Crown consultation and accommodation obligations have been met, x̣ṃəθḳẉəỵəm remains concerned, particularly because some conditions contain ambiguous language and rely on management plans that, while required by the conditions, will not be finalized until later in the process. x̣ṃəθḳẉəỵəm has also indicated that it expects to remain heavily engaged on the Project through ongoing communications with the Crown and the proponent.

# Indigenous-led Assessment of Proposed Tilbury Phase 2 LNG Expansion Project

## Quw'utsun Nation

Quw'utsun Nation  
August 2026

## Foreword

To the Crown, FortisBC, regulators, and all those who read this Indigenous-Led Assessment:

We write as the Chiefs of Quw'utsun Nation.

We speak from the lands and waters of Tl'uqtnus, Shnuwiih, and the South Arm of the Fraser River, where our laws arise from our relationships and responsibilities and have governed since time immemorial. Our authority is inherent and continues to govern our responsibilities in relation to these lands and waters. It is not granted by the Crown or the Proponent. It is inherent, and it endures.

This Quw'utsun Nation (QN) Indigenous-Led Assessment (ILA) is an application of Quw'utsun Law to the proposed FortisBC Tilbury Phase 2 LNG Project. It is an exercise of Quw'utsun Law, Quw'utsun title, and Quw'utsun responsibility. It is not a response to a project application, an appendix to a Crown process, or a record of Indigenous concerns. It is Quw'utsun Nation's assessment of whether the proposed Project is lawful under Quw'utsun Law. It is not a cultural values report, a technical comment, or a mitigation request. It sets out how Quw'utsun Law applies to the lands and waters affected by the proposed Project.

Our laws have governed these lands and waters since time immemorial. Long before Canada, British Columbia, environmental assessment statutes, permits, or industrial approvals, Quw'utsun Mustimuhw lived under laws that ordered our relationships with salmon, waters, winds, lands, plants, animals, ancestors, families, and future generations. Those laws continue. They have not been extinguished. They have not been displaced by colonial jurisdiction. They remain living law.

The Project is proposed in a place where Quw'utsun Nation has longstanding legal responsibilities. Tl'uqtnus, Shnuwiih, Tilbury Island, and the surrounding lands and waters of the South Arm of the Fraser River are not empty industrial space. They are part of a living legal, cultural, ecological, and territorial relationship. They are places of origin, use, occupation, harvest, travel, memory, responsibility, and return. They are also places from which our Quw'utsun Mustimuhw have been unlawfully excluded, but to which our rights, responsibilities, and jurisdiction continue to apply, and where our presence must be re-established.

Our ILA must be read in that context. Quw'utsun Nation is not a stakeholder commenting on development within someone else's jurisdiction. We are the rights and title-holder whose laws, lands, waters, and responsibilities are directly engaged by the Project.

Our ILA proceeds from a different baseline than that applied in the Project Application and the associated regulatory framework. The Application and regulatory assessment evaluate Project effects against existing conditions that are already degraded by long-term industrial activity and colonial displacement. It applies thresholds that treat harm as acceptable where it is incremental, mitigated, or within regulatory limits. Under Quw'utsun Law, these conditions do not establish an appropriate baseline for assessment.

Our baseline is not the present condition of an already impacted landscape. Our baseline is the set of conditions necessary to support the reestablishment of Quw'utsun Mustimuhw at Tl'uqtnus; the restoration of lands, waters, and ecosystems; and the continuation of culturally integral practices grounded in Quw'utsun Law. Effects are therefore assessed not against what remains after generations of dispossession and industrialization, but against the conditions that

must exist for restoration, re-establishment, and the exercise of Quw'utsun rights, title, laws, and responsibilities.

This distinction is fundamental. A project that contributes additional stress to a degraded system may be characterized as minor within a regulatory framework but represents a barrier to restoration and re-establishment under Quw'utsun Law.

For generations, colonial governments and industrial actors have treated our lands and waters as available for use, extraction, development, and regulation without our consent. They have measured value through production, revenue, jobs, emissions, thresholds, and economic indicators. They have repeatedly failed to account for what has been taken from Quw'utsun Mustimuhw: our village lands, our fisheries, our access, our ability to live in place, our ability to teach our children on the land and water, our ability to carry forward the relationships that make us who we are and our ability to exercise our jurisdiction and participate in decision-making.

This is our ILA and it proceeds under Quw'utsun Law.

It begins with Quw'utsun Law. It assesses the Project not only by asking what the Proponent predicts, but by asking what Quw'utsun Law requires. It asks whether salmon can continue to return. Whether waters can continue to support life. Whether families can safely reside at Tl'uqtinus. Whether Elders can teach. Whether children can learn. Whether plants, fish, birds, wildlife, and other kinship beings can continue to sustain and be sustained by these places. Whether permission has been sought and lawfully obtained. Whether benefits taken from the land and water are returned through reciprocity. Whether cumulative industrial harm is being repaired or deepened.

These are not secondary questions. They are the central questions.

The Project Application approaches effects through a colonial assessment structure that separates air, noise, water, fish, vegetation, economy, health, and culture into discrete Valued Components. Quw'utsun Law does not understand the world that way. A change to air quality is also a change to health, residence, ceremony, and teaching. A change to noise is also a change to speech, silence, safety, harvesting, and intergenerational transmission. A change to water is also a change to salmon, plants, restoration, food, and future generations. A change to one relation affects the whole.

Our Assessment therefore considers the Project in its full relational context.

The proposed Project is not occurring within an untouched landscape. It is proposed within a place already affected by industrial activity, colonial displacement, and cumulative ecological degradation. Under Quw'utsun Law, those existing impacts do not reduce the significance of new harm. They increase it. Where restoration is required, further degradation is not neutral. Where return is necessary for reconciliation, new barriers to residence, access, culture, stewardship, and ecological recovery move us further from that objective.

Quw'utsun Nation has articulated a vision for reconciliation at Tl'uqtinus and along Shnuwiih: recovery and restoration of our village lands, re-establishment of residence and river access, revitalization of culturally integral practices, restoration of land and water, and realization of economic opportunities compatible with those goals. This vision is not symbolic. It is a practical expression of our title, rights, law, and responsibility.

The ILA that follows applies that vision through Quw'utsun Law.

It also makes clear that consultation is not consent, mitigation is not restoration, and economic opportunity is not a substitute for lawful relationship. A project cannot be made lawful simply because impacts are predicted to be residual, moderate, mitigated, or economically offset. Under Quw'utsun Law, where required conditions cannot be maintained, where access is impaired, where permission is absent or cannot be sustained, where reciprocity is not met, or where harm further disrupts relationships already under strain, the Project fails.

This ILA is the result of a major undertaking by Quw'utsun Nation. It brings forward our laws, histories, teachings, technical review, community knowledge, and responsibilities to future generations. It does not ask the Crown or the Proponent to validate Quw'utsun Law. It requires decision-makers to grapple with it.

We submit our ILA with the authority and responsibility carried by our Nations and our ancestors. We do so for the people who lived at Tl'uqtnus before us, for the people who were kept from returning, for the children who must still learn who they are on the land and water, and for the salmon and other relatives whose return remains inseparable from our own.

Nothing in our ILA limits, waives, abrogates, or derogates from Quw'utsun title, rights, jurisdiction, laws, remedies, or positions in any legal, regulatory, consultation, or government-to-government process.

This ILA is not provided for information. It is provided as Quw'utsun Nation's assessment of the Project and the conclusions reached under Quw'utsun Law. We expect our ILA to be read as an expression of Quw'utsun Law and as a governing document for decision-making about this Project.

Chiefs of the Quw'utsun Nation:

## List of Appendices

Appendix A: Declaration for Reconciliation

Appendix B: Market and Non-Market Values Methodology

# 1. Introduction

The Quw’utsun Nation-led Assessment of the FortisBC Phase II LNG Expansion on Tilbury Island (the “**Project**”) intends to assess the impacts of the proposed project on Quw’utsun Nation Aboriginal Rights, including Aboriginal title, and way of life (“**Quw’utsun Rights**”) through the lens of our culture, our *snuw’uyulh* (teachings), our values, and our history. The assessment is a formal Nation-led assessment of project effects on QN and its rights, undertaken pursuant to section 19(4), the Assessment Plan, and the Process Order.

On August 7, 2025, the BC Supreme Court granted a declaration that the Quw’utsun Nation holds Aboriginal title to the Cowichan Title Lands directly across from the Project area, as well as a right to fish the entire south arm of the Fraser River for food, year-round and as needed.<sup>1</sup>

## 1.1. Report Roadmap

The basis for the Quw’utsun Nation Indigenous-led Assessment (ILA) of the FortisBC LNG Expansion on Tilbury Island begins with a foundation of **Quw’utsun Nation Legal Order** in **Section 2**. This section details the sources, resources, application, and consequences of Quw’utsun Nation law that underlay the assessment.

The Quw’utsun Nation ILA considers the condition of lands, waters, relationships, and governance at contact, prior to the cumulative effects of colonial dispossession and industrialisation, as the appropriate baseline for understanding effects to Quw’utsun Mustimuhw and our ability to exercise Quw’utsun Rights. The relevant history of the Quw’utsun Nation and our lands and waters at and around the Lands of Tl’uq̓tinus is detailed in **Section 3 - Rights and Title and Colonial Disruption**. This is followed by an **Economic Analysis of Historical Costs** resulting from the Quw’utsun Nation’s unlawful alienation from the lands and waters at and around the Lands of Tl’uq̓tinus in **Section 4** and additional **Ecological Context** in **Section 5**.

The **Project Effects Assessment** specific to the FortisBC LNG Expansion on Tilbury Island begins in **Section 6**, where the effects to Valued Components in the proponent’s Application are considered against the Quw’utsun Nation’s Declaration for Reconciliation in the context of Quw’utsun Nation law. **Section 7** then considers the **Current and Future Market Costs** related to the Project in an economic context.

**Section 8** then summarizes the impacts of the Project based on the Quw’utsun Nation ILA assessment framework and considers the lawfulness of these activities under Quw’utsun Nation law.

---

<sup>1</sup> *Cowichan Tribes v. Canada (Attorney General)*, 2025 BCSC 1490 (**Cowichan**)

## 1.2. Scope

To capture the pathway of effects that may result in impacts to Quw'utsun Rights, the temporal boundaries of the Indigenous Led Assessment span from pre-contact period (pre-1846) to future generations. To consider the impacts of the project in a culturally appropriate way, the temporal boundaries must allow for a fulsome understanding of how the Quw'utsun Nation exercised Quw'utsun Rights in absence of the barriers of development, as well as deep consideration for how impacts might be felt in the lives of future generations.

The spatial scope for the assessment will include but is not limited to the lands and waters of Tilbury Island, the lands and waters at and around the Lands of Tl'uqtnus inclusive of Cowichan Title Lands, and the South Arm of the Fraser River surrounding the Tilbury Phase 2 project area from the south to north bank. Areas beyond those outlined above be included if consideration of those areas is required to fully understand the potential impacts of the project.

## 1.3. Non-Derogation

*All descriptions of Quw'utsun Rights presented in this report are for the sole purposes of assessing potential adverse effects on those rights by the proposed Project. The descriptions are not, and should not be considered, comprehensive or exhaustive. This Indigenous-Led Assessment is to be interpreted in a manner which upholds Quw'utsun Nation's existing asserted and proven inherent rights, Indigenous Rights and Aboriginal Rights recognized and affirmed under section 35 of the Constitution Act, 1982, and not to limit, delineate, abrogate or derogate from them.*

## 1.4. Glossary

**"Cowichan Title Lands"** is that portion of the Lands of Tl'uqtnus over which Quw'utsun Nation Aboriginal Title has been declared. The Cowichan Title Lands are depicted in Schedule A of *Cowichan Tribes v. Canada (Attorney General)*, 2025 BCSC 1490 ("**Cowichan**").

**"Lands of Tl'uqtnus"**: the Lands of Tl'uqtnus claim area as set out in Schedule B of *Cowichan*.

**"Quw'utsun Law"**: legal order that arises from and governs Quw'utsun title to lands and waters as fully described in Section 2.

**"Quw'utsun Mustimuhw"**: The Quw'utsun people; members Cowichan Tribes, Stz'uminus First Nation, Penelakut Tribe, Halalt First Nation, and Lyackson First Nation.

**"Quw'utsun Rights"**: Quw'utsun Nation Aboriginal Rights, including Aboriginal title, and way of life.

**"Quw'utsun Snuw'uy'ulh"**: Quw'utsun Nation teachings and legal order as fully described in Section 2.1.1

**"Project"**: FortisBC Phase II LNG Expansion on Tilbury Island as per FortisBC's Revised Application accepted by the Environmental Assessment Office on March 27, 2026

**"Project-Relevant Title Area"**: refers to the 1607 acres in Richmond and 514 in Delta as shown in Figure 5.

**“Shnuwiilh”**: refers to the south arm of the Fraser River and its connected waters, including areas such as Tilbury Island, as depicted on Figure 2 in Section 3.

**“Tl’uqtinus”**: refers to the village site and associated lands located along the north shore of the south arm of the Fraser River, which form part of the broader Cowichan claim area.

## 2. Quw'utsun Legal Order<sup>2</sup>

### 2.1. Fundamental Quw'utsun Law

Quw'utsun<sup>3</sup> Law is one of the longest-continuing legal orders on these lands. It arises from and governs Quw'utsun title to these lands and waters. It has governed relations among people, salmon and other kinship beings, waters, winds, lands, ancestors, and all our more-than-human relatives since time immemorial. Long before the formation of the Canadian state, long before provincial statutes or federal jurisdiction, our legal traditions were already operating here, ordering community life, preventing and addressing harm, guiding harvesting, resolving disputes, and ensuring the renewal of relationships across generations. For clarity, this chapter uses several place-based terms that reflect different but interconnected aspects of Quw'utsun Territory. "Tl'uqtinus" refers to the village site and associated lands located along the north shore of the south arm of the Fraser River, which form part of the broader Cowichan claim area. "Shnuwiilh" refers to the south arm of the Fraser River and its connected waters, including areas such as Tilbury Island. Together, these places form part of Quw'utsun Territory, where Quw'utsun Mustimuhw hold longstanding relationships of use, stewardship, and responsibility, and where Quw'utsun Law applies to guide decision-making in relation to both village sites and the broader lands and waters affected by the Project.

#### 2.1.1. Quw'utsun Snuw'uy'ulh

Although Quw'utsun Snuw'uy'ulh is foundational to Quw'utsun culture, identity, and ways of being in the world, it is more than just a cultural concept. It describes the conditions of right relationship that are maintained, restored, and lived through Quw'utsun law. Snuw'uy'ulh provides the normative framework that gives meaning to our responsibilities to one another, to our lands and waters, and to our more-than-human relatives. It guides how people ought to conduct themselves, how decisions are made, and how relationships are repaired when harm occurs.

Embedded within Quw'utsun Snuw'uy'ulh is a coherent and legitimate legal order. It generates obligations, legal principles and processes that govern conduct, evaluate whether responsibilities have been met, and restore balance when they have not. While Quw'utsun Snuw'uy'ulh encompasses much more than law, law is one of the primary ways that Snuw'uy'ulh is given practical effect, shaping duties, resolving disputes, and sustaining harmonious relationships. The requirement for permission under Quw'utsun Law is consistent with, but not limited by, the standard of free, prior, and informed consent recognized in international law, and must be understood as a jurisdictional condition grounded in Quw'utsun title and legal authority.

---

<sup>2</sup> This chapter was developed through collaborative work undertaken with Dr. Sarah Morales, Su-taxwiye; Rocky James /Qwtiis, Siimultun, Thiyaustun; and Laxele'wuts'aat, Shana Thomas Huy'wu'qw, Hereditary Chief, Lyackson First Nation. Their work was instrumental in identifying, drawing out, developing, and articulating the Quw'utsun laws and legal principles applied throughout this Indigenous-Led Assessment.

<sup>3</sup> Cowichan Tribes, Stz'uminus First Nation, Penelakut Tribe, Halalt First Nation, and Lyackson First Nation have administered Quw'utsun Law as individual nations and collectively as Quw'utsun Nation. Including Coast Salish women, men, and 2SLGBTQIA+ members.

In this way, Quw'utsun Law is derived from our Snuw'uy'ulh and is a deliberative, interpretive, and living legal system, consistent with the work of John Borrows and other Indigenous legal scholars who affirm that Indigenous law is not static or frozen in the past. It is renewed through:

- story and story-analysis,
- teachings shared by Elders,
- place-based knowledge,
- collective deliberation,
- lived relationships,
- and the ongoing responsibilities we carry to maintain balance in our territories.

This Indigenous-Led Assessment (ILA) is conducted in accordance with Quw'utsun Law, which governs the individual and collective interests and inherent title and rights of its member communities: Cowichan Tribes, Stz'uminus First Nation, Penelakut Tribe, Halalt First Nation and Lyackson First Nation.

## 2.1.2. Tree Model

Quw'utsun Law is reflected in the context of a tree-structured legal methodology, grounded in the understanding that law grows from deep roots, is interpreted through a stable trunk, and branches outward into the contemporary decisions that must be made on our lands and waters. This model reflects how Quw'utsun Mustimuhw have always generated, interpreted, and applied law: through continuity, deliberation, and relationship.

### 2.1.2.1. Source

The roots of the tree are the sources of law: our First Ancestor stories; Xeel's teachings—where Xeel's is the Transformer and a central juridical authority in Quw'utsun Law whose actions and teachings reveal lawful and unlawful conduct, obligations, consequences, and the means of restoring balance; ancestral stories such as *The Sockeye That Became a Rainbow*; *The Creator and the Flea Lady*, and *The Marriage of the Seagull and the Crow*; ceremonial law; place-based teachings expressed through rivers, salmon, winds, stones, and the broader natural world; the authority of Elders and knowledge keepers; and the memories held by families and house groups. These sources do not merely contextualize law—they are law, as they reveal the foundational values and the legal obligations that have governed Quw'utsun life since time immemorial. They function simultaneously as legal instruction and historical record, documenting lawful and unlawful conduct and the consequences that follow. Within these teachings, authority is exercised through intervention where conduct disrupts order, and consequences are imposed to restore balance and establish enduring instruction in place. These sources are not exhaustive of Quw'utsun Law; additional legal obligations grounded in land-based practice, harvesting, and environmental stewardship are developed more fully in subsequent sections of this assessment.

### **2.1.2.2. Resource**

The trunk of the tree represents the resources of legal interpretation. This includes story-analysis, Elder teachings, oral histories, Hul'q'umi'num' meanings, place-names, on-the-ground observation, seasonal knowledge, the experiences of harvesters, and community deliberation. These resources enable us to interpret the meaning of law, clarify obligations, determine legal principles, and understand how ancestral teachings apply in present circumstances. This is consistent with the understanding that Quw'utsun law is deliberative and living, continuously renewed through interpretation and practice.

### **2.1.2.3. Application**

The branches of the tree represent application—the legal doctrines, rules, legal tests, obligations, standards, and consequences that flow from the foundational principles. This is where law becomes actionable. Principles such as respect, reciprocity, stewardship, healing, and collective responsibility give rise to specific duties that govern what must (or must not) occur at a place like Tl'uqtinus in relation to salmon and other kinship species who sustain and are sustained by this place. Application also requires that the ecological health of Tl'uqtinus be understood in relationship to the broader ecological health and environmental justice of the Quw'utsun Mustimuhw. Application is where Quw'utsun Law meets contemporary decision-making: each principle is operationalized into a determinative test, supported by explicit relational obligations, and demonstrated through measurable standards.

Through this tree-based method, Quw'utsun Law remains rooted, coherent, authoritative, and living—while fully capable of guiding present-day environmental governance, stewardship, and decision-making

In this ILA, and especially in relation to Tl'uqtinus, Shnuwiilh, Tilbury Island, and the surrounding lands and waters affected by the Project, each legal principle must be articulated not as an abstract idea but as a binding legal constraint on what must and must not occur in these places.

This includes:

- Respect for salmon and other kinship species, waters, currents, and the obligations of this location;
- Reciprocity for what the river, salmon, and lands have given;
- Stewardship as a responsibility inseparable from any proposed use;
- Interconnectedness, requiring cumulative and relational assessment;
- Healing and restoration, where harm is present;
- Collective responsibility, carried by families and related Nations; and the full suite of other Snuw'uy'ulh-grounded principles that structure Quw'utsun Law.

Each principle becomes a determinative requirement for assessing what must happen at and around the Lands of Tl'uq̓tinus to remain within Quw'utsun Law. These principles govern:

- how decisions must be made,
- what evidence is required,
- what standards must be met,
- and how to determine whether a proposed activity is lawful.

In this way, Quw'utsun Law — the oldest legal tradition on these lands — provides a coherent, enforceable, place-based framework through which all decisions at and around Tl'uq̓tinus must be evaluated and must be applied in ways that maintain broader ecological health and lawful conditions of environmental justice.

At and around the Lands of Tl'uq̓tinus, Respect requires the preservation of salmon migration integrity, the acknowledgement of helpers that sustain currents and orientation cues, and the maintenance of the cultural and spiritual conditions that bind Quw'utsun families to this shoreline. Reciprocity requires that any benefit sought from this place is matched by restoration, repair, and contributions to the lifeways of salmon, waters, winds, and people. Stewardship requires that conditions necessary for salmon renewal—including flow, temperature, turbidity, sediment balance, salinity, water quality, and energetic harmony—are maintained or strengthened; no project may lawfully proceed where these foundational relations are put at risk.

### 2.1.3. Method

Quw'utsun Law is multi-sourced and applied according to established legal principles. Its sources include sacred teachings associated with our First Ancestors and Xeel's, duties discerned in the natural world, customary practices carried by families and house groups, community deliberation about how we treat one another, and norms expressly posited by recognized Quw'utsun authorities. To bring law forward in contemporary decisions, we work with legitimate resources (Elders' teachings; story and story-analysis; place-names and oral histories; language, practices and artifacts; memories; and new ground-truthing at the place in question) and move through a consistent sequence: (1) frame the legal question; (2) analyze the resources; (3) deliberate and ground-truth; (4) synthesize principles into clear rules and measurable standards; and (5) implement, monitor and correct where obligations require it.

The following principles—drawn from Quw'utsun Laws and teachings and affirmed in Snuw'uy'ulh—are the legal foundation for determinations in this assessment.

## 2.2. Application of Quw'utsun Law

### *The Story as Source of Law*

Within Quw'utsun Territory, including Shnuwiih (the South Arm of the Fraser River), the Lands of Tl'uq̓tinus, the Project area, and interconnected lands and waters, Quw'utsun Law requires that each legal principle be interpreted and applied in relation to place, beings, and relationships. At the Lands of Tl'uq̓tinus, these obligations apply with particular force due to its role as a permanent village site and lifeline location connected to broader territorial responsibilities. This place-specific application is part of a broader system of territorial responsibility and ecological governance extending across the

South Arm of the Fraser River and throughout Quw'utsun Territory. Law is not abstract; it is territorial and relational, and its application depends on the responsibilities specific to the lands and waters across from our village and connected to Shnuwiih. These same legal obligations apply to all areas within Quw'utsun Territory affected by the Project, including Tilbury Island and the surrounding lands and waters, where Quw'utsun Nation holds legal responsibilities and exercises jurisdiction grounded in title, relationship, and long-standing use.

### 2.2.1. Source (Roots) at and around Lands of Tl'uqtnus

The sources of Quw'utsun Law arise across Quw'utsun Territory, including Shnuwiih (the South Arm of the Fraser River) and interconnected lands and waters. These sources include the river systems themselves, the salmon and other beings who move through their currents, the winds and tides that shape their passage, the stories and teachings tied to these places, and the multi-generational memory of families who have harvested, taught, and lived within these territories. At Tl'uqtnus, these sources are particularly concentrated, reflecting long-standing occupation, use, and responsibility within this broader system. These place-based sources reflect a broader system of territorial knowledge in which named places encode use, occupation, and the responsibilities that arise from long-standing relationships to lands and waters.

Across Quw'utsun Territory, Quw'utsun Law is grounded in multiple ancestral stories that operate as authoritative legal sources, each governing a distinct category of obligation. At the Lands of Tl'uqtnus and the surrounding lands and waters, these same teachings are directly engaged and applied within the relationships present at this place. Each story is tied to specific places and relationships within Quw'utsun Territory, and in this way establishes legal obligations while affirming jurisdiction over the lands and waters to which those teachings belong.

*The Sockeye That Became a Rainbow* establishes binding legal outcomes governing conduct, access, and relationship at Tl'uqtnus, rather than merely expressing values or teachings. *The Creator and the Flea Lady* governs authority and lawful process, setting out who may act, when permission is required, and how intervention must properly occur. *The Marriage of the Seagull and the Crow* governs lawful entry, access, and use of lands and waters across relationships, including the conditions attached to permission, sharing, and restitution between groups. *The Boys Who Became a Killer Whale* governs the legal consequences that arise when authority is ignored or power is used without permission, including transformation, loss of standing, and the need for recognition and correction following unlawful action. These teachings do not operate in isolation; taken together, they reflect a coherent and consistent legal order in which principles of authority, permission, reciprocity, and consequence are expressed across multiple stories and applied in relation to place.

### 2.2.2. Resource (Trunk) at and around Lands of Tl'uqtinus

The interpretive resources for Quw'utsun Law arise across Quw'utsun Territory, including interconnected lands and waters. At and around the Lands of Tl'uqtinus, these resources are engaged through the following:

- the salmon monitoring knowledge held by Quw'utsun Mustimuhw;
- the Hul'q'umi'num' language that describes kinship among beings;
- the experience of Elders who have witnessed ecological change along this channel;
- place-names and oral histories tied to the Lands of Tl'uqtinus;
- intergenerational harvesting practices;
- the stories that teach how helpers—currents, winds, gravels, and energies—must be acknowledged and supported; and,
- place-based knowledge systems, including place names that record ongoing relationships, use, and stewardship responsibilities.

These teachings situate those outcomes within the lifeways of salmon and other kinship beings, whose return and continuity are protected and sustained through Quw'utsun Law at and around the Lands of Tl'uqtinus and across the interconnected lands and waters within Quw'utsun Territory, where relationships, obligations, and authority are carried across places rather than confined to a single site.

Elders' teachings and story analysis clarify that in Quw'utsun Law, action is never assumed and authority must be recognized before intervention occurs. Lawful action also requires right conduct in advance of action, including careful preparation, truthful disclosure, and an orientation of respect toward the beings, relationships, and obligations already present at this place. Lawful action arises through relationship, consultation, agreement and permission, rather than unilateral decision-making. That consistency is evident across multiple stories, which repeatedly establish that authority must be recognized, permission must be obtained, and consequences follow where those obligations are not met.

Stories such as *The Creator and the Flea Lady* are interpreted as establishing that those who act without recognized authority, or without seeking permission from those who hold responsibility for a place, act unlawfully even if their intentions are not harmful. Standing to act is therefore relational: it depends on one's role, responsibilities, and connections to others, including to the lands and waters themselves. Where authority is shared or held collectively, lawful action requires consultation and agreement before proceeding.

The same interpretive teachings clarify that Quw'utsun Rights, inclusive of title, and territorial authority arise through ongoing caretaking relationships, naming, use, and responsibility, rather than through entitlement or free availability.

These relationships constitute the basis of territorial authority, through which Quw'utsun Mustimuhw hold lands and waters collectively, with enduring responsibilities of care that extend across generations.

These relationships are grounded in genealogy, place, and historical knowledge, rather than fixed or surveyed boundaries. Stories such as *The Marriage of the Seagull and the Crow* are understood to establish that lands and waters are not open for unrestricted entry or use; permission must be sought

and conditions attached to that permission must be respected. Entry into another's territory or into shared places creates obligations to act respectfully, to share benefits, and to respond appropriately if harm is caused. Where permission is breached or authority ignored, other stories—including *The Boys Who Became a Killer Whale*—are interpreted as establishing that recognition of unlawfulness and accountability are necessary to restore balance, and that transformation may follow from failure to act within lawful authority.

These resources clarify how principles such as respect, stewardship, environmental justice and interconnectedness must be understood in this particular location.

### 2.2.3. Application (Branches) at and around Lands of Tl'uqtinus

Within Quw'utsun Territory, including its interconnected lands and waters, Quw'utsun Law is applied through determinative legal tests that a proponent must meet. At and around the Lands of Tl'uqtinus, these tests are applied in relation to the specific ecological, cultural, and relational conditions of this place. These tests determine whether a proposed activity is lawful under Quw'utsun jurisdiction. Application is not discretionary or contextual; it is the point at which binding legal obligations are enforced.

Each legal test governs whether a proposed activity:

- maintains the salmon lifeline and the lifeways of related kinship species;
- upholds reciprocal balance with the river, lands and waters;
- respects and supports helpers such as currents, winds, tides, gravels, and shared energy;
- avoids foreseeable ecological, cultural, spiritual, and relational harm;
- protects the conditions necessary for the intergenerational transmission of law and teachings under Elders' authority; and,
- upholds collective responsibilities carried across the Quw'utsun Nation.

Each legal test is paired with Snuw'uy'ulh-grounded obligations and measurable standards that define the evidence needed to demonstrate lawfulness within Quw'utsun Territory. The ecological health at and around the Lands of Tl'uqtinus is inseparable from the broader ecological health and environmental justice of the Quw'utsun Mustimuhw. Where the obligations of a principle cannot be met at this place, the proposed activity is unlawful under Quw'utsun Law.

#### 2.2.3.1. Outcome Required by Story

*The Sockeye That Became a Rainbow* establishes binding obligations under Quw'utsun Law when applied to the Lands of Tl'uqtinus. It requires that the salmon's lifeline home remain intact and open, that helpers such as currents, tides, winds, and gravels be supported and not disrupted, and that kinship relations among beings be upheld through both intention and conduct.

The story establishes that transformation is lawful only where it restores or sustains balance. Any activity that disrupts lifelines, interferes with helpers or undermines relational continuity is unlawful under Quw'utsun Law. Failure to uphold relational duties renders the conduct unlawful and constitutes a breach of Snuw'uy'ulh.

The story further establishes that species living in relation to salmon – those who share their waters, timing and habitats – must not be harmed, displaced or placed at risk through interference with salmon lifeways. These duties are inseparable from the obligation to maintain the intergenerational continuity of harvesting, teaching and return.

Applied to the Lands of Tl'uqtinus, Quw'utsun Law therefore requires that a proposed project:

- does not interfere with salmon migration, return pathways or homing cues;
- does not degrade water quality, flow, temperature, turbidity, salinity, sediment balance or orientation conditions;
- does not disrupt helpers that sustain migration, renewal, shared energy systems and ecological balance; and,
- does not impair the ability of the Quw'utsun Mustimuhw to return to, harvest from, teach at, and maintain lawful relationships with this place across generations.

These legal outcomes are determinative. They are operationalized through the principles, legal tests, relational obligations, and measurable standards set out in the framework below and govern all legal determinations at and around the Lands of Tl'uqtinus in their relationship to Quw'utsun-wide ecological and justice obligations.

## 2.2.4. Proponent Obligations Under Quw'utsun Law: Access, Permission, and Reciprocity

The following obligations arise directly from the application of the legal principles, tests, and relational duties set out above, and define the conditions under which access, use, and benefit from lands and waters in Quw'utsun Territory may lawfully occur.

### 2.2.4.1. Access and Permission as Threshold Legal Requirements

These access and permission obligations arise from Quw'utsun Laws governing authority and lawful process, including those expressed in ancestral stories such as *The Creator and the Flea Lady*.

Under Quw'utsun Law, access to lands and waters is not presumed. Entry, use, occupation, or interference within Quw'utsun Territory, including the Lands of Tl'uqtinus and the surrounding lands and waters requires prior permission grounded in right conduct and lawful relations. Permission is not a procedural formality, consultation step, or regulatory checkpoint; it is a jurisdictional requirement that determines whether an activity may lawfully proceed at all. It is not satisfied by consultation processes or procedural engagement but requires the establishment of lawful authority to proceed in accordance with Quw'utsun Law. These requirements operate as a system of governance that regulates access to and use of lands and waters.

Permission under Quw'utsun Law is relational and conditional. It arises through respectful engagement, truthful disclosure, careful preparation, and demonstrated understanding of obligations to salmon, waters, helpers, families, and future generations. It must be actively established and cannot be assumed; it may be granted, withheld, or withdrawn where the conditions of lawful relationship are not met. Permission is specific in scope, limited in duration, and revocable where conduct breaches the conditions under which it was granted. Where permission has not been sought, has not been granted, or cannot be maintained because obligations cannot be met, access is unlawful.

These access and permission laws apply with particular force at and around the Lands of Tl'uqtinus, a permanent village site and lifeline location. Activities that interfere with migration of salmon (and related kinship species), return pathways, harvesting access, teaching routes, or the ability of the Quw'utsun Mustimuhw to return to and live at this place cannot be authorized through mitigation or accommodation alone. Where the foundational relationships of this place cannot be upheld, permission cannot lawfully be granted.

#### **2.2.4.2. Conditions Governing Lawful Access**

Where permission is granted, Quw'utsun Law imposes strict conditions on access and use. Use of lands and waters is governed by principles of restraint, such that only what is needed and what can be sustained may be taken, and any excess or unnecessary taking constitutes unlawful conduct.

These conditions flow from Snuw'uy'ulh-grounded principles, including respect, stewardship, interconnectedness, and the duty to maintain lifelines.

Lawful access requires, at a minimum, that:

- Lifelines remain intact, including salmon migration routes, water quality, orientation cues, and human access routes necessary for harvesting, teaching, and return;
- Helpers—such as currents, winds, gravels, sediments, and shared energy—are acknowledged and not disrupted;
- Access for the Quw'utsun Mustimuhw to harvest, teach, conduct ceremony, and re-establish residence is not diminished, blocked, rendered unsafe, or made unhealthy or unusable;
- Cumulative effects are assessed relationally, recognizing that multiple small interferences can together render access unlawful.

Certain forms of interference are categorically prohibited, regardless of proposed mitigation, because they sever lifelines or undermine the conditions necessary for renewal across generations. In such cases, the absence of lawful access is determinative.

#### **2.2.4.3. Reciprocity and Benefit-Sharing as Legal Obligations**

These reciprocal obligations reflect Quw'utsun Laws governing permissioned access and use between groups, including duties of restitution where access is taken or misused without consent.

Under Quw'utsun Law, any party seeking to benefit from the lands and waters within Quw'utsun Territory, including the Project Area, bears a legal obligation of reciprocity. This obligation is not contingent on harm, wrongdoing, or compensation claims. It arises from the act of use itself.

Reciprocity requires that benefits derived from lands and waters be shared in proportion to what is taken or gained, in ways that support:

- the renewal of salmon and other kinship species,
- the restoration and stewardship of lands and waters,
- the re-establishment of Quw'utsun residence, access, and culturally integral practices, and
- the intergenerational transmission of law and teachings.

This obligation arises alongside limits on use, requiring that extraction or benefit does not exceed what can be lawfully sustained within the relationships that govern this place.

Benefit-sharing is therefore a condition of lawful presence, not an economic offset or discretionary accommodation. Where a proponent extracts value without reciprocal contribution to these relationships, the resulting imbalance constitutes a breach of Snuw'uy'ulh and renders the activity unlawful.

Together, these principles establish a system of territorial governance grounded in authority, relationship to place, and enforceable obligations governing access, use, and conduct.

#### **2.2.4.4. Consequences of Breach**

Failure to obtain permission, maintain lawful access, or uphold reciprocal obligations results in unlawfulness under Quw'utsun Law. In such circumstances, Quw'utsun Nation permission cannot be granted or must be withdrawn, and the legal consequences that follow are governed by the relational and restorative framework set out in Section 2.3.

**Table 1: Quw’utsun Legal Framework: Snuw’uy’ulh Based Principles, Tests, and Duties in the Context of Development Projects**

| Quw’utsun Legal Principle and Snuw’uy’ulh Teaching                                                                                                          | Quw’utsun Legal Test                                                                                               | Relational Obligation (Legal Meaning/Snuw’uy’ulh Duty)                                                                                                                                                                                                                                                                                                                                                                                     |

If these rules and standards are not met, the project does not meet the requirements of Quw'utsun law.

These Snuw'uy'ulh-grounded principles, legal tests, relational duties, and measurable standards form the Quw'utsun legal framework governing any proposed activity at and around the Lands of Tl'uqtinus. In this chapter, we set out the law: its sources, interpretive resources, binding principles, and the specific requirements that must be met for any project to be lawful under Quw'utsun jurisdiction.

In the chapters that follow, this framework is the foundation for considering the evidence, technical assessments, and on-the-ground realities of the proposed Project. The legal standards articulated here are determinative: if a test cannot be met, the project is unlawful under Quw'utsun law. The assessment that follows evaluates the project against these standards and provides the Nation's legal determination. Section 2.3 sets out the consequences that follow when the determinative tests and standards in Section 2.2 are not met.

### 2.3. Consequences

Under Quw'utsun Law, legal consequences are restorative and relational. These consequences arise directly from the breach of lawful relationships and are not dependent on external enforcement or negotiated response. When a project fails a legal test in Section 2.2, it does more than violate a technical requirement — it disrupts the balance that salmon, waters, winds, lands, helpers, families, and future generations. These consequences reflect longstanding Quw'utsun Laws, including those expressed in *The Boys Who Became a Killer Whale*, which establish that acting without authority or permission gives rise to loss of standing and transformative consequences that follow from the breach itself, not from negotiated response.

Unlawfulness therefore triggers obligations to repair relationships, restore harmed systems, and reinstate the conditions required for renewal across generations. These obligations fall on the proponent and with the Crown, who must work with Quw'utsun Nation to make things right in accordance with our Snuw'uy'ulh.

The consequence of failing a determinative legal test is that permission cannot be granted. In Quw'utsun Law, there is no concept of “partial compliance” or “mitigation” where core relationships or lifeline pathways are harmed. A single breach weakens the whole legal order, just as one broken cedar strand weakens the rope. Where unlawful impacts occur, the proper response is restitution, ceremony, reintegration of relationships, and—if harm cannot be repaired—refusal or revocation of consent to the proposed activity.

The legal obligations set out in Section 2.2 establish the governing framework for assessing the Project under Quw'utsun Law. These obligations include threshold requirements of permission and access, binding conditions governing lawful use, and reciprocal obligations arising from the use of lands and waters.

This framework governs the interpretation of the historical, evidentiary, and effects-based analysis that follows in this ILA. Where later sections demonstrate that permission has not been obtained or cannot be maintained, that access and lifelines are impaired, or that reciprocal obligations are unmet, the Project fails the applicable legal tests and is unlawful under Quw'utsun jurisdiction.

