Leq'á:mel relies on various fish species that pass through the mouth of the Stó:lō for food and ceremony. Thus, Leq'á:mel have concerns that Tilbury Phase 2 may impact critically important fish species, thus affecting their ability to reach the waters at the core of Leq'á:mel territory.

Regarding hunting, Tilbury Phase 2 has heavily disturbed vegetation. There is a lack of high-quality foraging and nesting habitat for migratory and resident bird species. Wildlife use is mainly limited to the small riparian areas on the Tilbury Slough banks. According to the Revised Application, Leq'á:mel did not identify hunting locations near Tilbury Phase 2 during the environmental assessment of the nearby Tilbury Marine Jetty (TMJ) project.

Regarding plant gathering, Burns Bog, located near Tilbury Phase 2, is a cultural teaching area and medicinal plant harvesting area for Leq'á:mel and provides important ecosystem services as a unique wetland environment. Burns Bog hosts a high density of bog labrador tea, a culturally and medicinally important plant for Leq'á:mel citizens.

#### Potential Project Effects

The EAO identified the following pathway of effects, prior to the application of mitigation measures, along with associated VCs outlined in [Appendix 6](#), that may affect Leq'á:mel's harvesting rights during Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources** from increased noise, light, and air pollution (acoustics, air quality, soil, groundwater, land and resource use VCs) may deter Leq'á:mel members from accessing preferred harvesting areas near Tilbury Phase 2 site. Changes in fish distribution and abundance (fish and fish habitat VC) and the introduction of invasive plant species (vegetation VC) may further reduce the experience and preference of the practicing of harvesting rights;
- **Effects to Leq'á:mel Rights to fish, harvest, and hunt for Food, Social and Ceremonial (FSC) purposes** from habitat loss, (wildlife, fish, vegetation VCs), increased mortality risks to fish, birds, and wildlife (wildlife and wildlife habitat VCs), and changes in their behaviour due to sensory disturbances (acoustics, air quality VCs). Additionally, contamination risks to fish habitat in Tilbury Slough (surface water VC) and Fraser River downstream, as well as contaminated soil (soil VC) could impact important plant species, that may further impact traditional harvesting and cultural practices closer to Leq'á:mel core territory (see current context section above, statement regarding Nicomen Island); and,
- **Effects to the accessibility and availability of traditional lands and resources** from time and space may be lost when trying to access Burns Bog for plant gathering (vegetation VC).

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on harvesting and subsistence practices. A full table of Proponent mitigations can be found in Section XX of the Revised Application. Below is a summary of KMMs, how they address effects on the relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air quality measures, such as idle reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Leq'á:mel's harvesting and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during Construction and Operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Leq'á:mel's harvesting and cultural practices;
- **Surface Water (Section 7.4)** Erosion and -sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta -storm sewer system. These protections support water quality and fish habitat relied on to support Leq'á:mel's harvesting and cultural practices;

- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by Leq'á:mel for harvesting and cultural practices;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by Leq'á:mel for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing Construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to Leq'á:mel's harvesting and cultural practices;
- **Fish and Fish Habitat (Section 7.9)** Avoiding -in water works and implementing erosion, sediment, and -spill prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the health and availability of salmon and other fish species central to Leq'á:mel's FSC harvesting rights and cultural practices;
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas; used for harvesting or cultural practices; and,
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat and vegetation important to Leq'á:mel's harvesting and cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions to help reduce potential impacts on Leq'á:mel's harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting rights [see also [Section 8](#) of this Report]:

- **Condition 10 (Community Feedback Process)** creates a clear way for Leq'á:mel to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of Leq'á:mel's harvesting and cultural practices;
- **Condition 12 (CEMP)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to Leq'á:mel's harvesting and cultural practices;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to Leq'á:mel's harvesting and cultural practices;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emissions control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support Leq'á:mel's harvesting and cultural practices; and,
- **Condition 17 (Dry Street Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project related roads, which may lower potential impacts on salmon and other fish important to Leq'á:mel's harvesting and cultural practices.

In addition to the Proponent's mitigations and the provincial conditions, the EAO identified the following federal Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to harvesting:

- **Federal Consideration for Migratory Bird Protections:** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Leq'á:mel's harvesting practices and broader ecosystem conditions important to their way of life.

#### The EAO's Analysis and Conclusions

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Leq'á:mel's harvesting rights and interests:

- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources;
- Effects to Leq'á:mel's asserted Aboriginal rights to fish for FSC purposes; and,
- Effects on the accessibility and availability of traditional lands and resources.

Table 28: Summary of residual effects and rationale on Leq'á:mel and its harvesting and subsistence activities

| Residual Effects                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Assessment Rating*                                                                                                                                                                                                                                                              | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Harvesting and subsistence activities</p> <ul style="list-style-type: none"> <li>- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources</li> <li>- Effects to Leq'á:mel asserted Aboriginal rights to fish for FSC purposes closer to their core territory</li> <li>- Effects on the accessibility and availability of traditional lands and resources for plant gathering</li> </ul> | <p>Context (resilience): Low</p> <p>Magnitude: Negligible</p> <p>Extent: Local</p> <p>Duration: Medium Term</p> <p>Reversibility: Fully reversible</p> <p>Frequency: Continuous</p> <p>Affected Populations: Disproportionate</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><b>Context:</b> The interest is rated as having a low resiliency. Industrial development has already affected harvesting and subsistence activities, and some harvested species are of conservation concern.</p> <p><b>Magnitude:</b> The magnitude is rated as negligible, based on the Project negligible magnitude residual effect on fish and fish habitat and surface water VCs. Other key potential residual effects are rated as negligible to low in magnitude.</p> <p><b>Extent:</b> Rated as local, since the spatial scale of residual effects to applicable VC's is limited, the impact on harvesting is expected to remain local, primarily within the immediate Tilbury Phase 2 area. Leq'á:mel views the extent as regional, due to their view that an increased storage capacity from Tilbury Phase 2 will link with TMJ and increase vessel traffic on the Stó:lō, and impact fish and aquatic species.</p> <p><b>Duration:</b> The effects on harvesting will persist for as long as the Tilbury Phase 2 facility remains operational, making them medium-term.</p> <p><b>Reversibility:</b> Most effects, particularly those related to sensory disturbances such as noise and light, would cease if Tilbury Phase 2 were halted or upon Decommissioning, making them fully reversible.</p> <p><b>Frequency:</b> Rated as continuous as effects would be most prominent during Construction, but some effects (noise, light disturbance) would occur continuously.</p> <p><b>Affected Populations:</b> Tilbury Phase 2's impacts will primarily affect Leq'á:mel members who actively participate in harvesting. However, there may be indirect effects on those who choose not to harvest due to negative perceptions of environmental degradation in a highly developed area. These effects are considered disproportionate.</p> <p><b>Risk:</b> The likelihood of these effects occurring is low due to the effectiveness of mitigation measures, and due to their negligible magnitude and limited extent, the overall consequences are expected to be minor. Therefore, the risk is rated as low.</p> <p><b>Uncertainty:</b> The pathways of effects—such as noise, light, vibration, and impacts on harvesters—are well understood. While mitigation measures are expected to be moderately to highly effective, some uncertainty remains regarding their</p> |

| Residual Effects                                                                                                                  | Assessment Rating* | Rationale                                                                                                                              |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | effectiveness in fully addressing harvesters' experiences and perceptions. As a result, the level of uncertainty is rated as moderate. |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                        |

### *Cumulative Effects*

Leq'á:mel's harvesting and subsistence activities have already been affected by historical environmental degradation (see Background and Current Context section). The Revised Application identifies two foreseeable projects – the T1B and TMJ Projects – that are expected to add shipping to the Stó:lō and further alter the Tilbury Island foreshore prior to Construction of Tilbury Phase 2. These developments may introduce additional sensory disturbances (noise, light, vibration), degrade habitat and water quality, and impact culturally important plant, fish and wildlife resources.

Leq'á:mel has raised concerns about noise pollution from Construction negatively impacting fish navigation in the south arm of the Fraser River. The T1B Project will remove vegetation from the existing facility site, potentially impacting plant resources that Leq'á:mel members may harvest now or in the future. The TMJ Project's shipping activities in the Fraser River could also contribute to noise and disturbance in the aquatic environment, potentially affecting fish and marine mammals. In Leq'á:mel's view, Tilbury Phase 2 and TMJ are linked in that an increased storage capacity from Tilbury Phase 2 will affect TMJ and increase vessel traffic thereby effecting Leq'á:mel's access to culturally important fish species for harvesting.

The EAO notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### **Conclusion**

Considering the above analyses, including proposed proponent mitigations, EAO's conditions, and KMMs, and based on the Project specific effects of Tilbury Phase 2, the EAO concludes that the Project will have a negligible effect on the harvesting and substance activities of Leq'á:mel.

## **16.8.7 Cultural Use Sites and Areas**

### **Background**

Historically, Leq'á:mel have used the Stó:lō for various cultural purposes. Specifically, Leq'á:mel fished throughout their fishing areas on the Stó:lō and relied on sharing, gifting, trading from neighbouring First Nations at the mouth of the Fraser River. Close to Leq'á:mel's core territory, fishing followed protocols and ceremonies that embedded respect for the Creator. Salmon served an important cultural purpose for winter dances, funerals, burnings, marriages, and gatherings. Hunting provided a connection to the land, a strong sense of place, and an opportunity for traditional knowledge to be shared. The Stó:lō served as a focal point for spirituality, oral traditions, with most spiritual sites being linked directly to the river. Leq'á:mel was home to many large longhouses, where traditional knowledge was shared.

### **Current Context**

According to Leq'á:mel, Burns Bog, located 1.9 km to the southeast of Tilbury Phase 2, is a cultural teaching area and medicinal plant harvesting area.

From Leq'á:mel's perspective, immediate (Construction phase) and ongoing (Operation phase) increases in vehicle traffic for Tilbury Phase 2 will impede their citizens' ability to access critical teaching and medicinal plant harvesting areas, while also increasing traffic to and potential disturbance of places highly valued by Leq'á:mel citizens.

Teaching Leq'á:mel youth about the importance of cultural plants for medicinal and subsistence purposes is an integral component of Leq'á:mel identity and connection to the lands and waters. Medicinal plants are also critical to the health and well-being of Leq'á:mel citizens. Any disruption in Leq'á:mel citizens' ability to access medicinal plant harvesting and teaching places will have adverse effects on Leq'á:mel cultural continuity, especially as Leq'á:mel citizens see the habitat for these medicinal plants dwindling.

Furthermore, in Leq'á:mel's view, the concept of Shxweli (the interconnectedness of all things) is at the centre of Leq'á:mel culture, knowledge, and identity. Thus, according to Leq'á:mel, any potential impacts from Tilbury Phase 2 will impact Leq'á:mel culture and identity.

As mentioned in the Harvesting and Subsistence Activities section above, past activities have had adverse effects on cultural use. In addition, the Revised Application identified a decline in access to cultural use areas for Stó:lō Nations due to railway developments and expansions.

#### Potential Project Effects

The EAO identified the following pathway of effects, prior to the application of mitigation measures, along with associated VCs outlined in Appendix XX, that may affect Leq'á:mel's cultural use sites and areas during Construction, Operation and Decommissioning phases of the Tilbury Phase 2:

- **Effects to cultural heritage and structures, sites, or things historical, archeological, paleontological, or architectural significance;** While Tilbury Phase 2 is private property and not currently accessible for activities like plant harvesting and will remain restricted, Leq'á:mel currently uses areas adjacent to Tilbury Phase 2 and could use the site if they had the opportunity. While sensory disturbances (acoustic, air quality, culture, and land and resource use VCs) are predicted to have low magnitude impacts compared to existing industrial conditions, they do have the potential to alter the experience of Leq'á:mel members using cultural sites in the vicinity;
- **Loss of access to and disenfranchisement from cultural sites;** Leq'á:mel harvesters could experience direct adverse effects to cultural and spiritual practices if access to cultural sites is altered or lost due to closure or modification of trails, parking areas, or access points between Tilbury Phase 2 and the Fraser River for safety or construction purposes (land and resource use VC). Changes in sensory effects (acoustic, air quality, culture, and land and resource VCs) could change the experience of Leq'á:mel members using cultural sites, such as harvesting areas along the south arm of the Fraser River and Burns Bog; and,
- **Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas;** Access to cultural sites could be affected (soil, land and resource use, and archaeological and heritage resources VCs) by Tilbury Phase 2. Adverse effects to culture (culture VC) which are connected to potential effects on wildlife, habitat, and vegetation (See Harvesting and Subsistence section above) could influence the ability or desire to access these sites.

#### Mitigation Measures

The Revised Application summarizes relevant mitigation measures proposed by the Proponent to address potential Tilbury Phase 2 related effects on cultural use sites and areas, including:

- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm sewer system. These protections support water quality and the ecological integrity of adjacent areas, including those used by Leq'á:mel for cultural practices, teaching, and medicinal plant harvesting, thereby

helping to maintain the quality and accessibility of cultural use sites and areas relied upon by Leq'á:mel citizens;

- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species associated with Leq'á:mel cultural use sites and areas. These measures help maintain the availability and quality of plants used for cultural practices, teaching, and medicinal harvesting. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities, supporting the ecological conditions necessary for the continued use and integrity of Leq'á:mel cultural use sites and areas;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing Construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the wildlife and ecosystems associated with Leq'á:mel cultural use sites and areas. These measures contribute to sustaining the ecological conditions necessary for cultural practices, teaching, and harvesting activities, and help preserve the integrity and experience of Leq'á:mel cultural use sites and areas;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the ecological conditions associated with Leq'á:mel cultural use sites and areas, including areas relied upon for fishing, teaching, and cultural practices, and help maintain the availability of fish species central to the ongoing use and integrity of these cultural sites and areas;
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream ecosystems associated with Leq'á:mel cultural use sites and areas. These measures contribute to sustaining the conditions necessary for vegetation, fish, and other resources relied upon for cultural practices, teaching, and harvesting, and help preserve the integrity and continued use of Leq'á:mel cultural use sites and areas;
- **Land and Resource Use (Section 7.11)** Traffic-management planning, noise and lighting controls, and communication regarding project activities, help reduce disruptions to access and use of culturally important areas. These measures support Leq'á:mel's ability to safely access and continue cultural practices within their traditional territory;
- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support Leq'á:mel's ability to access, use, and maintain culturally important areas, including places of teaching, ceremony, and connection to land and water;
- **Soil (Section 7.6)** Soil-management measures, including erosion control, spill-prevention protocols, and careful handling and disposal of contaminated soils, help prevent the migration of pollutants into nearby cultural areas and waterways. Maintaining soil stability and quality supports the protection of culturally important places and landscapes used by Leq'á:mel;
- **Acoustics (Section 7.3)** Noise-reduction measures during Construction and Operation, including idle-reduction policies, equipment muffling, enclosures, and engineered noise controls, help limit disturbance to culturally important areas and activities. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of cultural knowledge by Leq'á:mel;

- **Air Quality (Section 7.2)** The air-quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Leq'á:mel's harvesting rights and cultural practices; and,
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance-find procedures, site protection, and early notification to Indigenous nations, help protect culturally important sites, features, and landscapes. These measures support Leq'á:mel's ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connections to territory.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on cultural use sites and areas (see [Section 8](#) of this Report):

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance;
- **Condition 10 (Community Feedback Process)** establishes a clear and structured mechanism for Leq'á:mel to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of culturally important landscapes and areas, supporting Leq'á:mel's continued access to and use of cultural sites during the Project Construction;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, lighting, wildlife interactions, and spills during project Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by Leq'á:mel;
- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emissions-control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites by Leq'á:mel; and,
- **Condition 15 (Chance Find Protocol)** requires the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If Leq'á:mel historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

#### The EAO's Analysis and Conclusions

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Leq'á:mel's cultural use sites and areas rights and interests:

- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance;
- Loss of access to and disenfranchisement from cultural sites; and,

- Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas.

The EAO's characterization of the residual effects of Tilbury Phase 2 on cultural use sites and areas are summarized in the table below.

Table 29: Summary of residual effects and rationale on Leq'á:mel and its cultural use sites and areas

| Residual Effect                                                                                                                                                                                                                                                                                                                                                                 | Assessment Rating*                                                                                                                                                                                                                                                          | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cultural use sites and areas<br><br>- Loss of access to and disenfranchisement from cultural sites<br><br>- Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas<br><br>- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance | Context (resilience): Low Resiliency<br><br>Magnitude: Negligible<br><br>Extent: Local<br><br>Duration: Medium-term<br><br>Reversibility: Partially Reversible<br><br>Frequency: Continuous<br><br>Affected Populations: Even<br><br>Risk: Low<br><br>Uncertainty: Moderate | <p><b>Context:</b> Rated as having low resiliency, recognizing that while Leq'á:mel culture has demonstrated resilience despite historical impacts, it is difficult to quantify how adaptable members are to additional adverse effects. Cultural strength may have been greater in the absence of cumulative disturbances, and potential linkages between cultural impacts and community health add to the complexity of assessment. Given the historical and ongoing challenges, this rating represents a conservative estimate.</p> <p><b>Magnitude:</b> Rated as negligible, based on the Project's negligible magnitude residual effects on fish and fish habitat and surface water VCs. Other connected VC residual effects are rated as negligible to low magnitude and are of local extent. Tilbury Phase 2 site is located on fee simple land with no public access.</p> <p><b>Extent:</b> Rated as local, as the residual effect will be within the local assessment area with Burns Bog being adjacent to Tilbury Phase 2.</p> <p><b>Duration:</b> Rated as medium-term, as residual effects will likely cease after the Decommissioning phase.</p> <p><b>Frequency:</b> Rated as continuous, particularly for loss of site use for cultural purposes, which is an ongoing effect.</p> <p><b>Reversibility:</b> Most sensory-related disturbances (e.g., noise, light) would be fully reversible following Tilbury Phase 2 Decommissioning. However, cultural impacts linked to the loss of access or disruption to traditional practices may be irreversible.</p> <p><b>Affected Populations:</b> The effect is expected to be evenly distributed among Leq'á:mel members. While direct impacts would disproportionately affect those actively practicing or seeking to practice their culture, indirect effects could extend to all members due to the interconnected nature of Leq'á:mel cultural identity.</p> <p><b>Risk:</b> The likelihood of negative cultural impacts occurring is low, but the overall consequence is expected to be minor, given the negligible magnitude of direct Tilbury Phase 2-related effects and the application of mitigation measures. Risk is therefore rated as low.</p> <p><b>Uncertainty:</b> Rated as moderate, as cultural effects are inherently challenging to quantify and may be subject to individual and community-specific experiences that are difficult to predict with certainty.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a>                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

#### Cumulative Effects

The Leq'á:mel's cultural use sites have already been extensively impacted by historical environmental degradation and land-use changes, as outlined in the Background and Existing Conditions section. These impacts have limited the nation's ability to use culturally important areas and have disrupted the transmission of Indigenous Knowledge.

As stated in the Revised Application, FortisBC notes that two foreseeable projects, T1B and TMJ, are expected to modify the Tilbury Island foreshore prior to construction of Tilbury Phase 2. TMJ would also introduce additional vessel traffic in the Fraser River. These developments are expected to introduce additional sensory disturbance (noise, light, vibration) affecting nearby cultural site access and use. T1B could remove vegetation, impacting culturally important plants and wildlife habitat, while TMJ shipping activities may increase aquatic disturbance, with potential effects on fish populations and cultural connections to the Fraser River.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

#### Conclusion

Considering the above analyses, including proposed proponent mitigations, EAO's conditions, and KMMs, and based on the Project specific effects of Tilbury Phase 2, the EAO concludes that the Project will have a negligible effect on the cultural use sites and areas of Leq'á:mel.

### 16.8.8 Social and Economic Conditions

#### Background

Harvesting and subsistence activities traditionally formed an essential economic foundation and access to cultural sites contributions to social and cultural identity for Leq'á:mel. For example, in Leq'á:mel's view, their roles as caretakers of the lands are tied heavily to their obligations to protect their wealth, which includes access to sturgeon, eulachon, salmon, and medicinal plants. Furthermore, from Leq'á:mel's perspective, lack of available fish in recent years has impacted its own redistributive economy and fragmented their cultural relationship with salmon in the Fraser River. The Revised Application uses indicators such as population, health, housing, education, employment, and economic development to reflect the nation's current social and economic conditions and connection to their traditional territory.

#### Current Context

The impacts of colonization and a history of industrial development have affected the social and economic conditions experienced by Leq'á:mel, either through adverse effects on traditional activities or independently. These historic and ongoing challenges have influenced various aspects of their community.

According to the 2021 Canada Census, 306 of Leq'á:mel's 453 members reside off reserve, relying on off-reserve economic activities. Leq'á:mel experiences housing challenges while also facing barriers to education and employment. Despite these systemic challenges, Leq'á:mel actively engages in economic development.

Leq'á:mel stated in their technical memo that disruptions to transportation routes and navigation along the south arm of the Fraser River directly effects their ability to access traditional territories, fisheries, and inter-community networks. These barriers undermine cultural practices such as harvesting and distribution, while also constraining opportunities for trade and social exchange that sustain Leq'á:mel's redistributive economy. Over time, these cumulative effects erode both the social cohesion and economic resilience of the community.

The loss of traditional activities has had profound social and economic effects. Over time, settlement, urban growth, railway expansions, industrial accidents, and pollution have reduced access to lands, fish, and wildlife habitats. Fishing and shellfish harvesting, once a cornerstone of their traditional economy, have been severely restricted due to contamination, further impacting their social and economic well-being. See Cultural Use Sites and Areas and Harvesting and Subsistence Activities sections for additional context.

### Potential Project Effects

The EAO identified the following pathway of effects, along with associated VCs in [Appendix 6](#), that may affect Leq'á:mel's social and economic conditions during Construction, Operation, and Decommissioning phases:

- **Effects on infrastructure and services;** Tilbury Phase 2 may add pressure on services if out-of-region workers are used, but according to the Revised Application effects are expected to be limited and not distinguishable from existing conditions (infrastructure services VC);
- **Effects on Leq'á:mel's intercommunity relations and trade;** Tilbury Phase 2 may move Leq'á:mel further away from their goal of strengthening an intra-community economy and inter-community economies along Tilbury Phase 2, given barriers faced in using waters and roadways for travel, and in potential impacts to fisheries on the Fraser River (employment and economy, fish and fish habitat, culture, wildlife and wildlife habitat, and land and resource use VCs);
- **Effects to Leq'á:mel's employment opportunities, Indigenous businesses, procurement opportunities, and Leq'á:mel revenue;** Tilbury Phase 2 could positively affect Leq'á:mel's employment and procurement opportunities, depending on member participation and access to contracts (employment and economy VC). While there may be more opportunities especially during Construction, smaller Indigenous businesses, including those linked to Leq'á:mel, may face challenges competing for workers or meeting Tilbury Phase 2 demands;
- **Effects to Leq'á:mel's ability to improve social and economic conditions;** Tilbury Phase 2 may support Leq'á:mel's ability to improve social and economic conditions by creating employment, training, and business opportunities (employment and economy, culture, fish and fish habitat, and wildlife and wildlife habitat VCs);
- **Effects to Leq'á:mel's commercial and non-commercial fishing, gathering, and cultural or ceremonial activities and practices;** Since Leq'á:mel traditional economies rely on economic practices such as feasting, sharing, gifting, and trading, with Leq'á:mel and neighbouring Indigenous communities, Tilbury Phase 2 could potentially further disrupt these already strained economies that shape relationships between Indigenous communities on the Fraser River and that are central to Leq'á:mel identity (fish and fish habitat, wildlife and wildlife habitat, employment and economy, and culture VCs).

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the proponent has proposed in response to potential Tilbury Phase 2 related effects on social and economic conditions. These include the following

- **Land and Resource Use VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting Leq'á:mel's long-term aspirations for land and water restoration and reducing stressors that can impact economic development and community well-being;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for Leq'á:mel members and businesses to participate economically in the project, supporting improved social conditions and community well-being;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socioeconomic impacts on Leq'á:mel and supporting and community stability;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports Leq'á:mel's food security and cultural identity by safeguarding salmon and other species essential to FSC

harvesting;

- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting Leq'á:mel's cultural continuity and nutritional well-being;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to Leq'á:mel's physical health and cultural practices;
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Leq'á:mel's social and economic interest;

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on social and economic conditions:

- **Condition 10 (Community Feedback Process)** provides Leq'á:mel with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting ongoing social and economic interests;
- **Condition 12 (CEMP)** requires mitigation measures to manage dust, noise, traffic, spills, surface water, erosion, and wildlife interactions during Construction. These measures help minimize Construction related disturbances that could affect community comfort of Leq'á:mel members;
- **Condition 13 (OEMP)** requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation. By limiting long-term environmental disturbances, this condition supports stable conditions that protect Leq'á:mel's social and economic interests;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality mitigates environmental stressors that may impact traditional resources, supporting the Social and Economic Conditions of Leq'á:mel by preserving the cultural acceptability of harvested species and ensuring that the traditional economies of feasting, sharing, and trading do not become more difficult or costly to maintain;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If Leq'á:mel historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated cultural or social harm; and,
- **Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support Leq'á:mel First Nation's socio-economic well-being through increased access to jobs, skills development, and business opportunities associated with Tilbury Phase 2.

#### The EAO's Analysis and Conclusions

After considerations in the EAO's conclusions on the linked VCs, and proposed mitigation measures, the EAO concludes that Tilbury Phase 2 is expected to result in no residual adverse effects on Leq'á:mel's social and economic conditions.

While the nation continues to experience extensive systemic challenges - including limited access to housing, employment, and culturally important lands - these are primarily the result of historic and ongoing regional industrial development, and not directly attributable to Tilbury Phase 2.

Tilbury Phase 2 is situated in an already industrialized area with limited current access or use by Leq'á:mel members,

and any additional demands on local services are expected to change compared to existing pressures.

There is potential for positive effects and combined with the absence of any material adverse effects from Tilbury Phase 2, supports the EAO's conclusion of no residual effect on social and economic conditions. Therefore, no characterization of effects or cumulative effects assessment was undertaken.

### 16.8.9 Indigenous Health and Well-being

#### Background

Colonialism has affected Indigenous peoples' health, and social and economic well-being. Indigenous perspectives on determinants of health are holistic in nature and include social determinants of health. For example, Leq'á:mel's Strategic Plan recognizes that four aspects of health need to be addressed: mental, emotional, physical, and spiritual. Thus, the effects on Leq'á:mel's harvesting and subsistence activities, cultural use sites and areas, and social and economic conditions all have a bearing on Leq'á:mel's Indigenous health and well-being.

#### Current Context

Historically, in the Fraser River delta, Indigenous well-being faced declines after loss of land and resources following agricultural and industrial development after European settlement. More recently, past projects have adversely affected the environment in the Fraser River, and thus Stó:lō Nations' Indigenous health and well-being.

The ability to fish is critical to the health and well-being of Leq'á:mel citizens and the practice of ceremony. Leq'á:mel stated that they currently cannot harvest enough salmon within DFO-prescribed fishing boundaries to support health and ceremonies. Although these DFO fishing areas stretch from the Mission Bridge to Sawmill Creek in the Fraser Canyon, the reduced fish populations in Leq'á:mel territory result in competition among all fishermen and impacts the health and well-being of Leq'á:mel citizens. Leq'á:mel worries that any additional impacts at the mouth of the Fraser River will potentially further affect their health and well-being.

#### Potential Project Effects

The EAO identified the following pathway of effects, along with associated VCs outlined in [Appendix 6](#) that may affect Leq'á:mel's Indigenous health and well-being during Construction, Operation, and Decommissioning phases of Tilbury 2:

- **Effects on the quality, quantity, and availability of harvested country foods:** Land, water or air-based contamination from Tilbury Phase 2 could adversely affect country foods such as fish and traditional plants. See Harvesting and Subsistence Activities section above;
- **Effects on the value and perceived quality of country foods:** Quality, quantity, or availability of plants or wildlife could be impacted from Tilbury Phase 2. Country foods could become contaminated (see list of potential project effects above). Community perceptions with respect to the quality of country foods have the potential to interact with Leq'á:mel members participation in harvesting and subsistence activities and cultural and spiritual practices in the absence of adverse effects (land and resource use and culture VCs);
- **Effects on air quality, noise and water quality:** Tilbury Phase 2 activities have the potential to contribute contaminants of concern to air and water, and increased noise levels in proximity to the facility property line (air quality, acoustics, surface water, land and resource use, and human health VCs); and,
- **Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites:** Tilbury Phase 2 may interact with Leq'á:mel's health and well-being through changes to traditional practices, access to cultural sites, and socio-economic factors. Leq'á:mel has identified the loss of traditional food sources, harvesting access (Burns Bog) as contributing to chronic health issues and limiting intergenerational knowledge transfer. Positive effects may include increased income and employment opportunities for members, while potential adverse effects relate to shift work and family stress.

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on Indigenous health and well-being. These include the following:

- **Land and Resource Use VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting Leq'á:mel's long-term aspirations for land and water restoration and reducing stressors that can affect well-being;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for Leq'á:mel members and businesses to participate economically in the project, supporting improved social conditions and community well-being;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socioeconomic impacts on Leq'á:mel and supporting health and community stability;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports Leq'á:mel's food security, cultural identity, and health by safeguarding salmon and other species essential to FSC harvesting;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting Leq'á:mel's cultural continuity and nutritional well-being;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to Leq'á:mel's physical health and cultural practices;
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Leq'á:mel's well-being;
- **Groundwater (Section 7.5)** Protecting groundwater from contamination helps maintain the quality of ecosystems that support fish, plants, and wildlife relied on for Leq'á:mel's subsistence and health;
- **Surface Water (Section 7.4)** Managing runoff, erosion, and sediment helps maintain water quality in the lower Fraser, supporting Leq'á:mel's cultural and nutritional reliance on healthy salmon and aquatic ecosystems;
- **Acoustics (Section 7.3)** Noise reduction measures limit sensory disturbance to people, wildlife, and harvesting areas, reducing stress and supporting Leq'á:mel's comfort, well-being, and connection to land and water;
- **Air Quality (Section 7.2)** Air emission controls help protect respiratory health and prevent contamination of country foods, supporting Leq'á:mel's physical well-being and confidence in harvesting; and,
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect Leq'á:mel members' physical, cultural, and mental health.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on Indigenous health and well-being:

- **Condition 10 (Community Feedback Process)** provides Leq'á:mel with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting Indigenous health and well-being;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)** requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with Leq'á:mel to be developed by the Holder in consultation with the Nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting Leq'á:mel's physical health and overall well-being;
- **Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan)** requires a plan to support economic participation for First Nations and local communities. By facilitating access to employment, training, and business opportunities, this condition supports the mental health and well-being of the Leq'á:mel' through increased community stability and economic security; and,
- **Condition 17 (Dry Street Sweeping Report)** requires FortisBC to submit a report on the effectiveness Dry Street Sweeping to mitigate the effects of 6-PPDQ on fish within eighteen months of a Certificate being issued. By informing measures to protect downstream aquatic environments, this condition supports Leq'á:mel's health and well-being by helping maintain confidence in environmental quality and minimizing potential concerns related to contamination of culturally important fish and waterways.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Well-being:

- **Accidents and Malfunctions Reporting** would support mitigation of potential impacts on the Nation's interests by ensuring timely responses, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

#### The EAO's Analysis and Conclusions

After considerations in the EAO's conclusions on the linked VCs, and proposed mitigation measures, the EAO concludes that Tilbury Phase 2 is not expected to result in residual adverse effects on Leq'á:mel's Indigenous health and well-being.

While the nation continues to experience extensive systemic challenges - including limited access to cultural sites and harvesting areas - these are primarily the result of historic and ongoing regional industrial development, and not directly attributable to Tilbury Phase 2.

Tilbury Phase 2 is situated in an already industrialized area with limited current access or use by Leq'á:mel members, and any additional demands on local services are expected to be negligible compared to existing pressures. Therefore, there is no characterization of effects or cumulative effects assessment undertaken for Indigenous health and well-being.

### 16.8.10 Positive Effects of Tilbury Phase 2

According to the Revised Application, Tilbury Phase 2 is expected to create job opportunities, particularly in construction, benefit Indigenous businesses through contracting and procurement, and potentially increase revenue for the Leq'á:mel government, while improving social and economic conditions and providing long-term skills training opportunities for Leq'á:mel members.

The positive effects of Tilbury Phase 2 depend on the level of participation and access Leq'á:mel members and businesses have to the opportunities generated, with direct positive effects on Leq'á:mel interests being limited compared to existing conditions.

For example, since Construction would have the greatest demand for skilled and semiskilled workers, Leq'á:mel members with a trades certificate and experience in the construction sector would be most likely to benefit from direct employment with Tilbury Phase 2. The potential positive effect on Leq'á:mel's employment and procurement opportunities depend on whether their members are directly or indirectly employed by Tilbury Phase 2 and whether their businesses can access contracting and procurement opportunities for Tilbury Phase 2.

### 16.8.11 Conclusions

Considering the above analyses, EAO's engagement with Leq'á:mel, their technical memo, the proponent's proposed mitigation measures, provincial conditions, and Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 is anticipated to have the following impacts on Leq'á:mel Indigenous interests:

- Negligible residual effects to harvesting and subsistence activities; and,
- Negligible residual effects to cultural use sites and areas.

Considering the above analysis the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on the Indigenous interests of Leq'á:mel has been adequately avoided, minimized or otherwise accommodated. Based on the engagement undertaken with Leq'á:mel on Tilbury Phase 2, as outlined above in Section 16.9.2, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with Leq'á:mel.

## 16.9 Lummi Nation

### 16.9.1 Community Profile

The Lummi Nation identifies as a self-governing nation in the U.S., the third largest tribe in Washington State, serving over 5,000 members. Also known as the *Lhaq'temish* people, Lummi Nation manages nearly 13,000 acres of tidelands on the Lummi Nation Reservation, which is situated to the west of Bellingham and to the south of Ferndale, Washington.

According to Lummi Nation, they were an independent and self-sufficient people for thousands of years. Their mission is to sustain that way of life.

### 16.9.2 EAO's consultation with Lummi Nation on Tilbury Phase 2

On January 31, 2024, Lummi Nation notified the EAO of their view that Tilbury Phase 2, along with three other projects in the Lower Mainland, have the potential to impact their asserted Section 35 rights. Lummi Nation requested to be a participating Indigenous nation on Tilbury Phase 2. The request was considered but in June 2024, the Province issued an order pursuant to the *Environment and Land Use Act* (ELUA Order) that set out Lummi Nation may not be a participating Indigenous nation, and Section 14 of the Act does not apply to them, in relation to the four projects in the Lower Mainland, including Tilbury Phase 2. The ELUA Order does not restrict the Province's ability to meet any constitutional obligations and the EAO is discharging any constitutional obligations owed to Lummi Nation on Tilbury Phase 2 in a manner consistent with *Haida Nation v. British Columbia* and *R v. Desautel*, and as laid out in a letter sent from EAO to Lummi Nation on [July 3, 2024](#). In addition to the consultation opportunities outlined in the July 3 letter, EAO also offered to meet with Lummi Nation to discuss the Project and its potential impacts on Lummi Nation's asserted Section 35 rights.

In a letter sent to Lummi Nation on [December 19, 2024](#), the EAO committed to continuing its previous engagement with Lummi Nation on potential transboundary impacts and consulting Lummi Nation in relation to potential impacts of the four specified EA projects, including Tilbury Phase 2, to Lummi Nation's asserted Section 35 rights. The EAO confirmed that the ELUA Order in no way restricts the EAO from consulting meaningfully and adequately despite this consultation being undertaken outside the participating Indigenous nation framework under the Act.

On March 5, 2025, the EAO met with Lummi Nation to discuss the Project and provide an overview of the assessment of Tilbury Phase 2. On [April 29, 2025](#), the EAO confirmed that it would be assessing the potential impacts to Lummi Nation and its asserted Section 35 rights during the Effects Assessment phase of the EA.

On May 5, 2025, the EAO amended the [Process Order](#) after sharing the amendment with Lummi Nation for review and comment, to reflect the CEO's [July 3, 2024](#), letter to Lummi Nation. Lummi Nation received funding from IAAC's public participation program to support its involvement in the Application Review and Effect Assessment Phases of the EA.

On April 18, 2026, Bill 15 - *Environmental Assessment Amendment Act, 2026* received Royal Assent. Bill 15 clarified that United States-based Indigenous nations are not eligible to participate in environmental assessments as participating Indigenous nations under the Act.

On July 23, 2026, Lummi Nation submitted a letter to EAO outlining concerns with the Assessment Report and referral materials. EAO reviewed the feedback, revised this section accordingly, and responded directly to Lummi Nation regarding their feedback.

The EAO used the following sources in drafting the assessment of Tilbury Phase 2 effects on Lummi Nation's asserted Section 35 rights:

- FortisBC's (Proponent) Revised Application;
- Information submitted during the EA;

- Conclusions from the EAO's assessment of VCs and other conclusions in this Report;
- Other sources of information publicly available and relevant to the EA of Tilbury Phase 2 or Lummi Nation, including information from other EAs along or near the Fraser River and Salish Sea; and
- Previous correspondence between Lummi Nation and the Province or Canada (including the EAO and IAAC).

To date, Lummi Nation has not provided feedback to the EAO on how Tilbury Phase 2 might impact Lummi Nation's asserted Section 35 rights nor have they provided information during the EA process on any current use by Lummi Nation members in the project area.

### 16.9.3 Assessment Boundaries

The spatial assessment boundaries for each Indigenous interest were identified based on the overlap of cultural use and occupancy area with the combined LAAs and combined RAAs identified for linked VCs. The LAA of each Indigenous interest consists of the combined LAAs of VCs that are linked to the Indigenous interest, whereas the RAA of each Indigenous interest consists of the combined RAAs of VCs that are linked to the Indigenous interest.

### 16.9.4 Regional Context

Lummi Nation is a signatory to the 1855 Treaty of Point Elliott with the U.S. Government. According to Lummi Nation, this treaty guarantees Lummi Nation's right to fish in their "usual and accustomed" fishing grounds, which comprise the fresh and salt waters of the Salish Sea. Canada is not a party to the 1855 Treaty.

Lummi Nation participated as an intervener before the Supreme Court of Canada in [R v Desautel](#). In its April 2021 decision, the Court concluded that groups whose members are neither citizens nor residents of Canada can be considered "Aboriginal peoples of Canada" and claim an Aboriginal right under Section 35 of the *Constitution Act, 1982*.<sup>23</sup> Lummi Nation asserts that it is an Aboriginal people of Canada within the meaning of Section 35.

In October 2021, Lummi Nation wrote to Canada and B.C. asserting Section 35 rights in Canada. Lummi Nation has stated that it intends to resume fishing, hunting, and gathering activities in the Canadian portion of the Salish Sea on the basis of the *Desautel* decision.<sup>24</sup>

### 16.9.5 Indigenous Interests

Based on EAO's analysis of the VCs ([Appendix 6](#)) and the information mentioned in Section 16.9 Lummi Nation, the following Lummi Nation Indigenous interests have been identified as having the potential to be affected by Tilbury Phase 2:

- Harvesting and subsistence activities; and
- Cultural use sites and areas.

The assessment of Lummi Nation's Indigenous interests in this section uses these categories. The EAO's assessment includes describing the Indigenous interest, the current context, potential effects, applicable mitigation, and the resulting effects analysis. If there is an adverse residual effect a characterization of effects and cumulative effects assessment is also completed. Indigenous governance systems and cultural continuation were not assessed as stand-alone interests, but were assessed as components of other Indigenous interests, with core analysis placed in the Cultural Use Sites and Areas Section.

### 16.9.6 Harvesting and Subsistence Activities

#### Background

In October 2021, Lummi Nation asserted to Canada and B.C. that it has both Treaty Rights and unextinguished Aboriginal rights, to among other things, hunt, fish, and gather throughout its traditional territory, which it asserted includes areas that are now part of Canada.

The Review Panel Report for Roberts Bank Terminal 2 (RBT2) located approximately 16 km southwest of Tilbury Phase 2, notes that Lummi Nation informed the Panel that it has treaty-protected fishing rights to fishing areas and resources, which rely substantially on the Fraser River sockeye run. Regarding fishing, Lummi Nation self-identifies as a *scha'enexw* (salmon) people who hold salmon to be sacred. Salmon forms the basis of its culture, traditional life ways and livelihoods.<sup>25</sup> In the RBT2 Consultation and Accommodation Report (CAR), Lummi Nation stated that it used to catch sockeye salmon in the area around Point Roberts, U.S., and Boundary Bay, Canada.

Lummi Nation also stated that reef net fishing was an important traditional method of fishing that Lummi Nation was trying to restore for its members, noting that there were traditionally reef net sites at Roberts Bank.<sup>26</sup> The RBT2 CAR identified other fish species of interest for Lummi Nation to include salmon (coho, steelhead, chum, pink, and Spring), clams, eulachon herring, and sturgeon. However, the RBT2 CAR stated that it was unclear to Canada where Lummi Nation harvested those species<sup>27</sup>.

Regarding hunting, the RBT2 CAR also identified species of interest for Lummi Nation to include sandpiper, geese, martens, and other birds. However, it also stated that it was unclear to Canada where Lummi Nation harvested those species.<sup>28</sup>

#### Current Context

It is the EAO's understanding that currently, Lummi Nation does not fish, hunt, or gather plants in the LAA for harvesting and subsistence activities for Tilbury Phase 2, although as stated above, Lummi Nation has stated that it intends to do so in the Canadian portion of the Salish Sea, following *Desautel*.

The Lower Fraser River supports key fish species such as Pacific salmon, eulachon, and sturgeon. The Lummi Nation identifies it as the main source of salmon entering the Salish Sea, which is central to their cultural and subsistence fishing<sup>29</sup>. Lummi Nation has raised concerns about habitat degradation at Roberts Bank caused by existing port infrastructure, particularly its impact on juvenile salmon. Due to declining salmon populations and conservation concerns, Lummi Nation members have not fished sockeye in the Salish Sea in recent years. They view further industrial development as a threat to fish habitat, salmon viability, and their ability to exercise fishing rights and maintain cultural traditions.<sup>30</sup>

Regarding plant gathering, the Project Footprint for Tilbury Phase 2 is not currently accessible for plant harvesting and will remain restricted and no changes to vegetation are expected outside of the Project Footprint.

### Potential Project Effects

The EAO has identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#) that may affect Lummi Nation harvesting rights and subsistence activities during the Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Changes to the experiences and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources, including:** potential changes in fish distribution and abundance in the LAA (from fish and fish habitat, surface water, and malfunctions and accidents VCs) may have transboundary effects on the amount of fish reaching Lummi Nation's territory in the U.S and could also influence fish availability in Canadian waters where Lummi may exercise fishing rights. However, Lummi Nation has not specified the locations within Canada where these asserted rights may be practiced. Sensory disturbances like noise, odour, dust, and visual landscape (acoustics, air quality, land and resource VCs) may further deter Lummi Nation members from accessing harvesting areas near Tilbury Phase 2;
- **Effects on Lummi Nation asserted rights to fish, harvest, and hunt for food, social, and ceremonial (FSC) purposes** from habitat loss (wildlife and wildlife habitat, fish and fish habitat, and vegetation VCs), increased mortality risks to fish, birds, and wildlife (wildlife and wildlife habitat VC), and changes in their behavior due to sensory disturbances (acoustics and air quality VCs). Additionally, contamination risks to fish habitat in Tilbury Slough (surface water VC) and Fraser River downstream, as well as contaminated soil (soil VC) could impact important plant species, may further impact traditional harvesting and cultural practices; and
- **Effects to the accessibility and availability of traditional lands and resources** may occur as a result of altered land or water based travel routes, access restrictions, or safety considerations, including changes to navigability and the usability of established travel corridors (land and resource use and surface water VCs), as well as indirect effects from sensory disturbances such as noise, dust, lighting, or visual changes that may discourage travel through otherwise accessible areas (air quality, acoustics, and land and resource use VCs).

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures that the Proponent has proposed in response to potential Tilbury Phase 2-related effects on harvesting and subsistence activities. A full table of Proponent mitigations can be found in [Appendix A](#) of the Revised Application. Below is a summary of mitigation measures, how they address effects on the relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air quality measures, such as idle reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Lummi Nation's harvesting and subsistence activities;
- **Acoustic (Section 7.3)** Noise reduction measures during Construction and Operation—such as idle reduction policies, equipment enclosures, and engineered noise controls—help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Lummi Nation's harvesting and subsistence activities;
- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on for harvesting and cultural practices;

- **Vegetation (Section 7.7)** Avoiding the Material Off-loading Facility, next to the Fraser River prevents disturbance to riparian areas and culturally important plant species relied on for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm sewer system. These protections support water quality and fish habitat relied on to support Lummi Nation's harvesting and subsistence activities;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing Construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to Lummi Nation's harvesting and subsistence activities;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the health and availability of salmon and other fish species central to Lummi Nation's harvesting or subsistence activities and culture practices; and
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used by Lummi Nation for harvesting or cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions which would help reduce potential impacts on Lummi Nation's harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting rights (see [Section 8](#) of this Report):

- **Condition 10 (Community Feedback Process)** creates a clear way for Lummi Nation to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of Lummi Nation's harvesting and subsistence activities;
- **Condition 12 (CEMP)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to Lummi Nation's harvesting and subsistence activities;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to Lummi Nation's harvesting and subsistence activities;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emissions control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support Lummi Nation's harvesting and subsistence activities; and
- **Condition 17 (Dry Street Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project-related roads, which may lower potential impacts on salmon and other fish important to Lummi Nation's harvesting and subsistence activities.

In addition to the Proponent's mitigations and the provincial conditions, the EAO identified the following KMMs and Follow-up Programs under the IAA that would mitigate potential effects to harvesting and subsistence activities:

- **Federal Consideration for Migratory Bird Protections;** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Lummi Nation harvesting practices and broader ecosystem conditions important to their way of life.

#### EAO's Analysis and Conclusions

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Lummi Nation's harvesting and subsistence activities:

- Changes to the experience and preferences around the practice of asserted harvesting rights;
- Effects on Lummi Nation's asserted rights to fish, harvest, and hunt for food, social, and ceremonial (FSC) purposes; and
- Effects to the accessibility and availability of traditional lands and resources.

The EAO's characterization of the residual effects of Tilbury Phase 2 on harvesting and subsistence activities are summarized in the table below.

Table 30: Summary of residual effect and rationale on Lummi Nation and its harvesting and subsistence activities.

| Residual Effect                                                                                                                                                                                                                                                                                                        | Assessment Rating*                                                                                                                                                                                                                          | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Harvesting and subsistence activities<br>- Changes to the experience and preferences around the practice of asserted harvesting rights<br>- Effects on Lummi Nation's asserted rights to fish, harvest and hunt for FSC purposes<br>- Effects to the accessibility and availability of traditional lands and resources | Context (resilience): Medium<br>Magnitude: Negligible<br>Extent: Local<br>Duration: Medium-term<br>Frequency: Continuous<br>Reversibility: Fully reversible<br>Affected Populations: Disproportionate<br>Risk: Low<br>Uncertainty: Moderate | <p><b>Context:</b> Lummi Nation's Indigenous interests are considered to have medium resilience to current fishing-related stresses. Residual effects, including sensory disturbance (land and resources, culture VCs), are unlikely to affect their asserted harvesting areas.</p> <p><b>Magnitude:</b> The magnitude of impact on harvesting and subsistence activities is rated as negligible. Impacts to fishing rights are also rated negligible due to negligible magnitude residual effects on relevant VCs (surface water, fish and fish habitat), negligible to low magnitude impact to vegetation and wildlife and wildlife habitat VCs, negligible to low impacts to culture and land and resource use VCs, and uncertainty around Lummi Nation harvesting in areas that could be directly or indirectly affected by the Project.</p> <p><b>Extent:</b> Rated as local since the spatial scale of residual effects to applicable VC's is limited.</p> <p><b>Duration:</b> The effects on harvesting and subsistence activities will persist for as long as the Tilbury Phase 2 facility remains operational, making them medium-term.</p> <p><b>Frequency:</b> Rated as continuous as effects would be most prominent during Construction, but some effects (noise, light disturbance) would occur continuously.</p> <p><b>Reversibility:</b> Most effects, particularly those related to sensory disturbances such as noise and light, would cease if Tilbury Phase 2 were halted or upon decommissioning, making them fully reversible.</p> <p><b>Affected Populations:</b> Tilbury Phase 2's impacts would primarily affect Lummi Nation members who actively harvest in the LAA, though indirect effects may also be felt by those who refrain from harvesting due to perceived environmental degradation in the highly developed area.</p> <p><b>Risk (likelihood and consequences):</b> The likelihood of these effects is low, given the effectiveness of mitigation measures. With negligible magnitude and local extent, consequences are expected to be minor, resulting in a low-risk rating.</p> <p><b>Uncertainty:</b> Uncertainty is rated as moderate due to the uncertainty regarding Lummi Nation's current harvesting practices in the area and low confidence in historic or future use that could be directly or indirectly affected by the Project.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a>                                                                                                                                                                                      |                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Cumulative Effects

As described in the Background and Current Context section, the Lower Fraser River and Tilbury Island areas have undergone longstanding industrial development, as well as impacts due to climate change, resulting in existing pressures on environmental conditions and on Lummi's harvesting and subsistence activities.

The Revised Application identifies several reasonably foreseeable projects that may affect Lummi's harvesting and subsistence interests. These include T1B, which would increase LNG production, and TMJ, which would introduce additional vessel traffic in the Fraser River and further development of the foreshore area. Both T1B and TMJ could contribute additional sensory disturbances (noise, light, vibration) and impact air quality in areas used by Lummi for harvesting. TMJ could further alter fish habitat and water quality in areas where Lummi assert harvesting and subsistence rights. The EAO also notes that the province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the Project-specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, FortisBC's proposed mitigation measures, EAO's Table of Conditions and KMMs, the EAO concludes that Tilbury Phase 2 would have negligible effects on Lummi's harvesting and substance activities.

## 16.9.7 Cultural Use Sites and Areas

### Background

According to Lummi Nation, the Salish Sea and affiliated landscapes contain hundreds of Lummi Nation archaeological sites registered with Washington State Historic Preservation Office as well as other tangible and intangible traditional cultural properties.<sup>31</sup> In Lummi Nation's view, the Salish Sea has an association with the culture, traditions, and history of the Lummi Nation people. The archaeological sites registered with Washington State are south of the Canada-U.S. border, and thus outside the LAA for archaeological and heritage resources for Tilbury Phase 2.

### Existing Conditions

On other EA projects in the Lower Mainland, Lummi Nation raised concerns about vessel traffic affecting cultural sites and areas. To date, Lummi Nation has not shared vessel traffic concerns specific to Tilbury Phase 2 and the EAO is not aware of any Lummi cultural use sites that interact with any VCs related to Tilbury Phase 2.

### Potential Project Effects

The EAO has identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#), that may affect Lummi Nation's cultural use sites and areas during the Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Effects to cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance;** The Project could affect cultural use sites and areas through Construction activities that disturb culturally significant places, such as archaeological sites, due to ground disturbance, accidental spills of deleterious substances, or other construction-related interactions (culture, soil, and archaeological and heritage resources VCs);

---

<sup>31</sup>Lummi Indian Business Council letter to Review Panel Secretariat, Roberts Bank Terminal 2 Project. 2019. <https://iaac-geic.gc.ca/050/documents/p80054/129457E.pdf>

- **Loss of access to and disenfranchisement from cultural sites;** Lummi Nation harvesters could experience direct adverse effects to cultural and spiritual practices if access to cultural sites is altered or lost due to closure or modification of trails, parking areas, or access points between the Project site and the Fraser River for safety or construction purposes (land and resource use VC). Changes in sensory effects (acoustic, air quality, culture, land and resource use VC) could change the experience of Lummi Nation members using cultural sites such as a historic fishing village, harvesting areas along the South Arm of the Fraser River and Burns Bog; and
- **Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas;** Access to cultural sites could be affected (land and resource use VC) by the Project. Adverse effects to culture (culture VC), which are connected to potential effects on wildlife, habitat, and vegetation (see Harvesting and Subsistence section above) could influence the ability or desire to access these sites.

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that FortisBC has proposed in response to potential Tilbury Phase 2 related effects on Lummi Nation's cultural use sites and areas. These include the following:

- **Air Quality (Section 7.2)** The air quality measures—such as idle reduction, dust control, electrification, equipment maintenance, and emissions controls—limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support cultural activities;
- **Acoustic (Section 7.3)** Noise reduction measures during Construction and Operation—such as idle reduction policies, equipment enclosures, and engineered noise controls—help limit disturbance to culturally important areas. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of cultural knowledge by Lummi Nation;
- **Soil (Section 7.6)** Soil management measures, including erosion control, spill prevention protocols, and careful handling and disposal of contaminated soils, help prevent the migration of pollutants into nearby cultural areas and waterways. Maintaining soil stability and quality supports the protection of culturally important places and landscapes used by Lummi Nation;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm sewer system. These protections support water quality and fish habitat relied on to support Lummi Nation's harvesting and subsistence activities;
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used by Lummi Nation for harvesting or cultural practices;
- **Infrastructure and Services (Section 7.12)** Measures to manage traffic, workforce accommodation, emergency response, and waste help prevent indirect pressures on local lands, waters, and community services, reducing the risk of additional strain on the ecosystems and access conditions that support harvesting and cultural practices;
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures and early notification to Indigenous nations, help protect culturally important sites and landscapes that support broader connection to territory and the continuity of cultural practices; and

- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support Lummi Nation's land- and water-based cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on Lummi Nation's cultural use sites and areas:

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance.
- **Condition 10 (Community Feedback Process)** establishes a clear and structured mechanism for Lummi Nation to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of culturally important landscapes and areas, supporting Lummi Nation's continued access to and use of cultural sites during Project Construction;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, lighting, wildlife interactions, and spills during project Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by Lummi Nation;
- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emissions control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites by Lummi Nation; and
- **Condition 15 (Chance Find Protocol)** requires the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If Lummi Nation historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

#### The EAO's Analysis and Conclusions

After considering the EAO's conclusions on the linked VCs, potential effects, and proposed mitigation measures, the EAO concludes that Tilbury Phase 2 is not expected to result in residual adverse effects on Lummi Nation's cultural use sites and areas interest.

In relation to fishing as a cultural use, no residual effects to the fish and fish habitat VC were identified after mitigation measures were applied. Potential project residual effects to land and resource use and culture VCs were considered negligible to low in magnitude and limited in geographic extent.

The EAO is not aware of any Lummi Nation cultural use sites that interact with any VCs related to Tilbury Phase 2. Additionally, the EAO is not aware of any archaeological or heritage resources associated with Lummi Nation in the LAA.

The EAO's conclusion of a negligible effect on Lummi Nation's harvesting and subsistence activities in the previous section, as well as lack of connection between harvesting and cultural use sites and areas, supports the EAO's conclusion of no residual effect on Lummi Nation's cultural use sites and areas of interest and therefore, no characterization of residual effects or cumulative effects assessment was undertaken.

#### 16.9.8 Conclusions

Considering the above analyses, the EAO's and IAAC's engagement with Lummi Nation, the mitigation measures, the EAO's recommended Table of Conditions, and the Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 is anticipated to have the following impacts on Lummi Nation's Indigenous interests:

- Negligible residual effect to harvesting and subsistence activities.

Considering the above analyses the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on Lummi Nation's Interests has been adequately avoided, minimized or otherwise accommodated. Based on the engagement undertaken with Lummi Nation on Tilbury Phase 2, as outlined above in Section 16.9.2, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with Lummi Nation.

## 16.10 Matsqui First Nation

### 16.10.1 Community Profile

Màthexwi First Nation (Matsqui) is a Stó:lō community located in the central Fraser valley and member of the Sto:lo Nation Tribal Council. The core traditional territory of Matsqui stretches along the Fraser River from Crescent Island to Sumas Mountain, and southward beyond the Canada-United States border. Matsqui has five reserves: Pekw'xe:yles (Peckquaylis), Matsqui 4, Matsqui Main 2, Sahhacum 1, and Three Island 3. Matsqui has a registered population at this time of 289, with 115 members living on reserve.

Matsqui is also a member of the Stó:lō Nation, negotiating land and resources agreements outside the B.C. treaty process. Matsqui has, along with Leq'á:mel First Nation, a Strategic Engagement Agreement in place with the province (currently extended to September 30, 2027), which sets out the consultation process for activities under the *Forest Act*, *Forest and Range Practices Act*, and *Water Sustainability Act*.

### 16.10.2 Matsqui Involvement in the Environmental Assessment

During the Early Engagement Phase, Matsqui did not identify as a participating Indigenous nation.

The EAO and the IAAC provided funding to support Matsqui's engagement in the environmental assessment process. They provided documents, project updates, the Initial Draft Project Description and DPD, and Process Planning documents for review. During the Process Planning phase, it was agreed that the EAO would conduct an assessment of Tilbury Phase 2 effects on Matsqui's Indigenous interests, as identified in Section 4 of the Assessment Plan.

### 16.10.3 Assessment Boundaries

Matsqui is a party to the Stó:lō Nation protective *Writ of Summons*, which was filed in the B.C. Supreme Court on December 9, 2003, asserting Aboriginal title to a territory identified in the *writ*. The Stó:lō Nation assert collective Aboriginal title and rights to the lands encompassed by their member nations and bands – from the mouth of the Fraser River to the Lower Fraser Canyon, the asserted territory extends from the U.S. border in the south, to Garibaldi Provincial Park in the north, and from the City of Vancouver in the west, to just past the community of Hope in the east. All Tilbury Phase 2 components are within the Stó:lō Nation's asserted territory.

The spatial assessment boundaries for each Indigenous interest were identified based on overlap of Matsqui's territory with the combined Local Area of Assessment and the combined Regional Area of Assessment identified for linked VCs, see Stó:lō Nation's section in the Revised Application ([Figure 11.17-1a](#)). The LAA of each Indigenous interest consists of the combined LAAs of VCs that are linked to the Indigenous interest, whereas the RAA of each Indigenous interest consists of the combined RAAs of VCs that are linked to the Indigenous interest.

### 16.10.4 Regional Context

Tilbury Phase 2, including the LAA and RAA, are situated within a region deeply tied to the cultural, historical, and economic activities of Stó:lō Nations. The word "Stó:lō" is Halqemeylem for "river", so the Stó:lō are the river people. For upper Stó:lō communities, which includes Matsqui, salmon fishing is core to their culture and contributed the greatest amount of food, especially dried salmon that was stored over the winter months. Today members of the Stó:lō Nation's communities currently practice traditional travel (canoeing) in ceremonial and spiritual practices for fishing, hunting, trapping and plant gathering as well as for wind drying activities.

The existing Tilbury LNG facility consists of gravel and paved areas, existing infrastructure, and equipment laydown areas supporting little plant life with very little to no habitat value for wildlife. The vegetation within Tilbury Phase 2 is mostly limited to ditch lines and spoil piles and is dominated by non-native and invasive plant species. Public access to Tilbury Phase 2 is limited, although there is currently public use of the dike to the north of Tilbury Phase 2 along the Fraser River.

### 16.10.5 Indigenous Interests

The EAO engaged Matsqui during the Early Engagement phase in the development of the [Joint Summary of Issue and Engagement for the Tilbury Phase 2 LNG Expansion Project](#), however, they did not provide comment at that time.

During the Readiness Decision phase in the development of the [Readiness Decision Report](#), EAO attempted to engage with Matsqui to understand their primary concerns regarding Tilbury Phase 2, however, the EAO did not receive any input.

The EAO did not receive any input from Matsqui during the Application Development and Review phase, and therefore relied on the Indigenous interests listed on [Tilbury Phase 2- Schedule C – Application Information Requirements](#) Table 6; see Proposed Preliminary List of Indigenous interests.

FortisBC (Proponent) identified Matsqui's Indigenous interests to be assessed in the Revised Application through:

- Reviewing requirements and guidance from the EAO and AIR; and
- Conducting engagement efforts with Matsqui to gather information on their Indigenous interests, as outlined in Section 11.17.3 Summary of Engagement of the Matsqui section in the of the Revised Application.

The EAO engaged with Matsqui during the development of this Report and to gain input on the proposed Indigenous interests, however the nation did not provide any comments. The EAO, therefore relied on the list of Indigenous interests identified in the AIR. These include:

- Harvesting and subsistence activities;
- Cultural use sites and areas;
- Social and economic conditions; and
- Indigenous health and well-being.

The assessment of Matsqui's Indigenous interests in this section uses these categories. The EAO's assessment includes describing the Indigenous interest, the current context, potential effects, applicable mitigation, and the resulting effects analysis. If there is an adverse residual effect a characterization of effects and cumulative effects assessment is also completed.

### 16.10.6 Harvesting and Subsistence Activities

#### Background

Historically, Matsqui relied on the Fraser River and its tributaries for fishing, particularly salmon, which remains central to their social, ceremonial, and economic life. Oral histories emphasize salmon as descendants of ancestral beings, reinforcing its cultural importance. The Matsqui prairie was rich in food sources, including medicinal plants and berries such as huckleberries, cow parsnip, and skunk cabbage. Hunting of deer, waterfowl, and other species, as well as plant gathering for food and medicine, were integral to subsistence and cultural practices. These activities were guided by traditional knowledge systems and seasonal rounds, and stewardship responsibilities were passed through generations. Stó:lō territory was made up of four separate "food processing" zones, each with distinct biological and geographical characteristics, and traditionally Stó:lō would have used the area of the lower Fraser River for a variety of harvesting subsistence or cultural purposes, including fishing, hunting, plant gathering, ceremonial activities, or habitation.

#### Existing Conditions

Matsqui members continue to value harvesting and subsistence activities for food security, cultural continuity, and community well-being, though these practices have been constrained by cumulative effects of colonization, industrial development, and land fragmentation.

Fishing for Food, Social, and Ceremonial (FSC) purposes occurs primarily in areas between Mission and the confluence of the Fraser River with Sawmill Creek, well upstream of the Tilbury Phase 2. There is no evidence of current fishing, hunting, or plant gathering by Matsqui near the south arm of the Fraser River adjacent to Tilbury Island, which is heavily industrialized and inaccessible. Regulatory restrictions, habitat degradation, and urbanization have reduced opportunities for traditional harvesting within Matsqui territory. Despite these challenges, salmon and other resources remain culturally important, and the nation seeks to uphold its constitutionally protected rights and responsibilities related to land and resource stewardship.

#### Potential Project Effects

The EAO identified the following pathway of effects, prior to the application of mitigation measures, along with associated VCs outlined in [Appendix 6](#), that may affect Matsqui's harvesting rights during Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- **Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources** from increased noise, light, and air pollution (acoustics, air quality, soil, groundwater, land and resource use VCs) may deter Matsqui members from accessing preferred harvesting areas near Tilbury Phase 2. Changes in fish distribution and abundance (fish and fish habitat VC) and the introduction of invasive plant species (vegetation VC) may further reduce the experience and preference of the practicing of harvesting rights; and
- **Effects to Matsqui Rights to fish, harvest, and hunt for food, social and ceremonial (FSC) purposes** from habitat loss (wildlife, fish and fish habitat, vegetation VCs), increased mortality risks to fish, birds, and wildlife (wildlife and wildlife habitat VCs), and changes in their behaviour due to sensory disturbances (acoustics, air quality VCs). Additionally, contamination risks to fish habitat in Tilbury Slough (surface water VC) and Fraser River downstream, as well as contaminated soil (soil VC) could impact important plant species, that may further impact traditional harvesting and cultural practices closer to Matsqui core territory.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on harvesting and subsistence practices, as mentioned in the section above. A full table of Proponent mitigations can be found in [Appendix A](#) of the Revised Application. Below is a summary of Key Mitigation Measures, how they address effects on the relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air-quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Matsqui's harvesting rights and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during Construction and Operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Matsqui's harvesting and cultural practices;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm sewer system. These protections support water quality and fish habitat relied on to support Matsqui's harvesting and cultural practices;
- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting

soil and runoff quality supports the health of fish habitat and vegetation relied on by Matsqui for harvesting and cultural practices;

- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by Matsqui for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to Matsqui's harvesting and cultural practices;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the health and availability of salmon and other fish species central to Matsqui's FSC harvesting and cultural practices;
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used for harvesting or cultural practices; and,
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat and vegetation important to Matsqui's harvesting and cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions to help reduce potential impacts on Matsqui's harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting rights (see [Section 8](#) of this Report):

- **Condition 10 (Community Feedback Process)** creates a clear way for Matsqui to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of Matsqui's harvesting and cultural practices;
- **Condition 12 (CEMP)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to Matsqui's harvesting and cultural practices;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to Matsqui's harvesting and cultural practices;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emissions-control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support Matsqui's harvesting and cultural practices; and
- **Condition 17 (Dry Street Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project-related roads, which may lower potential impacts on salmon and other fish important to Matsqui's harvesting rights and cultural practices.

In addition to the Proponent's mitigations and the provincial conditions the EAO identified the following Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to harvesting and subsistence activities:

- **Federal Consideration for Migratory Bird Protections:** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Matsqui's harvesting practices and broader ecosystem conditions important to their way of life.

#### The EAO's Analysis and Conclusions

After consideration of the proposed mitigation measures and potential effects, described above, the EAO identified the following residual effects:

- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources;
- Effects to Matsqui's asserted Aboriginal rights to fish for FSC purposes; and
- Effects on the accessibility and availability of traditional lands and resources.