### 3. Rights and Title and Colonial Disruption in Project Area

**A note on citations:** *This is a summary document. The following information has been sourced from the evidence provided to the Court in Cowichan, the Court’s conclusions in Cowichan, and our own oral history and Indigenous knowledge. The citations should not be thought of as a complete listing of all available sources for any given statement, nor are the citations to Cowichan exhaustive. We encourage the reader to take the time to read through the Cowichan judgment for further details relevant to each section of this report. The citations specific to Section 3 are found in Section 11: Endnotes.*

#### 3.1. Identity of Quw’utsun Nation c. 1846

Since time immemorial, the Quw’utsun Nation has had a distinct collective identity, has shared a common way of life, and has lived together in the same geographic area of southeast Vancouver Island, the southern Gulf Islands, and the South Arm of the Fraser River.<sup>1</sup> The Quw’utsun people or nation is the continuation of eleven local groups:

- i. Taatka (T’et’qe’; Tu’etqe’);
- ii. Quamichan (Kwa’mutsum; Kwamutsun; Qwamutsun);
- iii. Chemainus (Stz’uminus);
- iv. Penelakut (Pun’e’luxutth’; Pune’luxutth’);
- v. Clemclemaluts (Lhumlhumuluts’);
- vi. Yekwolas (Yuxwul’a’us; Yuxwula’us);
- vii. Halalt (Xul’el’’t’hu);
- viii. Somenos (Somena’; Somuna);
- ix. Comiaken (Qu’umiqun);
- x. Lamalcha (Hwlhumelhtse’; Hwlumélhtsu); and
- xi. Koksilah (Xwul’qw’selu; Hwulqw’selu).<sup>2</sup>

All along the coast Indigenous people used the term “Quw’utsun” to refer to us.<sup>3</sup> Our local groups are connected through shared origin stories explaining the origins of the world and of our people. We also had (and continue to have) a shared system of customary law, including property law (see Chapter 2),<sup>4</sup> which was recognized by Crown officials such as Hudson’s Bay Company (“HBC”) Chief Factor and Governor James Douglas.<sup>5</sup>

Our 11 local groups had separate winter villages but came together for resource harvesting and defence. Our oral history confirms that the Quw’utsun were a large group of people. One of the places we lived was Tl’uqtinus, directly across the river from the Project site. We harvested there together, lived there together, and we defended our territory together. The origin stories of our local groups differ, but they have similar central themes.

There is an extensive written historical record from 1824-1858 establishing that we had a distinct collective identity as an Aboriginal tribe, people and nation prior to, at and after the Crown's conclusive assertion of sovereignty in 1846. This record includes the perspective of Quw'utsun and other Indigenous persons and the express observations of the Crown's representative James Douglas.<sup>6</sup>

### 3.2. The Quw'utsun Nation c. 1846 are Continued today by Cowichan Tribes, Stz'uminus, Penelakut, Halalt, and Lyackson

The current members of the Cowichan Tribes, Stz'uminus First Nation, Penelakut Tribe, Halalt First Nation, and Lyackson First Nation bands are the descendants of the historic Quw'utsun people or nation existing in 1846. The Cowichan Tribes, Stz'uminus, Penelakut, Halalt and Lyackson became "bands" within the meaning of the *Indian Act* by virtue of the Crown's Indian reserve creation processes absent treaty in British Columbia before and after Confederation in 1871. These bands are collectively the continuation of the eleven local groups or communities comprising the Quw'utsun in 1846,<sup>7</sup> are the modern-day successor groups within the Canadian legal order to the Quw'utsun as an Aboriginal people, and are holders of the Quw'utsun Aboriginal title to the Lands of Tl'uqtnus.<sup>8</sup>

During its Indian reserve creation processes in British Columbia, the Crown bifurcated the Quw'utsun people by colonial land district. Consequently, an artificial distinction was officially drawn between the "Chemainus Indians" to the north – i.e., the Quw'utsun associated with the Chemainus District of land in the lower Chemainus Valley – and the "Cowichan Indians" to the south – i.e., the Quw'utsun associated with the Cowichan District of land in the lower Cowichan Valley. This bifurcation of the Cowichan people permeates much of the subsequent historical record and ethnographic literature, including as it relates to Indian bands and reserves. Most apparently, it appears in British Columbia Order-in-Council #1036 issued in 1938 transferring the administration and control of lands of and for Indian reserves within the province to Canada. In identifying reserve lands, following the Joint Indian Reserve Commission, the order-in-council classifies bands of the "Chemainus Tribe" (Halalt, Lyackson (part of the Taatka), Penelakut, Yekwolas, Lamalcha, Stz'uminus) and those of the "Cowichan Tribe" (Quamichan, Clemclemaluts, Somenos, Koksilah, Comiakén).

### 3.3. Quw'utsun Use, Ownership, Occupation and Influence in Project Area

This Part describes the Quw'utsun Nation's historic dominance and influence on the lower Fraser River delta, exercise of aboriginal title to the Lands of Tl'uqtnus and the Project area, and the traditional practices that the Quw'utsun engaged in in the Project area.

#### 3.3.1. Overview

Since ancient times, we have had a waterfront village on the Lands of Tl'uqtnus which we physically occupied with at least 108 Quw'utsun-constructed bighouses using permanent post and beam frames set into the ground. The bighouse frames extended about a mile (1.6 km) along the riverbank in rows with multiple neighbourhoods which housed over 2,250 Quw'utsun people in season.<sup>9</sup> This place is our *stl'ulnup* (a place where one is embedded; our sacred ancient homeland). The Lands of Tl'uqtnus was and is a *huliitun* – a place that sustained our people and kept us alive. *Huliitun* in Hul'qumi'num is something that sustains you. It is your food; it is your place, your *stl'ulnup*; it is your children. Our *stl'ulnup* at the Lands of Tl'uqtnus is part of what sustains us as a people. Along with the resources

that we were able to harvest there and at the Project area, it was a place that brought our people together and it is where we lived together.

The Lands of Tl'uq̓tinus are situated on the Fraser River's main channel and South Arm (known prior to and at contact by the local people as the "Cowichan River")<sup>10</sup> where a predictable abundance of fish, such as salmon and sturgeon, was readily available prior to, at and after 1846.<sup>11</sup> During this period, the Lands of Tl'uq̓tinus also provided a diversity of plant habitats and plants, such as grasses, stinging nettle, moss, ferns, cedar, hardhack, red alder, and pine, as well as blueberries, cranberries, crabapple, salmonberries, blackberries, raspberries, and red huckleberry, on good level, dry land in season.<sup>12</sup> These lands in turn were nested within a broader landscape that provided these and other resources, including the Project area which provided a variety of subsistence, material and medicinal resources easily accessible from our village site.

As a collective of at least 2,250 people, we regularly used the village lands at Tl'uq̓tinus to launch our canoe-based fisheries by the hundreds, to conduct our shore-based fisheries, to land, clean and dry our winter supply of fish by the thousands, and to feed ourselves with fresh food resources.<sup>13</sup> We physically etched ourselves into the village lands with trails accessing areas we regularly and intensively used for daily living. The village lands at Tl'uq̓tinus were our base of operations on the lower Fraser River.

Lands which were at 1846 dry land comprising our village are now covered with water (the "**Submerged Lands**") and a portion of those Submerged Lands now comprise the Cowichan Title Lands. We regularly used the Submerged Lands for a number of purposes: to harvest resources and as an access point for our village and surrounding lands, and as the place where we landed the trees that constituted the posts and beams for the infrastructure of the housing that was prominent along the waterfront. We also used the Submerged Lands as the point from which we launched our canoes to go from Tl'uq̓tinus to our winter villages and we used the Submerged Lands as the point where we landed our canoes when we returned from our winter villages to Tl'uq̓tinus and from which we launched and landed our canoes in pursuit of our traditional fishery. We used the Submerged Lands as a harbour for our canoes by the hundreds and it was the point from which we departed and returned upon our many military outings and our voyages up and down the Fraser River.<sup>14</sup>

We regularly used our village and surrounding areas, including the Project area, for plant harvesting, as well as game and bird hunting. We worked the lands, harvesting in immense volumes resources that we depended upon to sustain ourselves throughout the year. We cultivated and managed our village, settlement lands and surrounding lands to maximize resource production through practices such as landscape burning and plant pruning.

Tl'uq̓tinus was a base of operations for our presence on the South Arm, including the Project area. We had a defined land and water regime that involved repetitive visits to particular camps and fisheries or resource gathering areas within Shnuwiih, including hunting, trapping and plant harvesting on Tilbury Island, and fishing along the Tilbury Island shoreline (see Figure 1).

Figure 1: Portion of Map 5: Cowichan on the Lower Fraser River, including legend in Brealey, Dr. Kenneth, *Historical Geography of Cowichan Land Use and Occupancy Lower Fraser River: Map Series and Report*. This map series and report was admitted as an expert report in Cowichan and relied on by the Court.

### 3.3.2. The Village

We had a permanent village at the Lands of Tl'uq̓tinus prior to, at and after 1846 that existed as a Quw'utsun *stl'ulnup* – a named, ancient, and sacred Quw'utsun homeland with *s-thaw't-hw* (bighouses). The Hul'qumi'num word *stl'ulnup* has two root words - *tl'el* and *stl'etl'ul'*. *Tl'el* is to embed in something. *Stl'etl'ul'* is to be embedded. A *shhwa'mut* is where your house is within the *stl'ulnup*. The Quw'utsun were embedded at their *stl'ulnup* on the Lands of Tl'uq̓tinus.<sup>xv</sup> Tl'uq̓tinus is a Quw'utsun *stl'ulnup* and *shhwa'mut* and is a very important place to our people.

Despite having been unlawfully alienated from our village at Tl'uq̓tinus, the village remained well-known and discussed within our Quw'utsun Nation communities throughout the 20<sup>th</sup> century and through to current times. Quw'utsun Elder and knowledge holder Luschiim mapped our village as on the South Arm and main channel of the Fraser River at Lulu Island, on a bend in the river and directly across from Tilbury Island. He located it within Shnuwiih, which he mapped as encompassing the South Arm delta below Annacis Island. He obtained that information by means of our traditional methods of intergenerational knowledge transfer from his Elders and others who had gone before him.

Figure 2: Quw'utsun Elder and knowledge holder Luschiim mapping of the Lands of Tl'uq̓tinus and Shnuwiih

Ken Thomas (Sum'q̓inim), a Penelakut Tribe Councillor, testified in *Cowichan* that his grandfather and great uncle taught him when he was young that Quw'utsun people had a village site on the Fraser River.<sup>xvi</sup> Councillor Thomas explained his experience seeing Tl'uq̓tinus from the water while navigating the South Arm by boat. This included a trip with late Elder Florence James when she was discussing and identifying our village site with longhouses.<sup>xvii</sup> Another trip to the Lands of Tl'uq̓tinus

was with late Roy Edwards, a Penelakut Elder who told Councillor Thomas about the village site at Tl'uqtnus, with longhouses all along the shore.<sup>xviii</sup>

X'tli'li'ye' (former Cowichan Tribes Chief Lydia Hwitsum) learned from her mother, Wutth'iinthut and Sxe'wul't-hw about the Quw'utsun peoples' big village on the mainland that was accessed by canoe through Georgia Strait and the mouth of the Fraser River.<sup>xix</sup>

Stz'uminus Chief John Elliott learned from late Quw'utsun Elder and knowledge-keeper Willie Seymour that the Quw'utsun had a village site at Tl'uqtnus" and that his ancestors travelled to the Fraser River to fish.<sup>xx</sup>

The late Quw'utsun Elder and leader Qwestenuxun (Wes Modeste) deposed that his late Quw'utsun father Suhiltan (Elwood Modeste, b. 1902) often reflected with him on the Cowichan village sites on the lower Fraser River, across from the Gulf Island passes of Cowichan Gap (Porlier Pass) and Active Pass. The villages had cedar-planked houses with permanent house frames.<sup>xxi</sup> The late Squxulenuhw (William Seymour Sr.), Cowichan Tribes Chief (former), first learned of a Cowichan village or presence on the mainland from Qwestenuxun, whom he recognized as a traditional knowledge holder.

### 3.3.3. Fishing, Harvesting, Hunting, and Trade

The Quw'utsun people conducted myriad traditional activities at and around the Lands of Tl'uqtnus and Tilbury Island and all along the South arm of the Fraser River. The following section provides an overview of these practices and demonstrates the integrality of the area to the Quw'utsun way of life.

#### 3.3.3.1. The Quw'utsun Seasonal Round

We followed a shared consistent and regular seasonal round of resource harvesting which took place each year, following seasonally-specific rhythms. This seasonal round took us to the lower Fraser River and to our village lands at the Lands of Tl'uqtnus, where we availed ourselves of resources not readily available on southeast Vancouver Island or the Gulf Islands. We migrated as a collective to the Fraser River with our house planks to our village and settlement lands at the Lands of Tl'uqtnus as part of our seasonal round or annual pattern of movement between resource sites each year by late June. This pattern seasonal movement was consistent from time immemorial until through at least the 1870s, when colonial interference became stronger. Our annual pattern of movement included residing at our village on the South Arm of the Fraser River at the Lands of Tl'uqtnus.<sup>xxii</sup>

There were resources available to us in abundance at the Lands of Tl'uqtnus or on the lower Fraser River main channel that are either not available in abundance or not available at all on southeast Vancouver Island or the Gulf Islands, such as *lha'lus* (oolichans (eulachons)), *thuqi'* (sockeye), *haan* (pink salmon), *qwtaythun* (sturgeon), *maal'sum* (a type of blueberry), and *qwum'tsal's* (bog cranberry). Some Quw'utsun people would catch eulachon on the South Arm of the Fraser River around March. Sockeye and pink salmon would generally run in July and August. There were also resources available to the Quw'utsun in abundance on southeast Vancouver Island or the Gulf Islands that were not available on the Fraser, such as *saxwu* (clams and cockles) and *speenhw* (blue camas).<sup>xxiii</sup>

Our journey to the Lands of Tl'uqtnus would follow set routes. Families would travel to specific locations throughout the Gulf Islands harvesting camas, clams and other resources in preparation for the journey. At a designated time, the families would gather at designated "jump-off points", usually

at or near Sqtheq and Sqtheq'alh (Active Pass and Porlier Pass). The crossing of Sutl'qa'lus (Georgia Strait) depended on the wind and tide, and when the weather was *sliqwul* (calm). We camped at Active Pass, waiting for the tide and wind, and would cross over to the Fraser with many, many canoes. We travelled to and from our village at the Lands of Tl'uqtinus across the open water of Sutl'qa'lus (Georgia Strait) with our *siil'tuhw*, the wide, long cedar house planks, and cedar woven baskets to transport fish and berries back to Vancouver Island and the Gulf Islands, where we had our winter villages.<sup>xxiv</sup>

The *siil'tuhw* were placed across two or more canoes and tied on to create catamarans or trimarans (called *ta'la'quum*). This was done so our ancestors could carry more goods or cargo, and for safety and stability on the open water that was subject to wind and current. At the Lands of Tl'uqtinus, we used the *siil'tuhw* for the purpose of putting up walls at our dwellings or smokehouses, constructed with post and beam frameworks permanently in the ground.<sup>xxv</sup>

The pattern of Quw'utsun seasonal movement was consistent from early times until the 1870s, and our on Lulu Island on the south arm of the Fraser River was regularly occupied by Quw'utsun families through the 1800s.<sup>xxvi xxvii</sup>

The ethnographic record from Cowichan, Tsawwassen, Musqueam, and Katzie sources, also shows that the majority of Quw'utsun people annually migrated back and forth across the Georgia Strait to and from the Lands of Tl'uqtinus with their house planks as part of their traditional seasonal round prior to and at 1846.<sup>xxviii</sup> The ethnographic record confirms the annual pattern of Quw'utsun movement that was observed and documented by the HBC in the 1820s-1830s, as including movement to the Fraser River each June, continued through 1846. Every year members of our local groups moved to the Fraser River at the Lands of Tl'uqtinus with their house planks as a consistent, regular practice.<sup>xxix</sup>

### 3.3.3.2. Fishing and Harvesting

The Quw'utsun *stl'ulnup* at the Lands of Tl'uqtinus is a very important place where our people went to live and harvest together. We regularly used the Lands of Tl'uqtinus to 'aluxut (harvest) resources, namely, *s-tseelhtun* (fish, including salmon, sturgeon), *stthoom* (berries, including blueberries and cranberries), *tu ts'i'ts'usum* (plants, including trees) and *ma'uqw* (fowl). It is where we made *st'el* (dried salmon) to secure us through the winter.<sup>xxx</sup>

While resident at the Lands of Tl'uqtinus, we would *yuqwunup* (burn the ground) to provide soil fertilization, allow the *maal'sum* (bog blueberry) and other plants to grow better, provide new shoots of vegetation to attract animals and birds such as *ha'put* (deer) and *sti't-hwum* (willow grouse), and control unwanted vegetation.<sup>xxxi</sup> We would *lukwetsus-t* (break the branches) of *stthoom* (berry) bushes as pruning to ensure greater growth with more and better berries the following year. We cultivated the land.

Our true stories and histories inform our knowledge of salmon migrating to the Fraser River, beginning when Sockeye, king of the salmon, from the north followed his baby from the north around the west coast of Vancouver Island with the hired help of Steelhead and Spring Salmon and Humpback (Pink) Salmon who followed the next day.<sup>xxxii</sup> They also provide information about each of the salmon species that are found in the Fraser River.<sup>xxxiii</sup> We have an old story about the Thunderbird travelling across

*Sutl'qa'lus* (Georgia Straight) to share fish heads with his family.<sup>xxxiv</sup> Our true stories and histories also connect us to the *qwtaythun* (sturgeon) in the lower Fraser River.<sup>xxxv</sup>

The salmon were once so plentiful at Shnuwilh, the lower Fraser River, you could almost walk across the river on their backs.<sup>xxxvi</sup> Our people had their own conservation practices to ensure abundance. Different species were harvested at different times throughout the year so as not to overharvest.<sup>xxxvii</sup> Some Quw'utsun practiced a first salmon ceremony, which included prayers to call the salmon to the mouth of the river.<sup>xxxviii</sup> A mixture of sockeye salmon oil and red earth (*tumulh*) is used in the ceremony.<sup>xxxix</sup>

We regularly used the Lands of Tl'uqtinus to launch our canoe-based harvest of *s-tseelhtun* (fish), to conduct our shore-based harvest of *s-tseelhtun*, and to land, clean and dry our fresh and winter supply of *s-tseelhtun* by the thousands.<sup>xl</sup> The written records of the earliest non-Indigenous travellers to the area beginning in 1791 support that there was a Quw'utsun practice of fishing the south arm for food prior to and at first European contact.<sup>xli</sup>

In support of our fishing and fishing processing, we regularly harvested the Lands of Tl'uqtinus and surrounding areas for a multitude of tree and plant species, including:

- *tth'ux tth'ux* (stinging nettle), *swel'ulhhp* (willow), used to make fishing nets and fish traps;
- *quts'i* (mosses) for wiping fish;
- *suqeen* (bracken fern leaves) for cleaning and smoking salmon;
- *xpey'* (red cedar), *t'eets'ulp* (hardhack) for "fish spreaders", small sticks that hold the salmon fillet open during the smoking process;
- *kwalalu-ulhp* (red alder), and to a lesser extent *tsuw'nulhp* (cottonwood) for firewood when smoke drying salmon; and
- *qw'uyulushulhp* (lodgepole pine) as a fire starter when smoking salmon and for securing bindings and waterproofing fishing canoes and fishing implements.

The Fort Langley journals of 1827-30 also confirm that our people were on the Fraser River for various purposes, throughout the year. The journals show that our Quw'utsun village land and environs was a place for resource harvesting, feasting and trading. From the village, our ancestors also ventured upriver for fishing, trading, and for hostile encounters farther up the river and also on Puget Sound.<sup>xlii</sup> During the salmon fishing season, large numbers of Quw'utsun resided in the Quw'utsun village at the Lands of Tl'uqtinus. The Fort Langley journals describe that from June to October, women and children, as well as slaves, accompanied men to the fishery, for the women and slaves took on the majority of the fish, game, plant foods and material processing as well as the majority of the plant harvesting. Thus, at the height of the salmon season, around 2,250 Quw'utsun were present at Shnuwilh and on our settlement lands at Tl'uqtinus. At other times of the year, smaller Quw'utsun groups would reside periodically at the Lands of Tl'uqtinus for harvesting food available at that time, especially sturgeon.<sup>xliii</sup>

We harvested *qwtaythun* (sturgeon) at Shnuwilh and Tl'uqtinus; sturgeon was *'ulhtuneen* (a special, favorite food). There was a good spot for fishing *qwtaythun* at the *thii hwq'aq'uyum* (a big, slow, calm back eddy) across from Tl'uqtinus (i.e., at Tilbury Island). The Quw'utsun people would fish for sturgeon at Tilbury Island, where the water was calm and shallower. We would *p'ep'utl* (feeling with a spear) for the fish there.<sup>xliiv</sup> Luschiim learned from his great grandfather about another sturgeon

fishing site *tsuwmuns* Tl'uqtinus (down below in the water in front of Tl'uqtinus).<sup>xlv</sup> There were more sturgeon fishing sites in shallow water downstream from Tl'uqtinus.<sup>xlvi</sup> This oral history is corroborated by the written historical record which provides evidence of direct observation in December 1824 of Cowichan people at the entrance of the south arm in canoes, armed with long sturgeon spears.<sup>xlvii</sup> The surviving Fort Langley Journals of 1827-1830 also record Cowichan supplying the fort with fresh sturgeon<sup>xlviii</sup> and engaging in sturgeon fishing activities.<sup>xlix</sup>

We fished the South Arm year-round. Luschiim was told by his uncle-in-law that shortly after the coldest part of the winter in late February or early March, Quw'utsun people would go to Tl'uqtinus and wait for the eulachon to come.<sup>l</sup> Eulachon enter the Fraser River between March and May.

We also harvested trees and plants such as cottonwood, alder, willow, crabapple, hardhack, cedar, and spruce for material, medicinal and subsistence purposes. These species are all documented to have been present at Tilbury Island based on surveys conducted from 1858-1880, years when the Quw'utsun were resident at their village mere metres away from Tilbury Island.<sup>li</sup> The court in *Cowichan* acknowledged the Cowichan's lived reality that if a plant species required for material, medicinal or subsistence purposes was located in an area where the Cowichan were living out day-to-day life, then they would naturally have harvested those species in that area while they were there.<sup>lii</sup> Thus, while we were resident at Tl'uqtinus, the Project area served as a type of front yard where we could gather nearby resources needed for everyday living. Such regular and seasonal use coupled with very close proximity to a massive Quw'utsun village supports the expert conclusions that Tilbury Island was exclusive Cowichan territory (discussed below).

### 3.3.3.3. Fishing Methods, Fishing Technology, and Fish Processing

We had various traditional methods to fish salmon, including different methods with *swultun* (nets) such as using a *huw'qw'e'yun'* (drift net), *qwse'yun* (stationary net), and *'uxtim'tun* (dip net).<sup>liii</sup>

As a boy, Luschiim fished with his father Hwiinumetse' using the *huw'qw'e'yun* (drift net) on the lower South Arm to fish for *thuq'i* (sockeye salmon), *haan* (pink salmon) and *stth'a'qwi* (spring salmon). His father taught him the Quw'utsun traditionally fished this way using one or two canoes. An appropriate place to practice this form of fishing was in the section of the main river channel by Tl'uqtinus, their home, and part of Shnuwilh.<sup>liv</sup>

The *qwse'yun* (stationary net) has its roots in the words *qwse* (to fall in the water) and *yun* (referencing the net). One end of the net was tied to the shore or to a stationary object such as a pole set into the muddy riverbed. The net would be angled out, somewhat across the current to catch more migrating fish, the bottom anchored with rocks and the top floated with wood. Luschiim was taught by Hwulqwimut that some parts of the river opposite the Quw'utsun village site at Tl'uqtinus were good places to *qwse'yun* salmon (i.e., along Tilbury Island).<sup>lv</sup> Cowichan would also fish by stationary net from the shores of Tl'uqtinus.<sup>lvi</sup> *Chmutth'um* (muddy color) water like the main channel of the Fraser River can be fished by dip net anytime because the water is muddy and makes the dip net invisible to fish.<sup>lvii</sup>

Historically, our people would fish for sturgeon with a 3-pronged spear called *sh-tl'e'lhun'um'* made of a Douglas fir pole with *qethulhp* (oceanspray) as the prongs. The spear would have a weight attached to the bottom, and feathers attached to the prongs, which would act as 'feelers'. They would

feel the bottom of the river until they hit a sturgeon, a method called *p'ep'utl'*. When they located a *qwtaythun*, they would *thq'ut* (spear) it.<sup>lviii</sup>

The spinal cord (notochord) of the sturgeon, called *qw'ulhunu*, was considered a particular delicacy and was eaten raw. One end of the *qw'ulhunu* was put in the one's mouth and the other end was held in both hands. Then, using a squeezing motion, starting from the end held in the hands, the inside of the *qw'ulhunu* was squeezed into the mouth. A Quw'utsun oral tradition about Xeel's describes how the sturgeon came to have this cord. The story was told by Siamtunaat (Mary Rice of Penelakut) to Beryl Cryer in the 1930s.<sup>lix</sup>

Our late Elder Florence James' grandfather Qwulthimult-hw taught her about *tqép*, a round underwater net anchored from shore, used at the mouth of the river. Mrs. James's ancestors had this type of net for thousands of years. It was a friendly, kind, way to catch salmon.<sup>lx</sup> Sturgeon was also caught in large tidal traps<sup>lxi</sup> and fished with a bone hook baited with eulachon roe or a bag net woven of nettles.<sup>lxii</sup>

We would clean and dry the fish we caught on the South Arm of the Fraser River mainly at the waterfront at the Lands of Tl'uqtinus.<sup>lxiii</sup> We would have to dry fish on the Fraser River, because if we left it fresh it would go spoiled.<sup>lxiv</sup> We could dry salmon like *thuqi'* (sockeye) there by hanging it over a slow fire in the *s-thaw't-hw* (bighouses) we were living in or in *q'i'law't-hw* (plank smokehouse structures).

### 3.3.3.4. Hunting Mammals and Fowl

The Quw'utsun regularly hunted the Lands of Tl'uqtinus, for example, for *ha'put* (deer)<sup>lxv</sup> and *sti't-hwum'* (willow grouse), and used it as a base of operations to prepare for hunting or trapping *sqwaqwis ma'uqw* (waterfowl) downriver at Shnuwiilh.<sup>lxvi</sup> Tilbury Island was also used as a trapping area.

When an area has been *yuqwunup* (burned), new shoots come up at the *spuliipxun* (small meadows) where the berries come up. The deer go there to eat the new shoots or even the berries.<sup>lxvii</sup> Since we burned the *maal'sum* areas at the Lands of Tl'uqtinus, the small meadows there were a good place in terms of being deer hunting grounds.<sup>lxviii</sup> Fishing hooks and needles made of deer bone were used in mending fishing nets.<sup>lxix</sup>

The *qwa'upulhp* (crabapple tree) was habitat for the *sti't-hwum'* (willow grouse), which would eat the crabapples.<sup>lxx</sup> Luschiim's father taught him to hunt at night for *sti't-hwum'* that landed in *qwa'upulhp* and that long ago the Quw'utsun people hunted grouse this way using a pole or bow and arrow.<sup>lxxi</sup>

Our people regularly used the Lands of Tl'uqtinus to get to and from work hunting and trapping waterfowl at Shnuwiilh. We harvested ducks downriver and upriver from Tl'uqtinus, including during the fall and winter.<sup>lxxii</sup> The Lands of Tl'uqtinus were a base of Quw'utsun operations and a source for plant materials in our hunting technologies. Ducks would be caught using airborne nets. *Ma'uqw* would be hunted in streams and boggy areas, as well as intertidal areas within Shnuwiilh.<sup>lxxiii</sup> Our people had a specific process for preserving immense quantities of ducks to create *sq'i'lu* (preserves) for later use.<sup>lxxiv</sup> Waterfowl and seabirds are used for longhouse ceremonies and funerals for Elders.

### 3.3.3.5. Trade and Social Practices

Our people regularly used the Lands of Tl'uqtinus for trading and as a base of operations for travel to trade.<sup>lxxxv</sup> We would collect clams and sea resources on our way through the Gulf Islands to Tl'uqtinus, which would be dried and cured to become *sq'i'lu* (preserved foods) to share with the Quw'utsun families who stayed at Tl'uqtinus all year-round. Some *sq'i'lu* would also be traded or *hwayum* (sold).<sup>lxxxvi</sup> We traded clams and dried *t'eqe'* (salal) berry cakes at the Fraser River.<sup>lxxxvii</sup> The *s-tseelhtun* (fish) harvested from the south arm and preserved at the Lands of Tl'uqtinus would be brought back to trade, share and sell with our people who had stayed on Vancouver Island.<sup>lxxxviii</sup> While at our villages on the lower Fraser River, we would trade camas and clams for things like goat wool.<sup>lxxxix</sup>

While resident on the Fraser River harvesting fish, we could also work on arranging marriage and other social connections. In a region where marriage was an economic union between families of high status living in separate areas, occasions to meet and discuss such arrangements were of crucial importance. Since it would have been known that we would be at our village at the Lands of Tl'uqtinus village during the salmon season and have large quantities of a diversity of fresh and dried food fish, it was an opportune time for ceremonial occasions, including marriages and potlatches, to occur. Wealthy families depended upon having a surplus of salmon to use for ceremonies at which their escalating status would be both apparent and acknowledged.<sup>lxxx</sup> Large aggregations of Quw'utsun people living and working together at their Lulu Island village also provided Quw'utsun families with the opportunity to connect with other Quw'utsun families for trade, marriage, and sharing information.<sup>lxxxi</sup>

### 3.3.3.6. Cultural Importance

Culturally, fish are critical to us; they are both food and a gift from the Creator to sustain us through life.<sup>lxxxii</sup> When there are cultural events, communities really want traditional foods because traditional food is part of our culture: it is who you are and where you come from.<sup>lxxxiii</sup> It gives people power to know they have traditional foods to share with Elders and families and are treating them right. In Quw'utsun culture, when hosting a gathering, you are obligated to provide food for your guests.<sup>lxxxiv</sup> For Quw'utsun children to learn their culture, they need access to traditional foods.<sup>lxxxv</sup>

Salmon were and are used in Quw'utsun ceremonial practices, including burning, naming, initiation and memorial ceremonies. The number of fish required in this context is significant. For example, a Quw'utsun initiation ceremony takes four days and might require a good hundred or so salmon.<sup>lxxxvi</sup>

Our oral traditions indicate that we are a people connected to the Fraser River, and that we are fishers. Fishing implements were among the cultural arts that the First Ancestors brought to earth.<sup>lxxxvii</sup> Our practice of fishing for food such as salmon, prior to and at contact was a means of survival as well as part of our social fabric. It was, and is, culturally integral.<sup>lxxxviii</sup> Salmon, as a food resource that could be turned into wealth, allowed for Quw'utsun social stratification; titleholders could trade salmon for items such as blankets and canoes to be given away at ceremonial distributions.<sup>lxxxix</sup>

Different species of salmon are special for food and health. Sockeye salmon was and is generally the most favoured salmon of the Quw'utsun. One of the reasons is the most valuable and important resource is because it has more beneficial oils than all the other salmon.<sup>xc</sup>

### 3.3.3.7. Plant Harvesting

Our people regularly harvested and used approximately 120 different species of plants from the lands at and surrounding our village on the Lands of Tl'uqtinus, including the Project area. This includes 38-57 species used for food, 49-64 used for materials in technology, and 31-46 species potentially used as medicine.<sup>xcj</sup> Plants used for medicine, material and subsistence were, and are, highly important.

Our people harvest plants and berries for food and medicine. Important species include blueberries, cranberries, crabapples, salmonberries, blackberries, raspberries, and red huckleberries, grasses, stinging nettle, moss, ferns, cedar, hardhack, red alder, pine, cattails, tule, skunk-cabbage, willows, cottonwood, salal and labrador tea.

Tilbury Island was a harvesting area just a short row across the river from the Lands of Tl'uqtinus. Late Penelakut Elder Florence James described the Hul'q'umi'num name for Tilbury Island, Xupi'xunum, with reference to the prefix "Xup" and "pix" which means to scratch. She talked about how the Quw'utsun harvested berries from Tilbury Island, and presented a tool used as a traditional berry scraper (i.e., "scratching" the berries off) (Figure 3).<sup>xcii</sup>

Figure 3: Traditional Berry Scraper

### 3.3.4. Influence, Dominance, and Exclusive Occupation

We exclusively occupied our village and settlement lands at the Lands of Tl'uqtnus.<sup>xciii</sup> The Court confirmed in *Cowichan*:

[1535] The evidence demonstrates that a number of Coast Salish groups were present on the lower Fraser River, including the Musqueam, Tsawwassen, and Cowichan. The lower Fraser River was a place of abundant resources and fish runs. The evidence also shows that while many groups lived on the lower Fraser River, there were places that belonged to specific groups. The Cowichan established a large, permanent post and beam village along the waterfront of the south arm of the Fraser River. This was the Cowichan village. It belonged to the Cowichan, and other groups respected that it was on Cowichan land.

[1536] The Cowichan occupied their village *en masse* in the summer and maintained a periodic presence throughout the year. The evidence shows that the Cowichan had a perpetual right to their land at Tl'uqtnus, established through occupation, as a matter of Coast Salish and customary law.

[1537] The Cowichan exercised effective control over their land. There is no evidence of other Indigenous groups occupying this village. At the relevant time period, in the first half of the 18th century, **the Cowichan were the dominant Indigenous group on the lower Fraser River, in terms of size and strength.** They had many warriors and strength in numbers. They used intimidation and force to deter challenges from other groups. They established a reputation as a dangerous Nation with fierce warriors. These were strong messages to other Indigenous groups, who tended to avoid the Cowichan, and unless they were invited, they should not enter the Cowichan village and surrounding lands. [emphasis added]

As the Court recognized, we were the dominant indigenous group on the lower Fraser River. In terms of size and strength, we had many warriors and strength in numbers. We used intimidation and force. To deter challenges from other groups, we established a reputation as a dangerous nation with fierce warriors. These were strong messages to other indigenous groups who tended to avoid us.

As noted, the Quw'utsun had the capacity and intention to control their village and some surrounding areas on the South arm of the Fraser River prior to and as of 1846; this was a central finding of the court in *Cowichan* and a key component of the test for aboriginal title.<sup>xciv</sup> The Court in *Cowichan* also accepted the evidence that the Quw'utsun regarded the land on the south arm as our own.<sup>xcv</sup>

Quw'utsun Nation exclusive control over and occupation included Tilbury Island; expert evidence, oral history and the written record confirmed this (e.g., see Figure 4). The full delineation of exclusive Cowichan territory on the south arm by Dr. Kenneth Brealey is set out below:

*In my opinion, and as per the terms of my retainer, an hermeneutically informed historical geographic analysis that evaluates empirical data in context, incorporates oral historical evidence, is sensitive to the real socio-political constitution of Island Halq'eméylem society, and recognizes that the disruptions of colonization and the civilizing mission affect continuity, demonstrates that Cowichan nation territory on the lower Fraser River at first contact in 1792 and as of the Oregon Treaty in 1846 extended from approximately the west end of Annacis Island and down both sides of the south arm of the Fraser River to its mouth. It included all of the settlement at Tl'uq̓tinus as on Map 4, both sides of Canoe Pass about as far as the end of River Rd. W., and both sides of the main channel of the south arm to about the foot of No. 1 Rd., **Deas and Tilbury Islands**, and the half dozen islets in the south arm between Woodward's and Ladner Reaches. It therefore included the village of Hwlh̓its'um mapped as Island Halq'eméylem by the HTG on Map 2, and those Penelakut, Chemainus, and Cowichan Tribes fishing, gathering and camping places in what is now south Steveston reported by Dewhirst's and Thom's informants in the early 2000s. 722 As such, and over and above DgRs17 at the Tl'uq̓tinus settlement, it would have included Borden sites DgRs26 to 28 in the Woodward's Slough; and DgRt 8 and DgRs15. It would have also included the villages of Suwq̓w'eq̓sun and Pulhx̓uneewmuhw mapped as 'undetermined' by the HTG on Map 2, and so also Borden sites DgRs39 ('cultural material, fishing weir', foot of Nelson Rd. at the south arm); DgRr59 and possibly 23; and in what is now downtown Ladner DgRs41 ('cultural material, shell middens', north end of Cohilukthan Slough). In short, and in my opinion, Duff and Ham were correct to map the upper reaches of the south arm of the Fraser River as Cowichan. But even on the basis of an ethnographic record that does not, in the main, fully engage the ethnohistorical accounts, I conclude that the lower reaches were neither Tsawwassen (as in Ham) nor Musqueam (as in Duff). Territorially, they were Cowichan also.*

Figure 4: Map 5, Cowichan (and Coast Salish) Boundaries, legend in Brealey, Dr. Kenneth, *Historical Geography of Cowichan Land Use and Occupancy Lower Fraser River: Map Series and Report*. Exclusive Cowichan territory is outlined in red. This map series and report was admitted as an expert report in Cowichan and relied on by the Court.

### 3.4. Unlawful Alienation from Lands of Tl'uqtnus, Project Area, and South Arm of Fraser River

This Part describes how we were unlawfully alienated from our village at the Lands of Tl'uqtnus and our fishery, and the Project area, as a result of the Crown's failure to create a reserve for us at Tl'uqtnus and the subsequent disposition of those lands to private parties through unlawful Crown grants. Because of this theft, our people were unable to continue to live at our village on the Lands of Tl'uqtnus and to utilize the Project area. This section describes how the theft occurred, and how the harmful effects of this alienation have reverberated through multiple generations of Quw'utsun people and continue today.

### 3.4.1. Crown Promise, Appropriation, and Disposition

In 1853, Governor James Douglas, on behalf of Queen Victoria, promised the Quw'utsun that the Crown would treat them with justice and humanity so long as they remained at peace with settlers (the "**1853 Crown Promise**").<sup>x cvi</sup>

In September 1849, Douglas wrote to Barclay and recommended that, as a matter of justice and in order to keep peace in the colony, "the Indians Fishere's [sic] Village Sities [sic] and Fields, should be reserved for their benefit and fully secured to them by law". Barclay subsequently instructed Douglas "to consider the natives as the rightful possessors of such Lands only as they occupied by cultivation, or had houses built on, at the time when the island came under the undivided sovereignty of Great Britain in 1846".<sup>x cvii</sup> Douglas therefore pursued a policy of entering into treaties with Indigenous peoples that protected the lands about their village sites as reserves. After reaching agreements with neighbouring tribes, Douglas acknowledged that Quw'utsun wished to also enter into land disposition agreements, but he "declined their proposals in consequence of [their] not being prepared to enter into possession..."<sup>x cviii</sup> Douglas also wrote to James Yale, HBC Clerk, Fort Langley, on the lower Fraser River in May 1850 and advised, "I have been lately engaged in buying out the Indian right to the lands in this neighbourhood and to the westward. It is rather a troublesome business, but we are getting on very well. ... I mention this circumstance as your Indians will no doubt be claiming payment for their lands also; but that can be settled by and bye."<sup>x cix</sup>

Between 1850 and 1854, Douglas concluded fourteen treaties with various Indigenous groups, including the WSÁNEĆ and Snuneymuxw. In each instance, the terms of the treaty provided that village sites and cultivated fields were reserved for the Indigenous signatories' benefit.<sup>c</sup>

In January 1853, Governor Douglas travelled to Cowichan Bay where he met Quw'utsun chiefs and sought to establish rules for peaceful colonial relations with the Quw'utsun people. Specifically, he attended to arrest a murder suspect from Clemclemaluts. When confronted by a Quw'utsun war party, Douglas reported that he "assembled the Indians and spoke to them long, and seriously on the subject of their relations with the Colony, and the rules which must govern their conduct, in future." He noted that the Quw'utsun expressed "a sincere desire to live in peace with the Colony" and that the subsequent surrender of the murder suspect without bloodshed "may be considered, as an epoch, in the history of our Indian relations, which augers well for the future peace and prosperity of the Colony."<sup>ci</sup>

As to "the rules" the Governor sought to establish with the Quw'utsun, Douglas recorded them contemporaneously in his journal entry of January 7, 1853:

I afterwards addressed the Indians who were there assembled, on the subject of their relations with the Colony, and the Crown. I informed them that the whole country was a possession of the British crown, and that Her Majesty the Queen had given me a special charge, to treat them with justice and humanity and to protect them against the violence of all foreign nations which might attempt to molest them, so long as they remained at peace with the settlements. I told them to apply to me for redress, if they met with any injury or injustice at the hands of the Colonists and not to retaliate...<sup>cii</sup>  
[emphasis added]

That 1853 Crown Promise, in combination with English common law, translated to executive and legislative acts, resulting in the appropriation of “Indian” villages, settlements and cultivated lands therearound (collectively referred to herein as “Indian Settlement Lands”) from the Colony of British Columbia’s disposition processes, starting in 1859/60.<sup>ciii</sup> The Lands of Tl’uqtnus were, in fact, Indian Settlement Lands in 1859/60.<sup>civ</sup> Even though the Indian reserve creation process was not finalized for the Lands of Tl’uqtnus, steps taken by Governor Douglas in 1859/60 set aside all Indian Settlement Lands as anticipatory Crown reserves.<sup>cv</sup> Douglas’ policy in this regard was to set aside reserves “in conformity with the wishes of the natives”.<sup>cvi</sup> Later Crown agents geographically truncated the area in which reserves were to be marked out; subsequent instructions omitted the lands about the mouth of the Fraser River, and thus the Quw’utsun village, cultivated lands, and fishing station at Tl’uqtnus.<sup>cvii</sup> Rampant land speculation<sup>cviii</sup> by colonial officials on the lower Fraser River, including Chief Commissioner of Lands and Works (“**CCLW**”) Richard Clement Moody’s concealed acquisition of two sections of the Lands of Tl’uqtnus for himself, explains why the Lands of Tl’uqtnus were not demarked as an Indian reserve, as instructed by Governor Douglas in 1859/60.<sup>cix</sup> Just days before Governor Douglas set aside and reserved for the Crown all Indian Settlement Lands, Joseph W. Trutch certified as accurate the colonial survey, completed under contract to CCLW Moody in early October 1858.<sup>cx</sup> The Trutch survey identified the Cowichan village at the Lands of Tl’uqtnus (see Part III.B(2)).<sup>cxii</sup> In other words, the village was noted on the Trutch Survey conducted for Moody, which was the very basis for the survey description of the lands he covertly acquired.

The Crown’s policy of setting aside Indian Settlement Lands continued right up to 1871, when the Colony of British Columbia joined Confederation.<sup>cxiii</sup> The Crown was well-aware of the village and fishing station at Tl’uqtnus but failed to take the administrative steps required to finalize Indian reserve creation.<sup>cxiii</sup> The earliest Crown Grants to the Lands of Tl’uqtnus were issued just months before Confederation. The Cowichan continued to occupy and possess the Lands up to 1871 (and beyond),<sup>cxiv</sup> and consequently, the 1871 Crown Grants were made without authority.<sup>cxv</sup>

The appropriation of Indian Settlement Lands was carried forward into Confederation, with both BC and Canada assigned constitutional roles for the continued protection of appropriated Indian Settlement Lands, such as the Lands of Tl’uqtnus, with a view to finalizing Indian reserve creation.<sup>cxvi</sup> After several years of back and forth between BC and Canada on how to implement Article 13 and give effect to Indian reserve creation, the governments established the JIRC in November of 1875. Its objective was to “visit, with all convenient speed, in such order as may be found desirable, each Indian nation... in British Columbia, and...to fix and determine for each nation separately, the number, extent and locality of the Reserve or Reserves to be allowed to it.”<sup>cxvii</sup> The Commission’s work was carried out under Malcolm Sproat between 1876 and 1880.

In 1876-77, JIRC Commissioner Sproat met with the Quw’utsun who complained about the sale of the Lands of Tl’uqtnus to an absentee settler. Writing in January 1878, Sproat described the Lands of Tl’uqtnus and its continued occupation as follows:

As regards complaint No 5, it is stated to be true that the old fishery station on the Fraser known as the ‘Cowichan Fishery’ and annually used by them from time immemorial in getting fish for winter food, has been sold many years ago. The owner being an absentee, there has been no trouble about the land as yet. About one thousand Indians enamped there last season.<sup>cxviii</sup>

In January 1878, Sproat wrote to Albert N. Richards, Lieutenant Governor, British Columbia:

It is extremely inconvenient to the Province to have lands locked up from pre-emption or sale in fine districts, owing to the non-settlement of the Indian claims but this is a necessity, otherwise the Province might have to buy out the interest of the white settlers.

This is true in many parts of the country. I may mention one instance which will come up by and bye. The ancient fishing ground on the Lower Fraser of the Cowichan nation, ... has been sold and now belongs to a white nonresident. What can be done in such a matter?<sup>cxxix</sup>

On April 22, 1878, Sproat again noted the Quw'utsun complaint, this time to Indian Superintendent Powell, in relation to "an old fishing place on Frazer River frequented by the Cowichan... [that] has been sold some time ago over their heads."<sup>cxx</sup>

Neither the JIRC nor the Crown governments it represented addressed our complaint.<sup>cxxi</sup> There is no evidence that JIRC even visited the Lands of Tl'uqtinus.<sup>cxxii</sup>

Our people continued to occupy the Lands of Tl'uqtinus and the *Land Act*, as in force, prohibited Crown grants in relation to occupied or appropriated lands and Indian Settlement Lands, including at Tl'uqtinus.<sup>cxxiii</sup> Article 13 of the *BC Terms of Union*, 1871, constitutionally constrained BC's authority to sell these lands.<sup>cxxiv</sup> Despite the commitments of Article 13, Indian Reserve creation at the Lands of Tl'uqtinus stalled shortly after Confederation. Instead of properly protecting the Lands from disposition pending conveyance to Canada for the benefit of the Quw'utsun, as he was obliged to do, Lt. Governor Joseph Trutch and his successors continued to issue Crown Grants to the Lands of Tl'uqtinus starting with former CCLW Moody. The 1874 Crown Grants were made to well-connected land speculators and government officials,<sup>cxxv</sup> despite Federal Indian Superintendent Powell warning Trutch (and others) in 1873/74 that various Indigenous groups along the lower Fraser River were complaining that settlers were taking their land without compensation and that the BC government was not adequately protecting those lands as promised.<sup>cxxvi</sup> By 1914, the Crown had issued fee simple grants blanketing the entirety of the Lands of Tl'uqtinus.<sup>cxxvii</sup> Each of the post-Confederation Crown Grants were made without statutory authority because the *Land Act* did not authorize the sale of lands that were occupied, appropriated, or Indian settlements, all of which the Lands of Tl'uqtinus were. The Crown Grants were made without constitutional authority because Indian Settlement Lands, like the Lands of Tl'uqtinus, enjoyed constitutional protection from disposition by sale under Article 13.<sup>cxxviii</sup>

Additionally, BC later statutorily vested Richmond with (1) the fee simple interests to most of the Lands of Tl'uqtinus by operation of the *Municipal Act*, and (2) the soil and freehold of highways on the Lands of Tl'uqtinus by operation of the *Community Charter*, both of which occurred without constitutional authority.<sup>cxxix</sup>

As of approximately December 2017, there were 150 estates of fee simple interest in relation to the Lands of Tl'uqtinus.<sup>cxxx</sup> Each of these derive, through subdivision over time, from the 18 originating Crown Grants in the Lands of Tl'uqtinus. About half of the Lands of Tl'uqtinus are now held by a combination of Canada, the Vancouver Fraser Port Authority,<sup>cxxxi</sup> and the City of Richmond, though some of those lands are now being returned to the Quw'utsun as a result of the *Cowichan* decision.

The Crown's transfer of property rights to third parties at Tl'uqtnus and the Project area has and continues to adversely interfere with our ability to benefit from our own homelands and to use them in a way that upholds our obligations to those lands and to each other.

We were essentially made trespassers on our *st'l'unup*, our sacred ancient homeland. It follows that this interfered and infringed our access to our big houses, cultivated berry fields, canoe landing, fishing station, and fish drying racks. This, in turn, diminished our access to a variety and volume of plants, fish, and other resources used for technological, ceremonial, and spiritual purposes that were once cultivated, gathered, harvested, or otherwise collected at the Lands of Tl'uqtnus. A vital mainland trading station was lost and all the wealth, variety, and benefits associated therewith. Once a major participant in berry trading,<sup>cxxxii</sup> the loss of these foods and other resources also impacted our trading capacity and increased their dependence on non-traditional food sources. The loss of access to these things, which were housed/sourced at the Lands of Tl'uqtnus, represents a severe economic, cultural and spiritual loss, one which will take many, many generations to recover from.

Cascading reputational effects were equally profound. By depriving our people of legal access to the Lands of Tl'uqtnus, the control we once exercised over the South Arm has been heavily impacted. This has had significant knock-on effects for our modern fishing access, discussed in Section 3.4.2.

### 3.4.2. Fishing Regulations and DFO Policies

Prior to contact and the assumption of exclusive federal jurisdiction over “Sea Coast and Inland Fisheries” in 1867, we managed the fisheries we used – including the South Arm – in accordance with our own legal system and resource management practices. Beginning in the late 1800s, Canada's fisheries regime significantly disrupted the continuity of the Quw'utsun practice of fishing the South Arm for food.

Post-sovereignty Crown policy was originally not to interfere with Indigenous fisheries because fish was considered an inexhaustible staple of their diet.<sup>cxxxiii</sup> This policy changed after British Columbia joined Confederation and many of its fisheries came under federal jurisdiction. Through the remainder of the 1800s and into the early 1900s, Canada exerted increasing control over these fisheries<sup>cxxxiv</sup> until its regime dictated all aspects of fishing practices in the South Arm, including the practices of the Quw'utsun, and penalized those who did not comply.<sup>cxxxv</sup> By the mid-20th century, Canada's fisheries regime had effectively shut the Quw'utsun out from the South Arm fishery because it did not consider them “local” to the area since they did not have a reserve there.

In 1890, Canada began restricting the total number of licenses for salmon fishing on the Fraser River to 500 – 350 of which were allotted to the canneries.<sup>cxxxvi</sup> That same year, Canada refused to license our people to fish the South Arm because we were not “White men” nor recognized by Crown agent to be “River Indians” (because Crown had failed to finalize reserve lands for the Quw'utsun at the Lands of Tl'uqtnus and confined the Quw'utsun to Vancouver Island and the Gulf Islands.).<sup>cxxxvii</sup> Our fishermen resisted this decision, asserting they had a right to fish the Fraser because their fathers had harvested salmon there since before the canneries.<sup>cxxxviii</sup> They said they had a reserve on the Fraser River upstream from the Deas Island Cannery at “Kluck-tins” [Tl'uqtnus]<sup>cxxxix</sup> and this ought to entitle them to renewal of their licences.<sup>cxl</sup>

In 1894, Canada adopted new regulations which required Indigenous persons to get a “permit” to food fish.<sup>cxli</sup> Indigenous food fishing was now considered a privilege to be doled out by Crown agents. In 1895, our people complained about the loss of our ability to fish. They were concerned about the new permit requirement and wanted Canada to acknowledge the promise made by the JIRC, which was their right to fish as formerly.<sup>cxlii</sup> We petitioned the federal Minister of Fisheries about our lack of fishing rights in 1896.<sup>cxliii</sup>

In 1910, Canada adopted new regulations regarding Indian Food Fishing permits. Now the Fisheries Inspector would issue permits on the advice of the local Indian Agent.<sup>cxliv</sup> In 1917, Canada amended its regulations to empower the federal fisheries department to fix the place, method, and timing of any Indian food fishery<sup>cxlv</sup> and thus ushered in what became the status quo for Indigenous fisheries regulation: a default prohibition on Indigenous food fishing, subject to Crown permission on a wide variety of terms and conditions, with no change in its erroneous view that the Quw’utsun were not Fraser “River Indians.”

From 1978-1990, Canada formalized its status quo into written policies that continued to alienate us from the South Arm fishery, accessible only with “local” band permission. In 1978, DFO formalized its longstanding practice of only licensing Indigenous persons to fish for food in areas their band had fished in the previous 25 years.<sup>cxlvi</sup> The policy stated that DFO would only include a new area on a band’s licence if DFO deemed them “local” or “resident” to the area. A local/resident band was defined as bands with reserves near or adjacent to a specified area.<sup>cxlvii</sup> This was DFO’s “Adjacency Policy”. As we never had a reserve allotted to us at the Lands of Tl’uq̓tinus, we were never deemed local/resident to the Fraser River and remained excluded from fishing the South Arm for food.

The 1978 policy formalized existing DFO policy in which Indigenous fishers looking to fish in an “extraterritorial” area must get authorized by the “local” band (sometimes referred to as ‘protocol’).<sup>cxlviii</sup> Any fish caught would be counted against the “local” bands’ allocation.<sup>cxlix</sup> In 1982, Canada told the Musqueam Indian Band (“**MIB**”) it would not license members of non-local bands to fish in MIB fishing areas without their permission.<sup>cl</sup> Then, when Cowichan Tribes asked DFO for access to the Fraser River food fishery, DFO told them they had to get MIB’s permission.<sup>cli</sup> While Cowichan Tribes did not agree they needed permission, they complied so they could get enough fish to satisfy their community’s food fish needs.<sup>clii</sup> Thus, Canada formalized its treatment of the Quw’utsun as extraterritorial to the South Arm.

In 1992, DFO released its Aboriginal Fisheries Strategy which governed Indigenous food, social and ceremonial (“**FSC**”) fisheries. Comprehensive Fisheries Agreements (“**CFA**”) developed under the AFS determined fishing areas and other conditions listed on a band’s annual communal licence. MIB and Tsawwassen First Nation (“**TFN**”) had the South Arm included in these CFAs while the Quw’utsun bands did not.<sup>cliii</sup> In 1993, DFO released its “Policy for the Management of Aboriginal Fishing” (the “**1993 Policy**”). The 1993 Policy has never been amended and remains DFO’s primary policy governing FSC fisheries.<sup>cliv</sup> The 1993 Policy introduced DFO’s “Historic Use Policy”: Indigenous groups should fish, and have priority of access to food fish, in areas they historically (pre-contact or at contact) used.<sup>clv</sup> The 1993 Policy does not expressly incorporate the Adjacency Policy or its policy requiring “extraterritorial” bands to get protocol from “local” bands, however DFO continued to follow this approach.<sup>clvi</sup>

Following the Supreme Court of Canada decision in *R. v. Sparrow*,<sup>clvii</sup> Cowichan Tribes, Penelakut Tribe, Stz'uminus First Nation and Halalt First Nation all asserted their Aboriginal right to fish the South Arm to DFO and provided DFO with supporting documentation.<sup>clviii</sup> DFO responded by confirming that their Adjacency Policy, and its "local" band permission requirement still applied.<sup>clix</sup> If the Quw'utsun wanted to fish the Fraser River, according to DFO the only other options were to negotiate a treaty or establish their rights in court, both lengthy and expensive processes that would not provide near-term fishing access.<sup>clx</sup> Over the next 14 years, DFO applied its Adjacency Policy, which required us to get "local" band permission to fish the lower Fraser River, and failed to assess whether the Quw'utsun met the Historic Use Policy.<sup>clxi</sup> We repeatedly told DFO we disagreed with the permission requirement and informed them of our traditional practice of fishing the South Arm for food.<sup>clxii</sup> DFO did not change its approach through to 2006,<sup>clxiii</sup> though during this time it was also internally questioning the conflict between DFO's policies and how they applied to our South Arm fisheries, noting potential legal risk in their approach "particularly in the face of persuasive evidence of settlement in the Fraser by many Coast Salish First Nations".<sup>clxiv</sup>

In 2006, we took a united stance against DFO's requirement that we get "local" bands' permission before fishing the South Arm.<sup>clxv</sup> We pointed to historical records substantiating our historic use of the South Arm for fishing and asserted we were local to the South Arm.<sup>clxvi</sup> Discussing the issue internally, DFO staff recommended the following position:

"We should indicate that we have a concern for safety and proper management and as a result it is vitally important that Cowichan develop protocol with [Musqueam and Tsawwassen]."<sup>clxvii</sup>

This position was regional policy.<sup>clxviii</sup>

DFO followed this recommendation<sup>clxix</sup> and in later years often continued to take this position.<sup>clxx</sup>

Despite notice of the fact that the Quw'utsun were local to the South Arm, Canada maintained its prior approach to our detriment. Canada did so from 2008 to 2019, notwithstanding a series of new policies.<sup>clxxi</sup>

As of March 31, 2019, DFO still treated us as "extraterritorial" to the South Arm. DFO maintained that protocol discussions and agreements are desirable for safety<sup>clxxii</sup> and protocol remained important to DFO in deciding whether to license the Cowichan to fish the South Arm.<sup>clxxiii</sup> Thus, for over a century, Canada has maintained a fisheries regime that disrupted the Quw'utsun's practice of fishing the South Arm for food.

However, on August 7, 2025, the Court in *Cowichan* declared that the Quw'utsun Nation has the Aboriginal right to fish the South Arm for food, for any species, at any time of year. The Quw'utsun Nation have since that day been working steadfastly to get our boats back on the river beside our village and the Project area.

### 3.5. Colonial Disruption

Colonial harms over and above the unlawful alienation from the Lands of Tl'uq̓tinus and being prevented from fishing the south arm have caused extreme hardship and suffering for our people and impacted all aspects of Quw'utsun life, resulting not only in a disconnect from the Lands of Tl'uq̓tinus and the surrounding lands and waters, but also in disparate health, economic and other outcomes for our people. This section describes some of the main colonial policies and actions which have impacted the Quw'utsun people and provide a critical aspect of the context through which we assess proposed further interference with our ability to exercise our Quw'utsun Rights and carry out our way of life.

#### 3.5.1. The Indian Act

The *Indian Act, 1876* consolidated previous colonial Indian<sup>clxxiv</sup> legislation into one Act, with power over Indians centered in the federal Superintendent General of Indian Affairs.<sup>clxxv</sup> Its purpose was to “prepare [Indians] for a higher civilization” by encouraging them “to assume the privileges and responsibilities of full citizenship.”<sup>clxxvi</sup> In the *Indian Act, 1876* and subsequent iterations,<sup>clxxvii</sup> the federal government gave itself the power to unilaterally control every aspect of life on reserves and create whatever infrastructure it deemed necessary to achieve its desired end of assimilation through enfranchisement.<sup>clxxviii</sup> As shown below, Canada controlled where ‘Indians’ lived and worked, where they could go, and supervised the education of ‘Indian’ children.

##### 3.5.1.1. Confinement on *Indian Act* Reserves

The Quw'utsun were not fixed in space;<sup>clxxix</sup> they moved around their lands and waters and changed residences by season. Canada disrupted this movement by imposing residency requirements. The federal government wanted ‘Indians’ to stay on reserves. Douglas’ pre-confederation system of anticipatory reserves was intended to settle tribes permanently in villages.<sup>clxxx</sup> Post-confederation, the Crown continued its work by creating *Indian Act* reserves.

Then, in 1885, without legal authority or lawful foundation, Canada instituted a “pass system,” requiring permission from the Indian Agent before ‘Indians’ could leave their reserve. The pass system “was used, without any basis in law, to monitor, control, and limit the activities of Indigenous peoples.”<sup>clxxxi</sup>

#### 3.5.2. Prohibition on Raising Funds for Land Claims

In 1927, Canada amended the *Indian Act* to prohibit ‘Indians’ and their supporters from raising funds to pursue land claims without the consent of the Superintendent General.<sup>clxxxii</sup> This prohibition existed until 1951.<sup>clxxxiii</sup> Thus, in 1930, when Quw'utsun Chief Modeste, Chief George, and John Elliott sought to fund a legal claim to Aboriginal title, Indian Affairs directed the RCMP to investigate them for trying to raise money to hire a lawyer.<sup>clxxxiv</sup>

### 3.5.3. Residential Schools

Canada began formally funding residential schools in 1883.<sup>clxxxv</sup> The legislative intent of Canada's residential school system was to separate Indigenous children from their families "to minimize and weaken family ties and cultural linkages, and to indoctrinate children into...the legally dominant Euro-Christian society."<sup>clxxxvi</sup> Children were placed in residential schools far away from their reserves to discourage parents from visiting them.<sup>clxxxvii</sup> The idea was to assimilate Indigenous peoples by "kill[ing] the Indian in the child."<sup>clxxxviii</sup>

In 1894, *Indian Act* amendments empowered the Governor in Council to make regulations for compulsory attendance at school of any Indians of any province or named band. These regulations allowed the arrest and conveyance of children to school and the creation of summary conviction offences for parents or guardians who prevented children from attending.<sup>clxxxix</sup> Canada then passed regulations in 1894 which required all children between the ages of 7 and 16 to attend a day school on their reserve for the full school year. Indian Agents or justices of the peace could force children to attend a residential school if they thought the child was not being properly educated. If a child left a residential school without permission, or did not return at the promised time, school officials could get a warrant authorizing them to "search for and take such child back to the school in which it had been previously placed."<sup>cxc</sup>

In 1920, Canada amended the *Indian Act* to require all Indian children between the ages of 7 and 15 to attend day, industrial or boarding school. Previously, a child could only be committed to residential school if Canada determined they were not being properly cared for or educated, but now all Indigenous children had to attend. Truant officers could be appointed to enforce attendance and were authorized to "enter any place where he has reason to believe there are Indian children between the ages of seven and fifteen years." Parents who refused to send their children to school after being given notice could be fined or imprisoned and the child arrested without a warrant and brought to school.<sup>cxc</sup>

There were seven industrial residential schools and two boarding schools in British Columbia.<sup>cxcii</sup> Kuper Island Industrial School (on what is now called Penelakut Island) opened in 1890.<sup>cxciii</sup> Many Quw'utsun children attended it, as well as other residential schools.<sup>cxciv</sup> It closed in 1975.<sup>cxcv</sup> The last residential school in British Columbia closed in 1996.<sup>cxcvi</sup>

### 3.5.4. Impacts of Colonial Disruption on Quw'utsun Way of Life

The history of colonization in this country, "suppressed Aboriginal culture and languages, disrupted Aboriginal government, destroyed Aboriginal economies and confined Aboriginal people to marginal and often unproductive land."<sup>cxcvii</sup>

By the time the Colony of British Columbia was established in 1858, the Crown's attitude toward Indigenous peoples was shifting from "benevolent imperialism" to "administrative colonialism." Administrative colonialism continued with Confederation. The Crown forcibly exerted control over our lives through reserve creation, Indian Agent control, banning cultural practices, customs, and traditions, and implementing the residential school system.<sup>cxcviii</sup>

Colonialism displaced Indigenous peoples physically, denying them access to their traditional territories. It also displaced Indigenous peoples socially and culturally by subjecting them to intensive missionary activity and residential schools, imposing male-oriented Victorian values, and attacking

activities such as dances and ceremonies, all of which undermined their ability to pass on traditional values to their children. Colonialism displaced Indigenous peoples politically through colonial legal systems, forcing them to “abandon or at least disguise” traditional governing structures and processes “in favour of colonial-style municipal institutions.”<sup>ccix</sup>

The ongoing impacts this displacement has had on us and our way of life, our sense of identity as a people, and our ability to maintain a physical connection to our territory on the lower Fraser River, is profound.

#### **3.5.4.1. Confinement to Vancouver Island and Gulf Islands**

Colonial disruption physically and socially fragmented our people and disrupted our traditional practice of fishing the South Arm for food.

Our people moved around their lands and waters seasonally as a collective.<sup>cc</sup> However, *Indian Act* reserves and their predecessors sought to confine us to one location, interfering with the seasonal round we relied on for our nutritional foods, international trade, and maintenance of our kinship relations. The pass system further confined the Quw’utsun to reserves. The government’s push to keep us on reserves impacted our ability to harvest resources.”<sup>cci</sup>

For a while, even in the face of government policies aimed at confining us to reserves, our Elders and ancestors continued their seasonal round, harvesting fish and other resources on the South Arm. In the words of former Cowichan Tribes Chief X’tli’li’ye (Lydia Hwitsum), “They would try to continue to go out and harvest based on the cycles... [Y]ou couldn’t just let it go. They kept trying and trying to keep connecting with the ways of harvesting and connecting with each other...They tried really hard to keep that lifestyle going.”<sup>ccii</sup> But ultimately, we were largely confined to Vancouver Island and Gulf Island reserves. As Quw’utsun knowledge holder Ernie Elliott explained, in the 1970s, most of the Quw’utsun members lived on reserves; “that’s all they knew. That was their world.”<sup>cciii</sup> X’tli’li’ye’s grandmother needed a card signed by an Indian Agent or Superintendent of Indian Affairs to be “legitimately off the reserve.” X’tli’li’ye’s mother told her about the various ways in which the government tried to force our people to stay on their reserves. She described how our people tried to keep harvesting, but these systems made it difficult for them to “live their natural life...They couldn’t go and follow the cycles that they’d been following.”<sup>cciv</sup> The consequences for leaving their reserve without a pass were harsh. X’tli’li’ye described a tree in her village that used to be called “the hanging tree” because the government would hang people on it.<sup>ccv</sup>

Late Quw’utsun Elder Florence James described her deep connection to the South Arm and the Lands of Tl’uq̓tinus. She was taught that this area is a part of her. As a child, she used to row across the river from Tl’uq̓tinus to Tilbury Island with her sister. She had vivid memories of playing on the shoreline at Tilbury Island, watching the trembling aspen leaves shake in the wind and trying to catch sucker fish with homemade hooks and pieces of bread.<sup>ccvi</sup> Her ancestors were the same way: “That was their homeland.” She described the impact of feeling “cut off” from that homeland and “what you know and what you feel there” due to government trespass laws. She recounted how her family was afraid of going to jail for trespassing.<sup>ccvii</sup>

Racism in settler society also kept our people separate and confined to their reserves. X'tli'li'ye said that growing up: "we faced ridicule and racist comments." Her mother told her not to speak her language around *hwunitums* (non-Indigenous persons), and her brothers were regularly beaten up: "it was not safe by any stretch of the imagination."<sup>ccviii</sup> Ernie Elliott, late Chief Seymour, and late Sulipt'un (Norbert Sylvester) all testified in *Cowichan* about racism they experienced growing up. They were not allowed to go to bars or liquor stores, enter certain restaurants or stores, and the single movie theatre Indigenous people were allowed to attend was segregated.<sup>ccix</sup> When the Quw'utsun were allowed to go see doctors other than Indian Health doctors, there were separate waiting rooms for them.<sup>ccx</sup> They were not allowed downtown after 9:00pm. When Quw'utsun people travelled to the mainland by ferry, they had to stay on the car deck. They were not allowed upstairs.<sup>ccxi</sup> Chief Seymour described getting used to hearing racist comments while attending public school in Duncan: "Right up until grade 11 always hearing about the colour of our skin, that we were dirty, we were dumb."<sup>ccxii</sup> Even today, some Quw'utsun students drop out of school because of the racism they experience.<sup>ccxiii</sup>

### 3.5.4.2. Residential Schools

Residential schools had grievous impacts on Quw'utsun society and their way of life. Many members of the Quw'utsun Nation attended residential schools, including Kuper Island Industrial School.<sup>ccxiv</sup>

**A word of caution to the reader:** in *Cowichan*, Quw'utsun witnesses courageously shared with the Court their experiences at residential school and the resulting intergenerational trauma. We respectfully set out portions of their stories below.

The residential school system stripped Indigenous children of their language and identity and if they returned home, they had few useful trades, no parenting skills, and a deeply ingrained contempt for their own culture and traditions. In its Statement of Apology, Canada recognized "the consequences of the Indian Residential Schools policy were profoundly negative and that this policy has had a lasting and damaging impact on Aboriginal culture, heritage and language."<sup>ccxv</sup> But, as Stz'uminus Chief John Elliott testified, an "apology doesn't make it go away. It still exists and still lives in your community."<sup>ccxvi</sup>

One-way residential schools impacted the Quw'utsun's way of life was by severing family connections. Pahalicktun (Lyackson hereditary Chief Richard Thomas (past)) was separated from his siblings and didn't see his sister for years after that.<sup>ccxvii</sup> Students at Kuper Island Industrial School were punished if they were caught talking to any of their relations who were not at the school.<sup>ccxviii</sup>

Chief John Elliott's mother was removed from her family when she was seven. His grandfather's desire to fish was severely impacted by losing his children: "when they came and took his kids away... to residential school, my grandpa didn't fish anymore. And that's the hardest story to hear. To be a fisherman and to have it taken away from you, your children taken away from you... it's your family." John Elliott's grandfather stopped fishing: "His boat sat on the beach, and it never went in the water again. You know, it rotted on the beach."<sup>ccxix</sup>

When Sulipt'un was young, he remembered boats anchored all over places like Cowichan Bay, Kuper Island, and little *shts'uts'mi'nus*.<sup>ccxx</sup> When he returned from residential school circa 1955 there were hardly any boats remaining. Sulipt'un's uncle told him they were taken by the government.<sup>ccxxi</sup>

Ernie Elliott directed Cowichan Tribes' residential school recovery program until Crown funding was cut off. He described some of the stories survivors told about the abuse they experienced: "There was, you know, physical abuse, sexual abuse, psychological abuse." One survivor told him about having a piece of wood jammed into his mouth for speaking his language, breaking his jaw in two or three places.<sup>ccxxii</sup>

X'tli'li'ye's mother told her about being harshly punished for speaking her language. Her mother told her a story about sneaking away to see her brothers who were separated from her at Kuper Island Industrial School: "They'd go up, and they'd look at each other, and they'd go "we, we, we; we, we, we". They were trying to pretend they were speaking English because they had no idea how to speak English."<sup>ccxxiii</sup> The police removed Sulipt'un from the Halalt reserve and forced him to attend Kuper Island Industrial School. While there, he was only allowed to speak English: "If we spoke our language, we either got strapped real bad or we had to kneel in the hallway all night."<sup>ccxxiv</sup> Decades after leaving residential school, he was still trying to relearn his language.<sup>ccxxv</sup>

The late William Seymour, former Cowichan Tribes Chief, testified about the lasting impacts residential school had on the loss of language: "Today I can speak a few words in my language, but I can't carry on a conversation. I speak a word here and there. I'm 69 years old now, and I'm still struggling to learn my language, so I would say that the government did a good job."<sup>ccxxvi</sup> Loss of language is inextricably connected to loss of culture. In the words of Mr. Seymour, "[l]anguage and culture, you can't learn one without learning the other."<sup>ccxxvii</sup> Sulipt'un's father shared a similar sentiment: "He said that without our language, how are we going to teach our children our culture? How are they going to learn our culture without our language? Our language and culture go hand in hand."<sup>ccxxviii</sup> Mr. Seymour's inability to speak Hul'qumi'num impacted his relationship with Quw'utsun Elders. He does not understand what Elders are saying when they share stories and teachings in Hul'qumi'num. He considers "the loss of those stories from my Elders or a loss of those teachings is the biggest downfall of not being able to speak or understand my language." The impacts on his ability to learn harvesting knowledge were significant.<sup>ccxxix</sup>

Quw'utsun Nation member Larry George testified in *Cowichan* about how his inability to speak his language has also impacted his ability to learn about his culture. The bighouse is an important space for cultural knowledge transmission. However, bighouse work is conducted in Hul'qumi'num and many words used in ceremonies cannot be translated into English. Not being able to understand Hul'qumi'num means he cannot fully understand the ceremony's intent or purpose.<sup>ccxxx</sup>

Loss of language impacted the ability of generations of our people to learn from their Elders.<sup>ccxxxi</sup> Some Quw'utsun residential school survivors refused to teach their children their language and culture because of the negative stigma associated with it during their school years<sup>ccxxxii</sup> and/or because they did not want their children to go through what they did at residential school.<sup>ccxxxiii</sup>

Another way the residential school system fragmented our access to our own traditions and history was to take children away from their community while there were Elders still alive who could pass their knowledge on.<sup>ccxxxiv</sup> John Elliott said the few Elders left are disappearing and the Quw'utsun cannot get all their language and traditional teachings back without them.<sup>ccxxxv</sup>

Infrastructural and supervisory neglect and abuse at the schools led to frequent injuries, illness, and death. The work students were subjected to was inadequately supervised and often dangerous, and the badly built and poorly maintained schools constituted serious fire hazards. Inadequate water supply and firefighting equipment were noted at the Kuper Island Industrial School in 1958.<sup>ccxxxvi</sup>

The buildings were incubators of disease like tuberculosis.<sup>ccxxxvii</sup> In 1908, Kuper Island Principal P. Claessen described his school as “insanitary [sic]” and “ruinous” and there were reports of poor water supply or unsanitary sewage conditions in 1931 and 1934.<sup>ccxxxviii</sup> In 1921, Indian Agent Lomas alerted Indian Affairs to the need to segregate “children of tubercular tendencies” at the Kuper Island Industrial School. In 1922, a school inspector noted that 11 students at the Kuper Island school were out on sick leave: “The Indians...are inclined to boycott this school on account of so many deaths.”<sup>ccxxxix</sup> In the 1947-1948 school year, 13 of the 100 students at the Kuper Island Industrial School were hospitalized with tuberculosis. An Indian Affairs official described the method of medical examinations as “ineffective from the point of detecting any latent disease.”<sup>ccxli</sup>

Residential school students were not fed properly. Ernie Elliott described his father’s experience with the food at residential schools, providing a nuanced example of the impacts of the residential school system on his family. He once asked his mother why they could not have tomatoes. His mother told him a story of his father at residential school, where “the food was spoiled, and there was never enough.” His father and his friends would sneak into the tomato field at night and “gorge himself on tomatoes because he was hungry.” Since then, tomatoes triggered unpleasant memories for his father about residential school.<sup>ccxlii</sup>

Many children died at residential school or otherwise never returned home.<sup>ccxliii</sup> Three of Florence James’s great grandmother’s children died while attending residential school.<sup>ccxliv</sup> Her great grandmother never received an explanation for their deaths. Two of Sulipt’un’s aunts never returned home: “The priest and the nuns said they ran away. But I don’t think they did, though, because Kuper Island’s an island, and [it] would be hard to get off of there...”<sup>ccxlv</sup> Loneliness often drove students to take desperate and destructive measures, including suicide.<sup>ccxlv</sup>

The government did not regulate or monitor discipline at the schools. Both physical and sexual abuse often went unaddressed.<sup>ccxlvi</sup> Former students spoke of being locked up in dormitories, broom closets, basements and even crawl spaces. Corporal punishment was often coupled with public humiliation.<sup>ccxlvii</sup> Chief Seymour described being strapped with leather and wood while at St. Mary’s Residential School. He had friends who told him about the sexual abuse they endured.<sup>ccxlviii</sup> Chief Seymour also experienced abuse at the St. Catherine’s Indian Day School. He described the pain of having dental procedures done without freezing or painkillers. He testified that the nuns “would use a wire brush to scrub you with to try and get rid of your brown skin...”<sup>ccxlix</sup>

Pahalicktun described his experience at Kuper Island Industrial School:

It was like a prison...They took all of our belongings... They cut all our hair off like a pig shave. My first day in class, they had me sit in the front. We started the -- started doing our schoolwork. The nun, she come up to my desk and slapped her pointer on my desk to make it snap. Told me to stand up, so I stood up, and she told me to turn around, so I turned around and faced the rest of the class. She very loudly said -- and I'm never going to ever forget those words. She said, this is the disciple of the devil. Only because I was left-handed. They tried to make me use my right hand. When I said no, they tied my left hand behind my back and told me to use my right. I said no. And after not listening to her, I got sent down to the main office. Got down there, and I guess the nun probably already told the priest why I was there. Made me get on my knees, hold my hands out, and got the strap. While I was heading to the office, other students...commented to me, don't let him make you cry because that makes him happy. I tried hard not to make him happy. But I went down that office so many times. Every day I'd get sent down there and get strapped.<sup>ccli</sup>

Education at residential schools was simply repetitious drill, without development of tangible skills.<sup>ccli</sup> Mr. Seymour's parents, who attended Kuper Island Industrial School, only received a grade one education; most of the day was spent doing chores or farm work.<sup>cclii</sup> X'tli'li'ye's mother only received a grade two education at Kuper Island Industrial School, despite being there until the age of 12.<sup>ccliii</sup> Mrs. James's grandfather attended Kuper Island Industrial School but did not receive an education there.<sup>ccliv</sup> The same was true for her mother-in-law who went to residential school but did not even learn how to write her name. Pahalicktun testified, "residential schools weren't there to teach us; they were there to take the Indian out of us."<sup>cclv</sup>

### 3.5.4.3. Resulting Social Conditions

Colonial disruption has caused, and still causes, serious social and infrastructure issues in Quw'utsun communities.<sup>cclvi</sup> The impacts of residential schools did not cease with their closing. The effects of seven generations of residential schools are ongoing. The residential school system created poverty, poor housing, substance abuse, family violence and ill health for Indigenous peoples.<sup>cclvii</sup> John Elliott noted these ongoing effects on the Cowichan: "Some people say, why can't you get over it? It's not that easy. You can't get over it because it still lives within us and it's still something that you'll never - it'll take us generations to recover."<sup>cclviii</sup>

The Quw'utsun are still recovering from residential schools and intergenerational trauma.<sup>cclix</sup> Mr. Seymour testified that "even though today's children never went to residential school, they still suffer because of the loss of parenting skills that their parents are going through." Cowichan Tribes enacted a state of emergency in 2013 to address skyrocketing youth suicide rates in the community because "we were losing our kids one at a time almost on a daily basis... Those social issues are still there today..."<sup>cclx</sup> Ernie Elliott, Mr. Seymour, Councillor Thomas and Sulipt'un testified substance abuse is one method survivors and their families have used to dull their pain.<sup>cclxi</sup>

In 1969, Canada said “too often, to be an Indian is to be without – without a job, a good house, or running water.”<sup>cclxii</sup> Ernie Elliott noted, “it’s not our fault we’re in those conditions... [s]omeone else put us in those conditions.” Before the *Indian Act* and government interference, Indigenous peoples were totally self-sufficient.<sup>cclxiii</sup> As a result of the *Indian Act* and other colonial interference, housing shortages and extreme overcrowding is rampant on reserves. It was noted in the 1960s on Cowichan Tribes reserves, extended families lived in Indian Affairs houses approximately 24-by-48 feet, without running water, central heating, or insulation. Neither Cowichan Tribes nor its members could borrow money from the banks because they had no real property as security.<sup>cclxiv</sup> Decades later, the housing shortage has not improved, “We still need 4- or 500 housing units in Cowichan. We experience a lot of overcrowding. A lot of our people [are] living off reserve because there isn’t housing.”<sup>cclxv</sup> There is also a deficit of clean water on many reserves. Some reserves are under boil water orders and Stz’uminus was allotted reserves without fresh water sources.<sup>cclxvi</sup>

Poor quality education at residential schools led to chronic unemployment or underemployment.<sup>cclxvii</sup> Indigenous people have lower median after-tax income and are more likely to collect employment insurance and social assistance benefits.<sup>cclxviii</sup> For example, Mr. Seymour estimated approximately 70% of Cowichan Tribes members are receiving social assistance.<sup>cclxix</sup> The other Quw’utsun Nation communities experience similar challenges with unemployment, education, social services, poverty, and poor housing.<sup>cclxx</sup>

### 3.6. Resilience: Quw’utsun Substantial Connection to Shnuwiih, the Lands of Tl’uqtinus, and Fishing South Arm of Fraser River

#### 3.6.1. Persistence of Quw’utsun South Arm Fishery

Our people have continued our practice of fishing for food, even on the South Arm, notwithstanding the effects of colonial disruption to our way of life by continuing our seasonal round into the 1900s<sup>cclxxi</sup> and attempting to maintain our connection to the South Arm fishery through the limited legal means available to us (i.e., participating in commercial fishing); preserving and passing on our traditional knowledge; and continuing to fish for food throughout our traditional territory, as best we could.<sup>cclxxii</sup> The Court stated in *Cowichan*:

[3391] The Cowichan have faced over a century of colonial disruption that has interfered with their ability to fish the south arm for food. Yet, I accept that fishing the south arm for food still has a profound significance to their core identity and way of life, and remains an essential element of their culture.