Table 31: Summary of residual effects and rationale on Matsqui and its harvesting and subsistence activities.

| Residual Effects                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Assessment Rating*                                                                                                                                                                                                                                                              | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Harvesting and subsistence activities</p> <ul style="list-style-type: none"> <li>- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources</li> <li>- Effects to Matsqui asserted Aboriginal rights to fish for FSC purposes closer to their core territory</li> <li>- Effects on the accessibility and availability of traditional lands and resources for plant gathering</li> </ul> | <p>Context (resilience): Low</p> <p>Magnitude: Negligible</p> <p>Extent: Local</p> <p>Duration: Medium-term</p> <p>Reversibility: Fully reversible</p> <p>Frequency: Continuous</p> <p>Affected Populations: Disproportionate</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><b>Context:</b> Rated as having a low resiliency. Industrial development has already affected harvesting and subsistence activities, and some harvested species are of conservation concern.</p> <p><b>Magnitude:</b> The magnitude is rated as negligible, based on the negligible residual effects on fish and fish habitat and surface water VCs. Other key potential residual effects are rated as negligible to low in magnitude.</p> <p><b>Extent:</b> Rated as local, since the spatial scale of residual effects to applicable VC's is limited, the impact on harvesting is expected to remain local, primarily within the immediate Tilbury Phase 2 area. Matsqui views the extent as regional, due to their view that an increased storage capacity from Tilbury Phase 2 will link with Tilbury Marine Jetty (TMJ) and increase vessel traffic on the Stó:lō, and impact fish and aquatic species.</p> <p><b>Duration:</b> The effects on harvesting will persist for as long as the Tilbury Phase 2 facility remains operational, making them medium-term.</p> <p><b>Reversibility:</b> Most effects, particularly those related to sensory disturbances such as noise and light, would cease if Tilbury Phase 2 were halted or upon Decommissioning, making them fully reversible.</p> <p><b>Frequency:</b> Rated as continuous as effects would be most prominent during Construction, but some effects (noise, light disturbance, changes to experiences and preferences) would occur continuously.</p> <p><b>Affected Populations:</b> Tilbury Phase 2's impacts will primarily affect Matsqui members who actively participate in harvesting. However, there may be indirect effects on those who choose not to harvest due to negative perceptions of environmental</p> |

|                                                                                                                                          |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                          |  | <p>degradation in a highly developed area. These effects are considered disproportionate.</p> <p><b>Risk:</b> The likelihood of these effects occurring is low due to the effectiveness of mitigation measures, and due to their negligible magnitude and limited extent, the consequences are expected to be minor, resulting in an overall risk rating of low.</p> <p><b>Uncertainty:</b> The pathways of effects—such as noise, light, vibration, and impacts on harvesters—are well understood. While mitigation measures are expected to be moderately to highly effective, some uncertainty remains regarding their effectiveness in fully addressing harvesters' experiences and perceptions. As a result, the level of uncertainty is rated as moderate.</p> |
| <p>* Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a></p> |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Cumulative Effects

Matsqui's harvesting and subsistence activities have already been affected by historical environmental degradation (see Current Context section). The Revised Application identifies two foreseeable projects, T1B and TMJ, that are expected to add shipping to the Stó:lō and further alter the Tilbury Island foreshore prior to Construction of Tilbury Phase 2. These developments may introduce additional sensory disturbances (noise, light, vibration), degrade habitat and water quality, and impact culturally important plant, fish and wildlife resources.

Matsqui has raised concerns about noise pollution from Construction negatively impacting fish navigation in the South Arm of the Fraser River. The T1B Project will remove vegetation from the existing facility site, potentially impacting plant resources that Matsqui members may harvest now or in the future. The TMJ Project's shipping activities in the Fraser River could also contribute to noise and disturbance in the aquatic environment, potentially affecting fish and marine mammals. In Matsqui's view, Tilbury Phase 2 and TMJ are linked in that an increased storage capacity from Tilbury Phase 2 will affect TMJ and increase vessel traffic thereby effecting Matsqui's access to culturally important fish species for harvesting.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the Lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, including FortisBC's mitigation measures, EAO's Table of Conditions and KMMs, the EAO concludes that Tilbury Phase 2 would have a negligible effect on Matsqui's harvesting and substance activities.

## 16.10.7 Cultural Use Sites and Areas

### Background

Matsqui First Nation has deep historical and spiritual connections to the Fraser River and surrounding lands. The Fraser River is central to Matsqui identity, oral traditions, and ceremonial life, with many spiritual sites linked to back-eddies, pools, rocks, and sloughs along its course. Historically, the Matsqui prairie was abundant in culturally important plants and resources, reflected in place names such as Mómeqwem (medicinal tea leaves) and Xoxá:q'wem (cow parsnip stems). Longhouses and communal spaces near the Fraser River served as hubs for ceremonies, governance, and cultural transmission.

These sites were integral to maintaining kinship networks, spiritual practices, and stewardship responsibilities.

#### Current Context

Matsqui continues to value cultural sites and areas as essential for identity, language, and intergenerational knowledge transfer. However, cumulative effects of colonization, land alienation, and industrial development have fragmented access to traditional cultural landscapes. The south arm of the Fraser River near Tilbury Island, where Tilbury Phase 2 is located, is heavily industrialized and not identified as an area currently used by Matsqui for cultural purposes. No cultural sites have been documented within or adjacent to Tilbury Phase 2, and public access is restricted. Despite these constraints, Matsqui maintains aspirations to protect and revitalize cultural practices tied to the Fraser River and its tributaries, emphasizing stewardship and cultural continuity in land use planning and governance.

As mentioned in the Harvesting and Subsistence Activities, Section 16.10.6 above, past activities have had adverse effects on cultural use. In addition, the Revised Application identified a decline in access to cultural use areas for Stó:lō Nations due to railway developments and expansions.

#### Potential Project Effects

The EAO identified the following pathway of effects, prior to the application of mitigation measures, along with associated VCs outlined in [Appendix 6](#), that may affect Matsqui's cultural use sites and areas during Construction, Operation and Decommissioning phases of the Tilbury Phase 2:

- **Effects to cultural heritage and structures, sites, or things historical, archeological, paleontological, or architectural significance:** While Tilbury Phase 2 is private property and not currently accessible for activities like plant harvesting and will remain restricted, Matsqui would like to use areas adjacent to Tilbury Phase 2 and could use the Tilbury Phase 2 site if they had the opportunity. While sensory disturbances (acoustic, air quality, culture, and land and resource use VCs) are predicted to have low magnitude impacts compared to existing industrial conditions, they do have the potential to alter the experience of Matsqui members using cultural sites in the vicinity;
- **Loss of access to and disenfranchisement from cultural sites:** Matsqui harvesters could experience direct adverse effects to cultural and spiritual practices if access to cultural sites is altered or lost due to closure or modification of trails, parking areas, or access points between Tilbury Phase 2 and the Fraser River for safety or construction purposes (land and resource use VC). Changes in sensory effects (acoustic, air quality, culture, and land and resource use VCs) could change the experience of Matsqui members using cultural sites, such as harvesting areas along the south arm of the Fraser River; and
- **Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas:** Access to cultural sites could be affected (soil, land and resource use, and archaeological and heritage resources VCs) by Tilbury Phase 2. Adverse effects to culture (culture VC) which are connected to potential effects on wildlife, habitat, and vegetation (See Harvesting and Subsistence section above) could influence the ability or desire to access these sites.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed to potential Tilbury Phase 2 related effects on cultural use sites and areas. These include the following:

- **Land and Resource Use (Section 7.11)** Traffic-management planning, noise and lighting controls, and communication regarding project activities help reduce disruptions to access and use of culturally important areas. These measures support Matsqui's ability to safely access and continue cultural practices within their traditional territory;

- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support Matsqui's ability to access, use, and maintain culturally important areas, including places of teaching, ceremony, and connection to land and water;
- **Soil (Section 7.6)** Soil-management measures, including erosion control, spill-prevention protocols, and careful handling and disposal of contaminated soils, help prevent the migration of pollutants into nearby cultural areas and waterways. Maintaining soil stability and quality supports the protection of culturally important places and landscapes used by Matsqui;
- **Acoustics (Section 7.3)** Noise-reduction measures during construction and operation, including idle-reduction policies, equipment muffling, enclosures, and engineered noise controls, help limit disturbance to culturally important areas and activities. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of cultural knowledge by Matsqui;
- **Air Quality (Section 7.2)** The air-quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Matsqui's harvesting rights and cultural practices; and
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures, site protection, and early notification to Indigenous nations, help protect culturally important sites, features, and landscapes. These measures support Matsqui's ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connections to territory.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects to Indigenous cultural use sites and areas (see [Section 8](#) of this Report):

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance.
- **Condition 10 (Community Feedback Process)** establishes a clear and structured mechanism for Matsqui to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of culturally important landscapes and areas, supporting Matsqui's continued access to and use of cultural sites during project Construction;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, lighting, wildlife interactions, and spills during project Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by Matsqui;

- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emissions-control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites by Matsqui; and
- **Condition 15 (Chance Find Protocol)** requires the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If Matsqui historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

#### The EAO's Analysis and Conclusions

After consideration of the mitigation measures and potential effects, described above, the EAO concludes that Tilbury Phase 2 is not expected to result in residual adverse effects on Matsqui's cultural use sites and areas. The primary reasoning behind this conclusion is because Matsqui has not identified any cultural use sites or areas within or adjacent to Tilbury Phase 2 or within the LAA. Archaeological assessments conducted in 2013 and 2020 did not record cultural heritage resources in the area surrounding Tilbury Phase 2, and in the Revised Application there is no information indicating current cultural use by Matsqui. As no residual effects were identified, no characterization of effects or cumulative effects assessment was undertaken.

#### 16.10.8 Social and Economic Conditions and Indigenous Health and Well-Being

##### Background

Matsqui's social and economic systems were rooted in kinship networks, seasonal harvesting, and stewardship of land and water resources. Community well-being was supported through traditional practices such as fishing, hunting, and plant gathering, which provided food security and reinforced cultural identity. These practices were interconnected with governance, education, and health systems that emphasized holistic well-being, mental, emotional, physical, and spiritual health.

##### Current Context

Matsqui faces socio-economic challenges shaped by colonial policies and cumulative effects of land dispossession and industrial development. According to census data, Matsqui has a registered population of 289, with approximately 39% living on reserve. Employment rates remain lower than provincial averages, with a 2016 employment rate of 23.1% and higher unemployment among women (22.2%) compared to men (0%). Education levels show progress at the high school level (47.4% attainment) but limited postsecondary completion, reflecting systemic barriers.

Housing is limited, with 40 dwellings on Matsqui Main 2 reserve, and lone-parent households are present. Community infrastructure includes a health and community center in Abbotsford, but access to specialized health services depends on regional providers such as Fraser Health Authority and the First Nations Health Authority. Health disparities persist, including higher rates of chronic illness and socio-economic stressors, though initiatives through Indigenous health governance aim to improve culturally safe care.

Despite these challenges, Matsqui continues to prioritize cultural continuity and community well-being through education programs, environmental stewardship, and participation in regional health and emergency planning. Economic development opportunities, such as leasing land for a mobile home park and forestry agreements, provide some revenue, but broader aspirations for social and economic equity remain constrained by historical and ongoing structural barriers.

## Potential Project Effects

The EAO identified the following pathway of effects, prior to the application of mitigation measures, along with associated VCs in [Appendix 6](#) that may affect Matsqui's social and economic conditions and Indigenous health and well-being during Construction, Operation, and Decommissioning:

- **Social and Economic Conditions:**
  - **Effects on infrastructure and services:** Tilbury Phase 2 may add pressure on services if out-of-region workers are used, but according to the Revised Application effects are expected to be limited and not distinguishable from existing conditions (infrastructure services VC);
  - **Effects to Matsqui's employment opportunities, Indigenous businesses, procurement opportunities, and Matsqui revenue:** Tilbury Phase 2 could positively affect Matsqui's employment and procurement opportunities, depending on member participation and access to contracts (employment and economy VC). While there may be more opportunities especially during construction, smaller Indigenous businesses, including those linked to Matsqui, may face challenges competing for workers or meeting Tilbury Phase 2 demands;
  - **Effects to Matsqui's ability to improve social and economic conditions:** Tilbury Phase 2 may support Matsqui's ability to improve social and economic conditions by creating employment, training, and business opportunities (employment and economy, culture, fish and fish habitat, and wildlife and wildlife habitat VCs); and
  - **Effects to Matsqui's commercial and non-commercial fishing, gathering, and cultural or ceremonial activities and practices:** Tilbury Phase 2 could potentially disrupt economies that shape relationships between Indigenous communities on the Fraser River and that are central to Matsqui's identity (fish and fish habitat, wildlife and wildlife habitat, employment and economy, and culture VCs).
- **Indigenous Health and Well-being:**
  - **Effects on the quality, quantity, and availability of harvested country foods:** Land, water or air-based contamination from Tilbury Phase 2 could adversely affect country foods such as fish and traditional plants. See above Harvesting and Subsistence Activities, Section 16.10.8;
  - **Effects on the value and perceived quality of country foods:** Quality, quantity, or availability of plants or wildlife could be impacted from Tilbury Phase 2. Country foods could become contaminated (see list of potential project effects above). Community perceptions with respect to the quality of country foods have the potential to interact with Matsqui members participation in harvesting and subsistence activities and cultural and spiritual practices in the absence of adverse effects (land and resource use, and culture VCs);
  - **Effects on air quality, noise and water quality:** Tilbury Phase 2 activities have the potential to contribute contaminants of concern to air and water, and increased noise levels in proximity to the facility property line (air quality, acoustics, surface water, land and resource use, and human health VCs); and,
  - **Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites:** Tilbury Phase 2 may interact with Matsqui's health and well-being through changes to traditional practices, access to cultural sites, and socio-economic factors. Positive effects may include increased income and employment opportunities for members, while potential adverse effects relate to shift work and family stress.

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on social and economic conditions and Indigenous health and well-being.

These include the following:

- **Land and Resource Use VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting Matsqui's on-going stewardship of land and water resources and reducing stressors that can affect well-being;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for Matsqui members and businesses to participate economically in the project, supporting improved social conditions and community well-being;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socio-economic impacts on Matsqui and supporting health and community stability;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports Matsqui's food security, cultural identity, and health by safeguarding salmon and other species essential to FSC harvesting;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting Matsqui's cultural continuity;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to Matsqui's physical health and cultural practices;
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Matsqui's well-being;
- **Air Quality (Section 7.2)** Air emission controls help protect respiratory health and prevent contamination of country foods, supporting Matsqui's physical well-being and confidence in harvesting;
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect Matsqui members' physical, cultural, and mental health;
- **Acoustics (Section 7.3)** Noise reduction measures limit sensory disturbance to people, wildlife, and harvesting areas, reducing stress and supporting Matsqui's comfort, well-being, and connection to land and water;
- **Surface Water (Section 7.4)** Managing runoff, erosion, and sediment helps maintain water quality in the lower Fraser, supporting Matsqui's cultural and nutritional reliance on healthy salmon and aquatic ecosystems; and,
- **Groundwater (Section 7.5)** Protecting groundwater from contamination helps maintain the quality of ecosystems that support fish, plants, and wildlife relied on for Matsqui's subsistence and health.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects to social and economic conditions and Indigenous health and well-being:

- **Condition 10 (Community Feedback Process)** provides Matsqui with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting Indigenous health and well-being;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)** require ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with Matsqui First Nation to be developed by the Holder in consultation with the Nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting Matsqui's physical health and overall well-being;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If Matsqui historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated cultural or emotional harm, supporting Indigenous health and well-being;
- **Condition 16 (Indigenous and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support socio-economic well-being;
- **Condition 17 (Dry Street Sweeping Report)** requires FortisBC to submit a Report on the effectiveness Dry Street Sweeping to mitigate the effects of 6-PPDQ on fish within eighteen months of a Certificate being issued. By informing measures to protect downstream aquatic environments, this condition supports Matsqui's health and well-being by helping maintain confidence in environmental quality and minimizing potential concerns related to contamination of culturally important fish and waterways.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Well-being:

- **Accidents and Malfunctions Reporting** would support mitigation of potential impacts on the Nation's interests by ensuring timely responses, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

#### The EAO's Analysis and Conclusions

After consideration of the EAO's conclusions on the linked VCs, potential effects, proposed mitigation measures and conditions, the EAO concludes that Tilbury Phase 2 is not expected to result in residual adverse effects on Matsqui's social and economic conditions or Indigenous health and well-being.

While the nation continues to experience extensive systemic challenges - including limited access to housing, employment, and culturally important lands - these are primarily the result of historic and ongoing regional industrial development, and not directly attributable to Tilbury Phase 2.

Tilbury Phase 2 is situated in an already industrialized area with limited current access or not used by Matsqui members.

The potential for positive effects, combined with the absence of any material adverse effects from Tilbury Phase 2, supports the EAO's conclusion of no residual effect on social and economic conditions or Indigenous health and well-being. Therefore, no characterization of effects or cumulative effects assessment was undertaken.

#### 16.10.9 Positive Effects of Tilbury Phase 2

According to the Revised Application, Tilbury Phase 2 is expected to create job opportunities, particularly in construction, benefit Indigenous businesses through contracting and procurement, and potentially increase revenue for the Matsqui government, while improving social and economic conditions and providing long-term skills training opportunities for Matsqui members.

The positive effects of Tilbury Phase 2 depend on the level of participation and access Matsqui members and businesses have to the opportunities generated, with direct positive effects on Matsqui interests being limited compared to existing conditions.

For example, since Construction would have the greatest demand for skilled and semiskilled workers, Matsqui members with a trades certificate and experience in the construction sector would be most likely to benefit from direct employment with Tilbury Phase 2. The potential positive effect on Matsqui employment and procurement opportunities depend on whether their members are directly or indirectly employed by Tilbury Phase 2 and whether their businesses can access contracting and procurement opportunities for Tilbury Phase 2.

#### 16.10.10 Conclusions

Considering the above analyses, EAO's engagement with Matsqui, FortisBC's and Matsqui's engagement, mitigation measures, cumulative effects, the EAO's recommended Table of Conditions, and the Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 is anticipated to have negligible residual effects on harvesting and subsistence activities.

Considering the above analysis the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on the Indigenous interests of Matsqui has been adequately avoided, minimized or otherwise accommodated. Based on the engagement undertaken with Matsqui on Tilbury Phase 2, as outlined above in Section 16.10.2, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with Matsqui.

## 16.11 Métis Nation British Columbia

### 16.11.1 Community Profile

Métis people are one of the three Indigenous peoples of Canada recognized in Section 35(2) of the *Constitution Act, 1982*. Métis are descendants of unions between European men (explorers, fur traders, pioneers) and Indigenous women, who developed distinct communities with their own collective identity, way of life, and traditions, separate from those of their First Nations, Inuit, and European ancestors. MNBC is the recognized provincial organization representing Métis interests in B.C. MNBC represents the interest of over 19,000 registered citizens in 40 Chartered Communities across seven regions of the province and states that it represents the broader interests of approximately 90,000 self-identified Métis people in B.C. Since 2003, following the ratification of its Constitution, MNBC has developed laws, policies, and governance structures to advance Métis culture and interests in the province.

While MNBC identifies areas of interest throughout B.C. where Métis citizens reside and maintain cultural connections, there is no legally recognized Métis traditional territory in B.C., and no court has confirmed the existence of a historic Métis community or Métis homeland in the province. Accordingly, Métis do not possess land, water, or air-based rights in B.C. equivalent to those held by First Nations, and engagement with MNBC in EA processes occurs on the basis of Métis cultural interests and community presence rather than constitutionally recognized territorial rights.

### 16.11.2 Métis Nation British Columbia Involvement in the Environmental Assessment

During the Early Engagement Phase MNBC did not identify as a participating Indigenous nation.

Métis Nation British Columbia has had minimal involvement in the EA for Tilbury Phase 2. The EAO notified MNBC of key assessment milestones, including the Readiness Decision, issuance of the Process Order, and the submission of FortisBC's Revised Application, and provided advance notice of upcoming opportunities to review and comment during the Application Review phase.

The EAO used the following sources in drafting the assessment of Tilbury Phase 2 effects on their Indigenous interests:

- The Proponent's Revised Application;
- Information submitted during the EA by the Proponent and MNBC;
- Conclusions from the EAO's assessment of VCs;
- The Proponent's Indigenous Consultation Report;
- A summary of the Proponent's engagement with MNBC is provided in [section 11.12](#) of the Revised Application; and
- Other sources of secondary information publicly available and relevant to the EA of Tilbury Phase 2.

### 16.11.3 Assessment Boundaries

The spatial assessment boundaries for each Indigenous interest were defined based on the overlap of the cultural use and occupancy area with the combined LAAs and combined RAAs identified for linked VCs. Refer to Figure 11.12-1 in *Section 11.12 of the Revised Application* (Indigenous Interests and Tilbury Phase 2 Location figure). The LAA of each Indigenous interest consists of the combined LAAs of VCs that are linked to the Indigenous interest, whereas the RAA of each Indigenous interest consists of the combined Regional Assessment Areas of VCs that are linked to the Indigenous interest. The LAA are used more for assessing direct or indirect Tilbury Phase 2 effects, while the RAA is for assessing cumulative effects.

The assessment of potential effects related to Tilbury Phase 2 considered three distinct phases:

- Construction phase, with an estimated duration of three to six years;
- Operation phase, expected to last more than forty years; and
- Decommissioning phase, anticipated to take approximately two years.

#### 16.11.4 Regional Context

Tilbury Phase 2 lies within MNBC Region 2 – Lower Mainland. More specifically, the North Fraser Métis Association, New Westminster, and the Surrey Delta Métis Association, Delta, are located directly in proximity to Tilbury Phase 2. While Tilbury Phase 2 is within MNBC's Region 2 – Lower Mainland, where Chartered Communities such as the North Fraser and Surrey Delta Métis Associations are located, Métis citizens have raised concerns about potential effects on harvesting areas along the Fraser River. Métis peoples have a long history of settlement and resource use in this region, with cumulative impacts from industrialization and urban growth reducing access to cultural sites and traditional resources. Fishing, hunting, and plant gathering continue to occur near Tilbury Phase 2, though opportunities are constrained by industrial land use, restricted access, and ecological pressures on species such as salmon, waterfowl, and native plants.

It is the Proponent's understanding, based on information available at the time of writing the Revised Application, that while MNBC members fish and harvest in the south arm of the lower Fraser River, they do not currently use Tilbury Phase 2 itself, and FortisBC's removal of all in-river activities means Tilbury Phase 2 is not expected to affect MNBC's ability to harvest.

The existing Tilbury LNG facility consists of gravel and paved areas, existing infrastructure, and equipment laydown areas supporting little plant life with very little to no habitat value for wildlife. The vegetation within Tilbury Phase 2 is mostly limited to ditch lines and spoil piles and is dominated by non-native and invasive plant species. Public access to Tilbury Phase 2 is limited, although there is currently public use of the dike to the north of Tilbury Phase 2 along the Fraser River.

#### 16.11.5 Indigenous Interests

The EAO notified MNBC during the Early Engagement phase in the development of the [Joint Summary of Issue and Engagement for the Tilbury Phase 2 LNG Expansion Project](#); however, they did not provide comments. The EAO did not summarize an initial understanding of MNBC's interests at that stage.

During the Readiness Decision phase, the [Readiness Decision Report](#) indicates that MNBC did not engage with the EAO and did not identify any Tilbury Phase 2-related concerns at that time. Therefore, the EAO drafted the [Tilbury Phase 2- Schedule C – Application Information Requirements](#) Table 6, which outlines the Proposed Preliminary List of Indigenous Interests based on conversations with other First Nations involved in Tilbury Phase 2 and a preliminary understanding of Tilbury Phase 2 effects and how they may impact First Nation interests.

The Proponent identified MNBC Indigenous interests to be assessed in the Revised Application through:

- Reviewing requirements and guidance from the EAO; and
- Conducting engagement efforts with MNBC to gather information on their Indigenous interests, as outlined in [Section 11.12.3 of the Revised Application](#) - Summary of Engagement.

The EAO notified MNBC during the development of this Report; however, no comments were received on their section, and the EAO relied on the preliminary list of Indigenous interests identified in the AIR, which include:

- Harvesting and subsistence activities;
- Cultural use sites and areas;
- Social and economic conditions; and
- Indigenous health and well-being.

The assessment of MNBC Indigenous interests in this section uses these categories. The EAO's assessment of MNBC Indigenous interest includes; describing the Indigenous interest, current context, potential effects, mitigation, effects analysis. If there is an adverse residual effect a characterization of effects and cumulative effects assessment is also completed.

### 16.11.6 Harvesting and Subsistence Activities

#### Background

MNBC has historical ties to the Fraser River region, which supported Métis settlement, the fur trade, transportation, and harvesting. Harvesting remains vital to Métis culture, emphasizing sustainable practices and respect for the land. Métis citizens have engaged in harvesting and subsistence activities in the Lower Mainland since the late 1700s, with an important presence established by the early 1800s.

A Use and Occupancy Study for the nearby Tilbury Marine Jetty (TMJ) Certificate Application confirmed active land and marine harvesting for food, social, and ceremonial use. Métis harvesters traditionally collect various resources, including salmon species, crab, cod, eulachon, shellfish, firewood, berries, roots, wild onions, mint, currants, rose hips, dandelion, stinging nettle, and other edible or medicinal plants. Hunting targets have historically included deer, black bear, muskrat, beaver, otter, seal, and coastal birds.

#### Current Context

Available regional land-use information indicates that individual MNBC members continue to fish in the south arm of the Fraser River and harvest plants and other resources in nearby areas. Plant gathering remains an important practice in riparian and estuarine locations beyond the industrial footprint of Tilbury Phase 2.

Ongoing industrialization, dredging, shoreline modification, and urban development along the Fraser River have reduced the availability and quality of resources relied on for Métis harvesting. These pressures intersect with the harvesting and subsistence activities LAA and RAA, where MNBC citizens continue to access culturally important species and harvesting locations. MNBC members currently fish in the south arm of the lower Fraser River, with active fishing occurring approximately 400 metres from Tilbury Phase 2. Hunting for coastal birds, particularly ducks and geese, continues along adjacent shoreline areas, including between Tilbury Island and Deas Island, at distances of roughly 1.5 km from Tilbury Phase 2. Plant harvesting areas used by Métis citizens occur further upstream and along nearby riparian zones, with the closest known gathering area located approximately 3.25 km from Tilbury Phase 2. Traditional harvesting sites associated with MNBC presence also extend throughout the Fraser River delta, Roberts Bank, and Boundary Bay areas that remain culturally important despite cumulative industrial pressures.

Tilbury Phase 2 is situated on an industrial brownfield site with no existing access for harvesting. However, MNBC citizens continue to use areas within the broader harvesting and subsistence activities LAA and RAA, particularly the lower Fraser River, Roberts Bank, Boundary Bay, and the Fraser River delta, for fishing, gathering, and cultural land use activities.

#### Potential Project Effects

The EAO has identified the following pathway of effects, prior to the application of mitigation measures, along with the associated VCs outlined in [Appendix 6](#) that may affect MNBC's harvesting and subsistence practices during the Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- **Changes to the experience and preferences around the practice of harvesting and effects on the quality, quantity, and availability of resources:** Potential effects may arise from the loss or alteration of habitat supporting harvested wildlife, fish, bird, or plant species, including species of cultural and medicinal importance (wildlife and wildlife habitat, and vegetation VCs). Tilbury Phase 2 activities could result in changes to surface water quality or quantity, such as turbidity and hydraulic changes affecting the Fraser River and Tilbury Slough (surface water, and groundwater VCs). These environmental shifts may reduce the quality and quantity of habitat for harvested species and affect their availability, distribution, and abundance (fish and fish habitat VC). The quality of harvested species themselves may also be affected by changes in surrounding air, water, and soil conditions (air quality, and soil VCs). In addition, sensory disturbances—including noise, vibration, odour, dust, and visual change—could alter the qualitative experience of harvesting and diminish the cultural value of these practices (acoustic, and land and resources VCs);
- **Effects to Métis Nation British Columbia harvesting activities:** Potential effects include changes to harvesting methods and practices, such as timing and seasonality, which may alter the current use of lands and resources and harvesting-based livelihoods. Increased time, cost, and effort to reach harvesting sites could reduce harvesting success, while access restrictions may further limit opportunities. Habitat alteration may affect the quality, quantity, distribution, and abundance of species, as well as the quality of harvested resources. Shifts in timing or seasonal rounds could disrupt continuity of cultural traditions and livelihoods. Together, these changes may reduce MNBC citizens' ability to sustain harvesting practices (air quality, acoustic, surface water, groundwater, soil, vegetation, wildlife and wildlife habitat, fish and fish habitat, and land and resource use VCs); and
- **Effects to the accessibility and availability of traditional lands and resources:** Potential effects include changes in the ability to travel to or through current use areas, restrictions on access to culturally important places, and disruptions to accessible travelways. Use of the Fraser River and marine environment for navigation may also be affected, reducing opportunities to access traditional lands and resources (land and resource use, surface water, and infrastructure and services VCs).

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures that the Proponent has proposed in response to potential Tilbury Phase 2-related effects on harvesting and subsistence activities, as mentioned in the section above. A full table of Proponent mitigations can be found in [Appendix A](#) of the Revised Application. Below is a summary of mitigation measures, how they address effects on the relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support MNBC's harvesting and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during Construction and Operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support MNBC's harvesting and cultural practices;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm sewer system. These protections support water quality and fish habitat relied on to support MNBC's harvesting and cultural practices;

- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by MNBC for harvesting and cultural practices;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by MNBC for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife-protection measures, such as timing construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to MNBC's harvesting and cultural practices;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill-prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the health and availability of salmon and other fish species central to MNBC's FSC harvesting and cultural practices;
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used for harvesting or cultural practices; and
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat and vegetation important to MNBC's harvesting and cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions to help reduce potential impacts on MNBC's harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting activities (see [section 8](#) of this Report):

- **Condition 10 (Community Feedback Process)** creates a clear way for MNBC to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of MNBC's harvesting and cultural practices;
- **Condition 12 (CEMP)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to MNBC's harvesting and cultural practices;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to MNBC's harvesting and cultural practices;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emissions control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support MNBC's harvesting and cultural practices; and,
- **Condition 17 (Dry Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project related roads, which may lower potential impacts on salmon and other fish important to MNBC's harvesting and cultural practices.

In addition to the Proponent's mitigations and the provincial conditions the EAO identified the following Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to harvesting and subsistence activities:

- **Federal Consideration for Migratory Bird Protections:** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting MNBC's harvesting practices and broader ecosystem conditions important to their way of life.

#### The EAO's Analysis and Conclusions

After consideration of the mitigation measures and potential effects, described above, the EAO identified the following residual effects:

- Changes to the experience and preferences around the practice of harvesting and effects on the quality, quantity, and availability of resources;
- Effects to MNBC harvesting and subsistence activities; and
- Effects on the accessibility and availability of traditional lands and resources.

The EAO's characterization of the residual effects of Tilbury Phase 2 on Harvesting and subsistence activities are summarized in the table below.

Table 32: Summary of residual effects and rationale on Métis Nation British Columbia and its harvesting and subsistence activities

| Residual Effect                                                                                                                                                                                                                                                                                                                                                         | Assessment Rating*                                                                                                                                                                                                                                                      | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Residual Effect                                                                                                                   | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | impacts on harvesters, are well understood. While mitigation is expected to be moderately to highly effective, some uncertainty remains regarding its ability to fully address harvesters' experiences and perceptions. Therefore, the level of uncertainty is rated as moderate. |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                   |

### Cumulative Effects

As described in the Background and Current Context section, the lower Fraser River and Tilbury Island area have undergone longstanding industrial development, as well as impacts due to climate change, resulting in existing pressures on environmental conditions and on MNBC's harvesting and subsistence activities

MNBC raised concerns about ongoing erosion of harvesting opportunities and culturally important resources due to cumulative regional development. The Revised Application identifies several reasonably foreseeable projects that may affect MNBC's harvesting and subsistence interests. These include T1B, which would increase LNG production, and TMJ, which would introduce additional vessel traffic in the Fraser River and further development of the foreshore area. Both T1B and TMJ could contribute additional sensory disturbances (noise, light, vibration) and impact air quality in areas used by MNBC for harvesting. TMJ could further alter fish habitat and water quality in areas where MNBC may have in the past, present or future take part in harvesting and subsistence practices.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, including FortisBC's proposed mitigation measures, EAO's Table of Conditions and the federal Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 would have a negligible effect on MNBC's harvesting and substance activities.

#### 16.11.7 Cultural Use Sites and Areas

##### Background

Although MNBC does not hold reserve lands in B.C., Métis families maintain enduring cultural connections through historic settlement sites, travelways, and areas of spiritual and historical importance across the Lower Mainland. The Revised Application identifies three cultural sites and two boat sites located approximately 4–7 km from Tilbury Phase 2 within the cultural use sites and areas LAA. Historical settlements such as Fort Langley and Fort Victoria, connected by long-standing travel routes along the Fraser River, remain central to Métis identity and history. A Métis Use and Occupancy Study for the Lower Mainland further documented more than 100 cultural locations, including cabins, burial sites, and culturally important landforms, underscoring the depth and persistence of MNBC cultural use across the region.

##### Current Context

MNBC citizens continue to harvest and use the lower Fraser River, particularly along its south arm, where individual members fish, gather plants, and access nearby shorelines and riparian areas. A recent Cultural Use and Occupancy Study completed for the adjacent TMJ Project identified subsistence fishing sites near—but not within—the Tilbury Phase 2 area, confirming contemporary Métis use of the region.

Tilbury Phase 2 itself is a highly industrialized and previously disturbed site within the existing Tilbury LNG facility, with limited wildlife habitat and restricted access. Existing industrial activity, dredging, shoreline modification, and urban development across the lower Fraser River continue to influence MNBC's ability to harvest in the region.

#### *Potential Project Effects*

The EAO has identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#) that may affect MNBC's cultural use sites and areas during the Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- **Effects to cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance;** Tilbury Phase 2 could affect cultural use sites and areas through Construction activities that disturb culturally important places, such as archeological sites, due to ground disturbances, accidental spills of deleterious substances, or other construction-related interaction (culture, soil, and archaeological and heritage resources VC's);
- **Loss of access to and disenfranchisement from cultural sites;** MNBC harvesters could experience direct adverse effects to cultural and spiritual practices if access to cultural sites is altered or lost due to closure or modification of trails, parking areas, or access points between Tilbury Phase 2 and the Fraser River for safety or construction purposes (land and resource use VC). Changes in sensory effects (acoustic, air quality, culture, and land and resource use VC's) could change the experience of MNBC members using cultural sites, such as harvesting areas along the south arm of the Fraser River; and
- **Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas;** Access to cultural sites could be affected (land and resource use VC) by Tilbury Phase 2. Adverse effects to culture (culture VC) which are connected to potential effects on wildlife, habitat, and vegetation (See Harvesting and Subsistence section above) could influence the ability or desire to access these sites.

#### *Mitigation Measures*

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed to potential Tilbury Phase 2 related effects on cultural use sites and areas. These include the following:

- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm sewer system. These protections support water quality and the ecological integrity of adjacent areas, including those used by MNBC for cultural practices, teaching, and medicinal plant harvesting, thereby helping to maintain the quality and accessibility of cultural use sites and areas relied upon by MNBC members;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species associated with MNBC cultural use sites and areas. These measures help maintain the availability and quality of plants used for cultural practices, teaching, and medicinal harvesting. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities, supporting the ecological conditions necessary for the continued use and integrity of MNBC cultural use sites and areas;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing Construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the wildlife and ecosystems associated with MNBC cultural use sites and areas. These measures contribute to sustaining the ecological conditions necessary for cultural practices, teaching, and harvesting activities, and help preserve the integrity and experience of MNBC cultural use sites and areas;

- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the ecological conditions associated with MNBC cultural use sites and areas, including areas relied upon for fishing, teaching, and cultural practices, and help maintain the availability of fish species central to the ongoing use and integrity of these cultural sites and areas;
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream ecosystems associated with MNBC cultural use sites and areas. These measures contribute to sustaining the conditions necessary for vegetation, fish, and other resources relied upon for cultural practices, teaching, and harvesting, and help preserve the integrity and continued use of MNBC cultural use sites and areas;
- **Land and Resource Use (Section 7.11)** Traffic management planning, noise and lighting controls, and communication regarding project activities help reduce disruptions to access and use of culturally important areas. These measures support MNBC's ability to safely access and continue cultural practices within their traditional territory;
- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support the MNBC's ability to access, use, and maintain culturally important areas, including places of teaching, ceremony, and connection to land and water;
- **Soil (Section 7.6)** Soil management measures, including erosion control, spill prevention protocols, and careful handling and disposal of contaminated soils, help prevent the migration of pollutants into nearby cultural areas and waterways. Maintaining soil stability and quality supports the protection of culturally important places and landscapes used by MNBC;
- **Acoustics (Section 7.3)** Noise reduction measures during Construction and Operation, including idle reduction policies, equipment muffling, enclosures, and engineered noise controls, help limit disturbance to culturally important areas and activities. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of cultural knowledge by MNBC;
- **Air Quality (Section 7.2)** The air quality measures, such as idle reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support MNBC's harvesting and cultural practices; and
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures, site protection, and early notification to Indigenous nations, help protect culturally important sites, features, and landscapes. These measures support MNBC's ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connections to territory.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects to Indigenous cultural use sites and areas (see [Section 8](#) of this Report):

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps

reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance.

- **Condition 10 (Community Feedback Process)** establishes a clear and structured mechanism for MNBC to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of culturally important landscapes and areas, supporting MNBC's continued access to and use of cultural sites during project Construction;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, lighting, wildlife interactions, and spills during project Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by MNBC;
- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emissions control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites by MNBC; and
- **Condition 15 (Chance Find Protocol)** requiring the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If MNBC historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

#### The EAO's Analysis and Conclusions

After consideration of the mitigation measures, provincial conditions, and potential effects, described above, the EAO identified the following residual effects:

- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance;
- Effects of various project activities on cultural values and spiritual activities; and
- Loss of access to or disenfranchisement from cultural sites.

The EAO's characterization of the residual effects of Tilbury Phase 2 on Cultural Use Sites and Areas are summarized in the table below.

Table 33: Summary of residual effects and rationale on Métis Nation British Columbia and its cultural use sites and areas.

| Residual Effect                                                                                                                                                                                                                                                                                                                                                                                         | Assessment Rating*                                                                                                                                                                                                                                                                | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Cultural use sites and areas</p> <ul style="list-style-type: none"> <li>- Effects of various project activities on cultural values and spiritual activities</li> <li>- Loss of access to or disenfranchisement from cultural sites</li> <li>- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance</li> </ul> | <p>Context (resilience): Moderate</p> <p>Magnitude: Low</p> <p>Extent: Local</p> <p>Duration: Medium-term</p> <p>Frequency: Continuous</p> <p>Reversibility: Partially Reversible</p> <p>Affected Populations: Disproportionate</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><b>Context:</b> Rated as having moderate resiliency, recognizing that MNBC has demonstrated adaptability in maintaining cultural practices despite historical and ongoing industrial development within their territory. However, the persistence of cumulative disturbances in the Fraser River corridor, including habitat alteration, sensory impacts, and reduced access to key cultural areas, has likely diminished overall capacity to absorb additional adverse effects. This rating reflects a balanced assessment acknowledging both cultural resilience and the challenges posed by the highly modified setting.</p> <p><b>Magnitude:</b> Rated as low, based on the Project's negligible magnitude residual effect on fish, fish habitat, and surface water, which underpin many cultural activities. Other connected VC residual effects, including those to wildlife, vegetation, air quality, acoustics, and land and resource use, are expected to be negligible to low in magnitude and of local extent. The Tilbury Phase 2 site is located on fee simple industrial land, where access for cultural use is already restricted.</p> <p><b>Extent:</b> Rated as local, as the anticipated residual effects are geographically confined to the project vicinity and immediate surrounding areas. While MNBC members maintain connections across the lower Fraser, the predicted effects are unlikely to extend beyond the local assessment area for cultural use.</p> <p><b>Duration:</b> Rated as medium-term, as residual effects, particularly sensory disturbances and restricted access, would persist throughout Construction and Operation but are expected to cease following Decommissioning.</p> <p><b>Frequency:</b> Rated as continuous for restrictions on access to the project footprint, which is an ongoing condition. Sensory disturbances (e.g., noise, odour, visual changes) may be continuous during Operation but variable during Construction depending on activity type.</p> <p><b>Reversibility:</b> Most sensory-related effects (e.g., noise, visual, air quality) are expected to be fully reversible upon Decommissioning. However, any cultural impacts arising from sustained loss of access or long-term changes in practice patterns could be partially reversible if intergenerational use or knowledge transfer is disrupted.</p> <p><b>Affected Populations:</b> Direct impacts would disproportionately affect MNBC members actively engaging in cultural and ceremonial practices in proximity to Tilbury Phase 2, while indirect effects, through changes to the cultural landscape or perceptions of site quality, could be felt more broadly by the Nation.</p> <p><b>Risk:</b> The likelihood of direct Tilbury Phase 2-related impacts on cultural use sites is low, and the overall consequence is minor, given the low magnitude of predicted effects and the application of mitigation measures. Risk is therefore rated as low.</p> <p><b>Uncertainty:</b> Rated as moderate, acknowledging that cultural effects are complex to quantify and may be experienced differently among individuals and families. While mitigation is expected to be effective in addressing physical and sensory disturbances, uncertainties remain regarding long-term perceptions of site suitability for cultural use.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a>                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### Cumulative Effects

Incremental Project effects could interact with those from other foreseeable projects in the area, such as the TMJ Project, T1B, and other port-related expansions, potentially compounding sensory disturbances, navigation pressures, and loss of culturally important riparian landscapes.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, including proposed proponent mitigations, EAO's conditions, and KMMs, and based on the Project specific effects of Tilbury Phase 2, the EAO concludes that the Project will have a negligible effect on the cultural use sites and areas of MNBC.

#### 16.11.8 Social and Economic Conditions and Indigenous Health and Well-being

##### Background

MNBC is a distinct Indigenous people whose citizens primarily live off reserve and maintain strong cultural ties to land, harvesting, and resource use. The absence of reserve lands in B.C. and limited Métis-specific data contribute to persistent gaps in social outcomes, while long-standing inequities in housing, healthcare access, and cultural continuity continue to shape Métis well-being. Historically, Métis communities relied on intercommunity trade, labour mobility, and kinship networks throughout the Fraser River region. These practices continue to influence MNBC's economic development approach today, which prioritizes workforce participation, business partnerships, and procurement opportunities that align with Métis values of stewardship and self-reliance.

MNBC's understanding of health and well-being is rooted in a holistic worldview informed by the Cree concept of *miyopimatisiwin*, meaning "living well." This approach emphasizes the interconnectedness of spiritual, mental, physical, and emotional wellness and differs from biomedical models by placing cultural identity, community belonging, and cultural continuity at the center of health. Traditional harvesting practices play an important role in Métis wellness by supporting access to natural, nutrient-rich foods and reinforcing cultural values, intergenerational learning, and community cohesion. MNBC citizens emphasize that health is shaped not only by physical factors, but also by the ability to safely practice culture, maintain meaningful relationships, and access culturally grounded spaces and activities. Cultural safety, spiritual practices, and the transmission of Métis knowledge are recognized as essential determinants of well-being, and MNBC has identified concerns that disruptions to cultural practices or traditional ways of life may adversely influence health outcomes by weakening these cultural determinants.

##### Existing Conditions

MNBC citizens participate across diverse sectors in the Lower Mainland, with strong representation in construction and industrial trades. Despite these strengths, Métis households in the region experience some of the highest rates of core housing need in the province, alongside ongoing health and wellness challenges linked to cumulative colonial impacts.

MNBC continues to pursue training, employment, and procurement opportunities tied to major projects but has noted that large-scale developments can strain labour markets and reduce competitiveness for smaller Indigenous businesses. Social and economic resilience also depends on sustained access to culturally important resources; while individual MNBC members continue to use the lower Fraser River and adjacent lands for harvesting and cultural activities, the area is already heavily industrialized.

MNBC's current health and well-being are extensively shaped by the ongoing impacts of colonialism, resulting in disparities in social, economic, and health outcomes. Like other Indigenous peoples in Canada, MNBC continues to face systemic discrimination, influencing key social determinants of health. Harvesting and subsistence activities remain essential, as MNBC citizens emphasize harvesting their own food for FSC purposes, valuing the quality and cultural importance of traditional foods.

MNBC has expressed concerns that Tilbury Phase 2 could affect their well-being through impacts on cultural practices, traditional sites, and the environment. In particular, the Revised Application's assessment of potential effects on fish habitat is highly relevant to Indigenous health, given the cultural and dietary importance of harvesting.

#### Potential Project Effects

The EAO identified the following effect pathways of effect, prior to the application of mitigation measures, along with the associated VCs in [Appendix 6](#) that may affect MNBC's social and economic conditions and Indigenous health and well-being during Construction, Operation and Decommissioning phases of Tilbury Phase 2:

- **Social and Economic Conditions:**
  - **Effects on infrastructure and services:** Tilbury Phase 2 may add pressure on services if out-of-region workers are used, but according to the Revised Application effects are expected to be limited and not distinguishable from existing conditions (land and resource use, employment and economy, and infrastructure services VC's);
  - **Effects to MNBC's employment opportunities, Indigenous businesses, procurement opportunities, and MNBC revenue:** Tilbury Phase 2 could positively affect MNBC's employment and business opportunities, depending on member participation and access to contracts (employment and economy VC). Indigenous workers are also more likely to be in construction-related jobs. However, smaller Indigenous businesses may face challenges competing for workers or meeting Tilbury Phase 2 demands (culture VC);
  - **Effects to MNBC's ability to improve social and economic conditions:** Tilbury Phase 2 may support MNBC's efforts to improve social and economic conditions by creating employment, training, and business opportunities. Increased demand for skilled workers could also boost interest in trades training. (infrastructure and services, and employment and economy VC); and
  - **Effects on commercial and non-commercial harvesting, cultural activities, and intercommunity trade:** Tilbury Phase 2 may indirectly influence MNBC's participation in cultural or ceremonial activities tied to harvesting (culture VC), though effects are expected to be negligible. Pathways include potential changes to resource availability (fish and fish habitat, wildlife and wildlife habitat, and vegetation VCs) and access to harvesting areas (land and resource use VC). These could alter the scale or frequency of intercommunity trade and cultural exchange, though no direct interaction is anticipated.
- **Indigenous Health and Well-Being:**
  - **Effects on the quality, quantity, and availability of harvested country foods:** Land, water, or air-based contamination from Tilbury Phase 2 could adversely affect country foods such as fish and traditional plants (See Harvesting and Subsistence section above);

- **Effects on the value and perceived quality of country foods:** Quality, quantity or availability of plants or wildlife could be impacted from Tilbury Phase 2. Country foods could become contaminated. (See list of potential project effects above). Community perceptions with respect to the quality of country foods have the potential to interact with MNBC members' participation in harvesting and subsistence activities and cultural and spiritual practices even in the absence of adverse effects (land and resource use, and culture VCs);
- **Effects on air quality, noise and water quality:** Tilbury Phase 2 activities have the potential to contribute contaminants of concern to air and water, and increased noise levels in proximity to the facility property line (air quality, acoustics, surface water, land and resource use, human health VCs); and
- **Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites:** Tilbury Phase 2 may interact with MNBC's health and well-being through changes to traditional practices, access to cultural sites, and socio-economic factors. Effects on traditional ways of life due may still influence health outcomes indirectly. Positive effects may include increased income and employment opportunities for members, while potential adverse effects relate to shift work and family stress.

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that FortisBC has proposed in response to potential Tilbury Phase 2 related effects on social and economic conditions and Indigenous health and well-being. These include the following:

- **Land and resource use VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting MNBC's long-term aspirations for land and water restoration and reducing stressors that can affect well-being;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for MNBC members and businesses to participate economically in the project, supporting improved social conditions and community well-being;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socioeconomic impacts on MNBC and supporting health and community stability;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports MNBC's food security, cultural identity, and health by safeguarding salmon and other species essential to FSC harvesting;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting MNBC's cultural continuity and nutritional well-being;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to MNBC's physical health and cultural practices;
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to MNBC's well-being;
- **Groundwater (Section 7.5)** Protecting groundwater from contamination helps maintain the quality of ecosystems that support fish, plants, and wildlife relied on for MNBC's subsistence and health;

- **Surface Water (Section 7.4)** Managing runoff, erosion, and sediment helps maintain water quality in the lower Fraser, supporting MNBC's cultural and nutritional reliance on healthy salmon and aquatic ecosystems;
- **Acoustics (Section 7.3)** Noise reduction measures limit sensory disturbance to people, wildlife, and harvesting areas, reducing stress and supporting MNBC's comfort, well-being, and connection to land and water;
- **Air Quality (Section 7.2)** Air emission controls help protect respiratory health and prevent contamination of country foods, supporting MNBC's physical well-being and confidence in harvesting; and
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect MNBC members' physical, cultural, and mental health.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on social and economic conditions and Indigenous health and well-being:

- **Condition 10 (Community Feedback Process)** provides MNBC with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting Indigenous health and well-being;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)** require ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with MNBC to be developed by the Holder in consultation with the Nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting MNBC's physical health and overall well-being;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If MNBC historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated cultural or emotional harm, supporting Indigenous health and well-being;
- **Condition 16 (Indigenous and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support socio-economic well-being;
- **Condition 17 (Dry Street Sweeping Report)** requires FortisBC to submit a report on the effectiveness Dry Street Sweeping to mitigate the effects of 6-PPDQ on fish within eighteen months of a Certificate being issued. By informing measures to protect downstream aquatic environments, this condition supports MNBC's health and well-being by helping maintain confidence in environmental quality and minimizing potential concerns related to contamination of culturally important fish and waterways.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Well-being:

- **Accidents and Malfunctions Reporting** would support mitigation of potential impacts on the Nation's interests by ensuring timely responses, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

#### The EAO's Analysis and Conclusions

After considering the EAO's conclusions on the linked VCs and proposed mitigation measures, the EAO concludes that Tilbury Phase 2 is not expected to result in residual adverse effects on MNBC's social and economic conditions or Indigenous health and well-being interests.

While MNBC continues to experience extensive systemic challenges - including limited access to housing, employment, culturally important lands, access to holistic and community-based health and well-being programs - these are primarily the result of historic and ongoing regional industrial development, systemic effects to healthcare and not directly attributable to Tilbury Phase 2. Tilbury Phase 2 is situated in an already industrialized area with limited current access or use by MNBC members.

Although Tilbury Phase 2 may interact with aspirations for land and water restoration, or for re-establishing cultural practices in the area, the potential for employment, training, and contracting benefits may also support Métis Nation B.C.'s efforts to strengthen their economic conditions. On balance, the potential for positive effects, alongside the lack of material new barriers introduced by Tilbury Phase 2, supports the EAO's conclusion of no residual effect on social and economic conditions and therefore no characterization of effects or cumulative effects assessment was undertaken.

#### 16.11.9 Positive Effects of Tilbury Phase 2

For MNBC, the Revised Application anticipates several positive outcomes, particularly during the three- to six-year Construction phase, which will require many skilled and semi-skilled workers. MNBC citizens, 11.7% of whom held trades certificates or apprenticeships in 2016, could benefit from employment opportunities linked to Tilbury Phase 2. Tilbury Phase 2 may also increase contracting and procurement opportunities for Indigenous businesses, including MNBC enterprises.

MNBC is actively pursuing training and employment through corporate partnerships and tools like the MNBC Economic Development Portal. Further benefits could include higher incomes, job security, and improved social conditions for MNBC members and families. Tilbury Phase 2 may also encourage long-term participation in education and skilled trades, supporting MNBC's workforce development initiatives such as the Skills Training, Employment & Post Secondary Program (STEPS) program. Additionally, increased MNBC Government revenue is possible depending on economic involvement levels.

Overall, the Revised Application predicts positive residual effects for MNBC through employment, business opportunities, and social improvements, with no anticipated adverse interactions.

#### 16.11.10 Conclusions

Considering the above analyses, the EAO's engagement with MNBC, MNBC's engagement with FortisBC, mitigation measures, cumulative effects, the EAO's recommended Table of Conditions and the identified Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 is anticipated to have the following:

- Negligible residual effects to harvesting and subsistence activities; and
- Negligible residual effects to cultural use sites and areas.

Considering these analyses, the EAO concludes that the potential for adverse effects of Tilbury Phase 2 on the Indigenous interests of MNBC has been adequately avoided, minimized, or otherwise accommodated. Based on the engagement undertaken with MNBC on Tilbury Phase 2, as outlined above in Section 16.6.2, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with MNBC.

## 16.12 Pópkw'em First Nation

### 16.12.1 Community Profile

Pópkw'em (Popkum) is a Stó:lō community located along the Fraser River in the Upper Fraser Valley region, approximately 30 km west of Hope and 30 km east of Chilliwack. Pópkw'em is a modern descendant of the group ethnographically identified as Tait (or Tíyt). The Tíyt are one of several groups classified as upper Stó:lō. Though similar language and customs appear to have been shared between the upper Stó:lō that historically spoke the Halkomelem language, Tíyt spoke a unique dialect.

Pópkw'em is a member government of the Stó:lō Nation, negotiating land and resources agreements outside the B.C. treaty process. Pópkw'em has three reserves: Pekw'xe:yles (Peckquaylis), Popkum 1, and Popkum 2. Pópkw'em currently has a registered population of 13, with one member living on reserve.

### 16.12.2 Pópkw'em Involvement in the Environmental Assessment

During the Early Engagement phase, Pópkw'em did not identify as a participating Indigenous nation.

The EAO and the IAAC provided funding to support the Pópkw'em's engagement in the EA process. EAO provided documents, Tilbury Phase 2 updates, the draft Initial Project Description and DPD, and Process Planning documents for Pópkw'em's review. During the Process Planning phase, it was agreed that the EAO would assess the Project effects on Pópkw'em's Indigenous interests, as identified in Section 4 of the Assessment Plan.

### 16.12.3 Assessment Boundaries

All Tilbury Phase 2 components within the Project Footprint are within Pópkw'em's traditional territory.

The spatial assessment boundaries for each Indigenous interest were based on the overlap between Pópkw'em's traditional territory with the combined Local and RAAs identified for linked VCs. Refer to figure 11.17-1A in Section 11.17 of the Revised Application (Indigenous Interests and Proposed Project Location Figure). The LAA for each Indigenous interest reflects the combined LAAs of the VCs linked to that interest. The RAA is defined the same way, using the combined RAAs of the linked VCs. In general, the LAA is used to assess direct and indirect project effects, while the RAA supports the assessment of cumulative effects.

The assessment of potential effects related to Tilbury Phase 2 considered three distinct phases:

- Construction phase, with an estimated duration of three to six years;
- Operation phase, expected to last more than forty years; and
- Decommissioning phase, anticipated to take approximately two years.

### 16.12.4 Regional Context

The Project Footprint, as well as the Local and RAAs for Tilbury Phase 2, are situated within a region deeply tied to the cultural, historical, and economic activities of Stó:lō Nations. The word "Stó:lō" is Halqemeylem for "river", so the Stó:lō are the river people. For upper Stó:lō communities, which includes Pópkw'em, salmon fishing is core to their culture and contributed the greatest amount of food, especially dried salmon that was stored over the winter months. Today members of the Stó:lō Nation's communities currently practice traditional travel (canoeing) in ceremonial and spiritual practices for fishing, hunting, trapping and plant gathering as well as for wind drying activities.

The Project Footprint is located within the Stó:lō Nation's asserted territory, along the south arm of the lower Fraser River on Tilbury Island. The existing Tilbury LNG facility consists of gravel and paved areas, existing infrastructure, and equipment laydown areas supporting little plant life with little to no habitat value for wildlife. The vegetation within the Project Footprint is mostly limited to ditch lines and spoil piles and is dominated by non-native and invasive plant species.

Public access to the site is limited, although there is some use of a nearby dike directly opposite the fence line of Tilbury Phase 2 along the Fraser River.

#### 16.12.5 Indigenous Interests

The EAO engaged Pópkw'em during the Early Engagement phase in the development of the [Joint Summary of Issue and Engagement for Tilbury Phase 2 LNG Expansion Project](#); however, the EAO did not receive any input during that phase.

During the Readiness Decision phase in the development of the [Readiness Decision Report](#), EAO engaged with Pópkw'em who did not specifically indicate their primary concerns regarding Tilbury Phase 2. Therefore, the EAO relied on input gathered from technical advisors and participating Indigenous nations. This information was used in drafting the [Tilbury Phase 2- Schedule C – Application Information Requirements](#) Table 6; see Proposed Preliminary List of Indigenous Interests.

During the Application Development and Review phase, the EAO did not receive any input from Pópkw'em and therefore continued to rely on the Revised Application and external sources to confirm the Indigenous interests assessed in this Report.

FortisBC (Proponent) identified Pópkw'em's Indigenous interests to be assessed in the Revised Application through:

- Reviewing requirements and guidance from the EAO; and
- Conducting engagement efforts with Pópkw'em to gather information on their Indigenous interests outline in [Section 11.18.3](#) Summary of Engagement of the Pópkw'em's Section of the Stó:lō Nations section in the Revised Application.

The EAO attempted to engage Pópkw'em during the development of this Report. As no comments were received on their section, the EAO relied on the preliminary list of Indigenous interests identified in the AIR, which include:

- Harvesting and subsistence activities;
- Cultural use sites and areas;
- Social and economic conditions; and
- Indigenous health and well-being.

The assessment of with Pópkw'em's Indigenous interests in this section uses these categories. The EAO's assessment includes describing the Indigenous interest, the current context, potential effects, applicable mitigation, and the resulting effects analysis. If there is an adverse residual effect a characterization of effects and cumulative effects assessment is also completed.

#### 16.12.6 Harvesting and Subsistence Activities

##### Background

Pópkw'em members use, or have used, Pópkw'em's territory for generations, with multiple irreplaceable and interacting values spread along the Fraser River and throughout the Fraser Valley and Lower Fraser Canyon. Stó:lō territory was made up of four separate "food processing" zones, each with distinct biological and geographical characteristics, and traditionally Stó:lō would have used the area of the lower Fraser River for a variety of harvesting subsistence or cultural purposes, including fishing, hunting, plant gathering, ceremonial activities, or habitation.

##### Current Context

The Revised Application states that approximately 75% of Stó:lō community members continue to harvest traditional materials for food, social, and ceremonial (FSC) purposes, and have expressed concern regarding lost opportunities to gather, as well as the potential contamination. However, specifically to the Tilbury Phase 2 area, the Revised Application does not identify that Pópkw'em currently uses the south arm of the Fraser River for fishing, plant gathering, or hunting.

The present industrial developments, including land conversion, railway expansions, industrial accidents, the growth of the Port of Vancouver, and pollution, have had profound and far-reaching effects on Indigenous communities. These changes have reduced lands available for harvesting and gathering, adversely affected fish and fish habitat, wildlife, water quality, and access to cultural areas. The loss of land is considered an important factor contributing to cultural stress and decline in Indigenous well-being for Pópkw'em members.

#### Potential Project Effects

The EAO identified the following pathway of effects, prior to the application of mitigation measures, along with the associated VCs outlined in [Appendix 6](#) that may affect Pópkw'em's harvesting rights during the Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources** from increased noise, light, and air pollution (acoustics, air quality, soil, groundwater, land and resource use VCs) may deter Pópkw'em members from accessing preferred harvesting areas near Tilbury Phase 2 site. Changes in fish distribution and abundance (fish and fish habitat VC) and the introduction of invasive plant species (vegetation VC) may further reduce the experience and preference of the practicing of harvesting rights. While Pópkw'em not currently fish or harvest close to Tilbury Phase 2, they could in the future if the site was decommissioned to a more natural state;
- **Effects to Pópkw'em Rights to fish for FSC purposes** from habitat loss, (wildlife, fish and fish habitat, vegetation VCs), increased mortality risks to fish, birds, and wildlife (wildlife and wildlife habitat VCs), and changes in their behavior due to sensory disturbances (acoustics, air quality VCs). Additionally, contamination risks to fish habitat in Tilbury Slough (surface water VC) and Fraser River downstream, as well as contaminated soil (soil VC) could impact important plant species, may further impact traditional harvesting and cultural practices; and
- **Effects on the accessibility and availability of traditional lands and resources** may occur as a result of altered land or water based travel routes, access restrictions, or safety considerations, including changes to navigability and the usability of established travel corridors (land and resource use and surface water VCs), as well as indirect effects from sensory disturbances such as noise, dust, lighting, or visual changes that may discourage travel through otherwise accessible areas (air quality, acoustics, and land and resource use VCs).

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on harvesting and subsistence practices. A full table of Proponent mitigations can be found in [Appendix A of the Revised Application](#). Below is a summary of KMMs, how they address effects on the relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air-quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Pópkw'em's harvesting and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during construction and operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Pópkw'em's harvesting and cultural practices;

- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm sewer system. These protections support water quality and fish habitat relied on to support Pópkw'em's harvesting and cultural practices;
- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by Pópkw'em for harvesting and cultural practices;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by Pópkw'em for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to Pópkw'em's harvesting and cultural practices;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill -prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the health and availability of salmon and other fish species central to Pópkw'em's FSC harvesting and cultural practices;
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used for harvesting or cultural practices; and,
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat and vegetation important to Pópkw'em's harvesting and cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions to help reduce potential impacts on Pópkw'em's harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting rights (see [Section 8](#) of this Report):

- **Condition 10 (Community Feedback Process)** creates a clear way for Pópkw'em to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of Pópkw'em's harvesting and cultural practices;
- **Condition 12 (CEMP)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to Pópkw'em's harvesting and cultural practices;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to Pópkw'em's harvesting and cultural practices;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emissions-control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support Pópkw'em's harvesting and cultural practices; and,

- **Condition 17 (Dry Street Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project-related roads, which may lower potential impacts on salmon and other fish important to Pópkw'em's harvesting and cultural practices.

In addition to the Proponent's mitigations and the provincial conditions the EAO identified the following federal Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to harvesting and subsistence activities:

- **Federal Consideration for Migratory Bird Protections:** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Pópkw'em's harvesting practices and broader ecosystem conditions important to their way of life.

#### The EAO's Analysis and Conclusions

After consideration of the proposed mitigation measures and potential effects, described above, the EAO identified the following residual effects:

- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources;
- Effects to Pópkw'em Aboriginal rights to fish for FSC purposes; and
- Effects on the accessibility and availability of traditional lands and resources.

The EAO's characterization of the residual effects of Tilbury Phase 2 on harvesting and subsistence activities are summarized in the table below.

Table 34: Summary of residual effects and rationale on Pópkw'em and its harvesting and subsistence activities.

| Residual Effect                                                                                                                                                                                                                                                                                                                                             | Assessment Rating*                                                                                                                                                                                                                          | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Harvesting and subsistence activities<br>- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources<br>- Effects to Pópkw'em Aboriginal rights to fish for FSC purposes<br>- Effects on the accessibility and availability of traditional lands and resources | Context (resilience): Medium<br>Magnitude: Negligible<br>Extent: Local<br>Duration: Medium-term<br>Reversibility: Fully reversible<br>Frequency: Continuous<br>Affected Populations: Disproportionate<br>Risk: Low<br>Uncertainty: Moderate | <p><b>Context:</b> The interest is rated as having a medium resiliency. Pópkw'em harvesters historically frequented Tilbury Phase 2 site and surrounding areas for traditional harvesting before extensive industrial development. While current activity is reduced due to existing development pressures, the community remains moderately resilient to additional environmental stresses. If barriers were reduced, harvesting activity would likely increase.</p> <p><b>Magnitude:</b> Assessed as negligible, based on the absence of residual effects on fish, fish habitat, and surface water. Other key potential residual effects are rated as negligible to low (refer to the EAO's Analysis and Conclusion section and Table K). Historically, fishing and harvesting activities near Tilbury Phase 2 have been limited, with no current fishing activity reported. The only known ongoing harvesting may be minimal plant gathering along the site's edge.</p> <p><b>Extent:</b> Rated as local, since the spatial scale of residual effects to applicable VC's is limited, the impact on harvesting is expected to remain local, primarily within the immediate area of Tilbury Phase 2.</p> <p><b>Duration:</b> Effects on harvesting will persist for as long as the Tilbury Phase 2 facility remains operational, making them medium-term.</p> <p><b>Reversibility:</b> Most effects, particularly those related to sensory disturbances such as noise and light, would cease if Tilbury Phase 2 were halted or upon decommissioning, making them fully reversible.</p> <p><b>Frequency:</b> Rated as continuous as effects would be most prominent during Construction, but some effects (noise, light disturbance) would occur continuously.</p> |

| Residual Effect                                                                                                                   | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p><b>Affected Populations:</b> Tilbury Phase 2's impacts will primarily affect Pópkw'em members who actively harvest, though indirect effects may also be felt by those who refrain from harvesting due to perceived environmental degradation in the highly developed area.</p> <p><b>Risk:</b> Likelihood of these effects occurring is low given effectiveness of mitigation measures, with negligible magnitude of effects and limited extent, the overall consequences are expected to be minor. Therefore, the risk is rated as low.</p> <p><b>Uncertainty:</b> The pathways of effects—such as noise, light, vibration, and impacts on harvesters—are well understood. While mitigation is expected to be moderately to highly effective, some uncertainty remains regarding its ability to fully address harvesters' experiences and perceptions. Therefore, the level of uncertainty is rated as moderate.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Cumulative Effects

Pópkw'em's harvesting and subsistence activities have already been affected by historical environmental degradation (see Current Context section). The Revised Application identifies two foreseeable projects—T1BTMJ—that are expected to increase LNG production and add shipping to the Fraser River, altering the Tilbury Island foreshore prior to construction of Tilbury Phase 2. Both T1B and TMJ could contribute additional sensory disturbances (noise, light, vibration), degrade habitat and water quality, and impact culturally important plant and wildlife resources.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the Lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, including FortisBC's proposed mitigation measures, EAO's Table of Conditions and KMMs, the EAO concludes that Tilbury Phase 2 would have a negligible effect on Pópkw'em's harvesting and subsistence activities.

### 16.12.7 Cultural Use Sites and Areas

#### Background and Current Context

Pópkw'em's traditional territory spans approximately 3,077 km from Yale to Agassiz and into the Sunshine Valley. This area, along with the broader S'ólh Téméxw territory of the Stó:lō Nation, holds deep cultural, spiritual, and historical importance for Pópkw'em. Cultural use sites within these territories include places tied to oral histories, ancestral narratives, and spiritual practices, such as Lhílheqey (Mount Pópkw'em), which remains central to Pópkw'em identity and continuity.

Historically, Pópkw'em members relied on interconnected river systems and upland areas for fishing, hunting, plant gathering, and ceremonial activities, with cultural practices embedded in seasonal rounds and kinship-based stewardship. Pópkw'em continues to assert its rights and responsibilities to protect and maintain cultural connections to land and water, emphasizing the irreplaceable value of these sites for community well-being and intergenerational knowledge transfer.

Pópkw'em did not identify any specific cultural use sites or areas within Tilbury Phase 2 or within the cultural use sites and areas LAA.