The evidence of Quw’utsun witnesses in *Cowichan* confirms our practice of fishing for food, and the adaptations we made to keep our connection to the lower Fraser River, to the practice of fishing, and to fish as a source of food, into the 20<sup>th</sup> century. In *Cowichan*, many Quw’utsun witnesses testified about their personal recollections of learning to fish, and specifically their recollections of trips to fish the South Arm with family members, several of whom worked as commercial fishers. They also recalled learning how to prepare and eat traditional foods, including foods specific to the South Arm, like certain kinds of salmon, eulachon, and sturgeon.

Late Quw'utsun Elder Florence James testified that during her childhood (ca. 1950s) her father fished the Fraser River commercially with gillnetting and trolling equipment. He was obliged to sell his fish to BC Packers but would keep the good salmon he caught for his family. He also kept sockeye heads for the family to eat.<sup>cclxxiii</sup> Mrs. James's mother also fished and worked at the Fraser River canneries when Mrs. James was a child.<sup>cclxxiv</sup> Mrs. James learned to fish from her father when she was as young as six, and travelled to Shnuwiih to fish with him (ca. 1950s).<sup>cclxxv</sup> When they arrived at Tl'uqtinus to fish, her father would say "*ni tse' wulh tus 'utl Tl'uqtinus*" (we have arrived at Tl'uqtinus).<sup>cclxxvi</sup> Mrs. James returned to the Fraser River often as an adult with her late husband to practice their traditional way of fishing, up to about 1989.<sup>cclxxvii</sup>

Luschiim remembers fishing with his father Hwiinumetse' using the *huw'qw'e'yun* (drift net) on the lower South Arm to fish for *thuqi'* (sockeye salmon), *haan* (pink salmon) and *stth'a'qwi* (spring salmon).<sup>cclxxviii</sup> He recalled other Cowichan working at the canneries on the Fraser River.<sup>cclxxix</sup>

Both before and after Sulipt'un was taken to residential school (c. 1940s), he recalls Quw'utsun Nation members engaged in commercial fishing and longshoring and observed many family members fishing wherever they were not denied the ability to fish. He also recalled eating Fraser River sturgeon caught by his uncle Bob Thomas.<sup>cclxxx</sup>

Qwestenuxun learned to spearfish from his father and older cousins (ca. 1940s/50s). Qwestenuxun, X'tli'li'ye, and Councillor Thomas were all taught their families' process of smoking fish to preserve it for later use.<sup>cclxxxi</sup>

X'tli'li'ye learned how to fish with her brothers when she was a child (ca. 1960s/70s) and recalls there was always fish, including Fraser River sockeye, in the community. She testified that when she was young, the Cowichan people were still going to the Fraser and trying to have access to their traditional foods.<sup>cclxxxii</sup> She continues to fish wherever she can find them.<sup>cclxxxiii</sup>

John Elliott started to fish with his dad at 6 years old (ca. 1972), fished the Fraser River with his dad around age 13 or 14, and started to fish the Fraser River alone when he was 17 or 18.<sup>cclxxxiv</sup> He holds the important role of *hwkwunkwunlhnénun* (food gatherer)<sup>cclxxxv</sup> for his family and community,<sup>cclxxxvi</sup> which entails fishing in and around the Fraser River. In this role he needed to know where and when the fish will be in different locations. His father, grandfather and uncles taught him about where and when different species of fish are present.<sup>cclxxxvii</sup>

Despite over a century of colonial disruption interfering with our ability to fish the South Arm for food, fishing for food within our territory, including the South Arm, remains an essential element of our culture and identity. To the Quw'utsun, fishing and food fish signify who you are and where you come from. The Quw'utsun are a fishing people—we rely on fishing to sustain us. Fishing was, and is, integral to Quw'utsun culture. We teach our children about Quw'utsun culture through foods such as salmon because it ties them to tradition.<sup>cclxxxviii</sup> Salmon are part of the Quw'utsun people.<sup>cclxxxix</sup>

We take pride in being able to provide for our community and share traditional foods with Elders, family, and guests.<sup>ccxc</sup> The ancient Quw'utsun role of *hwkwunkwunlhnénun* (gatherer) involves gathering traditional foods, including fish and shellfish, for bighouses, dances, funerals, and other cultural events.<sup>ccxci</sup> This work is very important to Quw'utsun culture.

Seafood remains a staple of our diet. Traditional foods also play a dominant role at our cultural events, such as burning, naming, initiation, and memorial ceremonies. Such events require large quantities of salmon.<sup>ccxcii</sup> These gatherings connect us to our ancestors, as an open fire and traditional foods invite the ancestors to attend.<sup>ccxciii</sup> Spiritual wellness requires all attendees, including the ancestors, to be fed. The ancestors prefer salmon, clams, and other traditional foods.<sup>ccxciv</sup> We always set aside fish, particularly salmon, for cultural events and ceremonies.<sup>ccxcv</sup> We continue to be obligated to provide food for their guests.<sup>ccxcvi</sup> Each Quw'utsun Nation band spends considerable time and money applying for, and conducting, food fisheries for their thousands of members.<sup>ccxcvii</sup>

### 3.6.2. Maintenance of Substantial Connection to Lands of Tl'uqtinus and South Arm

Despite all of the disruptions imposed on them beginning in the mid-1800s, the Quw'utsun have nonetheless maintained a substantial cultural connection to our *stl'ulnup* at the Lands of Tl'uqtinus. Our spiritual connection to the Lands of Tl'uqtinus still exists. In *Cowichan*, Florence James described how when travelling to the Lands of Tl'uqtinus she felt a spiritual connection to the land.<sup>ccxcviii</sup> X'tli'li'ye described the powerful experience of fishing at Lands of Tl'uqtinus and how she felt the presence of the ancestors.<sup>ccxcix</sup> Penelakut Councillor Ken Thomas spoke of how fishing at Tl'uqtinus is important to the community, and also spoke of a spiritual connection to the land.<sup>ccc</sup> Councillor Thomas described the good feeling of being at the village site where his ancestors paddled, fished, harvested and went about their daily business. John Elliott described the importance to the community of fishing at the Lands of Tl'uqtinus where his ancestors fished, and, the few times he was able to fish at Tl'uqtinus, how special and meaningful that was.<sup>ccci</sup>

We are committed to continuing our fishing way of life, as evidenced by our desire to transfer fishing knowledge to our new generations. For example, Councillor Thomas teaches Penelakut youth how to fish and shares teachings from his Elders about respecting and sharing resources.<sup>cccii</sup> He testified that he would like to pass his ancestor's tradition of fishing on the South Arm down to his children and grandchildren and any other children who want to learn.<sup>ccciii</sup>

Notwithstanding lack of access, fishing the South Arm for food has profound significance to our sense of identity and way of life, as it has since time immemorial. Living at the Lands of Tl'uqtinus gave us an opportunity to practice our culture so that their children and grandchildren could apply the knowledge they had learned. To Luschiim, a Quw'utsun Elder and knowledge-holder, one of the reasons why recovering the Lands of Tl'uqtinus is important is because Elders share place-based knowledge with youth.<sup>ccciv</sup> John Elliott similarly spoke about how proper knowledge transmission involves hands-on experience to learn about the South Arm and to receive accompanying cultural and traditional teachings.<sup>cccv</sup>

Fishing on the South Arm is *huliitun* – it is what sustains us.<sup>cccvi</sup> As we explained to DFO in 2016:

Fishing the south arm of the Fraser River is our preferred means of exercising our culturally integral aboriginal right to fish for food. The south arm of the Fraser River is our homeland. It is where we were embedded at our permanent village at Tl'uqtnus, and it is where we obtained fish that sustained us as a people, at all legally relevant times. Fishing the area together is part of what makes us who we are as a nation. As a people we need to be able to practice who we are, fishers of the south arm of the Fraser River. Our Elders need the opportunity to teach the next generation of our people their fishing knowledge of the south arm; to be whole our fishers and people need the opportunity to engage in their ancestral custom of fishing the south arm of the Fraser River. Every single day that Canada prohibits us from fishing the south arm... [interferes with] the continuity of our culture.<sup>cccvii</sup>

After being told by the Crown that the Lands of Tl'uqtnus were not available to recover through the BC Treaty Process,<sup>cccviii</sup> we were forced to commit to the only other recourse available to us: a lengthy and costly trial process spanning over 5 years to recover our homeland at the Lands of Tl'uqtnus and our right to fish as our ancestors did. It was the longest trial in Canadian history. The Quw'utsun faced six defendants, two of whom were the Crown, and we told our story to the Court in hopes of having what was stolen returned to us. This alone demonstrates the continued and unshakeable connection that we have to the Lands of Tl'uqtnus and to the Project area, and the importance that it has to us.

### 3.7. Vision for Future: Cowichan Declaration for Reconciliation

On August 7, 2025, the Supreme Court of British Columbia handed down its judgment in *Cowichan* and granted declarations that the Quw'utsun have Aboriginal title to the Cowichan Title Lands and an Aboriginal right to fish the south arm of the Fraser River for food within the meaning of s. 35(1) of the *Constitution Act, 1982*. With this judgment, we can finally return home to our village and to our river.

The contemporary Quw'utsun perspective on Aboriginal title at the Lands of Tl'uqtnus, and our vision for the future, is articulated in the Cowichan's 2016 Declaration for Reconciliation (**Appendix "A"**) for the Lands of Tl'uqtnus, which declared that reconciliation should be consistent with the following land and resource use objectives:

- a. recovery and restoration of the Cowichan Nation owned village and surrounding lands at and about Tl'uqtnus on the South Arm of the Fraser River;
- b. reestablishment of Cowichan Nation permanent residence and river access at the village;
- c. reestablishment of Cowichan Nation culturally integral practices (e.g., harvesting fish, waterfowl, plants) on the South Arm of the Fraser River and mouth, including at and about Tl'uqtnus;
- d. realization of Cowichan Nation revenue, economic and employment opportunities, and benefits that are compatible with the above; and

promotion of education regarding the Cowichan Nation presence and interests on the South Arm of the Fraser River and its mouth.<sup>cccix</sup>

This vision guides how the Quw'utsun assess the compatibility of any proposed project or activity in the area with Quw'utsun Rights. In all cases, the following questions must be asked:

***How does the proposed project impact the ability of the Quw'utsun to achieve the vision set out in the Declaration for Reconciliation?***

The evidence demonstrates continuous occupation, use, and governance of the Lands of Tl'uqtnus and the South Arm of the Fraser River, and confirms that these lands and waters are held under Quw'utsun Law through enduring relationships of responsibility and care.

These lands and waters are not open for unrestricted entry, use, or benefit. Any proposed activity must be assessed in light of existing lawful relationships, including obligations to maintain salmon lifelines, uphold stewardship responsibilities, and ensure that use does not exceed what can be lawfully sustained.

The cumulative effects of colonial disruption, ongoing constraints on land and water use, and the continued exercise of rights and responsibilities by Quw'utsun Mustimuhw establish the legal context in which the Project must be assessed. Where these conditions result in imbalance or overuse, the Project engages obligations of reciprocity and limits on use that must be satisfied under Quw'utsun Law. These constraints and obligations are applied in the sections that follow to determine whether the Project can lawfully proceed.

## 4. Economic Analysis of Historical Costs

The unlawful alienation of the Quw'utsun Nation from the Lands of Tl'uqtnus and the surrounding lands and waters, as described in Section 3, imposed costs on the Nation. Understanding and characterizing these historical costs is a precondition for assessing whether the proposed Project is likely to perpetuate or worsen the conditions that created these costs, or whether it is likely to improve on them by providing benefits to the Nation or aligning with the Nation's aspirations for the Project area (see Appendix A).

Some of these costs have a clear monetary value ("market costs"), such as forgone land revenues and the cost of replacing food that could have been fished. Others, including effects on cultural practices, governance, health, and wellbeing, are difficult to quantify in monetary terms ("non-market costs"), either because there is no market for the goods and services concerned or because data on prices are unavailable. Section 4.1 estimates historical market costs in monetary terms where possible, and Section 4.2 describes historical non-market costs using qualitative methods. Technical details are provided in Appendix B.

### 4.1. Historical Market Costs

This section estimates the monetary value of two historical market costs resulting from unlawful alienation, recognizing that these capture only a portion of total costs to the Quw'utsun Nation.

The first is the market cost of interference with the Nation's ability to exercise its title to the Project-Relevant Title Area, which comprises the Lands of Tl'uqtnus claim area as defined in *Cowichan* and Tilbury Island (Section 4.1.1, Figure 2A). This cost is estimated in monetary terms by looking at the historical revenues the Nation has been forced to forgo from use of this land since unlawful alienation began ("loss of use") and the land's value as an asset today ("current value").

The second is the market cost of interference with the Nation's ability to exercise its fishing rights in and around Shnuwilh (on the South Arm of the Fraser River; see Figure B.1.2.1) (Section 4.1.2, Figure 2B). This cost is estimated based on what it would have cost to replace the sockeye the Nation would otherwise have fished for food.

Figure 5: Project-Relevant Title Area and Fishing Area (Brealey, 2019). Source: A. Lands of Tl'uqtnus Claim Area from Schedule A of the Fifth Further Amended Notice of Civil Claim, plus Tilbury Island and B. The "Cowichan Fishing" mapped by Dr. Kenneth Brealey (Brealey, 2019).

## 4.1.1. Title to Project-Relevant Title Area

### 4.1.1.1. Scope and Key Assumptions

**Geographic scope:** Loss of use and current value were estimated for the Project-Relevant Title Area, which covers the settlement uplands of the Lands of Tl'uqtnus<sup>4</sup> and Tilbury Island.<sup>5</sup> The Project-Relevant Title Area comprises 1607 acres in Richmond and 514 in Delta (see Figure 5).

<sup>4</sup> The "settlement uplands of the Lands of Tl'uqtnus" are the Lands of Tl'uqtnus as shown in Schedule A to the Fifth Further Amended Notice of Civil Claim, but excluding the submerged riverbed at the settlement riverfront.

<sup>5</sup> The boundaries of Tilbury Island are based on the spatial extent of the island as shown on OpenStreetMap, including land on the south side of Tilbury Slough. Since the analysis estimates loss of use and current value for land only, the Fraser River (in its current boundaries) is excluded.

*Figure 6: Map of the Project-Relevant and Overall Title Areas. Source: The overall title area (light red) is “Cowichan Territory” on the South Arm of the Fraser River and adjacent uplands, from Map 5 in Brealey (Brealey, 2019), and the Project-Relevant Title Area (dark red) is the “Cowichan Extended Land Management Area” from Map 5 in Brealey (Brealey, 2019) and Schedule A of the Fifth Further Amended Notice of Civil Claim, plus Tilbury Island.*

**Temporal scope:** Loss of use was estimated for the “loss of use period,” starting on the date of the first Crown grant for each parcel in the Project-Relevant Title Area (grant dates range from 1871 to 1914), and ending in 2022. Current value was estimated as of 2022.

**Key assumptions:** Both loss of use and current value were estimated based on actual historical land values and land uses in the Project-Relevant Title Area.

Loss of use was estimated using a leasing approach: for each year in the loss of use period, the analysis estimated the lease income the Quw’utsun Nation could have earned from the Project-Relevant Title Area, had it leased the land for its actual uses. Three inputs were estimated for each land use category (agricultural, industrial, commercial, and residential) and year (details in Appendix B):

- *Land use area* was estimated from Crown grant records, historical zoning maps, official community plans, land use plans, and land use maps for Delta and Richmond.
- *Per-acre value* was estimated by fitting historical land-price indices to both contemporary land values (from BC Assessment (BCA) 2013 to 2023 rolls and sale data) and historical anchor points (from census records, title searches, and archival sources).

- *Capitalization rates*, which convert land values to annual lease payments, were estimated from contemporary rates backcasted using historical bond yield and real estate price series.

Annual lease payments were then calculated as land use area multiplied by per-acre value and capitalization rate, summed across land uses. Deductions were made for one-time costs associated with subdivision and servicing and non-recoverable landlord expenses (see Appendix B.1.1.1). Nominal lease payments were brought forward to 2022 values using the Band Trust Account rate with annual compounding.

Current value was estimated by multiplying per-acre values by land use areas for 2022 and summing across land uses.

#### 4.1.1.2. Results

Loss of use and current value estimates are shown in Table 2. Loss of use is estimated at \$4.00 billion and current value at \$7.64 billion as of 2022. In total, the market cost to the Quw'utsun Nation of interference with their ability to exercise their title to the Project-Relevant Title Area is estimated at \$11.65 billion.

**Table 2: Market Cost of Interference with Title as of 2022, in Billions of Dollars**

| Section of Project-Relevant Title Area       | Loss of Use (Nominal \$) | Loss of Use (2022 \$) | Current Value (2022 \$) |
|----------------------------------------------|--------------------------|-----------------------|-------------------------|
| Tilbury Island                               | 0.68                     | 1.21                  | 2.78                    |
| Settlement uplands of the Lands of Tl'uqtnus | 1.78                     | 2.79                  | 4.86                    |
| Total                                        | 2.46                     | 4.00                  | 7.64                    |

These estimates reflect the fact that land in the Project-Relevant Title Area was unlawfully granted to settlers between 1871 and 1914 (see Figure 4). Most of Tilbury Island was granted in 1885 and the rest in 1902, while grants on the settlement uplands of the Lands of Tl'uqtnus started in 1871 and covered three quarters of the area by the late 1890s and the rest by 1914.

**Figure 7: Project-Relevant Title Area Grant Timeline**

Figure 5 shows the share of the Project-Relevant Title Area dedicated to each land use over time. Agricultural use (or uses treated as agricultural for the purpose of estimating land value) dominated for most of this period; industrial use grew from the 1970s onward; and residential and commercial development appeared from the early 2010s. See Appendix B for a detailed chronology of land use transitions.

Figure 8: Land Uses Over Loss of Use Period

#### 4.1.1.3. Limitations

While data from the Project-Relevant Title Area were used wherever available, data from elsewhere were used to fill gaps. Capitalization rates were backcasted using data from elsewhere in BC, Canada, and the United States (see Appendix B.1.1.1.4), and historical land values were taken from elsewhere in the Lower Mainland and interpolated using land price indices from elsewhere in BC, Canada, and the United States (see Appendix B.1.1.1.3). Site-specific factors such as port suitability, environmental remediation costs, or specialized zoning restrictions may not be captured by these data.

The land use history of the Project-Relevant Title Area was constructed using available maps rather than a detailed parcel-by-parcel history. This means that the timing of transitions from agricultural to industrial, residential, or commercial uses are in some cases approximate, and conservative in the sense that transitions to higher-value land uses were only recorded when they could be verified on available maps, even if they occurred earlier.

Finally, loss of use and current value were estimated based on the Project-Relevant Title Area's actual use, rather than its highest and best use (HBU) if the Quw'utsun Nation had been able to exercise its title. As discussed in Section 7, several factors suggest that the Project-Relevant Title Area's actual uses have generally fallen short of its HBU, meaning this is a conservative approach. In reality, the Nation would likely have chosen to use the area in fundamentally different ways than settlers actually

used it. However, the Nation was entitled to the option of using it in the same way.<sup>6</sup> Appendix B discusses these and other limitations in more detail.

#### **4.1.1.4. Connections to Non-Market Costs**

If the Quw'utsun Nation had received lease revenues from the Project-Relevant Title Area during the loss of use period, these revenues might have alleviated the non-market costs of alienation (discussed in Section 4.2): for example, by enabling spending to improve health and wellbeing, fund governance capacity, or fund programming to strengthen language, culture, and community. But revenues would not have addressed the root cause of these costs: alienation from the Lands of Tl'uqtinus and the surrounding lands and waters would still have disrupted cultural practices tied to place, severed connections to harvesting areas and medicinal plants, excluded the Nation from land use planning and stewardship, and hindered the intergenerational transmission of knowledge that depends on being present on the land.

### **4.1.2. Sockeye Food Fishery in and around Shnuwiilh**

#### **4.1.2.1. Background: Traditional Diet and Fishing Context**

Interference with the Quw'utsun Nation's ability to exercise its fishing rights in and around Shnuwiilh (see Figure 2B) began with the first application of federal fisheries regulations in BC in 1878. Quw'utsun Nation communities were not legally allowed access to food, social, and ceremonial (FSC) fisheries in and around Shnuwiilh until 2008, and, until early 2026, some months after the BC Supreme Court in *Cowichan Tribes v. Canada* declared that the Quw'utsun Nation had an Aboriginal right to fish the South Arm of the Fraser River for food, continued to be treated as "extraterritorial" bands with limited fishing rights that denied them the predictable access needed to feed Quw'utsun communities and fully develop fishing and processing capacity.

This interference limited access to key species in the Quw'utsun Nation's traditional diet. The area in and around Shnuwiilh is the Nation's primary source for species like *thuqi'* (sockeye), *haan* (pink salmon), and white sturgeon, which are *'ulhtuneen* (special or favourite food) for the Quw'utsun Nation and central to the Nation's mythology and way of life (Direct Examination of Arvid Charlie (Luschiim): Proceedings at Trial, Day 18, Court transcript, *Cowichan Tribes v. Canada* (Attorney General), 2019) (Direct Examination of Arvid Charlie (Luschiim): Proceedings at Trial, Day 16, Court transcript, *Cowichan Tribes v. Canada* (Attorney General), 2019).

---

<sup>6</sup> This assumption aligns with principles articulated by the Specific Claims Tribunal, describing rights to equitable compensation in the event of a breach in fiduciary obligation, whereby the party is owed not just the loss of the property, but also the forgone opportunity to use the property (*Beardy's & Okemasis Band #96 and #97 v. Her Majesty the Queen in Right of Canada*, 2016 SCTC 15).

#### 4.1.2.2. Scope and Key Assumptions

The market cost of this interference was approximated based on the monetary value of the sockeye that the Nation would otherwise have fished, from 1878 to present. Although the Quw'utsun Nation fished all available species as desired, sockeye was selected as a representative species because the Nation obtained it almost exclusively from in and around Shnuwiilh and because historical price data were available (Brealey, 2010) (Direct Examination of Arvid Charlie (Luschiim, 2019).

The analysis estimated the quantity of sockeye required to sustain a traditional Quw'utsun diet from 1878 to 2025, based on per-capita consumption estimates and historical population data, and valued those quantities at commercial sockeye prices. See Appendix B for full data and methods.

#### 4.1.2.3. Results

The value of the sockeye that the Quw'utsun Nation required to meet food needs in a traditional diet from 1878 to 2025 is \$787,807,857 (in 2025 dollars). This value represents what it would have cost the Nation to procure the required quantities communally at commercial prices.

Figure 6 shows the required quantities of sockeye, in kilograms. These quantities far exceed both the food, social, and ceremonial (FSC) limits the Nation holds today and those that other Nations in the area would have held since 1878 (Schubert, 1986).

Figure 9: Total Quantity of Fish Required to Meet Community Sockeye Food Needs. Source: Per-capita quantities from Erika R. Gavenus et al. and population data from Appendix C of Joan Lovisek and federal reports on registered membership of the five Quw'utsun Nation communities

#### 4.1.2.4. Limitations

The analysis covers only the sockeye fishery due to data limitations, leaving out *haan* (pink salmon), white sturgeon, and other species that would have supported a traditional Quw'utsun diet. In addition, the per-capita harvest rates from Gavenus et al. are coast-wide estimates for all coastal BC First Nations, not specific to the Quw'utsun Nation. Nation-specific rates would differ based on local salmon abundance, species preferences, and cultural practices.

Any quantities of sockeye that the Quw’utsun Nation has been able to harvest in spite of unlawful alienation should be deducted from estimates, though these quantities have been minor relative to total food needs. Further, the costs incurred by the Quw’utsun Nation in participating in DFO’s fishing process from 2008 onwards would offset the value of any sockeye obtained through that process. These costs have included short-notice travel from Vancouver Island reserves, lost wages from weekday-only openings as short as nine hours, and the staff time required to make annual requests for access that have frequently been denied (see Appendix B.1.2.1).

#### **4.1.2.5. Connections to Non-Market Costs**

Had the Quw’utsun Nation been able to obtain sockeye to meet community food needs, it might have alleviated some of the non-market costs discussed in Section 4.2, particularly costs associated with health. But it would not have addressed the many costs associated with the value of the act of fishing rather than the nutritional value of the fish alone: lost opportunities to pass on practices related to fishing and processing; lost economic and political ties facilitated by trade; the pride and psychological security that come from exercising harvesting rights; and participation in stewardship and planning of the sockeye fishery.

## **4.2. Historical Non-Market Costs**

The market costs described in Section 4.1 capture only a portion of costs to the Quw’utsun Nation. This section describes the historical non-market costs that the Quw’utsun Nation experienced due to unlawful alienation from the Lands of Tl’uq̓tinus and the surrounding lands and waters, including the Project area. These costs are organized into distinct but interrelated themes, developed through thematic analysis of witness testimonies and evidence from the Nation’s Aboriginal Title claim (*Cowichan Tribes et al. v. Canada*), and refined through engagement with Elders advisory committees from Quw’utsun Nation communities. Themes are intended to be distinct from each other and from historical market costs, to the greatest extent possible.

Themes were developed through thematic analysis of transcripts of witness testimonies and evidence from *Cowichan Tribes et al. v. Canada*, drawing on evidence compiled for the trial so that Elders and community members who had contributed evidence did not have to repeat themselves. This approach respected that discussions related to the Lands of Tl’uq̓tinus are traumatic for many members of Quw’utsun Nation. Preliminary themes were refined by the ILA Technical Working Group (TWG) with representatives from the five Quw’utsun Nations, and then further expanded and validated through engagement sessions with Elders advisory committees from Penelakut, Halalt and Lyackson, and Cowichan Tribes communities between July 2023 and February 2024. Appendix B provides more detail on the thematic analysis, specific witnesses, and the approach and outcomes of each engagement session, as well as detailed evidence and community aspirations for each theme.

### 4.2.1. Results

Four themes emerged that capture the historical non-market costs of unlawful alienation from the Lands of *Tl'uqtinus* and the surrounding lands and waters:

- **Language and Culture:** The cost to the Quw'utsun Nation from not being able to spend time at the Lands of *Tl'uqtinus*, a place of cultural significance and an important location to share and transfer knowledge, language, and culture specific to the lands there across generations.
- **Community, Kinship, and Trade:** The cost to the Quw'utsun Nation from not being able to foster social connections with family, kin, relatives, and neighbouring Nations, and to continue to exercise the economic and political roles and relationships that were facilitated by having a settlement and access to surrounding territory.
- **Health and Wellbeing:** The cost to the Quw'utsun Nation from not having access to medicines and resources that contribute to the health and wellbeing of individuals and the community, as well as the psychological and mental health effects that come from dislocation and lack of recognition of *Tl'uqtinus* as a Quw'utsun settlement.
- **Self-Determination and Governance:** The cost to the Quw'utsun Nation from not having been able to make decisions about the use, stewardship, and planning related to the lands and waters (including fisheries) at the Lands of *Tl'uqtinus*.

These themes refer to different aspects of *huliitun*, a *Hul'q'umi'num* word referring to “something that sustains you.” As Luschiim explains, “[*huliitun* is] your food; it's your place, your *stl'ulnup*; it's your children... So our *stl'ulnup* at Shnuwiilh [the lower Fraser River], *Tl'uqtinus*, that place is a part of what sustains us, but along with the food, that we're able to harvest for ourself and for other uses. It was the bringing together where we, Quw'utsun people, lived together. That's all part of the *huliitun*.” (Direct Examination of Arvid Charlie (Luschiim, 2019).

The Lands of *Tl'uqtinus* and the surrounding lands and waters are a *stl'ulnup*, an ancient ground where cultural identity is embedded in a relationship to the land. “Living together” in this place, a phrase that refers to a variety of economic, social, political, cultural, and spiritual activities, is one of the things that sustains Quw'utsun Mustimuhw. The four themes refer to different aspects of what has been lost as Quw'utsun Mustimuhw have been prevented from living together at the Lands of *Tl'uqtinus* and the surrounding lands and waters.

These themes are described briefly below. For detailed evidence, witness testimony, and community aspirations for each theme, see Appendix B.

**Language and Cultural Knowledge.** Unlawful alienation prevented Mustimuhw from sharing knowledge through hands-on cultural practices at the Lands of *Tl'uqtinus* and surrounding lands and waters, disrupting traditions of storytelling, ceremony, and experiential learning related to harvesting, fishing, and food processing. The loss of an ability to undertake these practices at a place of cultural significance had direct effects on cultural identity, knowledge, and social connections (Turner, 2007). Elders expressed a desire to see the lands available for ceremony and as a place where Quw'utsun children can go to learn Quw'utsun culture and the *Hul'q'umi'num* language.

**Community, Kinship, and Trade.** The Quw'utsun Nation maintained a seasonal and permanent settlement at the Lands of Tl'uqtinus with roughly 108 longhouses (Kennedy, 2019) housing up to 4,000 Quw'utsun people (Eldridge, 2019), facilitating social, economic, and political relationships. Unlawful alienation disrupted trade networks, naming practices, and relationships tied to seasonal gatherings, while arbitrary boundaries set by the Crown led to tension between Nations and families. The Nation is interested in reestablishing housing at the Lands of Tl'uqtinus and repairing relationships with neighbouring Nations.

**Health and Wellbeing.** Loss of access to traditional food sources, particularly salmon from in and around Shnuwiih, has contributed to food insecurity and diet-related health conditions among Mustimuhw. Reduced access to the Lands of Tl'uqtinus and the surrounding lands and waters has also limited availability of medicinal plants, and dislocation has imposed psychological costs, including experiences of harassment when visiting the area. Elders described a future where Mustimuhw are healthy and well, including recognition and restoration of the Lands of Tl'uqtinus and surrounding lands and waters as Quw'utsun territory.

**Self-Determination and Governance.** The Quw'utsun Nation has been excluded from land use and fisheries planning, consultation processes, and stewardship partnerships related to the Lands of Tl'uqtinus and the surrounding lands and waters. Industrial development and unlawful alienation have transformed the landscape, eliminating virtually all original ecosystems and plant communities, while also excluding the Nation from co-governance of fisheries resources. Elders highlighted a desire for control over and involvement in planning related to the Lands of Tl'uqtinus and the surrounding lands and waters.

These four themes are deeply interconnected (see Figure 7). The Quw'utsun Nation's relationship with land and water is foundational to all four. Language and culture shapes naming practices and protocols related to kinship and trade, serves as a core determinant of health, and underpins the protocols and practices of self-determination and governance. Community, kinship, and trade are facilitated by language and culture, and in turn support the health, wellbeing, and self-determination of Quw'utsun. Self-determination is itself a core social determinant of health and wellbeing: without it, full health and wellbeing cannot be achieved. The health of the lands and waters is deeply connected to the health of the Quw'utsun people, sustained by stewardship and governance knowledge gained through cultural practices, preserved in language, and upheld through protocols developed over millennia.

Figure 10: Connections Across Themes

### 4.2.2. Limitations

While care was taken to focus on historical costs resulting from unlawful alienation, these costs are inevitably connected to a broader set of effects from racism, colonization, and discrimination. There are similar challenges in separating market and non-market costs, although facilitators guided community engagement sessions to focus on historical non-market costs, and the theme descriptions used in the sessions were written to exclude the historical market costs described in Section 4.1.

Finally, the Quw'utsun Nation is actively rebuilding governance approaches. While the themes are intended to capture the shared experiences of the five communities within the Quw'utsun Nation, these communities have unique perspectives and experiences related to the Lands of Tl'uqtnus and the surrounding lands and waters (see Appendix B).

## 5. Ecological Context

The Quw'utsun Nation lived in relationship with the lands and waters at and around the Lands of Tl'uqtinus. The known ecological context of these lands prior to colonial disruption is that of an ecological rich and diverse landscape that contributed to both culture and wealth.

The Lands of Tl'uqtinus are where we lived, shared knowledge and harvested marine and plant resources. We also managed these lands and resources and acted as stewards. Expert reports support Quw'utsun Nation's environmental stewardship and land management, stating that "the [Quw'utsun] regularly and intensively used and customarily cultivated and managed (to enhance the quality and productivity of key resource species) these lands and plant resources" (Turner, 2019).

Research has shown that the soils at and around the Lands of Tl'uqtinus (ranging from the interior of Lulu Island to Tilbury Island, inclusive) would have supported a number of different ecosystems with distinct vegetative compositions. We named, and regularly harvested and used, approximately 120 different species of plants at and around Tl'uqtinus, including 38-57 species used for food, 49-64 species used for materials in technology; and 31-46 species potentially used as medicine (Turner, 2019).

The Quw'utsun Nation regularly managed and cultivated a significant number of plant and animal resources on which they relied, employing a number of practices and techniques, including burning over of adjacent bogs to enhance berry and bracken fern rhizome production and to create open prairies for deer forage; pruning berry bushes; regular tending and cutting of patches of cattails, tules and stinging nettles; clearing and tending patches of wapato in the sloughs nearby; maintaining groves and individual trees of western redcedar for construction, canoes, basketry materials and other purposes; and maintaining the populations of a significant number of other material, food and medicinal plant species (Turner, 2019).

Plants contributed to healthy traditional diets, likely in large quantity given the documented Quw'utsun population at Tl'uqtinus and its status as a *huliitun* (something that sustains you). The staple food of *sqewth* (wapato) is estimated to have been cultivated and harvested in excess of a million bulbs annually, using calculations of *speenhw* (camas) consumption for a population of 1000 people as a proxy. Similarly, *stth'oom* (berry) annual rate of consumption for a settlement of 1000 people is estimated to have been 10,000,000 to 20,000,000 berries per year. Pacific crabapple, bracken fern rhizomes, and other edible plants would have supplemented this component of traditional diet provided by the Lands of Tl'uqtinus and the surrounding lands as a *huliitun* (Turner, 2019).

In 1824, Francis Annance noted that "near the village [Tl'uqtinus] there is a beautiful forest of cypress [western redcedar, *Thuja plicata*] trees." Such a forest of cedars would have had prime importance for our people, and it is highly likely that we were carefully maintaining that forest, while using it for harvesting the materials and products needed, from single trees for canoes, to branches, roots and bark for various implements and containers, and bark for hats, mats and clothing (Turner, 2019).

Since unlawful alienation, introduction of large-scale European style agriculture, and industrialization of Lulu Island and the lower Fraser River environments, and expansion and development in the city of Richmond have transformed the landscape, eliminating virtually all the original ecosystems and plant communities, and thereby reducing the productive areas (Turner, 2019).

The peat bog and fen wetland habitats that extended at one time over one quarter of Lulu have nearly disappeared due to development and to the commercial cranberry and blueberry farms. Large areas of the peatlands have been dried up from dyking and changes in drainage. There are only a few remnants of the bog and other original habitats of Lulu Island. The prairies of Lulu Island in the areas around the village site at Tl'uqtinus and the Lands of Tl'uqtinus, have also been largely destroyed by farms and development (Turner, 2019).

In addition, some 235 invasive species have established themselves on Lulu Island and largely displaced the native Pacific estuarine flora. Since the original native plant species and communities that provided critical habitat for wildlife are now gone, many of the animal and bird species that would have been resources for us at and around the Lands of Tl'uqtinus have also disappeared (Turner, 2019).

As a result of unlawful alienation from the Lands of Tl'uqtinus and the surrounding lands and waters, we lost access to an important and diverse part of our traditional diet. Over time, this lack of access was compounded by the changing nature of land use. As of 1979, little of the original natural vegetation remained, concentrated in bogs and marshes. The remainder of the lands were logged and cleared and replaced by agricultural, residential, or commercial land uses. Only sparse remnants of the original vegetation types can still be seen today in small patches of native vegetation along the river at and near Tl'uqtinus (Turner, 2019). Currently, the land at and around the Lands of Tl'uqtinus is highly developed and previously diverse soils that would support a wide variety of vegetation are now heavily disturbed by industrial use and modern agricultural operations.

## 6. Project Effects Assessment

In Section 11.4 of the Application, the proponent concludes that the only residual effects to the Quw'utsun Nation's interests are positive effects to social and economic conditions and positive effects to health and wellbeing, all resulting from increased employment and economic opportunity. The Quw'utsun Nation disagrees with this conclusion based on the effects assessment herein.

In this Section, we will analyse the effects of changes to Valued Components from the Project application (see Section 6.1) in the context of the Quw'utsun Nation's vision for the future. This vision is articulated in the Cowichan's 2016 Declaration for Reconciliation (Appendix "A") for the Lands of Tl'uqtnus, which declared that reconciliation should be consistent with the following land and resource use objectives:

- a. recovery and restoration of the Cowichan Nation owned village and surrounding lands at and about Tl'uqtnus on the South Arm of the Fraser River;
- b. reestablishment of Cowichan Nation permanent residence and river access at the village;
- c. reestablishment of Cowichan Nation culturally integral practices (e.g., harvesting fish, waterfowl, plants) on the South Arm of the Fraser River and mouth, including at and about Tl'uqtnus;
- d. realization of Cowichan Nation revenue, economic and employment opportunities, and benefits that are compatible with the above; and
- e. promotion of education regarding the Cowichan Nation presence and interests on the South Arm of the Fraser River and its mouth.

In the Tree Model of Quw'utsun Legal Order shared in Section 2, the roots of the tree are the sources of law, such as stories and teachings. The trunk of the tree is made up of resources that enable us to interpret the meaning of law, clarify obligations, determine legal principles, and understand how ancestral teachings apply in present circumstances. The branches of the tree represent application of Quw'utsun law; this is where Quw'utsun law meets contemporary decision-making.

The Declaration for Reconciliation and the associated objectives are an application of and a resource for interpreting Quw'utsun law. The values and objectives expressed in the Declaration are grounded in and consistent with Quw'utsun teachings and stories, which remain the primary sources of law. Assessing project effects for alignment with the Declaration when grounded in these sources is an application of Quw'utsun Law. Some additional considerations under the Quw'utsun legal order for this assessment are as follows:

- **Healing and Restoration:** The effects assessment considers that the proposed Project exists in the context of profound cumulative harm and loss to the Quw'utsun Nation in terms of: (a) land access, (b) availability and quality of subsistence and medicinal resources, and (c) the ability to carry out legal obligations to the land and more-than-human relatives in the Project area, as described in earlier chapters. An effects assessment must be based in this cumulative context to address the need for healing and restoration. Healing and restoration are inclusive of healing the land that is a *huliitun* (something that sustains us) through ecological restoration.

- **Respect and Maintaining Connections to Home, Land and Origin:** The effects assessment respects the Quw'utsun Nation vision for reconciliation, assessing effects in the context of a residential location for Quw'utsun Mustimuhw being established at the Lands of Tl'uqtinus, which is essential for Quw'utsun Mustimuhw to connect to their *stl'ulnup* (place where one is embedded).
- **Stewardship:** The landscape at and around the proposed Project is heavily impacted by industrial use. This impacted landscape means that remaining values are more stressed and vulnerable, and less resilient to damage, and effects to these values are therefore of higher magnitude, not lesser. Through a lens of stewardship, the fact of the existing industrial landscape at and around the Lands of Tl'uqtinus does not serve to mitigate the industrial effects of Project Activities. On the contrary, it exacerbates and compounds them.
- **Transmission of Teachings and Intergenerational Obligation:** The effects assessment considers the ability of Elders to share knowledge at and around the Lands of Tl'uqtinus as a core component of re-establishing culturally integral practices. To this end, the effects assessment also considers each instance of lost opportunity to practice our culture or share our knowledge due to Project effects as an irreversible loss, even if the Project Activity that caused this loss could be stopped at a later date.
- **Preparation, Prayer and Right Conduct:** This principle is inclusive of uncertainty and the precautionary principle. In this assessment, undetailed commitments to mitigation in future Construction and Operational Environmental Management Plans are not sufficient for resolving uncertainty or for determining the effectiveness of mitigation measures.
- **Compassion / Acceptance / Avoid Harm:** Quw'utsun Mustimuhw physical, cultural, spiritual, and economic wellbeing and quality of life is implicit to each of the objectives set out in the Declaration for Reconciliation.

To fully consider how the proposed Project will affect our vision for the future at the Lands of Tl'uqtinus and the surrounding lands, including the Project area, in Section 6 we consider two future scenarios:

- **Scenario 1 - Project is not approved:** A brief qualitative exploration of potential or likely long-term outcomes in the Project area if the Project were not approved; namely the sub-scenarios of long-term maintenance and upgrading of existing infrastructure or eventual decommissioning.
- **Scenario 2 - Project is approved as proposed:** Evaluation of the Project's effects on Quw'utsun Mustimuhw and the Quw'utsun's ability to achieve the vision set out in the Declaration of Reconciliation.

## 6.1. Approach to Valued Components and Assessment Framework

For clarity and comparability with the proponent's Revised Application, this Section adopts the terminology of "Valued Components" (VCs). However, the use of this terminology does not indicate acceptance of the Application's methodological framework, nor does it define the analytical approach applied by Quw'utsun Nation.

The proponent's assessment is grounded in a regulatory effects characterization approach that evaluates impacts on discrete components using thresholds, significance determinations, and mitigation measures. This approach assumes that adverse effects may be rendered acceptable through the application of mitigation, monitoring, and adaptive management.

Quw'utsun Nation Indigenous-Led Assessment does not adopt this framework.

The assessment set out in this Section is conducted under Quw'utsun Law, which is a distinct legal order grounded in Snuw'uy'ulh (teachings), relational obligations, and place-based responsibilities. Under Quw'utsun Law:

- Effects are not treated as isolated changes to discrete “components,” but as disturbances within an interconnected system of relationships among lands, waters, salmon, other kinship species, and Quw'utsun Mustimuhw.
- The assessment is not based on whether effects are “significant” within regulatory thresholds, but whether legal obligations to maintain balance, respect, reciprocity, and intergenerational cultural continuity are upheld.
- Certain harms — including disruption to salmon lifelines, impairment of cultural practices, and interference with the transmission of Indigenous knowledge — cannot be justified or offset through mitigation measures, in part due to the irreversibility of said harm.
- Where the obligations associated with a legal principle cannot be fulfilled, the proposed activity is unlawful in that place.

Accordingly, while the VC structure is used as an organizational tool to engage with the Application, it is not determinative. Each VC section is instead used as an entry point to evaluate how Project activities affect:

- Quw'utsun Mustimuhw, including physical, cultural, and spiritual wellbeing; and
- the ability to achieve the vision set out in the Declaration for Reconciliation, including re-establishment of residence, restoration of land and water, and revitalization of culturally integral practices.

This approach reflects the fact that Quw'utsun Law does not assess effects in isolation. The loss of even a single opportunity to practice culture, transmit knowledge, or maintain relationships with land and water is not temporary or recoverable, but represents a lasting injury to the fabric of Quw'utsun life.

As such, the question addressed throughout this Section is not whether Project effects can be reduced or managed within a regulatory framework, but whether those effects are compatible with the legal obligations and future conditions required under Quw'utsun Law.

Where they are not, the Project does not meet the requirements of Quw'utsun Law.

## 6.2. Outstanding Issues with Application

Throughout the development and submission of the Application, the Quw'utsun Nation has encountered key issues that affect the overall development of the Application:

- Poor relationship building:** The Quw'utsun Nation seeks a relationship-based approach with proponents, aligned with the Quw'utsun legal principle of Right Conduct. The Quw'utsun Nation expects proponents to demonstrate readiness, respect, right mind, right heart, and honesty. The development of good relations, communications, and outcomes during the Application development phase are essential for these foundations to carry through into permitting, construction, and operations, should the Project be approved.
- Project splitting:** The Project and the Tilbury Jetty have been assessed, and in the case of the Jetty, approved, separately. This approach applies separate evaluations for components that are functionally connected, financially dependent, geographically connected, and, for the most part, intended to achieve a single purpose. The piecemealing of these projects is unaligned with Quw'utsun legal principles of interconnectedness and creates barriers to understanding the full web of relations.
- Regulatory requirements in place of meaningful Consultation:** Throughout the Application Review and issues resolution phase, the proponent responded to many of the Quw'utsun Nation's requests and concerns with reference to the Application meeting regulatory requirements or the Application Information Requirements. We are not participating as a third-party auditor of the Project's ability to meet already established requirements. We are participating in the delegated aspects of consultation to ensure that concerns around the decision on the Projects that might affect Quw'utsun Rights are considered, addressed, and accommodated where required. The approach taken by the proponent is in conflict with the Quw'utsun legal principle of respect. The EAO, insofar as it has not facilitated consultative processes which meaningfully address impacts to Quw'utsun Nation Aboriginal rights (including title) and Indigenous Rights, is not meeting its constitutional duties as an agent of the Crown in the circumstances. The legislative function of the EAO under the *Environmental Assessment Act* is to, *inter alia*, support the implementation of the United Nations Declaration on the Rights of Indigenous Peoples, and collaborating with Indigenous Nations in a manner consistent with the United Nations Declaration on the Rights of Indigenous Peoples. EAO's steadfast refusal to look beyond colonial regulatory guidelines in the context of consultation and accommodation on this Project is therefore in direct breach of its legislated mandate.
- Limiting methodologies:** The Application relies heavily on regulatory guidance, methodology, and thresholds for evaluating the magnitude of effects to Valued Components such as Air Quality and Acoustics. This approach undermines the value of the assessment as a tool for decision-making by Indigenous groups. The Application applies a narrow perspective of cumulative effects assessment and inappropriately limits the evaluation of impacts to our Rights. This approach is not in alignment with the application of the Quw'utsun legal principle of Healing and Restoration, which requires that we consider effects of the project in the context of past harms and how they are linked to project effects and outcomes.

### 6.3. Scenario 1: Project Not Approved

If the Project is not approved, marginal improvement of the current conditions in the direction of supporting the Quw'utsun Nation's vision for the Lands of Tl'uqtinus could be achieved. The potential improvements in this scenario, however incremental, are critical. Pursuit of Reconciliation with the Quw'utsun Nation at the Project area and the Lands of Tl'uqtinus will require a long-term effort made up of many instances of marginal gains. Quw'utsun Mustimuhw have repeatedly discussed loss of land and cultural activities as "death by a thousand cuts"; we now seek to heal a thousand wounds.

Aligning the lands and water at and around the Lands of Tl'uqtinus (including the Project area) with the Declaration for Reconciliations means moving towards an environment that better supports our goals of re-establishing residence, restored ecosystems, revitalized culturally integral practices, and realizing the benefits of economic opportunities. We are aware that it will take time and significant effort to manifest an environment with cleaner air, lower noise, increased natural landscapes, diverse ecosystems, and robust plant, wildlife, and fish populations. We are also aware that the existing resources are vulnerable, and that every action or activity counter this vision creates more barriers to achieving it.

If the project is not approved, there are two long-term outcomes for the existing infrastructure at the FortisBC facility on Tilbury Island. The first is that FortisBC maintains and upgrades the existing infrastructure into the future. The second outcome occurs when the current infrastructure reaches the end of its functional life and the facility is decommissioned.

If the project is not approved and the current infrastructure is maintained and upgraded into the future, we assume that improved technology will be applied to the facility and opportunities to further mitigate the existing effects may be available. While incremental, this could still result in an outcome that ranges from maintenance of the status quo to improvement over the current conditions and movement in a direction that could align with the Declaration for Reconciliation over time and when combined with cumulative efforts.

However, if not decommissioned sooner, the facility will eventually reach an end-of-life state that is beyond safe repairs and upgrades for continued operations. Eventual decommissioning and restoration of land and water values at and around the Lands of Tl'uqtinus presents the highest level of opportunity to align the proposed Project area with the Quw'utsun Nation's goals. While decommissioning presents a wider range of potential outcomes, we assume that decommissioning may present the opportunity to work with regulators and landowners to ensure that land uses at this location are increasingly aligned with the Quw'utsun Nation's Declaration for Reconciliation and the pursuit of the economic benefits that we too would like to see realized is better aligned with our values, vision, and Rights.

## 6.4. Scenario 2: Project Approved as Proposed

If the Project is approved as proposed in FortisBC's Revised Application, several project activities may have effects on the Quw'utsun Rights, Qu'w'utsun Nation values, and vision for our future at the Lands of Tl'uqtinus. The following section evaluates select aspects of the Project from the Application in a way that aligns with our values and decision-making. Each section includes a summary of potential effects of the project on the Valued Component from the Application and then considers the following questions:

- **How are Quw'utsun Mustimuhw affected?**
- **How does the proposed project impact the ability of the Quw'utsun to achieve the vision set out in the Declaration for Reconciliation?**

Some sections include a **Note on the Application** that includes details regarding the Application methodology or information specific to that Valued Component. In addition to these details, the following note applies to the evaluation of all Valued Components:

*Several Valued Components direct the reader to Section 11.4 for further assessment of effects specific to the Quw'utsun Nation's interests. However, effects to the Quw'utsun Nation's interests in 11.4 do not carry over any effects that are concluded to be negligible in the primary Valued Component chapter. This methodology severely limits the ability of Section 11.4 to consider how the magnitude of a given effect may differ in the context of cumulative effects and Quw'utsun Nation values, practices, and Rights.*

*The conclusions in Section 11.4 of the Application are that there will only be positive residual effects to the Quw'utsun Nation based on increased employment and economic opportunity. **The Quw'utsun Nation does not acknowledge the conclusions of Section 11.4 as informed, accurate, or usable in decision making.***

### 6.4.1. Visual Quality

**Note on the Application** *Visual Quality is considered as part of the Land and Resource Use Chapter in the Application. However, for the purpose of this Report, Visual Quality is treated as a separate Valued Component for effects assessment.*

Visual quality of the surrounding area will change as a result of Project construction and operational activities. During the daytime, the new LNG storage tank and other supporting infrastructure are predicted to be visible to observers at selected sites (Key Observation Points or KOPs) during daytime viewing conditions. A location on the shoreline at the Tl'uqtinus village site on Cowichan Title Lands directly across from the Project site (KOP #2) was selected as one of five locations that were considered.

The level of visibility of the proposed Project components was rated as being "Obvious" to observers at the Tl'uqtinus observation location. The view from Tl'uqtinus and from two locations on Tilbury Island were rated as having a "Moderate" level of visual contrast in the daytime, which is noticeable and attracts the attention of observers. At night, viewers at Tl'uqtinus are expected to notice an increase in the perceived level of brightness due to lighting associated with Project operations. The change will shift brightness levels from E2 (Low District Brightness) to E3 (Medium District Brightness).

This change is assessed in relation to whether visual conditions at Tl'uq̓tinus continue to support ongoing relationships to place, including use, teaching, and cultural presence.

The Land and Resource Use Chapter concludes that there is potential for adverse residual effects on Visual Quality as a result of Project activities.

### ***How are Quw'utsun Mustimuhw affected?***

Changes to Visual Quality will result in the land at and around the Lands of Tl'uq̓tinus, including the Project area (a named Quw'utsun traditional use area, Xupi'xunum) being at a more industrialized visual state. Industrial visuals and disrupted views are a major barrier to Quw'utsun Nation cultural continuity, connections with airspace, land and water of culturally significant places, and the ability of our Elders to recognize and transmit place-based knowledge. These changes mean that the Lands of Tl'uq̓tinus will look less, not more, like a contemporary version of the home our Ancestors stewarded. Locations that encourage enjoyment of place and that are viable for ceremonial and spiritual practices are reduced in availability. The cultural aspects of harvesting activities are also diminished in quality and experience.

These changes and limitations increase barriers to cultural continuity and revitalization. Similarly, friends and relatives will be less, not more, inclined to visit a location with increasingly industrial landscapes. The visual changes from the Project will also serve as additional reminders of the Quw'utsun Nation's alienation from the Lands of Tl'uq̓tinus, including the Project area, with implications for mental and spiritual health, which have consequential negative effects on our physical health.

### ***How does the proposed project impact the ability of the Quw'utsun to achieve the vision set out in the Declaration for Reconciliation?***

The effects of the Project on Visual Quality result in adverse effects on Quw'utsun Nation's land and resource use objectives in the Declaration for Reconciliation. Visual changes increase barriers to residence for Quw'utsun Mustimuhw residing at the re-established village at Tl'uq̓tinus due to effects on enjoyment and Sense of Place. Visual changes reduce the availability of locations where culturally integral practices can occur and be re-established. Reduced visual quality impacts the ability of the Quw'utsun Nation to realize certain economic benefits from Cowichan Title Lands, including tourism. These effects are evaluated in accordance with Quw'utsun Law, which requires that conditions supporting relationships to place are maintained.

## **6.4.2. Air Quality**

***Note on the Application:*** The Application states that all populations are affected evenly, however Indigenous communities in Canada are considered vulnerable populations at risk of higher incidence of asthma as a result of social, economic, and environmental conditions (Fenton et al., 2012). According to the 2005 Community Health Survey, prevalence rates of asthma in Indigenous populations was 11.7% compared to 8.3% of non-Indigenous Canadians (Garner, Carrière, Sanmartin, & Longitudinal Health & Administrative Data Research, 2010). Older populations are also at particular risk from health effects of SO<sub>2</sub>, increasing concern for Quw'utsun Elders.

Project-specific and cumulative changes to Air Quality result in increased levels of ambient airborne pollutants at and around the Lands of Tl'uqtinus. Specifically, the project will contribute to the increase in harmful gases (nitrogen dioxide - NO<sub>2</sub>, and sulfur dioxide - SO<sub>2</sub>) and fine particulate matter (PM<sub>2.5</sub>).

Operational modeling for the Project predicts NO<sub>2</sub> and SO<sub>2</sub> exceedances are predicted to land and water users on and near Tilbury Island and NO<sub>2</sub> exceedances that would affect residents at Tl'uqtinus. Project activities also contribute to an increase in cumulative exposure to particulate matter (PM<sub>2.5</sub>), with a higher increase during construction than during operations. Potential effects of particulate matter on vegetation are considered in section 6.4.5.

Existing background levels of NO<sub>2</sub>, SO<sub>2</sub>, and PM<sub>2.5</sub> and the associated health risks from other sources are already elevated; Project activities further increase air pollutants, moving away from cleaner air.

The presence of NO<sub>2</sub> and SO<sub>2</sub> can also increase odours; in absence of odour modeling for the Project, the occurrence of odours cannot be ruled out.

The Application does not provide adequate detail on planned mitigation measures for the Quw'utsun Nation to support conclusions regarding their effectiveness.

### ***How are Quw'utsun Mustimuhw affected?***

Changes to Air Quality affect our health and enjoyment of experience. Short-term exposure to ambient NO<sub>2</sub> is linked to increases in total non-accidental, cardiopulmonary, cardiovascular, and respiratory mortality. Long-term exposure to ambient NO<sub>2</sub> is associated with adverse respiratory effects, especially in children, including reduced measures of lung function, reduced lung function growth, and the development of asthma and allergic responses. Existing asthmatics are especially sensitive to NO<sub>2</sub> exposure. Of note, the effects associated with NO<sub>2</sub> have been observed in epidemiological studies at concentrations that occur in Canada, well below existing ambient air quality objectives and standards (Health Canada, 2016). Human health risk assessment has also identified potential health risks to the Canadian population from exposures to ambient concentrations of SO<sub>2</sub> below the current National Ambient Air Quality Objectives (Health Canada, 2016). Exposure to PM<sub>2.5</sub> can lead to eye, nose, throat and lung irritation, wheezing, coughing and shortness of breath as well as decreased lung function and aggravation of lung and heart conditions like asthma and heart disease. Youth, Elders, and those with existing cardiopulmonary conditions are at highest risk. These effects are considered in relation to whether conditions necessary for the health and wellbeing of Quw'utsun Mustimuhw are maintained.

Given that the Air Quality modeling for the Project includes potential for NO<sub>2</sub> and SO<sub>2</sub> exceedances beyond the National Ambient Air Quality Objectives, the cardiopulmonary, immunological and neurological risks to Quw'utsun Mustimuhw living and harvesting in and around the Lands of Tl'uqtinus is elevated. The health considerations for changes to Air Quality are carried into the holistic discussion of Human Health in Section 6.3.4.

In addition to the health effects of changes to Air Quality, odours resulting from the project result in decreased enjoyment of residential and cultural uses, affecting the times and locations available for spiritual and ceremonial uses. Odours from the Project will also serve as additional reminders of Quw'utsun Nation's alienation from the Lands of Tl'uqtinus and the surrounding lands, with additional

implications for mental and spiritual health, which have consequential negative effects on our physical health.

***How does the proposed project impact the ability of the Quw'utsun to achieve the vision set out in the Declaration for Reconciliation?***

The changes to Air Quality result in adverse effects on the Quw'utsun Nation's land and resource use objectives as set out in the Declaration for Reconciliation. Health concerns about Air Quality changes create barriers for Quw'utsun Mustimuhw who might otherwise choose to reside at their re-established village at Tl'uqtnus. For those who decide to reside at Tl'uqtnus, the Project contributes to air quality conditions that negatively affect health in our already vulnerable population. Risk specific to Elders contributes to barriers to intergenerational learning needed to re-establish culturally integral practices, and odours affect times and locations where these practices can occur. Health risks and effects from changes to air quality also affect Quw'utsun Mustimuhw's ability to reside at Tl'uqtnus to pursue employment opportunities. These effects are evaluated in accordance with Quw'utsun Law, which requires that conditions supporting health, presence on the land, and intergenerational continuity are maintained.

### 6.4.3. Acoustics

***Note on the Application:*** Despite repeated requests from Quw'utsun Nation, the Tl'uqtnus receptor (R3) was not assessed as a residential location with associated Permissible Sound Levels in the Application for the Project. The Quw'utsun Nation requested information be provided for Acoustic effects at residential density at R3 to reflect the intent to re-establish residence of the village site and communicated that estimates or placeholders would be an adequate approach rather than none. In the absence of this information, Quw'utsun Nation uses the daytime and nighttime PSL values for R4 (52 dBA and 51 dBA, respectively) as placeholder values.

The acoustic assessment for the Project considered five receptor sites. This section focuses on the shoreline at Tl'uqtnus (R3) in Cowichan Title Lands and an informal pathway on the shoreline at Tilbury Island representing river or shoreline harvester experience (R5).

Figure 11: Acoustic Receptor Sites as illustrated in the Noise and Vibration Technical Data Report in the Revised Application

During construction, a person at the TI'uqtinus receptor site (R3) is not expected to perceive a meaningful change in noise<sup>7</sup>, as the ambient sound from all sources (cumulative ambient daytime sound, 52.9dBA) already exceeds the daytime residential noise threshold (PSL) and increases marginally with worst-case Project noise (53.8dbA). Noise at night increases by a similarly small amount. However, the increase in noise at night would move sound levels from just below to just above the nighttime residential noise threshold (PSL) of 51dBA, and also continue to exceed the sleep disturbance threshold of 40dBA. Sleep can also be disturbed by more or louder 'noise events' like alarms or hammering (percussive) activities.

The change to ambient sound from all sources (cumulative ambient sound) at the shoreline harvester location during periods of project construction is significantly higher than current levels and exceeds speech intelligibility thresholds<sup>8</sup>. Current ambient conditions result in 4% of people being highly annoyed, while the loudest construction phase would result in 54.7% of people being highly annoyed. The acoustic assessment in the Application does not consider cumulative increases to intermittent and more disruptive sound variations associated with construction.

During operations, an increase in ambient sound from all sources (4.4dBA) is expected at the TI'uqtinus shoreline receptor. The Project will contribute to future conditions that have noise above the residential threshold and would be noticeable to residents. This increase will also push the cumulative sound levels just above the threshold for speech intelligibility.

<sup>7</sup> Humans are unable to notice a sound level change of less than approximately 2dB.

<sup>8</sup> The threshold is set based on conversational voice levels among people 1 to 4 metres apart. Background noise above the threshold interferes with the ability to hear all words being spoken.

The Tilbury shoreline harvester receptor, while already at a level of noticeable sound during the day (56.5dBA), experiences an increase in cumulative operational daytime noise (66.1dba). This would change the current metric of 4% of people being highly annoyed to 29.4% being highly annoyed for the life of the project. The ambient sound from all sources at night is currently above the sleep disturbance threshold, and Project activities will move noise further beyond that threshold.

Project-specific operational sound increases the current ambient noise from the existing Tilbury facility from 41.2 to 46.1 at the TI'uqtinus receptor and from 51.5 to 59.9 at the Tilbury shoreline harvester receptor. Because of the logarithmic scale on which noise is measured, these increases correspond to fivefold and tenfold increases relative to existing conditions. Should other contributors to ambient noise decrease in the future, operational Project noise results in noise levels higher than those without the Project.

The Application does not provide adequate detail on planned mitigation measures for Quw'utsun Nation to support conclusions regarding their effectiveness.

### ***How are Quw'utsun Mustimuhw affected?***

Changes to Noise from the Project contribute to the overall soundscape at and around the Lands of TI'uqtinus remaining disruptive, or becoming more disruptive, to Quw'utsun residents, harvesters, and land users. Project-specific noise results in an increase above existing facility noise during both construction and operation, contributing to disruptive noise that shifts the soundscape away from the Quw'utsun Nation's preferred conditions. Chronic, low-grade noise exposure acts as a persistent, non-specific stressor that threatens health by disrupting the body's stress response systems and can increase the risk of cardiovascular disease, immune system dysregulation, sleep fragmentation, and long-term cognitive and psychological strain.

The thresholds used to assess the magnitude of the effects of noise were not created with Indigenous input and do not fully consider Indigenous uses, lifeways, and needs. For the purposes of assessing the effects of noise on Sense of Place and the ability to engage in spiritual and ceremonial activities, the sleep threshold of 40dBA applies. Higher noise levels interrupt silence and block welcome sounds such as water movement, birdsong, and vegetation moving in the wind. Ambient sound already exceeds the threshold for these activities. Project noise worsens these conditions rather than support achieving them.

The effects of noise to speech intelligibility at the Tilbury Island shoreline harvester receptor (and by proxy, river users) deter Quw'utsun Mustimuhw from harvesting, fishing, and navigating in these areas. Those who engage in these activities at and around the receptor experience sound that affects speech intelligibility, affecting our ability to teach cultural practices. Noise is also a deterrent to culturally important wildlife species and our future restoration and revitalization of their populations. These effects are considered in relation to whether conditions necessary for communication, teaching, and safe navigation on the land and water are maintained.

As a result of the above, changes to noise disproportionately affect the Quw'utsun Nation, which disproves the proponent's conclusion that all populations will be affected equally by noise.

***How does the proposed project impact the ability of the Quw'utsun to achieve the vision set out in the Declaration for Reconciliation?***

The effects of changes to Noise result in adverse effects on Quw'utsun Nation's land and resource use objectives as set out in the Declaration for Reconciliation. Noise levels increase barriers to Quw'utsun Mustimuhw residing at the re-established village at Tl'uqtinus. Noise levels negatively impact the health of Quw'utsun Mustimuhw through chronic low-grade noise exposure, reduce the overall locations where culturally integral practices can occur and be re-established, and create barriers to conversations that are part of intergenerational learning on the land and water. Noise negatively affects efforts to revitalize and steward culturally important wildlife at and around the Lands of Tl'uqtinus. Noise impacts the ability of the Quw'utsun Nation to realize certain economic benefits from Cowichan Title Land, including from tourism. These effects are evaluated in accordance with Quw'utsun Law, which requires that sound conditions support presence on the land, communication, and intergenerational transmission.

#### **6.4.4. Soil**

The soil within the project footprint has little to no vegetation or topsoil that supports plant life, reflecting of long-term industrial use and associated cumulative impacts. There are limited undisturbed and vegetated areas in the riparian areas outside the project footprint, adjacent to the Fraser River and Tilbury Slough.

Effects to soil from Project activities occur on the Project site and worsen already low soil capability through soil mixing, compaction and rutting, altered drainage patterns, spills, and erosion. There is no commitment to remediate soil capability to a level that supports vegetation at the end of the Project's lifecycle.

The effects and impacts related to soil are addressed in relation to how soil interacts with vegetation, wildlife, and surface water in the associated sections.

#### **6.4.5. Vegetation and Wildlife**

The diversity of ecosystems that historically supported the Quw'utsun Nation at and around the Lands of Tl'uqtinus, including at the Project area, has largely been lost to agriculture and industrial use. However, important pockets of vegetation and wildlife habitat do remain. Maintaining and growing these pockets of vegetated land in ways that support cultural needs, including harvesting for food, medicine, and materials, is a priority for the Quw'utsun Nation. Several plants of cultural importance are found within the Project area, including cattail, thimbleberry, fireweed, red alder, red Elderberry, Pacific willow, and lanceolate plantain.

Tilbury Slough, which runs between Tilbury Island and Delta located just outside the Project, is a wetland complex of high ecological value. This wetland is stressed by current industrial activities but continues to maintain ecological function and provide wildlife habitat for birds, mammals, amphibians, and reptiles. The foreshore along the Fraser River, on the other side of Tilbury Island, consists of estuarine sedge and water hemlock marsh habitat.

During Project Construction and Operations, vegetation in these productive areas is not directly impacted by clearing. However, vegetation is at risk from the introduction of invasive species during construction. The proponent has noted that soil at the Project site will not be remediated to a level that supports vegetation and will not be revegetated at decommissioning. Increased particulate matter during construction may affect overall vegetation health should dust settle on leaves to the extent that photosynthesis is impacted. If particulate contains metals or other contaminants, a higher level of disruption to photosynthesis may occur.

Culturally important wildlife, such as waterfowl and ungulates, are uncommon in the area due to development and habitat loss. For the purposes of this assessment, effects to Wildlife at and around Tl'uqtnus are addressed in relation to Vegetation (habitat provision), Surface Water Quality (contamination), and Noise (wildlife deterrent).

### ***How are Quw'utsun Mustimuhw affected?***

If invasive species are introduced to either the Fraser River foreshore or the Tilbury Slough wetland, this results in a decrease in culturally important plants and overall functional habitat in the harvesting areas in and around Tl'uqtnus that we can use. In the case of some invasive species, these changes are not reversible. Given the highly stressed status of ecological function in the industrialized landscape, any loss of habitat and the associated culturally important plants significantly affect harvesting in the lands at and around Tl'uqtnus. The effects of changes to vegetation are not limited to the availability of culturally important plants; any loss of remaining ecological systems and important habitat also affects the ability of the Quw'utsun Nation to steward their lands. These effects are considered in relation to whether conditions necessary for harvesting and the continued availability of culturally important plants are maintained. Concerns about the safety of culturally important plants that have been affected by dust deposition may also deter harvesters.

Preserving the remaining pockets of habitat will not meet the needs of Quw'utsun Mustimuhw. In the long term, the Quw'utsun Nation seeks to restore agricultural and industrial lands at and around the Lands of Tl'uqtnus to a more vegetated and ecologically diverse landscape with increased availability of culturally important plants and wildlife for future generations. This objective does not prevent modern economic land uses. Quw'utsun Nation seeks to better integrate a landscape that supports cultural resources and practices. The proponent's refusal to remediate soil and revegetate at decommissioning greatly affects progress towards this goal.

Additional effects to Quw'utsun Mustimuhw related to harvesting culturally important plants are discussed in the context of Health and Culture.

### ***How does the proposed project impact the ability of the Quw'utsun to achieve the vision set out in the Declaration for Reconciliation?***

The effects of the Project on Vegetation result in adverse effects on Quw'utsun Nation's land and resource use objectives as set out in the Declaration for Reconciliation. If invasive species establish during construction activities, changes to vegetation in essential pockets of wetland and estuarine shoreline affect the availability of already limited resources and locations for culturally integral practices. Reduction of vegetation and the availability of culturally important plants also reduce the resources available for Quw'utsun Mustimuhw who use plants to make items for trade or sale. Dust

deposition resulting from construction may affect plant health and deter harvesting. The absence of a remediation and vegetation plan at decommissioning creates barriers to plant and wildlife restoration at Tl'uq̓tinus and surrounding lands. These effects are evaluated in accordance with Quw'utsun Law, which requires that conditions necessary to sustain culturally important plant and wildlife are maintained.

#### 6.4.6. Surface Water

***Note on the Application:*** *The quality and quantity of site runoff is stated to be unchanged throughout the Project. However, insufficient detail is provided to support this conclusion.*

Surface water in the Project area comprises two watercourses: Tilbury Slough and the Fraser River. Tilbury Slough comprises valuable wetland habitat. Samples show that water quality has been affected by existing industry, traffic, and general development. Phosphorous, PAHs (polycyclic aromatic hydrocarbons), chloride, and several metals already exceed guidelines for the protection of aquatic life and wildlife throughout the year.

The volume and current of the Fraser River, combined with low connectivity to the Project site,

reduces the likelihood of surface water effects to this watercourse. However, discharge from hydrostatic testing and stormwater will enter Tilbury Slough, increasing the likelihood that contaminants persist there. Water discharge treatment requirements beyond oil-water separation are unclear.

There are areas of the wetland in Tilbury Slough that have shown higher sensitivity to acid and nitrogen changes that result from air emissions. The proponent's analysis concludes that project-specific emissions are not predicted to cause eutrophication or increase acidity beyond Water Quality Guidelines.

The emerging contaminant 6PPD-quinone from tire rubber enters watercourses in areas of high traffic. The potential effects of 6PPD-quinone are further discussed in relation to Fish and Fish Habitat (Section 6.3.7), as are other relevant surface water quality effects.

#### ***How are Quw'utsun Mustimuhw affected?***

The Tilbury Slough wetland is an important surviving pocket of vegetated habitat that supports culturally important plants. The existing water quality in Tilbury Slough is a concern for the Quw'utsun Nation and would be the focus of long-term restoration efforts. Any untreated runoff from the Project area will contribute to sediment transport and reduce surface water quality in Tilbury Slough. Wetland features of Tilbury Slough reduce the risk of contaminants flowing into the Fraser River but increase the likelihood that contamination persists in the slough. These effects are considered in relation to whether conditions necessary to improve water quality and support culturally important habitat are maintained. The ability to restore a high level of water quality in important habitat areas is part of Quw'utsun Nation stewardship at and around the Lands of Tl'uq̓tinus, including the Project area.

***How does the proposed project impact the ability of the Quw’utsun to achieve the vision set out in the Declaration for Reconciliation?***

Water leaving the Project site conveys sediment and may convey chemical contaminants to the receiving environment. The Project contributes to the ongoing poor Surface Water Quality in Tilbury Slough, creating additional barriers to important fish, plant, and wildlife restoration at Tl’uqtnus and surrounding lands, including the Project area. Efforts to improve surface water quality in Tilbury Slough are affected by Project-specific runoff and discharge, contributing to limitations on resources and locations for culturally integral practices. These effects are evaluated in accordance with Quw’utsun Law, which requires that the conditions necessary to restore and sustain water-dependent ecosystems are maintained.

#### 6.4.7. Fish and Fish Habitat

***Note on the Application:*** *The original project design included barge delivery of construction materials and a materials offloading facility (MOF) on the Fraser River shoreline. The Project has since excluded barge delivery and the MOF from design, instead relying on land-based transportation. However, the Revised Application retained text on the effects of the MOF. For Fish and Fish habitat in particular, this creates challenges in clearly assessing the remaining effects of the Project unrelated to the MOF.*

With the exclusion of barge delivery and the materials offloading facility (MOF), the Project footprint does not extend into the foreshore of the Fraser River and accordingly, no effects are identified in relation to the placement of riprap. The potential effects to Fish and Fish Habitat that remain arise from the effects of construction and operational activities affecting Surface Water quality. The potential for a large release of contaminants is addressed in Malfunctions and Accidents (Section 6.3.8).

The shoreline along the Fraser River is largely categorized as High Value habitat. Due to the speed and volume of the river and low connectivity to the Project site (see Section 6.3.6 Surface Water), effects to Fish and Fish Habitat along the Fraser River shoreline are expected to be limited.

The shoreline throughout Tilbury Slough is categorized as High Value. There is a tidal gate in Tilbury Slough that creates a barrier to fish migration. While there was historic presence of all five salmon species in Tilbury Slough, currently only Chum, Chinook, and river-type Sockeye fry and juveniles use the lower, unimpeded reaches of the Slough unless the tidal gate is upgraded to facilitate fish passage. The primary concern regarding effects to Fish and Fish Habitat in Tilbury Slough is the effect of surface water quality changes from stormwater runoff (see Section 6.3.6 Surface Water). Water treatment requirements for discharge into Tilbury Slough beyond oil-water separation are unclear.

Additional concerns exist regarding risk to fish from contamination from 6PPD-quinone, found in tires and introduced into the environment through runoff in high-traffic areas. The increase in traffic during Project construction increases the introduction of this contaminant, particularly in absence of known effective mitigation measures and with uncertain effects in the aquatic environment.

The Application does not provide adequate detail on planned mitigation measures for Quw’utsun Nation to support conclusions regarding their effectiveness.

### ***How are Quw'utsun Mustimuhw affected?***

The abundance of fish that historically supported the Quw'utsun Nation at and around the Lands of Tl'uq̓tinus (see Sections 3.3.3 and 4.1.2) has declined significantly because of overfishing, climate change impacts, and the cumulative effects of development pressures on fish habitat. The Fraser River, one of the greatest salmon bearing rivers in the world, historically hosted salmon that were so abundant that you could almost walk across the river on their backs (see Section 3.3.3.2). Further, Quw'utsun Mustimuhw have largely been excluded from their rightful fisheries on the South Arm of the Fraser River, including at the Project area shoreline, because of unlawful alienation (see Section 3.4.2). One of the Quw'utsun Nation's highest priorities is restoring the health and abundance of Fraser River salmon populations and re-establishing access to these fisheries in support of our physical, cultural, spiritual, and economic wellbeing.

Surface water quality samples within Tilbury Slough already exceed freshwater guidelines for aquatic life. Additional contaminant risk to water quality via surface water impacts to Tilbury Slough associated with runoff from the Project contributes to cumulative effects to fish and fish habitat, reducing the ability of the aquatic environment to support the health and abundance of Sockeye and other salmonids and fish species needed to support Quw'utsun Mustimuhw cultural practices, traditional diet, and way of life. These effects are considered in relation to whether conditions necessary to support the health and abundance of fish populations are maintained.

### ***How does the proposed project impact the ability of the Quw'utsun to achieve the vision set out in the Declaration for Reconciliation?***

The effects of changes to Fish and Fish Habitat result in adverse effects on Quw'utsun Nation's land and resource use objectives as set out in the Declaration for Reconciliation. Restoration efforts in Tilbury Slough to improve the health of Fish and Fish Habitat are affected by Project-specific runoff and discharge. Uncertainty regarding 6PPD-quinone in the aquatic environment may result in additional effects to Fish, decreasing the availability of resources for culturally integral practices. Perceived risk regarding the safety of consuming fish can deter harvesters from engaging in culturally integral practices. These effects are evaluated in accordance with Quw'utsun Law, which requires that conditions supporting salmon populations and their continued return are maintained.

## **6.4.8. Malfunctions and Accidents**

***Note on the Application:*** The assessment scenarios in the Malfunctions and Accidents section does not consider that the Fraser River shoreline and Tilbury Slough may be used as harvesting areas and therefore may have harvesters present in the event of an LNG release or fire. Terminology around "low risk" is subjective and defined by the proponent based on one approach to risk tolerance. This approach allows the proponent, not those who bear the risk, to dictate acceptability.

The section on Malfunctions and Accidents considers potential project outcomes that are unintended, unlikely to occur, but have high consequences if they do occur. Three scenarios are of primary concern to the Quw'utsun Nation.

In the event of loss of LNG containment where the vapour does not ignite, primary concerns are exposure to freezing temperatures, hypoxia, or asphyxiation for humans and wildlife. These effects can occur beyond the Project footprint along the Fraser River or Tilbury Slough. If this occurs, individuals present in these areas are at risk of harm and access is likely to be restricted afterwards.

Risk of fire or explosion from multiple materials is considered to be an unlikely but possible scenario. These events could have a human injury zone extending 150m from the release point. Fires and explosions can cause short term air quality exceedances and access restrictions.

A release of hazardous materials is also considered to be possible, particularly hydrocarbons or refrigerant. Such a release can result in contamination affecting soil, groundwater, and surface water and subsequently affect vegetation, wildlife, and human health. While traditional foods are not harvested from within the proposed Project Site, contaminants can reach Tilbury Slough and Shnuwiih (south arm of the Fraser River) if containment fails.

The proponent has included how they will meet standard regulatory requirements that contribute to lowering the likelihood of these events in the Application. These steps do not eliminate the possibility of an Accident or Malfunction, and the severity of such an event is of concern to Quw'utsun Nation.

#### ***How are Quw'utsun Mustimuhw affected?***

The potential effects of Malfunctions and Accidents fall into two categories of outcomes. The first is the low-likelihood but high-consequence risk of harm or death to harvesters adjacent the project footprint based on LNG vapour release, fire, or explosion. We recognize that this requires an accident, a failure of containment, and a harvester present at that time. Despite the low likelihood, the severity of the outcome requires consideration.

The second category of outcome is both real and perceived effects on harvesting. This category includes the inability to harvest because of contamination reaching the Fraser River foreshore and Tilbury Slough through contamination pathways. We assess any contamination event affecting salmon in the Fraser River to be catastrophic given the historic cultural importance of salmon to the Quw'utsun Nation and the extent to which salmon populations are currently at risk. Importantly, Quw'utsun Mustimuhw may avoid harvesting on the river adjacent to the Project area and in front of our village site on the Lands of Tl'uqtiinus due to the perceived risk of a loss of LNG containment, fire, or explosion, regardless of such an event occurring. These effects are considered in relation to whether conditions necessary for safe access to harvesting areas and the continued exercise of harvesting practices are maintained.