#### Potential Project Effects

The EAO identified the following pathway of effects, along with associated VCs outlined in [Appendix 6](#), that may affect Pópkw'em's cultural use sites and areas during Construction, Operation and Decommissioning phases of Tilbury Phase 2:

- **Effects to cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance:** Tilbury Phase 2 could affect cultural use sites and areas through Construction activities that disturb culturally important places, such as archeological sites, due to ground disturbances, accidental spills of deleterious substances, or other construction-related interaction (culture, soil, and archaeological and heritage resources VC's);
- **Loss of access to and disenfranchisement from cultural sites:** Pópkw'em harvesters could experience direct adverse effects to cultural and spiritual practices if access to cultural sites is altered or lost due to closure or modification of trails, parking areas, or access points between Tilbury Phase 2 and the Fraser River for safety or construction purposes (land and resource use VC). Changes in sensory effects (acoustic, air quality, culture, and land and resource use VC's) could change the experience of Pópkw'em members using cultural sites, such as harvesting areas along the south arm of the Fraser River and Burns Bog; and
- **Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas:** Access to cultural sites could be affected (land and resource use VC) by Tilbury Phase 2. Adverse effects to culture (culture VC) which are connected to potential effects on wildlife, habitat, and vegetation (See Harvesting and Subsistence Activities section above) could influence the ability or desire to access these sites.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed to potential Tilbury Phase 2 related effects on cultural use sites and areas. These include the following:

- **Land and Resource Use (Section 7.11)** Traffic-management planning, noise and lighting controls, and communication regarding project activities help reduce disruptions to access and use of culturally important areas. These measures support Pópkw'em's ability to safely access and continue cultural practices within their traditional territory;
- **Culture VC (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support Pópkw'em's land- and water-based cultural practices;
- **Soil (Section 7.6)** Soil-management measures, including erosion control, spill-prevention protocols, and careful handling and disposal of contaminated soils, help prevent the migration of pollutants into nearby cultural areas and waterways. Maintaining soil stability and quality supports the protection of culturally important places and landscapes used by Pópkw'em;
- **Acoustics (Section 7.3)** Noise-reduction measures during construction and operation, including idle-reduction policies, equipment muffling, enclosures, and engineered noise controls, help limit disturbance to culturally important areas and activities. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of cultural knowledge by Pópkw'em;
- **Air Quality (Section 7.2)** The air-quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or

degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Pópkw'em's harvesting and cultural practices; and

- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures, site protection, and early notification to Indigenous nations, help protect culturally important sites, features, and landscapes. These measures support Pópkw'em's ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connections to territory.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on cultural use sites and areas (see [Section 8](#) of this Report):

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance;
- **Condition 10 (Community Feedback Process)** establishes a clear and structured mechanism for Pópkw'em to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of culturally important landscapes and areas, supporting Pópkw'em's continued access to and use of cultural sites during project Construction;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, lighting, wildlife interactions, and spills during project Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by Pópkw'em;
- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emissions-control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites by Pópkw'em; and,
- **Condition 15 (Chance Find Protocol)** requires the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If Pópkw'em historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

#### The EAO's Analysis and Conclusions

After consideration of the mitigation measures and potential effects, described above, the EAO has identified that there will not be any residual effects to Pópkw'em's cultural use sites and areas interest, primarily based on the above proposed mitigation measures, the EAO's analysis, and the lack of current use of Tilbury Phase 2 by Pópkw'em for cultural use sites and areas.

### 16.12.8 Social and Economic Conditions and Indigenous Health and Well-being

#### Background and Current Context

Pópkw'em is a small Stó:lō community with a registered population of 13 members, of which over 90 percent live off reserve. The nation holds three reserve parcels totaling approximately 160 hectares, including Popkum IR1 and IR2 near Bridal Falls. Housing on reserve is extremely limited, with only two private dwellings reported in 2021, reflecting extensive constraints on local residency and community development.

Economic development activities are minimal, with no documented business ventures beyond participation in provincial revenue-sharing agreements related to forestry and clean energy. Employment and income data for Pópkw'em were also unavailable; however, the nation has expressed interest in economic opportunities associated with major projects.

These conditions underscore systemic challenges linked to colonial policies and cumulative effects of land fragmentation, which have limited Pópkw'em's ability to sustain on-reserve housing, employment, and economic growth. Despite these constraints, Pópkw'em continues to assert its rights and seeks opportunities to improve social and economic well-being through partnerships and resource agreements.

Information specific to Pópkw'em's health and wellness is limited; however, the community shares many of the systemic challenges faced by other Stó:lō Nations. Pópkw'em members primarily reside off-reserve, which can create barriers to accessing culturally appropriate health services and community-based programs.

Broader Indigenous health determinants, such as intergenerational trauma, limited access to health care, and socio-economic disparities, continue to influence well-being. While regional services are provided through the Fraser Health Authority and the First Nations Health Authority, Pópkw'em relies on external programs for mental health, reproductive health, and chronic disease management.

The nation has expressed concerns about cumulative effects of industrial development on traditional ways of life, which are closely tied to holistic health, including physical, emotional, spiritual, and cultural dimensions. Loss of access to land-based practices, such as fishing, hunting, and plant gathering, has further impacted opportunities for cultural continuity and food security, both of which are integral to Indigenous health and well-being.

#### Potential Project Effects

The EAO identified the following pathway of effects, along with the associated VCs in [Appendix 6](#) that may affect Pópkw'em's social and economic conditions and Indigenous health and well-being during Construction, Operation and Decommissioning phases of the Tilbury Phase 2:

- **Social and Economic Conditions:**
  - **Effects on infrastructure and services:** Tilbury Phase 2 may add pressure on services if out-of-region workers are used, but according to the Revised Application effects are expected to be limited and not distinguishable from existing conditions (land and resource use, employment and economy, infrastructure services VC's);
  - **Effects to Pópkw'em's employment opportunities, Indigenous businesses, procurement opportunities, and Pópkw'em revenue:** Tilbury Phase 2 could positively affect Pópkw'em's employment and business opportunities, depending on member participation and access to contracts (employment and economy VC). Indigenous workers are also more likely to be in construction-related jobs. However, smaller Indigenous businesses may face challenges competing for workers or meeting Tilbury Phase 2 demands (culture VC);

- **Effects to Pópkw'em's commercial and non-commercial fishing, gathering, and cultural or ceremonial activities and practices:** Tilbury Phase 2 could potentially disrupt economies that shape relationships between Indigenous communities on the Fraser River and that are central to Pópkw'em's identity (fish and fish habitat, wildlife and wildlife habitat, employment and economy, and culture VCs); and
- **Effects to Pópkw'em's ability to improve social and economic conditions:** Tilbury Phase 2 may support Pópkw'em's efforts to improve social and economic conditions by creating employment, training, and business opportunities. Increased demand for skilled workers could also boost interest in trades training. (infrastructure and services, and employment and economy VC).
- **Indigenous Health and Well-Being:**
  - **Effects on the quality, quantity, and availability of harvested country foods:** Land, water or air-based contamination from Tilbury Phase 2 could adversely affect country foods such as fish and traditional plants. See Harvesting and Subsistence Section above;
  - **Effects on the value and perceived quality of country foods:** Quality, quantity or availability of plants or wildlife could be impacted from Tilbury Phase 2. Country foods could become contaminated (See list of potential project effects above). Community perceptions with respect to the quality of country foods have the potential to interact with Pópkw'em members' participation in harvesting and subsistence activities and cultural and spiritual practices even in the absence of adverse effects (land and resource use, and culture VCs);
  - **Effects on air quality, noise and water quality:** Tilbury Phase 2 activities have the potential to contribute contaminants of concern to air and water, and increased noise levels in proximity to the facility property line (air quality, acoustics, surface water, land and resource use, and human health VCs); and
  - **Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites:** Tilbury Phase 2 may interact with Pópkw'em's health and well-being through changes to traditional practices, access to cultural sites, and socio-economic factors. Effects on traditional ways of life due may still influence health outcomes indirectly. Positive effects may include increased income and employment opportunities for members, while potential adverse effects relate to shift work and family stress.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on social and economic conditions and Indigenous health and well-being. These include the following:

- **Land and Resource Use VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting Pópkw'em's on-going stewardship of land and water resources and reducing stressors that can affect well-being;
- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollution from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by Pópkw'em's health and well-being;
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbances to archeological and heritage materials, including chance find procedures and early notification to Indigenous nations, help protect culturally important sites and landscapes that support the spiritual and emotional well-being of Pópkw'em;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for Pópkw'em members and businesses to participate economically in the project, supporting improved social conditions and community well-being;

- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socioeconomic impacts on Pópkw'em and supporting health and community stability;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports Pópkw'em's food security, cultural identity, and health by safeguarding salmon and other species essential to FSC harvesting;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting Pópkw'em's cultural continuity and nutritional well-being;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to Pópkw'em's physical health and cultural practices;
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Pópkw'em's well-being;
- **Air Quality (Section 7.2)** Air emission controls help protect respiratory health and prevent contamination of country foods, supporting Pópkw'em's physical well-being and confidence in harvesting;
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect Pópkw'em members' physical, cultural, and mental health;
- **Acoustics (Section 7.3)** Noise reduction measures limit sensory disturbance to people, wildlife, and harvesting areas, reducing stress and supporting Pópkw'em's comfort, well-being, and connection to land and water;
- **Surface Water (Section 7.4)** Managing runoff, erosion, and sediment helps maintain water quality in the lower Fraser, supporting Pópkw'em's cultural and nutritional reliance on healthy salmon and aquatic ecosystems; and,
- **Groundwater (Section 7.5)** Protecting groundwater from contamination helps maintain the quality of ecosystems that support fish, plants, and wildlife relied on for Pópkw'em's subsistence and health.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects to social and economic conditions and Indigenous health and well-being:

- **Condition 10 (Community Feedback Process)** provides Pópkw'em with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting Indigenous health and well-being;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)** require ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with Pópkw'em to be developed by the Holder in consultation with the Nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;

- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting Pópkw'em's physical health and overall wellbeing;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If Pópkw'em historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated cultural or emotional harm, supporting Indigenous health and well-being;
- **Condition 16 (Indigenous and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support socio-economic well-being;
- **Condition 17 (Dry Street Sweeping Report)** requires FortisBC to submit a report on the effectiveness Dry Street Sweeping to mitigate the effects of 6-PPDQ on fish within eighteen months of a Certificate being issued. By informing measures to protect downstream aquatic environments, this condition supports Pópkw'em's health and well-being by helping maintain confidence in environmental quality and minimizing potential concerns related to contamination of culturally important fish and waterways.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Well-being:

- **Accidents and Malfunctions Reporting** would support mitigation of potential impacts on the Nation's interests by ensuring timely responses, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

#### The EAO's Analysis and Conclusions

After considerations in the EAO's conclusions on the linked VCs, potential effects, mitigation measures and conditions, the EAO concludes that Tilbury Phase 2 is not expected to result in residual adverse effects on Pópkw'em social and economic conditions and Indigenous health and well-being.

While the nation continues to experience extensive systemic challenges, including limited access to housing, employment, culturally important lands, access to holistic and community-based health and well-being programs, these are primarily the result of historic and ongoing regional industrial development, systemic effects to healthcare and not directly attributable to Tilbury Phase 2. Tilbury Phase 2 is situated in an already industrialized area with limited current access or use by Pópkw'em members.

Although Tilbury Phase 2 may interact with aspirations for land and water restoration, or for re-establishing cultural practices in the area, the potential for employment, training, and contracting benefits may also support the nation's efforts to strengthen their economic conditions. On balance, the potential for positive effects, alongside the lack of material new barriers introduced by Tilbury Phase 2, supports the EAO's conclusion of no residual effect on social and economic conditions. Therefore, no characterization of residual effects or cumulative effects assessment was undertaken.

#### 16.12.9 Positive Effects of Tilbury Phase 2

According to the Revised Application, Tilbury Phase 2 is expected to create job opportunities, particularly in Construction, benefit Indigenous businesses through contracting and procurement, and potentially increase revenue for the Pópkw'em, while improving social and economic conditions and providing long-term skills training opportunities for Indigenous people in the area.

The positive effects of Tilbury Phase 2 depend on the level of participation and access for Indigenous people and businesses that may have to the opportunities generated, with direct positive effects on Pópkw'em's interests being limited compared to existing conditions.

#### 16.12.10 Conclusions

Considering the above analyses, the EAO's engagement with Pópkw'em, FortisBC's and Pópkw'em's engagement, the mitigation measures, cumulative effects, the EAO's recommended Table of Conditions and the identified Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 is anticipated to have a negligible residual effect on Pópkw'em's harvesting and subsistence activities.

Considering the above analyses, the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on the Indigenous interests of Pópkw'em has been adequately avoided, minimized or otherwise accommodated. Based on the engagement undertaken with Pópkw'em on Tilbury Phase 2, as outlined above in Section 16.12.2, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with Pópkw'em.

## 16.13 Semiahmoo First Nation

### 16.13.1 Community Profile

Semiahmoo First Nation (Semiahmoo) are Coast Salish peoples located near White Rock, the U.S. border and Boundary Bay (Indigenous and Northern Affairs Canada 2019). Semiahmoo's traditional territory extends in a half-moon shape around Boundary Bay including sections of Point Roberts, the Serpentine and Nicomekl Rivers, and Lake Terrell (Brown 2014).

Semiahmoo is a transboundary nation that has historically inhabited and used areas of the Lower Mainland of B.C., the Salish Sea, and the state of Washington in the U.S. (Semiahmoo n.d.c). Semiahmoo people have deep connections to the land and resources in and around their traditional territory and continue to have close ties with the Lummi and Nooksack Peoples in the state of Washington.

Semiahmoo has approximately 151 members. The population of Semiahmoo Reserve was reported as 71 in the 2021 Canada Census, decreasing from 120 in 2016 (Statistics Canada 2023a).

### 16.13.2 Semiahmoo First Nation Involvement in the Environmental Assessment

During the Early Engagement Phase Semiahmoo did not identify as a participating Indigenous nation; however, the EAO worked collaboratively with Semiahmoo throughout the assessment process. As part of the TAC, Semiahmoo participated in technical meetings throughout the EA for Tilbury Phase 2.

The EAO and IAAC provided funding to support Semiahmoo's engagement in the EA process. EAO provided documents to Semiahmoo such as Tilbury Phase 2 updates, the draft Initial Project Description and DPD, and Process Planning documents for review. Semiahmoo was also invited to a number of meetings. During the Process Planning phase, it was agreed that the EAO would assess Tilbury Phase 2 effects on Semiahmoo Indigenous interests with input and review from Semiahmoo, as identified in Section 4 of the Assessment Plan.

The EAO used the following sources in drafting the assessment of Tilbury Phase 2 effects on their Indigenous interests:

- FortisBC's (Proponent) Revised Application;
- Information submitted during the EA by the Proponent and Semiahmoo;
- Conclusions from the EAO's assessment of VCs;
- The Proponent's [Indigenous Consultation Report](#); and
- A summary of the Proponent's engagement with Semiahmoo is provided in [Section 11.13 of the Revised Application](#).

### 16.13.3 Assessment Boundaries

All Tilbury Phase 2 components are within Semiahmoo's traditional territory.

The spatial assessment boundaries for each Indigenous interest were defined based on the overlap of the cultural use and occupancy area with the combined LAAs and combined RAAs identified for linked VCs (see Revised Application [Figure 11.13-1]). The LAA of each Indigenous interest consists of the combined LAAs of VCs that are linked to the Indigenous interest, whereas the RAA of each Indigenous interest consists of the combined RAAs of VCs that are linked to the Indigenous interest. The LAA is used more for assessing direct or indirect Tilbury Phase 2 effects, while the RAA is for assessing cumulative effects.

#### 16.13.4 Regional Context

The Project Footprint, as well as the LAA and RAA, are situated within a region deeply tied to the cultural, historical, and economic activities of Semiahmoo. According to the Revised Application, The Semiahmoo people consider themselves as part of the landscape, and this landscape serves as their sacred place, history book, storehouse of raw materials, and training ground.

Semiahmoo's traditional territory stretches north to Coquitlam, B.C., and the southern part of Stave Lake; west to include the southern Gulf Islands and parts of eastern Vancouver Island, including part of the Cowichan Valley and Saanich; east to the Abbotsford, B.C., area of the Lower Mainland of B.C.; and south in northwestern Washington state to include the San Juan Islands.

The Semiahmoo states that it has exclusive Aboriginal Rights and Title to Semiahmoo Bay, Point Roberts, and village sites at SCOUTEN and C'ELLENEM, and they were the traditional caretakers of the reef-net sites in those areas.

Semiahmoo has a profound relationship with the Fraser River, describing this relationship as one that sustains and nourishes its members physically, culturally, and spiritually. They traditionally used the southern arm of the lower Fraser River adjacent to the Project Footprint, in the vicinity of Deas Island and Tilbury Island, to fish and to harvest other traditional foods and material resources.

Semiahmoo is committed to protecting their waters, fish, and sacred sites. The impacts of European contact and industrialization, including contamination, have extensively affected their traditional harvesting areas. Their cultural and historical ties to this region remain strong, shaping their ongoing relationship with the land and waters.

The existing Tilbury LNG facility consists of gravel and paved areas, existing infrastructure, and equipment laydown areas supporting little plant life with very little to no habitat value for wildlife. The vegetation within the Project Footprint is mostly limited to ditch lines and spoil piles and is dominated by non-native and invasive plant species. Public access to the Project Site is limited, although there is currently public use of the dike to the north of the Project Site along the Fraser River.

#### 16.13.5 Indigenous Interests

The EAO engaged Semiahmoo during the Early Engagement phase in the development of the [Joint Summary of Issue and Engagement for the Tilbury Phase 2 LNG Expansion Project](#), where EAO summarized an initial understanding of Semiahmoo's interests; however, Semiahmoo did not provide comments. Therefore, the EAO drafted the [Tilbury Phase 2- Schedule C – Application Information Requirements](#) Table 6, which outlines the Proposed Preliminary List of Indigenous Interests based on conversations with other First Nations involved in the Project and a preliminary understanding of Tilbury Phase 2 effects and how they may impact First Nation interests.

The Proponent identified Semiahmoo's Indigenous interests to be assessed in the Revised Application through:

- Reviewing requirements and guidance from the EAO and AIR; and
- Conducting engagement efforts with Semiahmoo to gather information on their Indigenous interests, as outlined in [Section 11.13.3 of the Revised Application](#) - Summary of Engagement of the Semiahmoo section.

The EAO attempted to engage with Semiahmoo during the development of this Report; however, no comments were received on their section, and the EAO relied on the preliminary list of Indigenous interests identified in the AIR, which include:

- Harvesting and subsistence activities;
- Cultural use sites and areas;
- Social and economic conditions; and
- Indigenous health and well-being.

The assessment of Semiahmoo's Indigenous interests in this section uses these categories.

The EAO's assessment of Semiahmoo's Indigenous interests includes describing the Indigenous Interest, current context, potential effects, mitigation, and effects analysis. If there is an adverse residual effect, a characterization of effects and cumulative effects assessment is also completed.

### 16.13.6 Harvesting and subsistence activities

#### Background

Semiahmoo has a profound, holistic relationship with the Fraser River, which supports their physical, mental, spiritual, and emotional well-being. They hold an inherent responsibility to steward fish, wildlife, and plant habitats.

For thousands of years, harvesting for food, social, and ceremonial (FSC) purposes has been central to Semiahmoo life. Once among the wealthiest coastal nations due to a thriving fishery, they used marine resources for subsistence, trade, and economic purposes. Their traditional territory includes the Fraser River, Roberts Bank, Semiahmoo Bay, and the broader Salish Sea.

According to the Revised Application, Semiahmoo may have historically fished near the project site, at a village on the south arm of the Fraser River. However, access to this area would have required permission through marriage ties with the Quw'utsun Nation.

Plant gathering has also been an important traditional activity, along with hunting east of Boundary Bay on both sides of Canada and historically over the U.S. border, targeting species such as deer, elk, bear, beaver, and seal.

#### Current Context

According to the Revised Application, development, pollution, and fishery decline have reduced Semiahmoo's access to traditional marine food sources and economic resources. Contamination in the lower Fraser River has limited their ability to fish and harvest in historically used areas. Despite these challenges, the nation continues to uphold its stewardship responsibilities for fish, wildlife, and plant habitats.

Communal fishing access, when permitted, has occurred upstream of the Port Mann Bridge—outside the LAA for fish, fish habitat, and surface water—since at least 2004. More recently, members have reported harvesting beaver, waterfowl, and migratory birds near the George Massey Tunnel.

Current plant harvesting areas include Deas Island, Tilbury Island, and Burns Bog, though these have been affected by ongoing development. The Tilbury Phase 2 site is heavily disturbed, privately owned, and dominated by invasive species, limiting its value as a traditional harvesting site. While the Project Footprint is not accessible and will remain restricted, Semiahmoo members may continue gathering in nearby areas along the South Arm of the Fraser River.

#### Potential Project Effects

The EAO has identified the following pathway of effects, prior to the application of mitigation measures along with the associated VCs outlined in [Appendix 6](#), that may affect Semiahmoo's harvesting rights and subsistence activities during the Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- **Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources** from increased noise, light, and air pollution (acoustics, air quality, soil, groundwater, land and resource VCs) may deter Semiahmoo members from accessing preferred harvesting areas near Tilbury Phase 2 site. Changes in fish distribution and abundance (fish and fish Habitat VC) and the introduction of invasive plant species (vegetation VC) may further reduce the experience and preference of the practicing of harvesting rights. While Semiahmoo does not currently fish or harvest close to the Project site, they have historically and could in the future if the site was decommissioned to a more natural state;

- **Effects to Semiahmoo First Nation rights to fish for food, social and ceremonial (FSC) purposes** from habitat loss, (wildlife, fish, vegetation VCs), increased mortality risks to fish, birds, and wildlife (wildlife and wildlife habitat VCs), and changes in their behavior due to sensory disturbances (acoustics, air quality VCs). Additionally, contamination risks to fish habitat in Tilbury Slough (surface water VC) and Fraser River downstream, as well as contaminated soil (soil VC), could impact important plant species, and may further impact traditional harvesting and cultural practices; and
- **Effects on the accessibility and availability of traditional lands and resources** may occur as a result of altered land or water based travel routes, access restrictions, or safety considerations, including changes to navigability and the usability of established travel corridors (land and resource use and surface water VCs), as well as indirect effects from sensory disturbances such as noise, dust, lighting, or visual changes that may discourage travel through otherwise accessible areas (air quality, acoustics, and land and resource use VCs).

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures that the Proponent has proposed in response to potential Tilbury Phase 2-related effects on harvesting and subsistence activities, as mentioned in the section above. A full table of Proponent mitigations can be found in [Appendix A of the Revised Application](#). Below is a summary of KMMs, how they address effects on the relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air quality measures, such as idle reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Semiahmoo's harvesting and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during construction and operation—such as idle reduction policies, equipment enclosures, and engineered noise controls—help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Semiahmoo's harvesting and cultural practices;
- **Surface Water (Section 7.4)** Erosion and sediment-control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm-sewer system. These protections support water quality and fish habitat relied on to support Semiahmoo's harvesting and cultural practices;
- **Soil (Section 7.6)** Soil management measures—such as erosion control, spill prevention, and careful handling of contaminated soils—help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by Semiahmoo for harvesting and cultural practices;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by Semiahmoo for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to Semiahmoo's harvesting and cultural practices;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat and water quality used by salmon migrating through the lower

Fraser. These actions support the health and availability of salmon and other fish species central to Semiahmoo's FSC harvesting and cultural practices;

- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used for harvesting or cultural practices; and
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat and vegetation important to Semiahmoo's harvesting and cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions to help reduce potential impacts on Semiahmoo's harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting rights (see [Section 8](#) of this Report):

- **Condition 10 (Community Feedback Process)** creates a clear way for Semiahmoo to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of Semiahmoo's harvesting and cultural practices;
- **Condition 12 (CEMP)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to Semiahmoo's harvesting and cultural practices;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to Semiahmoo's harvesting and cultural practices;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emissions control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support Semiahmoo's harvesting and cultural practices; and
- **Condition 17 (Dry Street Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project related roads, which may lower potential impacts on salmon and other fish important to Semiahmoo's harvesting and cultural practices.

In addition to the Proponent's mitigations and the provincial Conditions the EAO identified the following federal Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to harvesting and subsistence activities:

- **Federal Consideration for Migratory Bird Protections:** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Semiahmoo's harvesting practices and broader ecosystem conditions important to their way of life.

#### The EAO's Analysis and Conclusions

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Semiahmoo's harvesting rights and interests:

- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources;

- Effects to Semiahmoo Aboriginal rights to fish for FSC purposes; and
- Effects on the accessibility and availability of traditional lands and resources.

The EAO's characterization of the residual effects of Tilbury Phase 2 on harvesting and subsistence activities are summarized in the table below.

Table 35: Summary of residual effects and rationale on Semiahmoo harvesting and subsistence activities.

| Residual Effect                                                                                                                                                                                                                                                                                                                                                                                                                | Assessment Rating*                                                                                                                                                                                                                                                                            | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Harvesting and subsistence activities</p> <ul style="list-style-type: none"> <li>- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources</li> <li>- Effects to Semiahmoo Aboriginal rights to fish for FSC purposes</li> <li>- Effects on the accessibility and availability of traditional lands and resources</li> </ul> | <p>Context (resilience): Medium resilience</p> <p>Magnitude: Negligible</p> <p>Extent: Local</p> <p>Duration: Medium-term</p> <p>Reversibility: Fully reversible</p> <p>Frequency: Continuous</p> <p>Affected Populations: Disproportionate</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><b>Context:</b> The interest is rated as having a medium resiliency. Semiahmoo harvesters historically frequented the Tilbury Phase 2 site and surrounding areas for traditional harvesting before extensive industrial development. While current activity is reduced due to existing development pressures, the community remains moderately resilient to additional environmental stresses. If barriers were reduced, harvesting activity would likely increase.</p> <p><b>Magnitude</b> Assessed as negligible, based on the negligible magnitude impact on fish and fish habitat, and surface water. Sensory disturbances associated with the Project (i.e. noise, light and air quality) are negligible to low in magnitude and are not expected to extend to area where Semiahmoo harvests or fishes. Historically, fishing and harvesting activities near the Project site have been limited, with no current fishing activity reported. The only known on-going harvesting may be minimal plant gathering along the site's edge.</p> <p><b>Extent:</b> Rated as local, since the spatial scale of residual effects to applicable VC's is limited, the impact on harvesting is expected to remain local, primarily within the immediate Project area.</p> <p><b>Duration:</b> The effects on harvesting will persist for as long as the Tilbury Phase 2 facility remains operational, making them medium-term.</p> <p><b>Reversibility:</b> Most effects, particularly those related to sensory disturbances such as noise and light, would cease if Tilbury Phase 2 were halted or upon decommissioning, making them reversible.</p> <p><b>Frequency:</b> Rated as continuous because while effects may be most pronounced during Construction, the Project introduces ongoing changes to baseline conditions (e.g., access, disturbance, and altered resource conditions) that persist over the life of the Project and continue to influence harvesting and subsistence activities.</p> <p><b>Affected Populations:</b> Tilbury Phase 2's impacts are expected to be disproportionately experienced by Semiahmoo members who actively harvest, while indirect effects may also be felt by those who refrain from harvesting due to perceived environmental degradation in the highly developed area.</p> <p><b>Risk:</b> The likelihood of these effects occurring is low due to the effectiveness of mitigation measures and conditions. Given their negligible magnitude and limited spatial extent, the resulting consequences are expected to be minor; therefore, overall risk is rated as low.</p> <p><b>Uncertainty:</b> The pathways of effects, such as noise, light, vibration, and impacts on harvesters, are well understood. While mitigation is expected to be moderately to highly effective, some uncertainty remains regarding its ability to fully address harvesters' experiences and perceptions. Therefore, the level of uncertainty is rated as moderate.</p> |
| <p>* Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a></p>                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Cumulative Effects

As described in the Background and Current Context sections, Semiahmoo's harvesting and subsistence activities have already been affected by historical environmental degradation. The Revised Application identifies two reasonably foreseeable projects, T1B and TMJ, that are expected to introduce additional vessel traffic in the Fraser River and further development of the Tilbury Island foreshore prior to construction of the proposed Project. These developments may introduce additional sensory disturbances (noise, light, vibration), degrade habitat and water quality, and impact culturally important plant and wildlife resources.

The EAO recognizes the project-specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

### Conclusion

Considering the above analyses, FortisBC's proposed mitigation measures, the EAO's Table of Conditions, and KMMs, the EAO concludes that Tilbury Phase 2 would have negligible effects on Semiahmoo's harvesting and subsistence activities.

## 16.13.7 Cultural Use Sites and Areas

### Background

The Semiahmoo states that the use of their traditional lands and resources, including these cultural use sites, has a spiritual and sacred element that is integral to their cultural identity. Their history notes a deep connection where their ancestors are intertwined with the landscape. They have a profound relationship with the Fraser River, stating that this relationship nourishes their members holistically (physically, mentally, spiritually, and emotionally).

These cultural use sites and the ability to access and practice traditions within them are intrinsically linked to the Semiahmoo's Aboriginal rights, which are recognized and affirmed under Section 35 of the *Constitution Act*, 1982. These rights include the right to harvest resources for FSC purposes, which are deeply connected to traditional territories and cultural practices.

### Current Context

Semiahmoo has identified several key cultural and harvesting use sites within the broader area of the Project, see Harvesting and Subsistence Activities section above. This includes a historic Indigenous village site<sup>32</sup> across from Tilbury Phase 2 on the south arm of the Fraser River, used for seasonal fishing and accessed through a series of marriage ties with Quw'utsun Nation. The nation has also emphasized the importance of Deas and Tilbury islands, Crescent Beach, and Point Roberts for traditional harvesting and temporary camps, as well as the spiritual and cultural importance of these places.

While some of these areas fall within the harvesting and subsistence RAA (e.g., Crescent Beach), they are outside the immediate LAA for harvesting activities. Semiahmoo has stressed that their use of traditional lands is both spiritual and practical, with ceremonies, gatherings, and ancestral connections deeply tied to the landscape. Maintaining access to these sites, including travel routes to the Gulf Islands and Victoria, is important for the continuation of cultural practices.

---

See Section 3.1 for naming and jurisdictional context regarding the Historic Indigenous Village Site.

### Potential Project Effects

The EAO has identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#), that may affect Semiahmoo's cultural use sites and areas during the Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- **Effects to cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural importance;** Tilbury Phase 2 could affect cultural use sites and areas through construction activities that disturb culturally important places, such as archaeological sites, due to ground disturbance, accidental spills of deleterious substances, or other construction-related interactions (culture, soil, archaeological and heritage resources VC);
- **Loss of access to and disenfranchisement from cultural sites;** Semiahmoo harvesters could experience direct adverse effects to cultural and spiritual practices if access to cultural sites is altered or lost due to closure or modification of trails, parking areas, or access points between Tilbury Phase 2 and the Fraser River for safety or construction purposes (land and resource VC). Changes in sensory effects (acoustic, air quality, culture, land and resource VC) could change the experience of Semiahmoo members using cultural sites, such as a historic fishing village, harvesting areas along the south arm of the Fraser River and Burns Bog; and
- **Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas;** Access to cultural sites could be affected (land and resource use VC) by Tilbury Phase 2. Adverse effects to culture (culture VC) which are connected to potential effects on wildlife, habitat, and vegetation (See Harvesting and Subsistence section above) could influence the ability or desire to access these sites.

### Mitigation Measures

The Revised Application summarizes relevant mitigation measures proposed by the Proponent to address potential Tilbury Phase 2 related effects on cultural use sites and areas, including:

- **Land and Resource Use (Section 7.11)** Traffic management planning, noise and lighting controls, and communication regarding project activities help reduce disruptions to access and use of culturally important areas. These measures support Semiahmoo's ability to safely access and continue cultural practices within their traditional territory;
- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support Semiahmoo's ability to access, use, and maintain culturally important areas, including places of teaching, ceremony, and connection to land and water;
- **Soil (Section 7.6)** Soil management measures, including erosion control, spill-prevention protocols, and careful handling and disposal of contaminated soils, help prevent the migration of pollutants into nearby cultural areas and waterways. Maintaining soil stability and quality supports the protection of culturally important places and landscapes used by Semiahmoo;
- **Acoustics (Section 7.3)** Noise reduction measures during Construction and Operation, including idle reduction policies, equipment muffling, enclosures, and engineered noise controls, help limit disturbance to culturally important areas and activities. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of cultural knowledge by Semiahmoo;
- **Air Quality (Section 7.2)** The air quality measures, such as idle reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Semiahmoo's harvesting rights and cultural practices; and

- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures, site protection, and early notification to Indigenous nations, help protect culturally important sites, features, and landscapes. These measures support Semiahmoo's ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connections to territory.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects to Indigenous cultural use sites and areas:

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance.
- **Condition 10 (Community Feedback Process)** establishes a clear and structured mechanism for Semiahmoo to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of culturally important landscapes and areas, supporting Semiahmoo's continued access to and use of cultural sites during project construction;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, lighting, wildlife interactions, and spills during project Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by Semiahmoo;
- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emissions control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites by Semiahmoo; and
- **Condition 15 (Chance Find Protocol)** requires the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If Semiahmoo historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

#### The EAO's Analysis and Conclusions

After considering the proposed mitigation measures, the EAO concludes that Tilbury Phase 2 could result in the following residual adverse effects to Semiahmoo's harvesting rights and interests:

- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance;
- Loss of access to and disenfranchisement from cultural sites; and
- Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas.

Semiahmoo and the EAO's characterization of the residual effects of Tilbury Phase 2 on cultural use sites and areas are summarized in the table below.

Table 36: Summary of residual effects and rationale on Semiahmoo First Nation and its cultural use sites and areas.

| Residual Effect                                                                                                                                                                                                                                                                                                                                                                                                                        | Assessment Rating*                                                                                                                                                                                                                                                                  | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Cultural use sites and areas</p> <ul style="list-style-type: none"> <li>- Loss of access to and disenfranchisement from cultural sites</li> <li>- Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas</li> <li>- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance;</li> </ul> | <p>Context (resilience): Low</p> <p>Magnitude: Negligible</p> <p>Extent: Local</p> <p>Duration: Medium-term</p> <p>Reversibility: Partially reversible</p> <p>Frequency: Continuous</p> <p>Affected Populations: Disproportionate</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><b>Context:</b> Rated as having low resilience, acknowledging that while the nation has shown cultural resilience in the face of historical impacts, it is difficult to quantify the community's capacity to absorb additional adverse effects. Cultural strength may have been greater in the absence of cumulative disturbances, and potential links between cultural impacts and community health further complicate the assessment. Given these historical and ongoing challenges, this rating reflects a conservative estimate.</p> <p><b>Magnitude</b> is assessed as negligible, based on the negligible magnitude residual effects on fish, fish habitat, and surface water. Other connected VC potential residual effects (wildlife and wildlife habitat, vegetation, land and resource use) are rated as negligible to low majority and are of local extent. The Tilbury Phase 2 site is located on fee simple land, with no public access.</p> <p><b>Extent:</b> Rated as local, as the anticipated residual effects are geographically confined to Tilbury Phase 2 vicinity and immediate surrounding areas. While Semiahmoo members reside throughout the Lower Mainland, it is unlikely that cultural effects would extend beyond the immediate Project area.</p> <p><b>Duration:</b> Rated as medium-term, as residual effects will likely cease after the Decommissioning phase.</p> <p><b>Frequency:</b> Rated as continuous, particularly for loss of site use for cultural purposes, which is an ongoing effect. Sensory disturbances (e.g., noise, light) may be either continuous or irregular, depending on Tilbury Phase 2 activities.</p> <p><b>Reversibility:</b> Most sensory-related disturbances (e.g., noise, light) would be fully reversible following project decommissioning. However, cultural impacts linked to the loss of access or disruption to traditional practices may be irreversible.</p> <p><b>Affected Populations:</b> Direct impacts would disproportionately affect those actively practicing or seeking to practice their culture; However, indirect effects could extend to all members due to the interconnected nature of Semiahmoo cultural identity.</p> <p><b>Risk:</b> The likelihood of negative cultural impacts occurring is low, and the overall consequence is expected to be minor, given the negligible magnitude of direct Tilbury Phase 2-related effects and the application of mitigation measures. Risk is therefore rated as low.</p> <p><b>Uncertainty:</b> Rated as moderate, as cultural effects are inherently challenging to quantify and may be subject to individual and community-specific experiences that are difficult to predict with certainty.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a>                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Cumulative Effects

As outlined in the Background and Current Context sections, Semiahmoo's cultural use sites have already been extensively impacted by historical environmental degradation and land-use changes. This includes contamination of key harvesting areas such as Semiahmoo Bay, restricted access and altered ecological conditions along the Fraser River, and industrial degradation of sites like Tilbury Island. These impacts have limited the nation's ability to use culturally important areas and have disrupted the transmission of Indigenous knowledge.

The Revised Application also identifies two reasonably foreseeable projects, the T1B and the TMJ Project, that are expected to further alter the Tilbury Island foreshore. TMJ would also introduce additional vessel traffic in the Fraser River. These developments may introduce additional sensory disturbances (e.g., noise, light, vibration), remove culturally important vegetation, and affect aquatic environments, potentially impacting fish populations and cultural connections to the river. The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River. The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses including FortisBC's proposed mitigation measures, the EAO's Table of Conditions, and based on the Project specific effects of Tilbury Phase 2, the EAO concludes that the Project will have a negligible effect on Semiahmoo's cultural use sites and areas.

## 16.13.8 Social and Economic Conditions

### Background

Semiahmoo's social and economic well-being is closely linked to their Section 35 Aboriginal rights, including harvesting and access to cultural sites. These rights have historically supported community identity, self-determination, and economic resilience. The Revised Application uses indicators such as population, health, housing, education, employment, and economic development to reflect the nation's current social and economic conditions and connection to their traditional territory.

### Current Context

Ongoing development, industrialization, and environmental degradation have extensively affected Semiahmoo's access to culturally and economically important areas, including those around Tilbury Island. This has disrupted traditional fishing and harvesting activities and contributed to declines in community health, limited housing options, and barriers to education and employment. Many members now live off-reserve and rely on off-reserve economic partnerships. Despite these systemic challenges, members continue to seek opportunities for education, employment, and cultural revitalization.

See sections on Cultural Use Sites and Areas and Harvesting and Subsistence Activities for additional context.

### Potential Project Effects

The EAO has identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#), that may affect Semiahmoo's social and economic conditions during the Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- **Effects on infrastructure and services;** Tilbury Phase 2 may add pressure on services if out-of-region workers are used, but according to the Revised Application effects are expected to be limited and not distinguishable from existing conditions (land and resources, employment and economy, infrastructure services VC);
- **Effects to Semiahmoo First Nation's employment opportunities, Indigenous businesses, procurement opportunities, and Semiahmoo First Nation revenue;** Tilbury Phase 2 could positively affect Semiahmoo's employment and business opportunities, depending on member participation and access to contracts (employment and economy VC). Indigenous workers are also more likely to be in construction-related jobs. However, smaller Indigenous businesses, including those linked to SFN, may face challenges competing for workers or meeting Tilbury Phase 2 demands (culture VC);

- **Effects to Semiahmoo First Nation's future aspirations for sites or areas surrounding Tilbury Phase 2;** Potential residual effects from Tilbury Phase 2 could affect Semiahmoo's aspirations for land and water restoration, and their continued use of the Fraser River amid growing regional development (fish and fish habitat, wildlife and wildlife habitat, vegetation VC, and see Cultural Use Sites and Areas and Harvesting and Subsistence Activities sections);
- **Effects to Semiahmoo First Nation's ability to improve social and economic conditions;** Tilbury Phase 2 may support Semiahmoo's efforts to improve social and economic conditions by creating employment, training, and business opportunities. Increased demand for skilled workers could also boost interest in trades training. (infrastructure and services, and employment and economy VC); and
- **Effects to Semiahmoo First Nation's commercial and non-commercial fishing, gathering, and cultural or ceremonial activities and practices;** Potential residual effects from Tilbury Phase 2 could affect Semiahmoo's ability benefit from commercial and non-commercial fishing and gathering due to fish and wildlife mortality and loss of traditional plants used for harvesting. Furthermore, there could be a loss to their ability to practice their cultural or ceremonial activities in the Project area (fish and fish habitat, wildlife and wildlife habitat, vegetation VC, and see cultural use sites and areas and harvesting and subsistence activities sections).

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that FortisBC has proposed in response to potential Tilbury Phase 2 related effects on social and economic conditions. These include the following:

- **Land and Resource Use VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting Semiahmoo's long-term aspirations for land and water restoration and reducing stressors that can impact economic development and community well-being;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for Semiahmoo members and businesses to participate economically in the project, supporting improved social conditions and community well-being;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socio-economic impacts on Semiahmoo and supporting health and community stability;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports Semiahmoo's food security, cultural identity, and local economy by safeguarding salmon and other species essential to FSC harvesting;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting Semiahmoo's cultural continuity, social cohesion, and ongoing participation in land-based economic and stewardship activities;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods, help sustain traditional harvesting practices, protect culturally significant resources, and support the social and economic activities tied to Indigenous knowledge, land use, and stewardship; and

- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Semiahmoo's social and economic interest.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on social and economic conditions:

- **Condition 10 (Community Feedback Process)** provides Semiahmoo with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting on-going social and economic interests;
- **Condition 12 (CEMP)** requires mitigation measures to manage dust, noise, traffic, spills, surface water, erosion, and wildlife interactions during Construction. These measures help minimize construction related disturbances that could affect community and social well-being of Semiahmoo members;
- **Condition 13 (OEMP)** requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation. By limiting long-term environmental disturbances, this condition supports stable environmental conditions that protect Semiahmoo's social and economic interests;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality mitigates sensory disturbances, such as dust and odors, and prevents particulate deposition that may impact traditional resources. This supports the social and economic conditions of Semiahmoo by preserving the cultural acceptability and integrity of harvested species, ensuring harvesting does not become more difficult or costly to access;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If Semiahmoo historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated social harm; and
- **Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support Semiahmoo First Nation's socio-economic well-being through increased access to jobs, skills development, and business opportunities associated with Tilbury Phase 2.

#### The EAO's Analysis and Conclusions

After considering the EAO's conclusions on the linked VCs, and proposed mitigation measures, the EAO concludes that Tilbury Phase 2 is not expected to result in residual adverse effects on Semiahmoo's social and economic conditions.

While the nation continues to experience extensive systemic challenges - including limited access to housing, employment, and culturally important lands - these are primarily the result of historic and ongoing regional industrial development, and not directly attributable to Tilbury Phase 2.

Tilbury Phase 2 is situated in an already industrialized area with limited current access or use by Semiahmoo members, and any additional demands on local services are expected to be negligible compared to existing pressures.

Although Tilbury Phase 2 may interact with cultural practices in the area, the potential for employment, training, and contracting benefits may also support the nation's efforts to strengthen their economic conditions.

On balance, the potential for positive effects, alongside the lack of material new barriers introduced by Tilbury Phase 2, supports the EAO's conclusion of no residual effect on social and economic conditions and therefore no characterization of effects or cumulative effects assessment was undertaken.

### 16.13.9 Indigenous Health and Well-Being

#### Background

The Semiahmoo's concept of health and well-being is holistic, deeply tied to their land, resources, and cultural traditions. It extends beyond physical health to include mental, spiritual, and emotional well-being.

#### Current Context

The Semiahmoo emphasizes that maintaining traditional practices, such as shellfish harvesting, is vital for the health and well-being of its members. However, due to pollution and contamination in their traditional waters, the Department of Fisheries and Oceans (DFO) has banned shellfish harvesting along the White Rock and Semiahmoo Reserve foreshore. This has led to a loss of cultural traditions, disrupted the transfer of Indigenous Knowledge, and contributed to chronic health issues in the community.

The nation also links mental health challenges to environmental degradation, including declining water quality, erosion, and reduced fish populations. Although swimming is now permitted again at White Rock Beach due to improved water quality, the community has faced long-term issues with access to clean drinking water since 1996. An improvement occurred in 2021, when the nation began receiving safe drinking water from Metro Vancouver, positively impacting community health.

#### Potential Project Effects

The EAO has identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#), that may affect Semiahmoo's Indigenous health and well-being during the Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- **Effects on the quality, quantity, and availability of harvested country foods:** Land, water or air-based contamination from Tilbury Phase 2 could adversely affect country foods such as fish and traditional plants (see Harvesting and Subsistence section above);
- **Effects on the value and perceived quality of country foods:** Quality, quantity or availability of plants or wildlife could be impacted from Tilbury Phase 2. Country foods could become contaminated. (See list of potential project effects above). Community perceptions with respect to the quality of country foods have the potential to interact with Semiahmoo members' participation in harvesting and subsistence activities and cultural and spiritual practices even in the absence of adverse effects (land and resource use and culture VCs);
- **Effects on air quality, noise, and water quality:** Tilbury Phase 2 activities have the potential to contribute contaminants of concern to air and water, and increased noise levels in proximity to the facility property line (air quality, acoustics, surface water, land and resource, health VCs); and
- **Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites:** The proposed Project may interact with Semiahmoo's health and well-being through changes to traditional practices, access to cultural sites, and socio-economic factors. Semiahmoo has identified the loss of traditional food sources and harvesting access as contributing to chronic health issues and limiting intergenerational knowledge transfer. Effects on traditional ways of life due may still influence health outcomes indirectly. Positive effects may include increased income and employment opportunities for members, while potential adverse effects relate to shift work and family stress.

## Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on Indigenous health and well-being. These include the following:

- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by Semiahmoo's health and well-being;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socioeconomic impacts on Semiahmoo and supporting health and community stability;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting Semiahmoo's cultural continuity and nutritional well-being;
- **Land and Resources VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting Semiahmoo's long-term aspirations for land and water restoration and reducing stressors that can affect well-being;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for Semiahmoo members and businesses to participate economically in the project, supporting improved social conditions and community well-being;
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures and early notification to Indigenous nations, help protect culturally important sites and landscapes that support the spiritual and emotional well-being of Semiahmoo;
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Semiahmoo's well-being;
- **Air Quality (Section 7.2)** Air emission controls help protect respiratory health and prevent contamination of country foods, supporting Semiahmoo's physical well-being and confidence in harvesting;
- **Acoustics (Section 7.3)** Noise reduction measures limit sensory disturbance to people, wildlife, and harvesting areas, reducing stress and supporting Semiahmoo's comfort, well-being, and connection to land and water;
- **Surface Water (Section 7.4)** Managing runoff, erosion, and sediment helps maintain water quality in the lower Fraser, supporting Semiahmoo's cultural and nutritional reliance on healthy salmon and aquatic ecosystems;
- **Groundwater (Section 7.5)** Protecting groundwater from contamination helps maintain the quality of ecosystems that support fish, plants, and wildlife relied on for Semiahmoo's subsistence and health;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports Semiahmoo's food security, cultural identity, and health by safeguarding salmon and other species essential to FSC harvesting;

- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to Semiahmoo's physical health and cultural practices; and
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect Semiahmoo members' physical, cultural, and mental health.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on Indigenous health and well-being:

- **Condition 10 (Community Feedback Process)** provides Semiahmoo with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting Indigenous health and well-being;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)**, requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with Semiahmoo to be developed by the Holder in consultation with the Nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting Semiahmoo's physical health and overall, well-being; and,
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If Semiahmoo historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated cultural or emotional harm, supporting Indigenous health and well-being;
- **Condition 16 (Indigenous and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support socio-economic well-being;

#### The EAO's Analysis and Conclusions

After consideration of the mitigation measures and potential effects, described above, the EAO and Semiahmoo identified the following residual effects:

- Effects on the quality, quantity, and availability of harvested country foods;
- Effects on the value and perceived quality of country foods;
- Effects on air quality, noise, and water quality; and
- Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites.

Semiahmoo and the EAO's characterization of the residual effects of Tilbury Phase 2 on Indigenous health and well-being are summarized in the table below.

Table 37: Summary of residual effects and rationale on Semiahmoo and its Indigenous health and well-being.

| Residual Effect                                                                                                                                                                                                                                                                                                                                                                                                                       | Assessment Rating*                                                                                                                                                                                                                                                                    | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Indigenous health and well-being</p> <ul style="list-style-type: none"> <li>- Effects on the quality, quantity, and availability of harvested country foods</li> <li>- Effects on the value and perceived quality of country foods</li> <li>- Effects on air quality, noise, and water quality</li> <li>- Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites</li> </ul> | <p>Context (resilience): Medium</p> <p>Magnitude: Negligible</p> <p>Extent: Local</p> <p>Duration: Medium-term</p> <p>Reversibility: Partially</p> <p>Frequency: Continuous/Irregular</p> <p>Affected Populations: Disproportionate</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><b>Context:</b> Semiahmoo has experienced extensive environmental and social challenges, reducing their resilience to further adverse effects. However, their efforts to maintain cultural connections and recent improvements, such as gaining access to clean drinking water, indicate a medium capacity for resiliency. There is expected to be a negligible to no interaction between Tilbury Phase 2 activities and Semiahmoo cultural use sites and areas, and harvesting and subsistence activities, see section above.</p> <p><b>Magnitude:</b> Rated as negligible because Tilbury Phase 2 is not expected to affect country food availability. Residual effects on VCs related to health, such as air quality and noise, are predicted to have a negligible to low magnitude after mitigation. Consistent with this, the Human Health VC is also rated as negligible to low. In addition, Tilbury Phase 2 is anticipated to have positive effects on socio-economic determinants of health through increased employment and economic opportunities.</p> <p><b>Extent:</b> The potential residual effects are rated as local since effects would be limited directly surrounding Tilbury Island and its immediate zone of influence on the Fraser River. They are not expected to spread across the wider territory or affect regional cultural or health systems.</p> <p><b>Duration:</b> Potential effects, including environmental changes and perceptual impacts, are expected to persist throughout Tilbury Phase 2's 40 plus years of Operation, making them medium-term. While sensory disturbances may end after Decommissioning, impacts on cultural well-being could have lasting effects.</p> <p><b>Frequency:</b> The frequency of effects is characterized as both continuous and irregular, depending on the stressor and Project phase. During the Operation phase, some stressors (e.g., noise and visual changes) may be present on a continuous basis. In contrast, construction-related stressors are expected to occur irregularly, reflecting the intermittent nature of construction activities. Additionally, the perception of environmental degradation could result in continuous effects on well-being.</p> <p><b>Reversibility:</b> The effects are considered partially reversible. Sensory disturbances, such as noise and light, are expected to be fully reversible after Decommissioning. However, impacts on human health and cultural well-being, including loss of connection to traditional practices and perceived environmental degradation, may be irreversible or require a long time to recover.</p> <p><b>Affected Populations:</b> While positive economic effects may benefit a broad range of Semiahmoo members, those engaged in traditional harvesting and cultural practices or with pre-existing health vulnerabilities could be disproportionately impacted by negative environmental changes or perceived risks.</p> <p><b>Risk:</b> The likelihood of effects on health and well-being is considered medium, due to potential changes in environmental conditions (air and noise) and perceptions related to country foods and traditional practices. With mitigation, residual effects are expected to be of negligible to low magnitude and limited extent, and no substantive effects on country food availability are anticipated. As a result, consequences to health and well-being are expected to be minor, with the overall risk assessed as low.</p> <p><b>Uncertainty:</b> The assessment of potential effects on the Semiahmoo's Indigenous health and well-being carries a moderate degree of uncertainty primarily due to the inherent challenges in quantifying cultural effects and</p> |

| Residual Effect                                                                                                                   | Assessment Rating* | Rationale                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | their subsequent impacts on well-being. These impacts can vary based on individual and community-specific experiences, making precise predictions difficult. |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                              |

### Cumulative Effects

Semiahmoo has already experienced extensive adverse effects from historical and ongoing industrial development and European contact to their Indigenous health and well-being. This has led to:

- Contamination and pollution of their traditional harvesting areas impacting the quality and availability of country foods like shellfish and fish. This has direct implications for their diet, traditional practices, and overall well-being;
- Loss and restriction of access to traditional lands and resources due to settlement, urban development, and industrial activities. This can disrupt cultural practices and the transmission of Indigenous Knowledge, which are integral to health and well-being; and
- A decline in economic resources linked to the loss of their once-abundant fishery, further impacting social and economic conditions, which are determinants of health.

The Revised Application identifies two reasonably foreseeable projects in the vicinity that could contribute to cumulative effects:

- The T1B Project, aiming to increase LNG production, will involve vegetation removal at the existing facility site, potentially impacting plant resources or wildlife habitat;
- The TMJ Project may introduce additional vessel traffic in the Fraser River and develop the foreshore area, potentially contributing additional sensory disturbances (noise, light, vibration), and further altering habitat and water quality; and
- Both TMJ and T1B have the potential to add to cumulative effects associated with decreased air quality and associated health impacts.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River. The EAO recognizes the project-specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, FortisBC's proposed mitigation measures, and EAO's Table of Conditions, the EAO concludes that Tilbury Phase 2 would have negligible effects on Semiahmoo's health and well-being interests.

#### 16.13.10 Positive Effects of Tilbury Phase 2

According to the Revised Application, Tilbury Phase 2 is expected to create job opportunities, particularly in construction, benefit Indigenous businesses through contracting and procurement, and potentially increase revenue for the Semiahmoo, while improving social and economic conditions and providing long-term skills training opportunities for Semiahmoo members.

The positive effects of Tilbury Phase 2 depend on the level of participation and access Semiahmoo members and businesses have to the opportunities generated, with direct positive effects on Semiahmoo interests being limited compared to existing conditions.

#### 16.13.11 Conclusions

Considering the above analyses, EAO's engagement with Semiahmoo, their comments, the proponent's proposed mitigation measures, provincial conditions, and Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 is anticipated to have the following impacts on Semiahmoo Indigenous interests:

- Negligible residual effects to Harvesting and Subsistence Activities;
- Negligible residual effects to Cultural Use Sites and Areas; and
- Negligible residual effects to Indigenous Health and Well-being

Considering the above analyses the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on Semiahmoo interests has been adequately avoided, minimized, or otherwise accommodated. Based on the engagement undertaken with Semiahmoo on Tilbury Phase 2, as outlined above in Section 16.13.2 above, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with Semiahmoo.

## 16.14 Snuneymuxw First Nation

This section of the Report was co-drafted by Snuneymuxw First Nation (Snuneymuxw) and the EAO.

### 16.14.1 Community Profile

Snuneymuxw are Coast Salish Indigenous peoples who have continuously lived on their traditional territory since time immemorial. Snuneymuxw's traditional territory and marine areas extend from eastern Vancouver Island across the Salish Sea to the Fraser River, including the Gulf Islands with reserve lands near Nanaimo, and several village and field sites throughout the region and up into the Fraser River area of the Lower Mainland of B.C. Snuneymuxw society, way of life, culture, and economy extended throughout the territory that was governed by Snuneymuxw according to Snuw'uyulh ("teachings") and worldview, which emphasize Snuneymuxw core values of mutual respect and recognition,

the interconnection of all things in creation and Snuneymuxw stewardship and jurisdiction<sup>33</sup>. Snuneymuxw means "the great people" in the Hul'q'umin'um' language.

Snuneymuxw has stated that they hold a sacred duty to protect and care for their environment, honoring their ancestors and ensuring the health of their territory for future generations and that they have clear concepts of ownership, governance, and stewardship of water, land, air, and resources, which are considered birthrights. Snuneymuxw society is organized around families and households, with a strong emphasis on cooperation. Property management, including tangible and intangible assets, was overseen by family heads.

Villages were central to life, with most people living where they were born or married into, and movement typically limited to areas with kinship ties. Intervillage marriages were common, even across linguistic groups, creating extensive networks that ensured access to resources and labor during times of need. Membership in a village required kinship, residency, labor contributions, and a name given at a publicly witnessed ceremony. Coast Salish ideology emphasized a strong connection to place while allowing for the movement of people, goods, and information across their territory. Shared values, kinship, and cooperative stewardship continue to guide the management and protection of Coast Salish territories.

Snuneymuxw maintains that it has held Aboriginal title and rights to its territory since time immemorial and are descendants of the Sarlequun Tribe, who signed and entered into the Sarlequun Snuneymuxw Treaty on December 23, 1854, at Xwsol'lexwel (Nanaimo harbour) with representatives of the Crown. The Snuneymuxw Sarlequun Treaty of 1854 is a pre-confederate trade and commerce treaty, protected under Section 35 of the *Constitution Act, 1982*. The Treaty included commitments to identify and protect from settlement or encroachment all Snuneymuxw First Nation's sacred villages, cultivated fields, marine areas, harvesting and gathering, and to ensure the right to hunt and fish "as formerly".<sup>34</sup> Snuneymuxw maintains that immediately following the signing of the Snuneymuxw Sarlequun Treaty of 1854, the Crown unlawfully took away or dispossessed of Snuneymuxw lands, waters and resources without the consent of the Nation and did not take the necessary steps required to honour their treaty obligations. Despite intense and persistent efforts by Snuneymuxw to protect their villages, fields, and harvesting areas, much of their traditional land and marine territories was taken by the Crown and given to settlers.

Today, Snuneymuxw members live primarily in the Nanaimo, Vancouver, and in Washington State, and use the land where their ancestors fished, dug for clams, hunted for deer, elk, and ducks, and harvested coastal plants and trees (Voices of the Snuneymuxw First Nation n.d.) There are six reserves of various area size located on Vancouver Island and the Gulf Islands. As of December 2022, Snuneymuxw had 1,920 registered members, with 38 percent living on reserve and 62 percent living off reserve.

### 16.14.2 Snuneymuxw First Nation Involvement in the Environmental Assessment

During the Early Engagement phase, Snuneymuxw identified as a participating Indigenous nation, which afforded Snuneymuxw certain procedural rights under the Act, as outlined in [Section 5](#): Participating Indigenous Nations.

As a member of the TAC, Snuneymuxw actively participated in technical meetings throughout the EA for Tilbury Phase 2. Snuneymuxw and the EAO collaborated closely, engaging in joint work planning, consensus-seeking, and co-authoring this section of the EAO's Assessment Report. The EAO and IAAC provided funding to support Snuneymuxw's involvement in the environmental assessment process.

On September 12, 2022, Snuneymuxw and FortisBC entered into the Snuneymuxw Assessment Agreement to fund an Indigenous Led Assessment (ILA) for the Tilbury Phase 2 Project. The plans for the Snuneymuxw-led assessment were agreed to during the Process Planning phase and included in the EAO's Assessment Plan. However, by September 2024, due to resource and capacity constraints, after much thought and consideration, Snuneymuxw decided to exit the ILA process and shift its resources and funding to support Snuneymuxw's participation as a participating Indigenous nation including working collaboratively with FortisBC to co-author the Snuneymuxw section in the Revised Application and co-authoring this section of the EAO's Assessment Report.

[Section 11.14](#) of the Revised Application includes a summary of FortisBC's engagement with Snuneymuxw who have been involved in the process since July 2019. The section was co-developed with Snuneymuxw through regular meetings and joint drafting. The Revised Application also includes tables summarizing engagement activities with Snuneymuxw members, which are further detailed in the Indigenous Engagement Report.

### 16.14.3 Assessment Boundaries

All Project components are within Snuneymuxw's traditional territory.

The spatial assessment boundaries for each Indigenous interest are based on the overlap between Snuneymuxw's traditional territory with the combined Local and RAAs identified for linked VCs. Refer to Figure 11.14-1 in the Revised Application (Indigenous Interests and Proposed Project Location Figure). The LAA for each Indigenous interest reflects the combined LAAs of the VCs linked to that interest. The RAA is defined the same way, using the combined RAAs of the linked VCs. In general, the LAA is used to assess direct and indirect project effects, while the RAA supports the assessment of cumulative effects.

The assessment of potential effects of Tilbury Phase 2 on Indigenous interests applies to all members of Snuneymuxw living, working, or exercising Indigenous interests within the LAA of the Indigenous interests.

The assessment of potential effects related to Tilbury Phase 2 considered three distinct phases:

- Construction phase, with an estimated duration of three to six years;
- Operation phase, expected to last more than forty years; and
- Decommissioning phase, anticipated to take approximately two years.

### 16.14.4 Regional Context

Tilbury Phase 2 overlaps Snuneymuxw's traditional territory, including historic fishing villages and salmon sites along the Lower Fraser River. Snuneymuxw historically camped on Lulu Island for fishing, berry harvesting, and trade, and advised the EAO that Snuneymuxw currently holds Area E Salmon Gill Net License via Fisheries and Oceans Canada (DFO)'s Allocation Transfer Program and conducts fisheries for FSC purposes under the Snuneymuxw Sarlequunn Treaty of 1854 rights (treaty fisheries) and does not hold or require licenses.

Snuneymuxw has deep territorial, cultural, and spiritual ties to the region that were interrupted by colonial policies and legislation resulting in alienation. A high volume of referral and consultative requests from multiple proponents and government agencies associated with ongoing capacity constraints due to inadequate funding has at times placed constraints on the nation's capacity to engage as fully as possible. However, Snuneymuxw has dedicated time and resources to engaging on Tilbury Phase 2 and continues to do so. Their efforts aim to ensure that insights into

how Snuneymuxw laws, governance, and customs have historically applied, and currently apply, in relation to the Project are considered and incorporated. Snuneymuxw pointed out that it was not consulted regarding previous development activities on Tilbury Island, as these occurred during historical decision-making processes that did not recognize or incorporate Aboriginal rights, pre-Confederation treaty rights, or the nation's traditional territories and land connections.

The existing Tilbury LNG facility consists of gravel and paved areas, existing infrastructure, and equipment laydown areas supporting little plant life with very little to no habitat value for wildlife. The vegetation within Tilbury Phase 2 is mostly limited to ditch lines and spoil piles and is dominated by non-native and invasive plant species. Public access to Tilbury Phase 2 is limited, although there is currently public use of the dike to the north of Tilbury Phase 2 along the Fraser River.

#### 16.14.5 Indigenous Interests

Snuneymuxw's letter with the Notice of Intent to Participate for Tilbury LNG<sup>35</sup> identified preliminary Indigenous interests in the Project area and Lower Fraser River that may interact with or be impacted by the Project, as summarized below:

- Potential effects to fisheries and historic fishing villages, lands, waters, and culturally important marine species; and
- Potential effects on cultural activities, traditional uses, and access to water-based activities on the lower Fraser River.

During the Readiness Decision phase in the development of the [Readiness Decision Report](#), the EAO engaged with Snuneymuxw who identified a key concern about marine shipping impacts and requested a marine shipping assessment be included in the scope of Tilbury Phase 2 to properly assess potential effects on their Section 35 rights and Indigenous interests. The EAO responded that it considers marine shipping of LNG products from Tilbury Phase 2 to be addressed in the separate Tilbury Marine Jetty (TMJ) EA, where Snuneymuxw was also engaged in the assessment. Information provided by Snuneymuxw through their Notice of Intent and engagement with the EAO and the Proponent informed the drafting of the [Tilbury Phase 2 – Schedule C – Application Information Requirements](#) Table 6, see Proposed Preliminary List of Indigenous Interests.

The Proponent identified Snuneymuxw Indigenous interests to be assessed in the Revised Application through:

- Reviewing guidance and requirements from the EAO and AIR; and
- Conducting engagement activities with Snuneymuxw to gather information on their interests, as outlined in [Section 11.14.3 of the Revised Application](#) - Summary of Engagement.

Based on the Revised Application and through discussion with Snuneymuxw the following Indigenous interests have been identified, by EAO and Snuneymuxw as having the potential to be affected by Tilbury Phase 2:

- Harvesting and subsistence activities;
- Cultural use sites and areas;
- Cultural continuation;
- Social and economic conditions;
- Indigenous health and well-being; and
- Aboriginal and Snuneymuxw Sarlequun Treaty of 1854 Rights.

The assessment of Snuneymuxw's Indigenous interests in this section uses these categories. The EAO's assessment methods of Snuneymuxw's Indigenous interests include describing the background and current context, identifying potential effects, mitigation measures, effects analysis. If there is an adverse residual effect, a characterization of

---

<sup>35</sup>Letter from Snuneymuxw First Nation, November 30, 2021

effects and cumulative effects assessment is also completed. In addition to the EAO's assessment of effects to Snuneymuxw's Indigenous interests, Snuneymuxw provided their position on how Tilbury Phase 2 will affect their Indigenous interests.

#### 16.14.6 Harvesting and Subsistence Activities, Cultural Use Sites and Areas, and Cultural Continuation

##### Background

Snuneymuxw's traditional territory encompasses one of the most resource-rich areas in the heart of the Salish Sea and members rely on these lands and waters for physical, cultural, and spiritual sustenance and well-being (Snuneymuxw First Nation 2018)<sup>36</sup>. Connection and kinship with the land and waters guide and inform resource use: fishing sockeye on the Fraser River in summer, harvesting chum on the Nanaimo River in autumn, wintering near Departure Bay, and gathering shellfish, camas, and marine mammals in spring on Gabriola Island and False Narrows. They also harvested wapato near the Pitt River and traditionally camped on Lulu Island - located across the Fraser River from the Project site - to engage in fishing, gathering, harvesting and trade as part of their seasonal lifestyle that continued until disrupted by colonial policies in the 19<sup>th</sup> century. The Lower Fraser River remains vital, providing food and cultural resources for thousands of years and continuing today (Snuneymuxw First Nation 2022a).

Fishing is a central harvesting and subsistence activity for Snuneymuxw. The importance of fishing, fisheries, and healthy marine environments is reflected in this quote by former Snuneymuxw Chief, Doug White:

"An interest in fisheries is not just the right to fish in a space, nor the act of fishing, but the protection of a whole fishery. This includes the body of water, the quality of that water, and the land that supports it—we are talking about everything that is necessary to support that fishery."<sup>37</sup>

Historical records from the early 1800s document Snuneymuxw's presence along the Fraser River, including the permanent village site, a salmon fishing location upriver, and the wapato gathering site at the mouth of the Pitt River. Although the village was conferred to other First Nations by the mainland Colony of B.C. in the 1860s, Snuneymuxw members continued to travel to the Fraser River during the colonial and post-Confederation periods for work at salmon canneries and cultural and recreational, spiritual and subsistence activities, as well as commerce and trade.

Snuneymuxw emphasizes the importance of the Snuneymuxw Sarlequun Treaty of 1854, which included promises to protect historic villages, cultivated lands, waterways and harvesting areas from settlement. However, Snuneymuxw has stated that immediately following the signing of the Treaty of 1854, the Crown unlawfully took away or disposed of Snuneymuxw lands, waters, and resources without the consent of Snuneymuxw, and did not take the necessary steps required to honour their treaty obligation resulting in extensive loss of traditional territory to settlers. The Project area lies within their traditional land and could impact culturally important sites, traditional practices, and access to water-based activities along the Lower Fraser River.

##### Current Context

Snuneymuxw holds Treaty rights to fish and hunt under the Snuneymuxw Sarlequun Treaty of 1854 and emphasizes the importance of marine ecosystems for their sustenance, economic livelihood, and cultural practices. As stated in the Regional Context section, they actively fish under the Area E Salmon Gill Net License and maintain treaty fisheries within the Project area, and have identified important resource camps (including fishing camps) and village sites located on Barnston Island (B.C. EAO 2024), Annacis Island, Lulu Island and near Fort Langley as areas of cultural importance that may be affected by the Project.

<sup>36</sup> Tilbury Phase 2 LNG Expansion Application, Section 11.14 [TIL2 Volume1 Section11.14 Snuneymuxw 20241129.pdf](#)

Source: Hutchings 2016: 6 quoted in Spicer 2015:8

The harvesting and subsistence activities LAA is near Pattullo Bridge, about 12 km upstream of Tilbury Phase 2. Snuneymuxw's traditional fishing village near Barnston Island (see above Background section) is located approximately 30 kilometers upstream of Tilbury Phase 2 outside the LAA, but within the RAA (see figure 11.14-2). Fisheries and Oceans Canada (DFO) reports indicate no recent Snuneymuxw fishing in the area of their historic fishing camps, however Snuneymuxw attribute colonial-era alienation and ongoing impacts due to cumulative effects from project development and settler occupation in the area as contributing factors to DFO's data set.