#### ***How does the proposed project impact the ability of the Quw'utsun to achieve the vision set out in the Declaration for Reconciliation?***

The potential for Malfunctions and Accidents related to the project results in impacts on the ability of the Quw'utsun to achieve the vision set out in its Declaration for Reconciliation. However unlikely, injury or loss of life resulting from loss of LNG containment, fire, or explosion would result in severe and irreversible impacts to the physical, cultural, and spiritual wellbeing that is implicit to re-establishing permanent residence at the village lands of Tl'uqtiinus. These effects are evaluated in

accordance with Quw'utsun Law, which requires that conditions supporting safe presence on the land and the continued exercise of cultural practices are maintained.

Perceived risk of loss of LNG containment, fire, or explosion affects the ability of Quw'utsun Mustimuhw to feel safe while engaging in culturally integral practices, can deter people from engaging in those practices, and reduces the viable locations for those practices. Overall safety concerns due to Malfunctions and Accidents reduce the perceived livability of the area, which is particularly profound when Quw'utsun Mustimuhw have only recently, after 150 years of struggle, recovered the ability to fish at the river adjacent to the Project and at and around the Lands of TI'uqtinus.

A large-scale contamination event with effects beyond the Project Footprint can impact culturally integral practices through effects to the health of fish, vegetation, and wildlife and the safety of consuming country foods. A large-scale contamination event sets back restoration efforts at and around the lands and waters of the Lands of TI'uqtinus.

#### 6.4.9. Employment and Economy

**Note on the Application:** *The Employment and Economy chapter in the Revised Application considers the history of traditional economies but assesses only indicators associated with Western economies (e.g. income, revenue, etc.). The Application notes that harvesting and subsistence is instead considered in the Culture VC. However, the Culture VC does not consider the real economic impacts related to harvesting, subsistence, and trade, nor is it addressed elsewhere. This creates a gap in the Application's ability to present a complete understanding of Project effects.*

*Land values are also considered in the Employment and Economy VC; this Report considers Land value in Section 8: Current and Future Market Costs.*

The Employment and Economy section identifies positive residual effects of the Project related to employment opportunities, contracting and procurement opportunities, government revenues, business revenue, and Provincial economic benefits. The Employment and Economy VC assessment identifies positive residual changes to opportunities for traditional economic activities, on the basis that wage economy employment increases available income for participating in traditional economies.

This conclusion results from an overgeneralization of a single study focused on Indigenous community members who live off-reserve. Household income was listed in that study as one of many factors influencing participation in hunting, fishing, and trapping; factors extended to include remoteness of residence, sex, age, household type, and involvement in First Nations organizations, social events or cultural activities (Kumar et al., 2019). Household income also appears less likely to affect participation in harvesting for plants and medicines. The conclusion that the Project's wage economy employment opportunities support positive residual changes to traditional economic activities at the site is unsupported.

### ***How are Quw'utsun Mustimuhw affected?***

As a result of unlawful alienation from the Lands Tl'uqtnus and the surrounding lands and waters, including the Project area, the Quw'utsun Nation is unable to maintain the economic and political roles and relationships that were facilitated by having a settlement and access to surrounding territory. Unlawful alienation also separated us from the wealth generated by the rich lands and resources at the Lands of Tl'uqtnus and the Project area (see Section 4). The outcomes of the *Indian Act* and residential schools compounded these effects, creating poverty, poor housing conditions, and reduced mobility (see Section 3.5).

The lack of permanent residence at Tl'uqtnus severely affects the ability of Quw'utsun Mustimuhw to pursue employment and other economic opportunities within their territory to the east of the Salish Sea. To pursue employment opportunities in this area, Quw'utsun Mustimuhw must spend time away from their families and procure and pay for lodging in an area of high cost of living. These combined costs create a significant barrier to the benefits of employment. Further, there is no permanent residential base from which Quw'utsun Mustimuhw would establish businesses that would profit from local economic benefits in the Project area. These are resources and relationships that the Quw'utsun Nation has been unable to establish in the modern mixed economy because of unlawful alienation. As a result, equitable distribution of economic benefits resulting from the Project is not achieved without clear and detailed commitments to how these barriers will be addressed.

Many aspects of the Project discussed across VC assessments in this report and summarized in our Conclusions in Section 8 affect the ability of Quw'utsun Mustimuhw to continue harvesting practices at and around the Lands of Tl'uqtnus now and into the future. Harvesting practices are culturally integral, and reduce the cost of living through subsistence harvesting and supplement income through sale and trade. These effects are considered in relation to whether conditions necessary to carry out harvesting and land-based economic practices are maintained.

### ***How does the proposed project impact the ability of the Quw'utsun to achieve the vision set out in the Declaration for Reconciliation?***

The effects of the Project result in adverse effects on Quw'utsun Nation's land and resource use objectives as set out in the Declaration for Reconciliation specific to economic benefits. The Quw'utsun Nation aims to realize economic benefits that are aligned with the accompanying objectives in the Declaration. The effects of the Project on the Quw'utsun Nation's ability to re-establish residence, restore the lands and waters at and around the Lands of Tl'uqtnus, including the Project area, and re-establish culturally integral practices indicate that benefits to employment and economy are not aligned with the Declaration. Project activities that result in barriers to harvesting affect the ability of our Quw'utsun Mustimuhw to realize economic benefits by reducing cost of living and supplementing income through sale and trade of traditional foods. These effects are evaluated in accordance with Quw'utsun Law, which requires that conditions supporting access to land-based economies and the equitable realization of economic benefits are maintained.

### 6.4.10. Human Health

**Note on the Application:** *The Human Health Chapter and associated Human Health Risk Assessment focuses on exposure pathways for contaminants from air and soil. The Quw'utsun Nation lens for health and wellbeing includes potential effects to physical, mental, cultural, and spiritual health.*

The Human Health Chapter in the Project Application considers contaminant pathways, noise, and any associated effects on Human Health. Air emissions identified in the Air Quality assessment include NO<sub>2</sub>, SO<sub>2</sub>, and PM<sub>2.5</sub>. Project activities contribute to an existing level of air pollutants, increasing pollutant concentrations relative to cleaner air conditions. Both NO<sub>2</sub> and PM<sub>2.5</sub> are non-threshold substances, meaning that there is robust western science information that any incremental increase in concentrations of these pollutants will be associated with an increased risk of adverse health outcomes (Health Canada, 2021).

The proponent concludes pathways via soil, groundwater, sediment, and surface water are not predicted to pose a risk to human health because contaminant levels are below guidelines. As a result, the potential for health effects of ingesting country foods is not retained for further evaluation. The pathway analysis only considers how existing contaminants on site may be mobilized and does not account for new contaminants that may be introduced by Project activities. There are no detailed, contaminant-specific monitoring or adaptive management plans to verify the predicted outcomes.

The HHRA includes an Indigenous receptor, but it does not evaluate Indigenous-specific land use patterns such as spending extended time on the land, harvesting, fishing, or participating in cultural activities near the Project Area. The Quw'utsun Nation can experience greater exposure than modelled receptors.

The proponent concluded that noise from the Project is not predicted to result in adverse health effects based on existing cumulative ambient noise conditions.

#### ***How are Quw'utsun Mustimuhw affected?***

As a result of unlawful alienation from the Lands of Tl'uqtinus and the surrounding lands, the Quw'utsun Mustimuhw have lost access to traditional food sources, particularly salmon from in and around Shnuwilh. Barriers to traditional diet have contributed to food insecurity and diet-related health conditions among Quw'utsun Mustimuhw (Section 4.2.1). Further, the residential school system created poverty, poor housing, substance abuse, family violence and ill health for Indigenous peoples (Section 3.5.4.3).

Short-term exposure to ambient NO<sub>2</sub> is linked to increases in total non-accidental, cardiopulmonary, cardiovascular, and respiratory mortality. Long-term exposure to ambient NO<sub>2</sub> is associated with adverse respiratory effects, especially in children, including reduced measures of lung function, reduced lung function growth, and the development of asthma and allergic responses. Existing asthmatics are especially sensitive to NO<sub>2</sub> exposure. Of note, the effects associated with NO<sub>2</sub> have been observed in epidemiological studies at concentrations that occur in Canada, well below existing ambient air quality objectives and standards (Health Canada, 2016). Human health risk assessment has also identified potential health risks to the Canadian population from exposures to ambient concentrations of SO<sub>2</sub> below the current National Ambient Air Quality Objectives (Health Canada,

2016). Exposure to PM2.5 can lead to eye, nose, throat and lung irritation, wheezing, coughing and shortness of breath as well as decreased lung function and aggravation of lung and heart conditions like asthma and heart disease. Youth, Elders, and those with existing cardiopulmonary conditions are at highest risk (see Section 6.3.2).

In addition to specific health outcomes, perceived risk of changes to quality of air, water, land, fish, vegetation, or wildlife affects diets and overall wellbeing and deter Quw'utsun Mustimuhw from spending time on the land. Culturally integral practices are intertwined with the health and wellbeing of Quw'utsun Mustimuhw.

Dislocation has imposed psychological costs. The intergenerational trauma resulting from the enactment of Crown policies and regulations like residential schools, is associated with symptoms associated with post-traumatic stress disorder, including feeling powerless, depressed, and suicidal (Isobel, McCloughen, Goodyear, & Foster, 2020). Indigenous youth in Canada show high rates of hopelessness and depressive symptoms, which has been linked to excessive drinking and suicidality (Stewart, et al., 2011). Healing must be culturally informed and consider the profound changes of "geographic dislocation and disruptions to their connections to the land and to their traditional patterns of subsistence" (Stewart, et al., 2011).

Health impacts are cumulative and interconnected. Project effects resulting in changes or contribution to cumulative effects to Noise, Visual Quality, and the ability to engage in cultural practices affect overall mental and cultural wellbeing linked to sense of place and connection to the Lands of Tl'uqtnus and the surrounding lands and waters, including the Project area. Psychological impacts also include fear and stress related to accidents. The project involves LNG infrastructure which carries real and perceived risks of accidents, including explosions or major releases. This causes ongoing stress and anxiety, affects mental health and sense of safety and changes how and where people feel comfortable spending time. These effects are considered in relation to whether conditions necessary to support overall health and the ability to live on, use, and remain connected to the land are maintained.

***How does the proposed project impact the ability of the Quw'utsun to achieve the vision set out in the Declaration for Reconciliation?***

The physical, cultural, spiritual, and economic wellbeing of Quw'utsun Mustimuhw is central to each of the objectives set out in the Declaration of Reconciliation. The collective changes to Valued Components in the Application move conditions further away from Quw'utsun Nation goals of achieving a restored landscape at and around the Lands of Tl'uqtnus that supports human health and wellbeing. These effects are evaluated in accordance with Quw'utsun Law, which requires that conditions supporting the health, wellbeing, and continued presence of our Quw'utsun Mustimuhw on the land are maintained.

Concerns regarding Project effects to Human Health affect our willingness to engage in culturally integral practices at and around the Project footprint. Human Health concerns can also deter those of us who wish to reside at Tl'uqtnus and seek employment in the area.

### 6.4.11. Culture

***Note on the Application:*** *The assessment of Culture and subsequent conclusions on effects are written by the proponent through a colonial lens and are limited by colonial approaches. Their conclusions of negligible effects depend on narrow baseline data and exclude cumulative cultural effects. For Quw'utsun Nation, a meaningful completion of the Culture section is dependent on strong understanding and relationship between the Quw'utsun Nation and the proponent, which has been absent.*

*The assessment of effects to Culture in the Application is highly dependent on the proponent's conclusions for other Valued Components, such as Air Quality, Acoustics, and Vegetation. Please refer to the relevant sections of this Report for the Quw'utsun Nation's conclusions on the effects of the Project, which differ from the proponent's and contribute to the assessment herein.*

Governance for the Quw'utsun Nation extends beyond emissions and includes abiding by Quw'utsun Nation laws and customs. The Culture section of the Application only considers the effects of greenhouse gas (GHG) emissions on governance. The proponent has committed to achieving 'net-zero' emissions by 2030. Quw'utsun Nation maintains concerns around the true effectiveness of tools like carbon credits to achieve 'net-zero' emissions.

Changes to cultural practices from project activities are also considered in the Application in the context of physical changes to lands, water, and resources, changes to access, and changes to sensory conditions. The proponent has assessed the effects of these changes as negligible based on their conclusions for other Valued Components. The proponent also concludes that there will be no effects to intergenerational knowledge transfer or cultural continuity, based on the same reasoning.

The Quw'utsun Nation disagrees with these conclusions. As discussed in the remainder of this section, Project activities contribute to the continuation of a landscape that limits Quw'utsun Nation culture and intentions to re-establish culturally integral practices at the Lands of Tl'uq̓tinus and its surrounding lands and waters.

#### ***How are Quw'utsun Mustimuhw affected?***

As explored in Sections 3 and 4 of this Report, colonial disruption through the *Indian Act* and unlawful alienation from Tl'uq̓tinus and the surrounding lands and waters, including the Project area, prevents Quw'utsun Mustimuhw from maintaining culturally integral practices through intergenerational knowledge transfer. The cultural continuity supported by storytelling, ceremony, and experiential learning related to harvesting, fishing, and food processing is severely disrupted, although not fully lost (see Section 3.6).

This cumulative context is critical when considering the magnitude of effects on Culture. The collective effects of Project Activities move the Lands Tl'uq̓tinus and the surrounding lands and waters away from the desired state that would best support Quw'utsun Mustimuhw and our ability to practice our Culture.

***How does the proposed project impact the ability of the Quw’utsun to achieve the vision set out in the Declaration for Reconciliation?***

The following negative effects of Project activities on individual Valued Components result in a collective impact on the Quw’utsun Nation’s ability to re-establish culturally integral practices on the south arm of the Fraser River and mouth, including at and about the Lands of Tl’uq̓tinus:

- Visual changes reduce the overall locations where culturally integral practices can occur and be re-established.
- Air Quality risk specific to Elders reinforce barriers to intergenerational learning needed to re-establish culturally integral practices, and odours affect times and locations where these practices can occur.
- Noise levels reduce the overall locations where culturally integral practices can occur and be re-established and create barriers to conversations that are part of intergenerational learning on the land and water. Noise may negatively affect future effort to revitalize and steward culturally important wildlife at and around the Lands of Tl’uq̓tinus.
- If invasive species establish during construction activities, changes to vegetation in essential pockets of wetland and estuarine shoreline affect the availability of already limited resources and locations for culturally integral practices. The absence of a remediation and vegetation plan at decommissioning creates barriers to important plant and wildlife restoration at the Lands of Tl’uq̓tinus and surrounding lands that would support culturally integral practices into the future.
- Sediment mobilization and potential for contaminants from Project runoff and discharge contribute to the ongoing poor Surface Water quality in Tilbury Slough, creating additional barriers to important plant and wildlife restoration at the Lands of Tl’uq̓tinus and surrounding lands, including the Project area. Efforts to improve cumulative surface water quality in Tilbury Slough are affected by Project-specific runoff and discharge, contributing to limitations on resources and locations for culturally integral practices.

These effects are evaluated in accordance with Quw’utsun Law, which requires that conditions supporting the continuation, transmission, and practice of Quw’utsun culture on the land are maintained.

## 6.5. Synthesis of Project Effects

The preceding sections have evaluated the Project’s effects across a range of topics presented in the Application, including Visual Quality, Air Quality, Acoustics, and other interrelated aspects of the biophysical and human environment. While these topics are presented using the structure of Valued Components for clarity, the assessment undertaken by Quw’utsun Nation does not treat them as discrete or independent categories of impact.

Taken together, the evidence demonstrates that Project activities introduce incremental and cumulative changes that further industrialize the conditions at and around the Lands of Tl’uq̓tinus, and along Shnuwiih (the South Arm of the Fraser River) within Quw’utsun Territory. These changes increase exposure to environmental stressors, and interfere with the conditions necessary for Quw’utsun Mustimuhw to live, practice culture, and restore relationships with this place. These effects are not isolated. They interact and compound, producing a broader pattern of impact that must be understood in its full relational context.

Across the areas assessed, several consistent conclusions emerge:

- Project activities contribute to conditions that move the Lands of Tl'uqtnus, the Project area, and Shnuwiih further away from, rather than toward, the state required to support Quw'utsun Nation's vision for reconciliation, including re-establishment of residence, restoration of ecological systems, and revitalization of culturally integral practices.
- Changes to air quality, noise, and the visual and physical environment create barriers to residence, harvesting, teaching, ceremony, and the intergenerational transmission of knowledge.
- Existing industrial conditions do not mitigate Project effects; rather, they increase the vulnerability of remaining values and amplify the magnitude of additional impacts.
- Reliance on future mitigation measures, monitoring, and adaptive management does not resolve these effects, particularly where impacts relate to cultural continuity, relational obligations, and long-term conditions of place.

Under the proponent's framework, these effects are evaluated in relation to thresholds, significance determinations, and the application of mitigation measures. Under Quw'utsun Law, the analysis proceeds differently.

The question is not whether effects can be characterized as negligible, minor, or significant within a regulatory system. The question is whether the Project, as proposed, meets the legal obligations required to maintain balance, uphold relationships, and protect the conditions necessary for Quw'utsun Mustimuhw to live in accordance with Snuw'uy'ulh.

On the basis of the assessment in this Section, the Project results in changes that:

- degrade the ecological, cultural, and experiential conditions in Quw'utsun Territory;
- impair the ability to re-establish residence and sustain community life;
- disrupt culturally integral practices, including harvesting, teaching, and ceremony; and
- create ongoing and cumulative conditions that undermine intergenerational continuity; and
- interfere with Quw'utsun Nation exercise of its Aboriginal title on Cowichan Title Lands.

These effects engage core legal principles under Quw'utsun Law, including respect for all relations, stewardship obligations, interconnectedness, and the requirement to maintain pathways of return for salmon, people, and knowledge.

Where these obligations cannot be met, the Project cannot be considered lawful in this place.

The analysis in this Section therefore establishes that the Project, as proposed, is not compatible with the conditions required to achieve the objectives of reconciliation in Quw'utsun Territory, including in the Project Area, at the Lands of Tl'uqtnus and the South Arm of the Fraser River as articulated in the Declaration for Reconciliation, nor with the legal requirements governing decision-making under Quw'utsun Law.

## 7. Current and Future Market Costs

The proposed Project would add to an existing pattern of infringement on Quw'utsun Rights that has already reduced the market value of the Lands of Tl'uqtnus and potentially Tilbury Island. Drawing on the cumulative effects assessment approach endorsed in *Yahey v. British Columbia* (2021 BCSC 1287), this section makes two arguments. First, past and ongoing infringements have limited the Quw'utsun Nation's land use options at the Lands of Tl'uqtnus and Tilbury Island, and the proposed Project would worsen these cumulative limitations (Section 7.1). Second, these limitations reduce the market value the Quw'utsun Nation can derive from the Lands of Tl'uqtnus (Section 7.2). Non-market costs are discussed in Section 4.2 and elsewhere in this report. Technical details are provided in Appendix B.3.

### 7.1. Infringements Have Limited Land Use Options

The Quw'utsun Nation's preferred uses for the Lands of Tl'uqtnus, as laid out in the 2016 Declaration for Reconciliation (see Appendix A), include recovery and restoration of the settlement and surrounding lands, permanent residence and river access, reestablishment of culturally integral harvesting practices, and compatible economic and employment opportunities.

Past and ongoing infringements have limited the Quw'utsun Nation's ability to pursue these residential, river access, and harvesting uses on the Lands of Tl'uqtnus and in the surrounding area, including Tilbury Island. The following subsections describe how various factors resulting from infringements have limited land use options: speculation and neglect, public good uses, and industrial encroachment.

#### 7.1.1. Speculation and Neglect

The *Cowichan Tribes v. Canada* trial produced detailed evidence of speculation and neglect at the Lands of Tl'uqtnus. Nearly a century of speculation and neglect left the Lands of Tl'uqtnus without the servicing that supports higher-value uses such as residential development, and removed from the economic and population centres in Richmond that would otherwise support residential potential.

Between the 1860s and 1914, the Colony and Province of British Columbia granted the lands to government officials, land agents, and well-connected individuals (*Cowichan Tribes v Canada*, 2025, Executive Summary and at paras. 1839-1856, 1904-1909, 1985-1990, 2023-2028, 2034-2037, 2046-2054, 2057-2060). None of the initial recipients used or occupied the land. As the Court found, "[m]any of the original grantees of land in the Claim Area were absentee settlers. Similarly, many subsequent owners did not use or occupy the land. The land was mostly idle for decades" (*Cowichan Tribes v Canada*, 2025, paras. 922, 1972, 2350).

This non-use, with accompanying poor servicing, persisted into the 1960s. Between 1920 and 1944, most fee simple holders failed to pay municipal taxes, and their lands were forfeited and sold under the Municipal Act (*Cowichan Tribes v Canada*, 2025, paras. 2341, 2350). A 1949 City of Richmond bylaw confirmed there were "no buildings of any kind upon the said lands" (Woodward & Company LLP, 2023, p. 88; see also *Cowichan Tribes v Canada*, 2025, para. 2352). When Canada and the Fraser River Harbour Commission (FRHC) acquired some of the Federal Lands of Tl'uqtnus from Richmond in 1968 and 1969, "[t]hese lands were generally undeveloped, poorly serviced by roads, and mostly vacant except for some peat extraction which was occurring" (*Cowichan Tribes v Canada*, 2025, para. 2440). This state depressed the land's value, allowing Canada and FRHC to acquire it cheaply (*Cowichan*

Tribes v Canada, 2025, para. 2729). For example, the development permit for 14000 Riverport Way, one of the few residential developments at the Lands of Tl'uq̓tinus, notes it is not expected to attract families due to its distance from schools (City of Richmond Development Applications Department, 2012).

### 7.1.2. Public Good Uses

The Agricultural Land Reserve (ALR) and other public good land uses have reduced the private market value of the Lands of Tl'uq̓tinus, even as they generated public benefits. There is no ALR on Tilbury Island, so this subsection applies to the Lands of Tl'uq̓tinus.

Approximately 30% of the Lands of Tl'uq̓tinus is in the ALR; before the Ecowaste landfill was removed from the ALR in 2023, this figure exceeded 50%. The ALR, established in 1973 under the *Agricultural Land Commission Act*, designates agriculture as the priority land use: farming is encouraged and non-agricultural uses are restricted, with exceptions requiring Agricultural Land Commission (ALC) approval. The ALR addresses a market failure: the benefits of preserving farmland near cities (e.g., food security, limiting sprawl) are largely captured by the public rather than by individual landowners, who would otherwise face strong incentives to convert land to higher-value uses. The ALR therefore depresses the private market value of land relative to its non-ALR use (Sussmann et al., 2016). Even if the Lands of Tl'uq̓tinus were removed from the ALR tomorrow, decades under ALR designation have reinforced its distance from economic and population centres, further limiting residential potential.

Parts of the Lands of Tl'uq̓tinus were used as a municipal landfill from the 1950s through to 1986 (Cowichan Tribes v Canada, 2025, paras. 2654, 2736), and subsequently as a landfill for construction, demolition, and excavation materials. Landfilling has likely reduced the suitability of the Lands of Tl'uq̓tinus for the Quw'utsun Nation's preferred uses, through contamination (Rantanen, 2023) and physical alteration of the land (Cowichan Tribes v Canada, 2025, paras. 2736, 2732) among other factors.

### 7.1.3. Industrial Encroachment

Since the 1960s, the Lands of Tl'uq̓tinus and Tilbury Island have been sites for, and surrounded by, industrial development, all without consultation of the Quw'utsun Nation (Cowichan Tribes v Canada, 2025, paras. 2489, 2686, 2475, 2487). This industrial development conflicts with the Quw'utsun Nation's preferred uses.

On Tilbury Island, industrial expansion began in 1971 with the Tilbury Base Plant, which converted approximately 120 acres of formerly agricultural land to industrial use; by 1979, a second phase added a further 100 acres (see Appendix B.1.1.1.2). Tilbury Island is now entirely under industrial use, with no residential development.

At the Lands of Tl'uq̓tinus, the FRHC acquired land between the late 1960s and 1974 with the aim of developing a deep-sea port (Cowichan Tribes v Canada, 2025, paras. 2726, 2728), and physically transformed it through "extensive filling" and dredging in pursuit of this goal (Cowichan Tribes v Canada, 2025, paras. 2736, 2732, 2737–2738). Industrial development has created soil and noise pollution so that one residential development at the Lands of Tl'uq̓tinus could only be built after soil remediation and required special design to alleviate indoor noise pollution from surrounding industrial properties (City of Richmond Development Applications Department, 2012).

Despite this industrial encroachment, the Lands of Tl'uq̓tinus have not been used to their full industrial potential. The Vancouver Fraser Port Authority (VFPA) and its predecessors have held the land in reserve as a potential deep-water port site without realizing this development (Cowichan Tribes v Canada, 2025, para. 2534). Reserving “trade-enabling industrial land” like the Lands of Tl'uq̓tinus is another public good, generating market and non-market value for the region, province, and country that the private landowner does not capture (InterVISTAS Consulting Inc. & Urban Systems, 2023). While VFPA has put some of its holdings at the Lands of Tl'uq̓tinus to use for logistics and the YVR Fuel Delivery Project, among other uses, over a quarter of the Lands of Tl'uq̓tinus was vacant in 2022 according to BC Assessment.

## 7.2. Limitations' Market Cost

The Quw'utsun Nation's preferred land uses, while not primarily motivated by market value, would involve higher market value than the agricultural and industrial uses to which cumulative infringements have largely limited the Lands of Tl'uq̓tinus and Tilbury Island. Residential development in particular would be substantially more valuable than existing agricultural uses, and potentially more valuable than existing industrial uses depending on density levels. The market cost of these limitations can be quantified by comparing the market value associated with different land uses.

The limited residential development that does exist at the Lands of Tl'uq̓tinus is more valuable than existing agricultural or industrial uses, according to BC Assessment (Table 3). Mid-rise residential land was assessed at over six times the value of industrial land and over eighty times the value of land in the ALR. On Tilbury Island, which is entirely dedicated to industrial use, land values are higher than industrial land values at the Lands of Tl'uq̓tinus, but lower than residential values there.

**Table 3: Assessed Value of the Lands of Tl'uq̓tinus, by Land Use, 2022**

| Land Use                    | Total Acres | Number of Properties | Value (2022 \$/acre) |
|-----------------------------|-------------|----------------------|----------------------|
| Residential (Single Family) | 0.2         | 1                    | \$7,792,577          |
| Residential (Mid-Rise)      | 3.9         | 3                    | \$18,363,497         |
| Commercial                  | 278.4       | 11                   | \$2,979,802          |
| Industrial                  | 618.2       | 21                   | \$2,779,350          |
| Agricultural Land Reserve   | 835.8       | 89                   | \$219,986            |

Sales data confirm that residential land values around the Lands of Tl'uq̓tinus approximate or exceed industrial values, depending on density, and far exceed agricultural values:

- In surrounding East Richmond, residential land sold for an average of \$6,175,770 per acre for single family and \$12,443,797 per acre for mid-rise in 2022.<sup>9</sup>

---

<sup>9</sup> Based on real estate sales data from Multiple Listing Service (see Appendix B.3.2).

- Sales data for industrial land suggest that assessed values may understate the value of industrial land: industrial land sold for an average of \$5.6 and \$5.4 million per acre in Richmond and Delta (respectively) in 2022 (InterVISTAS Consulting Inc. & Urban Systems, 2023).

Residential land values around the Lands of Tl'uq̓tinus might be higher were it not for the area's history of underdevelopment and industrial encroachment. East Richmond is among the lowest-value residential neighbourhoods in Richmond. Table 4 shows residential land values averaged across the rest of Richmond (excluding East Richmond), including high-rise values, which are not represented in East Richmond at all.<sup>10</sup>

**Table 4: Value of Residential Land in Richmond, Excluding East Richmond, 2022**

| Land Use                    | Value (2022 \$/acre) |
|-----------------------------|----------------------|
| Residential (Single Family) | \$9,867,062          |
| Residential (Mid-Rise)      | \$14,558,584         |
| Residential (High-Rise)     | \$20,546,383         |

High-rise residential land in Richmond sold for roughly \$20.5 million per acre in 2022, roughly seven times assessed industrial land values at the Lands of Tl'uq̓tinus in the same year. Across the rest of Richmond, single family and mid-rise residential land is also more valuable than the same uses at the Lands of Tl'uq̓tinus or in East Richmond, and substantially more valuable than the industrial and agricultural uses that dominate the Lands of Tl'uq̓tinus today.

In sum, cumulative infringements have limited land use at the Lands of Tl'uq̓tinus and potentially Tilbury Island to lower-value agricultural and industrial uses, while the Quw'utsun Nation's preferred uses would likely generate higher market value. The proposed Project would deepen these limitations by further entrenching industrial use and constraining the Nation's options for residential and other higher-value development.

The Project imposes ongoing and cumulative economic burdens on Quw'utsun lands and waters while further constraining access and use available to Quw'utsun Mustimuhw. The Project does not satisfy reciprocity obligations because it does not return benefits proportionate to what is taken from lands, waters, and lifeways, and therefore fails this legal requirement under Quw'utsun Law.

The cumulative effects of past and proposed use exceed what can be lawfully sustained within Tl'uq̓tinus, along Shnuwiilh, within the Project area, and across the South Arm of the Fraser River, and the Project therefore fails this legal requirement under Quw'utsun Law.

Where these conditions cannot be addressed and lawful balance cannot be restored, the Project does not meet the requirement for permission under Quw'utsun Law.

---

<sup>10</sup> East Richmond only has high-rise apartment sales in 2021.

## 8. Summary of Effects

In Section 11.4 of the Application, the proponent concludes that the only residual effects to the Quw'utsun Nations interests are positive effects to social and economic conditions and positive effects to health and wellbeing, all resulting from increased employment and economic opportunity. These conclusions rely heavily on the reasoning that the current industrial landscape allows for further industrial effects and that commitments to detail mitigation in the Construction and Operational Environmental Management Plans can be confirmed as highly effective. Further, these conclusions are based on a narrow lens that prioritizes regulations and thresholds and excludes the relevance of cumulative effects that have impacted the Quw'utsun Nation. As previously noted, the ***Quw'utsun Nation does not acknowledge the conclusions of Section 11.4 as informed, accurate, or usable in decision making.***

This vision in the Quw'utsun Nation Declaration for Reconciliation guides how we assess the compatibility of any proposed project or activity in the area with Quw'utsun Rights. We do not agree that environmental regulations and thresholds meet our needs when seeking to achieve this vision. In this Report, we have emphasized the following question:

***How does the proposed Tilbury Phase 2 Expansion Project impact the ability of the Quw'utsun to achieve the vision set out in the Declaration for Reconciliation?***

Currently, there are several aspects of the proposed Project that impact the ability of the Quw'utsun to achieve the vision set out in the Declaration for Reconciliation:

### **Recovery and restoration of the Cowichan Nation owned village and surrounding lands at and about Tl'uqtinus on the south arm of the Fraser River**

- The absence of a remediation and **Vegetation** plan at decommissioning creates barriers to important plant and wildlife restoration at the Lands of Tl'uqtinus and surrounding lands, including the Project area. Dust deposition resulting from construction may affect plant health and deter harvesting.
- Sediment mobilization and potential for contaminants from Project runoff and discharge will contribute to the ongoing poor **Surface Water** quality in Tilbury Slough, creating additional barriers to important plant and wildlife restoration at the Lands of Tl'uqtinus and surrounding lands.
- A large-scale **contamination event** may also set back restoration efforts at and around the lands and waters of the Lands of Tl'uqtinus.
- **Noise** may negatively affect future effort to revitalize and steward culturally important wildlife at and around the Lands of Tl'uqtinus.
- Restoration efforts in Tilbury Slough to improve the health of **Fish and Fish Habitat** may be affected by Project-specific runoff and discharge.
- No detailed mitigation, offsetting, or restoration plans provide a pathway to the project benefitting the lands and waters at and around the Lands Tl'uqtinus.

Based on the effects above, the proposed Project is unlawful when considered in the context of Quw'utsun legal principles of Respect, Reciprocity, Stewardship, Right Conduct, Avoiding Harm, Lawful Change, Healing and Restoration, and Maintaining Connections to Home, Land, and Origin.

### **Re-establishment of Cowichan Nation permanent residence and river access at the village lands of Tl'uqtnus**

- The proposed Project would deepen land use limitations by further entrenching industrial use and constraining the Nation's options for residential and other higher-value development.
- Changes to **Visual Quality** may increase the barriers to Quw'utsun Mustimuhw residing at the re-established village at Tl'uqtnus due to effects on enjoyment and Sense of Place.
- Health concerns related to **Air Quality** changes may create barriers for Quw'utsun Mustimuhw who might otherwise choose to reside at the re-established village at Tl'uqtnus. For those who decide to reside at Tl'uqtnus, the project will contribute to air quality conditions that negatively affect health in an already vulnerable population. Odours may affect enjoyment and Sense of Place.
- **Noise** levels may increase the barriers to Quw'utsun Mustimuhw residing at the re-established village at Tl'uqtnus due to annoyance, potential sleep disruption and other health impacts. For those who do decide to reside at Tl'uqtnus, noise may affect health, enjoyment and Sense of Place.
- However unlikely, injury or loss of life resulting from **loss of LNG containment, fire, or explosion** would deeply and irreversibly impact the physical, cultural, and spiritual wellbeing that implicit to re-establishing permanent residence at our village of Tl'uqtnus.
- Overall safety concerns due to **Malfunctions and Accidents** may reduce the perceived livability of the area and therefore act as a barrier to re-establishment of residence at Tl'uqtnus.

Based on the effects above, the proposed Project is unlawful when considered in the context of Quw'utsun legal principles of Respect; Healing and Restoration; Collective Responsibility; Compassion, Acceptance, and Avoiding Harm; Lawful vs. Unlawful Change; and Maintaining Connections to Home, Land and Origin.

### **Re-establishment of Cowichan Nation culturally integral practices (e.g. harvesting fish, waterfowl, plants) on the south arm of the Fraser River and mouth, including at and about Tl'uqtnus**

- Changes to **Visual Quality** are likely to reduce the overall locations where culturally integral practices can occur and be re-established.
- Concerns regarding Project effects to **Human Health** may affect our ability or willingness to engage in culturally integral practices at and around the Project footprint.
- **Air quality** risk specific to Elders may create barriers to intergenerational learning needed to re-establish culturally integral practices, and odours may affect times and locations where these practices can occur.
- **Noise** levels are likely to reduce the overall locations where culturally integral practices can occur and be re-established. Noise may also create barriers to conversations that are part of intergenerational learning on the land and water.
- If invasive species establish during construction activities, changes to **Vegetation** in essential pockets of wetland and estuarine shoreline are likely to affect the availability of already limited resources and locations for culturally integral practices.
- Efforts to improve cumulative **Surface Water** quality in Tilbury Slough may be affected by Project-specific runoff and discharge, contributing to limitations on resources and locations for culturally integral practices.

- Impacts on **Surface Water** may pose cumulative impacts to **Fish and Fish Habitat**, which may affect Quw'utsun Mustimuhw's ability to engage in Rights-based fisheries
- Uncertainty regarding 6PPD-quinone in the aquatic environment may result in unforeseen effects to **Fish and Fish Habitat**, decreasing the availability of resources for culturally integral practices. Perceived risk regarding the safety of consuming fish may deter harvesters from engaging in culturally integral practices.
- Perceived risk of **loss of LNG containment, fire, or explosion** may affect the ability of Quw'utsun Mustimuhw to feel safe while engaging in culturally integral practices, may deter people from engaging in those practices, and may reduce the viable locations for those practices.
- A large-scale **contamination event** with effects beyond the Project Footprint may impact culturally integral practices through effects to the health of fish, vegetation, and wildlife and the safety of consuming country foods.

Based on the effects above, the proposed Project is unlawful when considered in the context of Quw'utsun legal principles of Respect; Preparation, Prayer and Right Conduct; Transmission of Teachings and Intergenerational Obligation; Healing and Restoration; Collective Responsibility; and

Compassion, Acceptance, and Avoiding Harm.

**Realization of Cowichan Nation revenue, economic and employment opportunities and benefits that are compatible with the above**

- The effects of the Project on the Quw'utsun Nation's ability to re-establish residence, restore the lands and waters at and around the Lands of Tl'uqtnus, and re-establish culturally integral practices indicate that any benefits to **Employment and Economy** are not aligned with the Declaration.
- Project activities that result in barriers to harvesting affect the ability of Quw'utsun Mustimuhw to realize **Economic Benefits** through reducing cost of living and supplementing their income through sale and trade of traditional foods.
- Cumulative infringements have limited land use at the Lands of Tl'uqtnus to lower-value agricultural and industrial uses, while the Quw'utsun Nation's preferred uses would likely generate higher market value and the associated **Economic Benefits**.
- Reduced **Visual Quality** and increased **Noise** may preclude certain economic avenues, largely as they relate to tourism and residential opportunities.
- Health risks and effects from changes to **Air Quality** and **Noise** may affect Quw'utsun Mustimuhw's ability to reside at Tl'uqtnus to pursue employment opportunities.
- Reduction of **Vegetation** and the availability of culturally important plants may also reduce the resources available for Quw'utsun Mustimuhw who want to use plants to make items for trade or sale.
- **Human Health** concerns may also deter those of us who wish to reside at Tl'uqtnus and seek employment there.

Based on the effects above, the proposed Project is unlawful when considered in the context of Quw'utsun legal principles of Reciprocity; Stewardship; and Healing and Restoration.

**Promotion of education regarding the Cowichan Nation presence and interests on the south arm of the Fraser River and mouth**

- Throughout the Application, our relationship to the Lands of Tl'uq̓tinus and the surrounding lands and waters is minimized and the colonial narrative of mainland First Nations and Island First Nations established through the *Indian Act* and reserve system is perpetuated. This issue is present in every Valued Component where the interests of select Nations are prioritized due to their standing in the colonial system. The Application itself relegates acknowledgement of our court-declared Aboriginal title to the Cowichan Title Lands at the Lands of Tl'uq̓tinus and right to fish the South arm for food to a mere footnote, essentially refusing to engage with it.
- Despite specific requests from the Quw'utsun Nation, expert input and Indigenous Knowledge in the Revised Application specific to the Quw'utsun Nation's use and occupation of Tl'uq̓tinus and the surrounding lands and waters, including Tilbury Island, is attributed to Indigenous groups generally, and in some cases, included in ways that imply that this knowledge applies to other Nations. This misrepresentation of Indigenous Knowledge is detrimental to the Quw'utsun Nation, our knowledge holders, and our history.

Based on the effects above, the proposed Project is unlawful when considered in the context of Quw'utsun legal principles of Respect; Preparation, Prayer and Right Conduct; Healing and Restoration; and Compassion, Acceptance, and Avoiding Harm.

## 9. Conclusion

The appropriate baseline for assessing impacts to the Quw'utsun Nation's rights and title is the condition of lands, waters, relationships, and governance at contact, prior to the cumulative effects of colonial dispossession and industrialisation. The Quw'utsun Nation Indigenous-led Assessment herein considers the cumulative history of loss resulting from unlawful alienation and how the proposed Project interacts with Quw'utsun Nation law, the Nation's vision for the future as articulated by the Declaration for Reconciliation, and a holistic understanding of how the proposed Project will interact with our rights and title now and into the future.

The Quw'utsun Nation does not agree with the proponent's conclusions that the only residual effects of the Project are positive economic benefits. The Quw'utsun Nation also does not accept any implication that Project-related economic benefits can answer, balance, or offset continued infringements on its rights, title, restoration objectives, and cultural continuity. Economic participation cannot substitute for restoring and lawfully exercising rights and title at the Lands of Tl'uqtinus, Project area, and along the South Arm of the Fraser River at Shnuwiih.

Throughout this assessment, the Project as proposed is determined to be unaligned with the Declaration for Reconciliation across the effects of multiple Project Activities and their interactions with the Valued Components outlined in the Application. These impacts present outstanding, residual effects to Quw'utsun Nation Mustimuhw intending to reside at, and exercise their rights and culture at and around, the Lands of Tl'uqtinus, including the Project area.

The Project as proposed is unlawful under Quw'utsun Law across the application of multiple legal principles. Unlawfulness is more than a violation of a technical requirement — it disrupts the balance of salmon, waters, winds, lands, helpers, families, and future generations. Unlawfulness therefore triggers obligations to repair relationships, restore harmed systems, and reinstate the conditions required for renewal across generations. These obligations fall on the proponent and with the Crown, who must work meaningfully with the Quw'utsun Nation to make things right in accordance with our Snuw'uyulh.

<sup>lxiv</sup> *Cowichan* at para. 3251

<sup>lxv</sup> Sulipt'un, Qwestenuxun and X'tli'li'ye gave evidence about deer as a traditional Quw'utsun food and John Elliott testified as to the practice of hunting: Sulipt'un, 21 Jan 2020 2:48:37-2:49:26; 2:50:46-2:50:56; 22 Jan 2020 11:06:28-11:07:51; X'tli'li'ye, 2 Dec 2020 at 10:38:01-10:38:25; J Elliott, 14 Dec 2020 at 10:44:35 10:45:15; Ex 1614, 10 Sep 2009 Qwestenuxun (E Modeste) Affidavit at para. 9, 18.

<sup>lxvi</sup> Dr. Kennedy concluded the Trutch-identified two trails from the Cowichan village reached away from the shore to the surrounding prairie grassland and bogs where the Cowichan would have regularly hunted. She reported that the Cowichan hunted game including deer while resident on the South Arm of the Fraser River, including in the lands surrounding their village: Ex 114, Kennedy Report at ep 208t, 260m (p 194t, 246m).

<sup>lxvii</sup> Dr Turner, as noted, identified bog blueberry, prairie, grassland habitat and burned ground in the Trutch survey and on the Lands of Tl'uqtinus as mapped by Dr. Brealey. Consistent with Luschiim, Dr. Turner's evidence is one type of landscape management in the region was periodic burning and sporadic clearing of certain areas by fire. Per Suttles, deer find better fodder in the few years following a burn and probably fluctuated in abundance in any single area depending on the recency of fires: Ex 101, Turner Report at ep 35b-36t (pp 28b-29t). Burned over prairies are known to have provided better browsing habitat for deer. Trutch's survey of the area has references to burning. These burned areas probably reflect traditional landscape burning practices of the Cowichan aimed to enhance production of resources such as grasses to increase deer forage areas: Ex 101, Turner Report at ep 37t (p 30t).

<sup>lxviii</sup> Luschiim, 3 Oct 2019 at p 36(18)-37(17)

<sup>lxix</sup> F James 18 Sep 2019 3:36:29-3:37:35

---

<sup>lxx</sup> As noted, Dr. Turner identified crabapple in the Trutch survey and on the Lands of Tl'uqtnus as mapped by Dr. Brealey: Ex 101, Turner Report at ep 99t, 101m, 211 (Appendix 3, #49, #67, #68) (pp 91t, 93m, 205); Ex 652, Brealey Report at ep 200 (Map 4). <sup>lxxi</sup> Luschiim, 1 Oct 2019 at 60(3-46).

<sup>lxxii</sup> *Cowichan* at para. 1167

<sup>lxxiii</sup> Luschiim, 3 Oct 2019 at 33(2)-34(3). Sulipt'un learned from Shhwuwul't-hw (Angus Smith), Hwiinumetse' (Simon Charlie) and his grandfather that the Quw'utsun would paddle across to Shnuwiilh in the fall to catch ducks with nets in the marshy area. His grandfather said that because it was nice and flat there, they could stand the net up when it was just getting to be dusk, and that is how they caught the ducks: Sulipt'un, 23 Jan 2020 at 10:23:48-10:25:45; 10:11:24-10:13:35.

<sup>lxxiv</sup> The ma'uqw was barbequed very slowly over a fire that is the right heat. Dripping fat is caught in a tth'e'wi (large shell). The ma'uqw gets quite dry, then is placed in a smokehouse to finish curing or st'el (dry it out): Luschiim, 3 Oct 2019 at 34(45)-35(36). Ma'uqw was one of the foods which could be mixed with dried berries to make trail food: Luschiim, 3 Oct 2019 at 10(40)-11(16).

<sup>xcv</sup> *Cowichan* at para. 1215, 1211

<sup>xcvi</sup> *Cowichan* at paras. 3, 6 (Executive Summary), 1703, 1722, 2855-2856, James Douglas was charged with developing colonial policy toward Indigenous peoples under instructions from Archibald Barclay, the Secretary of the HBC in London. Initially he did so as Chief Factor of the HBC on Vancouver Island, and as of May 16, 1851 he did so in his capacity as Governor for the Colony of Vancouver Island: *Williams Lake Indian Band v. Her Majesty the Queen in Right of Canada*, 2014 SCTC 3 at para. 21, rev'd *Canada v. Williams Lake Indian Band*, 2016 FCA 63, aff'd *Williams Lake Indian Band v. Canada (Aboriginal Affairs and Northern Development)*, 2018 SCC 4; Ex 741, Brealey Report #2 at ep 7-9 (p 1-3).

<sup>xcvii</sup> Ex 741, Brealey Report #2 at ep 7-8 (p 1-2).

<sup>xcviii</sup> Ex 136, 16 May 1850 J Douglas to A Barclay; Ex 137, 1846-1851 Fort Victoria Letters at ep 2 (p 94-95).

<sup>xcix</sup> Ex 135, 7 May 1850 J Douglas to JM Yale at ep 2.

<sup>c</sup> Ex 741, Brealey Report #2 at ep 8-9 (p 2-3).

<sup>ci</sup> Ex 150, 21 Jan 1853 J Douglas to JS Pakington at ep 2-3 (emphasis added).

<sup>cii</sup> Ex 148, c. 1853 J Douglas Private Papers; Ex 149, Transcript of Ex 148 at ep 6-7 (p 34-35). Douglas reiterated that promise to the Cowichan in 1857: Ex 1648, 24 Feb 1857 J Douglas Despatch 4 to Labouchere at ep 4.

<sup>ciii</sup> Governor Douglas' authority over the Crown's administration in the Colony was established by Letters Patent in 1858: Ex 824, 2 Sep 1858 Letters Patent at ep 4 (p 3). He represented the Crown in every particular, received detailed instructions from the Crown, and "was, in fact, the law": *Attorney General of British Columbia v. Attorney General of Canada*, [1906] U.K.P.C. 61, [1906] A.C. 552 at 3 (JCPC). As of and potentially prior to July 1, 1858, Douglas had instructions to colonize and settle the mainland of British Columbia, instructions regarding the approach to be taken by Douglas with respect to Indigenous' interests in the new mainland colony of British Columbia, echoing the British Crown's earlier "special charge" to Douglas to treat Indigenous peoples with justice and humanity: Ex 741, Brealey Report #2 at ep 9-10 (p 3-4); Ex 821, 1 Jul 1858 EB Lytton Despatch 1 to J Douglas; Ex 628, 31 Jul 1858 EB Lytton letter to J Douglas at ep 9-10; Ex 741, Brealey Report #2 at ep 10 (p 4); Ex 628, 14

Aug 1858 EB Lytton Despatch No. 7 to J Douglas at ep 10; Ex 1051, 14 Aug 1858 EB Lytton instructions to J Douglas at ep 8; Ex 823, 2 Sep 1858 EB Lytton Despatch 12 to J Douglas and 5 Nov 1858 response at ep 3, 5 (p 12, 14); The Crown instructions to Douglas for the "peopling and opening up" of British Columbia were subject to Douglas dealing with the prior "interests of the Natives", and that those interests included "lands possessed by

them: Ex 741, Brealey Report #2 at ep 10 (p 4). On October 11, 1858, Douglas replied to Lytton's Dispatch No. 6 assuring him that he would "not fail to give the fullest scope to your humane consideration for the improvement of the native Indian tribes, and shall take care that all their civil and agrarian rights be protected": Ex 629, 11 Oct 1858 Governor Douglas to EB Lytton at ep 10 (p 39); Ex 741, Brealey Report #2 at ep 11 (p 5). On December 30, 1858, in his Dispatch No. 62, Lytton provided Douglas with supplemental instructions "on the policy to be adopted towards the Indian tribes," suggesting that Douglas work towards settling them "permanently in villages": Ex 826, 30 Dec 1858 EB Lytton Despatch 62 to J Douglas at ep 3 (p 15). Douglas issued Proclamation No. 13 declaring the Crown's underlying title to all the lands in British Columbia and confirmed his executive authority with respect to lands: Ex 1434, 14 Feb 1859 Proclamation No. 13 at ep 1-2. Douglas advised of his intention to create Crown reserves, including anticipatory reserves for the Indians of their village sites and cultivated fields, on March 14, 1849: Ex 828, 14 Mar 1859 J Douglas Despatch 114 to EB Lytton; Ex 741, Brealey Report #2 at ep 13-14 (p 7-8). He instructed his subordinates that Indian Settlement Lands were reserved: Ex 605, 1 Oct 1859 Circular to Gold Commissioners and Magistrate at ep 2 (transcribed at ep 8); Ex 1434, 14 Feb 1859 Proclamation No. 13; Ex 604, 07 Oct 1859 J Douglas to RC Moody at ep 3-4 (transcribed at ep 7-8).

<sup>civ</sup> Ex 114, Kennedy Report at ep 302 (p 288) and Table 6 at ep 308-309 (p 294-295); Ex 1161, Layland Response to Lovisek at ep 15-16 (p 12-13), Ex 623, 1858 Gibbs field map; Ex 2028, Lovisek Response at ep 38 (p 37).

<sup>cv</sup> Ex 830, 04 Jan 1860 Proclamation of the Colony of BC, s. 1; Ex. 835, 12 Jan 1860 Governor Douglas Despatch 35 to the Duke of Newcastle at paras. 4, 8 (ep 7, 8). Colonial correspondence, notably between 1860-64, confirms that Douglas established an administrative process for transitioning Crown reserves of Indian Settlement Lands to finalized Indian reserves, namely, by (1) consultation with Indigenous villagers as to the extent of their settlement, followed by (2) demarcating posts or stakes placed in the ground: Ex 2821, 9 Oct 1860 J Douglas Despatch to the Duke of Newcastle at ep 6 (p 26); Ex 787, 5 Mar 1861 C Good letter to CCLW Moody; Ex 838, 5 Mar 1861 C Good letter to W Cox at ep 2 (transcribed at ep 4). On April 13, 1861, CCLW Moody sent a memo to his subordinate Captain R.M. Parsons, R.E. and ordered him to "mark out successively and as early as practicable by posts

and in any other clear and permanent way, Boundaries of Lands Claimed by Indians in this neighbourhood – *extending from Harrison River, inclusive, to the Sea...* Ex 788, 13 Apr 1861 CCLW Moody to RE Parsons (with transcript); Ex 741, Brealey Report #2 at ep 19 (p 13). On April 30, 1861, Captain Parsons in turn instructed Corporal Charles Sinett but truncated the geography of CCLW Moody's directions so that Corporal Sinett was instructed to proceed from the Harrison River down the Fraser River only as far as Fort Langley, and thereby

not to the south shore of Lulu Island on the river's main channel (i.e., South Arm): Ex 840, 30 Apr 1861 RE Parsons to RE Sinett with transcript; Ex 741, Brealey Report #2 at ep 20-21 (p 13-14). Moody was slow to demarcate and publish the location of existing and anticipated reserves: Ex 209; 2 Aug 1861 C Good to CCLW Moody; Ex 842, 4 Mar 1862 WAG Young to CCLW Moody with transcript; Ex 741, Brealey Report #2, at ep 22-23 (p 16-17); Ex 607, 2 Jun 1862 RC Moody to W Young at ep 3 (p 24); Ex 843, 9 Jun 1862 W Young to CCLW Moody at ep 3 (p 24). Moody then told Douglas that there was insufficient capacity to fulfill Douglas' reserve creation mandate: Ex 847, 28 Apr 1863 CCLW Moody to J Douglas; Ex 741, Brealey Report #2 at ep 24 (p 18).

<sup>cvi</sup> Ex 846, 27 Apr 1863 J Douglas to CCLW Moody; Ex 741, Brealey Report #2 at ep 24-25 (p 18-19); Ex 848, 11 May 1863 W Young to CCLW; Ex 603, 24 Jan 1864 Opening Address – 1st Session of 1st Parliament of BC at ep 4; Ex 851, 16 May 1864 W McColl report encl instructions; Ex 741, Brealey Report #2 at ep 27 (p 21); Ex 108, 14 Oct 1874 J Douglas to IW Powell at ep 1.

<sup>cvi</sup> Ex 850, 6 Apr 1864 C Brew to W McColl.

<sup>cvi</sup> Douglas had concerns with Moody's conduct as CCLW, notably his rampant land speculation. Dr. Brealey opined that Douglas repeatedly tried to correct Moody's failures to execute on the Colony's Indian reserve

creation policy: Ex 741, Brealey Report #2 at ep 23-25 (p 17-19). Likewise, Dr. Kennedy explained: “In 1861, the citizens

of New Westminster accused Moody and his friends of squandering money and awarding contracts for roads without public advertisement, of faulty administration of public lands, and of the setting aside of government reserves for the benefit of government officers. A brief investigation showed that Moody had acquired land from the

government at a public auction or had registered pre-emptions, thus providing evidence of the public’s charge of land speculating. as of 1873 [Moody] held 3,049 acres.” Ex 114, Kennedy Report at ep 105-106 (p 91-92), citing to Ex 206, 6 Apr 1861 WAG Young to CCLW Moody and Ex 205, 5 Apr 1861 WAG Young Circular to Magistrates. Historians typically describe Moody as being a land speculator: T Binnema, 19 Jul 2021 at 11:00:04-11:00:11.

<sup>cix</sup> There is no evidence that Moody, or anyone else, consulted with the Cowichan or otherwise demarcated the boundaries of their Crown reserve, as Douglas had instructed. This, in spite of the fact that Moody and other colonial officials clearly had knowledge of the Cowichan village lands, cultivated fields and fishing station at Tl’uq̓tinus on the main channel of the lower Fraser River below New Westminster: Ex 741, Brealey Report #2 at ep 24-25 (p 18-19). In July 1863 Douglas disbanded the Columbia Detachment of the Royal Engineers. Moody continued in his capacity as CCLW into October 1863, and on November 11, 1863, departed the mainland Colony of British Columbia with the Royal Engineers by sail from New Westminster: Ex 741, Brealey Report #2 at ep 25 (p 19); Ex 213, 14 Nov 1863 The Leave Taking (The British Columbian). Shortly before departing, Moody covertly acquired 2 sections of the Lands of Tl’uq̓tinus: Ex 741, Brealey Report #2 at ep 49 (p 43). Moody sold some of the lands to himself in September 1863, through a land agent who paid the deposit on Moody’s behalf. When Moody acquired these Lands of Tl’uq̓tinus, Proclamation No. 16 was in effect and required that lands sold by private contract must first be put up for public auction. There is no evidence that Sections 27 and 34 were ever offered for public auction. In fact, on September 6, 1873, when BC put up for auction most of the adjacent Lands of Tl’uq̓tinus, Sections 27 and 34 were not included, likely because they were already under contract to Moody’s covert agent: Ex 114, Kennedy Report at ep 106-107 (p 92-93); Ex 2645, 20 Jan 1860 Proclamation 16, Colony of BC at ep 2 (p 65); Ex 2642, 6 Sep 1873 Gazette, Sale by auction.

<sup>cx</sup> Ex 1424, 25 Jul 1859 agreement between Moody and Trutch - Lulu Island survey; D Kennedy, 7 Jan 2020 at 10:12:53-10:23:01; Ex 15, 30 Sep 1859 Trutch Field Notes at ep 37.

<sup>cx</sup> See generally Ex 15, 30 Sep 1859 Trutch Field Notes at ep 18, 21-22, for identification of Indian Village.

<sup>cxii</sup> Queen Victoria instructed the Governors Frederick Seymour (1864-69) and Anthony Musgrave (1869-71) to especially protect Indigenous’ peoples in the free enjoyment of their possessions and against all injustice: Ex 1054, 11 Jan 1864 Royal instructions to Gov Seymour (transcript of Ex 1055) s. 1 at ep 1 and s. 26 at ep 13 (emphasis added); Ex 1057, 16 Oct 1869 Royal instructions to Gov Musgrave (with transcript) at s. XXIV, ep 30 (p 195)

(manuscript) and ep 40 (transcript). In April-May 1864, Governor Seymour refused a petition to pre-empt Indian Settlement land on the Fraser River, thus confirming that the colonial government intended for Indian Settlement Lands, whether or not they were used seasonally, or had been formally made Indian reserves, to remain appropriated from disposition in May 1864: Ex 1195, 9 May 1864 Minutes of Exec Council at ep 3 (p 11); Ex 1196, 12 May 1864 Colonial Secretary to G Tranfield (with transcript); Ex 1202, 28 Jul 1864 Colonial Secretary to G Tranfield. Governor Seymour’s April 1865 Land Ordinance confirmed prohibition on pre-empting any Indian Settlement Lands: *Land Ordinance*, 1865, 28 Vict., No. 23. CCLW Trutch continued Douglas’ policy of reserve creation, but adopted a more parsimonious approach to determining the extent of Indian reserves: Ex 861, 19 Nov 1867 JW Trutch to Colonial Secretary at ep 4; Ex 857, 26 May 1867 J Trutch re Mr. McIvor’s application at ep 4; Ex 741, Brealey Report #2 at ep 50, 32 (p 44, 26); Re example at Nicola Lake, August 1868: Ex. 864, 5 Aug 1868 JW Trutch to P O’Reilly at ep 3; Ex 741, Brealey Report #2 at ep 31 (p 25). Governor Seymour’s assent to the Indian Reserve Ordinance, 1869 which empowered magistrates to resolve disputes in the protection of Indian Lands, expressly recognizes that there are Indian Reserves and

Indian Settlement Lands, both of which the Crown is undertaking to protect from unlawful encroachment: *Indian Reserves Ordinances*, 1869, 32 Vict., No. 125. CCLW Trutch instructed Surveyor Green to exclude Indian Settlement Lands from timber surveys in 1869-70, confirming and reaffirming the Colonial government's understanding in that Indian Settlement Lands were appropriated from disposition, whether or not they were formally staked out as Indian reserves: Ex 1203, 8 Sep 1869 J Trutch to FW Green; Ex 1204, 24 Oct 1870 J Trutch to FW Green. Governor Musgrave's Land Ordinance, 1870 again confirmed prohibition on pre-empting lands of any Indian settlement: Land Ordinance, 1870, 33 Vict., No. 144, s. 3 (ep 2), s. 42 (ep 7-8). The focus during Musgrave's tenure shifted to making reserves above the Harrison River: Ex 741, Brealey Report #2 at ep 34 (p 28).

<sup>cxiii</sup> Dr. Brealey's opinion on this point was unequivocal: "I also must conclude that the administrations of Governors William Seymour and Anthony Musgrave knew full well there was still a standing occupied Cowichan village and settlement at Tl'uqtinus after 1864, and through to Confederation in 1871, and could have easily set out a reserve at that place during this period. Indeed, even allowing for the parsimonious acreage formula implemented by Trutch, a reserve allotted at this location may yet have been no less than a couple thousand acres in size": Ex 741, Brealey Report #2 at ep 50 (p 44).

<sup>cxiv</sup> Ex 101, Turner Report at ep 53-54 (p 46-47); Ex 652, Brealey Report at ep 190 (p 185), citing Ex 273 1901 CM Tate diary; Ex 2654, 1913 Curtis re: Cowichan seasonal round at ep 4 (p 41); Ex 741, Brealey Report #2 at ep 50-51 (p 44-45); Ex 943 at ep 6, Dr. Kennedy, 17 Dec 2019 at 12:16:07-12:24:53 (Note: The Deas cannery was established in 1873: Ex 2026, at ep 100b, fn. 379); Ex 114, Kennedy Report at ep 319 (p 305); Ex 101, Turner Report at ep 52 (p 45). See also Ex 114, Kennedy Report at ep 208 (p 194). See also Ex 652, Brealey Report at ep 188 (p 183); Ex 265, 20 Jan 1878 GM Sproat Memo on Cowichan Reserve at ep 26 (p 25) (transcribed at ep 37); Ex 5, Eldridge Report at ep 25 (p 20); Ex 114, Kennedy Report at ep 212 (p 198). See also Ex 264, 12 Jan 1878 GM Sproat to Lieutenant Governor at ep 1, 3; D Kennedy, 6 Dec 2019 at 10:03:21-10:04:52; K Brealey, 22 Jul 2020 at 56(5-35); M Eldridge, 26 Sep 2019 at 12:09:40-12:11:09, 12:19:19-12:20:19; Ex 2026, Lovisek Land Report at ep 107-108; J Lovisek, 17 Jun 2021 at 10:29:03-10:32:26; J Lovisek, 18 Jun 2021 at 12:21:36-12:24:25; J Lovisek, 21 Jun 2021 at 11:03:02-11:05:12; J Lovisek, 17 Jun 2021 at 10:28:13-10:33:11; J Lovisek, 18 Jun 2021 at 2:03:03-2:51:06; J Lovisek, 21 Jun 2021 at 10:43:08-10:46:03, 11:03:02-11:05:12. For evidence of further Cowichan complaints to the Crown, beyond 1877, see endnote 297. Dr. Lovisek agreed the historical record up to at least 1890 is consistent with the Cowichan insisting they had claims to the Lands of Tl'uqtinus: J Lovisek, 17 Jun 2021 at 10:29:03-10:33:11.

<sup>cxv</sup> Just ten weeks before British Columbia's confederation with Canada took effect on July 20, 1871, Governor Musgrave issued two Crown grants of fee simple interests in relation to the Lands of Tl'uqtinus (the "1871 Crown Grants"): Ex 235, 6 May 1871 Crown Grant No 1154 to T Argyle; Ex 236, Crown Grant No. 1154, including certificate of purchase at ep 1; Ex 236, Crown Grant No. 1154, incl. certificate of purchase at ep 2,3; Ex 889, Original BC land register for B4N, R5W, of the New Westminster District of land at ep 27; Ex 1271, 6 May 1871 Crown Grant No. 1155; T Binnema, 19 Jul 2021 at 11:28:17-11:31:44; Ex 889, Original BC land register for B4N,

R5W, of the New Westminster District of land at ep 9. Crown Grant 1154 includes what Dr. Brealey identified as the village itself and is also contained within the archaeological site DgRs-17: Ex 652, Brealey Report ep 200 (Appendix A, Map 4). The area of Crown Grant 1155 includes the northeast corner of the village and the Cowichan blueberry patches: Ex 652, Brealey Report at ep 200 (Appendix A, Map 4); Ex 101, Turner Report at ep 37 (p 30), ep 54 (p 47), ep 211 (p 205). See also Appendix A.2: Crown Grants shown on Schedule A. The 1871 Crown Grants were purportedly granted under the *Land Ordinance, 1870*, which authorized "free grants of the unoccupied and unappropriated Crown Lands of the Colony..." However, the 1871 Crown Grants were made without statutory authority because the Lands of Tl'uqtinus were both occupied and appropriated. Moreover, Governor Musgrave had no authority to issue any grants that would result in an Indigenous people being dispossessed of its Aboriginal title to Indian Settlement Lands, which the Lands of Tl'uqtinus were. As noted, Queen Victoria had expressly instructed Musgrave to protect Indigenous peoples' "Free Enjoyment of their Possessions" and prevent all injustice which may be practiced or attempted against them. The Cowichan were in possession of the Lands of Tl'uqtinus at the time of the 1871 Crown Grants, so the grants issued under the *Land Ordinance, 1870* constituted an injustice against them.

---

<sup>cxvi</sup> Following Confederation, Indigenous people in BC expressed concerns about the rate and manner of Indian reserve creation in the Province. Canadian officials encouraged BC to adopt a “most liberal and enlightened interpretation” to the spirit and meaning of Article 13: Ex 867, 21 Jun 1873 IW Powell to Lieutenant Governor at ep 3; Ex 741, Brealey Report #2 at ep 36-38, 27 (p 30-32, 21); Ex 870, 5 Aug 1874 IW Powell to the Provincial Secretary encl 14 Jul 1874 Petition of Indian Chiefs at ep 3; Ex 108, 14 Oct 1874 J Douglas to IW Powell at ep 1; Ex 872, 15 Oct 1874 J Lenihan to Provincial Secretary at ep 3; Ex 873, 02 Nov 1874 D Laird memo at ep 4 and 7.

<sup>cxvii</sup> Ex 741, Brealey Report #2 at ep 42 (p 36).

<sup>cxviii</sup> Ex 265, 20 Jan 1878 GM Sproat Memo on Cowichan Reserve at ep 26 (p 25) (transcribed at ep 37); Ex 5, Eldridge Report at ep 25 (p 20); Ex 114, Kennedy Report at ep 212 (p 198). See also Ex 264, 12 Jan 1878 GM Sproat to Lieutenant Governor at ep 1, 3; D Kennedy, 6 Dec 2019 at 10:03:21-10:04:52; K Brealey, 22 Jul 2020 at 56(5-35); M Eldridge, 26 Sep 2019 at 12:09:40-12:11:09, 12:19:19-12:20:19. Canada’s expert Dr. Lovisek agreed

that this complaint was made about the Cowichan village at the Lands of Tl’uqtinus: Ex 2026, Lovisek Land Report at ep 107-108; J Lovisek, 17 Jun 2021 at 10:29:03-10:32:26; J Lovisek, 18 Jun 2021 at 12:21:36-12:24:25; J Lovisek, 21 Jun 2021 at 11:03:02-11:05:12; J Lovisek, 17 Jun 2021 at 10:28:13-10:33:11; J Lovisek, 18 Jun 2021 at 2:03:03-2:51:06; J Lovisek, 21 Jun 2021 at 10:43:08-10:46:03, 11:03:02-11:05:12.

<sup>cxix</sup> Ex 264, 12 Jan 1878 GM Sproat to Lieutenant Governor at ep 1, 3-4.

<sup>cxx</sup> Ex 266, 22 Apr 1878 GM Sproat to Colonel Powell. Despite this correspondence, there is no evidence that Sproat actually investigated the Cowichan complaints at the Lands of Tl’uqtinus, and it was Dr. Brealey’s opinion that

“he simply did not”: Ex 741, Brealey Report #2 at ep 47-48 (p 41-42).

<sup>cxixi</sup> Report at ep 356 (p 342); Ex 741, Brealey Report #2 at ep 46-48 (p 40-42); J Lovisek, 21 Jun 2021 at 11:03:02-11:06:01.

<sup>cxixii</sup> Ex 741, Brealey Report #2 at ep 48-49 (p 42-43).

<sup>cxixiv</sup> *British Columbia Terms of Union*, R.S.C. 1985, App. II, No. 10; *Jack v. The Queen* (1979), [1980] 1 S.C.R. 294, 1979 CanLII 175 at 301-302; *Williams Lake Indian Band v. Her Majesty the Queen in Right of Canada*, 2014 SCTC 3at para. 337. As BC was bound to convey title to lands appropriated as Crown reserves of Indian Settlement Lands to Canada, it must also hold true that BC did not have the constitutional authority to unilaterally extinguish Crown protection of appropriated Indian Settlement Lands, prior to conveyance.

<sup>cxixv</sup> Ex 114, Kennedy Report at ep 104-105 (p 90-91).

<sup>cxixvi</sup> See endnote 359.

cxxvii Lieutenant Governor Trutch issued seven Crown Grants of fee simple interest over the Lands of Tl'uq̓tinus between July and December 1874. BC issued Crown Grant No. 1424 of Sections 27 and 34 to Richard Clement

Moody (former CCLW): Ex 242, 30 Jul 1874 Crown Grant No. 1424 to RC Moody incl. Receipt 3 Sept 1863 to JJ Cochrane and 19 May 1874 Certificate of Purchase at ep 4. See also Ex 243, 30 Jul 1874 Crown Grant No. 1424 to RC Moody; Ex 242, 30 Jul 1874 Crown Grant No. 1424 to RC Moody incl. Receipt 3 Sept 1863 to JJ Cochrane and 19 May 1874 Certificate of Purchase; T Binnema, 19 Jul 2021 at 10:57:37-10:59:37; Defendants' Responses to Land Title NTA at para. 4(c); Ex 243, 30 Jul 1874 Crown Grant No. 1424 to RC Moody. Moody never used or occupied these lands: T Binnema, 19 Jul 2021 at 10:57:37-10:59:37. BC issued Crown grant No. 1454 of Section 26 to James Morrison: Ex 245, 17 Oct 1874 Crown Grant No. 1454 to J Morrison; Ex 246, 17 Oct 1874 Crown Grant No. 1454 to J Morrison including receipts; Ex 889, Original BC land register for B4N, R5W, of the New Westminster District of land at ep 28. It appears that James Morrison was a land agent. There is no evidence that Morrison ever

used or occupied Section 26: T Binnema, 19 Jul 2021 at 11:34:02-11:34:26. BC issued Crown grant Nos. 1474, 1476, 1479, and 1480 granting Sections 28, 29, 32, and 33 to Michael John Goode: Defendants' Responses to Land Title NTA at para. 4(e)-(h); Ex 247, 8 Dec 1874 Crown Grants No. 1474 to MJ Goode; Ex 1272, 8 Dec 1874 Crown Grant No. 1476; Ex 1273, 8 Dec 1874 Crown Grant No. 1479; Ex 248, 8 Dec 1874 Crown Grant No. 1480 to MJ Goode. There is no evidence that Goode ever used or occupied the lands: T Binnema, 19 Jul 2021 at 11:46:43-11:48:13. BC issued Crown grant No. 1489 of Section 4 to Thomas Wilton: Defendants' Responses to Land Title NTA at para. 4(i); Ex 1274, 17 Dec 1874 Crown grant No. 1489. There is no evidence that Wilton ever used or occupied these lands: T Binnema, 19 Jul 2021 at 11:38:38-11:41:18. BC issued 1875 Crown Grants to the Lands of Tl'uq̓tinus to Thomas Lett Wood and Robert Burnaby as trustees under the marriage settlement of Matthew Trotter Johnston: Ex 241, 13 Oct 1873 Certificate of Purchase No. 126; T Binnema, 19 Jul 2021 at 11:35:50-11:41:18; Ex 889, BC Land Register for B4N R5W NW District at ep 23-24, 27; Defendants' Responses to Land Title NTA at para. 4(j)-(l); Ex 876, 16 Apr 1875 Crown grant No 1520; Ex 877, 16 Apr 1875 Crown grant No 1521; Ex 878, 16 Apr 1875 Crown grant No 1522 Wood and Burnaby Section 23, without receipt. Matthew Trotter Johnston was a

Justice of the Peace on Vancouver Island and was also, between 1866 to 1876, in a business partnership with Gilbert Malcom Sproat, the same Sproat that then became a member of the JIRC: T Binnema, 19 Jul 2021 at 11:40:07-11:41:31; Ex 114, Kennedy Report at ep 107 (p 93). Thomas Lett Wood was a lawyer who served as Attorney General for the Colony of Vancouver Island from August 1864 until its merger with the Colony of British Columbia, upon which he became the Solicitor General for the unified Colony: T Binnema, 19 Jul 2021 at 11:35:50-11:41:18. Robert Burnaby was a civil servant in London who arrived in British Columbia in 1858 with a personal letter of introduction from Sir Bulwer-Lytton to Governor James Douglas. Once in BC, Burnaby secured a position as private secretary to R.C. Moody and was affiliated with the Lands and Works Department. Burnaby was prominent in colonial politics and was elected to Legislative Assembly on November 29, 1860. He also acted as a real estate and land agent during the 1870's: T Binnema, 19 Jul 2021 at 11:41:55-11:46:43. Neither Trotter Johnston, Lett Wood, nor Burnaby ever occupied or used the Lands of Tl'uq̓tinus: Ex 652, Brealey Report at ep 187-188 (p 182-183); T Binnema, 19 Jul 2021 at 11:37:26-11:41:18. In 1893, Lieutenant-Governor Dewdney issued Crown grant 4251/55 granting William and Joseph Wilson a fee simple interest to all 160 acres in Section 18, B4N R4W, New

Westminster District, along with other lands not overlapping the Lands of Tl'uq̓tinus, for a total surveyed area of 480 acres: Defendants' Responses to Land Title NTA at para. 4(m); Ex 1275, 27 Mar 1893 Crown grant No. 4251/55. Additional Crown Grants made from 1910-1914 alienated the remaining Lands of Tl'uq̓tinus to non-

Indigenous purchasers, many, perhaps all, of whom appear to have been absentee owners who made little or no use of the land: T Binnema, 19 Jul 2021 at 10:50:12-10:50:44; Defendants' Responses to Land Title NTA at para. 4(n)-(r); Ex 1276, 23 Aug 1910 Crown grant No. 414-264; Ex 1277, 18 Apr 1911 Crown grant No. 1394/277; Ex 1278, 17 Jan 1912 Crown grant No. 2703/296; Ex 1280, 23 Dec 1914 Crown grant No. 7188/364; Ex 1279, 23 Dec 1914 Crown grant No. 7189/364.

cxxviii *Cowichan* at paras. 2080 and 2081

<sup>cxxix</sup> The original grantees of the Lands of Tl'uqtnus were generally land speculators who never used or occupied those lands. The Lands of Tl'uqtnus largely lay idle, and between 1920-1944 the fee simple interest holders of most of the Lands of Tl'uqtnus failed to pay their municipal taxes, resulting in the forfeiture and sale of their lands under the *Municipal Act*, as amended. During tax sale proceedings there were no bids equal to the upset price for these Lands. Consequently, Richmond and the plaintiffs agree that Richmond was declared to be the purchaser of the municipal tax sale lands at the Lands of Tl'uqtnus and was vested with the fee simple interests thereto: Ex 1349, 10 Jul 2020 ASF Plaintiffs and Richmond at paras. 3-4, 8, 12 (ep 3-4); Ex 1373, 10 Nov 1920 Tax sale; Ex 1374, 04 Mar 1921 Tax sale; Ex 1375, 17 Oct 1922 Tax sale; Ex 1376, 22 Oct 1923 Tax sale; Ex 1377, 30 Nov 1925 Tax sale; Ex 1349, 10 Jul 2020 ASF Plaintiffs and Richmond at paras. 5-7, 9-11, 14, 15-17, 18-21, 22-23 25-27, 29 (ep 3-5), Tab C (ep 22), Tab E (ep 26); Ex 1739, 28 Nov 1949 Bylaw No 1131 (transcript). See also Ex 1349, 10 Jul 2020 ASF Plaintiffs and Richmond at Tab R (ep 61). Note that Exhibit 1739 is the transcript of Tab R and incorrectly says "Section 32" where it should say "Section 22" when looking at the original Bylaw 1131 at Tab R. Since January 1, 2004, BC's *Community Charter*, s. 35(1)(a) has vested the soil and freehold of highways to municipalities. Prior to 2004, a municipality's statutory right of possession to highways was short of ownership. A municipality could not, for example, grant charges or tenures to highway lands: *FortisBC Energy Inc. v. Surrey (City)*, 2013 BCSC 2382 at paras. 260-261. Further, the municipality's right of possession to highways (for example, under historical iterations of the *Municipal Act*) was limited to possessing and managing the lands only for highway purposes: *Affleck and McCandlish v. Nelson (City)*, [1957] B.C.J. No. 146, 1957 CanLII 577 (SC) at para. 3; *Barrett v. North Vancouver (District)*, 1978 CarswellBC 74, 1978 CanLII 368 (CA) at para. 20. By comparison, BC's vesting of the soil and freehold of the highways under the *Community Charter* transfers an ownership interest in those lands to the municipality that is akin to a Crown grant: See *Community Charter*, 2003, s. 35(7)(c), (d) (ep 28), which provide that many of the same Crown reservations apply to vesting under section 35(1)(a) "as if the vesting were made by Crown grant."

<sup>cxxx</sup> Ex 1358, Land Titles Common Book of Documents.

<sup>cxxxi</sup> Aside from one small area saved for conservation, the VFPA has designated the Federal Tl'uqtnus Lands for industrial or terminal development in its Land Use Plan. The VFPA has declined to designate any part of the lands for Cowichan use, occupation, or decision-making. Nor has it designated any of the Federal Tl'uqtnus Lands for the purposes of implementing the Cowichan's Declaration for Reconciliation or shared any lease revenue from the Federal Tl'uqtnus Lands with the Cowichan. From the Cowichan perspective, the VFPA, as Canada's agent, has

managed the Federal Tl'uqtnus Lands in a manner that is dramatically inconsistent the Cowichan Declaration for Reconciliation. VFPA land-use planning excludes the Cowichan from decision making, planning, and management of those lands, which were central features of Cowichan enjoyment of their Aboriginal title to their traditional village at Tl'uqtnus. It also excludes the Cowichan from accessing and using the Federal Tl'uqtnus Lands

<sup>cxxxii</sup> Ex 652, Brealey Report at ep 61 (p 56).

<sup>cxxxiii</sup> *Jack v. The Queen* (1979), [1980] 1 S.C.R. 294, 1979 CanLII 175 at 308-309.

<sup>cxxxiv</sup> Canada's Fisheries Act came into force in British Columbia in 1876: *An Act respecting the extension and application of "The Fisheries Act" to and in the Provinces of British Columbia, Prince Edward Island, and Manitoba*, S.C. 1874, c. 28 proclaimed in force 28 May 1876, (1876) C. Gaz., vol. 9, no. 48, p 1536, ep 2; *R. v. Sparrow*, [1990] 1 S.C.R. 1075, 1990 CanLII 104 at 1096. The first regulations affecting British Columbia fisheries were implemented in 1878: *Salmon Fishery Regulations, 1878*, s. 1, ep 2; *Jack v. The Queen* (1979), [1980] 1 S.C.R. 294, 1979 CanLII 175 at 309. For the first time, "Indian" fishing was restricted. Fishing was only permitted for the Indigenous person's own consumption. Sale or barter was prohibited: *R. v. Sparrow*, [1990] 1 S.C.R. 1075, 1990 CanLII 104 at 1096. The federal paradigm of individualized Indigenous fishing was in place until *Sparrow* in 1990: J Nener, 31 Mar 2021 at 3:40:07-3:40:48; see also Ex 1905, 1993 Policy for the Management of Aboriginal Fishing at ep 5 (p 3).