The Project Footprint is a heavily disturbed brownfield site within Tilbury Industrial Park and consists mainly of gravel and paved surfaces with minimal vegetation dominated by non-native species. Vegetation reviews identified culturally important plants in riparian areas along Tilbury Slough, and Indigenous Knowledge highlighted species used in traditional practices. Snuneymuxw continues to gather seaweed, plants, and medicines from coastal and intertidal areas near the Project area. Industrial development has extensively altered wildlife habitat, leaving only fragmented riparian zones that support species adapted to urban environments, such as coyotes, raccoons, skunks, rabbits, waterfowl, and songbirds.

Snuneymuxw has not specified hunting impacts from the Project as a key concern, and firearm restrictions on Tilbury Island prohibit hunting near the Project site. However, they have emphasized historical environmental dispossession from colonization, which reduced resource access and affected well-being. While Snuneymuxw has historical hunting sites in the area, no specific locations within the Project Footprint have been identified.

Snuneymuxw has identified potential effects on their cultural activities in the Project area. FortisBC acknowledges that cultural use in the area and the presence of important places connected to Snuneymuxw, though no specific sites have been identified within the Project Footprint to date. Archaeological assessments in 2013 and 2020 found no heritage resources, and Snuneymuxw has not reported known cultural heritage sites within the Project Footprint to date. However, Snuneymuxw has informed the EAO of their historic resource camps and village sites that are within both the LAA and broader Project area located on Barnston Island, Annacis Island, Lulu Island (located across the Fraser River from the Project Footprint) and near Fort Langley, and notes that a Cultural Knowledge and Use Study is underway in relation to the Fraser River Tunnel Project that contains cultural use information relevant to the Lower Fraser River and the Tilbury Phase 2 Project area. The nation also continues to maintain treaty fisheries for food, social, ceremonial, and commercial purposes and use canoeing areas along the Fraser River<sup>38</sup>.

Cultural continuation refers to the transmission and practice of Snuneymuxw cultural identity, language, values, and traditions across generations. Snuneymuxw emphasizes that sharing Snuneymuxw stories, cultural knowledge, language, and ceremony allow present and future generations to benefit from the wisdom and teachings of elders and ancestors while creating new paths and opportunities for the community. It is further acknowledged that language and the ability to revitalize language plays a vital role in building and restoring a sense of place, connecting members to knowledge, stories, and place names rooted in their traditional territory. Industrial development and colonial alienation have disrupted cultural continuity and knowledge transmission in important areas of Snuneymuxw territory, and Project impacts could further interfere with this interest.

#### Potential Project Effects

The EAO and Snuneymuxw identified the following pathways of effects, prior to the application of mitigation measures along with associated VCs outlined in [Appendix 6](#), that may affect Snuneymuxw's harvesting and subsistence activities, cultural use sites and areas and cultural continuation due to Tilbury Phase 2 during Construction, Operation and Decommissioning phases of Tilbury Phase 2:

- **Harvesting and Subsistence Activities:**

---

<sup>38</sup> The EAO acknowledges that this report describes conditions as understood at the time of assessment. Cultural knowledge and site-specific information are dynamic and may change as new insights and findings come to light.

- **Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity and availability of resources** from increased emissions, noise and visual changes (air quality, acoustics, land and resource use VCs) may hinder Snuneymuxw from practicing harvesting rights in preferred areas and fishing sites around the Tilbury Phase 2 site. Changes in fish distribution and abundance (fish and fish habitat VC), the introduction and spread of invasive plant species (vegetation VC) and the potential for accidents or malfunctions may further impact the perception, experience and preferences of practicing harvesting rights;
- **Effects on the accessibility and availability of traditional lands and resources** may occur as a result of altered land and water based travel routes, access restrictions, or safety considerations, including changes to navigability and usability of established travel corridors (land and resource use and surface water VCs), as well as indirect effects from sensory disturbances such as noise, dust, lighting, or visual changes that may discourage travel through otherwise accessible areas (air quality, acoustics, and land and resource use VCs). Snuneymuxw First Nation maintains that harvesting rights continue from a pre-contact baseline and treaty rights were established pre-confederacy, so while the effects are low magnitude due to lack of access, they still exist; and
- **Effects to the Snuneymuxw Sarlequun Treaty of 1854 rights to fish** from potential fish habitat loss, increased mortality risks, changes in distribution or abundance (fish and fish habitat VC) and changes in behaviour due to sensory disturbances (acoustics, air quality VCs). Additionally, contamination risks to fish habitat in Tilbury Slough (surface water VC) may further impact traditional harvesting, cultural practices and current fisheries (culture VC). Furthermore, the potential for accidents and malfunctions creates a low likelihood risk of effects to fish habitat from hazardous materials release, leaks or spills from terrestrial vehicle collisions near waterbodies.
- **Cultural Use Sites and Areas:**
  - **Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas;** The predicted levels of sensory disturbance (acoustics, land and resource use and air quality VCs) could impact and deter Snuneymuxw members from engaging in their cultural and spiritual practices, such as fishing and canoeing at their preferred locations close to the project site (culture, land and resource use VCs); and
  - **Effects to fisheries, historic fishing villages, and fishing rights related to Project related changes to fishing;** while residual effects to relevant VCs (surface water, fish and fish habitat VCs) are considered to be low, predicted levels of sensory disturbances and contamination risks to fish habitat in the Tilbury Slough could result in changes to fish behaviour and distribution thus impacting Snuneymuxw fisheries, treaty right to “fisheries as formally” and historic fishing villages (culture, archaeological and heritage resources, land and resource use VCs).
- **Cultural Continuation:**
  - **Effects on the ability to revitalize, develop and participate in intergenerational cultural transmission due to experience of being on the land:** the predicted changes in sensory disturbances (air quality, acoustics, land and resource use VCs) could result in effects to Snuneymuxw members’ experience on the land and therefore impact the ability to engage in activities associated with revitalizing, developing and participating in intergenerational language and cultural transmission (culture, land and resource use VCs); and
  - **Disconnection from cultural heritage due to interruption of the use of travelways, navigable waterways and water bodies:** Interactions with Project sensory disturbances (air quality and acoustic VCs) and perception of increased environmental degradation may impact or deter Snuneymuxw members’

practice of canoeing and other use of navigable waterways in the area (culture, and land and resource use VCs).

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures that FortisBC has proposed to Potential Tilbury Phase 2-related effects on harvesting and subsistence rights, as mentioned in the section above. A full table of Proponent mitigations can be found in [Appendix A of the Revised Application](#). Below is a summary of Key Mitigation Measures, how they address effects on relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Snuneymuxw's harvesting and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during Construction and Operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Snuneymuxw's harvesting and cultural practices;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm sewer system. These protections support water quality and fish habitat relied on to support Snuneymuxw's harvesting and cultural practices;
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat and vegetation important to Snuneymuxw's harvesting and cultural practices;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by Snuneymuxw for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to Snuneymuxw's harvesting and cultural practices;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat and water quality used by salmon migrating through the Lower Fraser River. These actions support the health and availability of salmon and other fish species central to Snuneymuxw's FSC harvesting and cultural practices;
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used by Snuneymuxw for harvesting or cultural practices;
- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support Snuneymuxw's land- and water-based cultural practices; and

- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures and early notification to Indigenous nations, help protect culturally important sites and landscapes that support Snuneymuxw's broader connection to territory and the continuity of cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions to help reduce potential impacts on Snuneymuxw's harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting (see [Section 8](#) of this Report):

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance;
- **Condition 10 (Community Feedback Process)** to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely response, follow-up actions, and reporting helps ensure that issues such as dust, noise, light, or disturbances near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of harvesting and cultural areas;
- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of harvesting areas and culturally important landscapes and areas, supporting Snuneymuxw continued access to and use of harvesting and cultural areas;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of harvesting and cultural areas relied on by Snuneymuxw;
- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emissions control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan maintains conditions suitable for access to, and use of culturally important areas and sites used by Snuneymuxw to exercise harvesting rights and cultural practices;
- **Condition 15 (Chance Find Protocol)** requiring the development and implementation of a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If Snuneymuxw historically used the area, it would also help mitigate effects on any of their cultural materials that may be present; and fossils throughout the life of Tilbury Phase 2; and,
- **Condition 17 (Dry Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project-related roads, which may lower potential impacts on salmon and other fish important to Snuneymuxw's harvesting and cultural practices.

In addition to the Proponent's mitigations and the provincial conditions the EAO identified the following federal Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to harvesting and subsistence activities:

- **Federal Consideration for Migratory Bird Protections;** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from

project activity, supporting Snuneymuxw's harvesting practices and broader ecosystem conditions important to their way of life.

#### Snuneymuxw and the EAO's Analysis and Conclusions

After consideration of the mitigation measures and potential effects, described above, the EAO and Snuneymuxw identified the following residual effects:

- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources (fish, wildlife, vegetation);
- Effects on the accessibility and availability of traditional lands and resources;
- Effects on the Snuneymuxw Sarlequun Treaty of 1854 rights to fish;
- Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas;
- Effects to fisheries, historic fishing villages, and fishing rights related to Project related changes to fishing;
- Effects on the ability to revitalize, develop and participate in intergenerational cultural transmission due to experience of being on the land; and
- Disconnection from cultural heritage due to interruption of the use of travelways, navigable waterways and water bodies.

Snuneymuxw and the EAO's characterization of the residual effects of Tilbury Phase 2 on harvesting and subsistence activities, cultural use sites and areas, and cultural continuation are summarized in the separate tables below.

Table 38: Summary of residual effects and rationale on Snuneymuxw and its harvesting and subsistence activities.

| Residual Effects                                                                                                                                                                                                                                                                                                                   | Assessment Rating*                                                                                                                                                                                                                          | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Harvesting and subsistence activities<br>-Changes to the experience around practice of harvesting rights and effects to quality, quantity and availability of resources<br>-Effects on the accessibility and availability of traditional lands and resources<br>-Effects on the Snuneymuxw Sarlequun Treaty of 1854 rights to fish | Context (resilience): Medium<br>Magnitude: Negligible<br>Extent: Local<br>Duration: Medium-term<br>Reversibility: Fully reversible<br>Frequency: Continuous<br>Affected Populations: Disproportionate<br>Risk: Low<br>Uncertainty: Moderate | <p><i>Snuneymuxw maintains that although acknowledged in the cumulative effects sections below, the Overall Seriousness of Effect is based on a current or contemporary baseline, whereas Snuneymuxw's assessment and baseline is considered as pre-contact. Further they state, the narrow assessment metrics provided through the environmental assessment process do not always integrate Snuneymuxw's approach. Snuneymuxw states to gain a fulsome and holistic understanding of the area and the severity of the effects, the assessment should aim to also consider, to an extent, the historical and cumulative effects of activities and development in the Project area.</i></p> <p><b>Context:</b> Snuneymuxw have traditionally harvested fish, plants, and other resources in the LAA, and maintains FSC sockeye fisheries in the Project area. Harvesting has declined due to development pressures and colonial impacts, though the potential effects on hunting and subsistence show medium resiliency and could increase activity if barriers were reduced.</p> <p><b>Magnitude:</b> Impact is considered negligible. Project activities are not expected to cause detectable direct or indirect effects on salmon or other fish migrating past the Project site. Other key potential residual effects such as vegetation and wildlife are rated as negligible to low in magnitude. Historically hunting and harvesting activities occurred near the Project site but given access and firearms restrictions there is no current activity reported. There is some ongoing harvesting of seaweed and other plants in the intertidal and coastal areas within the broader Project area.</p> <p><b>Extent:</b> Rated as local given the spatial scale of residual effects to applicable VCs is limited; impacts to harvesting activities are expected to remain localized within the project area.</p> <p><b>Duration:</b> Expected through the operational life of the facility, therefore rated medium-term.</p> |

| Residual Effects                                                                                                                  | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p><b>Reversibility:</b> impacts are considered fully reversible, especially noise and light disturbances that end with decommissioning.</p> <p><b>Frequency:</b> Considered continuous - while construction poses the greatest disruption, ongoing effects remain during Operation.</p> <p><b>Affected Populations:</b> Direct effects fall disproportionately on active harvesters in the Project area, with indirect effects on those deterred by actual and perceived degradation or alienation.</p> <p><b>Risk:</b> Despite the high likelihood of effects, consequences are considered minor given the low magnitude, localized scale, and reversibility, leading to a low overall risk rating.</p> <p><b>Uncertainty:</b> The pathways of effects, such as noise, light, vibration and impacts on harvesters, are well understood. Although mitigation measures are anticipated to be moderately to highly effective, some uncertainty remains regarding their ability to fully address harvester's experiences and perceptions. Thus, the overall level of uncertainty is assessed as moderate.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 39: Summary of residual effects and rationale on Snuneymuxw and its cultural use sites and areas.

| Residual Effects                                                                                                                                                                                                                                                                     | Assessment Rating*                                                                                                                                                                                                                                                                  | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Cultural use sites and areas</p> <p>-Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas</p> <p>-Effects to fisheries, historic fishing villages, and fishing rights related to Project related changes to fishing</p> | <p>Context (resilience): Low</p> <p>Magnitude: Negligible</p> <p>Extent: Local</p> <p>Duration: Medium-term</p> <p>Reversibility: Partially reversible</p> <p>Frequency: Continuous</p> <p>Affected Populations: Disproportionate</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><i>Snuneymuxw maintains that although acknowledged in the cumulative effects sections below, the Overall Seriousness of Effect is based on a current or contemporary baseline, whereas Snuneymuxw's assessment and baseline is considered as pre-contact. Further they state, the narrow assessment metrics provided through the environmental assessment process do not always integrate Snuneymuxw's approach. Snuneymuxw states to gain a fulsome and holistic understanding of the area and the severity of the effects, the assessment should aim to also consider, to an extent, the historical and cumulative effects of activities and development in the Project area.</i></p> <p><b>Context:</b> The interest is assessed as having low resiliency, recognizing that Snuneymuxw maintains strong cultural ties to the area and actively exercises FSC fisheries, despite colonial impacts. However, the community's capacity to absorb additional adverse effects is difficult to quantify. Cultural strength may have been greater without cumulative disturbances, and potential links between cultural impacts and community health add complexity. Considering historical and ongoing challenges, this rating reflects a conservative estimate.</p> <p><b>Magnitude:</b> Considered negligible as the Project Footprint is on fee simple land within an already heavily modified landscape where past and present cumulative impacts have reduced cultural use. Effects on fish, fish habitat, and surface water are also negligible. Residual effects, such as sensory disturbances and access limitations, are expected to alter but not significantly disrupt existing conditions. Related effects on air quality and acoustics are low and localized, though members living, fishing, or accessing the Fraser River for cultural purposes near the site may experience some minor discernable impacts.</p> <p><b>Extent:</b> Rated as local, as the anticipated residual effects are primarily confined to the Project footprint and immediate surrounding areas, reflecting the negligible magnitude of effects and absence of measurable changes to broader biophysical or cultural use patterns beyond the vicinity of Tilbury Phase 2. While Snuneymuxw</p> |

| Residual Effects                                                                                                                  | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p>members reside throughout the region, most cultural impacts are unlikely to extend beyond the immediate project area.</p> <p><b>Duration:</b> Rated medium-term, as residual effects will discontinue after decommissioning phases.</p> <p><b>Reversibility:</b> Most sensory effects are reversible, though cultural impacts from reduced access and disrupted site use may be harder or impossible to reverse, therefore rated as partially reversible.</p> <p><b>Frequency:</b> Considered continuous particularly for restricted access to site for cultural purposes, which is an ongoing effect. Sensory disturbances, such as light or noise, may be either continuous or irregular depending on project activities.</p> <p><b>Affected Populations:</b> Those most affected include members actively fishing or engaging in cultural activities in proximity of the Project on the Fraser River, with indirect effects on those deterred by perceived degradation resulting in an overall disproportionate effect to this interest.</p> <p><b>Risk:</b> While some residual effects are moderately likely, their consequences are considered minor due to negligible magnitude, partial reversibility, and the already diminished cultural access and use caused by pre-existing industrialization. The Project will only add a negligible contribution; therefore, the overall risk is rated low.</p> <p><b>Uncertainty:</b> Assessed at moderate due to challenges in predicting cultural impacts and presuming a moderate to high effectiveness for mitigation measures. Given the negligible magnitude of effects, the altered state of the Project area, and anticipated effectiveness of mitigation, the seriousness of effect on Snuneymuxw's cultural use sites is assessed as negligible to minor.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 40: Summary of residual effects and rationale on Snuneymuxw and cultural continuation.

| Residual Effects                                                                                                                                                                                                                                                                                                      | Assessment Rating*                                                                                                                                                                                                                                                              | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <p>Cultural continuation</p> <p>-Effects on the ability to revitalize, develop and participate in intergenerational cultural transmission due to experience of being on the land</p> <p>-Disconnection from cultural heritage due to interruption of the use of travelways, navigable waterways and water bodies:</p> | <p>Context (resilience): Low</p> <p>Magnitude: Low</p> <p>Extent: Regional</p> <p>Duration: Medium-term</p> <p>Reversibility: Partially reversible</p> <p>Frequency: Continuous</p> <p>Affected Populations: Disproportionate</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><i>Snuneymuxw maintains that although acknowledged in the cumulative effects sections below, the Overall Seriousness of Effect is based on a current or contemporary baseline, whereas Snuneymuxw's assessment and baseline is considered as pre-contact. Further they state, the narrow assessment metrics provided through the environmental assessment process do not always integrate Snuneymuxw's approach. Snuneymuxw states to gain a fulsome and holistic understanding of the area and the severity of the effects, the assessment should aim to also consider, to an extent, the historical and cumulative effects of activities and development in the Project area.</i></p> <p><b>Context:</b> Despite strong cultural endurance in the face of historic and ongoing colonial impacts, the overall resiliency of cultural continuity to additional adverse effects is rated low. This precautionary rating reflects the likelihood that cumulative disturbances have reduced cultural vitality in the Project area and recognizes that the ability to transfer and practice culture are often closely tied to community health and well-being.</p> <p><b>Magnitude:</b> Although the direct project-related effects to cultural use sites are considered negligible in magnitude, the loss of cultural connection due to continued reduced access, altered experience, and long-term site disruption presents an ongoing challenge to the transmission of culture, and that is assessed as having low severity. Snuneymuxw's ability to revitalize and participate in cultural transmission in the Project area would likely increase with improved access and</p> |

| Residual Effects                                                                                                                  | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p>environmental rehabilitation, however the Project keeps or slightly worsens the ongoing barriers by perpetuating environmental concerns through air pollution and sensory disturbances.</p> <p><b>Extent:</b> Regional to reflect potential impacts on various VCs within their respective RAAs, and that impacts to cultural continuity may be felt by Snuneymuxw members who reside throughout the region.</p> <p><b>Duration:</b> Rated as medium-term as impacts from the Project are expected to cease following decommissioning, however assessing duration for cultural continuity is inherently challenging as it involves a continuous temporal aspect and is difficult to predict how long impacts will be felt if the current cultural continuum is disrupted.</p> <p><b>Reversibility:</b> Most sensory effects that impact experience of being on the land or water (air quality, noise, vibration) are reversible; however, impacts to continuing cultural practices may be irreversible therefore this is rated as partially reversible.</p> <p><b>Frequency:</b> Rated as continuous, particularly for loss of site use for cultural purposes, which is an ongoing effect. Sensory disturbances (e.g., noise, light) may be either continuous or irregular, depending on Tilbury Phase 2 activities.</p> <p><b>Affected Populations:</b> Direct impacts would disproportionately those who actively continue cultural practices and by those who have ceased participation due to alienation or environmental concerns. However, indirect effects may be felt evenly due to the interconnectedness of Snuneymuxw cultural identity.</p> <p><b>Risk:</b> The likelihood of negative cultural impacts occurring is low, and the overall consequence is expected to be minor, given the negligible magnitude of direct Tilbury Phase 2-related effects, the application of mitigation measures, and the significant cumulative impacts already existing in the Project area (see Cumulative Effects section below). Risk is therefore rated as low.</p> <p><b>Uncertainty:</b> Rated as moderate, as cultural effects are inherently challenging to quantify and may be subject to individual and community-specific experiences that are difficult to predict with certainty.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### Cumulative Effects

As described in the Background and Current Context section, the lower Fraser River and Tilbury Island area have been extensively impacted by historical land use, industrialization and related environmental degradation, as well as impacts due to climate change, resulting in existing pressures on environmental conditions and on Snuneymuxw's harvesting and subsistence activities, cultural use sites and areas, and cultural continuation.

The Revised Application identifies several reasonably foreseeable projects that may affect Snuneymuxw's harvesting and subsistence activities, cultural use sites and areas, and cultural continuation interests. These include T1B which would increase LNG production, and TMJ, which would introduce additional vessel traffic in the Fraser River and further development of the foreshore area. Both T1B and TMJ could contribute additional sensory disturbances (noise, light, vibration) and impact air quality in areas used by Snuneymuxw for harvesting, and cultural purposes. TMJ could further alter fish habitat and water quality in areas where Snuneymuxw assert harvesting and subsistence rights, important cultural sites and areas, and the ability for the transmission of Indigenous Knowledge to future generations.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analysis, FortisBC's proposed mitigation measures, the EAO's Table of Conditions, and the identified Key Mitigation Measures, the EAO and Snuneymuxw concludes that Tilbury Phase 2 would have a negligible effect on Snuneymuxw's harvesting and subsistence activities, and minor effects on Snuneymuxw's cultural use sites and areas, and cultural continuation.

While Snuneymuxw acknowledges that Tilbury Phase 2 in isolation would result in negligible effects on harvesting and subsistence activities, and negligible to minor effects on cultural use sites and cultural continuity, they emphasize that the Project contributes to an already degraded landscape shaped by ongoing industrial pressures. Within this context, Snuneymuxw anticipates that the combined effects of past, present, and reasonably foreseeable future developments, including Tilbury Phase 2, will result in moderate cumulative effects on their ability to exercise Aboriginal and treaty rights related to harvesting, access to cultural use sites, and the continuation of cultural practices.

## 16.14.7 Social and Economic Conditions and Indigenous Health and Well-being

### Background

Snuneymuxw historically occupied a vast territory across the east coast of Vancouver Island, the Gulf Islands, and the Lower Fraser River region. Their socio-economic system was traditionally based on connection and kinship with the land and waters, and the health and abundance of fish, wildlife, and land-based resources, including salmon fishing, root gathering, and trade, with established resource camps, including fishing camps and village sites along the Fraser River, located on Barnston Island, Annacis Island, Lulu Island and near Fort Langley. These practices supported a self-sufficient economy deeply connected to the land and water, shaping the fundamental aspects of their community life.

Snuneymuxw's health and well-being have always been rooted in access to its lands, clean water, and traditional (country) foods. The physical, emotional, and spiritual benefits of harvesting, cultural practices, and being on the land are central to wellness. Snuneymuxw maintains that although the Snuneymuxw Sarlequun Treaty of 1854 was meant to protect Snuneymuxw sovereignty and life-sustaining resources, it was never implemented, leading to land loss and rights not being recognized. Industrial development, environmental degradation, and restricted access to territories have reduced traditional food sources and disrupted cultural continuity, harming health, and resilience. Historic and ongoing impacts, including epidemics, land dispossession, and resource exploitation, have caused cultural stress, socio-economic challenges, and declines in health and well-being, affecting both treaty and Section 35 rights.

### Current Context

Snuneymuxw relies on the Salish Sea and its marine ecosystems for economic well-being, particularly through shellfish aquaculture and fisheries. As mentioned in above sections, Snuneymuxw holds Area E Salmon Gill Net License through DFO's Allocation Transfer Project and conducts its treaty rights to fisheries as formerly within the Project area. Members harvest shellfish and hold licenses for herring, crab, and various clam species, extending from Neck Point on Vancouver Island to Gower Point near Gibsons, B.C. Snuneymuxw also participates in Dungeness crab and prawn fisheries, which are an important source of work and income for members. Shellfish tenures supported by a 2002 Memorandum of Agreement are located near Gabriola Island, approximately 40 km from the Project area and outside the Project's assessment boundaries.

Snuneymuxw is actively involved in a variety of economic development initiatives aimed at supporting citizen well-being, creating opportunities, and building a sustainable economy. Economic activities are managed by Petroglyph

Development Group (PDG), a wholly owned corporate entity aimed at aligning development with Snuneymuxw Snuw'uyulh, the teachings of ancestors and elders. Activities include managing over 1,000 hectares of forested land through Petroglyph Forestry, co-managing the culturally important Saysutshun (Newcastle Island) and offering tourism experiences, operating the Saysutshun Ferry Service and Concession, and managing Petroglyph Properties. As of December 2025, PDG has completed five major casino acquisition agreements in B.C., significantly expanding their gaming portfolio, with deals involving Casino Nanaimo, Elements Casino Victoria, River Rock Casino Resort, and Chances Maple Ridge<sup>39</sup>. PDG also runs the Snuneymuxw Market Gas Bar and has partnered in the cannabis industry through Coast Salish Canna. Additionally, PDG collaborates with the Nanaimo Youth Services Association to deliver a 22-week employment and training program focused on skill development and job creation.

Additionally, Snuneymuxw collaborates with all levels of government to provide a broad range of health services through its Health Department. On-reserve programs support all age groups and focus on community health and wellness including areas such as health promotion, psychological well-being, addictions, chronic illness prevention, communicable disease control, and environmental health. Services include community workshops, preventive care, advocacy, and educational materials.

In January 2023, Snuneymuxw and FortisBC signed the Tilbury Projects Agreement<sup>40</sup> to ensure shared benefits from the Project and the TMJ project. Under this agreement, Snuneymuxw supports the projects and regulatory processes, while FortisBC commits to providing education, training, and community investments. The Project is expected to result in positive residual effects for the nation, such as increased employment, improved social conditions, and enhanced economic opportunities.

#### Potential Project Effects

The EAO and Snuneymuxw identified the following pathway of effects, prior to the application of mitigation measures, along with associated VCs outline in [Appendix 6](#) that may affect Snuneymuxw's social and economic conditions and Indigenous health and well-being during Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Social and Economic Conditions:**
  - **Effects to Snuneymuxw's future aspirations for sites or areas surrounding the Project:** Relates to employment (employment and economy, land and resource use, fish and fish habitat VC) which is expected to positively support economic development plans, including those of the Snuneymuxw. Snuneymuxw aims to maximize benefits for its members, including those living in the Lower Mainland, by using the Project to enhance employment and procurement opportunities, aligning with its broader economic development goals;
  - **Effects to Snuneymuxw's employment opportunities, Indigenous businesses, procurement opportunities, and Snuneymuxw revenue:** The Project is expected to positively impact employment (employment and economy VC), especially during the 3-to-6-year Construction Phase, which will require many skilled and semiskilled workers. Snuneymuxw members with trades certificates, about 25.2 percent of the nation as of 2016, are likely to benefit from these job opportunities. The Project may also support Snuneymuxw businesses through procurement and contracting opportunities, although success depends on direct involvement and access to contracts; and
  - **Effects to Snuneymuxw's commercial and non-commercial fishing, gathering, and cultural or ceremonial activities and practices:** Impacts to vegetation, wildlife, and fish habitat (vegetation, wildlife and wildlife habitat, and fish and fish habitat VCs) have the potential to interact with Snuneymuxw

<sup>39</sup> Petroglyph Development Group News Article: [Snuneymuxw First Nation Expands Gaming Portfolio with Agreement to Acquire Great Canadian Casino Vancouver | PDG News](#)

Tilbury Projects Agreement: [Snuneymuxw Inks Deal With Fortis BC Concerning LNG | Business Examiner](#)

hunting, gathering or cultural sites and treaty fisheries conducted in the Project area. Although extensive industrial development impacts and ongoing restricted access have reduced Snuneymuxw's current use of the Project area for commercial and non-commercial FSC practices, and noting a lack of information related to specific use sites, the absence of information does not mean these sites do not exist, or that use of the Project area for these purposes would not increase if barriers were reduced.

- **Indigenous Health and Well-being:**
  - **Effects on Air Quality, Noise and Water Quality:** Project activities have the potential to contribute contaminants of concern to water and air (air quality, groundwater and surface water VCs) and increased noise levels in proximity to the Project site (acoustics VC), which may affect Snuneymuxw members' health and well-being particularly those living or working near the Project site;
  - **Effects on the quality, quantity, and availability of harvested traditional (country) foods:** Potential effect relates to harvesting and subsistence activities (vegetation, wildlife and wildlife habitat, and fish and fish habitat VCs), human health (air quality, groundwater and surface water VCs) and cultural practices (culture VC). There is potential for Project activities to interact with Snuneymuxw's FSC sockeye fisheries within Project area or potentially affect other harvesting areas through exposure to air or water contaminants; and
  - **Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites:** This broad effect encompasses Snuneymuxw members health and well-being (human health, air quality, acoustics VC) related to effects to traditional ways of life and cultural sites (culture VC, see also Harvesting and Subsistence Activities and Cultural Use Sites and Areas sections). The Project's ongoing restricted access to potentially important cultural or harvesting sites, interactions with sensory disturbances on both land and water and perceived alienation from the area may affect the health and well-being of Snuneymuxw members.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that FortisBC has proposed in response to potential Tilbury Phase 2 -related effects on social and economic conditions and Indigenous health and well-being. These include the following:

- **Land and Resources VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions. These measures support Snuneymuxw's economic and social conditions by sustaining land-based activities and long-term restoration goals. They also help by reducing stressors and supporting cultural continuity, knowledge transfer, and overall Indigenous health and well-being;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for Snuneymuxw members and businesses to participate economically in the project, supporting improved social conditions and community well-being;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems and mitigate risks associated with large-scale development, such as housing insecurity and social disruption. These measures support Snuneymuxw's economic and social conditions while reducing health and community well-being risks, and helping maintain social cohesion and alignment of community stability;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports Snuneymuxw's food security, cultural identity, and health by safeguarding salmon and other species essential to FSC harvesting;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality, along with avoiding sensitive periods, managing lighting disturbance, and preventing invasive species, helps sustain

species important for cultural practices and country food harvesting. These measures support Snuneymuxw's cultural continuity, access to country foods, and land-based livelihoods, contributing to economic and social conditions while also supporting nutritional, physical, and cultural aspects of Indigenous health and well-being;

- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to Snuneymuxw's land-based activities, contributes to economic and social conditions while also supporting physical health, cultural practices, and well-being;
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity, support cultural practices, harvesting, and intergenerational knowledge transfer linked to Snuneymuxw's cultural continuity, Indigenous health and well-being;
- **Groundwater (Section 7.5)** Protecting groundwater from contamination helps maintain the quality of ecosystems that support fish, plants, and wildlife relied on for Snuneymuxw's subsistence and health;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm sewer system. These protections support water quality and fish habitat relied on to support Snuneymuxw's connection to cultural practices, and health and well-being;
- **Acoustics (Section 7.3)** Noise reduction measures during Construction, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Snuneymuxw's connection to cultural practices that impact health and well-being;
- **Air Quality (Section 7.2)** The air quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbances emission controls help protect respiratory health and prevent contamination of country foods, supporting Snuneymuxw's physical well-being and confidence in harvesting; and
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect Snuneymuxw members' physical, cultural, and mental health.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on social and economic conditions and Indigenous health and well-being:

- **Condition 10 (Community Feedback Process)** provides Snuneymuxw with a clear mechanism to raise concerns related to community well-being, safety, access, culturally important areas, and environmental or sensory disturbances. Timely response, follow-up actions, and reporting helps ensure issues such as noise, dust, light, traffic, or other perceived project effects, particularly those occurring near cultural sites, harvesting areas, or travel routes, are identified and addressed early;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)**, requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with Snuneymuxw to be developed by the Holder in consultation with the Nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;
- **Condition 16 (Indigenous and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By

outlining employment, contracting, and training strategies, this condition helps support socio-economic well-being;

- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. These measures help maintain air quality and visibility to support access to culturally important areas and harvesting activities, contributing to social and economic conditions and protecting Indigenous health and well-being;
- **Condition 15 (Chance Find Protocol)** requiring the development and implementation of a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If Snuneymuxw historically used the area, it would also help mitigate effects on any of their cultural materials that may be present;
- **Condition 17 (Dry Street Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project-related roads, which may lower potential impacts on salmon and other fish important to Snuneymuxw's for harvesting and cultural practices. Snuneymuxw and the EAO's Analysis and Conclusions; and,

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Well-being:

- **Accidents and Malfunctions Reporting** would support mitigation of potential impacts on the Nation's interests by ensuring timely responses, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

#### Social and Economic Conditions

Although Snuneymuxw continues to experience systemic social and economic challenges, such as limited access to culturally important lands and resources, community stresses from environmental degradation, discriminatory colonial policies, and barriers to practicing traditional economies, these issues are largely the result of historic and ongoing regional industrial development and are not directly caused by Tilbury Phase 2.

Despite these obstacles, Snuneymuxw has demonstrated strong economic resilience through the establishment of PDG and its management of self-directed economic initiatives. Further benefits to the nation may be realized through the *Tilbury Projects Agreement* signed in relation to both the Project and TMJ, and the FortisBC's Implementation Committee, which is intended to support discussion and implementation of economic opportunities related to the Project. Considering this, it is EAO's view that Snuneymuxw will have the opportunity to be directly involved in planning and implementation and offered meaningful access to contracts and long-term participation mechanisms, these opportunities could help offset any potential adverse effects, including future aspirations for sites within the Project area.

Considering these potential benefits, the EAO's conclusions on the linked VCs, and proposed mitigation measures, KMMs and conditions and the lack of any substantial new barriers introduced by the Project, the EAO has determined that there is no residual effect on social and economic conditions. Consequently, no additional characterization of effects or cumulative effects assessment was conducted for this Indigenous Interest.

#### Indigenous Health and Well-being

After considering the proposed mitigation measures, the EAO and Snuneymuxw concludes that Tilbury Phase 2 could result in the following residual effects to Snuneymuxw's Indigenous health and well-being:

- Effects on air quality, noise and water quality;
- Effects on the quality, quantity, and availability of harvested country foods; and,
- Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites.

The EAO and Snuneymuxw's characterization of the residual effects of Tilbury Phase 2 on Indigenous health and well-being are summarized in the table below.

Table 41: Summary of residual effects and rationale on Snuneymuxw and its Indigenous health and well-being.

| Residual Effects                                                                                                                                                                                                                                                                                                                                              | Assessment Rating*                                                                                                                                                                                                                                                                         | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Indigenous health and well-being</p> <ul style="list-style-type: none"> <li>- Effects on Air Quality, Noise and Water Quality</li> <li>- Effects on the quality, quantity, and availability of harvested country foods</li> <li>- Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites</li> </ul> | <p>Context (resilience): Medium</p> <p>Magnitude: Low</p> <p>Extent: Local</p> <p>Duration: Long-term</p> <p>Reversibility: Partially reversible</p> <p>Frequency: Continuous/intermittent</p> <p>Affected Populations: Disproportionate</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><i>Snuneymuxw maintains that although acknowledged in the cumulative effects sections below, the Overall Seriousness of Effect is based on a current or contemporary baseline, whereas Snuneymuxw's assessment and baseline is considered as pre-contact. Further they state, the narrow assessment metrics provided through the environmental assessment process do not always integrate Snuneymuxw's approach. Snuneymuxw states to gain a fulsome and holistic understanding of the area and the severity of the effects, the assessment should aim to also consider, to an extent, the historical and cumulative effects of activities and development in the Project area.</i></p> <p><b>Context:</b> Snuneymuxw has experienced extensive impacts to community health and well-being related to environmental degradation, colonization and land dispossession, reducing resilience to further effects. However, due to ongoing efforts to support and improve community health with a broad range of programs, a medium capacity for resiliency has been demonstrated.</p> <p><b>Magnitude:</b> Rated as low because Tilbury Phase 2 is expected to have minor impact on key health and well-being factors, such as water quality and traditional (country food) availability. Residual effects to the human health VC are assessed low, and associated VCs such as acoustics and air quality are predicted to be low in magnitude with mitigation measures and air emissions controls in place and thus expected to present a negligible incremental change to the experience of Snuneymuxw members engaged in land and water based cultural activities. Additionally, Tilbury Phase 2 is anticipated to positively impact socio-economic determinants of health by increasing employment and economic opportunities.</p> <p><b>Extent:</b> The residual effects are expected to occur at a local scale. Direct impacts, such as noise and air quality disturbances, will be primarily localized near Tilbury Phase 2. While Snuneymuxw members live throughout the region and access resources throughout their traditional territory, indirect effects on well-being are unlikely to extend beyond the local Project area.</p> <p><b>Duration:</b> Potential effects, including environmental changes and perceptual impacts, are expected to persist throughout the Tilbury Phase 2's 40+ years of operation, making them medium-term. However, while sensory disturbances may end after decommissioning, impacts on cultural well-being or human health such as respiratory illness or disease could have lasting effects, and therefore long-term.</p> <p><b>Frequency:</b> The frequency of effects is both continuous and intermittent. Some stressors, such as noise and visual changes, may be continuous throughout the operational phase, while others, particularly those during construction, may be intermittent. Additionally, the perception of environmental degradation could result in continuous effects on well-being.</p> <p><b>Reversibility:</b> The effects are considered partially reversible. Sensory disturbances, such as noise and light, are expected to be fully reversible after decommissioning. However, impacts on human health and cultural well-being, including loss of connection to traditional practices and perceived environmental degradation, may be irreversible or require a long time to recover.</p> <p><b>Affected Populations:</b> While positive economic effects may benefit a broad range of Snuneymuxw members, those engaged in traditional harvesting and cultural practices or with pre-existing health vulnerabilities could be disproportionately impacted by negative environmental changes or perceived risks.</p> |

| Residual Effects                                                                                                                  | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p><b>Risk:</b> The likelihood of a negative effect occurring is moderate and the consequences are likely to be minor due to some positive effects and mitigations measures, therefore the risk is low.</p> <p><b>Uncertainty:</b> The assessment of potential effects on Snuneymuxw Indigenous health and well-being carries a moderate degree of uncertainty. While effects pathways to health indicators from water and air quality are more understood, the rating is primarily due to the inherent challenges in quantifying cultural effects and understanding how these effects influence overall well-being. Such impacts can vary widely among individuals and within the community, making precise predictions difficult.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Cumulative Effects

Tilbury Phase 2 is located within an area that has been subject to extensive historical and ongoing industrial development, and Snuneymuxw's health and well-being have already been affected by cumulative impacts associated with pollution, habitat degradation, and reduced access to traditional lands and resources.

Furthermore, the Revised Application identifies other reasonably foreseeable projects in the vicinity that could contribute to cumulative effects: T1B and the TMJ Project, expected to introduce sensory disturbances and result in impacts to plant and wildlife habitat as well as aquatic life and habitat from shipping activities. Both T1B and TMJ have the potential to add cumulative effects associated with decreased air quality and associated health impacts.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project-specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

Snuneymuxw has expressed concerns that the current characterization of cumulative effects does not accurately reflect their lived experience or the full scope of impacts to their health, well-being, and cultural continuity. In their view, cumulative industrial pressures in the lower Fraser River region have already resulted in significant and measurable degradation of environmental quality, including contamination of traditional harvesting areas and reduced availability of culturally important foods such as fish and shellfish. These conditions have direct implications for nutrition, food security, and overall community well-being.

Snuneymuxw further emphasize that restricted access to traditional lands and waters, resulting from urbanization, industrial development, and increased marine traffic, has disrupted land-based practices and hindered the intergenerational transmission of Snuneymuxw knowledge and language, which are central to cultural resilience and health. They highlight that declines in fish populations and access to natural resources have also constrained fisheries-related livelihoods and broader socio-economic conditions.

Snuneymuxw's perspective, even incremental project-related effects may be meaningful in this context. They have also expressed concern that the assessment's conclusion of negligible cumulative effects is not sufficiently supported and does not align with their understanding of existing pressures or their significance.

### Conclusion

Considering the above analysis, FortisBC's proposed mitigation measures, the EAO's Table of Conditions, the EAO concludes that Tilbury Phase 2 would have a negligible effect on Snuneymuxw's health and well-being interests.

In Snuneymuxw's view, Indigenous health and well-being will continue to be affected by existing and reasonably foreseeable industrial and environmental pressures, to which Tilbury Phase 2 will contribute. However, ongoing efforts to support members' health and quality of life, together with potential community well-being benefits from the *Tilbury Project Agreement*, including education, training, and continued community investments, may help offset these pressures. Considering this broader context, Snuneymuxw concludes that the cumulative effect on health and well-being is minor-to-moderate.

#### 16.14.8 Aboriginal and Snuneymuxw Sarlequun Treaty of 1854 Rights

##### Background

Snuneymuxw are descendants of the Sarlequun Tribe, the signatories to the Snuneymuxw Sarlequun Treaty of 1854, signed at Xwsol'lexwel (Nanaimo Harbour) between the Sarlequun People and representatives of the Vancouver Island colonial government led at the time by James Douglas. The treaty is one of only a few pre-Confederation treaties in B.C. and described as a trade and commerce agreement that guaranteed protection for Snuneymuxw cultivated fields, sacred villages, marine areas, and traditional rights to hunt, fish, harvest, and gather "as formerly".

In the years that followed the signing of the treaty, colonial authorities neglected to fulfill commitments to implement it. The lands and resources meant to be protected were never surveyed, and much of Snuneymuxw's traditional territory was alienated and expropriated by settlers under colonial and provincial regimes. As a result, Snuneymuxw communities experienced displacement and erosion of their cultural and economic systems. Despite these challenges, the treaty remains an integral part of Snuneymuxw identity and central to its ongoing legal and political advocacy.

Snuneymuxw also asserts Aboriginal rights and title over its traditional lands and resources, which are recognized and protected under Section 35 of the *Constitution Act, 1982*. These rights include land use, cultural practices, and resource management, and are considered to exist alongside, and be reinforced by, the Snuneymuxw Sarlequun Treaty of 1854.

##### Existing Conditions

Snuneymuxw asserts Aboriginal and treaty rights in the context of Tilbury Phase 2, emphasizing that it was not consulted during earlier industrial developments on Tilbury Island, some of which occurred at a time when Aboriginal and pre-Confederation treaty rights were often disregarded. The Project falls within Snuneymuxw territory and the area includes important historic resource camps, including fishing camps, village sites and marine areas central to both treaty and constitutionally protected activities such as fishing, harvesting, and cultural practices. The potential for the Project to impact these sites has raised concerns about cumulative effects on Snuneymuxw's ability to exercise their rights.

[Section 11.14.2.18 of the Revised Application](#) notes that ongoing capacity constraints have limited Snuneymuxw's ability to provide FortisBC with its perspectives on how Snuneymuxw laws, governance traditions, philosophies, or customs have historically or currently applied to the Project. While this contributes to uncertainty in fully understanding how the Project may align or conflict with Snuneymuxw's exercise of their asserted Aboriginal and treaty rights in the area, it does not indicate the absence of relevant Snuneymuxw laws or legal traditions, nor does it suggest greater levels of adverse effect. Rather, it underscores the importance of ongoing engagement and support to enable more meaningful participation in future assessments and decision-making processes.

FortisBC has made changes to the Project design, including the removal of waterborne deliveries to reduce effects on fish habitat and marine use, however Snuneymuxw continues to emphasize that meaningful recognition of their treaty rights requires more than mitigation. The nation is not participating in the B.C. Treaty Commission modern-day treaty process but is instead focused on the direct implementation of the Snuneymuxw Sarlequun Treaty of

1854<sup>41</sup>. Through formal agreements and engagement processes, including participation on FortisBC's Implementation Committee, Snuneymuxw is working to ensure that its rights, title, and governance are respected in decisions affecting their lands and waters. The treaty remains a guiding legal and cultural framework for how Snuneymuxw evaluates and responds to current and future developments in their territory.

#### Potential Project Effects

The EAO and Snuneymuxw identified the following pathways of effect, prior to the application of mitigation measures, along with associated VCs in [Appendix 6](#) that may affect Snuneymuxw's Aboriginal and Snuneymuxw Sarlequun Treaty of 1854 Rights during Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Changes to Snuneymuxw's cultural traditions, laws, customs, protocols and governance systems that inform how they exercise their Aboriginal and Snuneymuxw Sarlequun Treaty of 1854 Rights:** This potential pathway of effect encompasses Snuneymuxw's ability to apply laws, customs or protocols related to exercising Aboriginal and treaty rights in the Project area (culture, land and resource use, vegetation, wildlife, and fish and fish habitat VCs). Although the Project Footprint is located on private property with restricted access, it remains situated within an area of cultural importance to Snuneymuxw, where Aboriginal and treaty rights were historically and meaningfully exercised and could be in the future. As such, there remains potential for the Project to impact or alter cultural traditions that underpin the exercise of these rights;
- **Effects on ability to use, develop, and control traditional lands and resources:** The expansion of land-based infrastructure and associated Operation of Tilbury Phase 2 further encroaches on areas historically used for harvesting (fish and fish habitat, vegetation, wildlife and wildlife habitat, land and resource use and culture VCs). Although the Project site is privately held and industrially zoned land, the impacts are still relevant as there is potential for the Project's sensory and air quality impacts to disturb Snuneymuxw's use and efforts to steward and restore areas within the LAA. Snuneymuxw's Aboriginal rights originate from a pre-contact baseline and are further affirmed through their treaty; therefore, additional reduction in available harvesting areas represents a continued impact on these longstanding rights; and,
- **Changes to ongoing conservation efforts to restore important fish species and habitat:** The Project's predicted sensory disturbances (air quality, acoustic VCs) and potential contamination risks in the Tilbury Slough (surface water, soil VCs) may alter fish behaviour, health and distribution (fish and fish habitat VC). These changes could interact with Snuneymuxw conservation and stewardship efforts, and potentially affect Snuneymuxw fisheries, including their treaty right to fish.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that FortisBC has proposed in response to potential Tilbury Phase 2-related effects on Aboriginal and Snuneymuxw Sarlequun Treaty of 1854 Rights. These include the following:

- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures supports Snuneymuxw's treaty rights and stewardship responsibilities for fish and aquatic ecosystems within its traditional territory. By protecting fish habitat and maintaining water quality for salmon migrating through the Lower Fraser River, these measures help sustain ecological conditions necessary for Snuneymuxw to exercise its inherent authority over land and water management;
- **Surface Water VC (Section 7.4)** Erosion and sediment-control measures, along with containment and treatment of contact water, support Snuneymuxw's treaty rights and stewardship responsibilities for water within its traditional territory. By preventing sediment or contaminants from entering Tilbury Slough and the Delta storm-sewer system, these measures help maintain water quality and aquatic conditions necessary for

Snuneymuxw to exercise its governance systems; Managing runoff, erosion, and sediment helps maintain water quality in the lower Fraser, supporting Snuneymuxw's cultural and nutritional reliance on healthy salmon and aquatic ecosystems;

- **Air Quality (Section 7.2)** The air-quality measures, such as idle reduction, dust control, electrification, equipment maintenance, and emissions controls, support Snuneymuxw's treaty rights and stewardship responsibilities within its traditional territory. By limiting emissions that may affect land, waters, and ecological conditions on and adjacent to Tilbury Island, these measures help maintain environmental conditions necessary for Snuneymuxw to exercise its inherent authority over land and resource management;
- **Vegetation VC (Section 7.7)** Avoidance of the MOF footprint supports Snuneymuxw First Nation's treaty rights and stewardship responsibilities by preventing disturbances to riparian areas and culturally important plant species relied on by Snuneymuxw members. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support Snuneymuxw's ability to exercise its inherent authority over land management, environmental oversight, and planning decisions affecting lands and ecosystems;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, supports Snuneymuxw's treaty rights and stewardship responsibilities for wildlife and ecosystems within its traditional territory. By maintaining habitat conditions and ecological integrity, these measures assist Snuneymuxw in exercising its inherent authority over land and resource management;
- **Land and Resources VC (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities support Snuneymuxw's treaty rights and stewardship responsibilities by reducing disruptions to land-use patterns and activities within its traditional territory. These measures help maintain conditions necessary for Snuneymuxw to exercise its inherent authority over land and resource management;
- **Culture VC (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity supports Snuneymuxw's treaty rights and stewardship responsibilities for cultural heritage within its traditional territory. By maintaining the integrity of culturally important places and landscapes, these measures help enable Snuneymuxw to exercise its inherent authority over the identification, protection, and management of cultural sites and areas, consistent with Snuneymuxw's governance systems;
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors support Snuneymuxw's treaty rights and stewardship responsibilities by helping maintain environmental and social conditions within its traditional territory. By limiting project-related stressors and supporting Snuneymuxw's ability to manage and oversee activities affecting community well-being, these measures assist Snuneymuxw in exercising its inherent authority over land management, environmental oversight, and planning processes that influence the health and sustainability of its community;
- **Acoustic (Section 7.3)** Noise reduction measures limit sensory disturbance to people, wildlife, and harvesting areas, reducing stress, and supporting Snuneymuxw's comfort, well-being, and connection to land and water; and
- **Soil (Section 7.6)** Soil management measures, including erosion control, spill prevention protocols, and careful handling and disposal of contaminated soils, help prevent the migration of pollutants into nearby cultural areas and waterways. Maintaining soil stability and quality supports the protection of culturally important places and landscapes used by Snuneymuxw.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on Aboriginal and Snuneymuxw Sarlequun Treaty of 1854 Rights:

- **Condition 10 (Community Feedback Process)** provides Snuneymuxw with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting engagement on Aboriginal and Snuneymuxw Sarlequun Treaty of 1854 Rights;
- **Condition 12 (CEMP)** requires mitigation measures to manage dust, noise, traffic, spills, surface water, erosion, and wildlife interactions during Construction. These measures help minimize construction-related disturbances that could affect community comfort, safety, health, and well-being of Snuneymuxw members;
- **Condition 13 (OEMP)** requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation. By limiting long-term environmental disturbances, this condition supports stable conditions that protect Aboriginal and Snuneymuxw Sarlequun Treaty of 1854 Rights;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting Aboriginal and Snuneymuxw Sarlequun Treaty of 1854 Rights;
- **Condition 15 (Chance Find Protocol)** requiring the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. The condition helps to maintain Snuneymuxw Sarlequun Treaty of 1854 Rights, authority and cultural heritage management process;
- **Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan)** requiring the development and implementation of a plan supporting economic participation of First Nations, and local communities, that would describe employment and contracting strategies and training practices. This plan supports Snuneymuxw Sarlequun Treaty of 1854 Rights through the strengthening of economic self-determination, institutional capacity, and community-directed decision-making; and,
- **Condition 17 (Dry Street Sweeping Report)** requires FortisBC to submit a report on the effectiveness Dry Street Sweeping to mitigate the effects of 6-PPDQ on fish within eighteen months of a Certificate being issued. By informing measures to protect downstream aquatic environments, this condition supports Aboriginal and Snuneymuxw Sarlequun Treaty of 1854 Rights helping maintain confidence in environmental quality and minimizing potential concerns related to contamination of culturally important fish and waterways.

In addition to the Proponent's mitigations and the provincial conditions the EAO identified the following Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to Snuneymuxw Sarlequun Treaty of 1854 Rights:

- **Federal Consideration for Migratory Bird Protections:** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Snuneymuxw's harvesting practices and broader ecosystem conditions important to their way of life.

#### Snuneymuxw and the EAO's Analysis and Conclusions

- Changes to Snuneymuxw's cultural traditions, laws, and governance systems that inform how they exercise their Aboriginal and Snuneymuxw Sarlequun Treaty of 1854 Rights;

- Effects on ability to use, develop, and control traditional lands and resources; and
- Changes to ongoing conservation efforts to restore important fish species and habitat.

Table 42: Summary of residual effects and rationale on Snuneymuxw and its Aboriginal Rights and Snuneymuxw Sarlequun Treaty of 1854 Rights.

| Residual Effects                                                                                                                                                                                                                                                                                                                                                                                                                          | Assessment Rating*                                                                                                                                                                                                                                                                    | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Further they state, the narrow assessment metrics provided through the environmental assessment process do not always integrate Snuneymuxw's approach. Snuneymuxw states to gain a fulsome and holistic understanding of the area and the severity of the effects, the assessment should aim to also consider, to an extent, the historical and cumulative effects of activities and development in the Project area.</i></p> <p><b>Context:</b> Snuneymuxw asserts Aboriginal and treaty rights throughout their traditional territory, including the Project area. Although Snuneymuxw has endured many challenges to exercising their rights due to colonial policies, alienation and other factors, the interest is considered moderately resilient, with the ability to respond and adapt to some stresses, and because rights-based activities would likely increase if barriers were reduced.</p> <p><b>Magnitude:</b> for this interest is assessed as low by the EAO, because the Project Footprint lies on privately owned land with limited access in an industrialized area, which already restricts Snuneymuxw's ability to participate in decision-making or exercise their laws and protocols in the Project area. Furthermore, the anticipated residual effects to relevant VCs, (i.e. negligible residual effects to fish and fish habitat or surface water, negligible to low magnitude of effect for vegetation and wildlife and wildlife habitat, low magnitude for culture and land and resource use) resulting from Tilbury Phase 2 are not expected to alter Snuneymuxw cultural traditions, ability to make decisions over traditional lands and resources or impact ongoing conservation efforts appreciably more than existing conditions.</p> <p><i>Snuneymuxw assessed the magnitude for this interest at medium; from their perspective the severity of the potential residual effects resulting from the Project will change the role relative to existing conditions but is within the interest's capacity to adapt.</i></p> <p><b>Extent:</b> Effects are regional in extent given Snuneymuxw members live and exercise their rights throughout their territory, although sensory impacts will be more localized to the project area.</p> <p><b>Duration:</b> Residual effects related to Tilbury Phase 2 are rated as medium-term and expected to discontinue after decommissioning.</p> <p><b>Reversibility:</b> Rated partially reversible. Sensory impacts like noise and light will end after decommissioning, while cultural impacts tied to alienation from lands or ability to exercise governance systems may be harder to reverse.</p> <p><b>Affected Populations:</b> Those most engaged in traditional practices or conservation work in the area would experience direct disproportionate impacts, although indirect impacts affecting Aboriginal and Treaty rights, which are shared by all Snuneymuxw members would be felt evenly.</p> <p><b>Frequency:</b> Both continuous and intermittent, as certain stressors may be elevated during Construction and others will persist throughout the Operation Phase. Additionally, the perception of environmental degradation that is contrary to Snuneymuxw's laws, legal traditions, and stewardship of caring and protecting the environment may be felt continuously.</p> |

| Residual Effects                                                                                                                  | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p><b>Risk:</b> Overall risk is rated as low due to the moderate likelihood that effects will occur, expected effectiveness of mitigation, and low consequence severity. Noting that an accident or malfunction could increase the severity to moderate.</p> <p><b>Uncertainty:</b> Rated high, reflecting difficulties in assessing cultural effects and limited information on Snuneymuxw Indigenous laws and governance systems in relation to the Project.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### Cumulative Effects

As described in the Background and Existing Conditions section above, restricted access, altered ecological conditions, and the long-standing effects of colonial land alienation have diminished Snuneymuxw's capacity to access and use culturally important sites, such as traditional harvesting grounds and historic villages, for cultural, subsistence, and governance purposes. These impacts have also hindered the intergenerational transmission of knowledge and cultural practices, limiting opportunities for youth to learn on the land in accordance with Snuneymuxw protocols and teachings. According to Snuneymuxw, such disruptions are in direct conflict with the exercise of rights affirmed through the Snuneymuxw Sarlequun Treaty of 1854, which guaranteed continued access to and use of these lands and resources.

In addition to the Project-specific effects of Tilbury Phase 2, FortisBC has identified two other foreseeable projects that are expected to alter the foreshore of Tilbury Island: the T1B and the TMJ projects. These developments are likely to contribute to increased sensory disturbances, further diminishing the quality of experience and cultural connection to land and waters near the Project site. Increased shipping activity in the Fraser River associated with the TMJ Project may disrupt fish populations, adversely affecting Snuneymuxw fisheries, an activity central to both Aboriginal and treaty rights, as well as cultural identity and community well-being.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, including FortisBC's proposed mitigation measures, EAO's Table of Conditions and the federal Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 would have a minor effect on Snuneymuxw's ability to exercise their Aboriginal Treaty Rights.

Snuneymuxw considers the Project in relation to cumulative effects on its Aboriginal and Snuneymuxw Sarlequun Treaty of 1854 Rights as moderate. This position reflects Snuneymuxw's assessment that, when evaluated against a treaty-consistent and pre-contact baseline, the Project contributes to erosion of the quality and integrity of rights exercised within its territory.

#### 16.14.9 Potential Positive Effects of Tilbury Phase 2

According to the Revised Application, the Tilbury Phase 2 Project is expected to create positive effects for Snuneymuxw. One major benefit is the opportunity for direct employment and skills development, particularly during the Project's three-to-six-year construction phase, which will require a large workforce of skilled and semiskilled labor. Given that a portion of Snuneymuxw members hold trades certificates, the Project may offer

important pathways for members to secure construction-related jobs, helping to strengthen individual and community economic well-being.

In addition to employment, the Project offers potential contracting and procurement opportunities for Snuneymuxw-owned businesses. Local and regional Indigenous businesses could benefit by providing goods and services to the Project, supporting broader goals for economic self-sufficiency and business development. Furthermore, under the *Tilbury Projects Agreement* between Snuneymuxw and FortisBC, there are commitments to community investment, education, and training initiatives that aim to build long-term capacity within the nation. These opportunities are aligned with the nation's pursuit of the implementation of the Snuneymuxw Sarlequun Treaty of 1854, which includes commitments to protect and support Snuneymuxw livelihoods, economic participation, and access to land and resources. In this way, the Project has the potential not only to generate tangible benefits, but also to support the realization of treaty rights through increased economic inclusion and recognition of Snuneymuxw governance and development goals.

#### 16.14.10 Conclusions

Considering the above analyses and the EAO's engagement with Snuneymuxw, Snuneymuxw's engagement with FortisBC, mitigation measures, cumulative effects, the EAO's recommended Table of Conditions and the identified Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 is anticipated to have the following impacts on Snuneymuxw Indigenous interests:

- Negligible residual effects to harvesting and subsistence activities, which Snuneymuxw characterizes as moderate;
- Minor residual effects to cultural use sites and areas, which Snuneymuxw characterizes as moderate;
- Minor residual effects to cultural continuity, which Snuneymuxw characterizes as moderate;
- Negligible residual effects to Indigenous health and well-being, which Snuneymuxw characterizes as minor-to-moderate; and
- Minor residual effects to Snuneymuxw's Aboriginal and Snuneymuxw Sarlequun Treaty of 1854 Rights, which Snuneymuxw characterizes as moderate.

Considering the above analysis, the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on the Indigenous interests of Snuneymuxw has been adequately avoided, minimized, or otherwise accommodated. Based on the engagement undertaken with Snuneymuxw on Tilbury Phase 2, as outlined above in Section 16.14.2, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with Snuneymuxw.

## 16.15 S'ólh Téméxw Stewardship Alliance First Nations

### 16.15.1 Community Profile

The S'ólh Téméxw Stewardship Alliance (STSA) is a collective of seventeen Stó:lō First Nations formed to support title-holding communities in making unified stewardship decisions across S'ólh Téméxw (Halq'eméylem word for 'our world'/'our land'), the Stó:lō traditional territory. Its purpose is to uphold and protect the integrity of Stó:lō Peoples' relationship with their land, waters, and cultural practices, and to ensure member Nations' rights and interests are recognized in decision-making processes. The STSA Signatory First Nations membership (referenced hereafter as the STSA) includes Aitchelitz, Seabird Island, Shxwhá:y Village, Skowkale, Soowahlie, Squiala, Tzeachten, Yakweakwioose, Kwaw-kwaw-Apilt, Scowlitz, Skawahlook (Sq'ewá:lxw), Skwah, Sumas, Shxw'ow'hamel and Yale First Nations. Chawathil and Cheam First Nation are also included within the STSA membership, but they participate separately in the assessment process and are addressed in [Appendix 6, Sections 16.01](#) and [16.02](#).

### 16.15.2 S'ólh Téméxw Stewardship Alliance First Nation Involvement in the Environmental Assessment

During Early Engagement, the STSA submitted a notice to engage as a participating Indigenous nation for the Tilbury Phase 2 EA on behalf of its signatory nations. The EAO provided formal notifications and key documents to individual the STSA nations listed in the Assessment Plan rather than to the STSA as a collective. The [Assessment Plan](#) outlines consultation expectations with potentially affected Indigenous nations, including those represented by the STSA. The STSA identified several key issues requiring focused analysis, including potential effects on salmon relied on for FSC purposes, air-quality-related health concerns, impacts on cultural and spiritual practices, and the need to consider the S'ólh Téméxw ecosystem as an interconnected system.

The STSA actively participated in the Process Planning phase by reviewing the [Process Order](#), [Assessment Plan](#), and [Tilbury Phase 2 - Schedule C – Application Information Requirements](#) materials; providing updated secondary-source information; and emphasizing that cumulative industrial and climate impacts on the Fraser River must be assessed holistically through a Stó:lō worldview. The STSA and the EAO worked collaboratively during this phase through regular check-ins, and the STSA expressed interest in co-drafting their section of the Report to ensure Stó:lō-specific considerations are meaningfully incorporated. While FortisBC shared draft documents with the STSA member nations, the EAO issued formal notifications and assessment materials directly to individual the STSA signatory nations listed in the Assessment Plan. During the Application Review Phase, the STSA and its signatory nations were invited to participate in TAC meetings and were provided full opportunity to review and comment on the Revised Application.

The Process Order requires FortisBC to consult with Indigenous nations, and the Assessment Plan directs the Proponent to develop an Indigenous Engagement and Collaboration Plan

The EAO used the following sources in drafting the assessment of Tilbury Phase 2 effects on the STSA's Indigenous interests:

- The Proponent's Revised Application;
- Information submitted during the EA by the Proponent and the STSA;
- Conclusions from the EAO's assessment of VCs; and
- [Section 11.08 of the Revised Application](#), along with the Proponent's [Indigenous Engagement Report](#), provides a summary of the Proponent's engagement with the STSA.

Section 11.08 of the Revised Application includes a summary of FortisBC's engagement with the STSA, who have been involved in the process since July 2019. The section was co-developed with the STSA through regular meetings and joint drafting. The Revised Application also includes tables summarizing engagement activities with the STSA members, which are further detailed in the Indigenous Engagement Report.

### 16.15.3 Assessment Boundaries

All Tilbury Phase 2 components are within S'ólh Téméxw.

The spatial assessment boundaries for each Indigenous interest were based on the overlap between S'ólh Téméxw and the combined Local and RAAs identified for linked VCs. Refer to Figure 11.8-1 in [Section 11.08 of the Revised Application](#) (S'ólh Téméxw and Reserve Sites Figure). The LAA for each Indigenous interest reflects the combined LAAs of the VCs linked to that interest. The RAA is defined the same way, using the combined RAAs of the linked VCs. In general, the LAA is used to assess direct and indirect Tilbury Phase 2 effects, while the RAA supports the assessment of cumulative effects.

The assessment of potential effects related to Tilbury Phase 2 considered three distinct phases:

- Construction phase, with an estimated duration of three to six years;
- Operation phase, expected to last more than forty years; and
- Decommissioning phase, anticipated to take approximately two years.

### 16.15.4 Regional Context

Tilbury Phase 2 is situated within S'ólh Téméxw, the traditional territory of the Stó:lō Peoples represented by the STSA. This territory generally encompasses the lower Fraser River watershed, with boundaries that vary by source but are commonly described as extending from Yale through the Fraser Valley to the estuary, and outward to areas such as Harrison Lake, the Coquihalla River, the Strait of Georgia, and south into Washington State. The Fraser River is central to Stó:lō cultural identity, subsistence, and stewardship. It provides ecological and cultural lifelines through fishing, travel, and ceremony.

The STSA has consistently emphasized that this river and its connected ecosystems are already under strain from historic and ongoing industrialization, including degraded fish habitat, reduced water quality, and restricted access to traditional sites. Historical impacts—from the 1858 Gold Rush to subsequent waves of land loss, industrial development, and urbanization—have further eroded ecological integrity and Indigenous well-being. In this context, the STSA has expressed concern that additional development may exceed ecological and cultural thresholds within S'ólh Téméxw.

The STSA signatory First Nations, as part of the broader Stó:lō Peoples, have a long history of using the south arm of the lower Fraser River adjacent to Tilbury Phase 2. The Tilbury Island region lies within S'ólh Téméxw, where Stó:lō communities fished for salmon and eulachon for at least 6,400 years, gathered wetland plants such as cranberries and wapato, and travelled the Fraser River, an essential cultural corridor linking villages, harvesting camps, and ceremonial sites. These historical uses, reflected in nearby archaeological sites and longstanding cultural practices, remain integral to the health, identity, and continuity of Stó:lō Indigenous interests today.

According to the Revised Application, the STSA does not currently use the south arm of the lower Fraser River adjacent to Tilbury Phase 2 to fish, hunt, gather plants, or access cultural sites or areas, given the highly industrialized and inaccessible condition of the Tilbury Island site, the absence of waterborne Tilbury Phase 2 activities, and the lack of identified site-specific traditional use in the immediate vicinity.

The existing Tilbury LNG facility consists of gravel and paved areas, existing infrastructure, and equipment laydown areas supporting little plant life with very little to no habitat value for wildlife. The vegetation within Tilbury Phase 2 is mostly limited to ditch lines and spoil piles and is dominated by non-native and invasive plant species. Public access to Tilbury Phase 2 is limited, although there is currently public use of the dike to the north of Tilbury Phase 2 along the Fraser River.

### 16.15.5 Indigenous Interests

The EAO engaged the STSA during the Early Engagement phase in the development of the [Joint Summary of Issue and Engagement for the Tilbury Phase 2 LNG Expansion Project](#). The EAO summarized an initial understanding of the STSA's interests including:

- Impacts to rights to fish salmon relied on by nations for FSC well-being;
- Impacts on community members' health and wind-dried salmon from cumulative air quality effects;
- Impacts on cultural and spiritual practices and related impacts on health and well-being;
- Protection of S'ólh Téméxw ecosystem as an integrated system; and
- Potential impacts on the maintenance and transmission of cultural practices from past developments and future projects.

The Proponent has identified the STSA's Indigenous interests to be assessed in the Revised Application through:

- Reviewing requirements and guidance from the EAO, including the AIR; and
- Conducting engagement efforts with the STSA to gather information on their Indigenous interests, as outlined in Section 11.8.3 Summary of Engagement of the STSA section in the Revised Application.

The EAO engaged the STSA during Process Planning regarding their Indigenous interests where the STSA expressed a preference for co-drafting their section of the Report with the EAO to ensure that effects are understood and framed through a Stó:lō worldview, developing a broader Stó:lō EA policy they would apply to Tilbury Phase 2.

During Application Review, the STSA engaged as a participating Indigenous nation, receiving invitations to provide comments on the Revised Application, engage in TAC discussions, and review draft materials issued by the EAO. In the Revised Application, the STSA provided information to the Proponent directly regarding their Indigenous interests in relation to Tilbury Phase 2. The EAO and the STSA worked collaboratively on the selection of Indigenous interests, along with the preliminary list of Indigenous interests identified in the AIR, which include:

- Harvesting and subsistence activities;
- Cultural use sites and areas;
- Social and economic conditions;
- Indigenous health and well-being;
- Cultural continuation; and
- Indigenous governance systems.

The assessment of the STSA's Indigenous interests in this section uses these categories.

The EAO's assessment includes describing the Indigenous interest, the current context, potential effects, applicable mitigation, and the resulting effects analysis. If there is an adverse residual effect, a characterization of effects and a cumulative effects assessment are also completed. Cultural continuation and Indigenous governance systems were not assessed as stand-alone interests, but as components of other Indigenous interests, with core analysis placed in the cultural use sites and areas sections. Analysis of governance and cultural continuation interests are also integrated into the harvesting and subsistence activities, social and economic conditions, and Indigenous health and well-being sections.

### 16.15.6 Harvesting and Subsistence Activities

#### Background

The STSA represents several Stó:lō First Nations for whom harvesting and subsistence activities are central to cultural identity and constitutionally protected Aboriginal Rights. Guided by the principle *Mekw stám illeq'tol* ("everything is connected"), the STSA emphasizes the interdependence of people, animals, and the environment through *shxweli* (life force).

The STSA members have relied for generations on salmon, sturgeon, eulachon, and other resources, which are not only vital food sources but are also understood as ancestral beings embedded in Stó:lō governance and identity. Traditional practices such as wind-drying salmon continue to hold cultural importance, though they have been constrained by historic regulations and the effects of industrial development. Plant gathering, hunting, and ceremonial use of surrounding lands remain integral, with historical harvesting sites located near Tilbury Phase 2. Historical harvesting sites used by the STSA signatory Nations occur very close to Tilbury Phase 2, including archaeological site, with evidence of precontact fishing, located within 1 km of Tilbury Phase 2 on the opposite bank of the Fraser River. Additional major Stó:lō fishing and gathering sites, such as the Glenrose and St. Mungo archaeological sites 6–7 km upriver and historic cranberry-picking and cannery locations across the lower Fraser, demonstrate that Tilbury Phase 2 lies within a longstanding, resource-rich harvesting landscape used for at least 6,400 years.

#### Current Context

The STSA face cumulative impacts from industrial, agricultural, and residential activity throughout S'ólh Téméxw, which have degraded the Fraser River and constrained the exercise of Indigenous Rights and Title. Pollution, declining fish populations, and disrupted habitat directly affect food security, cultural practices, and stewardship responsibilities. Although Tilbury Phase 2 is an industrial brownfield with limited ecological value and no current fishing use, the STSA has stressed that effects must be understood within the broader Fraser River system. Traditional harvesting areas within the LAA and RAA include sites such as Qiqá:yt and Tsitslhes, and while fishing persists in some areas, continued regional development has reduced opportunities for hunting, gathering, and traditional resource use. Specifically, Qiqá:yt, a major Stó:lō cranberry-gathering and wintering site, is located across the Fraser River from present-day New Westminster and just outside Tilbury Phase 2's LAA, while Tsitslhes, a historic Stó:lō settlement and fishing camp, lies within approximately 13 km of the Tilbury Island Project Site along the lower Fraser River.

Baseline conditions already reflect cumulative degradation, leaving limited resilience to absorb further impacts. The STSA has raised concerns that additional pressures from Tilbury Phase 2—particularly changes in air quality, noise, and visual landscapes—could further disrupt fishing practices, reduce access to culturally important resources, and compound existing stresses on their ability to meaningfully exercise Aboriginal rights.

The STSA exercises traditional governance through the S'ólh Téméxw Use Plan Policy—an environmental management and land use framework that protects culturally sensitive wildlife and vegetation zones, including key Fraser River habitats. The policy guides stewardship decisions rooted in Stó:lō law and requires activities to be assessed for consistency with cultural and ecological priorities.

#### Potential Project Effects

The EAO has identified the following pathway of effects prior to the application of mitigation measures, along with the associated VCs outlined in [Appendix 6](#) that may affect the STSA Signatory First Nation's harvesting and subsistence activities during the Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- **Effects on the Fraser River ecosystem and water quality, migrating and spawning salmon and fish and fish habitat, marine and aquatic species and habitat;** Potential effects include changes to the Fraser River ecosystem and water quality from Tilbury Phase 2-related activities, including alterations to surface water and groundwater conditions (surface water and groundwater VCs). These pathways may affect the health, distribution, and abundance of culturally important marine and aquatic species (fish and fish habitat, wildlife and wildlife habitat, vegetation VCs). Tilbury Phase 2 activities may also interact with migrating and spawning salmon through potential changes in habitat quality, flow conditions, and exposure to contaminants of concern such as 6PPD-Quinone (6-PPDQ), which could alter seasonal harvesting opportunities and patterns. Broader effects on fish, marine species, and aquatic habitat may influence the availability, quality, and reliability of key species harvested within the Fraser River and associated marine environments (fish and fish habitat VC). Changes to accessible travelways and navigation routes along the Fraser River and nearby marine waters (land and resource use VC), along with any temporary access restrictions, may affect the ability of the STSA members to travel to or use preferred harvesting locations (culture VC). These pathways could influence the timing or seasonal round of harvesting activities and the overall practice of harvesting within S'ólh Téméxw;
- **Effects on Aboriginal Rights to fish, harvest, and hunt for food, social and ceremonial (FSC) purposes:** Potential effects include changes to harvesting methods and practices, including timing, seasonality, and preferred harvesting locations, due to alterations in air quality (air Quality VC), noise and vibration (acoustic VC), and surface water or groundwater conditions (surface water, groundwater VCs). Tilbury Phase 2-related changes to habitat quality and species availability, distribution, abundance, and health may influence harvesting success and the quality and quantity of harvested species, including fish, wildlife, plants, and migratory birds (vegetation, wildlife and wildlife habitat, and fish and fish habitat VCs). Effects on hunting, trapping, and migratory bird harvesting may also occur through changes to sensory conditions or habitat suitability. Increased harvesting effort—such as greater time, travel difficulty, or expense—along with potential access restrictions or disruptions to travelways (land and resource use VC) may affect the ability to exercise Aboriginal Rights for FSC purposes and may alter harvesting-based livelihoods and current use of lands and resources for traditional purposes;
- **Changes to the current use of lands and resources for traditional purposes:** Potential effects include changes to harvesting methods and practices, such as timing, seasonality, or preferred locations, as well as increased effort required to access or use traditional areas. These pathways may be influenced by changes in habitat quality and species availability, distribution, and abundance, along with sensory disturbances such as noise, air emissions, and vibration during Construction and Operation. Additional effects may include temporary restrictions on travelways or access to culturally important areas due to construction activities and surface water alterations (vegetation, wildlife and wildlife habitat, fish and fish habitat, acoustic, air quality, surface water, and land and resource use VCs);

- **Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources:** There are potential Tilbury Phase 2-related changes to surface water and groundwater quality, including turbidity and hydraulic conditions in the Fraser River and Tilbury Slough (surface water, and groundwater VCs), along with potential exposure to contaminants such as 6-PPDQ, may affect the health, distribution, and quality of culturally important fish, wildlife, bird, and plant species (fish and fish habitat VC; wildlife and wildlife habitat VC; vegetation VC). Sensory disturbances—such as noise and vibration (acoustic VC), odour and dust (air quality and soil VC), and visual changes to the landscape—may alter the experience of harvesting and influence preferences for historically and contemporarily used harvesting locations. These pathways may contribute to changes in the abundance, distribution, or behavior of harvested species, affect the current and future availability and quality of traditional foods, and reduce accessibility to culturally important harvesting sites due to changes in travelways or localized access restrictions (land and resource use VC). Even where measurable population effects are limited, shifts in species presence, condition, or predictability can influence harvesting success, seasonal rounds, and cultural trust in harvested resources; and
- **Effects to the accessibility and availability of traditional lands and resources:** Tilbury Phase 2 activities may affect the ability to travel to or through areas traditionally used for harvesting through changes to surface water levels and flow conditions, localized construction restrictions, and modifications to land- or water-based travelways (surface water, groundwater, and land and resource use VCs). Temporary access limitations, including reduced navigability on the Fraser River or marine routes, may influence the STSA members' ability to reach key harvesting locations (fish and fish habitat VC). Sensory disturbances such as noise and vibration (acoustic VC), air emissions and dust (air quality and soil VCs), and vegetation removal or alteration (vegetation VC) may further affect access by diminishing comfort, safety, or cultural accessibility of travel routes. These pathways may reduce the availability of culturally important land and water-based harvesting sites and affect patterns of use within S'ólh Téméxw.

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on harvesting and subsistence activities. As mentioned in the section above. A full table of Proponent mitigations can be found in [Appendix A of the Revised Application](#). Below is a summary of mitigation measures, how they address effects on the relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support the STSA's harvesting and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during Construction and Operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support the STSA's harvesting and cultural practices;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm-sewer system. These protections support water quality and fish habitat relied on to support the STSA's harvesting and cultural practices;

- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by the STSA for harvesting and cultural practices;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by the STSA for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing Construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to the STSA's harvesting and cultural practices;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the health and availability of salmon and other fish species central to the STSA's harvesting and cultural practices;
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used for harvesting or cultural practices; and
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat and vegetation important to the STSA's harvesting and cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions to help reduce potential impacts on the STSA's harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting (see [Section 8](#) of this Report):

- **Condition 10 (Community Feedback Process)** creates a clear way for the STSA to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of the STSA's harvesting and cultural practices;
- **Condition 12 (CEMP)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to the STSA's harvesting and cultural practices;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to the STSA's harvesting and cultural practices;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emission control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support the STSA's harvesting and cultural practices; and
- **Condition 17 (Dry Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project-related roads, which may lower potential impacts on salmon and other fish important to the STSA's harvesting and cultural practices.

In addition to the Proponent's mitigations and the provincial conditions the EAO identified the following Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to harvesting and subsistence activities:

**Federal Consideration for Migratory Bird Protections;** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting the STSA's harvesting practices and broader ecosystem conditions important to their way of life.

#### The EAO's Analysis and Conclusions

After consideration of the mitigation measures and potential effects, described above, the EAO identified the following residual effects:

- Effects on Aboriginal rights to fish, harvest, and hunt for FSC purposes; and
- Changes to the current use of lands and resources for traditional purposes.

The EAO's characterization of the residual effects of Tilbury Phase 2 on harvesting and subsistence activities are summarized in the table below.

Table 43: Summary of residual effect and rationale on the S'ólh Téméxw Stewardship Alliance and its harvesting and subsistence activities.

| Residual Effect                                                                                                                                                                                     | Assessment Rating*                                                                                                                                                                                                                | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Harvesting and Subsistence Activities<br>- Effects on Aboriginal Rights to fish, harvest, and hunt for FSC purposes<br>- Changes to the current use of lands and resources for traditional purposes | Context (resilience): Low<br>Magnitude: Low<br>Extent: Local<br>Duration: Medium-term<br>Reversibility: Fully reversible<br>Frequency: Continuous<br>Affected Populations: Disproportionate<br>Risk: Low<br>Uncertainty: Moderate | <p><b>Context:</b> The interest is rated as having low resilience due to existing cumulative industrial, urban, and port development pressures within the STSA's traditional territory, particularly along the Fraser River and marine environment. While harvesting activity continues in other parts of the territory, areas near the Tilbury site are already under environmental stress, making them less able to absorb additional changes without affecting harvesting quality and success.</p> <p><b>Magnitude:</b> The magnitude is assessed as low, as potential residual effects may either undetectably or slightly alter the availability, distribution, and quality of harvested species and harvesting experiences without eliminating the ability to exercise rights. There are negligible magnitude residual effects on fish, fish habitat, and surface water after mitigation. Negligible to low magnitude residual effects may remain for air quality, acoustic, vegetation, wildlife and wildlife habitat, land and resource use. These may influence both the feasibility and quality of harvesting and traditional land use.</p> <p><b>Extent:</b> Rated as local, since the spatial scale of residual effects to applicable VC's is limited, the impact on harvesting is expected to remain local, primarily within the immediate Tilbury Phase 2 area.</p> <p><b>Duration:</b> Rated as medium-term, as residual effects may persist through Construction and Operation (&gt;2 years) but are expected to diminish or cease following decommissioning and successful restoration.</p> <p><b>Reversibility:</b> Most effects, particularly those related to sensory disturbances such as noise and light, would cease if Tilbury Phase 2 were halted or upon decommissioning, making them fully reversible.</p> <p><b>Frequency:</b> Rated as continuous, as certain effects, such as noise, light disturbance, and dust, would occur continuously. Some effects would occur seasonally or periodically in alignment with harvesting and traditional land use activities, and during certain operational activities at Tilbury Phase 2.</p> <p><b>Affected Populations:</b> Rated as disproportionate, as impacts would most acutely affect Elders, fishers, hunters, and knowledge holders engaged in FSC harvesting, as well as those reliant on land-based practices for cultural continuity.</p> <p><b>Risk:</b> The likelihood of these effects occurring is low given the effectiveness of</p> |

| Residual Effect                                                                                                                   | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p>proposed mitigation measures, including removal of in-river works, environmental management plans, and air and acoustic controls. With negligible low magnitude and VC residual effects confined to a local extent, the overall consequences are expected to be minor. While cumulative pressures in the Fraser River corridor heighten sensitivity, the incremental contribution of Tilbury Phase 2 is small. Therefore, the risk is rated as low.</p> <p><b>Uncertainty:</b> The pathways of effects, such as increased noise, light, vibration, and impacts on harvesters, are well understood. While mitigation measures are expected to be moderately to highly effective, some uncertainty remains regarding their effectiveness in fully addressing harvesters' experiences and perceptions. As a result, the level of uncertainty is rated as low.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### Cumulative Effects

As described in the Background and Current Context section, the Lower Fraser River and Tilbury Island area have experienced decades of industrial activity. These existing pressures have already affected environmental conditions, and in turn the STSA's harvesting and subsistence interests by reducing availability of culturally important resources and altering how members would access and use that area.

The Revised Application identifies several reasonably foreseeable projects that may adversely affect the STSA's harvesting and subsistence interests. These include T1B, which would increase LNG production, and TMJ, which would introduce additional vessel traffic on the Fraser River and further modify the foreshore next to the Project site. After mitigation and conditions have been implemented, the residual effects would be minimally disrupted from current conditions. Both T1B and TMJ could contribute additional sensory disturbances (noise, light, vibration), and impact air quality in areas potentially used by the STSA for harvesting. TMJ could further alter fish and fish habitat, vegetation, and vegetation habitat as well as water quality in areas used by the STSA for harvesting. Climate change is also expected to continue to influence vegetation, wildlife, and fish resources relied upon by the STSA nations. The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project-specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, FortisBC's proposed mitigation measures, and EAO's Table of Conditions, the EAO concludes that Tilbury Phase 2 would have negligible effects on the STSA's harvesting and subsistence activities.

## 16.15.7 Cultural Use Sites and Areas

### Background

For the STSA, cultural use sites and areas are deeply tied to history, identity, and ongoing cultural practices, rooted in their relationship with S'ólh Téméxw, the land, air, water, and resources, which sustain the well-being of present and future Stó:lō generations. The cultural principle of tómiyeqw (connecting Stó:lō seven generations past and future) reflects this enduring responsibility across time.

There are known archaeological and historical sites near Tilbury Phase 2 and within the LAA and RAA of linked VCs. The Fraser River delta has been continuously used by Indigenous communities for at least 6,400 years, and sites in the vicinity typically represent seasonal camps and resource extraction locations for fishing, hunting, berry picking, and plant gathering. A precontact archaeological site containing heritage features—including a fishing weir—is located within approximately 1 km of Tilbury Phase 2. The Deas Island cannery site (ca. 1871), the closest cannery site to Tilbury Phase 2, reflects longstanding Stó:lō participation in regional fisheries. Other culturally important areas, such as Qiqá:yt (a major historic cranberry-picking camp) and the transformer site Stl'aleqem on Barnston Island, are located just outside or within linked assessment areas and form part of the broader network of cultural sites connected to the lower Fraser River.

These places are fundamental to cultural continuation and Indigenous governance systems, where intergenerational knowledge, language, and cultural identity are shared, and where traditional governance practices such as stewardship, territory management, and community decision-making occur. Named places, ceremonial sites, longhouses, potlatch gatherings, and travel corridors provide settings for storytelling, teaching laws and protocols, and practicing spiritual and communal responsibilities that reinforce Stó:lō identity, self-determination, and connection to S'ólh Téméxw. The S'ólh Téméxw Use Plan Policy<sup>42</sup> and the Stó:lō Heritage Policy<sup>43</sup> underscore the role of these sites in guiding development and protecting cultural heritage.

The lower Fraser River region has long been central to cultural activities, including harvesting, spiritual practices, social gatherings, and travel. Tilbury Phase 2 and surrounding lands hold historic importance for fishing, hunting, plant gathering, and ceremony. However, infringement and development have resulted in the loss of cultural sites and traditional knowledge.

#### Current Context

For the STSA, cultural use sites and areas have been shaped by historical disenfranchisement and ongoing industrial, agricultural, and residential development. Colonial policies constrained governance systems and cultural responsibilities, while contemporary processes often limit participation in decision-making and the application of Indigenous laws, customs, and protocols. Many important places have been disrupted or remain inaccessible, with Tilbury Phase 2 situated on private industrial land that restricts traditional use. These access constraints, combined with broader pressures on land and water, continue to erode opportunities to uphold cultural practices, maintain intergenerational knowledge, and protect heritage values across S'ólh Téméxw.

The STSA members who continue to actively use cultural sites and areas throughout the lower Fraser River region, where the river remains a central cultural and spiritual site for ceremony, travel, canoe journeys, and the transmission of intergenerational knowledge. Despite urbanization around Tilbury Island, Stó:lō members continue harvesting and gathering activities, including plant gathering, cranberry picking at places such as Qiqá:yt, and FSC fishing for salmon and other culturally important species, supported through family ties and longstanding use of resource sites along the estuary. Spiritual and historical places, such as the transformer site Stl'aleqem on Barnston Island and nearby archaeological camps and fishing sites, continue to guide cultural teachings, stewardship responsibilities, and the maintenance of place-based knowledge.

#### Potential Project Effects

The EAO has identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#), that may affect the STSA's cultural use sites and areas during the Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or

<sup>42</sup> [The S'ólh Téméxw Use Plan Policy](#)

[The Stó:lō Heritage Policy](#)

**architectural significance;** Tilbury Phase 2 activities may disturb or alter sites of cultural, archaeological, and historical importance, including storied places, habitation sites, and archaeological areas along the South Arm of the Fraser River, Tilbury Island, and Lulu Island (archaeological and heritage resources, and soil VCs). Sensory disturbances, such as noise and vibration (acoustic VC), odour, dust, and air emissions (air quality VC), and changes to visual resources, may affect the cultural setting and result in qualitative changes to the experience of using cultural sites and exercising associated cultural practices, customs, beliefs, and values (culture VC). Changes to accessible travelways, areas with access restrictions, and navigation along the Fraser River and nearby marine environments may further limit access to culturally important sites and influence participation in communal activities (land and resource use VC);

- **Effects of various Tilbury Phase 2 activities on cultural values and spiritual activities;** Tilbury Phase 2 activities may affect the integrity and accessibility of cultural sites and areas used for spiritual practices, including impacts to the Fraser River and the sockeye salmon run, which hold deep cultural significance beyond their subsistence value (culture, land and resource Use, and fish and fish habitat VCs). Potential effects include changes to or loss of access to cultural sites and areas through accessible travelway alterations or areas with access restrictions, as well as sensory disturbances such as noise and vibration (acoustic VC), odour and air quality changes (air quality VC), visual changes, and dust (land and resource use VC) that could degrade the cultural setting and experience. Participation in communal activities, harvesting, and ceremonial practices may be further influenced by disturbances or alterations to sites of historical and archaeological importance (archaeological and heritage resources VC) and changes to the availability of culturally important species like salmon;
- **Effects of the Tilbury Phase 2 activities on the cultural and ceremonial use areas in and around the project Area;** Tilbury Phase 2 activities may result in loss of access to, or disenfranchisement from, cultural and ceremonial sites through disturbance or alteration of areas of historical, cultural, and archaeological importance (archaeological and heritage resources, culture, and land and resource use VCs). Sensory disturbances, including noise and vibration (acoustic VC), odour, dust, and air quality changes (air quality and soil VCs), and shifts in visual resources, may lead to qualitative changes in the experience of using cultural sites and exercising associated cultural practices, customs, beliefs, and values. Changes to accessible travelways, the creation of areas with access restrictions, and potential effects on navigation along the Fraser River and adjacent marine environments may further limit the use of these areas for communal activities, gatherings, and ceremonial purposes (land and resource use VC).
- **Loss of access to or disenfranchisement from cultural sites;** Tilbury Phase 2 activities may result in changes to physical, cultural, or spiritual sites, including the disturbance or alteration of areas of historical, archaeological, and cultural importance (archaeological and heritage resources; culture, and land and resource use VCs). Disruption or alteration of trails, accessible travelways, and navigable waterways, including navigation along the Fraser River, along with the creation of areas with access restrictions, may limit the ability to reach and use important cultural sites. Sensory disturbances such as noise, odour, dust, and changes to visual resources may further diminish the experience of participating in communal activities and exercising cultural practices, customs, beliefs, and values associated with these sites.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed to potential Tilbury Phase 2 related effects on cultural use sites and areas. These include the following:

- **Air Quality (Section 7.2)** The air quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support the STSA's cultural practices;

- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the health and availability of salmon and other fish species central to the STSA's connection to cultural practices;
- **Acoustics (Section 7.3)** Noise reduction measures during Construction and operation, including idle reduction policies, equipment muffling, enclosures, and engineered noise controls, help limit disturbance to culturally important areas and activities. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of cultural knowledge by the STSA;
- **Soil (Section 7.6)** Soil management measures, including erosion control, spill-prevention protocols, and careful handling and disposal of contaminated soils, help prevent the migration of pollutants into nearby cultural areas and waterways. Maintaining soil stability and quality supports the protection of culturally important places and landscapes used by the STSA;
- **Land and Resource Use (Section 7.11)** Traffic-management planning, noise and lighting controls, and communication regarding project activities help reduce disruptions to access and use of culturally important areas. These measures support the STSA's ability to safely access and continue cultural practices within their traditional territory;
- **Infrastructure and Services (Section 7.12)** Measures to manage traffic, workforce accommodation, emergency response, and waste help limit indirect pressures on local lands, waters, and access routes. By managing congestion and pressures on community services, these measures help maintain safe access to culturally important areas and manage disturbance to cultural landscapes relied on by the STSA;
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures, site protection, and early notification to Indigenous nations, help protect culturally important sites, features, and landscapes. These measures support the STSA's ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connections to territory; and
- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support the STSA's ability to access, use, and maintain culturally important areas, including places of teaching, ceremony, and connection to land and water.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects to Indigenous cultural use sites and areas (see [Section 8](#) of this Report):

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance.
- **Condition 10 (Community Feedback Process)** to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;

- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of culturally important landscapes and areas, supporting the STSA's continued access to and use of cultural sites during project Construction;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, lighting, wildlife interactions, and spills during project Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by the STSA;
- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emissions-control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites by the STSA; and,
- **Condition 15 (Chance Find Protocol)** requiring the development and implementation of a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If the STSA historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

#### The EAO's Analysis and Conclusions

After consideration of the mitigation measures, provincial conditions, and potential effects, described above, the EAO identified the following residual effects:

- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance;
- Effects of various Tilbury Phase 2 activities on cultural values and spiritual activities; and
- Loss of access to or disenfranchisement from cultural sites.

The STSA and the EAO's characterization of the residual effects of Tilbury Phase 2 on cultural use sites and areas are summarized in the table below.

Table 44: Summary of residual effects and rationale on the S'ólh Téméxw Stewardship Alliance and its cultural use sites and areas.

| Residual Effect                                                                                                                                                                                                                                                                                                                                           | Assessment Rating*                                                                                                                                                                                                                                                       | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cultural use sites and areas<br><br>- Effects of various Tilbury Phase 2 activities on cultural values and spiritual activities<br><br>- Loss of access to or disenfranchisement from cultural sites<br><br>- Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance | Context (resilience): Medium<br><br>Magnitude: Low<br><br>Extent: Local<br><br>Duration: Medium-term<br><br>Frequency: Continuous<br><br>Reversibility: Partially reversible<br><br>Affected Populations: Disproportionate<br><br>Risk: Low<br><br>Uncertainty: Moderate | <p><b>Context:</b> The interest is rated as having moderate resiliency, recognizing that the STSA has demonstrated adaptability in maintaining cultural practices despite historical and ongoing industrial development within their territory. However, the persistence of cumulative disturbances in the Fraser River corridor, including habitat alteration, sensory impacts, and reduced access to key cultural areas, has likely diminished overall capacity to absorb additional adverse effects. This rating reflects a balanced assessment acknowledging both cultural resilience and the challenges posed by the highly modified setting.</p> <p><b>Magnitude:</b> The magnitude of impact is rated as low, based on the Project's negligible magnitude residual effects on fish, fish habitat, and surface water, which underpin many cultural activities. Other connected VC residual effects, including those to wildlife, vegetation, air quality, acoustics, and land and resource use, are expected to be negligible to low in magnitude and of local extent. The Tilbury Phase 2 site is located on fee simple industrial land, where access for cultural use is already restricted.</p> <p><b>Extent:</b> Rated as local, as the anticipated residual effects are geographically confined to Tilbury Phase 2 vicinity and immediate surrounding areas. While the STSA members continue to maintain connections across the lower Fraser, the predicted effects are unlikely to extend beyond the local assessment area</p> |

| Residual Effect                                                                                                                   | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p>for cultural use.</p> <p><b>Duration:</b> The effects on cultural use sites and areas are rated as medium-term. The residual effects, particularly sensory disturbances and restricted access, would persist throughout Construction and Operation but are expected to cease following Decommissioning.</p> <p><b>Frequency:</b> Rated as continuous for restrictions on access to Tilbury Phase 2, which is an ongoing condition. Sensory disturbances (e.g., noise, odour, visual changes) may be continuous during Operations but variable during Construction depending on activity type.</p> <p><b>Reversibility:</b> Most effects, particularly those related to sensory disturbances such as noise, and light, would cease if Tilbury Phase 2 were halted or upon Decommissioning. However, any cultural impacts arising from sustained loss of access or long-term changes in practice patterns could be partially reversible if intergenerational use or knowledge transfer is disrupted.</p> <p><b>Affected Populations:</b> Tilbury Phase 2's impacts would disproportionately affect the STSA members who actively engage in cultural and ceremonial practices in proximity to the Project area. While indirect effects, through changes to the cultural landscape or perceptions of site quality, could be felt more broadly by the STSA.</p> <p><b>Risk:</b> The likelihood of direct Tilbury Phase 2-related impacts on cultural use sites is low due to the application and effectiveness of proposed mitigation measures, and the overall consequence is minor, given the negligible to low magnitude of predicted residual effects. Therefore, the risk is rated as low.</p> <p><b>Uncertainty:</b> Rated as moderate, acknowledging that cultural effects are complex to quantify and may be experienced differently among individuals and families. While mitigation is expected to be effective in addressing physical and sensory disturbances, uncertainties remain regarding long-term perceptions of site suitability for cultural use.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Cumulative Effects

The STSA emphasizes that, in the Stó:lō worldview, the Fraser River is understood as a single, interconnected cultural site, such that impacts to any one part of the river system create effects on the whole river system.

The historical context of environmental degradation and land-use changes has already affected the STSA's cultural use sites and areas, as detailed in the Background and Current Context sections above. The STSA experiences limited access and altered ecological conditions along the Fraser River, and the degraded state of sites like Tilbury Island due to industrial development. These past and present impacts have reduced the ability of the STSA nations to fully utilize culturally important locations and have hindered the transmission of Indigenous Knowledge.

According to the Revised Application two foreseeable projects, T1B and TMJ, are expected to modify the Tilbury Island foreshore prior to Construction of Tilbury Phase 2. These developments are expected to introduce additional sensory disturbances (noise, light, vibration) affecting nearby cultural site access and use. T1B could remove vegetation, impacting culturally important plants and wildlife habitat, while TMJ shipping activities may increase disturbances, with potential effects on fish populations and cultural connections to the Fraser River. The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

#### Conclusion

Considering the above analysis, FortisBC's proposed mitigation measures, and EAO's Table of Conditions, the EAO concludes that Tilbury Phase 2 would have negligible effects on STSA's cultural use sites and areas.

### 16.15.8 Social and Economic Conditions

#### Background

The social and economic conditions of the STSA are deeply interconnected with their cultural identity and enduring relationship to S'ólh Téméxw, their traditional territory encompassing land, air, water, and resources. Stó:lō socio-cultural and economic relations, values, and governance are rooted in connections to ancestors, land, and sacred places, reflecting a holistic worldview where social, economic, political, environmental, and spiritual dimensions are inseparable. Traditionally, the Fraser River and surrounding ecosystems sustained Stó:lō economies and cultural practices and continue to inform decision-making guided by Stó:lō laws and principles of sustainability. Current conditions reflect both historical impacts and ongoing pressures from industrial, agricultural, and residential activities across the region.

#### Current Context

Historical and ongoing industrial, agricultural, and urban development across S'ólh Téméxw have contributed to cumulative effects degrading ecological integrity and extensively impacting Aboriginal rights, traditional practices, and community well-being. Demographic and housing data reflect the legacy of colonialism, including limited housing, infrastructure gaps, and past barriers to clean water. Health and wellness concerns link to environmental degradation and disruptions to traditional food systems, affecting physical, mental, and spiritual health. The transition from traditional subsistence to wage-based employment has shifted economic patterns, though many of the STSA members maintain involvement in both contemporary and traditional livelihoods. Traditional activities, fishing, shellfish harvesting, hunting, and plant gathering, face constraints from urbanization, habitat loss, and restricted access to cultural sites, undermining food security, cultural continuity, and knowledge transfer. While Tilbury Phase 2 itself is already heavily industrialized and not used currently by the STSA for social or economic activities, its proximity to the Fraser River means further industrial expansion on this site could adversely affect the surrounding ecosystem that underpins the STSA's commercial, non-commercial, and future economic aspirations.

#### Potential Project Effects

The EAO has identified the following pathways of effects, along with the associated VCs outlined in [Appendix 6](#), that may affect the STSA's social and economic conditions during the Construction, Operation, and Decommissioning Phases of the Tilbury Phase 2:

- **Changes to employment opportunities, Indigenous businesses, procurement opportunities, and Indigenous Government revenue:** Tilbury Phase 2 activities may generate direct, indirect, and induced employment, along with procurement and contracting opportunities for Indigenous businesses, which may contribute to increased Indigenous government revenue (employment and economy VC). These opportunities relate to access to Tilbury Phase 2-related economic benefits, including employment income, labour force participation, and local job market conditions. Training, certification, and education initiatives associated with Tilbury Phase 2 may strengthen workforce readiness and support long-term skill development (infrastructure and services VC). Culturally aligned employment and procurement approaches may also reinforce Indigenous governance capacity and community-driven cultural programs (culture VC). Interactions with land and resource use patterns may influence how Tilbury Phase 2-related economic activities integrate with local development aspirations (land and resource use VC);

- **Effects on the STSA's ability to improve social and economic conditions:** Tilbury Phase 2 may support the ability of the STSA to advance community-led plans related to economic development, land use, language and cultural revitalization, and reclamation (culture VC). Access to Tilbury Phase 2-related employment, procurement, and contracting opportunities may enhance economic equity, employment income, labour force participation, and skill development, contributing to increased Indigenous government revenue and community capacity (employment and economy VC). Training and education associated with Tilbury Phase 2 activities may further strengthen workforce readiness and support long-term improvements in education and job market outcomes (infrastructure and services VC). These opportunities may also reinforce interfamily and intercommunity ties by supporting shared economic initiatives and cultural programming across S'ólh Téméxw;
- **Effects on commercial and non-commercial fishing, hunting, trapping, and gathering and cultural or ceremonial activities and practices:** Tilbury Phase 2-related changes to the availability, distribution, and quality of fish, wildlife, and plant species may influence both commercial and non-commercial harvesting opportunities, including marine fisheries and licensed hunting, trapping, and gathering activities (employment and economy, and culture VCs). Changes that make harvesting take more time, cost more, or become harder to access can reduce the individual, household, or community benefits of non-commercial harvesting and negatively affect important FSC practices. These changes could also influence participation in intercommunity activities and the amount, type, or frequency of harvested goods traded within the STSA. Tilbury Phase 2 interactions with land use, access, and resource availability may affect the alignment of Tilbury Phase 2 with the STSA signatory nations' plans for economic development, land use, language and cultural revitalization, and reclamation (infrastructure and services, and land and resource use VC);
- **Effects on the STSA future aspirations for sites or areas surrounding Tilbury Phase 2:** Tilbury Phase 2 activities may interact with long-term community aspirations related to economic development, land use, language and cultural revitalization, and reclamation initiatives (culture VC). Changes to the surrounding landscape and resource conditions may influence the STSA's ability to advance land-based programming, cultural infrastructure, or stewardship initiatives envisioned for the region (land and resource use VC). Access to Tilbury Phase 2-related employment, procurement, or training opportunities may support some nation-led economic development goals, while broader industrial growth may limit opportunities for culturally aligned land use or reclamation in specific areas (employment and economy, and infrastructure and services VCs). These interactions could shape how future land use, cultural, and community development plans are implemented across S'ólh Téméxw;
- **Effects on intercommunity relations and trade:** Tilbury Phase 2 activities are not expected to measurably affect intercommunity relations or traditional trade networks within the STSA. Indicators such as harvesting effort, harvesting success, and the amount or frequency of harvested materials exchanged between communities are not anticipated to experience meaningful change, given Tilbury Phase 2's location within an already industrialized area and the limited interaction with culturally important harvesting sites (land and resource use VC). As a result, no effects are predicted on individual, household, or communal income derived from non-commercial harvests, nor on participation in intercommunity cultural or reciprocal sharing practices (culture, employment and economy, and infrastructure and services VCs); and
- **Effects on infrastructure and services:** Tilbury Phase 2 activities are not expected to influence the availability, quality, or accessibility of community infrastructure or public services for the STSA. No measurable changes are anticipated to health care or social service facilities, emergency response capacity, recreational or educational services, or transportation infrastructure, given Tilbury Phase 2's industrial setting and limited interaction with community-based service systems (infrastructure and services VC). As a result, no effects are predicted on culturally aligned programs or community well-being initiatives linked to Indigenous governance, employment, or land use (culture, employment and economy, and land and resource use VCs).

## Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on social and economic conditions. These include the following:

- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to the STSA's physical health and cultural practices;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting the STSA's cultural continuity and nutritional well-being;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports the STSA's food security, cultural identity, and health by safeguarding salmon and other species essential to FSC harvesting;
- **Employment and Economy (Section 7.10)** Employment, training, and procurement measures create pathways for the STSA members and businesses to participate economically in the project, supporting improved social and economic conditions and community well-being;
- **Land and Resources VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting the STSA's long-term aspirations for land and water restoration and reducing stressors that can impact economic development and community well-being;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socio-economic impacts on the STSA and supporting community stability; and
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to the STSA's social and economic interest.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on social and economic conditions:

- **Condition 10 (Community Feedback Process)** provides the STSA with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting ongoing social and economic interests;
- **Condition 12 (CEMP)** requires mitigation measures to manage dust, noise, traffic, spills, surface water, erosion, and wildlife interactions during Construction. These measures help minimize Construction-related disturbances that could affect community, social, and economic well-being of members;
- **Condition 13 (OEMP)** requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation. By limiting long-term environmental disturbances, this condition supports stable environmental conditions that protect the STSA's social and economic interests;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality mitigates sensory disturbances, such as dust and odors, and prevents particulate deposition that may impact traditional resources. This supports the Social and Economic Conditions of the STSA by preserving the cultural acceptability and integrity of harvested species, ensuring harvesting does not become more difficult or costly to access; and,

**Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support the STSA's socio-economic well-being through increased access to jobs, skills development, and business opportunities associated with Tilbury Phase 2.

#### The EAO's and the STSA's Analysis and Conclusions

After consideration of the mitigation measures and potential effects, described above, the EAO identified the following residual effects:

- Reduced economic access to harvesting and fishing livelihoods, with potential impacts on Indigenous businesses and non-wage economies;
- Disruption of land-based economic activities, including traditional and cultural economic practices; and
- Potential loss of future economic self-determination due to cumulative industrial development affecting land use plans, resource stewardship, and sustainable economic aspirations.

The EAO and the STSA's characterization of the residual effects of Tilbury Phase 2 on social and economic conditions are summarized in the table below.

Table 45: Summary of residual effects and rationale on the S'ólh Téméxw Stewardship Alliance and its social and economic conditions.

| Residual Effect                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Assessment Rating*                                                                                                                                                                                                                                                                | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Social and economic conditions</p> <ul style="list-style-type: none"> <li>- Reduced economic access to harvesting and fishing livelihoods, with potential impacts on Indigenous businesses and non-wage economies.</li> <li>- Disruption of land-based economic activities, including traditional and cultural economic practices.</li> <li>- Potential loss of future economic self-determination due to cumulative industrial development affecting land use plans, resource stewardship, and sustainable economic aspirations.</li> </ul> | <p>Context (resilience): Medium</p> <p>Magnitude: Low</p> <p>Extent: Local</p> <p>Duration: Medium --term</p> <p>Reversibility: Partially reversible</p> <p>Frequency: Continuous</p> <p>Affected Populations: Disproportionate</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> | <p><b>Context:</b> The STSA signatory nations demonstrate cultural and economic resilience through community-led initiatives, language revitalization, and adaptive approaches to socio-economic challenges. However, cumulative industrialization and historic displacement continue to limit full economic development potential. Given this balance of adaptive capacity and ongoing pressures, resilience is rated as medium.</p> <p><b>Magnitude:</b> The magnitude is assessed as low. Tilbury Phase 2 does not directly overlap with active harvesting or community-based economic activities, and residual effects to linked VCs are characterized as negligible to low magnitude. Any indirect influences, such as minor sensory or cumulative pressures, are limited in scale and not expected to measurably affect existing social or economic conditions. While Tilbury Phase 2 may contribute incremental strain on traditional economies, it also introduces positive employment and procurement opportunities that partially offset adverse effects.</p> <p><b>Extent:</b> Potential effects are local. While some economic linkages (e.g., fish species or harvesting practices) connect to broader networks, measurable socio-economic effects would be concentrated near Tilbury Phase 2.</p> <p><b>Duration:</b> Rated as medium-term, as residual socio-economic effects are expected to persist through Construction and into the early and mid-operational period but are unlikely to last for the full life of Tilbury Phase 2, given their low magnitude, localized extent, and partial reversibility.</p> <p><b>Reversibility:</b> The impacts are partially reversible as employment-related changes may be reversible post-project, but long-term disruptions to traditional livelihoods may be harder to reverse without specific recovery efforts.</p> <p><b>Frequency:</b> Rated continuous due to socio-economic interactions with Tilbury Phase 2 that would occur regularly throughout Tilbury Phase 2. Restrictions or sensory disturbances may affect harvesting activities during specific periods, while employment or procurement opportunities occur at specific Tilbury Phase 2 milestones.</p> <p><b>Affected Populations:</b> The effect is expected to be disproportionate; as Indigenous harvesters, Elders, and community members engaged in traditional</p> |

| Residual Effect                                                                                                                   | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p>land-based or non-wage economies are more likely to experience effects than the broader population.</p> <p><b>Risk:</b> The risk rated as low, as some residual socio-economic effects may occur, however there is a low likelihood they would cause widespread or severe disruption. Potential consequences for traditional economic activities, harvesting, and Indigenous businesses are expected to be minor due to negligible to low magnitude impacts to related VC's. Although cumulative regional pressures remain,</p> <p><b>Uncertainty:</b> Limited site-specific socio-economic data regarding long-term participation in Tilbury Phase 2 benefits contribute to a moderate uncertainty rating.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

#### Cumulative Effects

As described in the Background and Current Context section, the lower Fraser River and Tilbury Island area have undergone longstanding industrial development, as well as impacts due to climate change, resulting in existing pressures on STSA's social and economic conditions which reflect long-standing industrial, urban, and infrastructure pressures across S'ólh Téméxw, which have constrained traditional economies, harvesting practices, and Indigenous business development. The Revised Application identifies several reasonably foreseeable projects that may affect the STSA's social and economic interests. These include T1B, which would increase LNG production, and TMJ, which would introduce additional vessel traffic in the Fraser River and further development of the foreshore area. Both T1B and TMJ could contribute additional sensory disturbances (noise, light, vibration) and impact traditional harvesting practices.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

#### Conclusion

Considering the above analyses, including FortisBC's proposed mitigation measures, EAO's Table of Conditions and the Federal Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 would have a negligible effect on the STSA's social and economic interests.

### 16.15.9 Indigenous Health and Well-being

#### Background

For the STSA, health and well-being are holistic concepts rooted in their deep spiritual, cultural, and physical connections to S'ólh Téméxw, their traditional territory encompassing land, water, air, and all living beings. This worldview centres on shxwelí (the spirit or life force) that links people, places, and nature, making environmental health inseparable from community health. The Fraser River, salmon, and surrounding ecosystems are central to well-being, providing nourishment and sustaining cultural and spiritual practices.

Participating in traditional activities like harvesting, ceremonies, and intergenerational teaching strengthens identity, resilience, and mental and spiritual health. However, historical and ongoing industrial development, habitat degradation, and restricted access to culturally important areas have contributed to cumulative impacts and cultural stress, affecting physical health and psychosocial well-being. The STSA emphasize that health assessments must look beyond physical health to include the cultural, spiritual, and emotional dimensions of well-being, reflecting their inherent responsibility to steward S'ólh Téméxw for future generations.

#### *Existing Conditions*

The health and well-being of the STSA are deeply connected to their lands, waters, and cultural practices. Stó:lō understand health as holistic, encompassing spiritual, emotional, mental, and physical dimensions linked through shxwelí, the life force uniting people, places, and beings. The Fraser River is central to this connection, sustaining physical health, cultural identity, and spiritual well-being. Historical dispossession, environmental degradation, and restricted access to resources have contributed to health disparities, including higher rates of chronic illness, mental health challenges, and cultural stress within the STSA communities. Loss of access to traditional foods, such as salmon, shellfish, wild plants, and medicinal resources, has diminished nutrition, disrupted cultural practices, and heightened risks of diseases, including respiratory conditions tied to pollution and habitat loss.

#### *Potential Project Effects*

The EAO has identified the following effects pathways, prior to application of mitigation measures, along with the associated VCs in [Appendix 6](#), that may affect the STSA Signatory First Nation's Indigenous health and well-being during Construction, Operation, and Decommissioning Phases of Tilbury Phase 2:

- **Changes to the experience when exercising an Indigenous interest, including presence of visual disturbances, changes in air quality, effects of vibrations from construction activities, and acoustic disruptions;** Tilbury Phase 2 activities may create sensory and environmental disturbances, such as reduced air quality, increased noise and vibration during construction, and visual changes that alter the experience of exercising Indigenous interests at culturally important sites (air quality, acoustic, surface water, and groundwater VCs). These disturbances may diminish the comfort, safety, and cultural suitability of locations used for harvesting, cultural practices, or community activities (harvesting and subsistence activities, and cultural use sites and areas). Such changes could negatively affect overall health and well-being by discouraging participation in land-based practices, cultural continuity, and community connection (human health VC);
- **Effects on Indigenous health due to changes in harvesting and subsistence activities, construction-related disturbances, and air quality impacts;** Potential effects include changes in harvesting and subsistence activities, which may occur if Tilbury Phase 2 activities alter species availability, site accessibility, or the cultural acceptability of traditional harvesting areas. Effects of vibrations from construction activities and acoustic disturbance (acoustic VC) may reduce comfort, safety, and the cultural suitability of areas used for harvesting, gatherings, or cultural practices. Dust caused by construction and increased traffic (soil and air quality VCs) and reduced air quality resulting from increased road traffic (air quality VC) may further affect the experience of exercising Indigenous interests. These disturbances may diminish participation in harvesting, cultural or spiritual practices, and communal activities, with potential implications for physical, mental, and cultural well-being (cultural use sites and areas, and human health and land and resource use VCs);

- **Effects on Indigenous health due to effects to traditional ways of life and to cultural sites;** Potential effects include reduced participation in harvesting and subsistence activities and diminished ability to engage in cultural and spiritual practices associated with culturally important places (cultural use sites and areas). Sensory disturbances such as noise and vibration (acoustic VC), odour and reduced air quality (air quality VC), dust (soil VC), and visual changes may alter the experience of exercising Indigenous interests, affecting comfort, cultural acceptability, and a sense of safety at important sites. Changes to accessible travelways, areas with access restrictions, and navigation along the Fraser River and marine environment (land and resource use VC) may further limit participation in communal and ceremonial activities. These combined effects may influence physical, mental, emotional, and cultural well-being (human health VC) by disrupting cultural practices, intergenerational knowledge transfer, and community cohesion;
- **Effects on the quality, quantity, and availability of harvested country foods;** Tilbury Phase 2 activities may influence the availability, distribution, and health of culturally important foods, including fish, wildlife, birds, and traditional plants, through changes to habitat, water quality, and ecosystem conditions (fish and fish habitat, wildlife and wildlife habitat, vegetation, surface water, groundwater, and soil VCs). Increased contaminants of concern, including air emissions and construction-related sedimentation (air quality and surface water VCs), may affect species quality or abundance, reducing harvesting success and altering seasonal harvesting patterns. Sensory disturbances such as noise, vibration, odour, dust, and visual changes (acoustic, air quality, and soil VCs) may further influence the ability or desire to harvest in preferred areas, affecting both access and cultural continuity (cultural use sites and areas and social and economic conditions);
- **Effects on the value and perceived quality of country foods;** Changes to environmental conditions, including air quality, water quality, noise, vibration, odour, and dust (air quality, acoustic, surface water, groundwater, and soil VCs), may influence community perceptions of the safety, purity, and cultural integrity of harvested foods. Even where measurable contamination is not present, concerns about exposure to tire-derived toxins, industrial runoff, or habitat disturbance may reduce confidence in traditional foods and limit their use in cultural, social, and ceremonial contexts (cultural use sites and areas). Reduced participation in harvesting and communal food-sharing practices can affect food security, intergenerational knowledge transfer, and broader aspects of Indigenous health and well-being (human health VC and social and economic conditions); and
- **Effects on Indigenous health due to changes in air quality, noise, and water quality;** Tilbury Phase 2 activities may contribute to changes in air quality, noise and vibration levels, and surface and groundwater quality, which can influence the experience of exercising Indigenous interests (air quality, acoustic, surface water, and groundwater VCs). These sensory and environmental disturbances, including odour, dust, reduced visibility, and changes to drinking and recreational water quality, may affect participation in harvesting and subsistence activities, cultural and spiritual practices, and communal activities (cultural use sites and areas). Such disruptions can influence cultural practices, customs, and values associated with important sites, with potential consequences for physical, mental, and spiritual health and well-being (human health VC). Even where measurable contamination is not present, perceived declines in environmental quality may reduce confidence in land- and water-based activities essential to cultural continuity and community cohesion.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on Indigenous health and well-being. These include the following:

- **Air Quality (Section 7.2)** Air emission controls help protect respiratory health and prevent contamination of country foods, supporting the STSA's physical well-being and confidence in harvesting;

- **Acoustics (Section 7.3)** Noise reduction measures limit sensory disturbance to people, wildlife, and harvesting areas, reducing stress and supporting the STSA's comfort, well-being, and connection to land and water;
- **Surface Water (Section 7.4)** Managing runoff, erosion, and sediment helps maintain water quality in the lower Fraser, supporting the STSA's nutritional reliance on healthy salmon and aquatic ecosystems;
- **Groundwater (Section 7.5)** Protecting groundwater from contamination helps maintain the quality of ecosystems that support fish, plants, and wildlife relied on for the STSA's health and well-being;
- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by the STSA sustenance, directly impacting health and well-being;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to the STSA's physical health;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting the STSA's nutritional well-being;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports the STSA's food security and health by safeguarding salmon and other species essential to FSC harvesting;
- **Land and Resources VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting the STSA's long-term aspirations for land and water restoration and reducing stressors that can affect well-being;
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures and early notification to Indigenous nations, help protect culturally important sites and landscapes that support the spiritual and emotional well-being of the STSA;
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to the STSA's overall well-being; and
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect the STSA members' physical, cultural, and mental health.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on Indigenous health and well-being:

- **Condition 10 (Condition Community Feedback Process)** provides the STSA with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting Indigenous health and well-being;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)** require ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with the STSA to be developed by the Holder in consultation with the Nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to

catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;

- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting the STSA's physical health and overall well-being;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If the STSA historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated cultural or emotional harm, supporting Indigenous health and well-being; and,
- **Condition 16 (Indigenous and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support socio-economic well-being.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Well-being:

- Accidents and Malfunctions Reporting would support mitigation of potential impacts on the Nation's interests by ensuring timely responses, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

#### The EAO's Analysis and Conclusions

After consideration of the mitigation measures and potential effects, described above, the EAO identified the following residual effects:

- Sensory disruption and psychological stress;
- Reduced confidence in country food safety and harvesting practices; and
- Disruption of cultural continuity and intergenerational knowledge transfer.

The EAO's characterization of the residual effects of Tilbury Phase 2 on Indigenous health and well-being are summarized in the table below.

Table 46: Summary of residual effects and rationale on the S'ólh Téméxw Stewardship Alliance and its Indigenous health and well-being.

| Residual Effect                                                                                                                                                                                                                                                                                             | Assessment Rating*                                                                                                                                                                                                                                                                         | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Indigenous health and well-being</p> <ul style="list-style-type: none"> <li>- Sensory disruption and psychological stress</li> <li>- Reduced confidence in country food safety and harvesting practices</li> <li>- Disruption of cultural continuity and intergenerational knowledge transfer</li> </ul> | <p>Context (resilience): High</p> <p>Magnitude: Negligible</p> <p>Extent: Local</p> <p>Duration: Short-term</p> <p>Reversibility: Fully reversible</p> <p>Frequency: Continuous</p> <p>Affected Population: Even</p> <p>Risk: Low</p> <p>Uncertainty: Moderate</p> <p>Importance: High</p> | <p><b>Context:</b> The resilience of the STSA communities is assessed as high, reflecting the nations' strong cultural, social, and governance structures that continue to sustain community well-being despite historic and ongoing pressures. Cultural revitalization initiatives and adaptive harvesting practices support the nations' ability to respond to environmental and social change. The People of the Rivers Referrals Office (PRRO) play a key role by providing technical and research support to the STSA throughout the referral process, acting as a facilitator for the STSA communities rather than a decision-making body. Although cumulative industrial and colonial impacts have placed strain on health, cultural practices, and land use, the demonstrated capacity of the STSA communities to adapt and maintain cultural integrity indicates a high level of resilience to the negligible, localized disturbances anticipated from Tilbury Phase 2.</p> <p><b>Magnitude:</b> The magnitude is considered negligible as anticipated changes to health and well-being, such as minor sensory disturbances or temporary uncertainty about country food safety, are not expected to result in a measurable change to Indigenous health outcomes. The ability to exercise Indigenous practices and maintain wellness will remain intact. Negligible to low magnitude impacts to air quality and human health VCs may occur.</p> <p><b>Extent:</b> The extent is assessed as local since potential effects would be limited to areas directly surrounding Tilbury Island and its immediate zone of influence on the Fraser River. They are not expected to spread across the wider territory or affect regional cultural or health systems.</p> <p><b>Duration:</b> The potential effects, including environmental changes and perceptual impacts, are expected to persist throughout Tilbury Phase 2's 40 plus years of Operation, making them medium-term. While sensory disturbances may end after decommissioning, impacts on cultural well-being could have lasting effects.</p> <p><b>Reversibility:</b> Is assessed as fully reversible as residual effects such as noise, vibration, and dust will cease once construction is completed, and air and water quality measures will restore conditions. Confidence in country foods and traditional practices is expected to return once temporary Tilbury Phase 2 disturbances are resolved.</p> <p><b>Frequency:</b> Is rated as continuous because the anticipated effects, such as dust, odour, noise, and vibration, are expected to occur regularly during active construction periods, specific operational activities, or discrete Tilbury Phase 2 phases. These effects may not always be constant but will arise at intervals tied to Tilbury Phase 2 schedules, site preparation, equipment use, or traffic increases.</p> <p><b>Affected populations:</b> considered even as effects are expected to be experienced generally across the community in a relatively uniform manner. No subgroup (e.g., Elders, youth, or harvesters) is expected to experience a disproportionately greater burden, given the negligible nature of the effects.</p> <p><b>Risk:</b> Is assessed as low, because residual effects on Indigenous health and well-being are unlikely to persist after mitigation is applied. The overall magnitude remains negligible to low and of local extent, meaning consequences would not lead to measurable or lasting health impacts.</p> <p><b>Uncertainty:</b> Is considered moderate, as there is limited specific health data and partial integration of Indigenous health frameworks contribute to gaps in fully predicting the scale and long-term consequences of potential impacts.</p> |
| <p>* Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a></p>                                                                                                                                                                    |                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### Cumulative Effects

As noted in the Background and Current Context sections above, historic and ongoing industrial development in the Lower Fraser River has contributed to long-standing cumulative impacts on the STSA's Indigenous health and well-being. Pollution, habitat degradation, declining access to traditional foods, and increasing pressures on land and water have already created a context in which the STSA health and well-being outcomes are challenged.

As stated above, FortisBC notes that two foreseeable projects, T1B and TMJ, are expected to result in cumulative impacts to air quality and associated human-health pathways, and these additional sensory and environmental stressors could further affect the STSA members' overall health and well-being, especially given existing regional pressures on traditional foods have already been shaped by cumulative industrial, urban, and infrastructure development across S'ólh Téméxw. The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, FortisBC's proposed mitigation measures, and EAO's Table of Conditions, the EAO concludes that Tilbury Phase 2 would have negligible effects on the STSA's health and well-being interests.

#### 16.15.10 Positive Effects of Tilbury Phase 2

According to the Revised Application, Tilbury Phase 2 may create employment, training, and procurement opportunities for the STSA, including Construction phase jobs, Indigenous contracting, and increased revenue through participation in procurement streams. These opportunities have the potential to support community economic development, skill building, and cultural and governance programming. Both the STSA acknowledges that increased employment and economic opportunities could result from Tilbury Phase 2, with potential improvements in social conditions. However, the STSA has emphasized that these benefits depend on minimizing risks to traditional economies and ensuring Indigenous participation.

The magnitude of positive effects will depend on the accessibility of opportunities for the STSA members and businesses, and direct economic benefits may be limited when considered alongside the broader socio-economic conditions and cumulative industrial pressures experienced across S'ólh Téméxw.

#### 16.15.11 Conclusions

Considering the above analyses, the EAO's and FortisBC's engagement with the STSA, FortisBC's commitments in Appendix A of the Revised Application, and the EAO's table of provincial conditions, KMMs to inform federal conditions under the IAA 2019, the EAO concludes that Tilbury Phase 2 is anticipated to have the following impacts on the STSA's Indigenous interests:

- Negligible residual effects to the STSA's harvesting and subsistence activities;
- Negligible residual effects to the STSA's cultural use sites and areas;
- Negligible residual effects to the STSA's socio-economic conditions; and
- Negligible residual effects to the STSA's Indigenous health and well-being.

Considering the above analyses, the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on the STSA's interests has been adequately avoided, minimized or otherwise accommodated. Based on the engagement undertaken with the STSA on Tilbury Phase 2, as outlined above in Section 16.15.2 the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with the STSA.

## 16.16 Skwxwú7mesh Úxwumixw (Squamish Nation)

### 16.16.1 Community Profile

The Skwxwú7mesh Úxwumixw (Squamish Nation) is a Coast Salish Nation with deep ancestral ties to their traditional territory, which spans from Point Grey north to the Elaho River, and east to Port Moody and Whistler. This territory includes Burrard Inlet, Howe Sound, and major urban areas such as Vancouver and the District of Squamish.

The nation has 24 reserves, with communities located in North Vancouver, West Vancouver, and along the Squamish River. Kitsilano 6 is the closest reserve to Tilbury Phase 2 Liquefied Natural Gas (LNG) Expansion Project (Tilbury Phase 2). Skwxwú7mesh Úxwumixw members speak Skwxwú7mesh Sníchim, a critically endangered language undergoing revitalization through dedicated language and cultural programs.

Skwxwú7mesh Úxwumixw governance is led by the Nexwsxwníwntm ta Úxwumixw, with support from departments focused on leadership, intergovernmental affairs, and the protection of Aboriginal Rights and Title. The Nation continues to steward and strengthen its cultural identity, governance, and language despite the ongoing impacts of colonization.

### 16.16.2 Squamish Nation's Involvement in the Environmental Assessment

FortisBC have engaged with Skwxwú7mesh Úxwumixw regarding Tilbury Phase 2 since July 2019, primarily through virtual meetings due to COVID-19. Regular updates were provided, and input was sought on key documents, including the Initial Project Description (IPD), DPD, and Revised AIR; however, no comments were received.

FortisBC also shared draft content specific to Skwxwú7mesh Úxwumixw ([Section 11.15](#)), lists of secondary sources, and offered opportunities to participate in site tours, fieldwork, and review technical reports. Despite these efforts, Skwxwú7mesh Úxwumixw did not raise key issues or propose mitigation measures during the engagement period.

On February 3, 2025, the EAO received an email communication from Skwxwú7mesh Úxwumixw, stating that in their recently released Climate Legacy Strategy<sup>44</sup>, Skwxwú7mesh Úxwumixw does not support new industrial fossil fuel projects in the Skwxwú7mesh Aysáych (territory). Therefore, Skwxwú7mesh Úxwumixw does not support Tilbury Phase 2 and will not be providing any further review or comment related to Tilbury Phase 2.

The assessment of potential impacts on Skwxwú7mesh Úxwumixw was guided by methodology in Section 11.1 of the AIR, incorporating a Gender-based Analysis Plus (GBA Plus) approach. Due to limited direct input, the analysis relied on secondary sources to identify potential effects on Indigenous interests, including harvesting and subsistence activities, cultural use, socio-economic conditions, and health and well-being.

Because Skwxwú7mesh Úxwumixw's traditional territory does not overlap with key Local and RAAs, FortisBC concluded limited potential for Tilbury Phase 2-related effects. However, the absence of input meant that effects on cultural continuity and Indigenous governance systems were not assessed.

### 16.16.3 Assessment Boundaries

The spatial assessment boundaries for each Indigenous interest were based on the overlap between Skwxwú7mesh Úxwumixw traditional territory with the combined Local and RAAs identified for linked VCs. Refer to Figure 11.15-1 in the Revised Application (Indigenous interests and Tilbury Phase 2 Location Figure). Although the Project Footprint is located outside Skwxwú7mesh Úxwumixw traditional territory, it lies directly adjacent to it, with the closest Skwxwú7mesh Úxwumixw reserve (Kitsilano 6) being 16 km away.

The assessment of potential effects related to Tilbury Phase 2 considered three distinct phases:

- Construction phase, with an estimated duration of three to six years;

<sup>44</sup> Squamish Nation Climate Legacy Strategy: [ClimateLegacyStrategy\\_Final\\_Sep16\\_DIGITAL\\_Booklet.pdf](#) (See Quick Start Action #1 which states "No new industrial fossil fuel projects in the Skwxwú7mesh Aysáych".)

- Operation phase, expected to last more than forty years; and
- Decommissioning phase, anticipated to take approximately two years.

#### 16.16.4 Regional Context

The Project Footprint is located on Tilbury Island, B.C., within an existing industrial zone. The site lies in the Tilbury Industrial Park and is already cleared and developed as part of the current LNG facility. Public access is limited, though the Fraser River dike, directly opposite Tilbury Phase 2's fence line, is used recreationally.

Although outside Skwxwú7mesh Úxwumixw's traditional territory, the nation was included in the assessment due to its interest in the nearby Tilbury Marine Jetty (TMJ) project. Other industrial developments in the area, including the TMJ and T1B, may alter the surrounding foreshore and contribute to regional cumulative effects.

FortisBC concluded that Tilbury Phase 2 would not result in residual effects on Skwxwú7mesh Úxwumixw's Indigenous interests and did not conduct a cumulative effects assessment specific to the nation. However, the broader industrial context, including overlapping timelines and proximity to areas of interest, highlights the potential for cumulative impacts on Indigenous interests such as harvesting, cultural use, socio-economic conditions, health and well-being.

#### 16.16.5 Indigenous Interests

The EAO engaged Skwxwú7mesh Úxwumixw during the Early Engagement phase in the development of the [Joint Summary of Issue and Engagement for Tilbury Phase 2 LNG Expansion Project](#), however the EAO did not receive any input during that phase.

During the Readiness Decision phase in the development of the [Readiness Decision Report](#), the EAO engaged with Skwxwú7mesh Úxwumixw who did not specifically indicate their primary concerns regarding Tilbury Phase 2. Therefore, the EAO relied on input gathered from technical advisors and participating Indigenous nations. This information was used in drafting the [Tilbury Phase 2- Schedule C – Application Information Requirements](#) Table 6, see Proposed Preliminary List of Indigenous Interests.

During the Application Development and Review phase and again during the Effects Assessment and Recommendation Phase, the EAO received a communication from Skwxwú7mesh Úxwumixw stating that in their recently released [Climate Legacy Strategy](#), they do not support new industrial fossil fuel projects in their traditional territory. Therefore, Skwxwú7mesh Úxwumixw does not support Tilbury Phase 2 and will not be providing further review or comments.

The Proponent identified Skwxwú7mesh Úxwumixw's Indigenous interests to be assessed in the Revised Application through:

- Reviewing requirements and guidance from the EAO;
- Conducting engagement efforts with Skwxwú7mesh Úxwumixw to gather information on their Indigenous interests outline in [Section 11.15.3](#) Summary of Engagement of the Skwxwú7mesh Úxwumixw's section of the nation's section in the Revised Application; and
- FortisBC relying heavily on secondary data and sources external to Skwxwú7mesh Úxwumixw.

The EAO attempted to engage Skwxwú7mesh Úxwumixw during the development of the Report. As no comments were received on their section, the EAO relied on the preliminary list of Indigenous interests identified in the AIR. The following interests were considered:

- Harvesting and subsistence activities;
- Cultural use sites and areas;
- Social and economic conditions; and
- Indigenous health and well-being.

The assessment of Skwxwú7mesh Úxwumixw's Indigenous interests in this section uses these categories. The EAO's assessment includes describing the Indigenous interest, the current context, potential effects, applicable mitigation, and the resulting effects analysis. If there is an adverse residual effect a characterization of effects and cumulative effects assessment is also completed.

### 16.16.6 Harvesting and Subsistence Activities

#### Background

Skwxwú7mesh Úxwumixw members have historically engaged in, and continue to engage in, fishing for saltwater and freshwater fish species throughout their traditional territory. The Fraser River has been a major source of salmon for Skwxwú7mesh Úxwumixw since time immemorial. They historically practiced a seasonal pattern of arriving on the Fraser River in April to fish and returning to Burrard Inlet in late September, however there is uncertainty about where specifically on the Fraser River this fishing took place or if it was close to Tilbury Phase 2. Skwxwú7mesh Úxwumixw historically hunted and fished within the RAA, but not within the LAA.

Skwxwú7mesh Úxwumixw members gathered plants from forests which was an essential practice for thousands of years, providing materials for construction, tools, clothes, medicine, and various food items like berries, roots, and tender green shoots. Maintaining access to these opportunities is crucial for cultural continuity.

Hunting land and sea animals for food and spiritual purposes, such as deer and elk, has been significant, particularly for Skwxwú7mesh Úxwumixw Elders. Trapping for furs occurred historically, though less frequent today, with some families still maintaining registered traplines.

Skwxwú7mesh Úxwumixw members were economically self-sufficient through their relationship with the land and participated in extensive trade networks with other Indigenous nations, utilizing their traditional territory as a major trade route between the coast and the interior.

#### Existing Conditions

According to the Revised Application, with the arrival of Europeans and the subsequent colonialism, industrialization and urban developments have had far-reaching and detrimental effects on Skwxwú7mesh Úxwumixw's ability to exercise their harvesting and subsistence activities. There have been severe negative impacts on fish populations and habitats due to industrial activities like logging, dredging, pollution in the Howe Sound and Squamish River estuary, leading to the near absence of species like eulachon. With the destruction of old-growth forests and habitat for important plant life and wildlife species, resulting from logging, leading to wildlife population declines.

FortisBC has stated in the Revised Application that Tilbury Phase 2 is on private industrial property and does not have any information indicating that Skwxwú7mesh Úxwumixw currently uses the south arm of the lower Fraser River close to Tilbury Phase 2 for fishing, plant gathering, hunting, or accessing cultural sites. The Department of Fisheries and Oceans (DFO) Canada do not indicate that Skwxwú7mesh Úxwumixw holds a Food, Social and Ceremonial (FSC) fishing license in the lower Fraser River. Furthermore, FortisBC acknowledges that Tilbury Phase 2 is entirely outside of Skwxwú7mesh Úxwumixw traditional territory, though it is directly adjacent to it and overlaps with the RAA for harvesting and subsistence activities.

#### Potential Project Effects

The EAO identified the following pathway of effects, along with the associated VCs outlined in [Appendix 6](#), that may affect Skwxwú7mesh Úxwumixw's harvesting rights and subsistence activities during Construction, Operation, and Decommissioning Phases of Tilbury Phase 2:

- **Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources** from increased noise, light, and air pollution (acoustics, air quality, land and resource VCs) may deter Skwxwú7mesh Úxwumixw members from accessing preferred harvesting areas near Tilbury Phase 2 site. Changes in fish distribution and abundance (fish and fish habitat

VC) and the introduction of invasive plant species (vegetation VC) may further reduce the experience and preference of the practicing of harvesting rights. While Skwxwú7mesh Úxwumixw does not currently fish or harvest close to Tilbury Phase 2, they have historically, and could in the future if the site was decommissioned to a more natural state;

- **Effects to Skwxwú7mesh Úxwumixw Rights to fish for FSC purposes** from habitat loss, (wildlife, fish and fish habitat, vegetation VCs), increased mortality risks to fish, birds, and wildlife (wildlife and wildlife habitat VCs), and changes in their behavior due to sensory disturbances (acoustics, air quality VCs). Additionally, contamination risks to fish habitat in Tilbury Slough (surface water VC) and Fraser River downstream, may further impact traditional harvesting and cultural practices; and
- **Effects on the accessibility and availability of traditional lands and resources** may occur as a result of altered land or water based travel routes, access restrictions, or safety considerations, including changes to navigability and the usability of established travel corridors (land and resource use and surface water VCs), as well as indirect effects from sensory disturbances such as noise, dust, lighting, or visual changes that may discourage travel through otherwise accessible areas (air quality, acoustics, and land and resource use VCs).