<sup>cxv</sup> Canada's *Fisheries Act* and regulations make it illegal to fish without a licence: *Pacific Fishery Regulations*, 1993 SOR/93-54 s. 26(1); *Ahousaht Indian Band and Nation v. Canada (Attorney General)*, 2009 BCSC 1494 at para. 546; Read ins, 19 Jan 2021 at 2:15:43-2:17:55; J Nener, 14 Apr 2021 at 10:36:23-10:36:59. If the Cowichan were to fish the South Arm for food without a licence, then they would be in violation of s. 26(1) of the *Pacific Fishery Regs.*, and subject to prosecution: Read ins, 19 Jan 2021 at 2:13:56-2:15:33; J Nener, 14 Apr 2021 at 10:36:50-10:36:59. See also: K Thomas, 1 Oct 2020 at 10:54:07-10:54:25. This basic structure is not new. For over a century (since 1917), Canada has prohibited Aboriginal people from fishing for food without authorization, and only in compliance with its terms: *R. v. Sparrow*, [1990] 1 S.C.R. 1075, 1990 CanLII 104 at 1095-1097; *Jack v. The Queen* (1979), [1980] 1 S.C.R. 294, 1979 CanLII 175 at 310.

clxx *Cowichan* at paras. 3370, 3371

clxxi From 2008 through to trial starting in 2019, DFO continued to apply its Adjacency Policy, which largely prevented the Cowichan from accessing their South Arm fishery. DFO required the Cowichan to engage in protocol discussions and negotiate protocol agreements with “local” bands. Protocol was an important criterion in DFO deciding whether it would allow the Cowichan access to the South Arm food fisheries. DFO’s supplemental licensing procedures instructed DFO staff to inquire about protocol prior to providing the Cowichan with South Arm access: J Nener, 1 Apr 2021 at 2:25:18-2:25:38; K Conley, 28 Sep 2021 at 10:10:04-10:10:18; The Supplemental License Issuance Procedures are issued annually: Ex 2195, 2009 Procedures at ep 1; DFO followed the 2009 procedures in 2010: Ex 2198, 23 Jul 2010 Email at ep 2 attaching Ex 2195; J Nener, 5 May 2021 at 10:48:42-10:52:35 & K Conley, 23 Sep 2021 at 3:42:13-3:44:24 re Ex 1973, 2011 Procedures at ep 2, 4, 9; J Nener, 1 Apr 2021 at 2:17:57-2:18:32 & 2:21:33-2:21:57 re Ex 1915, 2012 Procedures at ep 2, 7; Ex 2213, 2013 Procedures at ep 1-2, 7; Ex 2229, 2014 Procedures at ep 1-2, 8; Ex 2242, 2015 Procedures at ep 2, 9; Ex 2250, 2016 Procedures at ep 2, 8-9; Ex 2254, 2017 Procedures at ep 2, 8-9; B Matts, 9 Jul 2021 at 2:23:07-2:24:09 re Ex 1916, 2018 Procedures at ep 2, 8-9. DFO’s licensing request form asked “extraterritorial” bands to indicate whether they had protocol with “local” bands: See e.g. K Spencer, 13 Sep 2021 at 12:07:07-12:07:50 re Ex 2289, 2015 request form; See annual supplemental license issuance procedures, cited above. Ex

2333, 10 Jul 2012 K Conley to FNs; J Nener, 1 Apr 2021 at 2:34:59-2:35:51; 16 Apr 2021 at 10:11:25-10:13:46; Ex 2259, 28 Jun 2018 K Spencer to CT/STZ/PT at ep 7, 12-13. DFO repeatedly told the Cowichan they needed to engage in protocol discussions with “local” bands to get South Arm access: J Nener, 1 Apr 2021 at 12:10:20-12:11:09; J Elliott, 9 Dec 2020 at 12:19:43-12:21:46, 2:25:17-2:27:22; 10 Dec 2020 at 3:56:13-3:57:42; 5 Jan 2021 at 2:02:18-2:04:36, 2:05:40- 2:11:43; 6 Jan 2021 at 3:42:26-3:47:33; L George, 6 Feb 2020 at 3:00:50-3:01:14, 3:45:59- 3:48:42; 20 Feb 2020 at 10:49:58-10:50:18; 25 Feb 2020 at 2:16:24-2:18:13; 26 Feb 2020 at 2:08:27-2:09:49; X’tli’li’ye, 2 Dec 2020 at 2:03:49-2:04:10; 3 Dec 2020 at 10:25:42-10:26:27. **2008:** L George, 18 Feb 2020 at 3:47:44-3:49:16 (p 356) re Ex 394, 7 Jul 2008 J Joe to HTG. **2009:** X’tli’li’ye, 2 Dec 2020 at 2:13:47-2:14:32. **2010:** X’tli’li’ye, 2 Dec 2020 at 2:27:06-2:27:21; L

ccxxvii W Seymour, 21 Sep 2020 at 1:52:10-1:54:06.

ccxxviii Sulipt'un, 21 Jan 2020 at 2:15:19-2:15:54. Dr. Kennedy and Mrs. James also referred to the loss of traditional history and knowledge because of residential school, including the resulting fragile state of the Hul'qumi'num language: Ex 114, Kennedy Report at ep 500 (p 486); F James, 18 Sep 2019 at 10:54:18-10:55:17.

ccxxix W Seymour, 10 Mar 2020 at 2:44:15-2:44:58; W Seymour, 21 Sep 2020 at 1:52:01-1:53:21; See also W Seymour, 21 Sep 2020 at 12:09:47-12:11:05.

ccxxx L George, 5 Feb 2020 at 12:05:59-12:15:09; His wife also speaks very little Hul'qumi'num because of going to Kuper Island Industrial School from age 6 to 12: 5 Feb 2020 at 12:02:38-12:05:59.

ccxxxi E Elliott, 23 Jan 2020 at 2:22:44-2:25:15; K Thomas, 29 Sep 2020 at 10:39:07-10:39:51, 2:53:36-2:55:59; 30 Sep 2020 at 12:20:33-12:23:58. According to John Elliott, the loss of language and culture because of residential schools

is one of the biggest challenges for his community: J Elliott, 15 Dec 2020 at 3:43:43-3:45:49; 16 Dec 2020 at

11:18:08-11:20:22, 11:30:59-11:31:18, 11:32:04-11:32:21, 11:34:25-11:36:11, 11:51:16-11:52:17, 11:54:33-11:56:11. It is hard to rebuild cultural practices and share them with your children when you do not know your language. Luschiim testified that Cowichan teachings and language were eroded because people

were sent to residential schools and Indian day schools: Luschiim, 9 Oct 2019 at 21(47)-23(10). Pahalicktun also testified that residential school impacted his ability to learn about ceremonies, traditional medicines, and

---

culture: Pahalicktun, 20 Jan 2020 at 2:27:30-2:29:54, 2:34:36-2:40:18; See also W Seymour, 10 Mar 2020 at 3:30:20-3:33:26.

ccxxxii See e.g. W Seymour, 21 Sep 2020 at 12:14:57-12:16:50.

ccxxxiii E Elliott, 23 Jan 2020 at 2:22:44-2:23:32; Pahalicktun, 20 Jan 2020 at 12:03:27-12:04:03; W

Seymour, 10 Mar 2020 at 2:23:11-2:24:04, 3:29:40-3:30:17; J Elliott, 16 Dec 2020 at 11:59:49- 12:01:09, 12:03:42-12:08:01; X'tli'li'ye, 2 Dec 2020 at 10:34:11-10:35:15; K Thomas, 29 Sep 2020 at 10:39:07-10:41:40; 30 Sep 2020 at 12:20:33-12:23:58. Even when parents taught their children Hul'qumi'num, they did so in secret because of

their experiences at residential school. For example, X'tli'li'ye's mother spoke Hul'qumi'num at

home, but when they left the house, they only spoke English: X'tli'li'ye, 2 Dec 2020 at 10:34:11-10:35:15.

cclxxi Ex 114, Kennedy Report at ep 212-213, 319-320, 335, 367, 486-495 (p 198-199, 305-306, 321, 353, 472-481); D Kennedy, 6 Dec 2019 at 10:50:50-10:53:21, 11:04:13-11:15:10. Ex 114, Kennedy Report at ep 197, 199-201 (p 183, 185-187), ep 213 (p 199): In 1901, Reverend C.M. Tate who resided among the Cowichan at the time, found that the villages on Vancouver Island were nearly deserted during the Fraser sockeye runs. On 4th August 1901, Tate wrote in his diary: "Preached at Quamichan, Keenipsim, Comiakem, Clemclemilits & Somenos. Most of the people gone to the Fraser...."; Ex 273, 3 Aug 1901 CM Tate diary at ep 2; Ex 274, 25 Oct 1881 WH Lomas to IW Powell at ep 6, 17 (p xiv, 155). See also Ex 652, Brealey Report at ep 190 (p 185). Dr.

Brealey concluded the Cowichan continued to fish salmon on the lower Fraser River at the Lands of Tl'uq̓tinus through Confederation until the turn of the 20th century: Ex 652, Brealey Report at ep 47, 62-63, 189-193 (p 42, 57-58, 184-188). Dr. Lovisek opined that the Cowichan's practice of fishing the South Arm for food continued annually from before European contact until at least the 1850s and that there is anthropological information indicating the Cowichan were fishing on the South Arm circa 1870: J Lovisek, 9 Jun 2021 at 10:38:11-10:41:39; 21 Jun 2021 at 11:59:12-12:09:06, 12:29:01-

12:29:25 23 Jun 2021 at 10:09:37-10:11:50, 3:05:02-3:05:24; Ex 2027, Lovisek Fish Report at ep 18-19, 25-26, 29, 36-37, 51, 58 (p 16-17, 23-24, 27, 34-35, 49, 56); Ex 2026, Lovisek Land Report at ep 48, 112-113. Dr. Lovisek agreed that the Cowichan complaint made to Commissioner Sproat in 1877 regarding their ancient fishing ground was in reference to the Cowichan village at the Lands of Tl'uq̓tinus: J Lovisek, 21 June 2021 at 10:40:46-10:46:03, 11:03:02-11:05:12. In Dr. Lovisek's opinion, the Cowichan stopped harvesting sockeye on the South Arm by

about 1915. Her conclusion was based on work by David Rozen discussing the severe impact on the seasonal round caused by the arrival of settlers, and the heavy exploitation of salmon by commercial fisheries, around the 1890s: Ex 2027, Lovisek Fish Report at ep 51, 58 (p 49, 56), citing Ex 980, D Rozen, 1978, Ethnozoology at ep 8, 38, 40, 42 (p viii, 3, 18, 20, 22).

<sup>cccix</sup> Ex 1042, 8 Jan 2016 CNA Declaration for Reconciliation.

### 16.7.2 The EAO's Views

#### Quw'utsun Nation's Assessment

Participating Indigenous nations have the opportunity under section 19(4) of the *Environmental Assessment Act* (2018) to carry out an assessment with respect to the potential effects of the project on the nation and on its rights. Quw'utsun Nation completed an effects assessment under section 19(4), as agreed upon in the Assessment Plan of the Process Order.

The EAO acknowledges and respects that Quw'utsun Nation's section 19(4) assessment (Indigenous-Led Assessment) has been undertaken using its own laws, knowledge systems, and decision-making frameworks, and that the assessment reflects Quw'utsun Nation's perspectives on the nature and severity of potential effects on its Aboriginal rights.

The EAO recognizes that there are areas of both similarity and difference between Quw'utsun Nation's assessment and EAO's conclusions. These may reflect differences in assessment approaches, as well as differing views regarding the sufficiency of information, characterization of effects, adequacy of mitigation and accommodation measures, and conclusions. The characterization of residual effects and determination of significance presented in Quw'utsun Nation's Indigenous-Led Assessment are those reached by Quw'utsun Nation through its own assessment framework.

Quw'utsun Nation's Indigenous-Led Assessment was considered by EAO alongside the broader assessment record, including information and comments received from Quw'utsun Nation throughout the environmental assessment process. Collectively, this information informed EAO's understanding of potential Project effects and the implications of those effects for Quw'utsun Nation's rights, title, interests, and community. Quw'utsun Nation's Indigenous-Led Assessment also informed EAO's understanding of the effects identified by Quw'utsun Nation, including concerns related to rights, title, restoration objectives, harvesting, cultural continuity, governance responsibilities, mitigation and accommodation measures, and assessment conclusions. Quw'utsun Nation's Indigenous-Led Assessment further informed EAO's consideration of accommodation measures, such as provincial conditions, federal Key Mitigation Measures and regulatory requirements intended to avoid, reduce, manage, or otherwise accommodate the effects identified by Quw'utsun Nation.

#### Quw'utsun Nation's Involvement in the Consultation Process

Quw'utsun Nation's concerns were not considered only at the stage of reviewing the Indigenous-Led Assessment. Rather, Quw'utsun Nation's concerns informed the environmental assessment throughout the process, including the EAO's development of assessment methodologies, information requirements, requests for additional studies, consideration of project effects on Aboriginal rights and title, development of proposed provincial conditions, and EAO's accommodation analysis.

Quw'utsun Nation identified as a participating Indigenous nation for the Project, which provided opportunities to participate in the environmental assessment process, including through development of the Process Order, Application Information Requirements, Assessment Plan, FortisBC Revised Application, EAO's Assessment Report and ongoing engagement with the EAO and FortisBC.

During early stages of the EA, Quw'utsun Nation identified concerns regarding rights, title, restoration objectives, harvesting, cultural continuity, and the future use of Tl'uqtinus. These concerns informed development of the Assessment Plan, selection of valued components, assessment methodologies, and identification of issues requiring further study such as air quality.

Quw'utsun Nation's Indigenous-Led Assessment was not considered solely at the conclusion of the assessment process. Rather, concerns raised through the Indigenous-Led Assessment and related submissions were considered throughout the assessment and are reflected in the Key Issues sections of the Valued Component assessments within [Appendix 6 \(Sections 17.1 through 17.14\)](#). QN's targeted advocacy across these sections, covering Air Quality, Acoustics, Surface Water, Vegetation, Wildlife, Fish Habitat, Economy, Land Use, Culture, and Human Health, informed the assessment and development of these sections. These include the integration of the Tl'uqtinus historic village site as a sensitive receptor, enhanced environmental monitoring, localized economic inclusion initiatives, and new requirements for 6-PPDQ runoff mitigation and psychosocial health considerations across Condition 3 (Document Development), Condition 10 (Community Feedback Process), Conditions 12 and 13 (Construction and Operations Environmental Management Plans), Condition 14 (Air Quality Management Plan), Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan), and Condition 17 (Dry Street Sweeping Report), and EAO's consideration of accommodation measures intended to address the effects identified by Quw'utsun Nation.

Throughout the assessment, comments and submissions from Quw'utsun Nation resulted in requests for additional information from FortisBC and contributed to EAO's understanding of potential effects and pathways of effects. These issues are reflected throughout the Assessment Report and are identified within the key issues sections of the relevant valued component sections and informed EAO's consideration of mitigation measures, accommodation measures, proposed provincial conditions, and conclusions regarding potential project effects on Quw'utsun Nation rights and title.

The EAO worked collaboratively with Quw'utsun Nation throughout the environmental assessment process. Quw'utsun Nation participated in technical discussions and iterative engagement opportunities to review project information, identify potential effects on its rights, and provide input on mitigation and accommodation measures to mitigate impacts on Quw'utsun Nation's rights and title. The EAO and Quw'utsun Nation maintained ongoing dialogue throughout the process, including regular meetings and discussions to understand, assess, and respond to issues as they arose.

Through engagement during the Process Planning phase, it was identified that Quw'utsun Nation would undertake an Indigenous-led assessment of project effects on its rights under section 19(4) of the Act.

### Provincial Conditions and Key Federal Mitigation Measures

The EAO notes that Quw'utsun Nation recommended additional specific mitigations, and those recommendations were considered and responded to in the development of provincial and federal conditions.

Provincial conditions and federal Key Mitigation Measures were developed to avoid, reduce, or otherwise accommodate potential impacts on Quw'utsun Nation's Aboriginal rights including the integrity of salmon lifeways and harvesting practices; access to and restoration of Tl'uqtnus and associated cultural use areas; the continuity of cultural practices, teachings, and intergenerational knowledge transmission; ecological health and relationships among lands, waters, and kinship species; Quw'utsun Nation governance, stewardship, and decision-making authority; and community health and well-being. The following provincial conditions and federal Key Mitigation Measures also address the matters assessed by Quw'utsun Nation in their Indigenous-Led Assessment .

### **Recovery and restoration of the Quw'utsun Nation owned village and surrounding lands at and about Tl'uqtnus on the south arm of the Fraser River**

The EAO identified the following proposed provincial conditions that are intended to avoid, reduce, or otherwise accommodate potential project effects on environmental and cultural values relevant to Quw'utsun Nation's restoration objectives for Tl'uqtnus and surrounding lands, with any management plans from these conditions to be developed in consultation with Quw'utsun Nation.

- Condition 10 (Community Feedback Process) creates a clear way for Quw'utsun Nation to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of vegetation, water quality, acoustic conditions, and related environmental components, fish and fish habitat and other culturally important ecosystems;
- Condition 12 (Construction Environmental Management Plan) requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. By reducing disturbance and protecting the environmental conditions that support fish, wildlife, and plants, this condition helps avoid or reduce further degradation of culturally important ecosystems;
- Condition 13 (Operations Environmental Management Plan) requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to Quw'utsun;
- Condition 14 (Air Quality Management Plan) ensures the Project selects and applies effective emissions control technologies and monitors air contaminants during Operation. By managing pollutants that can affect fish, salmon, vegetation, and other culturally important species, this plan helps avoid or reduce the potential for additional Project-related degradation of environmental conditions that are relevant to Quw'utsun Nation's longer-term recovery objectives; and,
- Condition 17 (Dry Street Sweeping Report) helps assess whether dry street sweeping can avoid or reduce 6PPD quinone on project related roads, which may contribute to improvements in water quality relevant to salmon and other fish species important to Quw'utsun Nation.

### **Re-establishment of Quw'utsun Nation permanent residence and river access at the village lands of Tl'uqtnus**

The EAO identified the following proposed provincial conditions that would mitigate potential effects to re-establishment of Quw'utsun Nation permanent residence and river access at the village lands of Tl'uqtnus, with any management plans from these conditions to be developed in consultation with Quw'utsun.

- Condition 3 (Document Development) requires that management plans include monitoring programs, clear reporting requirements, and defined roles for First Nations, including opportunities to receive monitoring data and assess mitigation effectiveness. By improving transparency and enabling Quw'utsun Nation to track environmental conditions, mitigation implementation, and monitoring results over time, this condition provides information relevant to Quw'utsun Nation's decisions regarding access, use, and future presence at TI'uqtinus.
- Condition 4 (Consultation) requires the Holder to be available to meet regularly with Quw'utsun Nation throughout all Project phases to discuss issues and concerns related to the Project. By providing a structured and ongoing forum for dialogue, this condition establishes a mechanism for identifying, discussing, and resolution of concerns related to access, safety, and use of TI'uqtinus, helping maintain confidence in returning to and using the area.
- Condition 9 (Public Information and Flaring Notices) requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps avoid or reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance.
- Condition 10 (Community Feedback Process) establishes a clear and structured mechanism for Quw'utsun Nation to raise concerns related to Project effects on culturally important areas, access, or sensory conditions. The condition requires concerns to be documented, responded to, and reported on, providing a formal process for identifying such issues as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- Condition 12 & 13 (Construction and Operations Environmental Management Plan) require comprehensive plans to manage dust, noise, visual quality, traffic, emergencies, and other disturbances during Construction and Operations. By managing and mitigating Project-related sensory and environmental disturbance, these conditions are intended to avoid or reduce potential Project-related effects on access, cultural use, and sense of place at TI'uqtinus. Requiring clear communication protocols for emergencies between the Proponent and Quw'utsun Nation supports timely information-sharing and response, which helps address safety concerns and contributes to community confidence in accessing and using the area.
- Condition 14 (Air Quality Management Plan) ensures the selection and implementation of effective emissions control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access, cultural use, and time spent on the land at TI'uqtinus, supporting sense of place and the potential for re-establishing a sustained Quw'utsun Nation presence; and,

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to re-establishment of Quw'utsun Nation permanent residence and river access at the village lands of TI'uqtinus:

- Accidents and Malfunctions Reporting would support mitigation of potential impacts on Quw'utsun Nations interests by ensuring timely response, incorporation of Indigenous perspectives, and continuous improvement to avoid or reduce the risk and severity of future incidents.

**Re-establishment of Quw'utsun Nation culturally integral practices (e.g. harvesting fish, waterfowl, plants) on the south arm of the Fraser River and mouth, including at and about Tl'uqtinus**

The EAO identified the following proposed provincial conditions that would mitigate potential effects to re-establishment of Quw'utsun Nation culturally integral practices (e.g. harvesting fish, waterfowl, plants) on the south arm of the Fraser River, with any management plans from these conditions to be developed in consultation with Quw'utsun Nation.

- Condition 12 & 13 (Construction and Operations Environmental Management Plan) require measures to manage noise, dust, lighting, traffic, water quality, and spills. By avoiding or reducing disturbance and maintaining environmental conditions that support fish, wildlife, and plants, these conditions help sustain the ecological basis needed for harvesting and support safe access to harvesting areas;
- Condition 14 (Air Quality Management Plan) requires emissions controls and monitoring during Operations. By requiring emissions controls and monitoring, this condition is intended to avoid or reduce Project-related air quality effects that may affect visibility, time spent on the land and water, and harvesting, and helps avoid or reduce barriers to returning to and using areas such as Tl'uqtinus;
- Condition 10 (Community Feedback Process) requires accessible mechanisms to raise concerns and obtain timely responses. By enabling Quw'utsun Nation to identify and resolve issues affecting access, safety, or harvesting conditions, this condition supports ongoing use of harvesting areas and responsiveness to changing conditions;
- Condition 4 (Consultation) requires regular engagement with Quw'utsun Nation throughout all project phases. By maintaining ongoing dialogue, this condition supports identification and resolution of issues that may affect harvesting timing, access routes, or conditions, helping sustain confidence in re-establishing practices;
- Condition 3 (Document Development) requires monitoring programs, reporting, and defined roles for First Nations in plan implementation. By providing access to monitoring results related to water quality, wildlife, and other indicators, this condition supports informed decision-making about when and where harvesting can safely occur.
- Condition 17 (Dry Street Sweeping Report) evaluates measures to avoid or reduce 6PPD-quinone and related contaminants entering aquatic environments. By supporting improved water quality for fish habitat, this condition may contribute to improved conditions for salmon and other species central to Quw'utsun Nation harvesting practices.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to harvesting:

- Migratory Bird Protections require protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Quw'utsun's harvesting practices and broader ecosystem conditions important to their way of life.

**Realization of Quw'utsun Nation revenue, economic and employment opportunities and benefits.**

The EAO identified the following proposed provincial conditions that would mitigate potential effects to Quw'utsun Nation revenue, economic and employment opportunities, with any management plans from these conditions to be developed in consultation with Quw'utsun.

- Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan) requires the development and implementation of measures to support First Nations employment, contracting, and training opportunities. By prioritizing Indigenous participation, identifying capacity needs, and tracking outcomes over time, this condition directly supports access to employment, business opportunities, and associated revenues for Quw'utsun members and affiliated entities.
- Condition 4 (Consultation) requires the Holder to meet regularly with Quw'utsun Nation throughout all project phases. By providing a structured forum to discuss employment, contracting, and procurement opportunities, this condition supports alignment of project activities with Quw'utsun economic priorities and enables issues related to participation to be identified and addressed early.
- Condition 3 (Document Development) requires that plans include clear roles, reporting, and, where applicable, opportunities for First Nations involvement in monitoring and implementation. By requiring transparency in how commitments are carried out and reported, this condition supports accountability for economic inclusion measures and enables Quw'utsun Nation to track and respond to outcomes over the Project lifecycle.
- Condition 10 (Community Feedback Process) requires mechanisms to raise concerns and track responses. By providing a formal pathway for Quw'utsun Nation to identify barriers to employment, contracting, or participation, this condition supports timely resolution of issues that may affect realization of economic benefits.

**Promotion of education regarding the Quw'utsun Nation presence and interests on the south arm of the Fraser River and mouth**

The EAO identified the following proposed provincial conditions that would mitigate potential effects to education regarding the Quw'utsun Nation presence and interests on the south arm of the Fraser River, with any management plans from these conditions to be developed in consultation with Quw'utsun.

- Condition 4 (Consultation) requires the Holder to meet regularly with Quw'utsun throughout all project phases. By maintaining ongoing dialogue, this condition supports opportunities for Quw'utsun to communicate its interests, values, and presence to the Proponent and informs how these are reflected in project planning and implementation.
- Condition 3 (Document Development) requires that plans include consideration of Indigenous knowledge, defined roles for First Nations, and clear reporting requirements. By incorporating Quw'utsun knowledge and perspectives into project planning and monitoring, this condition supports broader awareness and recognition of Quw'utsun presence, interests, and stewardship responsibilities.

- Condition 10 (Community Feedback Process) requires communication tools and reporting on concerns raised by First Nations and the public. By creating accessible channels for engagement and documentation of issues, this condition supports visibility of Quw'utsun concerns and interests and promotes greater understanding of their presence in the area.
- Condition 9 (Public Information) requires publicly accessible project information, including notices of activities and project updates. By increasing awareness of when and where project activities occur in areas of importance to Quw'utsun, this condition supports transparency around the use of these areas and may contribute to broader recognition of their ongoing connection to the south arm of the Fraser River.

## EAO Conclusion

EAO recognizes that Quw'utsun Nation's Indigenous-Led Assessment reached conclusions that differ from those reached by the EAO regarding the nature and seriousness of Project effects on Quw'utsun Nation's rights, title, interests, community, and restoration objectives. EAO did not seek to revisit or replace Quw'utsun Nation's conclusions. Rather, EAO relied on Quw'utsun Nation's assessment in understanding the effects identified by the Nation and considered how the proposed provincial conditions, federal Key Mitigation Measures, and follow-up programs responded to those effects. The EAO acknowledges that Quw'utsun Nation disagrees with EAO's conclusions regarding the adequacy and effectiveness of those measures. Based on its consideration of the assessment record as a whole, EAO is of the view that these measures appropriately avoid, reduce, manage, or otherwise accommodate potential Project impacts on Quw'utsun Nation's rights, title, interests, and community.

In consideration of the above analyses and the proposed provincial conditions, federal Key Mitigation Measures and follow-up programs, the EAO concluded that the potential adverse effects of Tilbury Phase 2 on Quw'utsun Nation and its rights have been adequately avoided, minimized or otherwise accommodated. Based on the engagement undertaken with Quw'utsun Nation on Tilbury Phase 2, as outlined above, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult and accommodate Quw'utsun Nation.

## Quw'utsun Nation Statement on EAO Conclusions

Quw'utsun Nation provided comments on EAO's assessment conclusions, including its views on Project effects, impacts on Quw'utsun Nation rights, title and interests, accommodation measures, and the overall sufficiency of the assessment. EAO acknowledges that Quw'utsun Nation disagrees with EAO's conclusions regarding Project effects, accommodation measures, and the adequacy of mitigation and accommodation. The following excerpt, from Quw'utsun Nation, highlights their position regarding EAO's conclusions:

Quw'utsun Nation does not agree with EAO's conclusions regarding the proposed Fortis BC Phase 2 LNG Project's (Project) effects on Quw'utsun Nation rights, title, and interests.

Quw'utsun Nation's Indigenous-Led Assessment (ILA) concludes that the Project contributes to ongoing barriers to the recovery and restoration of the Lands of Tl'uqtinus, including the Cowichan Title Lands, as defined in *Cowichan Tribes v. Canada (Attorney General)*, 2025 BCSC 1490, the re-establishment of Quw'utsun Nation presence and river access, the continuation and revitalization of culturally integral practices, and the restoration and maintenance of relationships among lands, waters, salmon, sturgeon, and other kinship beings and Quw'utsun Mustimuhw.

Quw'utsun Nation's assessment further concludes that the Project deepens existing cumulative effects arising from colonial displacement, industrial development, and ecological degradation rather than supporting reconciliation, restoration, or return. The Project as proposed provides no benefits, either tangible or intangible, to the Quw'utsun Nation, nor has the Crown or the proponent proposed any meaningful accommodation for infringements of Quw'utsun Nation Aboriginal and Indigenous rights identified in the Quw'utsun Nation Indigenous-Led Assessment.

Quw'utsun Nation's Indigenous-Led Assessment remains the authoritative assessment of Project impacts on Quw'utsun Nation rights, title, interests, responsibilities, and way of life. It was undertaken pursuant to Quw'utsun Nation Law by the Nation whose rights, title, lands, waters, and future are directly affected by the Project. No other assessment can determine the significance of impacts to Quw'utsun Nation rights, title, and interests on behalf of Quw'utsun Nation.

Quw'utsun Nation is concerned that EAO's conclusions do not reflect developments in the law respecting Quw'utsun Nation rights, title, and future use of the lands and waters at issue, including court-declared Aboriginal title and fishing rights and Quw'utsun Nation's objectives for the restoration of the Lands of Tl'uqtnus, Shnuwiilh, and the South Arm of the Fraser River. These matters form part of the context within which Quw'utsun Nation assessed Project effects and are fundamental to understanding the significance of impacts on Quw'utsun Nation rights, title, interests, responsibilities, and way of life.

Quw'utsun Nation does not agree that the proposed provincial conditions, federal Key Mitigation Measures, or future management processes demonstrate that impacts to Quw'utsun Nation's rights and title have been adequately avoided, minimized, or otherwise accommodated. Mitigation is not accommodation, and mitigation still results in a net adverse impact to Quw'utsun Nation. While the assessment record identifies numerous plans, monitoring programs, consultation requirements, and adaptive management mechanisms, it does not demonstrate how those measures support the conclusions reached regarding residual effects, accommodation, restoration, re-establishment, harvesting, or other rights-based outcomes.

Quw'utsun Nation remains concerned that its Indigenous-Led Assessment was acknowledged but not substantively engaged as an assessment framework. The record does not demonstrate how the Indigenous-Led Assessment informed baseline selection, effects characterization, residual effects conclusions, mitigation design, significance determinations, or accommodation conclusions, nor does it explain any departure from Quw'utsun Nation's findings.

For these reasons, Quw'utsun Nation maintains that the assessment record does not support EAO's conclusions regarding the adequacy of mitigation, accommodation, or the significance of project effects on Quw'utsun Nation's rights, title, interests, responsibilities, and way of life.

## 16.8 Leq'á:mel First Nation

### 16.8.1 Community Profile

Leq'á:mel First Nation (Leq'á:mel) is located in Deroche, B.C., 22 km east of Mission, B.C., in the Fraser Valley region. Leq'á:mel used to be one of the most popular trading hubs in Stó:lō territory and served as a natural place for families from up and down the Fraser River to gather. It is also the cradle of Halq'eméylem, the traditional language of the Stó:lō people.

The Sxwōxwiyám, which are the ancient accounts of how the world came to be, stated that the ancestors of Leq'á:mel did not have fire. Seeing this, the sun descended from the sky as a man and provided fire to EE-AY-lep-kelem and taught him how to use it. In a fight with his enemy Qals, EE-AY-lep-kelem sprinkled some white wood ashes over himself and proclaimed that he was powerful and wise after the sun's help, leaping high into the air. Qals then transformed EE-AY-lep-kelem into a sturgeon and challenged him to do the same in the water in the future. Therefore, Leq'á:mel are also known as Skowó:wech or the sturgeon people and consider themselves to be resilient like the sturgeon, who have stood up against the test of time.

Leq'á:mel is a part of the Stó:lō Nation. As a Stó:lō people, Leq'á:mel have lived on the territory of S'ólh Téméxw (which is the Halq'eméylem name for the shared asserted territory of the Stó:lō) since time immemorial. The Stó:lō are also considered part of the Coast Salish Peoples.

In 2022, Leq'á:mel and Leq'á:mel First Nation signed a Strategic Engagement Agreement (SEA) with the B.C. government. The Agreement Area in the SEA includes Tilbury Island and nearby portions of the Fraser River.

According to the 2021 Canada Census, the population of Leq'á:mel is 453 members, of which 147 members reside on reserve.

### 16.8.2 Leq'á:mel First Nation Involvement in the Environmental Assessment

During the Early Engagement Phase, Leq'á:mel did not identify as a participating Indigenous nation.

The EAO and IAAC provided funding to support Leq'á:mel's engagement in the environmental assessment process. They provided documents, project updates, the draft IPD and DPD, and Process Planning documents for review. During Process Planning phase, it was agreed that the EAO would assess Tilbury Phase 2 effects on Leq'á:mel's Indigenous interests, as identified in Section 4 of the Assessment Plan.

On April 29, 2025, Leq'á:mel submitted a [technical memorandum](#) expanding on their key areas the Indigenous interests to be assessed by the EAO. This memo was shared with the FortisBC to include in their Revised Application. [Section 11.17](#) of the Revised Application summarizes FortisBC's engagement with the Leq'á:mel since 2020.

### 16.8.3 Assessment Boundaries

Leq'á:mel asserts Aboriginal rights and title over their traditional territory, which includes everything as far as the eye can see from Leq'á:mel, south to the Nooksack River, east to the Harrison knob, northwest to the north shore of Stave Lake, southwest to the northern shores of the Alouette Lake and down the west side of Silver Creek.

The spatial assessment boundaries for each Indigenous interest were identified based on overlap of Leq'á:mel's territory with the combined LAA and the combined RAA identified for linked VCs, see Stó:lō Nation's section in the Revised Application (see Figure 11.17-1a). The LAA of each Indigenous interest consists of the combined LAAs of VCs that are linked to the Indigenous interest, whereas the RAA of each Indigenous interest consists of the combined RAAs of VCs that are linked to the Indigenous interest.

#### 16.8.4 Regional Context

Leq'á:mel's traditional territory lies within S'ólh Téméxw, encompassing lands and waters along the lower Fraser River and its tributaries. This area has historically supported dense populations due to its abundant resources and strategic location for trade and cultural exchange. The Fraser River remains central to Leq'á:mel's identity, serving as a vital corridor for fishing, transportation, and spiritual practices.

Historically, Nicomen Slough and adjacent waterways provided safer and more accessible fishing grounds compared to the main river channel, enabling sustainable harvests of salmon, sturgeon, and eulachon. These resources were not only critical for food security but also for ceremonial and social functions, reinforcing cultural continuity and governance systems. Today, Leq'á:mel maintains strong connections to these areas through stewardship responsibilities and land use planning that prioritize ecological integrity and cultural heritage. While Tilbury Phase 2 on Tilbury Island is located downstream in a heavily industrialized zone, far removed from Leq'á:mel's primary fishing and cultural use areas, the Fraser River continues to hold profound cultural and spiritual significance for the community.

The existing Tilbury LNG facility consists of gravel and paved areas, existing infrastructure, and equipment laydown areas supporting little plant life with very little to no habitat value for wildlife. The vegetation within Tilbury Phase 2 is mostly limited to ditch lines and spoil piles and is dominated by non-native and invasive plant species. Public access to Tilbury Phase 2 is limited, although there is currently public use of the dike to the north of Tilbury Phase 2 along the Fraser River.

#### 16.8.5 Indigenous Interests

The EAO engaged Leq'á:mel during the Early Engagement phase in the development of the [Joint Summary of Issue and Engagement for the Tilbury Phase 2 LNG Expansion Project](#); however, they did not provide comment at that time.

During the Readiness Decision phase in the development of the [Readiness Decision Report](#), EAO attempted to engage with Leq'á:mel to understand their primary concerns regarding Tilbury Phase 2, however the EAO did not receive any input.

The EAO received the technical memo (see below for linked attachment), submitted April 29, 2025, from Leq'á:mel during the Application Development and Review phase, which expanded on and confirmed the Indigenous interests listed on [Tilbury Phase 2- Schedule C – Application Information Requirements](#) Table 6, see Proposed Preliminary List of Indigenous interests.

The Proponent identified Leq'á:mel Indigenous interests to be assessed in the Revised Application through:

- Reviewing requirements and guidance from the EAO and AIR;
- Conducting engagement efforts with Leq'á:mel to gather information on their Indigenous interests, as outlined in Section 11.17.3 Summary of Engagement of the Leq'á:mel section of the Revised Application;
- Leq'á:mel's [technical memorandum](#) to EAO, submitted on April 29, 2025, which introduces the the Zone of Influence (ZOI) which is an area defined by Leq'á:mel First Nation to represent the geographic scope where the Tilbury Phase 2 could affect their rights, cultural values, and ecological interests, particularly around the mouth of the Fraser River and adjacent lands like Burns Bog, all the way up river 60 km to Leq'á:mel's core territory. It signifies the interconnectedness of these waterways and lands to Leq'á:mel's identity, stewardship responsibilities, and traditional practices, highlighting that Tilbury Phase 2 impacts within this zone may have far-reaching cultural and ecological consequences and was used in the assessment of potential impacts to Leq'á:mel.

The EAO engaged with Leq'á:mel during the development of the Report, and considered the technical memo, which resulted in beneficial information that supported the EAO to confirm the list of Indigenous interests identified in the AIR. These include:

- Harvesting and subsistence activities;
- Cultural use sites and areas;
- Social and economic conditions; and,
- Indigenous health and well-being.

The assessment of Leq'á:mel's Indigenous interests in this section uses these categories. The EAO's assessment of Leq'á:mel's Indigenous interests includes describing the Indigenous interest, current context, potential effects, mitigation, and effects analysis. If there is an adverse residual effect a characterization of effects and cumulative effects assessment is also completed.

### 16.8.6 Harvesting and Subsistence Activities

#### Background

Leq'á:mel First Nation, a distinct member of the Stó:lō Nations, holds a deep and enduring connection to their traditional territory known as S'ólh Téméxw, which encompasses lands and waters around the Fraser River extending northeast to Agassiz, B.C. This territory includes culturally important areas such as the Fraser River, Nicomen Slough, wetlands, and Burns Bog—a vital medicinal plant harvesting and cultural teaching site.

Historically, fishing for salmon, sturgeon, and eulachon has been central to Leq'á:mel's diet, health, and ceremonial life. However, members currently face challenges in harvesting sufficient salmon within Department of Fisheries and Oceans (DFO) prescribed boundaries due to industrial impacts downstream, leading them to rely on neighboring communities and commercial sources for key fish species.

Hunting remains important, particularly for deer and ducks, with intact habitats necessary to sustain healthy wildlife populations. Plant gathering, especially medicinal plants like bog labrador tea found in Burns Bog, is critical to the community's health and cultural continuity, though habitat degradation and access limitations have been noted.

Tilbury Phase 2 is largely industrial, situated on private property within the existing Tilbury LNG facility on Tilbury Island, and is not accessible for harvesting or gathering activities.

Leq'á:mel have asserted Section 35 rights, title, and responsibilities for their territory. They also assert the right to ensure that their members benefit socially, culturally, spiritually, and economically from resources from their land.

#### Current Context

Past activities such as agriculturalization, industrialization, and urbanization have affected Stó:lō Nations' ability to harvest and carry out subsistence practices.

Regarding fishing, Leq'á:mel stated that they do not fish below the Port Mann Bridge, which includes Tilbury Phase 2, but they do fish in the areas between Port Mann Bridge to Sawmill Creek. According to Leq'á:mel, they currently cannot harvest adequate numbers of salmon within DFO-prescribed fishing boundaries to support healthy citizens and critical cultural ceremonies.

Furthermore, although Tilbury Phase 2 is around 60 to 70 km from Nicomen Island, at the core of Leq'á:mel territory, according to Leq'á:mel knowledge holders, salmon can swim that distance in one to one-and-a-half days. This means that salmon passing by Tilbury Phase 2 will reach the core of Leq'á:mel territory in less than two days' time.