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures that the Proponent has proposed in response to potential Tilbury Phase 2-related effects on harvesting and subsistence activities, as mentioned in the section above. A full table of Proponent mitigations can be found in [Appendix A of the Revised Application](#). Below is a summary of Key Mitigation Measures, how they address effects on the relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air quality measures, such as idle reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Skwxwú7mesh Úxwumixw's harvesting and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during Construction and Operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Skwxwú7mesh Úxwumixw's harvesting and cultural practices;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm sewer system. These protections support water quality and fish habitat relied on to support Skwxwú7mesh Úxwumixw's harvesting and cultural practices;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by Skwxwú7mesh Úxwumixw for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing Construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to Skwxwú7mesh Úxwumixw's harvesting and cultural practices;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the health and availability of salmon and other fish species central to Skwxwú7mesh Úxwumixw's harvesting and cultural practices;

- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used for harvesting or cultural practices; and
- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support Skwxwú7mesh Úxwumixw's land and water based cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions to help reduce potential impacts on Skwxwú7mesh Úxwumixw's harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting (see [Section 8](#) of this Report):

- **Condition 10 (Community Feedback Process)** creates a clear way for Skwxwú7mesh Úxwumixw to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of Skwxwú7mesh Úxwumixw's harvesting and cultural practices;
- **Condition 12 (CEMP)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to Skwxwú7mesh Úxwumixw's harvesting and cultural practices;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to Skwxwú7mesh Úxwumixw's harvesting and cultural practices;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emissions control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support Skwxwú7mesh Úxwumixw's harvesting and cultural practices; and,
- **Condition 17 (Dry Street Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project related roads, which may lower potential impacts on salmon and other fish important to Skwxwú7mesh Úxwumixw's harvesting and cultural practices.

In addition to the Proponent's mitigations and the provincial Conditions the EAO identified the following federal Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects on harvesting and subsistence activities:

- **Federal Consideration for Migratory Bird Protections:** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Skwxwú7mesh Úxwumixw's harvesting practices and broader ecosystem conditions important to their way of life.

#### The EAO's Analysis and Conclusions

After consideration of the mitigation measures and potential effects, and analysis described above, the EAO has identified that there will not be any residual effects to Skwxwú7mesh Úxwumixw's harvesting and subsistence activities, primarily due to the fact that Skwxwú7mesh Úxwumixw's harvesting and subsistence areas do not overlap with the LAA and the effects from associated VCs will not impact the Regional Assessment Area.

### 16.16.7 Cultural Use Sites and Areas

#### Background

The Skwxwú7mesh Úxwumixw have numerous connections to their traditional lands and waters, which are imbued with meaning through Skwxwú7mesh place names. These places were, and remain, sites for the practice of their traditions, customs, and lifeways. Their culture is defined in relation to the land in its natural state and through the use of its resources. The traditional territory is considered a repository of Skwxwú7mesh Úxwumixw peoples' oral history and knowledge of the land. Oral history sites hold equal importance to archaeological sites for Skwxwú7mesh Úxwumixw members. A strong spiritual and cultural connection to the land informs their identity, based on the premise of living in a harmonious relationship with the land and its resources.

#### Current Context

FortisBC stated in the Revised Application that Skwxwú7mesh Úxwumixw has not identified cultural sites or areas currently in use in or adjacent to the Project Footprint and that Skwxwú7mesh Úxwumixw does not currently use the south arm of the lower Fraser River near the Project Footprint to fish, gather plants, hunt, or access cultural sites. There are no archaeological or heritage resources that were identified in the Project Footprint during assessments in 2013 and 2020.

#### Potential Project Effects

The EAO identified the following pathway of effects, prior to the application of mitigation measures, along with associated VCs in [Appendix 6](#), that may affect Skwxwú7mesh Úxwumixw's cultural use sites and areas during Construction, Operation, and Decommissioning Phases of the Tilbury Phase 2 project:

- **Loss of access to and disenfranchisement from cultural sites;** Skwxwú7mesh Úxwumixw harvesters could experience direct adverse effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites, such as the Fraser River as a travelway and traditional use areas (land and resource use VC). Changes in sensory effects (noise, air quality, visual landscape) (land and resource use VC) could change the experience of Skwxwú7mesh Úxwumixw members using cultural sites; and,
- **Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas;** Access to cultural sites could be affected (land and resource use VC) by the Project. Adverse effects to culture (culture VC) which are connected to potential effects on wildlife, habitat, and vegetation (See Harvesting and Subsistence section above) could influence the ability or desire to access these sites.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed to potential Tilbury Phase 2 related effects on cultural use sites and areas. These include the following:

- **Air Quality (Section 7.2)** The air quality measures, such as idle reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat and the experiential qualities of culturally important areas. They help protect salmon, wildlife, vegetation, and surface water that support Skwxwú7mesh Úxwumixw's harvesting and cultural practices;
- **Acoustics (Section 7.3)** Noise reduction measures during Construction and Operation—including idle reduction policies, equipment muffling, enclosures, and engineered noise controls—help limit disturbance to culturally important areas and activities. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of cultural knowledge by Skwxwú7mesh Úxwumixw;
- **Soil (Section 7.6)** Soil-management measures, including erosion control, spill-prevention protocols, and careful handling and disposal of contaminated soils, help prevent the migration of pollutants into nearby

cultural areas and waterways. Maintaining soil stability and quality supports the protection of culturally important places and landscapes used by Skwxwú7mesh Úxwumixw;

- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm sewer system and maintain the environmental conditions and experiential qualities of culturally important areas. These protections support water quality and fish habitat relied on to support Skwxwú7mesh Úxwumixw's harvesting and cultural practices;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat, water quality, and the environmental conditions and experiential qualities of culturally important areas used by salmon migrating through the lower Fraser. These actions support the health and availability of salmon and other fish species central to Skwxwú7mesh Úxwumixw's harvesting and cultural practices;
- **Land and Resource Use (Section 7.11)** Traffic-management planning, noise and lighting controls, and communication regarding project activities help reduce disruptions to access and use of culturally important areas. These measures support Skwxwú7mesh Úxwumixw's ability to safely access and continue cultural practices within their traditional territory;
- **Infrastructure and Services (Section 7.12)** Measures to manage traffic, workforce accommodation, emergency response, and waste help limit indirect pressures on local lands, waters, and access routes. By managing congestion and pressures on community services, these measures help maintain safe access to culturally important areas and manage disturbance to cultural landscapes relied on by Skwxwú7mesh Úxwumixw;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas, culturally important plant species, and the environmental conditions and experiential qualities of culturally important areas relied on by Skwxwú7mesh Úxwumixw for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing Construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions and the environmental conditions and experiential qualities of culturally important areas that support the animals and ecosystems important to Skwxwú7mesh Úxwumixw's harvesting and cultural practices;
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance-find procedures, site protection, and early notification to Indigenous nations, help protect culturally important sites, features, and landscapes. These measures support Skwxwú7mesh Úxwumixw's ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connections to territory; and
- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support Skwxwú7mesh Úxwumixw's ability to access, use, and maintain culturally important areas, including places of teaching, ceremony, and connection to land and water.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects to Indigenous cultural use sites and areas (see [Section 8](#) of this Report):

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance;
- **Condition 10 (Community Feedback Process)** establishes a clear and structured mechanism for Skwxwú7mesh Úxwumixw to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of culturally important landscapes and areas, supporting Skwxwú7mesh Úxwumixw's continued access to and use of cultural sites during the Project Construction;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, lighting, wildlife interactions, and spills during project Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by Skwxwú7mesh Úxwumixw;
- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emission control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites by Skwxwú7mesh Úxwumixw; and,
- **Condition 15 (Chance Find Protocol)** requiring the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If Skwxwú7mesh Úxwumixw historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

#### The EAO's Analysis and Conclusions

After consideration of the mitigation measures and potential effects, and analysis described above, the EAO has identified that there will not be any residual effects to Skwxwú7mesh Úxwumixw, primarily due to the fact that Skwxwú7mesh Úxwumixw cultural use sites and areas do not overlap with the LAA and the effects from associated VCs will not impact the RAA.

### 16.16.8 Social and Economic Conditions and Indigenous Health and Well-being

#### Background

The effects on the social and economic conditions of Skwxwú7mesh Úxwumixw are deeply rooted in their ancient history and intricate connection to their lands, waters, and people, which have continuously shaped their traditions, customs, and ways of life over millennia. This strong spiritual and cultural bond to the land fundamentally informs their identity, emphasizing a harmonious relationship and dependence on its resources.

The effects for Indigenous health and well-being, particularly concerning Skwxwú7mesh Úxwumixw, highlights a complex interplay of historical, social, and economic factors, along with community-led initiatives for holistic wellness. Across Canada, Indigenous populations have endured, and continue to experience, the severe and detrimental effects of colonialism, which have profoundly impacted their social, economic, and health well-being. This systemic discrimination and oppression contribute to pervasive and persistent adverse social and economic conditions for Indigenous peoples relative to non-Indigenous Canadians.

These socio-economic conditions, often referred to as social determinants of health, directly shape health outcomes. As a result, Indigenous peoples in Canada face significant health disparities, including shorter life expectancies, higher rates of chronic and communicable illnesses, increased addiction rates, and higher infant mortality rates compared to non-Indigenous Canadians

#### Current Context

The Skwxwú7mesh Úxwumixw currently has a registered population of 4,497 as of March 2023, with approximately 53.1% residing on their own or other reserves. Social conditions, though impacted by colonialism, show ongoing efforts towards well-being.

Skwxwú7mesh Úxwumixw continues to experience severe and detrimental effects of colonialism that impact their social, economic, and health well-being. Health disparities include shorter life expectancies, higher rates of chronic disease and addiction, and higher infant mortality rates compared to non-Indigenous Canadians. These disparities are often linked to intergenerational trauma, racism, limited education, and high rates of poverty.

Despite these challenges, the Skwxwú7mesh Úxwumixw, through its Yúustway department, provides a range of health and wellness services, including community health, health benefits, home and community care, and recreational services. Departments like Ayás Ménmen focus on child and family services, and Chiýáxw project on asserting jurisdiction in caring for children and families. The Elder's Program and Yúusnewas project (investigating former residential school sites for unmarked graves) highlight cultural and spiritual well-being efforts. The nation also implements policies like the Cultural Grants Policy and Cultural Cedar Tree Policy to support cultural projects and sacred language preservation. Their overall Community Well-Being (CWB) Index score in 2016 was 68.2, higher than the B.C. First Nations average but lower than non-Indigenous B.C. communities.

Housing is a critical priority for the nation. The Hiýárh ta Skwxwú7mesh Housing Society is actively involved in this area, specifically developing and managing non-profit housing. A substantial number of occupied dwellings within the nation needed repairs, with some requiring minor attention and others more significant work. Although the housing CWB Index for Skwxwú7mesh Úxwumixw generally indicates a better situation than the average for B.C. First Nations, it still falls short when compared to non-Indigenous communities. Skwxwú7mesh Úxwumixw members experienced lower employment rates and a significant unemployment rate compared to the broader Metro Vancouver area. While their labor well-being was better than the average for First Nations in B.C., it was still lower than that of non-Indigenous communities.

#### Potential Project Effects

The EAO identified the following pathway of effects, along with associated VCs outlined in Appendix 6,, that may affect Skwxwú7mesh Úxwumixw's social and economic conditions and Indigenous health and well-being during Construction, Operation, and Decommissioning Phases of the Tilbury Phase 2 project:

- **Social and Economic Conditions:**
  - **Effects to Skwxwú7mesh Úxwumixw's employment opportunities, Indigenous businesses, procurement opportunities, and Skwxwú7mesh Úxwumixw revenue:** The Project is expected to positively impact employment (employment and economy VC), especially during the 3 to 6 year Construction phase, which will require many skilled and semi-skilled workers. Skwxwú7mesh Úxwumixw members with trades certificates have the potential to benefit from these job opportunities. The Project may also support Skwxwú7mesh Úxwumixw businesses through procurement and contracting opportunities, although success depends on direct involvement and access to contracts.

- **Indigenous Health and Well-being:**
  - **Effects on the quality, quantity, and availability of harvested country foods:** Land, water or air-based contamination from the Project could adversely affect country foods such as fish and traditional plants. See Harvesting and Subsistence Activities section above;
  - **Effects on the value and perceived quality of country foods:** Quality, quantity or availability of plants or wildlife could be impacted from the Project. Country foods could become contaminated. (See Harvesting and Subsistence section above). Community perceptions with respect to the quality of country foods have the potential to interact with Skwxwú7mesh Úxwumixw members' participation in harvesting and subsistence activities and cultural and spiritual practices even in the absence of adverse effects (land and resource use and culture VCs);
  - **Effects on air quality, noise and water quality:** The Project activities have the potential to contribute contaminants of concern to air and water, and increased noise levels in proximity to the facility property line (air quality, acoustics, surface water, land and resource use, human health VCs); and,
  - **Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites;** The Project may interact with Skwxwú7mesh Úxwumixw's health and well-being through changes to traditional practices, access to cultural sites, and socio-economic factors. Effects on traditional ways of life due may still influence health outcomes indirectly. Positive effects may include increased income and employment opportunities for members, while potential adverse effects relate to shift work and family stress.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that FortisBC has proposed in response to potential Tilbury Phase 2 related effects on social and economic conditions and Indigenous health and well-being. These include the following:

- **Land and Resource Use VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting Skwxwú7mesh Úxwumixw's long-term aspirations for land and water restoration, and reduces stressors that can affect well-being;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for Skwxwú7mesh Úxwumixw members and businesses to participate economically in the project, supporting improved social conditions and community well-being;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socioeconomic impacts on Skwxwú7mesh Úxwumixw and supporting health and community stability;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports Skwxwú7mesh Úxwumixw's food security, cultural identity, and health by safeguarding salmon and other species essential to harvesting;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting Skwxwú7mesh Úxwumixw's cultural continuity and nutritional well-being;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to Skwxwú7mesh Úxwumixw's physical health and cultural practices;

- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Skwxwú7mesh Úxwumixw's well-being;
- **Groundwater (Section 7.5)** Protecting groundwater from contamination helps maintain the quality of ecosystems that support fish, plants, and wildlife relied on for Skwxwú7mesh Úxwumixw's subsistence and health;
- **Surface Water (Section 7.4)** Managing runoff, erosion, and sediment helps maintain water quality in the lower Fraser, supporting Skwxwú7mesh Úxwumixw's cultural and nutritional reliance on healthy salmon and aquatic ecosystems;
- **Acoustics (Section 7.3)** Noise reduction measures limit sensory disturbance to people, wildlife, and harvesting areas, reducing stress and supporting Skwxwú7mesh Úxwumixw's comfort, well-being, and connection to land and water;
- **Air Quality (Section 7.2)** Air emission controls help protect respiratory health and prevent contamination of country foods, supporting Skwxwú7mesh Úxwumixw's physical well-being and confidence in harvesting; and
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect Skwxwú7mesh Úxwumixw members' physical, cultural, and mental health.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on social and economic conditions and Indigenous health and well-being:

- **Condition 10 (Community Feedback Process)** provides Skwxwú7mesh Úxwumixw with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting Indigenous health and well-being;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)** require ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with Skwxwú7mesh Úxwumixw to be developed by the Holder in consultation with the Nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting Skwxwú7mesh Úxwumixw's physical health and overall well-being;
- **Condition 16 (Indigenous and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support socio-economic well-being; and,
- **Condition 17 (Dry Street Sweeping Report)** requires FortisBC to submit a report on the effectiveness Dry Street Sweeping to mitigate the effects of 6-PPDQ on fish within eighteen months of a Certificate being issued.-By informing measures to protect downstream aquatic environments, this condition supports Skwxwú7mesh Úxwumixw's health and well-being by helping maintain confidence in environmental quality and minimizing potential concerns related to contamination of culturally important fish and waterways.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Well-being:

- **Accidents and Malfunctions Reporting** would support mitigation of potential impacts on the Nation's interests by ensuring timely responses, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

#### The EAO's Analysis and Conclusions

After consideration of the mitigation measures and potential effects described above, the EAO has determined that there will be no residual effects to Skwxwú7mesh Úxwumixw's social and economic conditions and health and well-being interests. This conclusion is informed by the absence of residual adverse effects from Tilbury Phase 2 on employment and the economy, together with the current level of Indigenous health and well-being services provided by Skwxwú7mesh Úxwumixw to their members.

#### 16.16.9 Positive Effects of Tilbury Phase 2

According to the Revised Application, the Tilbury Phase 2 project may create positive effects for Skwxwú7mesh Úxwumixw. One major benefit is the opportunity for direct employment and skills development, particularly during the Project's 3-to-6-year Construction phase, which will require a large workforce of skilled and semi-skilled labor.

In addition to employment, the Project offers potential contracting and procurement opportunities for Squamish-owned businesses. Local and regional Indigenous businesses could benefit by providing goods and services to the Project, supporting broader goals for economic self-sufficiency and business development.

#### 16.16.10 Conclusions

Considering the above analyses and the EAO's engagement with Skwxwú7mesh Úxwumixw, FortisBC's engagement with Skwxwú7mesh Úxwumixw's, Tilbury Phase 2 related mitigations, cumulative effects, the EAO's recommended Table of Conditions and the identified federal Key Mitigation Measures, the EAO concludes that Tilbury Phase 2 is not anticipated to have any impacts on Skwxwú7mesh Úxwumixw's Indigenous interests.

Considering the above analyses and the proposed provincial conditions, federal Key Mitigation Measures and Follow-up Programs, the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on the Indigenous interests of Skwxwú7mesh Úxwumixw has been adequately avoided, minimized or otherwise accommodated. Based on the engagement undertaken with Skwxwú7mesh Úxwumixw on Tilbury Phase 2, as outlined above in Section 16.16.2, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with Skwxwú7mesh Úxwumixw.

| herring, and (3) the post-1971 production where severe restrictions kept the colonial commercial catch low even as stock size recovered. (Ketchen et al. 1983) .....                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 2-18 |
| <b>Figure 12:</b> Time series for Pacific herring spawn index in thousands of tonnes (t) from 1951 to 2019. Note that it remains unclear if the decline from 2016 to 2019 in spawn index value accurately reflects a true decline in estimated spawning biomass as the model has insufficient information. Dashed vertical line indicates shift in dominant survey method from surface (pre-1987) to dive (post-1988) surveys. (DFO 2020) .....                                                                                                                                                                                                                                                                                                                                | 2-19 |
| <b>Figure 13:</b> ŠNEWIL/Fraser River estimated eulachon abundance status (circles), seven-year smoothed abundance status estimations (black line), three-year smoothed catch (grey fill) and a polynomial fitted trend line (red line). Abundance estimates are based on quantitative catch data (also including CPUE, spawning stock biomass estimates, test fishery catches) as well as qualitative data (annual run size report comments, and fishing effort comments). Note that the low colonial commercial eulachon catches between the early 1900s and early 1940s reported here are likely due to deteriorated eulachon markets as knowledge of other species increased, which is why eulachon abundance is estimated to be high during this time. (Moody 2008) ..... | 2-20 |
| <b>Figure 14:</b> Vegetation cover of the ŠNEWIL/Fraser delta in 1858-1880, with inset showing areas surrounding Tilbury Island. (Minister of Supply and Services Canada 1979) .....                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 2-22 |
| <b>Figure 15:</b> Map of 1925 (BLUE) and 2000 (BLACK) boundaries of peat bogs in Fraser Delta (Hebda et al. 2000:181) illustrating the loss of these areas over time. Purple dashed lines indicate the extent of the Fraser Lowland. (Butler 2019) .....                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 2-23 |

## 1. INTRODUCTION AND PURPOSE

This report represents SṪÁUTW First Nation's Indigenous-led assessment (ILA) under Section 19(4) of the *Environmental Assessment Act* (SBC 2018, c 51) for the Tilbury Phase 2 LNG Expansion Project (the Project). The Project proponent, FortisBC, has submitted an application for an environmental assessment certificate (the Application). This SṪÁUTW First Nation assessment is intended to be included as part of the Assessment Report prepared by the British Columbia (BC) Environmental Assessment Office (EAO).

The purpose of this ILA is to better describe the Nation's Douglas Treaty and Aboriginal rights and interests in the Lower Mainland in the context of the Project, and more accurately identify and characterize the Project's potential impacts on these rights in consideration of existing cumulative effects.

SṪÁUTW First Nation has protected rights to lands and resources within its territory, which spans the San Juan and southern Gulf Islands, from Southern Vancouver Island across the Salish Sea to the Lower Mainland. As a signatory to the Douglas Treaties of the 1850s, SṪÁUTW has rights to harvest and hunt, and to carry on its fisheries as formerly, including incidental rights to access and travel to and from fisheries and to manage traditional waters. These rights have been affirmed several times by the courts (e.g., *Saanichton Marina Ltd. v. Claxton*, 1989; *R. v. Bartleman*, 1984, *R. v. Joseph*, 1990).

This report is fundamentally an assessment of the Project's potential impacts on SṪÁUTW First Nation rights and interests. Cumulative effects in the Project area (and the Lower Mainland broadly) have intensified over approximately 150 years of colonization, industrialization, urbanization, and settlement, which have created barriers to the meaningful exercise of the Nation's rights.

Many First Nations in Canada, including SṪÁUTW, have long recognized that existing and ongoing impacts of cumulative effects must be the starting point to understand the potential impacts of new developments. This contrasts with the conventional Crown environmental assessment process that focuses on the incremental contribution of proposed projects, and only then considers the potential for cumulative effects. The conventional approach is flawed; this was made clear by the findings of Justice Burke in *Yahey v British Columbia*, 2021 BCSC 1287: when considering *rights*, what matters is if the rights can be exercised in a meaningful way—and in the context of additional development, whether those developments constitute a continued or further breach of protected rights.

The existing level of cumulative effects is such that SṪÁUTW cannot meaningfully exercise inherent and constitutionally protected Aboriginal and Treaty rights in the Project area and Lower Mainland. While the incremental effect of any individual project on SṪÁUTW First Nation rights may be relatively minor against the backdrop of existing cumulative effects, each nonetheless has the potential to, at minimum, contribute to the continuation of conditions adverse to the exercise of rights. Concrete and concerted action is required by proponents and Crown governments to reduce cumulative effects and impacts in SṪÁUTW First Nation territory inside and outside the scope of the Project to minimize further breaches of SṪÁUTW First Nation rights.

**Figure 1:** SENĆOTEN place names and SṪOLE/reef net sites from the SṪÁUTW Marine Use Study (Evans et al. 2015), specifically prepared for SṪÁUTW First Nation's review of the proposed Kinder Morgan Trans Mountain Expansion.

## 2. CUMULATIVE EFFECTS IN SṪÁUTW FIRST NATION TERRITORY

For thousands of years before the arrival of non-Indigenous settlers and the imposition of the Canada-USA (United States of America) border, SṪÁUTW lived and harvested at SMOKEĆ/Point Roberts and Boundary Bay, fishing at hereditary reef net sites alongside their allies, including the Lummi First Nation. SṪÁUTW travelled extensively in the Lower Mainland on the ŚNEWIL/ Fraser River and its tributaries, as well as the Salmon, Nicomekl, and Serpentine Rivers and other rivers and streams. SṪÁUTW harvested and traded while travelling, and picked KEXMIN/wild celery), SṪA, KEN/cattails, SẼLEL/tule rushes, SKÁUISELŁ/wapato tubers, and S,ELŁTENEN, /berries; hunted for SMÍEṪ;/deer, KÍYI, EĆ/elk and PEKELKEN/mountain goats; and exchanged fish for goat's wool and other highly valued trade items. These activities and the prosperous economy they supported were anchored by villages, fishing stations, and reef net sites at SMOKEĆ/Point Roberts, SĈEU, OṪEN/Tsawwassen, and along the ŚNEWIL/ Fraser River, as well as by the SEŃCOṪEN place names, travel routes, and ceremonial places that tied—and continue to tie—SṪÁUTW to the lands and waters of the territory (Figure 1).

*There was clean water, clean beaches, dense first growth forests, crystal clear lakes, streams, rivers teaming with fish of all kinds. Huge herds of deer, elk, and flocks of ducks would blot out the sun. Beaches full of crabs, clams, sea urchins, were there for the taking and much more. These are the gifts of XÁLS, Our Creator (Claxton and Elliott 1994:49).*

For SṪÁUTW First Nation, it is self-evident that the meaningful exercise of rights is not possible in the Lower Mainland today. This is corroborated by spatial analyses conducted by SṪÁUTW of access barriers and disturbances in the southwestern portion of the Lower Mainland using publicly available data layers from Data Catalogue BC<sup>1</sup> and Parcel Map BC<sup>2</sup> (Figure 2). The analysis shows that between 93.0% and 99.8% of the terrestrial portion of the area is disturbed, depending on the methodology employed (i.e., without additional buffers and excluding parks vs. inclusion of parks and using a 250 m buffer on roads, respectively). Remaining “undisturbed” fragments are generally non-contiguous islands surrounded by residential and industrial development. This level of disturbance is higher than the level of disturbance identified in Blueberry River First Nations territory (i.e., 72.6% to 83.9%) that informed Justice Burke’s findings in *Yahey v British Columbia*, 2021 BCSC 1287.

The Project, if approved, would be a continued breach of the Nation’s inherent and constitutionally protected Aboriginal and Treaty rights. For this reason, SṪÁUTW First Nation urges the Minister to reject the Project without substantive commitments and conditions to address cumulative effects in SṪÁUTW First Nation territory. SṪÁUTW knowledge and understanding along with Western scientific rationales are provided for these conclusions in this assessment for the benefit of FortisBC and BC EAO.

The arrival of European settlers, colonial laws and restrictions, industrial development, and settlement have rapidly transformed the biophysical, social, economic, and cultural landscape of the Lower Mainland and SṪÁUTW First Nation’s territory in general. A timeline of key events focused on the Lower Mainland that have resulted in the loss of habitats and species populations across terrestrial, aquatic, and marine environments that used to allow SṪÁUTW First Nation society and culture to prosper is provided in Table 1. With the direct and intentional disruption of SṪÁUTW First Nation life by colonial institutions and policies, SṪÁUTW political, spiritual, and social systems were also irrevocably disrupted.

<sup>1</sup> More specifically, much of the data included in the map is derived from the BC Cumulative Effects Framework (CEF) Human Disturbance dataset and the CEF Integrated Roads dataset, both of which were developed by the province to support cumulative effects assessment in BC.

<sup>2</sup> The accuracy of this publicly available data may vary and does not represent every type of land or water encumbrance. The land and water designations are subject to change over time (e.g., water licences may expire; Crown lands may become private lands; lease boundaries of industrial projects may change).

**Figure 2:** Access barriers and disturbances to the meaningful exercise of STÁUTW First Nation rights in the Lower Mainland.

Key events include smallpox epidemics brought on by Europeans; the establishment of the Canada-USA border beginning in 1846 (and subsequent agreements), which impacted and eventually cut off access to SṪÁUTW fisheries and village sites south of the border; overfishing and competition from colonial commercial fisheries, and regulations leading to the decline of reef net fisheries in the late 19th and early 20th centuries; and overfishing, contamination, and habitat fragmentation leading to the decline of ŚNEWIL/ Fraser River sockeye salmon throughout the 20th century, continuing to the present.

In the 100+ years since the banning of the reef net fishery in 1916, SṪÁUTW First Nation rights in the Lower Mainland have been further impacted by extensive residential and industrial development, including the expansion and urbanization of cities like Surrey, ŚĆEU, OFEN/ Tsawwassen, and Delta and the draining, diking, and clearing of much of the Lower Mainland for agricultural purposes. Today, the Lower Mainland is blanketed by thousands of private land parcels, developments (including pulp mills, industrial parks, and industrial ports), roads and highways, water licences, and other land and water tenures that limit, block, or otherwise impact SṪÁUTW's access to fishing, hunting, gathering and village sites. Development has also impacted the availability and abundance of plants and animals traditionally gathered by SṪÁUTW through habitat destruction, pollution, and fragmentation.

The remainder of this section summarizes how some of the key environmental conditions foundational to SṪÁUTW First Nation rights have changed over time in the vicinity of the Project, providing important context to SṪÁUTW's ILA.

**Table 1:** Timeline of key events that have impacted the ability of SṪÁUTW First Nation and WSÁNEĆ peoples to meaningfully exercise rights in SṪÁUTW First Nation and WSÁNEĆ territories, with a focus on the Lower Mainland.

|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Early 1800s | Commercial logging in the Vancouver area begins with the cutting of spars for ships (Boyle et al. 1997:186).                                                                                                                                                                             |
| 1818        | Pursuant to the Treaty of Joint Occupation, Great Britain and the United States agree that "Oregon Country" (the area west of the Rocky Mountains) would remain open for joint occupation and settlement for the next ten years (Convention of Commerce 1818; ratified 30 January 1819). |
| 1827        | Great Britain and the United States agree to extend the joint occupation of "Oregon Country" indefinitely (Convention Between His Majesty and the United States of America 1827).                                                                                                        |
| 1827        | The Hudson's Bay Company (HBC) establishes Fort Langley on the ŚNEWIL/ Fraser River. The Fort takes up land and shifts Indigenous harvesting and trading patterns.                                                                                                                       |
| 1839        | HBC constructed a new Fort Langley approximately 4 km upstream from the original post, in part to support increased fish processing and trade (Cullen 1979).                                                                                                                             |
| 1843        | HBC establishes Fort Victoria, a trading post on southern Vancouver Island.                                                                                                                                                                                                              |
| 1846        | The British Crown asserts sovereignty in British Columbia ( <i>Cowichan Tribes v. Canada (Attorney General)</i> , 2025 BCSC 1490)                                                                                                                                                        |
| 1846        | The Oregon Treaty begins negotiation of the Canada-USA border at the 49 <sup>th</sup> parallel, impacting access to the reef net fishery at SMOKEĆ/ Point Roberts, as well as other important areas like Semiahmoo and Birch Bay.                                                        |
| 1849        | Vancouver Island becomes a British Crown Colony. The territory was leased to HBC for a period of 10 years.                                                                                                                                                                               |
| 1852        | The South and North Saanich Douglas Treaties are signed. The Treaties include written promises to allow SṪÁUTW to hunt and carry on their fisheries "as formerly" and keep their village sites and enclosed fields.                                                                      |
| 1856        | Britain and the United States agree to carry out a joint boundary survey (Hayes 2012).                                                                                                                                                                                                   |

|            |                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1858       | The Colony of British Columbia is established. The Fraser River Gold Rush rapidly increases the presence of non-Indigenous settlers in BC.                                                                                                                                                                                                                                                                  |
| Late 1850s | European settlers begin to pre-empt land in the Fraser Delta (Habitat Working Group 1979:9).                                                                                                                                                                                                                                                                                                                |
| 1862-1863  | A smallpox epidemic devastates First Nations' populations throughout BC and Vancouver Island (Van Rijn 2006).                                                                                                                                                                                                                                                                                               |
| 1860       | The <i>Pre-emption Act</i> is passed, setting the stage for the large-scale taking up of land by non-Indigenous settlers. Indigenous peoples are banned from pre-empting land within a few years of the Act.                                                                                                                                                                                                |
| 1860s      | Settlement in what is now Surrey leads to ditching, small creek diversions, and the constructions of dikes along the Serpentine and Nicomekl Rivers (KPA Engineering Ltd. 1994:5). Diking facilitates growing agricultural development of the wet lowlands throughout the lower Fraser basin (Boyle et al. 1997:186).                                                                                       |
| 1866       | The colonies of Vancouver Island and mainland British Columbia are united.                                                                                                                                                                                                                                                                                                                                  |
| 1866       | Indigenous peoples are prevented from pre-empting land. The ban continues until 1953 (Union of BC Indian Chiefs n.d.).                                                                                                                                                                                                                                                                                      |
| 1868       | The Ladner brothers pre-empt land in the area now bearing their namesake. By the late 1800s, Ladner was at the centre of agricultural development (including clearing, diking, and draining) on the mainland (Madysen 2023). In the New Westminster District, which includes what is now Greater Vancouver and the Fraser Valley, 27,797 acres of land had been sold at auction by 1868 (Mikkelsen 1950:3). |
| 1870       | Great Britain and the USA sign a declaration confirming the maps surveying and marking out the international border on the mainland, but are not able to agree on the path of the border through the Salish Sea (Declaration Between Great Britain and the United States 1870).                                                                                                                             |
| 1870       | The Annieville Cannery, the first fish cannery built in British Columbia, opens on the ŚNEWIL/Fraser River across from New Westminster (Annieville Cannery 2024). Other canneries follow, increasing the presence of non-Indigenous settlers on the Fraser.                                                                                                                                                 |
| 1870-1890  | BC's salmon canning industry grows rapidly (Timeline 2024).                                                                                                                                                                                                                                                                                                                                                 |
| 1871       | Great Britain and the USA sign a treaty agreeing to submit their claims to the Emperor of Germany to resolve their dispute on the path of the border, either through the Rosario or Haro Strait (Treaty Between Great Britain and the United States 1871).                                                                                                                                                  |
| 1871       | The Colony of British Columbia joins Canada.                                                                                                                                                                                                                                                                                                                                                                |
| 1872       | The border dispute between Great Britain and the United States is resolved through binding arbitration, with the Emperor of Germany confirming that the border should run through Haro Strait (the United State's position) instead of Rosario Strait (Great Britain's position).                                                                                                                           |
| 1873       | Deas Island Cannery is established (City of Delta 2025).                                                                                                                                                                                                                                                                                                                                                    |
| 1873       | Consistent with the Emperor of Germany's 1872 decision on the border dispute, Great Britain and the USA sign an agreement marking out the border through Haro Strait (Protocol between Great Britain and the United States 1873).                                                                                                                                                                           |
| 1876       | The <i>Indian Act</i> consolidates existing laws that are intended to forcibly assimilate Indigenous people.                                                                                                                                                                                                                                                                                                |
| 1877       | By order of the Joint Indian Reserve Commission, reserves are formally created for the "Saanich Indians" at only some winter villages and fishing sites, in breach of the Douglas Treaties.                                                                                                                                                                                                                 |
| Late 1870s | 10 canneries of the 11 canneries operating in BC are located on the ŚNEWIL/Fraser River (Meggs 1991:22).                                                                                                                                                                                                                                                                                                    |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1878       | The federal <i>Fisheries Act</i> is implemented in BC, creating a host of fishing regulations that impact Indigenous people's ability to fish commercially and for food (Carlson 2001:164).                                                                                                                                                                                                                                         |
| 1880-1881  | The number of cases of salmon packed from the ŠNEWIL/Fraser River rises from a few hundred in 1870 to 42,155 in 1880 and 142,516 in 1881 (Meggs 1991:22).                                                                                                                                                                                                                                                                           |
| 1883       | 23 canneries are operating on the ŠNEWIL/Fraser River (Timeline 2024).                                                                                                                                                                                                                                                                                                                                                              |
| 1884       | Potlatches are banned under the Indian Act.                                                                                                                                                                                                                                                                                                                                                                                         |
| 1885       | The completion of the Canadian Pacific Railway increases the presence of settlers in the lower Fraser basin (Timeline 2024). Fish traps are established at SMOKEĆ/Point Roberts (Meggs 1991:44).                                                                                                                                                                                                                                    |
| 1888       | The <i>Fisheries Act</i> prohibits Indigenous fishing "by means of nets or other apparatus without leases or licences from the Minister of Marine and Fisheries," but indicates that "Indians shall, at all times, have liberty to fish for the purpose of providing food for themselves but not for sale, barter or traffic, by any means other than with drift nets, or spearing" (Aboriginal Fisheries in British Columbia 2009) |
| 1889       | In an attempt to reduce overfishing, the federal government reduces the number of fishing licences (Timeline 2024).                                                                                                                                                                                                                                                                                                                 |
| 1891       | The non-Indigenous population outnumbers the Indigenous population of BC for the first time (Carlson 2001:166).                                                                                                                                                                                                                                                                                                                     |
| 1892       | The sockeye catch of the non-Indigenous trap net fishery at SMOKEĆ/Point Roberts is 37,000 (US Commission of Fish and Fisheries 1900:303).                                                                                                                                                                                                                                                                                          |
| 1894       | The Gulf of Georgia Cannery, the largest cannery in BC until 1902, begins production on the south arm of the ŠNEWIL/Fraser River (Lorenz et al. 2002:9). Alaska Packers takes over the cannery at Lily Point (Dougherty 2009). Various salmon fishing regulations are implemented in the Fraser River District (Rathbun 1900:326).                                                                                                  |
| 1895       | The sockeye catch of the non-Indigenous trap net fishery at SMOKEĆ/Point Roberts grows to 680,000 (US Commission of Fish and Fisheries 1900:303).                                                                                                                                                                                                                                                                                   |
| 1896       | 21 fish traps are active at SMOKEĆ/Point Roberts and Boundary Bay (Meggs 1991:45).                                                                                                                                                                                                                                                                                                                                                  |
| 1897       | 54 BC canneries operating on the west coast export more than 48 million points of canned salmon (Lorenz et al. 2002:13).                                                                                                                                                                                                                                                                                                            |
| Late 1800s | Farmers in the Nicomekl lowlands begin reclaiming land for agricultural purposes through the construction of dikes and drainage ditches and canals (Cook 2020:7).                                                                                                                                                                                                                                                                   |
| 1901       | The total salmon pack from the ŠNEWIL/Fraser River reaches two million cases, an amount that subsequently leads to concerns about the sustainability of the canning industry on the ŠNEWIL/Fraser River (Meggs 1991:82).                                                                                                                                                                                                            |
| 1910-1911  | The Surrey Diking District is formed to construct sea dams on the Serpentine and Nicomekl Rivers. Both rivers are closed to navigation for dam construction (Cook 2020:7).                                                                                                                                                                                                                                                          |
| 1911       | Sales of subdivided lots on Crescent Beach at the mouth of the Nicomekl River begin (Luxton 2016:3).                                                                                                                                                                                                                                                                                                                                |
| 1912       | Extreme overfishing by the colonial commercial fishing industry devastates the ŠNEWIL/Fraser River salmon runs (Carlson 2002:167).                                                                                                                                                                                                                                                                                                  |
| 1913       | Sea dams on the Nicomekl and Serpentine Rivers are completed (KPA Engineering Ltd. 1994:5). The Hells Gate rock slide devastates the ŠNEWIL/Fraser River salmon run (Carlson 2002:167).                                                                                                                                                                                                                                             |
| 1916       | Fish traps are banned in Canada in an effort address overfishing. Although reef nets are not the cause of overfishing, they are considered a trap and included in the ban (Elliott 1990:60; Barsh 2021). Some reef net fishing south of the Canada-USA border continues.                                                                                                                                                            |

|             |                                                                                                                                                                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1917        | The salmon cannery peaks in BC, with 84 canneries in operation (Timeline 2024).                                                                                                                                                                                            |
| Late 1910s  | After decades of heavy fishing, the salmon runs around SMOKEĆ/Point Roberts are depleted, leading Alaska Packers to close the cannery at Lily Point (Dougherty 2009).                                                                                                      |
| 1918        | The North Arm of the ŚNEWIL/Fraser River is dredged to improve navigability for larger vessels (Richmond Archives 2018).                                                                                                                                                   |
| 1919-1922   | The ŚNEWIL/Fraser River closes for fishing completely due to drastically reduced salmon populations (Carlson 2002:168).                                                                                                                                                    |
| 1920s       | Dip net fishing is banned on the ŚNEWIL/Fraser River (Carlson 2002:168).                                                                                                                                                                                                   |
| 1924-1926   | Sumas Lake is drained (Carlson 2002:168).                                                                                                                                                                                                                                  |
| 1930        | By 1930, urbanization (especially in Vancouver and Richmond) and agriculture (especially in Surrey) have taken over much of the delta area and lowland near ŚNEWIL/Fraser River (Boyle et al. 1997:190).                                                                   |
| 1931        | The population of Vancouver reaches almost 250,000 (BC Statistics n.d.). The Vancouver Airport opens on Sea Island.                                                                                                                                                        |
| 1936        | WSÁNEĆ peoples report that they have been prevented from digging clams, a key trade item, in their homeland by the Department of Fisheries (Knighton 2004:15).                                                                                                             |
| 1941-1946   | The Royal Canadian Air Force opens a flight training school at Boundary Bay (Boundary Bay Airport 2025). The base is decommissioned in 1946.                                                                                                                               |
| 1950s       | Mechanical drag line dredging of the Nicomekl River becomes more frequent (Cook 2020:8).                                                                                                                                                                                   |
| 1950s-1980s | The population of Delta expands rapidly, growing from 8,752 in 1956 to 74,692 in 1981 (Province of British Columbia n.d.). Surrey's population undertakes a similar trajectory, almost doubling from 49,366 in 1956 to 98,601 in 1971 (Province of British Columbia n.d.). |
| 1953        | The Trans Mountain Pipeline is built, crossing the ŚNEWIL/Fraser River north of Surrey and terminating at Burnaby Tunnel (Trans Mountain Corporation n.d.).                                                                                                                |
| 1955        | Annacis Island becomes Canada's first industrial park (Annacis Island 2017).                                                                                                                                                                                               |
| 1956        | The first offshore tankship carrying oil from the terminus of the Trans Mountain pipeline at Burnaby to California departs in the 1956 with 118,000 barrels of oil (Trans Mountain 2015).                                                                                  |
| 1957        | On February 25, 1957, a Ministerial Order issued under the Indian Act recognized SṪÁUTW, Tseycum, Tsartlip, Pauquachin, and Malahat as separate Indian Bands and divided the WSÁNEĆ reserves among the Bands. (Department of Citizenship and Immigration 1957)             |
| 1958-1959   | Construction of SĆEU,OFEN/Tsawwassen ferry terminal and causeway begins (Tsawwassen First Nation n.d.).                                                                                                                                                                    |
| 1959        | The George Massey Tunnel opens. Now connected to Vancouver, suburban growth in Delta and other municipalities south of the ŚNEWIL/Fraser River increases (Artibise and Favrholt 2007).                                                                                     |
| 1960        | BC Ferries' first route between Swartz Bay and SĆEU,OFEN/Tsawwassen opens (Gyarmati 2020b).                                                                                                                                                                                |
| 1968        | Construction of the Deltaport begins (Tsawwassen First Nation n.d.).                                                                                                                                                                                                       |
| 1970        | The Delta coal port officially opens at Roberts Bank. At the time, the port is one of the largest deep sea facilities in the world (Gyarmati 2020a).                                                                                                                       |
| 1970s       | Sand from the Nicomekl River is dredged to form a beach area at Blackie's Spit in Surrey (Berris et al. 1999:4). The Nicomekl River is also dredged in the 1970s.                                                                                                          |

|      |                                                                                                                                                                                                                                                                                                                                                                        |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1971 | Tilbury LNG Plant begins operation on the ŚNEWIL/Fraser River at Tilbury Island in Delta (FortisBC 2025a). The population of Vancouver reaches almost 430,000, nearly quadrupling in 50 years from 117,217 in 1921 (Province of British Columbia n.d.).                                                                                                                |
| 1973 | The SĆEU,OFEN/Tsawwassen terminal and causeway are expanded (Tsawwassen First Nation n.d.)                                                                                                                                                                                                                                                                             |
| 1976 | The SĆEU,OFEN/Tsawwassen terminal and causeway are expanded again (Tsawwassen First Nation n.d.)                                                                                                                                                                                                                                                                       |
| 1983 | The Boundary Bay Airport is restored and reopened (Boundary Bay Airport 2025).                                                                                                                                                                                                                                                                                         |
| 1986 | The Alex Fraser Bridge is completed across the ŚNEWIL/Fraser River, increasing suburban growth in Delta (Artibise and Favrholt 2007).                                                                                                                                                                                                                                  |
| 1991 | The SĆEU,OFEN/Tsawwassen terminal and causeway are expanded again (Tsawwassen First Nation n.d.)                                                                                                                                                                                                                                                                       |
| 1997 | The Deltaport container terminal opens (Gyarmati 2020a).                                                                                                                                                                                                                                                                                                               |
| 1998 | A DFO study determines that “approximately 117 streams, many of them salmon bearing, appear to have been physically lost in the Lower Fraser Valley since records first started to be kept” (Precision Identification Biological Consultants 1998:6).                                                                                                                  |
| 2009 | A record low return of sockeye salmon to the ŚNEWIL/Fraser River results in the closure of the fishery for the third consecutive year (Cohen 2012a:3). This return represents the low point of a steady decline in sockeye salmon stock since the early 1990s (Cohen 2012a:2).                                                                                         |
| 2010 | The Deltaport Third Berth expansion opens (Gyarmati 2020a).                                                                                                                                                                                                                                                                                                            |
| 2011 | As of 2011, at least 160 hectares of low marsh at Sturgeon Bank have receded, impacting essential habitat for birds and salmon (Maxwell 2021:10; Balke 2017)                                                                                                                                                                                                           |
| 2012 | In response to concerns about the state of ŚNEWIL/Fraser River sockeye salmon, the Cohen Commission is established. The Commission finds that climate change and human activities (including road construction, dams, mining, and agriculture) have had adverse impacts on ŚNEWIL/Fraser River salmon at all life stages (Cohen 2012b).                                |
| 2016 | The population of Surrey exceeds half a million (Province of British Columbia n.d.).                                                                                                                                                                                                                                                                                   |
| 2017 | Contaminated water from drilling operations (horizontal boring) is released into creeks (including a creek that flows into the Serpentine River) in Coquitlam and Surrey, killing hundreds of fish (Black Press Media Staff 2022).                                                                                                                                     |
| 2018 | A mass die-off of fish and crayfish in the Nicomekl River is caused by discharge from a cement plant (Larsen 2018).                                                                                                                                                                                                                                                    |
| 2019 | A landslide at Big Bar Canyon, north of Lillooet, traps migrating salmon and devastates early Fraser River salmon runs (Owen 2020).                                                                                                                                                                                                                                    |
| 2020 | A study published in 2020 determines that an additive commonly used to prevent damage to tire rubber (6PPD-quinon) is likely the cause of acute mortality events in coho salmon populations (Tian et al. 2021). ŚNEWIL/Fraser River sockeye salmon have their worst return in recorded history (Rooney 2020).                                                          |
| 2021 | A research study concludes that only 15% of historical floodplain fish habitat in the Lower Fraser still exists (Finn et al. 2021:8). The study further finds that 1,727 of salmonid stream habitat has been completely lost from the landscape (Finn et al. 2021:8). Boundary Bay populations of salmon have experienced some of the most devastating habitat losses. |
| 2023 | The Roberts Bank Terminal 2 Project is approved by the Government of Canada and BC.                                                                                                                                                                                                                                                                                    |

|      |                                                                                                                                                                                                                                                                                                       |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2024 | A spill in the Hope Slough, which flows into the ŚNEWIL/Fraser River, kills thousands of salmon (CBC News Staff 2024). The Tilbury Marine Jetty Project is approved by IAAC and the province and receives an Environmental Assessment Certificate. The Trans Mountain Expansion Project is completed. |

## 2.1 Ambient Environmental Conditions

From the 1850s to today, the overarching trajectory of ambient environmental conditions that support ecosystem and human health have declined, with adverse effects for the resources and environmental qualities that are the basis of SṪÁUTW First Nation cultural life, economy, and identity.

### *Water Quality and Flow*

Through the late 1800s and into the mid-1900s, water quality in the lower ŚNEWIL/Fraser River was increasingly impacted by untreated sewage disposal and industrial runoff (Keeling 2004; Environment Canada 1992; Boyle et al. 1997; Hoos and Packman 1974; Landos 2024). Because water quality in the lower ŚNEWIL/Fraser River is impacted by activities in the upper watershed, the effects of growing industries of forestry, mining, agriculture, urban development, and other human activities upstream are concentrated cumulatively in the lower ŚNEWIL/Fraser River (Landos 2024). Into the 1960s, sewage and drainage was still flowing untreated into the ŚNEWIL/Fraser River (Keeling 2004:76). Pulp mills in Kamloops and Prince George also added contaminant loadings which were thought to be reaching a point of threatening “the symbolically and economically important salmon fisheries of the river” (Keeling 2004:76).

While the implementation of more recent water quality objectives and developments in pollution control have improved water quality since, contaminants (e.g., bacterial levels, urban and agricultural runoff) remain a concern (Hanna 1998; Keeling 2004; 2005; Environment Canada 1992); this is especially so “where flows are limited and flushing is restricted, such as sloughs, side channels, and small streams” (Environment Canada 1992:39). Keeling (2005) notes that “attempts to construct the ŚNEWIL/Fraser estuary as a sink for wastes failed to account for its complexity and variability, resulting in long-term environmental degradation” (59). Total ammonia and phosphorus concentrations have increased from 2003 to 2020 (Metro Vancouver 2020). In 2020, while most water quality objectives were met, total suspended solids and some total metal concentrations were noted as above objectives or guidelines (Metro Vancouver 2020). (ŚNEWIL/Fraser River water quality objectives and provincial and federal guidelines do not necessarily reflect SṪÁUTW conditions required for the meaningful exercise of rights.)

In addition to marine pathogens and heavy metal contaminants, sediment loadings have also changed over time due to dredging, diking, jetty construction, and riverbank armouring (Atkins et al. 2016; Barrie and Currie 2000). In the 1800s, navigational dredging was already taking place, creating a loss of sediment from the delta (Atkins et al. 2016:793). By 1975, channel training works on the South Arm of the ŚNEWIL/Fraser River were complete, and with the trifurcation project in New Westminster constructed, 85% of the ŚNEWIL/Fraser River discharge, along with nearly 100% of the sediment loadings, were then being transported through the South Arm (Atkins et al. 2016:793) (Figure 3). Since 2024, approximately 4x10<sup>6</sup> m<sup>3</sup> of sand each year is dredged in the arms of the lower ŚNEWIL/Fraser River and deposited in the deeper waters of the Salish Sea (La Croix et al. 2024; Atkins et al. 2016:793). Ongoing dredging contributes to coastal erosion and negatively impacts aquatic ecosystems through habitat degradation (Schaefer 2004; La Croix et al. 2024).

Simultaneous to the engineered alteration of the Lower Mainland’s waterways, terrestrial ecosystems and associated flow regimes have also been changed substantially from settlement and development. This is encapsulated by a description in a 1994 report on the Serpentine and Nicomekl Rivers from the BC government’s floodplain mapping program:

*[T]he drainage basins have undergone dramatic changes and continue to change at an unprecedented rate. The tidal flats in the lowlands have become farmlands. The once-forested uplands are now a patchwork of residential subdivisions. Several small lakes which once existed in the basins have been drained. Storm drains and ditches, many with small detention basins, now convey runoff from the uplands to the lowlands, altering the hydrologic response of the basin from its predevelopment regime (KPA Engineering Ltd. 1994:6).*

**Figure 3:** Conceptual site model for pre-1800s (LEFT) and existing (RIGHT) sediment regimes of the Fraser Delta. Red arrows indicate sediment pathways; larger arrows imply more sediment. Red solid lines indicate jetties, and red dashed lines indicate dykes. (Atkins et al. 2016)

### Air Quality

From around the 1850s, air quality declined with industrialization until the mid-1900s when new regulations implemented in response to public concern led to improving air quality into the present day (Thiessen 2017; Environment Canada 1992; Hoos and Packman 1970). Sources of air pollution in the mid-1900s in the Lower Mainland included coal steam locomotives; bulk ship loading facilities; sawmills; slash-and-burn forestry operations; commercial incinerators and municipal garbage burning; and household chimneys and rubbish fires (Thiessen 2017:18). By the mid-1950s and into the 1960s, air quality measures led to improving conditions. For example, dust and soot falling on the ground declined steadily to 8.3 tons per square mile per month in 1968, down from 30 tons per square mile per month in 1949 (Thiessen 2017:35, 88-89). Improvements were also observed for haze and sulphur dioxide in the air (Thiessen 2017:35). By the mid-1980s, anthropogenic air pollution still affected air quality, but had stabilized, likely because of more stringent air pollution regulations (Environment Canada 1992). From 2002 to 2021, nitrogen dioxide, sulphur dioxide, and carbon monoxide have been trending downward, and short-term and average concentrations have declined since the mid-1990s, except for PM<sub>2.5</sub> due to wildfire smoke in recent years (Metro Vancouver 2024).

### Soil Quality

In 1821, soil quality was described as “fertile” in the ŚNEWIL/Fraser Delta (Merk 1931:73-74, as quoted by Oliver 2010:98). Soil quality has declined since (Boyle et al. 1997; Environment Canada 1992), “due to intensive agricultural production, heavy fertilization, and limited conservation practices” (Environment Canada 1992:51). There have been declines in both net primary production and organic soil carbon over the last 170 years, with organic soil carbon’s most intense declines from the mid-1800s to 1930 (Boyle et al. 1997:185). A study in 2018 found that soil quality has continued to decline in the ŚNEWIL/Fraser Delta due to agricultural practices (Augustinowicz 2021:32). Soils in the ŚNEWIL/Fraser Delta have declining soil organic matter levels as well as deep soil compaction (Odhiambo et al. 2012:41). Another study showing a decrease in soil organic matter from 1984 to 2018 (Figure 4) attributed large losses to land use and land cover changes in the region (Paul et al. 2020). Land use and land cover changes in the ŚNEWIL/Fraser Delta include the extensive diking and dredging of the ŚNEWIL/Fraser River described in the *Water Quality and Flow* section above. Notably, the flooding events of the ŚNEWIL/Fraser River prior to the diking and alteration of flow contributed to the fertility of the soils that initially attracted agricultural land uses (Grandolfo-Lucia 2016) that are now causing declines in soil fertility (Augustinowicz 2021; Odhiambo et al. 2012; Paul et al. 2020).

**Figure 4:** Absolute change in soil organic carbon from 1984 to 2018 from positive change (green) to negative change (red). Blue areas represent water area, and grey areas represent built up land in 2018. (Paul et al. 2020)

### Ambient Noise

Prior to widespread urbanization and development, there was minimal anthropogenic noise, with the soundscape dominated by the “ocean, forest, birds, animals, winds, Indian life” (Schafer 1973; Penner 2021:30;32). Schafer (1973) provides a timeline of the Vancouver soundscape from pre-1836 to 1973,

documenting the introduction of specific noises in the soundscape. Notably, the steam-driven train added noise in 1887 and airplanes in 1910 (Schafer 1973).

Noise levels became a broad concern to residents of the Lower Mainland in the mid-1900s, and notably so by the mid-1970s after the expansion of Vancouver International Airport (GVRD 1986). Across the Lower Mainland, a study of noise levels was first conducted in 1971 through the Greater Vancouver Noise Survey, which found that the average ambient noise level was 45 dBA and 48 dBA in Delta and Richmond respectively (Figure 5). Average ambient noise was recorded at 58 dBA during the day and 52 dBA at night for industrial areas, and 45 dBA during the day and 42 dBA at night for rural areas (Table 2). By 1975, the areas around the South Arm of the SNEWIL/ Fraser River were noted as having “serious noise levels” resulting from the Vancouver Airport by the Greater Vancouver Regional District (GVRD 1986) (Figure 6). Atmospheric noise levels measured in 2021 at a site on the east side of Burns Bog captured an average noise level of 72.5 dB (equivalent to 72.5 dBA at a frequency of 1kHz) during rush hour and 57.7 dB (equivalent to 57.7 dBA at a frequency of 1kHz) prior to rush hour (Ebb Environmental Consulting Inc 2021), revealing that noise levels have increased from 1971. However, the recent trend may be in decline based on a 2020 study noting a decrease in the 24-hour noise level (i.e. average noise level of a 24-hour period) in Metro Vancouver by an average of 2.20 dBA between 2019 and 2020 (Yu et al. 2023).

**Table 2:** L10 (indication of peak noise), L50 (indication of mean level of noise during a given time period), and L90 (indication of ambient sound level in absence of noise sources) in dBA for industrial, commercial, residential, and rural areas during the day and at night across the Lower Mainland as part of the Greater Vancouver Noise Study (Price 1972).

| Level                      | Industrial |           | Commercial |           | Residential |           | Rural     |           |
|----------------------------|------------|-----------|------------|-----------|-------------|-----------|-----------|-----------|
|                            | Day        | Night     | Day        | Night     | Day         | Night     | Day       | Night     |
| <b>L<sub>10</sub></b>      | <b>69</b>  | <b>64</b> | <b>72</b>  | <b>66</b> | <b>64</b>   | <b>55</b> | <b>58</b> | <b>53</b> |
| <b>L<sub>50</sub></b>      | <b>58</b>  | <b>52</b> | <b>62</b>  | <b>52</b> | <b>51</b>   | <b>44</b> | <b>45</b> | <b>42</b> |
| <b>L<sub>90</sub></b>      | <b>49</b>  | <b>44</b> | <b>51</b>  | <b>43</b> | <b>42</b>   | <b>35</b> | <b>36</b> | <b>32</b> |
| <b>Mean upper extremes</b> | <b>63</b>  | <b>59</b> | <b>68</b>  | <b>64</b> | <b>57</b>   | <b>50</b> | <b>51</b> | <b>48</b> |
| <b>Mean lower extremes</b> | <b>56</b>  | <b>50</b> | <b>59</b>  | <b>48</b> | <b>49</b>   | <b>42</b> | <b>44</b> | <b>36</b> |

**Figure 5:** Noise levels (dB) across the Lower Mainland in 1971 as part of the Greater Vancouver Noise Survey (BKL n.d.).

**Figure 6:** Areas impacted by noise from Vancouver International Airport in 1975. Grey cross-hatching indicates areas "seriously affected" by noise from airport operations, and grey hatching indicates areas "slightly lower but still serious noise levels" (GVRD 1986).

Underwater noise has emerged as an issue since the mid-1800s, which has not been quantified prior to recent decades in the SNEWIT/ Fraser River estuary (i.e. 2000s, 2010s, 2020s). While the mandate to manage general habitat protection provisions including sound have been included in the *Fisheries Act* and

*Oceans Act* since 1977 and 1996 respectively, measures for underwater noise specifically have only been introduced since 2008 (Breeze et al. 2022). While not specific to the ŚNEWIL/Fraser River estuary, one report comparing the findings of three underwater noise studies from 1965 to 2002 in the deep waters of the Northeast Pacific Ocean (i.e. a significant distance off the continental shelf of North America) found that noise levels had increased from around 80 dB to 91 dB across this time period (Chapman and Price 2011). In the Salish Sea, two studies have quantified non-anthropogenic noise (i.e. underwater noise due to rain and wind alone) which can be used as a proxy for noise levels around the time of the Douglas Treaties. MacGillivray et al. (2024) found the inner Salish Sea broadband (i.e. all frequencies) noise to be around 80 dB in summer and 90 dB in winter at 10 metres depth, while Burnham et al. (2021) found the inner Salish Sea to be around 48 dB in winter (no value for summer) modelled at 8kHz (i.e. not broadband but a specific frequency).

Underwater noise has increased dramatically in recent decades, in large part due to increases in vessel traffic (see Section 2.5 for more information on vessel traffic specifically) (MacGillivray et al. 2024; Breeze et al. 2022; St-Pierre 2023). Quantifying of anthropogenic noise in the ŚNEWIL/Fraser River estuary specifically has been limited to Environmental Assessment processes such as the Fraser River Tunnel Project and Pattullo Bridge Replacement Project, which have documented existing broadband (i.e. all frequencies) sound pressure levels in the South Arm at a median of 108.7 dB, with ambient sound exceeding 120 dB 20% of the time (BC Ministry of Transportation and Infrastructure 2015:4.3-8; Zykov et al. 2018:29).

Underwater noise is known to impact marine mammals and fish. Impacts of anthropogenic sound on fish are well documented, including behaviour changes (e.g., spatial movement), reduced foraging efficiency and communication, increased stress hormones, and reduced fitness (Popper and Hawkins 2018; Holles et al. 2013; Nichols et al. 2015; Whitefield and Becker 2014; Nedelec 2015; Murchy 2024). Salmon are known to avoid noise (Boyes 1982). Adult salmon (sockeye and pink) migrating back into the ŚNEWIL/Fraser River have been found to avoid approaching vessels (Xie et al. 2008). Underwater noise can result in altered behaviour and masking of acoustic signals in marine mammals (Burnham et al. 2021; MacGillivray et al. 2024; Erbe et al. 2019). KELŁOLEMEĆEN/killer whales alter respiration patterns, swim speeds, direction, and behaviour (decreased foraging behaviour and increased surface-active behaviour) in loud soundscapes (Erbe et al. 2019; St-Pierre 2023).

STÁUTW First Nation members have also identified large-vessel traffic effects as contributing to poor fish and ecosystem health by increasing sedimentation and water turbidity and the exposure of shorelines and the river bottom and seabed to additional wave action and currents. These concerns are captured in the quotes below.

*That sediment that's being created and the clarity in the water. People don't think that bothers anybody, but if you're a fish you have to breathe it. Yeah. And it's really detrimental to their health too. (STÁUTW Respondent ID110)*

*Not only the salmon, but the whales, seals, and everything, they all use these same paths that these huge freighters are using. So the freighters are creating a destruction all along their path. And now the sea life can't live in that anymore. And it's like a little desert all along there. All along their path, you know, there's sediment disturbance in the way. (STÁUTW Respondent ID110)*

*The kelp and the eelgrass and stuff, there's virtually nothing left under the pass of the ships [...] The force that's put onto the bottom is something that follows up underneath even though they're not touching the bottom there. The more and more ships they see, the more and more actual damage. (STÁUTW Respondent ID110)*

The implications of these changes to water, air, soil, and noise are many and cumulative across generations of SṪÁUTW.

## 2.2 Fish and Fishing Conditions

### *Salmonids*

In the mid-1800s, stocks of the five species of pacific salmon (chinook, coho, chum, pink, and sockeye) and sea-run trout (steelhead, cutthroat, and bull trout) were considered abundant in the SṪÁUTW/Fraser River (Albright 1985; HTG n.d.; Carlson 1998; Haggan et al. 2006; Lepofsky et al. 2005). The “huge quantity of fish that appeared during short intervals” (Carlson 1998:23) were a “predictable and reliable resource” (Albright 1985:10). Sockeye runs alone were estimated at about 100 million fish prior to 1913 (Lepofsky et al. 2005:272).

*At times there were so many salmon jumping as one looked across the strait, that the salmon seemed as though they were hanging in mid air, even the water became frothy from salmon jumping as they travelled to the Fraser River (Claxton and Elliott 1994:24).*

Notably, in the archaeological record, salmon, herring, and flatfishes (i.e. halibut, flounder, sole) rank as the top three most ubiquitous fish taxa found at archaeological sites in the Salish Sea, with 15-30% of the fish bone fragments identified at sites around the SṪÁUTW/Fraser River estuary coming from salmon alone (McKehnie and Moss 2016) (Figure 7). Similar findings were documented at the Crescent Beach site in Boundary Bay by Ham (1982:255).

**Figure 7:** Geographic patterning of relative abundance of herring (top left), salmon (top right) and flatfish (bottom left) versus all other fish bones identified, based on zooarchaeological data (NISP refers to the number of identified specimens) from archaeological sites represented by black dots. Relative abundance is interpolated by inverse distance weighting from archaeological sites. Red circle encompasses where the South Arm of the SNEWIL/ Fraser River meets the Salish Sea. Note that between panels, colours represent different %NISP ranges. (McKechnie and Moss 2016)

Salmonid populations have decreased since the mid-1800s (Boyle et al. 1997; Levings 2004; Environment Canada 1992; Ross 1953; Hoos and Packman 1974), in part due to “the heavy exploitation of salmon by [colonial] commercial fisheries<sup>3</sup> interest around the last decade of the Nineteenth Century” (Rozen 1978:62, as quoted in HTG n.d.:8). The first cannery opened operations in 1871 (Ross 1953:111), leading to decades of higher fishing pressure, and “by the -1890s [...] the newcomers had transformed fishing into a growing industry and established a monopoly on the river” (Ross 1953:111).

<sup>3</sup> References to commercial fisheries should be understood to mean industrial-scale commercial fishing rather than smaller-scale and traditional harvest and trade. We use the term “colonial” commercial fishery to denote this difference. Indigenous participation in colonial commercial fisheries should not be construed as being representative of Indigenous cultural, political, and/or economic beliefs and practices.

Salmonid stocks in the ŚNEWIL/Fraser River declined further throughout the early- to mid-1900s, with fluctuations and some recovery of certain species in recent decades. Prior to 1913, the dominant run of sockeye every fourth year was in the order of 100 million fish (Ricker 1987, as cited by Landos 2024:54 and Lepofsky et al. 2005:272). The decades following were marked with reduced catches indicating drastic sockeye declines (Landos 2024; Ross 1953:130). Restoration efforts and controls on fishing effort in the 1940s and 1950s led to some population recovery in the second half of the century, although still lower relative to the pre-1913 era (Landos 2024; Environment Canada 1992:70). Recent sockeye population estimates are in the order of 100,000 annually in 2018, 2019, and 2020, and up to 1.5 million in 2021 (Landos 2024). Pink salmon have followed similar trends to sockeye, with great declines followed by a slight recovery, and 2021 returns estimated to be 7.99 million (Landos 2024; Environment Canada 1992:70). Chum showed initial declines followed by a slight increase but returns since 2017 were well under predictions (Landos 2024; Environment Canada 1992:70). Chinook and coho populations have trended downwards and remained low (Landos 2024; Environment Canada 1992:70). While there are conflicting estimates on total salmon returns of all species, several sources point to returns around 20 to 24 million into the early 2000s (Environment Canada 1992:70; Lepofsky et al. 2005:272).

Trout stocks have also trended down since the mid-1800s. Not much is known about coastal cutthroat trout populations distributed in the lower ŚNEWIL/Fraser River; five populations are extinct, four were at high risk of extinction as of 2018, and the rest (accounting for approximately 80% of these populations, though total number of populations is unknown) were of unknown status (Hatfield Consultants 2018:50; McPhail et al. 1998). Prior to 1974, coastal cutthroat trout with an anadromous life history (sea-run coastal cutthroat trout) had been in decline over several decades in the lower ŚNEWIL/Fraser River (Hoos and Packman 1974:110). Beyond cutthroat trout, steelhead trout (i.e. anadromous rainbow trout) colonial commercial catches were not reported prior to the 1930s, but showed a “sharp decline” in the 1940s and continual decline in the 1960s and 1970s (Hoos and Packman 1974:124). There is concern that the ŚNEWIL/Fraser River winter steelhead trout stock are at risk of extinction as they are often caught as by-catch in net salmon fisheries (Hatfield Consultants 2018:50). Two upper ŚNEWIL/Fraser River stocks of steelhead trout that migrate through the lower ŚNEWIL/Fraser River are designated as Endangered by COSEWIC in a 2020 reassessment.

In addition to fishing pressure, habitat loss, diking, and declines in water quality have contributed to declining salmon stocks (Boyle et al. 1997:193; DFO 2025; Levings 2004; Hanna 1998; Finn et al. 2021), with only limited spawning habitat left in the lower ŚNEWIL/Fraser River and associated tributaries. Many streams throughout the lower ŚNEWIL/Fraser River have become inaccessible to salmon, leading to significant loss of spawning and rearing habitat (Finn et al. 2021; DFO 2025; Levings 2004; Precision Identification Biological Consultants 1998) (Figure 8). Fisheries and Oceans Canada (DFO) notes that “salmon spawning locations were more extensive prior to intensive land and in-water development in the Lower Fraser” (DFO 2025:para.13). The Lower ŚNEWIL/Fraser River is also important feeding habitat for salmon fry and smolts (Schaefer 2004:42), and the first- and second-order streams are vital for non-anadromous trout (Levings 2004:222). Urbanization has contributed to habitat loss leading to the extinction of numerous stocks (Levings 2004:222). By 1988, the loss of estuarine salmon habitat was estimated at about 75% (Birthwell et al. 1988, as cited in Hanna 1998:71).

Boyle et al. (1997:194) note that heavy metals and organic contaminants such as chlorinated phenols have been found in aquatic organisms in the ŚNEWIL/Fraser River and tributaries, with undetermined effects on the viability of aquatic organisms. While the exact role that contaminants have had in salmon population declines remains unclear due to a lack of data, multiple lines of evidence including reports by the Cohen Commission, DFO, and best professional judgment from toxicology experts point to contaminants having sublethal effects on salmon that have contributed to long-term declines by introducing additional stressors on top of fishing pressure and habitat loss (Landos 2024). These sublethal effects include

physiological impairment; reproductive and developmental effects; reduced growth rates; and increased susceptibility to disease and predation, nutritional stress, and sub-optimal environmental conditions (Landos 2024).

**Figure 8:** (TOP) Status of stream health in 1998 based on extent of habitat degradation as wild (green), threatened (pink), endangered (yellow), or lost (red) (Precision Identification Biological Consultants 1998), and (BOTTOM) status of stream connectivity in 2021 based on mapped barriers to fish passage for salmon as accessible (green), inaccessible (red), channelized (marron), or lost (grey) (Finn et al. 2021). Several streams marked as endangered (TOP – yellow) in 1998 are lost or inaccessible to salmon (BOTTOM – grey or red) in 2021 (examples shown in blue circles).

Tidal marsh areas in the SNEWIL/Fraser River estuary are important habitat for juvenile Pacific salmon including chinook, chum, and pink (Levy and Northcote 1982). Juvenile chinook salmon currently use

estuary habitats extensively from late March to July (lower ŚNEWIL/Fraser River population) or even until mid-August (South Thompson ocean-type population) (Scott et al. 2024). An analysis of habitat connectivity in the ŚNEWIL/Fraser River estuary reveals that extensive development (including the hardening of shoreline) has disconnected patches of suitable salmon rearing habitat, meaning salmon may have to migrate downstream for multiple tidal cycles to reach the next patch of suitable habitat (Loranzo 2024) (Figure 9). In addition to reduced connectivity in the mainstem of the ŚNEWIL/Fraser River, streams are also degraded habitat. A study in 1998 found that from the mouth of the ŚNEWIL/Fraser River to Stave River, 51% of streams were endangered, 21% threatened, and the remaining 28% were wild (Precision Identification Biological Consultants 1998). Streams were assessed based on criteria evaluating environmental state (e.g. loss of riparian vegetation, diking, water quality, urbanization) and were considered threatened if they met one criterion, and endangered if they met two or more criteria. Across the entire Fraser Valley from Hope to the mouth of the ŚNEWIL/Fraser River, 15% of streams were marked as lost by 1998 (Precision Identification Biological Consultants 1998). Salmon habitat is predicted to change unfavourably under all future climate change scenarios (Iacarella and Weller 2023), with the lower ŚNEWIL/Fraser region experiencing increases in the frequency with which critical thresholds for temperature are surpassed, reducing spawning migration success (Hague et al. 2011).

**Figure 9:** Suitable salmon rearing habitat patches (solid green) and the distance from these habitat patches (dark green at 0m to red at >500m) showing habitat connectivity. (Loranzo 2024)

### Groundfish

Starry flounder and English sole have been documented at the mouth of the ŚNEWIL/Fraser River and as far up as Mission for Starry flounder (Ketchen et al. 1983; Hoos and Packman 1974:114; McPhail et al. 1998; Levings 2004). Flatfishes including flounder and sole (alongside other herring and salmon) rank among the top three most ubiquitous fish taxa found at archaeological sites in the Salish Sea, with 20-30% of all fish bones identified at archaeological sites around the ŚNEWIL/Fraser River estuary coming from flatfish species (mostly halibut, flounder and sole) (McKehnie and Moss 2016) (Figure 7). Little information is available about the historical abundance of starry flounder or other flounder and sole species within the ŚNEWIL/Fraser River (Hoos and Packman 1974:114-115). Both starry flounder and English sole were

historically harvested commercially in the Salish Sea and ŚNEWIL/Fraser River estuary, but stocks have declined significantly since the 1960s (Levings 2004). In 1973-1974, starry flounder were recorded at a density of 4.14-4.82 individuals per 100 m<sup>2</sup> between the mouth of the ŚNEWIL/Fraser River and Tilbury Island (Richardson et al. 2000). Similarly, starry flounder were found at every sampling occasion in the Deas Slough area of the ŚNEWIL/Fraser River estuary in a study in 1976-1977, with a density of 9 individuals per 100 m<sup>2</sup> (Birtwell et al. 1993).

Sturgeon are also an important groundfish to the ŚNEWIL/Fraser River ecosystem. Like other fish of colonial commercial value, white sturgeon experienced dramatic population declines in the decades following the increases in harvest rates in the late 1800s and is now considered “threatened” in the lower ŚNEWIL/Fraser River with under 50,000 individuals remaining (DFO 2025).

On an archaeological timeframe (i.e. 10,000 cal B.P. to around 1800; McKechnie et al. 2014; Ritchie et al. 2016), sturgeon and salmon remains were identified at the Dionisio Point archaeological site on Galiano Island. While sturgeon do (rarely) swim in saltwater ocean habitats between freshwater systems, they are most closely associated with brackish and freshwater habitats such as the ŚNEWIL/Fraser River as well as areas in western Vancouver Island (Ewonus 2011). Thus, the sturgeon identified at the archaeological site on Galiano Island gives indication of sturgeon presence in the ŚNEWIL/Fraser River system prior to the 1800s as well as fishing and transport activities at the time, with the authors indicating “the most logical origin for this [sturgeon] specimen is the ŚNEWIL/Fraser River” with subsequent transport across the Salish Sea (Ewonus 2011:86).

In the mid- to late-1800s, “sturgeon weighing up to 184 kg were a daily occurrence in the Fraser River catches at the time” (DFO 1995:7). However, exploitation resulted in “serious depletion of the older age classes” by the early 1900s, as well as an overall decrease in abundance (Hoos and Packman 1974:122). Across the ŚNEWIL/Fraser River, catches fell in the early 1900s followed by a short period of recovery, but since 1917, annual harvest has remained low (DFO 1995:7-8; Oloriz and Parlee 2020; Landos 2024:69; Environment Canada 1992:72) (Figure 10). Sturgeon populations declined “to the point that when a large individual fish was caught in 1930 it was considered exceptional” (Landos 2024:69).

**Figure 10:** Estimated colonial commercial gillnet harvest of green and white sturgeon in the ŚNEWIL/Fraser River from 1880 to 1990. (DFO 1995)

Population declines of sturgeon in the ŚNEWIL/Fraser River have been linked to overfishing,<sup>4</sup> declines in prey species eulachon, and declines in habitat quality and quantity due to dredging, gravel extraction, diking and channelization (Hatfield et al. 2004:2-3; Landos 2024:69; Hanna 1998:71). Additionally, effects of contaminants may have contributed to population declines. In 1974, the Federal Fisheries Inspection Laboratory found high mercury levels (above the federal standard maximum acceptable limit) in white sturgeon between Mission and New Westminster in the ŚNEWIL/Fraser River (Hoos and Packman 1974:113). The longevity of white sturgeon put them at greater risk of mercury bioaccumulation, especially when they spend their whole lives exposed to mercury-contaminated waters.

Population declines of sturgeon have continued in more recent decades. Mark-recapture data (much of it collected through the catch-and-release recreational fishery) shows a 25% decline in 7-to-55-year-old fish from 2006 to 2019 and a 70% decline in juvenile (7-to-12-year-old fish) from 2004 to 2019 (Landos 2024:69-70). While the recapture rates of large sturgeon indicate that this fishery does not result in direct mortality, there is a potential that stress from catch-and-release practices may contribute to low juvenile recruitment and spawning success (Oloriz and Parlee 2020). The lower ŚNEWIL/Fraser River population of white sturgeon was assessed as Threatened by COSEWIC in 2012. Robust abundance data is lacking, but the best estimate of white sturgeon in 2015 was 47,166 individuals (Hatfield Consultants 2018).

#### *Forage Fish*

As noted by Morin et al. (2023:303) there were “significant reductions in the major forage fish fisheries around Vancouver within decades of the initial Euro-Canadian settlement”.

Herring, while not considered anadromous, do spawn in estuarine habitats along the shores of the ŚNEWIL/Fraser River on eelgrass and other intertidal and subtidal vegetation. Herring populations show significant declines across the last 200 years, from consistently highly abundant in the archaeological record to near total collapse in the late 1960s, followed by minor recovery and recent declines (though data on the recent declines is lacking) (McKehnie et al. 2014; Ketchen et al. 1983; Landos 2024; Province of BC 1971; Schweigert et al. 1990; Cleary et al. 2017; DFO 2020).

Archaeological fisheries data that spans 2,500-200 y B.P. indicates that in the Salish Sea, herring were consistently highly abundant with low variability, where sufficient herring was consistently available to meet the needs of harvesters (McKehnie et al. 2014). Herring, alongside salmon and flatfishes, rank as the top three most ubiquitous fish taxa found at archaeological sites in the Salish Sea, with 30-50% of fish bones identified at archaeological sites around the ŚNEWIL/Fraser River estuary coming from herring (McKehnie and Moss 2016) (Figure 11). Overall, the archaeological record indicates that ancient herring populations had a higher mean abundance than in the last century (McKehnie et al. 2014).

The colonial commercial fishery for herring was first reported in 1877 where landings ranged from 130 to 650 tonnes from the Salish Sea through beach seines (Ketchen et al. 1983). Production from the Salish Sea reached 42,000 tonnes in the late 1920s, settling to 13,000 tonnes in 1932 (Figure 11). From 1935-67, production increased to meet expanding markets and rose to +70,000 tonnes by the mid-1950s with an all time high of 78,000 tonnes in 1963-64 (Ketchen et al. 1983). Several indicators suggest that abundance (not always directly correlated to landings) was highest in 1949 to 1954 but was still relatively high during the 1963-64 season. This was followed by a sudden drop in abundance as measured by low spawning escapement. This drop in abundance is mostly attributed to the colonial commercial fishery (i.e., increased

<sup>4</sup> Regarding overfishing, sturgeon management (and thus fishing regulations) at the turn of the century (i.e. 2000) was likely based on overestimations of sturgeon abundance. There are several sources of overestimation not accounted for at the time. First, BC Commercial Catch Statistics do not separate green and white sturgeon, meaning decision-making will not be specific to either species. Second, poaching is widespread, undercounting for fishing pressure. And third, initial catch data were first collected decades after the inception of colonial commercial fisheries (DFO 1995:8).

efficiency in fishing gear, increased effort) as well as some less impactful natural factors like the effect of sea surface temperature on egg survival (Ketchen et al. 1983). Herring recovered rapidly by the mid-1970s after a 4-year closure of the colonial commercial fishery (Landos 2024:71; Province of BC 1971:132). Through the late 1970s and early 1980s there were declines that even quota management introduced in 1986 failed to reverse. Up to 1986, herring bait fishermen continued to see spawning biomass declines and disappearances (Schweigert et al. 1990).

**Figure 11:** Historical production of herring by the Canadian fishery in the Strait of Georgia (in statistical areas 13-19 and 29). Note that times when production does not reflect abundance include: (1) the dips in the 1950s which correspond to industrial strikes on production (e.g. fishing years of 1952-53 and 1957-58), (2) the dip from 1967 to 1971 which reflects the closure of all herring fisheries but small bait and food herring, and (3) the post-1971 production where severe restrictions kept the colonial commercial catch low even as stock size recovered. (Ketchen et al. 1983)

While the stock of herring in the Salish Sea has not completely collapsed, its status is highly variable and remains unknown. A recent assessment in 2017 for the entire Salish Sea population shows an increasing trend in stock biomass since 2010 (Cleary et al. 2017:23). However, an approximate 60% reduction in biomass from 2017 to 2020 has been reported (Landos 2024:71). However, limitations around information and large uncertainties surrounding this recent decline were reported by DFO (DFO 2020:9). Additionally, within the context of a longer timeline, the spawn index (extent of herring spawn as a proxy for abundance) has been highly variable in recent decades (Figure 12). Differences of abundances between the archaeological record and modern pattern of variability has been attributed to industrial-scale colonial commercial fishing (McKehnie et al. 2014).

**Figure 12:** Time series for Pacific herring spawn index in thousands of tonnes (t) from 1951 to 2019. Note that it remains unclear if the decline from 2016 to 2019 in spawn index value accurately reflects a true decline in estimated spawning biomass as the model has insufficient information. Dashed vertical line indicates shift in dominant survey method from surface (pre-1987) to dive (post-1988) surveys. (DFO 2020)

Another forage fish of significance in the ŚNEWIL/Fraser River is eulachon. Eulachon are an important food source for many culturally significant species including salmon and sturgeon. Eulachon populations associated with the ŚNEWIL/Fraser River have trended from abundance to an “Endangered” population at 1% of pre-contact levels (Landos 2024; Hoos and Packman 1974; Moody 2008; Morin et al. 2023; DFO 2015; 2025; Burns et al. 2023; Hatfield Consultants 2018).

Eulachon returns in the late 1800s were considered “vast and immense” (Landos 2024:68). Eulachon were harvested commercially since 1881 but have declined since then, likely in part due to habitat destruction (Hoos and Packman 1974:123). Eulachon populations dipped in the late 1800s due to the initial expansion of the colonial commercial fishery, but likely recovered during the decades following when commercial catch was low, likely due to a focus on new and more valuable fisheries (Moody 2008) (Figure 13). However, this was followed by a steep decline in eulachon abundance throughout the latter half of the 1900s after the colonial commercial eulachon fishery expanded once more (Morin et al. 2023:316). The ŚNEWIL/Fraser River population of eulachon were assessed as blue listed by the BC Conservation Data Centre in 2000 and as Endangered by COSEWIC in 2011 (DFO 2015; 2025; Burns et al. 2023:633). In 2024, the population is in a state of significant decline, with one report indicating current populations are around 99% below pre-contact levels (Landos 2024:68), and another report documenting a 98% decline over the decades of the 1990s and 2000s specifically (Hatfield Consultants 2018:49).

**Figure 13:** ŠNEWIL/Fraser River estimated eulachon abundance status (circles), seven-year smoothed abundance status estimations (black line), three-year smoothed catch (grey fill) and a polynomial fitted trend line (red line). Abundance estimates are based on quantitative catch data (also including CPUE, spawning stock biomass estimates, test fishery catches) as well as qualitative data (annual run size report comments, and fishing effort comments). Note that the low colonial commercial eulachon catches between the early 1900s and early 1940s reported here are likely due to deteriorated eulachon markets as knowledge of other species increased, which is why eulachon abundance is estimated to be high during this time. (Moody 2008)

#### Marine Invertebrates

Many marine invertebrates are found at the mouth of the ŠNEWIL/Fraser River. While marine invertebrate populations have not declined the same extent as other fisheries (except TEXTEX/Olympia oyster and Á,CEX/Dungeness crab), barriers to consumption come from the declines in water quality (see section on *Water Quality* above), contaminating shellfish and presenting risks to human health if consumed.

In the archaeological record, species such as crab, chiton, ŁÁU,KEM/mussel, TEXTEX/Olympia oyster, sand clam, bent-nosed clam, STELO,EM/cockles, SQLÁ,I,/ littleneck clams, and S,OXE/butter clams were found at the Crescent Beach archaeological site in Boundary Bay (Ham 1982:251) indicating these species were ubiquitous (i.e. consistently encountered in archaeological samples, indicating consistent harvest and use of the species, which is interpreted by archaeologists as relative abundance) in the archaeological timeframe (i.e., 10,000 cal B.P. to around 1800; McKechnie et al. 2014; Ritchie et al. 2016).

Colonial commercial landings of the TEXTEX/Olympia oyster were not reported until 1884, and continued until 1935 until it collapsed due to overfishing; heavy mortality from a severe winter in 1929; and competition with introduced Pacific oyster in 1912 (Ketchen et al. 1983).

Á,CEX/Dungeness crab catches were first documented in Boundary Bay (and potentially also Sturgeon and Roberts Banks) in the early 1900s (Ketchen et al. 1983; Hoos and Packamn 1974:99). Landings were not well documented until 1951, and even then, fishing effort recorded may not be directly indicative of abundance because it does not account for number of traps fished. Across the entire Salish Sea, there are indications that abundance has declined from mid-1960s to mid-1970s (Ketchen et al. 1983:1108-1109).

However, little information is available to quantify that decline or to contextualize it within the longer-term population size variability.

Sporadic limited colonial-commercial fisheries have occurred for sea urchins and sea cucumbers over the years (Ketchen et al. 1983). Additionally, as of 1974, shrimp fishing was taking place off Sturgeon Bank, though it was noted that at the time there was no management program in effect (Hoos and Packman 1974:100).

The colonial commercial fishery of clams in the Salish Sea likely developed in the late 1800s, but landings were not recorded until 1951. Landings of butter, littleneck, and manilla clams together since 1951 have fluctuated from around 300 tonnes to 900 tonnes (Ketchen et al. 1983). Fluctuations in landings have only in some instances been connected to overfishing (i.e., other reasons for changes in landings include pollution or socio-economic conditions like availability of other work) (Ketchen et al 1983:1113). While the fluctuations in landings may not accurately represent abundance of clams, beaches within easy access are heavily exploited (Ketchen et al. 1983).

In the 1970s, Boundary Bay specifically was found to contain a “sizeable population of butter clams, littleneck clams, horse clams, mussels, cockles, and mud clams” that while never exploited by colonial commercial operations like at other accessible beaches, were harvested recreationally (Hoos and Packman 1974:97-99). In addition, although native *TECTEX*/Olympic oyster were still present, non-native species such as Pacific and Atlantic oyster were the most abundant, Atlantic oyster having been “seeded extensively” by the Crescent Oyster Company in Boundary Bay (Hoos and Packman 1974:87). Hoos and Packman (1974) note that “Boundary Bay was the single most productive oyster bed in British Columbia prior to 1960 when the fishery was closed owing to coliform bacterial pollution” (86).

A preliminary baseline study of Roberts and Sturgeon Banks in 1973 found the infaunal community to be a “normal” estuarine habitat “relatively unaffected by present developments on the Fraser” (Hoos and Packman 1974:90). However, this same study also documented significantly high levels of mercury and silver in molluscs from Sturgeon Bank, and PCBs in crabs, likely from the Iona sewage outlet, indicating the infaunal community was not “normal”. Overall, shellfish are “common” in the Fraser River tidal flats but contaminated, restricting harvest (Hoos and Packman 1974).

Shellfish harvesting across the SṪÁUTW/ Fraser River delta continues to be closed today due to a biotoxin closure and a sanitary closure (BC CDC n.d.). Marine biotoxins (e.g. saxitoxins, domoic acid) are a group of contaminants naturally produced by phytoplankton causing shellfish poisoning (paralytic, amnesic, and/or diarrhetic) in humans and other animals. Sanitary closures are the result of high levels of microbial pathogens (e.g. the bacteria *Salmonella*, the virus Norovirus) that can affect human health. Notably, marine pathogens originate from pollution sources such as wastewater treatment plant effluent, dredging, and agricultural activities. Thus, sanitary closures can be attributed to declines in water quality due to those human activities throughout the entire SṪÁUTW/ Fraser River basin. In 2018, the invertebrate community was noted to reflect “the relatively poor-quality mud-sand substrate conditions typical of the region” (Hatfield Consultants 2018:50).

## 2.3 Vegetation and Plant Gathering Conditions

An understanding of the richness of opportunity for SṪÁUTW First Nation plant gathering around the time of Treaty in the Lower Mainland can be aided by outlining the condition of vegetation in that period.

**Figure 14:** Vegetation cover of the SNEW/ Fraser delta in 1858-1880, with inset showing areas surrounding Tilbury Island. (Minister of Supply and Services Canada 1979)

Around 1858, the Vegetation LAA was covered in a combination of prairie grass and shrubs that flooded seasonally, as well as mixed and wet forest (Figure 14). The wetlands—including fen, marsh, bog, and swampy habitats—were extensive across the Lower Mainland (Boyle et al. 1997:190) (Figure 14 and Figure 15), and “substantial areas [of prairie] were flooded seasonally” (Lepofsky et al. 2005:272). These wetland areas contained abundant and accessible resources including STÁKEN/cattails, rushes, SELTENEN/berry bushes, and SKÁUISELL/wapato (Lepofsky et al. 2005:272; Butler and Campbell 1987; Lyons 2017; Lyons et al. 2020; 2023; McKelvie 1947; Szychter 1992; Ham 1982):

- The marshy areas south of Canoe Pass were filled with several types of STÁKEN/cattails and rushes (Rozen 1985:248 as cited by HTG n.d.:6). Grasslands were plentiful behind the flooded areas (Butler and Campbell 1987:17; Oliver 2010:99; Ham 1982:37).
- S,ELTENEN/Berry bushes including cranberries and blueberries were found in the boggy areas (Ladner 1979:17; Butler and Campbell 1987:15). Archaeological sites across the ŠNEWIL/Fraser delta show a high ubiquity for berries such as salal, red elderberry, raspberry, Oregon grape, and bog cranberry indicating their extensive presence historically (Lyons 2017). In 1858, Royal Engineers that surveyed the ŠNEWIL/Fraser River delta came across extensive growths of blueberries in boggy areas where First Nations had engaged in controlled burning to prevent encroachment of pines (Butler and Campbell 1987:13-14). Even into the early 1930s, "wild blueberries and blackberries were still available for picking" (Szychter 1992:78), and "berries...grew in profusion on the marshy lands" (McKelvie 1947:73).
- Archaeobotany and paleoethnobotany studies document wetland SKÁUISEL/wapato gardens in the Pitt River area of the Lower Mainland (Lyons et al. 2020; 2023), indicating that such SKÁUISEL/wapato gardens could have existed in other locations throughout the Lower Mainland.

**Figure 15:** Map of 1925 (BLUE) and 2000 (BLACK) boundaries of peat bogs in Fraser Delta (Hebda et al. 2000:181) illustrating the loss of these areas over time. Purple dashed lines indicate the extent of the Fraser Lowland. (Butler 2019)

Around 1858, in addition to the prairie and wetland, the perimeter of Tilbury Island was covered by both mixed woodland of ČEUN-ELČ,ČEUN-ELP/cottonwood, ŠKOLNELČ/alder, SXELE,ILČ/willow and crabapple, as well as mixed wet coniferous forests of XPÁY/POŠELEK/cedar, 7KIL,ELČ/hemlock, TFKÁ,ILČ/spruce, and TENKÁLČ/yew (Figure 14). Across the Lower Mainland more generally, forested areas included deciduous forests of SXELE,ILČ/willow, crabapple, 7FKÁ,ELČ/maple, ČEUN-ELČ,ČEUN-ELP/cottonwood, and

SKOLNELĆ/alder in the drier sections of fens, including across ŠNEWIL/Fraser River delta, while coniferous sections were dominated by JSÁY/Douglas fir, XPÁY/western red cedar, and 7KLEĆ/hemlock (Boyle et al. 1997:190; Ross 1953:132; Szychter 1992:48; Oliver 2010; Butler et al. 2021; Ham 1982:42-45). John Work (1824) notes that “nothing but thick willows are seen for some distance from the water, where the banks though low are well wooded with pine, cedar, alder and some other trees” (as quoted in Butler et al. 2021:6). Figure 16 and Figure 17, while photographed in 1977 and 1987 respectively, present an image of what native shrubs and trees lining a slough and grasses and estuarine marsh might have looked like in 1850 on the South Arm of the ŠNEWIL/Fraser River such as around Tilbury Island.

**Figure 16:** Native shrubs and trees line the path of a slough west of the London Farm house in Steveston on the South Arm in 1977. City of Richmond Archives photograph 1984 4 21. (Friends of Richmond Archives 2025)

**Figure 17:** Estuarine marsh in the Alaksen Wildlife Area showing grassy areas. Photo circa 1987. (Butler and Campbell 1987)

Diking activities from the 1890s onward introduced barriers to First Nations access to land, water, and food resources. Ethnobotanist Nancy Turner (2014) notes that while SKÁUISELL/wapato used to occur in dense patches in the Fraser Valley, diking and draining of wetlands have reduced SKÁUISELL/wapato’s abundance and led to its disappearance from many of the areas where it had once been cultivated. And, as described by Gandolfo-Lucia (2016:49), which the dyke system protected farmers it also “produced new social vulnerabilities. The successful construction of a system of dikes was simultaneously a dispossession of the First Peoples of the valley because they interrupted traditional ecologies and sources of food” and furthermore facilitated colonial settlement and land privatization (56).

The loss of land for native plant communities and reduction in native plant coverage due to urbanization, agriculture, and spread of introduced species, etc. can be summarized along four rough time periods, punctuated by key land use and development changes.<sup>5</sup>

#### *Pre-1900: The Dawn of Colonial Cultivation, Ditching, and Diking*

As previously discussed, around the 1850s, Tilbury Island was covered by prairie and shrubs with small patches of forest on its perimeter consisting of deciduous ĆEU,N-EŁĆ,ĆEU,N-EŁP/cottonwoods and

<sup>5</sup> Note that these time periods were identified by the authors to aid the reader in following the information presented along the timeline.

April 2026 | Page 2-25

**Figure 19:** Vegetation types of historic ŠNEWIL/Fraser River estuary (notably including salt and tidal marsh as well as eelgrass) prior to European settlement, based on flooding and soil studies as well as survey reports from early settlers in 1858-1888. (DFO 1979)

**Figure 20:** Hydrographic chart showing channel changes between 1860 and 1946 as well as marsh vegetation features (prominent dashed lines). (Hales 2000)

### 1900-1950: Land Clearing, Conversion, Extraction, and Encroachment of Invasive Species

Through the early 1900s, shifts in vegetation cover continued, including loss of wetlands and forests to farms (Butler 2019) (Figure 21 and Figure 22) and introduction of invasive species of vegetation such as sow thistle and mare's tail (Ladner 1979:18; McKelvie 1947:68). Tilbury Island continued to be used for farming practices (Figure 22). In addition, the expansion of dikes continued to shift sedimentation patterns and tidal marshes, where salt marshes in the SNEWIL/Fraser River estuary were experiencing rapid vertical aggradation between 1910 and 1954, and lateral growth between 1930 and 1954 (Hales 2000) (Figure 20).

**Figure 21:** Approximate land cover for the Lower Mainland prior to 1827 (LEFT) and in 1930 (RIGHT) showing conversion of wetland to urban use along the South Arm including on Tilbury Island. (Boyle et al. 1997)

**Figure 22:** Aerial survey of Fraser Delta in 1930 showing urbanization and agricultural development, with inset showing Tilbury Island. (Department of the Interior 1935)

*1950-2000: Accelerating Land Conversion, Urbanization, and Industrialization*

At Tilbury Island during this period, land use was transitioning from farmland to industrial use. The Dow Chemical plant was under development in 1960 and operating in 1961 (Figure 23; Figure 24; Figure 25). A decade later, the Tilbury Island LNG facility opened in 1971.

**Figure 23:** Photograph of the future site of Dow Chemical on Tilbury Island, looking towards Lafarge Cement on Lulu Island. Don, Lion, and Annacis Islands are to the right. May 1960. (City of Richmond Archives, Item # 2010 87 39)

**Figure 24:** Photograph of the future site of Dow Chemical on Tilbury Island, looking towards Lafarge Cement on Lulu Island. Lion Island is to the right. January 1961. (City of Richmond Archives, Item # 2010 87 41)

**Figure 25:** Photograph of the Dow Chemical site and Wharf on Tilbury Island, Delta. May 1961. (City of Richmond Archives, Item # 2010 87 42)

More generally across the Lower Mainland, by the late 1900s, continued urbanization and industrialization had left minimal wetland, bog, and forested areas (Department of Environment 1975:8; Hanna 1998:69; Oliver 2010:12;157). Seasonal wet meadows, which used to cover 43% of the Fraser Delta in 1880, made up <1% of land cover, with bog reduced from 26% to 1%, and trees and shrubs from 31% to 10% (Table 3). By the turn of the century, XPÁY/western red cedar was present “significantly less than before 1827” while deciduous trees had increased from 1919 (Boyle et al. 1997:190).

As evident on the map of Figure 26, by the late 1960s the Lower Mainland had been heavily developed and urbanized. Most of the SNEWIL/Fraser River was surrounded by industrial, agricultural, and industrial development. Figure 26 shows residential, commercial, industrial, civic and institutional, parks and recreational, and agricultural zoning in the southwestern portion of the Lower Mainland in 1968.

Marsh aggradation and lateral growth slowed after 1954, though lateral growth continued through to 1994 at the end of the study by Hales (2000). In 1979, authors of the Fraser River Estuary Study concluded that “the present Fraser wetlands are but a vestage [sic] of the original estuarine and floodplain system which supported large numbers of both resident and migratory fauna” (DFO 1979:1).

CELEM/Eelgrass lost 30% of their coverage on Roberts Bank between 1969 and 1984 (Harrison 1990), and the eelgrass habitats that remain have decreased in condition and become more fragmented across the Salish Sea (Nahirnick et al. 2020; Santo 2022). Salt marsh decreased from 2,230 hectares in the 1850s to 380 hectares by 1979 (Table 4). Visualizing these losses, eelgrass and tidal marsh were documented by Swinbanks in 1979, as shown in Figure 27. Human activities that have contributed to marsh and other intertidal vegetation loss include diking, industrialization (e.g. port development), river training structures (i.e. jetties), dredging, filling, and log booming (DFO 1979).

**Table 3:** Historical changes from 1880 to 1985 in the areal extent of habitat types in the Fraser River Delta, based on Butler and Campbell (1987). (Schaefer 2004)

| Habitat                        | Area of delta cover (%) |      |
|--------------------------------|-------------------------|------|
|                                | 1880                    | 1985 |
| Seasonal wet meadows           | 43                      | <1   |
| Bog                            | 26                      | 1    |
| Trees and shrubs               | 31                      | 10   |
| Cultivated farmland            | 0                       | 37   |
| Urban/industrial/miscellaneous | 0                       | 52   |

**Figure 26:** Development in the Western Portion of the Lower Mainland, 1968 (City of Vancouver Archives, Item #MAP 739). Yellow parcels are residential; red parcels are commercial; purple parcels are industrial; blue parcels are civic and institutional; dark green parcels are parks and recreation; and light green parcel are agricultural.

**Table 4:** Historic Extent (prior to European Settlement) and present extent (1979) of the marshes and wetland communities in the SNEWIL/Fraser River floodplains (from the mouth of the river to Mission, including Pitt River system). Of the area flooded annually, 31% remains in a “relatively natural state” due to diking. (DFO 1979)

| Plant Community     | Historic Extent (ha.) | Present Extent (ha.) |
|---------------------|-----------------------|----------------------|
| Salt Marsh          | 2,230                 | 380                  |
| Bulrush Marsh       | 1,760                 | 1,690                |
| Cattail/Sedge Marsh | 1,830                 | 1,493                |
| Wet Meadows         | 12,400                | 2,604                |
| Wet Meadow/Willow   | 2,350                 | 258                  |
| <b>TOTAL</b>        | <b>20,570</b>         | <b>6,425</b>         |

**Figure 27:** Vegetation and sediment cover of intertidal areas of Roberts Bank (TOP) and Boundary Bay (BOTTOM) in 1979 (Swinbanks 1979).

Tidal marsh habitat losses have continued since the 1980s, with 160 hectares of tidal marsh lost in Sturgeon Bank in the SNEUIL/ Fraser River delta from 1989 to 2011 (Balke 2017). Wake erosion from vessels is a major factor driving marsh recession (Stewart et al. 2024). While the North Arm has experienced higher levels of tidal marsh recession correlated to the higher levels of vessel activity (specifically, tugboats with log boom tows), this gives insight into what effects may occur in the South Arm should vessel traffic continue to increase.

Tidal marsh conservation has been a focus since the 1980s, with over 100 tidal marsh creation projects delivered throughout the SNEUIL/ Fraser River estuary to compensate for and offset habitat loss. Figure 28 shows the location of tidal marsh projects (78 of over 100 tidal marsh creation projects known assessed in

Stewart et al. 2024). A study in 1995 found that compensation activities have ensured no net loss of brackish-freshwater marsh in the ŚNEWIL/ Fraser River estuary from 1983 to 1993, but a net deficit for saltmarsh specifically (Kistritz 1995). However, recent research has showed that these compensation activities do not result in habitat equal in ecological value to what was lost; salmon were found to be less abundant at sites where compensation activities had taken place compared to unmodified sites (Noble 2024).

Alongside tidal marsh loss, tidal marsh vegetation in the ŚNEWIL/ Fraser River estuary has experienced homogenization through increased abundance of invasives over the 40-year period from 1979 to 2019 (Lane et al. 2024).

**Figure 28:** Locations of tidal marsh creation projects on the South Arm of the ŚNEWIL/ Fraser River as compensation for loss (FREMP n.d.b)

*Present Day: Significant Losses and Rarity of Historical Habitat*

At Tilbury Island, industrial activity has continued with the “construction and operation of the Weyerhaeuser marine jetty, sawmill, and lumber yard” (Golder Associates Ltd. 2019:44).

Across the Lower Mainland in general, as summarized by Boyle et al. (1997:194), by the turn of the century,

*land cover in the Lower Fraser Basin has changed significantly since Europeans arrived in 1827. Forested areas have declined, and there have been changes in species composition and stand age as a consequence of logging, an increase in fires, agricultural development, and urbanization. Diking the extensive wetlands and fens of the Fraser lowlands and clearing land for agricultural purposes have reduced both wetlands and lowland forests. Consequently, agricultural and urban areas have increased in the basin.*

Approximately 5% of native plant species became locally extinct in the lower ŚNEWIL/Fraser within the past 100 years (Boyle et al. 1997:193). Land cover in 2014 is shown in Figure 29.

Major marine vegetation areas mapped in 2007 through shoreline habitat surveys are shown in Figure 30 (FREMP n.d.a.) (more recent mapping in 2020 by Worthington et al. 2024 from Earth observation data shows similar coverage of tidal marsh to FREMP n.d.a.). Much of the benthos in the ŚNEWIL/Fraser River estuary has become “often like an anoxic environment” due to historical effects of log booming from the accumulation of woody debris, and other human activities such as agriculture (Santo 2022:35;53). Sedimentation management actions in the ŚNEWIL/Fraser River delta have destroyed much of the marsh in the main navigation channels, but also created stable areas on the lee side of channel training structures that have enabled marsh development (Hales 2000). Historical gold mining activities in the latter half of the 19<sup>th</sup> century may have resulted in an increased sediment load deposited in the ŚNEWIL/Fraser River delta. This layer of sediment was also found to have an unnaturally high level of mercury likely linked to mining activities (Hales 2000). These historical and ongoing activities have led to the decrease in marsh and eelgrass habitat in the ŚNEWIL/Fraser River Estuary, as well as the reduction in quality of the habitat that remains.

**Figure 29:** Fraser River delta habitat and land cover in 2014 from Lidar and Multispectral Scanner imagery (Vancouver Fraser Port Authority, Metro Vancouver Land Cover Classification, 2014). Red shading represents urban areas, beige represents modified grass (predominantly agricultural lands), and natural grass, forest, and shrub cover in shades of green. (Kehoe et al. 2020)

**Figure 30:** Marsh (blue), eelgrass (green), and sandflat (orange and pale yellow) habitat in the SNEWI/ Fraser River estuary in 2007, with inset showing Tilbury Island (FREMP n.d.a).

## 2.4 Wildlife and Hunting Conditions

### *Waterfowl*

The SNEWI/ Fraser River wetlands historically supported an abundance of waterfowl prior to 1850 (Albright 1985; Butler and Campbell 1987; Butler et al. 2021; Ladner 1979; Ross 1953; Leach 1979). The SNEWI/ Fraser River delta (tidal marshes and wetlands in particular) is a key link in the Pacific Flyway, one of the largest bird and waterfowl migration routes in North America (Wilson 2003:2; Butler and Campbell 1987; La Croix et al. 2024). Migratory waterfowl were “plentiful in spring and fall” (Albright 1985:13). There

were an estimated 214 species that used the floodplains of the ŚNEWİŁ/Fraser River prior to 19th century diking (Butler et al. 2021). Many historians in the 1800s noted the abundance of birds in the ŚNEWİŁ/Fraser River delta (Butler et al. 2021:1-2; Leach 1979:29); John Work wrote in 1824 that “geese, particularly white ones, were very numerous” (as quoted by Leach 1979:29). Accounts from early settlers record game birds as “readily available” (Ladner 1979:18) and “tolerably plentiful” (Ross 1953:XI). The diversity of birds found in the ŚNEWİŁ/Fraser River delta prior to colonization is further buttressed by archaeological findings of bird bones at village sites in the lower ŚNEWİŁ/Fraser River; species present from 250-1,200 years ago include those shown in Table 5 (Trost 2005 as cited in Butler et al. 2021:6).

**Table 5:** Lines of evidence for presence of different bird species in the Lower Mainland prior to 1860.

| Common Species Name           | Archeological Evidence (Trost 2005 as cited in Butler et al. 2021:6) | Qualitative Accounts from Early Historians and Settlers |
|-------------------------------|----------------------------------------------------------------------|---------------------------------------------------------|
| Common Loons                  | Yes                                                                  |                                                         |
| grebes                        | Yes                                                                  |                                                         |
| geese                         | Yes                                                                  | Ross (1953:XI)                                          |
| mallards                      | Yes                                                                  | Ladner (1979:18); Ross (1953:XI)                        |
| teals                         | Yes                                                                  | Ladner (1979:18); Ross (1953:XI)                        |
| scaups                        | Yes                                                                  |                                                         |
| Long-tailed Ducks             | Yes                                                                  | Ladner (1979:18)                                        |
| scoters                       | Yes                                                                  | Ross (1953:XI)                                          |
| goldeneyes and/or Buffleheads | Yes                                                                  |                                                         |
| mergansers                    | Yes                                                                  |                                                         |
| Bald Eagles                   | Yes                                                                  |                                                         |
| coots                         | Yes                                                                  |                                                         |
| gulls                         | Yes                                                                  |                                                         |
| shorebirds                    | Yes                                                                  |                                                         |
| crows                         | Yes                                                                  |                                                         |
| blackbirds and songbirds      | Yes                                                                  |                                                         |
| grouse                        |                                                                      | Ladner (1979:18); Ross (1953:XI); Diaz (2019:48)        |
| widgeons                      |                                                                      | Ladner (1979:18); Ross (1953:XI)                        |
| pintails                      |                                                                      | Ladner (1979:18); Ross (1953:XI)                        |
| wood ducks                    |                                                                      | Ladner (1979:18); Ross (1953:XI)                        |
| shovelers                     |                                                                      | Ladner (1979:18); Ross (1953:XI)                        |
| gadwalls                      |                                                                      | Ladner (1979:18); Ross (1953:XI)                        |

Waterfowl, which were documented in the billions in 1820 in the Lower Mainland, declined to around 500,000 annually in the last four decades of the 20th century (Table 7) (Butler and Campbell 1987:6; Boyle et al. 1997). Butler et al. (2021) note that while conditions for hunters might not be directly comparable, “the average hunter in the 1950s was getting less than one sixth [...] of the number shot by the hunters in

1929" indicating that "waterfowl were more numerous in the early 20th century than by the mid-century" (7). As noted by Leach (1979:29), "most of the species of geese and swans formerly common or abundant in the lower Fraser Valley became transient or rarities between 1859 and 1947" and "have declined to a small remnant of their former numbers". In addition to declines in population abundances, species richness has decreased from 214 bird species across the floodplain prior to diking at the end of the 19th century to 187 species in agricultural areas, 127 in residential, and 75 in industrial in 2021 (Table 7; Butler et al. 2021). Though waterfowl and other bird species were in decline to 1995, many species of previous concern in 1987 have "fared well in the ensuing years" (Butler et al. 2021).

**Table 6:** Estimated populations of wildlife in the Lower Mainland in 1820 and 1995. (Boyle et al. 1997)

| Wildlife          | Estimated population |           |
|-------------------|----------------------|-----------|
|                   | 1820                 | 1995      |
| Roosevelt elk     | 1000                 | 0         |
| Black-tailed deer | 1000                 | 6000-7000 |
| Black bear        | 2000                 | 500-600   |
| Grizzly bear      | 200-300              | 0         |
| Rodents/rabbits   | thousands            | thousands |
| Waterfowl         | billions             | 506,600*  |

**Table 7:** Number of species that used the original floodplain prior to the 19th century diking contrasted with species numbers found in 2021 in farmland, residential, and industrial lands of the SNEWIL/Fraser River delta (Butler et al. 2021)

| Species groups               | Original floodplain | Farmlands  | Residential | Industrial |
|------------------------------|---------------------|------------|-------------|------------|
| Waterfowl                    | 27                  | 22         | 6           | 2          |
| Wading birds                 | 4                   | 2          | 0           | 0          |
| Raptors                      | 14                  | 13         | 9           | 4          |
| Shorebirds                   | 30                  | 30         | 1           | 1          |
| Gulls                        | 10                  | 9          | 7           | 2          |
| Owls                         | 9                   | 8          | 6           | 4          |
| Swift/Hummingbird/Woodpecker | 10                  | 9          | 10          | 5          |
| Songbirds                    | 99                  | 89         | 84          | 56         |
| <b>Total</b>                 | <b>214</b>          | <b>189</b> | <b>127</b>  | <b>75</b>  |

Several bird species have also historically been introduced to the Lower Mainland and may be present in the Indigenous Interests LAA, competing with native species (Taylor 1950:12-13), including:

- Pheasants introduced in 1869 (Ball 1981:36-37);
- Quail introduced in the early 1960s (Ball 1981:36-37); and
- Canada Geese systematically introduced to the SNEWIL/Fraser River estuary in the late 1960s and 1970s from Southern Ontario and Alberta, forming a hybrid population (Janus et al. 2022:8). Note that Canada Geese native to the SNEWIL/Fraser River estuary used the areas as migratory habitat but not as breeding habitat until the mid-1900s (Janus et al. 2022:7). In 2022, the hybrid population of introduced Canada Geese living year-round in the SNEWIL/Fraser valley was estimated at 20,000 (Janus et al. 2022:8). The introduction of Canada Geese has created conservation and management issues due to unintended and detrimental effects such as destruction of vegetation (Janus et al. 2022:14-15).

### *Land-based Mammals*

In addition to waterfowl, the Lower Mainland had an abundance of terrestrial animals prior to 1850 including STKÁYE/wolves, SPÁĚT/bears, KÍYĚĆ/elk, SMÍET/deer, ČEĆIKEN/mink, SXÍEQES/raccoon, PEPEĚIN/skunk, SKELÁU/beavers, XOĚEN/martens, and SKELKEL/muskrat (Oliver 2010; Stiefel 1985; Ross 1953; Keen 2002; Ball 1981; McKelvie 1947; Albright 1985; Ham 1982). John Work, who was on McMillan's expedition in 1824, documented consistent marks of beavers such as chewed tree stumps and beaver lodges and dams that along their route from the Nicomekl River through the Salmon River and down the ŠNEWIL/ Fraser River (Oliver 2010:99). Keen (2002) notes that in the 1860s "beaver, muskrat and mink were plentiful, as were deer. There were even reports of bears being seen on the islands which now comprise Richmond" (2). This is echoed by Ross (1953) who documents that in the 1860s "when settlement began in the 1860s there were wolves and bears roaming the islands. Nearby it is believed there were wapiti [elk], deer, mink, beavers and seals" (XI). A similar perspective is documented by McKelvie (1947) that "the woods were alive with game in those days. Bands of elk stalked majestically across forest openings, fleet deer grazed in the many natural meadows" (3). Across the Lower Mainland, Roosevelt elk and black-tailed deer were estimated at a population of 1,000 each in 1820, with black bear estimated at 2,000 and QEIQYEĆEN/grizzly at 200-300 (Boyle et al. 1997). Archaeological evidence from village sites across the Lower Mainland confirms the presence and use of many of these terrestrial mammals including SPÁĚT/bears, SMÍET/deer, SKELÁU/beavers, hare, and lynx (Diaz 2019:48).<sup>6</sup>

Terrestrial mammal populations followed even steeper trajectories in population declines, beginning with the fur trade and continuing with the rapid urbanization and land conversion (see land cover change in Plant Gathering section above) (Oliver 2010; Ball 1981; Boyle et al. 1997; Butler and Campbell 1987; Szychter 1992; Hoos and Packman 1974; Province of British Columbia 1971).<sup>7</sup>

#### *Pre-1900: The Fur Trade Decimates Beaver*

In the 1800s, the fur trade along the ŠNEWIL/ Fraser River resulted in "a substantial reduction in fur bearer populations, particularly that of beaver" (Ball 1981:48) such that "in 1896, the government moved to protect beaver, marten, and land otter [...] it appears that beaver continued to be depleted" (Ball 1981:49). The loss of Roosevelt elk was even faster, and were extirpated quickly following initial colonization of the Lower Mainland in 1850 (Hoos and Packman 1974; Butler and Campbell 1987:19; Boyle et al. 1997:193). Other terrestrial mammals such as SMÍET/deer and rodents were still abundant; early settlers supplemented their diet of home-grown vegetables with "wild game, which was still plentiful in the nineteenth century" (Szychter 1992:74).

#### *1900-1970: Urbanization Continues Trends of Declining Mammal Populations*

Snowshoe hare, TEKNEĆ/cougar, STKÁYE/wolf, and QEIQYEĆEN/grizzly bears were extirpated during this era (Table 6; Boyle et al. 1997:193). Boyle et al. (1997) notes that QEIQYEĆEN/grizzly bears specifically (though likely others as well) were "extirpated from the basin due to ecosystem changes" (193).

<sup>6</sup> Archaeological evidence is provided for the presence of bears, deer, beavers, hare, and lynx in the Lower Mainland prior to 1860 by Diaz (2019:48). Qualitative accounts are also available for different species of terrestrial mammal in the Lower Mainland, including wolves, deer, and mink (Ross 1953: XI); bears and elk (Ross 1953: XI; McKelvie 1947:3); and beavers (Oliver 2010:99, citing John Work in 1824; Ross 1953:XI).

<sup>7</sup> Note that following time periods were identified by the authors to aid the reader in following the information presented along the timeline.

### 1970-Present: Remaining Wildlife Restricted to Remaining Forests

In 1995, black-tailed deer were present in the thousands, a 6-7 fold increase from their estimated population in 1820 in the Fraser Delta (Table 6) (Butler and Campbell 1987:19) but can only “be found scattered throughout the more heavily wooded portions of the delta, especially in and around Burns Bog, as are limited numbers of black bear” (Hoos and Packman 1974). Black bear population estimates in 1995 were between 500 and 600, decreasing from 2,000 in 1820. In 1985, trees and shrubs covered 10% of the delta, down from 31% in 1880 (Table 8). (Remaining forest cover is mapped in Figure 29 and 31.)

In a 1971 report, the Province of British Columbia noted that “unless our efforts increase in proportion to the increased pressures on both fish and wildlife and their habitat, it is unlikely that they will survive to provide for future generations the pleasure it has afforded many of us in the past” (18).

**Table 8:** Mammal and bird species that were threatened or extirpated in the Fraser Delta by 1987. (Butler and Campbell 1987)

| Species                                                          | Status*                      | Reference                    |
|------------------------------------------------------------------|------------------------------|------------------------------|
| Snowshoe hare ( <i>Lepus americanus washingtoni</i> )            | Extirpated 1950              | Cowan and Guiguet 1965       |
| Roosevelt elk ( <i>Cervus elaphus roosevelti</i> )               | Extirpated 1850              | Cowan and Guiguet 1965       |
| Cougar ( <i>Felix concolor</i> )                                 | Extirpated 1900              | Anderson 1884                |
| Wolf ( <i>Canis lupus fuscus</i> )                               | Extirpated                   | Cowan and Guiguet 1965       |
| Yellow-billed Cuckoo ( <i>Coccyzus americanus</i> )              | Extirpated 1950              | Munro and Cowan 1947         |
| Purple Martin ( <i>Progne subis</i> )                            | Extirpated 1966              | Weber 1980                   |
| Western Bluebird ( <i>Sialia mexicana</i> )                      | Extirpated 1971              | Weber 1980                   |
| Horned Lark ( <i>Eremophila alpestris</i> )                      | Extirpated 1981              | R.W. Campbell, unpubl. data  |
| Burrowing Owl ( <i>Athene cunicularia</i> )                      | Extirpated 1976              | BCWRS                        |
| Black bear ( <i>Ursus americanus</i> )                           | Threatened<br>12 individuals | Kucy 1971                    |
| Sandhill Crane ( <i>Grus canadensis tabida</i> )                 | Threatened<br>4 individuals  | Weber 1980                   |
| Common Barn-Owl ( <i>Tyto alba</i> )                             | Threatened<br>26 individuals | Campbell <i>et al.</i> 1972a |
| Yellow-headed Blackbird ( <i>Xanthocephalus xanthocephalus</i> ) | Threatened<br>40 individuals | Weber 1980                   |

\* Extirpated = no longer occurs (mammals) or nests (birds) in the Fraser River delta; threatened = numbers declining and will be extirpated if present conditions prevail, or occurs in such low numbers that its future existence is precarious.

**Figure 31:** Access barriers and disturbances in the Lower Mainland shown as different kinds of development alongside parks and remaining publicly accessible forest lands.

### Marine Mammals

Alongside waterfowl and land mammals, marine mammals play an important ecological and cultural role in the ŚNEWIL/ Fraser River estuary and into the Salish Sea.

KELLOLEMEĆEN/killer whale populations, specifically for Southern Resident Killer Whales (SRKWs), have declined over the past 200 years from a population of around 200 to 75 individuals in 2025 (Orca Network 2025).

There are few western science records of KELLOLEMEĆEN/killer whales around the ŚNEWIL/ Fraser River estuary and Salish Sea before the 1960s. Prior to the 1900s, based on carrying capacity estimates alone, SRKWs were thought to consist of approximately 200 individuals (Seidler 2020; Osborne 1999). Between 1900 and 1940, an estimated 50 SRKWs died due to the turn of the whaling industry focus to include KELLOLEMEĆEN/killer whales, as well as competition over salmon as food sources with humans (Seidler 2020; Werner 2021; Wilk 2019). By the mid-1900s, the SRKW population was likely under 150 individuals (Wilk 2019:28). Into the 1960s and 1970s, SRKW and other KELLOLEMEĆEN/killer whale populations were reduced by live captures for the entertainment industry (Seidler 2020:56-57; Werner 2021; Wilk 2019). Sixty-seven KELLOLEMEĆEN/killer whales (including 47 SRKWs) were taken into captivity in the late 1960s and early 1970s (Seidler 2020:63; Wilk 2019:28). The first population assessment for SRKWs in 1976 documented 71 individuals, which noted that there was clear decline in the species prior to this date (Seidler 2020:67; Osborne 1999) (Figure 32). Into the 1980s, KELLOLEMEĆEN/killer whales (likely referring to SRKWs) continued to be seen around the ŚNEWIL/ Fraser River estuary: “70 killer whales comprising

four family groups frequently visit the estuary for feeding...they do not ascend the river as do seals although they occasionally do use the shallow areas of the estuary" (DFO 1979:8).

At their population level of the past few decades (i.e. 1970s to 2000s), SRKWs are considered "a remnant population due to killing and capture by European settlers at the turn of the century [1899 to 1900] to the 1970s" (Osborne 1999: ii). A long-term dataset from 1976 to 2014 shows the area off Roberts Bank at the mouth of the ŠNEWIL/Fraser River as frequently used habitat (Olson et al. 2018) (Figure 33), and a more recent dataset from 2008 to 2020 shows that the locations with the highest frequency of occurrence (i.e. how often whales are present) include the ŠNEWIL/Fraser River estuary (as well as Haro Strait and Swiftsure Bank) (Thorton et al. 2022), indicating that the ŠNEWIL/Fraser River habitat is of value to the remaining population.

**Figure 32:** SRKW population by century from 100 B.C. to 1900, estimated based on the theoretical carrying capacity before the 1900s. (Osborne 1999)

**Figure 33:** Southern resident killer whale density (number of whales per km<sup>2</sup>) based on effort-corrected data from 1976-2014. (Olson et al. 2018)

,ASW/harbour seal frequent the ŠNEWIL/Fraser River, following their key prey salmon. This species has not faced the same population declines as other species (e.g. salmon, sturgeon, eulachon, herring, SRKWs) in the ŠNEWIL/Fraser River Estuary ecosystem. In 1979, "at least 700 harbour seals occur all year in the estuary...this is the largest concentration of the species in B.C." (DFO 1979:5-6). The ŠNEWIL/Fraser River estuary and surrounding marine areas contain haul out habitat (Figure 34).

**Figure 34:** Seal haul out sites (black hexagons) around the Fraser River Estuary in 1979. (DFO 1979)

## 2.5 Habitation and Access Conditions

A brief history of impacts to the WSÁNEĆ rights of habitation and access is provided in the WSÁNEĆ Traditional Use Study for the Roberts Bank Terminal 2 Project (Evans et al. 2019:13):

*Prior to about 1850, WSÁNEĆ settlements were distributed throughout their traditional territory [...] By the middle of the 19th century, however, and due to a variety of factors -- including population declines brought on by diseases associated with European contact, as well as raids by other northern First Nations, and eventually land pre-emptions by white settlers -- most of the families from the island villages relocated to Saanichton Bay, the largest of the settlement sites on the Saanich Peninsula (Bouchard and Kennedy 1991:18; Claxton and Sam 2010:20; Davis and Simonsen 1995:2; Suttles 1974:76-82). They did not abandon their former home sites though, and continued to return to use and occupy them seasonally during their seasonal rounds (Vanden Berg 1997:1; Suttles 1974:76-82).*

The establishment of "Indian Reserves" through the *Indian Act* is described by Claxton (2015:207) as "undoubtedly one of the most devastating limitations on the ability of STÁUTW people to move freely", but only one of many impacts to STÁUTW freedom of movement.

Many transportation routes once utilized by STÁUTW simply no longer exist. Many waterways in the Lower Mainland are either completely lost or so altered (via diversion, ditching, draining, or other means) that they are no longer suitable for travel. At the same time, the rapid growth of major transportation infrastructure, including roads, highways, bridges, and tunnels has facilitated widespread development and the influx of non-Indigenous settlers from early settlement to the present.

Multiple lines of evidence speak to the rapid increases in vessel traffic over time since 1850.

Before contact, First Nations on the South Coast travelled extensively between islands and the mainland, sometimes journeying hundreds of miles and maintaining an ocean trade network that stretched from the Puget Sound to the Aleutian Islands (Mikinaak 2025). Large ocean-going canoes also allowed Nations on the exposed outer coast to remain connected through travel and trade (McMillan and McKechnie 2015).

Post-contact, vessel traffic steadily grew along with new arrivals to the area, and as the Industrial Revolution took off, so too did industrial shipping on the coast with the rise of the steamship. By the mid-19th century, the SṪNEWIL/Fraser River gold rush had brought a slew of steamships to BC (Schuthe 1950). Steamships also provided supplies that aided the construction of the Canadian Pacific Railway; in turn, in 1891, as the railway spread west, Canadian Pacific launched its Pacific fleet of steamships. As the BC population grew in the early 20th century, so too did the province's shipping industry (Sager 1993). By 1928, there were roughly 250 Canadian large merchant vessels (over 200 tons) on the entire BC coast. This number had grown to 283 by 1938, and 368 by 1948 (Schuthe 1950). More recently, roughly 6,000 unique vessels visited Canada's Pacific Region between 2014 and 2016, most undertaking multiple transits in the region and transiting through the busy Fraser Delta region (ClearSeas 2020).

Recreational vessel activity in the 1800s and 1900s is not as well documented as industrial shipping. Canoes, sailboats, and other small recreational vessels would have been present in the SṪNEWIL/Fraser River in the late 1800s and early 1900s, but the number of vessels at any specific time during this period is unknown. Wenstob (2015) documents that into the 1880s, 1890s, and 1900s, "'touring' by dugout canoe was a growing recreational past-time in British Columbia" (220). In 1887, there were 250 boats noted to be fishing in Canoe Pass on the SṪNEWIL/Fraser River (Swenerton 1993:15). In the latter half of the 1900s, recreational (sport) fishing vessels were documented through creel surveys. In 1960, there were about 200,000 boat trips by recreational vessels in the Strait of Georgia (English et al. 2002:1). This peaked at 769,000 boat trips in 1980 to a low of 162,000 boat trips in 1998 (English et al. 2002:1). From 1973 to 1976, the population of resident pleasure craft vessels (one kind of recreational vessel) in the Strait of Georgia increased from 34,000 to 93,000 boats (Cooke 1977: iii). While only an unknown portion of these vessels would have contributed to recreational vessel activity within the SṪNEWIL/Fraser River, the near tripling of recreational vessel ownership in the region speaks to an increase in recreational vessel traffic generally. In addition to the presence of recreational vessels being a barrier to access for SṪÁUTW people, recreational vessel activity may also act as stressors to marine life. For example, wildlife viewing vessels pose a higher risk to harbour seals than other vessel types due to their unpredictable speeds and courses of travel (Olson et al 2021). Some recreational vessel use is not regulated other than proof of competency (e.g., Pleasure Craft Operator Card).

Today, vessel tracking technologies have made it possible to document the cumulative presence and trends of both large commercial vessel traffic and small recreational vessel traffic over time, and have recently been compiled for public access by Global Fishing Watch. Most larger commercial vessels are required to carry Automated Identification System (AIS), which tracks vessel positions. Visualizing cumulative AIS-broadcasted positions over time (Figure 35) highlights hotspots of vessel activity (e.g., adjacent to Tilbury Island) and reveals a trend of steadily increasing hours of vessel presence across the Fraser Delta region (with total hours of vessel presence across the area pictured rising more than threefold from roughly 500,000 hours in 2012 to 1.7 million hours in 2024). Although smaller recreational and fishing vessels are not tracked by AIS, new automated satellite image analysis technology reveals patterns of use for these vessels as well, showing widespread use along the edge of the Delta's mudflats and up into the South Arm of the SṪNEWIL/Fraser River (Figure 36). Many of these smaller vessels will be crabbing boats (Figure 37), as the Fraser Delta sees some of the highest catch per unit effort for crab on the South

Coast (Nephin et al. 2023), and annual catches in the Delta (Pacific Fisheries Management Area 29) have increased significantly since the 1990s (Hemmera 2014).

**Figure 35:** Heatmap of cumulative vessel traffic hours in the SNEWIL/Fraser River Delta between 2012 and July 2025 based on Automated Information System (AIS) tracking system transmissions from primarily commercial vessels, with the bar at the bottom of the figure demonstrating the significant ramping up of total hours of traffic per year in the area shown. Inset shows Tilbury Island and surrounding areas. Via Global Fishing Watch [map portal](#).

**Figure 36:** Heatmap of cumulative individual vessel detections from Sentinel-2 optical satellite imagery of the SNEWI/ Fraser River Delta between 2019 (earliest year of data available) and July 2025 for untracked vessels that do not broadcast AIS, typically comprising smaller fishing and recreational vessels stable over time. Inset shows Tilbury Island and surrounding areas. Via Global Fishing Watch [map portal](#).

**Figure 37:** Heatmap of catch per unit effort for Dungeness Crab between 2007-2017 (reproduced from Figure 6 of Nephin et al. 2023).

Legislation and regulation around fishing activities have also presented barriers to access to First Nations across BC, including STÁUTW. The first legislation on fishing activity (Indigenous and colonial) was the expansion of the *Fisheries Act* to include BC in 1879 (Swenerton 1993:12). An amendment to the *Fisheries Act* in 1888 restricted the use of drift nets and spearing while introducing licensing fees (Swenerton 1993:21). Further licensing restrictions on Indigenous fishers were implemented in 1984 and 1910 on fishing gear types, areas and times (Swenerton 1993:21). It was not until the *Constitution Act* of 1982 and common law cases, such as *R v Sparrow* in 1990, that the regulatory control of the Department of Fisheries and Oceans (previously Department of Fisheries) over the Indigenous fishery was “subject to meaningful consultation” with First Nations and “infringement would be limited to valid legislative objectives” (Swenerton 1993:82).

Alongside the regulation of the Indigenous fishery, in the decades following the introduction of the *Fisheries Act*, regulations on the colonial commercial fishery were arguably ineffective (Swenerton 1993:12-19). Until the 1960s, licensing focused on “everything but the numbers of fish and people fishing,” instead being focused on restrictions over gear, timing, and areas (Swenerton 1993:15;49; Sinclair 1978:15-17). License limitations were first successfully implemented in the colonial commercial fishery in 1969. However, recreational fisheries were not regulated until a tidal water sportfishing license was introduced in 1981 (Swenerton 1993:70).

## 2.6 Summary of Cumulative Effects

*The abundance of salmon and all other foods that sustained the Saanich people, the clams, duck, and deer have now been exploited and mismanaged to near extinction. The beautiful clam beaches, lakes, streams and rivers are now fouled with sewage and are polluted so badly that shellfish gathering and swimming in the waters can be hazardous to one's health. The beautiful homeland of the Saanich, the islands, the bays, the inlets, are inhabited with strangers. The hereditary campsites, burial grounds, and old village sites and reef net locations are now forbidden ground (Claxton and Elliott 1994:52).*

Since the arrival of Europeans, environmental conditions in the Lower Mainland have deteriorated severely and rapidly, including those conditions that once supported SṪÁUTW culture and society. Today, SṪÁUTW can no longer meaningfully exercise its inherent and constitutionally protected Aboriginal and Treaty harvesting, governance, and cultural and socio-economic rights in the Lower Mainland. These conditions are not only a symptom of urban and industrial development and settlement on natural resources, but a long history of colonial policies aimed purposely and specifically at dismantling and disempowering Indigenous culture and governance, including through the pass system, residential schools, and the *Indian Act*. Modern-day Crown regulations continue to violate the Nation's autonomy and right to self-governance. This is the context in which FortisBC is proposing the Tilbury Phase 2 LNG Expansion Project, which must be considered to accurately assess the Project's potential effects on SṪÁUTW First Nation.

### 3. SṪÁUTW FIRST NATION EFFECTS ASSESSMENT

#### 3.1 Effects Assessment Methods

SṪÁUTW First Nation has undertaken a systematic assessment of the Project's potential impacts on its rights and interests. The methods used in this assessment differ in some ways from the conventional Valued Component (VC)-based framework adopted by FortisBC in its Application. The following two sections provide commentary on FortisBC's assessment methods (Section 3.1.1) and then an overview of the different approach applied by SṪÁUTW First Nation in this assessment (Section 3.1.2).

##### 3.1.1 *Commentary on FortisBC Effects Assessment Methods*

###### 3.1.1.1 *Aggregation of Effects Assessment*

As part of the overall approach set out in both the Application Information Requirements (AIR; EAO 2022) and in Section 11.1 of the Application, FortisBC has elected to conduct an aggregated effects assessment for the five WSÁNEĆ Nations. Section 11.1.1 of the Application notes that Table 11.1-1 "provides rationales as to whether the assessment of effects of the proposed Project on an Indigenous nation's Indigenous interests is partially aggregated with that of other Indigenous nations". However, the rationale provided in the table simply says that the Malahat, Pauquachin, Tsartlip, SṪÁUTW (Tsawout), and Tseycum First Nations were each identified by the BC EAO and Impact Assessment Agency of Canada (IAAC) in the Joint Summary of Issues and Engagement as Nations whose interests could reasonably be anticipated to be affected by the Project; it does not provide a justification for aggregating the effects assessment for the five Nations.

It is SṪÁUTW First Nation's view that it is more appropriate to assess effects to each WSÁNEĆ Nation's interests separately.

###### 3.1.1.2 *Separate Assessment of the Tilbury Marine Jetty and Tilbury Phase 2 LNG Expansion Projects*

SṪÁUTW First Nation acknowledges EAO and FortisBC's position that the Project is separate and distinct from the Tilbury Marine Jetty (TMJ) Project, and that the TMJ Project has already undergone a separate environmental assessment. However, it is inarguable that the two projects are interlinked as the one will form part of the distribution system for the other. The separate assessment of these two projects has had some unfortunate methodological outcomes.

When the TMJ Project was assessed, the Tilbury Phase 2 LNG Expansion Project was not sufficiently advanced to be included in the list of reasonably foreseeable projects considered in the cumulative effects assessment (CEA). In the Tilbury Phase 2 LNG Expansion Project assessment, the TMJ Project is listed for potential inclusion as an existing project in the CEA. However, since (according to the conventional approach to effects assessment) the consideration of cumulative effects on Valued Components (VCs) and Indigenous interests hinges on the identification of project-specific adverse residual effects to those VCs and interests, the cumulative effects of both projects on SṪÁUTW First Nation interests have never been substantively considered (please see additional commentary on this point in Section 3.1.1.8). Similarly, FortisBC's Application considers as separate the existing Phase 1A Expansion (operational in 2018) and planned Phase 2B Expansion (in service ~2027) despite their physical overlap with the Project Footprint, temporal proximity, and operational interdependence.

In addition, the separation of the ŚNEWIL/Fraser River and marine environments from the terrestrial environment that broadly characterizes these two assessments creates an artificial division that does not align with the interconnected and interdependent nature of SṪÁUTW First Nation's land and marine use or its exercise of rights (as highlighted in the quote below). It is also inconsistent with ecological realities, where organisms (e.g., clams, ducks, bullrushes, salmon) are reliant on both aquatic and terrestrial systems to thrive.

*The ÁLENENEŽ [homeland, village, where one comes from] includes the marine environment as much as it does the terrestrial environment. It was said that our people did not distinguish land from water but, rather, that all of it was our homeland. Elders often say that our territory is well defined by place names in our language, encoding and embodying our relationship to the territory (Claxton and Price 2020:118).*

### 3.1.1.3 Information Sources and Consultation

SṪÁUTW First Nation acknowledges and agrees with FortisBC's comment in Section 11.1.7.6 and Section 11.18.4 of the Application that there are limitations to the assessment that have arisen resulting from a reliance on secondary data. SṪÁUTW First Nation has included additional information sources in this analysis to help support a more robust assessment; see also Section 3.2.

SṪÁUTW First Nation emphasizes that FortisBC's engagement and consultation activities to date have been inadequate, resulting in an incomplete and misrepresentative assessment of potential effects from the Project to SṪÁUTW First Nation's constitutionally protected Treaty and Aboriginal interests.

As communicated to the BC EAO under separate cover, FortisBC has not responded to SṪÁUTW First Nation comments and concerns in a timely manner. Opportunities to provide comment (on the Application) have moreover been unreasonably short. The result is that FortisBC's Section 11.18 of the Application does not adequately capture the potential of impacts of the Project on SṪÁUTW First Nation, nor does it incorporate SṪÁUTW First Nation's provided feedback in a meaningful way, including representation of SṪÁUTW First Nation's rights in the Lower Mainland.

### 3.1.1.4 Selection of Spatial Boundaries

To assess effects on WŚÁNEĆ Nations' interests—in addition to the Project Footprint—in Section 11.18.5.1 of the Application, FortisBC notes that the selected spatial boundaries of assessment (depicted in Figure 11.18-1D of the Application for SṪÁUTW First Nation) are based on the overlap of:

- The traditional territories of each of the WŚÁNEĆ Nations; and
- An LAA comprised of the combined LAAs for VCs identified by FortisBC as being linked to Indigenous interests, and an RAA comprised of the combined RAAs for the same VCs.

Not all SṪÁUTW First Nation interests are fully represented by VCs (in whole or in part), nor by the overlap suggested by Figure 11.18-1D of the Application. With respect to the former, as noted in the EAO's Effects Assessment Policy (EAO 2020), this is only appropriate where Indigenous interests are fully represented by VCs. Not all SṪÁUTW First Nation interests are fully represented by VCs, in whole or in part. Additionally, despite FortisBC updating Figure 11.18-1D with SṪÁUTW's Consultation Area that now overlaps the Project Footprint and a much greater portion of the ŚNEWIL/Fraser River than previously, FortisBC's analysis of potential effects to SṪÁUTW is not reflective of this.

### 3.1.1.5 Existing Conditions

FortisBC notes that the description of existing conditions for SṪÁUTW First Nation (found in Section 11.18.5.2 of the Application) is based on secondary sources, without primary sources from SṪÁUTW First Nation; SṪÁUTW First Nation concurs with FortisBC's statement regarding the limitations of an effects assessment with no primary sources and no feedback on preferred secondary sources. Nonetheless, SṪÁUTW First Nation has provided input to FortisBC through review of Section 11.18 of the Application.

In the first subsection of Section 11.18.5.2 of the Application, FortisBC provides a general overview of the WŚÁNEĆ peoples' historical use of the area around the Project and surrounding region, as well as the changes brought about during European colonization of the BC coast, resulting in a reduction of lands available for harvesting and gathering, loss of territory and access to cultural use areas, reduction in the quantity and quality of important resources, among other impacts. Statements made throughout the remainder of this section suggest that the WŚÁNEĆ peoples (including SṪÁUTW First Nation) do not currently exercise rights within the Project area, despite SṪÁUTW First Nation providing input to the contrary; for example:

- *It is FortisBC's understanding from information available to FortisBC at the time of writing that WŚÁNEĆ Nations do not currently use the south arm of the lower Fraser River adjacent to the proposed Project Footprint to fish, gather plants, hunt, or access cultural sites or areas.*
- *According to the DFO website for Indigenous fisheries on the Fraser River, WŚÁNEĆ Nations are not involved in the lower Fraser salmon fishery (DFO n.d.), and WŚÁNEĆ Nations have not indicated to FortisBC that their members fish within the proposed Project Footprint or the Harvesting and Subsistence Activities LAA.*
- *Potential effects to plant gathering due to the proposed Project have not been expressed as an issue of key concern by WŚÁNEĆ Nations [...]. FortisBC does not have information to indicate that these Nations use publicly accessible areas of the proposed Project Footprint or Harvesting and Subsistence Activities LAA for plant gathering, either by foot or boat access.*
- *Potential effects to hunting due to the proposed Project have not been expressed as an issue of key concern by WŚÁNEĆ Nations (Table 11.18-9). Hunting locations were not identified by WŚÁNEĆ Nations during the EA of the nearby TMJ project (WesPac 2019).*
- *FortisBC does not have information to indicate the presence of specific cultural use sites and areas in the proposed Project Footprint or within the LAA (B.C. EAO 2022). Potential effects to cultural use sites and areas due to the proposed Project have not been expressed as an issue of key concern by WŚÁNEĆ Nations [...].*

These statements do not accurately reflect SṪÁUTW First Nation members' rights and interests in the Project LAAs (as defined in Section 11.18.5.1 of the Application) or current exercise of these rights and interests, and do not speak to how the Nation used the land prior to the changes described in the historical overview (Section 2), nor to its future plans to exercise rights in the Project area (see Section 3.3.2).

### 3.1.1.6 Identification of Relevant SṪÁUTW First Nation Interests

In its discussion of the Indigenous interests identified for the WŚÁNEĆ Nations in Section 11.18.2.19 of the Application, FortisBC states that:

*Potential effects to cultural continuation and opportunities for intergenerational knowledge transmission and spiritual connections represent intangible values, which reflect the beliefs,*

*perceptions, values, and qualitative experience of WSÁNEĆ Nations that cannot be assessed by FortisBC without input from WSÁNEĆ Nations. Similarly, information is needed from WSÁNEĆ Nations regarding conditions related to their ability to meaningfully exercise Indigenous Governance Systems for FortisBC to assess potential effects from the proposed Project. FortisBC has not received knowledge or feedback relating to Cultural Continuation and Indigenous Governance Systems from the WSÁNEĆ Nations. As such, effects to Cultural Continuation and Indigenous Governance Systems are not assessed.*

A lack of information provided by STÁUTW First Nation relating to Cultural Continuation and Indigenous Governance Systems does not indicate the Nation's lack of interest in these topics, nor does it establish an absence of potential effects to STÁUTW Cultural Continuation and Indigenous Governance Systems. This STÁUTW First Nation assessment addresses these shortcomings (see Sections 3.3.2.5, 3.3.2.7, 3.3.3.3, 3.3.3.5, and 3.3.6).

### 3.1.1.7 Characterization of STÁUTW First Nation Rights and Interests

Sections 11.18.2.18 and 11.18.2.19 of the Application are provided to meet the requirements found in section 11.1.2.1 of the AIR (EAO 2022), which states that the Application must provide "an overview of the understanding of Indigenous interests in the area that could be affected by the Project". Within this area, the Application was to:

- Identify the environmental and socio-economic conditions that support the community's meaningful exercise of their rights; and
- [Indicate] How historic, existing, and reasonably foreseeable future activities have cumulatively affected or could affect the conditions that support or limit the Indigenous community's meaningful exercise of their rights.

The same section of the AIR also notes that the Application was to provide a list of the Indigenous interests that may be impacted by the Project within the same area and:

- Summarize how the identified Indigenous interests have been affected by cumulative effects to-date; and
- Summarize past, present, and anticipated future use of the Project Area by Indigenous nations over time and practices in the Project Footprint regarding the Indigenous interests identified. This summary will include Project Footprint-specific use values present in the Project's LAA and RAA, which are areas identified and/or mapped by Indigenous nations as having environmental, cultural, spiritual, transportation, subsistence, and habitation value.<sup>8</sup>

However, Section 11.18.2.18 of the Application simply states that "It is FortisBC's understanding from information available to FortisBC at the time of writing that WSÁNEĆ Nations **do not currently use** the south arm of the lower Fraser River **adjacent to the proposed Project Footprint** to fish, gather plants, hunt, or access cultural sites or areas [...] (WesPac n.d.; B.C. EAO 2022)" (emphasis added). With relevance to the bolded passages in this text, STÁUTW First Nation notes that:

- The statement about WSÁNEĆ Nations' *current* use of an area does not meet the AIR requirement to describe how historic and existing activities have cumulatively affected conditions for the meaningful exercise of rights; and

---

<sup>8</sup> It is unclear what the meaning of the last sentence is, as it would be unusual to limit discussion of values present in the LAA and RAA to those that occur only within the Project Footprint.

- The AIR asks for an overview of Indigenous interests in the area that could be affected by the Project, not just in the Fraser River adjacent to the proposed Project Footprint.

This Sᑭᐱᐱᐱ First Nation assessment provides an overview of how cumulative effects have affected the ability of the Nation and its members to meaningfully exercise rights that could be affected by the Project.

### 3.1.1.8 Cumulative Effects Assessment Methodology

As noted in Section 3.1.1.2, FortisBC's approach to CEA generally follows EAO guidance and conventional assessment practice, where if it is found that there are no residual effects to a Valued Component (VC) or Indigenous Interest, no CEA for that VC or interest is undertaken. However, EAO (2020) does note that the approach and level of effort applied to CEA may be modified depending on "the level of past or existing disturbance in the project's zone of influence." In particular, as noted in EAO guidance (EAO 2017), it may be appropriate to modify this approach when assessing effects to Indigenous interests:

*The potential impacts of a proposed project on Aboriginal rights can be characterized by understanding effects of a proposed project on factors that are important for the exercise of a right. This includes the cumulative impacts on biophysical VCs such as impacts on wildlife populations, impacts on specific sites of traditional use, and social, cultural, spiritual, and experiential perspectives of the Aboriginal group. **If the current ability to practice an Aboriginal right is already constrained due to factors such as previous developments, the conclusion on effects from a current project on that right may be more serious** (EAO 2017; emphasis added).*

The current ability of Sᑭᐱᐱᐱ First Nation members to meaningfully exercise inherent and constitutionally protected Aboriginal and Treaty rights in the Lower Mainland are already constrained by factors including considerable historical and existing development. Historical and continuing barriers limiting Sᑭᐱᐱᐱ First Nation from exercising its rights are not just important as background to the assessment. The existing level of cumulative effects loading and resulting rights alienation must be considered when concluding on residual and cumulative effects relating to the Project.

### 3.1.1.9 Note on Malfunctions and Accidents

In Section 9.2.5 of the Application, FortisBC identifies the potential interaction of malfunctions and accidents with Indigenous Interests, listing specific concerns expressed by individual Indigenous Nations during engagement. Neither Wᑭᐱᐱᐱ Nations or Sᑭᐱᐱᐱ First Nation are included in this list, even though Section 11.18.3.2 of FortisBC's Application notes that Wᑭᐱᐱᐱ Nations have expressed concerns about Project spills, and that past industrial accidents have resulted in impacts to Wᑭᐱᐱᐱ Nations ability to exercise Indigenous Interests by adversely affecting "fish and fish habitat, wildlife and wildlife habitat, water quality and quantity, settlements and travel ways, plants, and plant species."

A discussion of potential interactions between malfunction and accident scenarios and Indigenous Interests *in general*, as well as a characterization of associated risks, is provided in Sections 9.4 through 9.9 of the Application. In Section 9.2.5 of the Application, FortisBC acknowledges that "some Indigenous nations may experience effects from malfunctions and accidents more than others" but does not offer any further details.

Sᑭᐱᐱᐱ First Nation has not assessed the potential impacts of Project malfunctions and accidents on its exercise of rights in this report, but provides the following commentary on the analysis provided in FortisBC's Application:

- Sᑭᐱᐱᐱ First Nation confirms its concern about the effects of potential Project malfunctions and accidents on its exercise of rights.

- FortisBC characterizes the likelihood of some malfunction and accident scenarios as “remote”, which it defines as “unheard of in the industry; not expected to occur.” This includes scenarios like (1) loss of containment of liquified natural gas, (2) fire or explosion, and (3) terrestrial vehicle collision, which a cursory literature search indicates are not unheard of in industry.
- FortisBC provides separate ratings of likelihood for the combination of each scenario with VCs and Indigenous Interests. STÁUTW First Nation’s understanding from EAO (2020) guidance and Section 9.0 of the AIR is that likelihood is intended to express the probability of the scenario occurring at all, rather than its probability of interacting with VCs and interests. Therefore, a single characterization of likelihood should be applied across each scenario (with the consequence to VCs and Indigenous interests potentially being variable).
- As noted previously in relation to the effects assessment, FortisBC seems to have assessed effects of malfunctions and accidents mainly based on Indigenous Nations’ *current* use of areas, rather than Nations’ historical or aspirational future use of areas or exercise of Indigenous rights (e.g., in Section 9.6.3.7 of the Application, stating that “Given that there is no harvesting of plants or animals on the proposed Project Site [...] the risk level for the release of hazardous material to the economic well-being or health of Indigenous nation member [sic] is considered low”).

### 3.1.2 STÁUTW First Nation Assessment Methodology

It is STÁUTW First Nation’s perspective that the Application does not adequately, appropriately, or accurately assess the Project’s effects on STÁUTW First Nation for reasons including the methodological deficiencies as described above, and insufficient characterization and description of existing cumulative effects and impacts on STÁUTW First Nation interests.

This assessment conducted by STÁUTW First Nation largely follows the methodology outlined in Section 11.01 of the Application and EAO guidance (EAO 2017; 2020) but reaches different conclusions than FortisBC. This is because:

- STÁUTW First Nation’s inherent and constitutionally protected Aboriginal and Treaty rights and interests are demonstrably more extensive than acknowledged by FortisBC;
- *Current exercise* of STÁUTW First Nation inherent and constitutionally protected Aboriginal and Treaty rights and interests are demonstrably more extensive than acknowledge by FortisBC; and
- The extensive and deleterious cumulative effects in the Project area do not detract from the existence of STÁUTW’s inherent and constitutionally protected Treaty and Aboriginal rights, nor do existing cumulative effects preclude the possibility of further breaching STÁUTW First Nation’s inherent and constitutionally protected Aboriginal and Treaty rights.

In contrast to the assessment and methodology adopted by FortisBC in Section 11.18 of the Application, this assessment:

- Is specific to STÁUTW First Nation (see Section 3.1.1.1);
- Includes an assessment of potential Project cumulative effects that considers interdependent operations (e.g., TMJ Project, Phase 1A and 2B Expansions; see Section 3.1.1.2) and the considerable degree to which STÁUTW First Nation rights are already constrained due to previous developments (see Section 3.1.1.8);
- Includes consideration of STÁUTW First Nation primary sources of information such as interviews and oral histories, and secondary sources, including ethnographic and spatial data, among others (see Sections 3.1.1.3 and Section 3.2);

- Includes consideration of STÁUTW First Nation's Consultation Area defined in its Consultation Protocol and Policy (STÁUTW First Nation 2024), which overlaps the Project Footprint (see Section 3.1.1.4);
- Identifies and emphasizes STÁUTW First Nation rights and interests that may be impacted by the Project, including in the south arm of the lower ŚNEWIL/Fraser River adjacent to the Project Footprint, and the Harvesting and Subsistence Activities and Cultural Use Sites and Areas LAAs, and speaks to past, present, and future exercise of these rights (see Sections 3.1.1.5 and 3.1.1.7); and
- Respecting STÁUTW First Nation's inherent and constitutionally protected Aboriginal and Treaty rights, includes an assessment of Project effects and impacts on Cultural Continuation and STÁUTW First Nation governance (see Section 3.1.1.6), including potential effect pathways identified by FortisBC in Table 11.1-4 of the Application such as "effects on the ability to revitalize, develop, and participate in intergenerational cultural transmission" and "ability to implement Indigenous laws, customs, and protocols".

### 3.2 Information Sources and Limitations

This STÁUTW First Nation assessment relies on a diversity of primary and secondary data sources, many of which were not collected to specifically inform this effects assessment or in the Project context, or collected by STÁUTW First Nation. Key sources information include:

- Interviews conducted with STÁUTW First Nation members and STÁUTW First Nation oral histories;
- FortisBC's Application;
- Ethnographic and ethnohistorical studies and journals;
- Archaeobotanical studies and journals;
- Academic sources, including some produced by STÁUTW First Nation members;
- Grey literature including government and non-government reports;
- Past environmental assessment applications and related materials, including some materials specific to STÁUTW First Nation and others respecting WSÁNEĆ First Nations;
- STÁUTW First Nation policy and governance documents; and
- GIS analyses conducted by STÁUTW First Nation based on public databases (e.g., data layers from Data Catalogue BC and Parcel Map BC).

As noted, many information sources relied on for this assessment are not specific to the Project; STÁUTW First Nation adopts a conservative approach in using and interpreting results from these sources. This assessment uses and applies the terminology of source material where appropriate and applicable and where it cannot accurately or appropriately be replaced by terms defined for the Project's assessment (e.g., Project Footprint, LAA, RAA).<sup>9</sup>

---

<sup>9</sup> Where appropriate, geographic terminology like Lower Mainland, ŚNEWIL/Fraser River, and ŚNEWIL/Fraser delta are used. In general, the Lower Mainland encapsulates the lower Fraser valley west of Hope; ŚNEWIL/Fraser River is specific to the aquatic/marine environment of the river and its tributaries, and terrestrial areas immediately adjacent (e.g., riparian areas); and the ŚNEWIL/Fraser delta is distinguished from the Lower Mainland as it only refers to the lowlands west of where the Surrey Highland and the Burrard Highland separate to form the peatland and floodplain, i.e., west of New Westminster bordered by the higher ground of Surrey and Vancouver (La Croix 2024).

Where information is available and specific to the Project Footprint and immediate area, these are presented. However, in the absence of such data, information at higher spatial scales and/or different time periods is often used and relied on to approximate or estimate conditions at the Project Footprint over time. The Project effects and residual effects identified in this assessment are based on the best available information and the cultural perspectives and lived experiences of SṪÁUTW First Nation and its members. However, it is important to note that systematic Western scientific documentation of environmental conditions in the 1800s and early 1900s are rare; where available, multiple lines of evidence are presented for confidence.

Importantly, this assessment is not comprehensive of SṪÁUTW First Nation knowledge or rights and should not be construed to represent the totality of SṪÁUTW First Nation rights and interests in the Lower Mainland or SṪÁUTW First Nation territory. Much of SṪÁUTW First Nations' knowledge—which may be culturally sensitive—is not available or appropriate to share in public processes or for environmental assessments. An abundance of knowledge is also held by the community and not in a form that has been recorded and shared for these purposes.

### **3.3 Assessment of Potential Effects on SṪÁUTW First Nation Interests**

#### **3.3.1 Assessment Boundaries**

The boundaries of this SṪÁUTW First Nation assessment are based on the potential for the Project to interact and impact the inherent and constitutionally protected Aboriginal and Treaty rights of SṪÁUTW First Nation.

##### **3.3.1.1 Spatial Boundaries**

As described in Section 3.1.1.4, in alignment with the EAO Effects Assessment Policy (EAO 2020), to assess the Project's impacts on its rights and interests, including those established under the Douglas Treaties, SṪÁUTW First Nation makes use of the SṪÁUTW Consultation Area as defined in its Consultation Protocol and Policy (SṪÁUTW First Nation 2024). Specifically, this effects assessment focuses on the overlap between the Consultation Area and the LAAs and RAAs identified by FortisBC (i.e., Cultural Use Site and Areas, Harvesting and Subsistence Activities, Indigenous Health and Well-being, and Social and Economic Conditions; see Figure 11.18-1D in the Application).

##### **3.3.1.2 Temporal Boundaries**

The temporal boundaries of the Project's construction, operation, and decommissioning phases are the same as described in the Application in Section 11.18.5.1.

The Project duration is based on the following three phases:

- Construction Phase – Estimated 3- to 6-year duration
- Operation Phase – Estimated 40+-year duration
- Decommissioning Phase – Estimated 2-year duration

The proposed Project in-service date is 2031+. Further to the proposed Project schedule above, SṪÁUTW First Nation also considers the Project environmental assessment process, pre-construction, due to potential interactions and effects on SṪÁUTW First Nation health and well-being (see Section 3.3.3.6). The timespan from around 1850 (the signing of the Douglas Treaties) to today is also considered to contextualize and inform this assessment as cumulative effects trends are highly relevant to

understanding the Project's potential impact on STÁUTW First Nations' inherent and constitutionally protected Aboriginal and Treaty rights.

### **3.3.1.3**    *Administrative and Technical Boundaries*

The Canada-USA border established through the Oregon Treaty beginning in 1846 (and subsequent agreements) is an administrative boundary that has constrained the assessment of potential effects. Contemporary and historical data on social and ecological systems are often falsely constrained by this boundary, rather than following natural boundaries of these systems, limiting the ability to draw complete conclusions. Limitations related to information sources used to inform this assessment are additionally described in Section 3.2.

### 3.3.2 Existing Conditions

#### 3.3.2.1 SṪÁUTW First Nation Use of the Proposed Project Area

SṪÁUTW First Nation is a Coast Salish Nation and one of five Nations that constitute the WŚÁNEĆ peoples. WŚÁNEĆ peoples are unified by their shared use of the SENĆOŦEN language and shared identity as Saltwater Peoples (Elliott and Poth 1990; Suttles 1974:61).

*The ocean waters around our island homes were our fields, rivers, and highways. They fed us, and we travelled on them. The WŚÁNEĆ are called saltwater people because the sea was our home as much as the land. Our homelands and homewaters are one and the same thing. We named most landforms as they're seen from the sea. Our language, SENĆOŦEN, not only describes these places in clear, "picturizing" ways, but actions words-verbs- go first in our sentences. Our livelihood was fisheries-based, working in a very active environment: constantly moving, changing seas and shores. From our waters and seashores, [SṪÁUTW] people harvested a rich varied diet, as well as foods for trade. We say that, "when the tide is out, the table is set". Also the ocean is our "kitchen table". This harvest is the product of a highly dynamic, complex system, of which our NEHIMET (ancestral family lineages) had encyclopaedic knowledge. Understanding traditional [SṪÁUTW] lives and culture begins with understanding the rhythms of our marine environment throughout the season and months of the year. (Claxton and Sam 2010:5)<sup>10</sup>*

SṪÁUTW First Nation territory, or ÁLENENEŹ (homeland, village, where one comes from), spans the San Juan and southern Gulf Islands, from Southern Vancouver Island across the Salish Sea to the Lower Mainland. As discussed in the following sections of this assessment, SMOKEĆ/Point Roberts and Boundary Bay, as well as the ŚNEWIL/Fraser River and other areas of the Lower Mainland, are central to SṪÁUTW's inherent and constitutionally protected Aboriginal and Treaty rights.

With respect to the Project and its potential effects, this includes rights related to, but not limited to:

- Harvesting and subsistence activities;
- Cultural use sites and areas
- Governance systems;
- Social and economic conditions;
- Cultural continuation; and
- Health and well-being.

Each category of interests is described in the remainder of Section 3.3.2, and the potential for the Project to affect SṪÁUTW First Nation's related rights are assessed in Sections 3.3.3 to 3.3.6.

#### 3.3.2.2 Historical Context

Since time immemorial, SṪÁUTW have exercised their rights and responsibilities within the proposed Project area. This included fishing salmon and sturgeon, gathering terrestrial and aquatic/marine plants, and hunting and trapping in the Lower Mainland, including in and along the ŚNEWIL/Fraser River. Prior to colonization, SṪÁUTW First Nation members travelled and accessed the land and waters of the Lower Mainland unimpeded by the barriers of colonial institutions and effects of industrial and urban

---

<sup>10</sup> The SENĆOŦEN spelling in brackets is used in place of the English spelling of quoted material throughout this report for consistency.

development. This access allowed SḴÁUTW to utilize a wide variety of natural resources, implement the Nation's laws, and form relationships with other Indigenous peoples through ties based in trade and kinship. SḴÁUTW First Nation members were also able to live by cultural beliefs and practice customs, freely expanding and transmitting SḴÁUTW knowledge, and steward the land for future generations according to cultural laws and principles, securing the health and well-being of the Nation and its members. Before colonization, the territory enabled the Nation to thrive.

Because of the combined effects of colonization, industrialization, urbanization, and settlement, the ability of SḴÁUTW First Nation members to meaningfully exercise inherent and constitutionally protected Aboriginal and Treaty rights in the Lower Mainland is no longer possible (e.g., see Section 2 and Figure 2). It is however beyond the scope of this ILA to comprehensively detail the consequences of these changes over time on SḴÁUTW First Nation rights and rights practice. Instead, the historical context presented in Section 2 provides a backdrop to understand the current condition of selected SḴÁUTW First Nation rights and interests that may be impacted by the Project, which are discussed in further detail below.

### 3.3.2.3 *Harvesting and Subsistence Activities*

#### **Definition**

FortisBC's Application does not define the Indigenous interest of "Harvesting and Subsistence Activities"; however, the potential effect pathways and associated indicators (Table 11.1-4), and topics to consider (Table 11.18-6), are indicative that the focus is on the rights to fish, harvest, and hunt, including associated methods, experiences, and preferences, and the accessibility and availability of the lands and resources.

SḴÁUTW First Nation territory (reflected by the SḴÁUTW Consultation Area) includes the Project Footprint and overlaps the Harvesting and Subsistence Activities and Cultural Use Sites and Areas LAAs. Within SḴÁUTW First Nation territory, the Nation has inherent and constitutionally protected Aboriginal and Treaty rights, including being "at liberty to hunt over the unoccupied lands, and to carry on our fisheries as formerly" as guaranteed by the Douglas Treaties. The Douglas Treaties also included oral promises that SḴÁUTW would be able to hunt over unoccupied lands and carry on fishing and harvesting with the same freedom as when SḴÁUTW were the *sole occupants* of the country.

The ŚNEWIL/Fraser River is central to SḴÁUTW harvesting and subsistence rights, not only fishing, but also picking KEXMIN/wild celery, SḴA,KEN/cattails and SZELEL/tule rushes, SKÁUISELL/wapato tubers and S,ELLTENEN/berries, and hunting for deer, elk and mountain goats. These rights—alongside other SḴÁUTW First Nation rights—must be viewed as interconnected; they cannot be understood separately. For example, resources obtained through fishing and hunting are foundational to relationships between SḴÁUTW and other First Nations. SḴÁUTW First Nation rights in the Lower Mainland are knit together by established travel routes that cross between the water and the land to permanent villages. Resources like clams, SḴA,KEN/cattails, and waterfowl—and even fish—are dependent on terrestrial, marine, and intertidal environments. SḴÁUTW First Nation harvesting and subsistence rights in the Lower Mainland are anchored by villages and fishing stations at SMOKEĆ/Point Roberts and along the ŚNEWIL/Fraser River, which also facilitated access to a diversity of plants and animals.

#### **Current Condition**

##### *Fishing*

*And then, for gillnet, we fished right up into Steveston, and all the way up under the first couple of bridges and some of the sloughs. I remember fishing [...] Yeah. It was a lot of fun back then. We*

*caught everything. It was all the salmon species, we got some big sturgeon- all kinds of stuff. So, yeah, I fished up there for quite a few years. (STÁUTW Respondent ID103)*

STÁUTW First Nation is no longer able to meaningfully exercise the right to fish in the Lower Mainland or in the Harvesting and Subsistence Activities LAA. SMOKEĆ/Point Roberts, CELLTENEM/Boundary Bay, the ŚNEWIL/Fraser River and its tributaries (Serpentine River, Nicomekl River, and Salmon River) are central to STÁUTW fishing and economic rights. STÁUTW First Nation's fishing and economic rights are rooted in the annual pursuit and harvest of the five salmon species and steelhead, including by following migrating salmon into the ŚNEWIL/Fraser River (Claxton 2015:69–70; Suttles 1974:189; Suttles 1987:35–36).<sup>11</sup> After harvesting salmon at the SXOLE/reef net fishery at SMOKEĆ/Point Roberts, many STÁUTW families followed the salmon as they entered the ŚNEWIL/Fraser River delta, fishing on the ŚNEWIL/Fraser River and on smaller tributaries. WSÁNEĆ families are also known to have fished as far up the ŚNEWIL/Fraser River as Yale, processing fish by wind drying along the way.

Permanent villages at SĆEU,OFEN/Tsawwassen and SMOKEĆ/Point Roberts enabled a successful reef net fishery (Claxton and Elliot 1993:15). While in the Lower Mainland, STÁUTW ancestors would pick a variety of plants for food and medicine, and hunt for ungulates and mountain goats (MacLachlan 1998:40; 184; Welsh 2002:34;40; Jenness 1974:7; 12; Suttles 1974:63–64). Plant gathering and the materials they furnished in turn supported fishing activities (STÁUTW First Nation 2024). Fishing gear was made each year with cedar rope, willow bark, and stone (for anchor and net weights); dune grass was used to lure salmon into nets; canoes were fashioned from cedar trees; and balsam branches used to collect herring spawn.

*The lead of the net had dune grass in the twinings of the XETZLEN (floor lines) and the SQÁLEL (upright side lines). The SLEQAI (dune grass) that was used was specially chosen for its quality and length. The dune grass reflected the sunlight in a special way. It is believed that the salmon entering the SXOLE (reef net) felt safely surrounded by dune grass in the running tide. It is also believed that the salmon were fooled into thinking that the lead was the actual bottom as they entered into the SXOLE (the net itself) (Claxton and Elliott 1994:16–17).*

The Fort Langley journals further documented the passage of “Sanch”—or WSÁNEĆ—on the ŚNEWIL/Fraser River in the pursuit of salmon in 1827 (MacLachlan 1998:34). Similarly, James Douglas recorded the presence of 12 WSÁNEĆ heads of families when he took census at Fort Langley in 1840 (Fritz 2016), highlighting the presence of STÁUTW ancestors in the Lower Mainland and the Harvesting and Subsistence Activities LAA.

In addition to salmon, dogfish, sturgeon, crabs, and clams are harvested in or near the Lower Mainland (e.g., at the mouth of the ŚNEWIL/Fraser River) as resource and access conditions allow (Evans et al. 2015; 2019; Figure 38).<sup>12</sup> Claxon and Sam (2010) write of the long tradition of clamming that is evident in the archaeological and oral historical record:

<sup>11</sup> The high ubiquity of flatfishes found in archaeological sites at the mouth of the South Arm and in particular along Roberts Bank to SMOKEĆ/Point Roberts (Figure 7) (McKechnie and Moss 2016) is evidence that flatfishes were also fished for subsistence by STÁUTW near SXOLE/reef net fishery sites at SMOKEĆ/Point Roberts (Claxton and Elliott 1993; 1994).

<sup>12</sup> In Section 11.18.5.2 of the Application, FortisBC notes that the “WSÁNEĆ Nations have not indicated to FortisBC that their members fish within the proposed Project Footprint or the Harvesting and Subsistence Activities LAA”. This is despite FortisBC's reference to *WesPac* (n.d.)—a section of the TMJ Project Marine Shipping Assessment—which summarizes the 2015 STÁUTW (Tsawout) Marine Use Study prepared as part of the assessment of the TransMountain Expansion (specifically the marine shipping component; Evans et al. 2015). The 2015 TransMountain Expansion study cites an earlier study (Aberley 2002) in which interviews of STÁUTW members were conducted, and which confirms the use of the south arm of the ŚNEWIL/Fraser for fishing (e.g. “... respondents indicated long-term and recurring seasonal use of the Fraser for fishing, including use as a commercial fishery. Two boat

*Nearly every bay and beach in our homeland was a clamming site. Many of these were extensive and had been used for thousands of years. We know this from our oral history, and we also know it from the kitchen middens that remain, full of clam shell fragments and other shell and bone remains or our activities. (Claxton and Sam 2010:73)*

SḴÁUTW and WSÁNEĆ use of clam beds in SMOKEĆ/Point Roberts, SĆEU,OFEN/Tsawwassen, and around Boundary Bay, is evident in living memory and analogously in settler accounts (e.g., Clark 1980:86).

*Traditionally, they would gather right along the boundary, the Blaine side. Right along the front of the village that was there. My [personal relation] said there was really good clams in there... he said there was a really good crab fishery in there, too. (SḴÁUTW Respondent ID100)*

*On the Point [Roberts] there is an old Indian burying ground. And the vast bed of clam shells show that it has been a point used extensively by the Indians for centuries (Clark 1980:86).*

Clams and crab—only two of numerous valued intertidal and nearshore species—continue to be important to SḴÁUTW culture and diets, providing sustenance and serving ceremonial purposes (Evans et al. 2019:51). Bivalves have also traditionally been used to manufacture goods including tools and weaponry (Claxton and Sam 2010).

---

*anchorage sites were identified near the mouth of the Fraser and at Steveston." "[SḴÁUTW] harvesters have recently fished for sturgeon nearer the mouth or in the estuary of the Fraser.").* Figure 38 reproduces a map from the Evans et al. (2015) study cited by FortisBC, showing SḴÁUTW fishing locations extending up the south arm of the SNEWIL/ Fraser River, including in the area adjacent to the Project Footprint. This information source thus indicates SḴÁUTW First Nation fishing activity in the area that FortisBC states they understand that no fishing occurs, and within the Project LAA for Harvesting and Subsistence Activities.

**Figure 38:** Map of STÁUTW fishing locations taken from Evans et al. (2015). Note that the information represented in this figure are not representative of STÁUTW “as formerly” and were specifically collected to inform fishing locations impacted by marine tanker traffic associated with the Trans Mountain Expansion Project.

Since the 1800s, the rapid colonization, settlement, and transformation of the Lower Mainland through development have made the meaningful exercise of STÁUTW First Nation fishing rights “as formerly” impossible. Where once the SXOLE/reef net salmon fishery at SMOKEĆ/Point Roberts was so abundant that the catch provided the community with a major portion of its winter salmon supply, now:

- Fishing villages and stations are no longer accessible due the privatization of land and creation of the Canada-USA border beginning in 1846 (and subsequent agreements);
- Pollution, sedimentation, dykes and foreshore armouring, and large-scale infrastructure have reduced fish habitats and populations (see Section 2.1 and Section 2.2);
- Overfishing by colonial commercial fisheries (and historic canneries) has reduced salmon stocks and increased competition; and
- Colonial regulations and laws have restricted how, where, and when Indigenous peoples can fish (e.g., preventing fishing for commercial purposes without a licence or lease, banning the SXOLE/reef net fishery in 1916 in Canada, and 1934 in Washington state).

Although salmon continues to be highly sought after, STÁUTW First Nation members articulated the impacts of these cumulative effects on the exercise of fishing rights in the Lower Mainland, as follows:

*Years ago, there used to be a number of STÁUTW people that fished [on the mainland]. [...] [But] as the salmon declined, so have the people, right? (STÁUTW Respondent ID103)*

*Well, a lot of the areas that were traditionally available to us now are industrialized. Industrial lands. And they're not really accessible for our people anymore. (STÁUTW Respondent ID100)*

*We had fishing opportunities every year [growing up]. Now it seems like we're reliant on cycle years. So, there's no more fish. Like, they come in fourths – sockeye come in four-year-cycles. And now we're reliant on basically one predominant year that seems to be coming back strong. But it's been slowly declining over the last few cycles, as well. So, to me, that's not right, you know? [...] When I was a kid, we fished Johnstone Strait, San Juan, Pender and mouth of the Fraser, and every year was good. There were tons of fish there. I always remembered that, as a kid. (STÁUTW Respondent ID103)*

*The Fraser River is just becoming non-existent. And that's not only sockeye, it's chinook, it's pink salmon. Pink salmon were huge. I remember fishing there with my late uncle when I was a boy, and pink salmon were massive. And there was just millions of them. Now, you don't even see them anymore. Just declined. (STÁUTW Respondent ID103)*

A recent study by Kehoe et al. (2020) based on expert elicitation analyzed the probability that different species groups will continue to survive in the ŠNEWIL/Fraser River delta under current management conditions (i.e. business as usual, without additional conservation measures) versus with additional management and governance actions. Anadromous fish species (including Pacific salmon and sturgeon) were assessed to have a ~45% probability of persistence under status quo conditions (i.e. ~55% probability of going locally extinct) (Kehoe et al. 2020) (Figure 39).

**Figure 39:** Probability of persistence (i.e. probability of not going locally extinct) of species groups in the Fraser River delta. Baseline (dark blue) represents species persistence probabilities under no additional management (i.e. business as usual, status quo). Mgmt. (light blue) and Co-Gov. (green) represent species persistence probabilities should additional management and/or overarching co-governance strategies be implemented. Under baseline management conditions, only 5 of 13 species groups have a higher than 50% probability of persistence and none have a higher than 60% probability of persistence. Under baseline management conditions, two thirds of species within the Fraser River estuary are predicted to have less than a 50% probability of persistence over the next 25 years (n = 67 of total 102 species; 8 of 13 species groups). (Kehoe et al. 2020)

Another recent (2024) study found that the lower ŚNEWĪL/Fraser River (LFR) is “clearly in a reduced capacity to support fish production and many of the changes that have been caused by industrialization have compound effects that make [the LFR] an increasingly inhospitable place for juvenile salmon through loss of habitat and higher flow rates” (Lozano 2024:6–8). The study noted that even relatively intact habitat patches, such as the South Arm marshes, are still impacted by diking, which prevents salmon from easily reaching this superior habitat (Lozano 2024:22). This extensive fragmentation is directly attributable to the development and privatization of most of the ŚNEWĪL/Fraser River shoreline, the density of which makes restoration efforts particularly challenging (Lozano 2024:14).

Remaining salmon and fish populations that use the waterways of the Lower Mainland are moreover impacted by acute and persistent pollution. Examples include exposure of salmon to contaminants from vessel discharges, dredging, and those commonly contained in tire rubber (6PPD-quinon) and discharges from industrial operations that have been linked to high salmon mortality (see Table 1; Tian et al. 2021; Larsen 2018).

It is not only fish populations that have declined but so has the *size* of certain species of fish, like lingcod. As recounted by one SṪÁUTW First Nation member, lingcod were once so large and voracious that young children were cautioned against putting their hands in the water while traveling by canoe, but that “there is no more cod like that anymore”.

*The cod fish were huge in the day. He said, maybe you better go and spear that cod fish. So they went out there and they speared him and they cut him open. Sure enough that kid was in there. So the cod fish in those days were very much, you knew they were like that. That's why when we used to be travelling in the canoe we were not allowed to have your fingers in the water. Because when we were travelling you like to put your hands in the water. We weren't allowed to do that because of the cod fish being predators like the way they were, like I said, there is no more cod like that anymore. You get cod they are only that big. I don't know how many years it gets for them to go to a full size. But the [SṪÁUTW] people respected the AYET, maybe that's why they call them their SiYEt, their elder brother today, but their sacred name is—getting back again—everything was a human being at one time. But they changed, that's why they became predators. The cod fish will eat anything. The [SṪÁUTW] people enjoyed the cod as their food. Also respected as a predator for small children. (SṪÁUTW Respondent ID111)*

The SṪÁUTW First Nation crab fishery and intertidal/nearshore gathering rights have similarly been impacted (Evans et al. 2015; 2019). Clam and bivalve harvesting generally have been heavily impacted by pollution, including from vessel discharges, and resulting closures in SṪÁUTW First Nation territory, increasing risks of biotoxin and contamination exposure and related health consequences (Evans et al. 2019). Water quality in the SNEWIL/Fraser River specifically has impacted shellfish harvesting where, “despite early improvements F. coliform levels have remained too high to allow shellfish harvesting within the estuary” (Hanna 1998:67), which has been closed since 1962 (Environment Canada 1992).

*We are impacted because we are eating wrong foods now, the foods that we depended on. Now it is all poison. When they first started to come in, like it is the way it is today, Mother was saying, we'll be ok, we can always go down to the beach and dig clams for our food. That's the first thing that went out, contamination of clams and even the crab I think. I don't know how they are justifying the fact that the crab is now also contaminated. The crabs that I was talking about, those big purple crabs, there is no more of them big purple crabs. Just the little brown ones. (SṪÁUTW Respondent ID111)*

The SṪÁUTW practice of “raking” for crabs and sea urchin, has been impacted by decreased water clarity caused by turbidity generated by passing vessels; barriers of regulation; and colonial commercial and recreational competition (including loss of gear), climate change, pollution, and invasive species that have reduced populations.

*When you were talking about people being able to see right into the water to see the octopus, one of the things they bring up here is that with the vessels going by, it stirs up all the sediment, so the water is less clear, so it's harder for people to fish in those ways. (SṪÁUTW Respondent ID110)*

Additionally, the increasing cost of gear and equipment (see Section 3.3.2.6) is affecting nearly all SṪÁUTW First Nation harvesting and subsistence rights—interacting with dwindling and accessible resources—and disrupting cultural knowledge transmission (see Section 3.3.2.7) required for the continuity and success of harvesting traditions. With respect to fishing specifically, vessel traffic, in-water development, and pollution have all impacted accessibility fishing sites and remaining fish stocks, resulting in additional costs in time, effort, and money; safety hazards; and lower success rates (Evans et al. 2015; see also Section 3.3.2.4).

#### *Plant Gathering*

SṪÁUTW First Nation is no longer able to meaningfully exercise rights to gather terrestrial, aquatic, and marine vegetation in the Lower Mainland and the Harvesting and Subsistence Activities LAA. As described by FortisBC in Section 11.18.5.2 of the Application, the WSÁNEĆ Nations relied on numerous plant species for food, medicines, crafting equipment and tools, and for use as building materials, including plants

gathered from the shoreline (e.g., camas bulbs), intertidal, riparian, and marine environments (e.g., seaweeds).

SṪÁUTW First Nation plant gathering, hunting, and fishing together comprised the seasonal round and were complementary activities. WŚÁNEĆ and SṪÁUTW First Nation use of the Lower Mainland is evident in the archaeological record, oral histories, and living memory of members. One example of the former is the archaeological site DgRs-30, located north of the Whalen Farm site and south of Beach Grove. A report on the site references “small gauge, two-strand, twisted cordage...made from inner cedar bark”, which is notable given its location and that SṪÁUTW fishing gear was made from cedar rope and willow bark (Claxton and Elliot 1994:13).

In conjunction with the fishing season, SṪÁUTW gathered a variety of food plants and medicines; KẸXMIN/wild celery, a sacred medicinal plant, was also picked for flavouring, ceremonial and other uses (Jenness 1974:7).

*My [personal relation] said that when they would travel off the Serpentine River, they would pick berries all along that. [...] Yeah, he said that was just rich with berries up there. All the way along the river, so they would enjoy them all the way. (SṪÁUTW Respondent ID100)*

In addition to the Douglas Treaties guaranteeing the “right to village sites and enclosed fields”, SṪÁUTW First Nation also has inherent and constitutionally protected Aboriginal and Treaty rights to harvest plants across SṪÁUTW First Nation territory. In SṪÁUTW First Nation territory, this has included:

- Picking S,ELLTENEN/berries, including soap berries, blackberries, blackcaps, salal berries, salmon berries, wild strawberries, cranberries, thimbleberry, blueberries, and others, which were collected in baskets and sometimes dried or processed for winter consumption (Suttles 1974:63–64; Claxton and Elliot 1993; Welsh 2002);
- Harvesting SKÁUISELL/wapato, and planting and harvesting of camas, for food, and collection hog fennel (Evans et al. 2019; Claxton and Elliot 1993);
- Collection and use of bracken roots and horsetail, as well as nettles, cedar and willow bark, SṪA,KEN/cattails, and SẼLEL/tule rushes for rope, housing, bedding, insulation, mats, utensils, fishing gear, and other goods (Claxton and Elliot 1993; Welsh 2002; Evans et al. 2019);
- Collection and consumption of KẸXMIN/wild celery (a sacred medicinal plant) for flavouring and ceremonial uses (Jenness 1974:7); and
- Collection and use of a variety of seaweeds and kelp, including DE,LOEDC/rockweed, LEKES/red laver/red sea lettuce, O,EN/bull kelp, as well as CELEM/eelgrass, many of which are used for food but also medicines for ailments including wounds and tuberculosis, and sold for income (Claxton and Sam, 2010:85-86).

The collection of seaweeds and kelp show how vegetation gathering is not limited to terrestrial environments. The collection of seaweeds—like most harvesting rights—complemented other harvesting activities. Elliot and Poth (1990) described the collection of LEKES/red laver while clamming and how it was processed for winter, and the past richness of the land and water:

*They would be digging clams, roasting clams, drying clams. They took seaweed or LEKES at that time. It grows on rock between high tide and low tide. When the tide is partly out it comes out of the water, and in some places it grows very thick, and of course our people harvested it. They would pick LEKES and spread it out in the sun to dry. They had to be very careful it didn't get rained on because fresh water would spoil it. It would turn bad. If it looked like it was going to rain they would have to run out and cover it or pick it up and get it out of the rain. That was another nourishing food. After*

*it was dry, it was pressed into blocks; pressed and compacted and put away for the winter. In the winter time it would be take out and used in cooking or just eaten the way it was. There was no way you could starve in this country. We had too much of everything. (47-48)*

Despite SṪÁUTW's inherent and constitutionally protected Aboriginal and Treaty rights to gather plants, and to enclosed fields and village sites, it is evident that these rights can no longer be exercised in a meaningful way in the Lower Mainland (e.g., Figure 2, see also Section 2.3).

The intensive urbanization and industrialization of the Lower Mainland is plain, as is its implication for the meaningful exercise of SṪÁUTW plant gathering and harvesting. This is underscored by FortisBC's description of the Project Footprint in Sections 11.18.5.2 and 11.18.5.3 of the Application (respectively, below):

*"The proposed Project Footprint was previously cleared of natural forest resulting in little to no native soils remaining in place, but is vegetated and has been heavily disturbed, with the majority of the proposed Project Footprint being used for industrial purposes. The existing Tilbury LNG facility consists of gravel (60 percent) and paved (40 percent) areas, existing infrastructure, and equipment laydown areas supporting little plant life with very little to no habitat value for wildlife. The vegetation within the proposed Project Footprint is mostly limited to ditch lines and spoil piles and is dominated by nonnative and invasive plant species."*

*"Over 98 percent of the proposed Project Footprint is industrial land use and is not vegetated."*

The impact of colonial systems can also be subtle. Take modern agriculture; as observed by one SṪÁUTW member, the ability to plant and harvest camas has been disrupted by the expansion of non-traditional crops like potato.

*Whereas before, the only thing that our people used to use for starch was a plant called camas. It was like an onion. And that's what our people used to eat. Before, and then introduction of potatoes into our diet replaced camas because it was so much easier to plant and harvest. And a lot of our fields that were traditionally camas fields around here got plowed up and turned into potato fields. So, it's pretty hard to find a good camas field now. (SṪÁUTW Respondent ID100)*

Similar to terrestrial harvesting, the collection and protection of nearshore/intertidal marine vegetation has also been adversely impacted by industrialization, urbanization, colonization, and settlement (e.g., Baker 2016 documents extensive loss of access to red laver, including along the SNEWIL/Fraser River). For example, the parallel collection and processing of clams and seaweed has been disrupted by the loss of, and access to, clam beds from pollution and urbanization, while kelp beds and eelgrass habitats that are nurseries for many marine species are in decline (Evans et al. 2015:85) and are further threatened by development, including the approved Roberts Bank Terminal 2 Project.

*I'm really concerned about kelp. Kelp is disappearing. People don't think about kelp, right? They found that out—migrating fry out of the Fraser River and the Cowichan River will hang out in the Southern Gulf Islands and stay within the foreshore for their first year of their life because within those kelp patches and seaweed and stuff there is so much food for those little guys to eat. It's disappearing and they don't know why. I remember as a kid, there used to be kelp all along the beach—around James Island and down along the shore all over the place, and now there is not. It's like, there's the big kelp beds, the big bull kelp, but it's that different species, like a smaller bull kelp—it's disappearing. (Tsawout MUS 2015:85)*

Spatial analysis conducted by SṪÁUTW First Nation demonstrates that the level of impact in the Project Footprint is mirrored across the Lower Mainland (Figure 2), which is almost completely unavailable to SṪÁUTW for the exercise of terrestrial rights—with adverse implications for related tangible and intangible

rights. (As noted previously, there is a close relationship between SṪÁUTW First Nation plant harvesting rights and fishing, as well as other rights as will be discussed subsequently.)

*When I think about the Douglas Treaty, it says that we can carry on and hunt and fish as formerly, but the biggest part is the next part, that our village sites and our enclosed fields would be protected forever. That's been broken so many times. (SṪÁUTW Respondent ID102)*

Tilbury Island specifically has seen wholesale changes in vegetation and land uses over time due, transforming from native grassland to agricultural land then industrial use.

- Prior to the 1900s, Tilbury Island was covered in prairie grasses with patches of willow and cedar, with the outer edge being mixed woodland of cottonwood and alder and the inner edge being mixed coniferous forests with cedar and hemlock (Figure 14).
- Tilbury Island lands were privatized by 1876 (Figure 18), and farming was documented as early as 1909 (Szychter 1992:107).
- By 1974 much of the island was agricultural land transitioning into industrial use; the Tilbury Island LNG facility opened in 1971. Tilbury Island was included in the areas proposed for future industrial development under the Lower Mainland Regional Planning Board in 1957 and 1961 (Hoos and Packman 1974), leading to the transition of agricultural land cover to industrial use in the decade following.
- Industrial uses have dominated Tilbury Island since the 1970s, which has been subject to “dredging, in addition to the construction and operation of the Weyerhaeuser marine jetty, sawmill, and lumber yard” (Golder Associates Ltd. 2019:44), as well as FortisBC’s Phase 1A Expansion (and planned Phase 2B Expansion).

### Hunting

Contrary to FortisBC’s interpretation that the Project Footprint and Harvesting and Subsistence Activities LAA are of limited hunting importance due to a lack of available species/habitat; existing firearms restrictions; and an absence of expressed concern, SṪÁUTW First Nation emphasizes the continued existence of SṪÁUTW First Nation’s right to hunt “as formerly” in SṪÁUTW First Nation territory. SṪÁUTW First Nation’s right to hunt is inclusive of the Project Footprint and SṪÁUTW First Nation territory within the Harvesting and Subsistence Activities LAA where FortisBC identifies the presence of culturally important species and habitats.

Species hunted and/or trapped by the SṪÁUTW in the Lower Mainland include deer (particularly black-tailed deer); elk; mountain goats; beaver; and marten. In between intervals of salmon fishing on the mainland, SṪÁUTW men would hunt deer and elk, and at the close of the salmon season they harvested mountain goats, as well as sometimes trapped for beaver and muskrats (MacLachlan 1998:40; Welsh 2002; Jenness 1974:7;12).

SṪÁUTW also pursue a wide variety of waterfowl in habitats such as sloughs, protected inlets, and marshland, traditionally using nets and spears (Claxton and Elliot 1993; Evans et al. 2019). Sought-after waterfowl include surf scoters, pintails, mallards, sea pigeon, sawbill mergansers, murres, buffleheads, widgeons, brant, Canada geese, barrow’s goldeneye, common goldeneye, American black duck, (Evans et al. 2015; Webster 2000); upland game birds were also hunted, including grouse pheasant, and quail (Aberley 2002). Seagull eggs were collected from rocky shorelines, often simultaneously with camas bulbs (Elliot 1983; Claxton and Elliot 1993; SṪÁUTW Respondent ID130; Welsh 2002).

As with fish and vegetation, land animals are not only important as sustenance but valued for many other purposes including utilitarian, economic, artistic, and ceremonial. For instance, crabs and urchin were

traditionally collected using rakes crafted from deer antlers—a method that continues to be preferred by some SṪÁUTW today (Evans et al. 2015:73).

Trade involving meat and pelts was a central part of the traditional economy. The Fort Langley journals recorded the passage of WŚÁNEĆ in October 1827, from whom venison was purchased (they are documented as having been encamped nearby on the Salmon River [Little Portage River]).<sup>13</sup> The WŚÁNEĆ are also documented visiting in the winter of 1829, carrying beaver skins (some of which were recorded as being obtained through trade and to be used for blankets) (McDonald in The Fort Langley Journals, 1827-30:94). The SṪÁUTW are also known to have traded surplus fish to obtain goat's wool, deer and elk meat, and dry goods (see Section 2.3.2.6 for more details).

*October 12th, 1827: We are occasionally visited by straggling Indians, who still bring us fresh fish and a little venison. There are a few of the Sanch [WŚÁNEĆ] Village Indians encamped not far from us upon the Little Portage River, where they take a quantity of Salmon on Wears [Weirs] by barring up part of the River. They also kill a few Beaver in wooden Traps constructed in the same manner as those for Martens, and contrive to secure a Red Deer now and then in Pitfall (MacLachlan 1998:41).*

Mountain goats—which could only be obtained on the mainland—and their wool were a key resource used for making blankets, a medium of exchange and a main gift at potlatch ceremonies, and their horns were used to make spoons and bracelets (Welsh 2002:34). The quotes below highlight the importance of wool as a SṪÁUTW ceremonial and economic resource linked to the ŚNEWIL/Fraser River, and how access to mountain goat wool has changed.

*Well, the biggest items that I knew of [that was traded for] was mountain goat wool. Mountain goat wool was a really prized possession, and I have a SWE, KO, Ł that was made for me that's made out of wool, but my great-grandfather had one that was made of mountain goat wool. (SṪÁUTW Respondent ID100)*

*Indians long ago used goat and sheep wool to make blankets; the weaving method was used. Blankets were used for trading and selling. The areas mainly camped at were the Fraser River and Sechelt area. These short journeys were always enjoyed by the people because travelling was a life-long work and pleasure. The main trail the Indian people followed through was called the "Eulachon Trail" because eulachon oil was dropped all along the trail. During the travel back home, the people gathered wool which was snagged on the bushes and branches. Good quantities were found. The wool was used for clothing, blankets, hats, and belts, etc. Present times, sheep wool is used for knitting and other costumes. The disadvantage now is that it must be bought for a good sum of money. (SṪÁUTW First Nation 2019:23)*

Ducks, too, have important roles in ceremony in SṪÁUTW culture; they are staple food in feasts, funerals, and community events. Feathers from the pileated woodpecker are "valued for its prettiness and regalia use. Also medicinal use for men" SṪÁUTW Respondent ID111). The surf scoter—or "black duck"—especially has a key place in the SṪÁUTW smokehouse and ceremonies;<sup>14</sup> its meat is used in duck soup, and its feathers are lain on the floor to protect and initiate dancers (Evans et al. 2015:111). Being a duck hunter for the SṪÁUTW community is therefore an important role suffused with spiritual and ceremonial purpose.

<sup>13</sup> It should be noted that numerous interactions with WŚÁNEĆ individuals and families are documented between 1827 to 1830 in the Fort Langley Journals, including passage of the WŚÁNEĆ up and down the ŚNEWIL/Fraser River and its tributaries, to and from fishing grounds and village sites (MacLachlan 1998). Interactions between the WŚÁNEĆ and occupants of the Fort include trade in food and goods including venison, elk meat, beaver skins, and blankets. WŚÁNEĆ were also sometimes hosted at Fort Langley.

<sup>14</sup> Smokehouse, bighouse, and longhouse are used interchangeably in this report.

*With people they mainly relied on Black Ducks because it had a lot to do with their culture, for the smokehouse and stuff of that nature. They used them for the feathers on the floors. Other bands, say for instance the Penelakut band, they depended on what they called a murre. They also ate loons. Nanaimo, and that they eat same thing, and I even heard them shooting shags, mergansers and stuff, and depending on that. But Saanich people was mainly black ducks. (Tsawout MUS 2015:111)*

The historical record and SṪÁUTW oral histories and experiences make clear that hunting cannot be understood as simply a land-based right, it is also connected to the ocean and rivers: hunting grounds were reached by travel over water, animals like beaver rely on watercourses and terrestrial ecosystems, and traditional hunting methods were, at times, amphibious.

While deer can be caught by many traditional and contemporary methods, including netting, pit traps, bows, snares, and rifle, the practice of “pit lamping” underscores the socially-fabricated boundary between the land and water. Hunting at night using illumination is a Treaty-protected right of the W̱SÁNEĆ (R. v. Morris [2006] SCC 59), which traditionally entailed hunting “at night with a fire built on clay on a board in a canoe. The shadows cast by the fire tricked the deer into entering the water to escape the motion of the shadows. They were killed from canoes.” (Welsh 2002:32 in Section 11.18.5.2 of the Application). Indeed, the SṪÁUTW prefer to hunt deer in areas accessible by boats to facilitate transport of the kill (Evans et al. 2015:114).

SṪÁUTW First Nation is no longer able to meaningfully exercise their right to hunt and trap in the Lower Mainland. The same forces of colonization, settlement, and urbanization that have alienated SṪÁUTW First Nation from fishing and plant harvesting rights have simultaneously reduced the presence and habitat of traditionally-hunted species and access to them.

With the loss of wetlands (see Section 2.3) that are important habitat for waterfowl and migratory birds, many native bird populations have decreased since the 1850s (Boyle et al. 1997; Leach 1979; Province of British Columbia 1971; Butler et al. 2021).

Spatial analysis conducted by SṪÁUTW First Nation (Figure 2 and 31) categorically show the absence of accessible habitats that would support an abundance of animals such as waterfowl, beaver, and elk in the Lower Mainland. Moreover, access to remaining hunted species is highly restricted due to the presence of residential and industrial infrastructure and human populations. SṪÁUTW First Nation members identified private property, residential and commercial development, and harvesting regulations as barriers, and that the presence of people creates safety concerns that prevent them from hunting.

*[In response to being asked whether he hunts in the Study Area]: In the lower Fraser, no. It's too populated. I mean, I've always got rifles and guns on board, but it's for, you know [...] less populated areas [...]. (SṪÁUTW Respondent ID103)*

*And there's too many houses in this area [in SṪÁUTW ÁLENENEZ]. Everywhere, surrounding, so there's no chance of getting back that hunting territory for that reason. Unless you're using a bow, and you're sure about your shot. Other than that, no, no hunting for deer in our territory, because of surrounding houses. You've just got to be careful, mindful of where it's gonna travel and stuff. (SṪÁUTW Respondent ID300)*

Public safety concerns while hunting are ever-present, including outside of the Lower Mainland in SṪÁUTW First Nation territory. For example, SṪÁUTW hunters expressed the need to be vigilant about hikers, even during designated hunting seasons in non-residential areas where hunting is permitted (Evans et al. 2015:114; Evans et al. 2019:40). Perversely, deer—which have atypically increased in numbers (Table 6)—can sometimes be easy to find in urban areas, but accessing places where deer are available

and safety risks are reduced—including on the mainland—can mean incurring significant expenses in time and money with no guarantee of success.

*If was to go hunt up in Duncan and those areas there, I could spend hundreds of dollars and never see one deer, and get back to Victoria and see a hundred” (Tsawout MUS 2015:114)*

Similarly, the availability and accessibility of the sacred surf scoter has declined with time, and the expense to pursue them has risen. As a result, some SṪÁUTW hunters have turned to alternative species of waterfowl which are not seen as adequate substitutes.

Despite the magnitude of these changes in wildlife populations and their accessibility in the Lower Mainland over time, FortisBC’s Application (Section 11.18.5.2 of the Application) indicates that species of importance to the W̱SÁNEĆ Nations and supporting habitats can still be found in and around the Project Footprint, specifically Tilbury Slough. This includes the presence of rabbits, beaver, and waterfowl (“green-winged teal, lesser scaup, Canada goose, mallard”), bald eagle, and beaver, suggesting that while these animals may not be accessible or plentiful, there continues to be an opportunity for recovery.

### Conclusion

SṪÁUTW First Nation has inherent and constitutionally protected Aboriginal and Treaty rights to fish, harvest, and hunt in SṪÁUTW First Nation territory, including in the Lower Mainland. These rights have not been extinguished and continue to be protected despite the considerable level of cumulative effects and access barriers that effectively prevent the meaningful exercise of these rights “as formerly”. SṪÁUTW stresses the interlinked nature of rights and rights practice, which should be understood holistically—tangible and intangible rights are complementary and interdependent; marine, aquatic, and terrestrial ecosystems are connected. The actions of developers and the Crown today have the potential to improve conditions that support SṪÁUTW First Nation rights or alternatively contribute further to the continuation and increasing degradation of these conditions.

### 3.3.2.4 Cultural Use Sites and Areas

#### Definition

FortisBC’s Application does not define the Indigenous interest of “Cultural Use Sites and Areas”; however, the potential effect pathways and associated indicators (Table 11.1-4 of the Application), and topics to consider (Table 11.18-6 of the Application), are indicative that the focus is on:

- Physical resources, sites and locations of cultural (including habitation sites and place names), historical, archaeological, paleontological or architectural value;
- Cultural and spiritual practices, including customs and beliefs; and
- Loss of access to, and disenfranchisement from these sites (including through sensory experiences).

SṪÁUTW First Nation also considers areas in which it has rights to harvest, transmit knowledge, and govern to be cultural use sites and areas, these are discussed in Sections 3.3.2.3, 3.3.2.5, and 3.3.2.7, respectively.

#### Current Condition

##### *Habitation, Access*

FortisBC’s Application concludes in Section 11.18.5.2 that the W̱SÁNEĆ Nations do not “access cultural sites or areas” in or near the Project Footprint, and that no cultural sites or areas have been identified by

the WSÁNEĆ Nations “in or adjacent to the proposed Project Footprint, LAA, or RAA”. SṪÁUTW First Nation disagrees and identifies cultural use rights throughout its territory, including the lower arm of the ŚNEWIL/Fraser River and the Project Footprint.

SṪÁUTW First Nation has exercised rights to access the Lower Mainland, including the ŚNEWIL/Fraser River to fish, hunt, and trade as described in Section 3.3.2.3 and Section 3.3.2.6. The SṪÁUTW seasonal round, as it applies to the Lower Mainland, was anchored by permanent villages at SMOKEĆ/Point Roberts and Boundary Bay, and along established access routes following the ŚNEWIL/Fraser River, Serpentine, Salmon, and Nicomekl Rivers (MacLachlan 1998:173; Fritz, 2016; Vandenberg 1998:19). (SṪÁUTW First Nation emphasizes that access to use sites, facilitated by streams and creeks, would have been much more extensive prior to diking.) Contemporary WSÁNEĆ research has furthermore identified multiple habitation sites in the Lower Mainland in SĆEU, OFEN/Tsawwassen, in addition to those on SMOKEĆ/Point Roberts (Evans et al. 2019:28).

In 1841, Charles Wilkes, the leader of the “1838-1842 US Exploring Expedition,” identified the area around the mouth of the ŚNEWIL/Fraser and around SMOKEĆ/Point Roberts as being inhabited by WSÁNEĆ:

*“The 4th of July was spent near Point Roberts; and on the 5th, the brig reached the mouth of Fraser’s river, ...It is inhabited by the Nanitch [Saanich] tribe, who accompanied the brig thither from Birch Bay” (Wilkes 1845:483).“*

Historical records from Fort Langley between 1827 to 1830 (MacLachlan 1998:34) documented the passage of WSÁNEĆ families up and down the ŚNEWIL/Fraser River, including the transport of wooden planks used in the construction of housing. (Traditional housing was purposely made to be easily assembled and disassembled.)

*Saturday [August of 1927] 25th. [...] Families from the Sanch Village at Point Roberts have been passing in continued succession during the day all bound for the Salmon fishery. Their Luggage as well as that of the other tribes is transported up and down the River on Rafts, which are formed by laying Boards across two or more Canoes Kept 8, 10 or 12 feet asunder. They have also among them large War canoes procured from Indians to the northward, which are used by them as Luggage Boats, and which contain a great Bulk of Furniture & Baggage. The Size of some of these craft is fully 50 feet in length and 6 to 7 ft. across the middle.*

And, in his ethnographic analysis of “The Fort Langley Journals” Suttles notes that “During the fall a group of Saanich camped up the Salmon River, just above the Fort” (Suttles in MacLachlan 1998:173).

One SṪÁUTW First Nation member recalled how families would access the ŚNEWIL/Fraser River and its tributaries—in this case the Serpentine River—to harvest and reach village sites, highlighting both continued use since before the Douglas Treaties and the importance of knowledge transmission to the exercise of rights.

*That’s the one [access point to the Fraser River] that our family used. [...] Our family used that one, and that’s as much as my father told me. But a lot of them went up the Fraser, paddled up the Fraser to the village site there. [...] I think a lot of it had to do with family knowledge. A lot of it was the family knowledge knew of this area, so our family traditionally used that Serpentine River as a good way to access the river and access the resources along the Serpentine River, ‘til they got to the Fraser River, and then go down to the village. (SṪÁUTW Respondent ID100)*

*They would fish from where the Serpentine River met the Fraser. They would fish there all the way down to the traditional fishing village that was on the right side of the entrance to the Fraser River. There was a WSÁNEĆ fishing village on the right side of the mouth of the Fraser. So, they- my [personal relation] said they used to go up there to the Serpentine River till it got to the Fraser, and*

*then they'd come down. They'd fish on the way down to the village that was there that was recognized as a WSÁNEĆ fishing station. So that was on the right side of the mouth of the Fraser. (SṪÁUTW Respondent ID100)*

The historical exercise of rights by SṪÁUTW ancestors and relations in the Lower Mainland is also evinced by numerous place names in the region. Some are associated with geographic features like river mouths and bluffs, as well as fishing and fish processing locations, and sacred sites. One SṪÁUTW First Nation member notes how SĆEU,ŌFEN/Tsawwassen itself is a WSÁNEĆ name and location of a village.

*Tsawwassen is actually a WSÁNEĆ name. And it referenced their fish camp. But the original village was Tsawwassen, was a WSÁNEĆ village. [...] A lot of the people that went over there to participate in the reef net site, a lot of the families stayed there. So it was a continuous village. [...] Some of them just stayed there during the height of the fish season, and then came home, but then certain families stayed there year-round. (SṪÁUTW Respondent ID100)*

The SṪÁUTW have therefore resided on the Lower Mainland and used and relied on the ŚNEWIL/Fraser River and its tributaries for travel, trade, and harvesting for generations, and continue to hold protected rights to do so today.

It is however no longer possible for SṪÁUTW First Nation to exercise rights related to village sites or to carry on fishing and hunting as formerly in SṪÁUTW First Nation territory in the Lower Mainland. (As previously noted, access over the water is also an important component of SṪÁUTW harvesting and subsistence rights.) This is predominantly due to rapid and intensive urbanization, industrialization, and settlement of the region as discussed in Section 2 and 3.3.2.3.

Colonization and settlement also disrupted permanent SṪÁUTW village sites, temporary habitations sites, and access in the Lower Mainland, including in SMOKEĆ/Point Roberts where squatters displaced reef net fishers, forcing them to relocate to Goodfellows Point (Evans et al. 2019:20).

*This is our homeland. I can still hear my Mother saying, where shall we camp tonight. Oh, this is a good place here, we'll camp here. Now it doesn't matter which beach you go to, you'll be asked to leave. Because it's all private beach. (SṪÁUTW Respondent ID111)*

SṪÁUTW First Nation villages in the Lower Mainland are now surrounded or taken over by urban populations, industry, agricultural operations, parklands, and more, precluding the ability to live, hunt, and harvest in these locations and in preferred ways.

Burns Bog, for example, is a relatively large green space near the Project. While it is an example of a relatively intact habitat that supports a variety of wildlife and plant life, it is mostly closed to the public for conservation reasons. Consumptive activities are prohibited in the areas that are accessible to the public. This means that the entire Burns Bog, although likely one of the more suitable areas for harvesting, is inaccessible to harvesters. Other areas, like the South Arm Marshes, have mixed regulations: it is possible to hunt in some parts of the Marshes, but not permissible to camp overnight.

A pointed example of how colonial structures and governance has impacted rights to habitation and access is the creation of the international border beginning in 1846 (and refined through subsequent agreements), which divided the WSÁNEĆ and alienated Canadian WSÁNEĆ from villages in the modern-day United States.

*ID100: In Blaine. There was, practically right where the city is and continue down to where the border is there [points at map]. And see where the Peace Arch border [crossing] is, then it ran down and right along the beach, through Blaine. Practically to the end of the town area. That was all WSÁNEĆ village. And some of our people stayed on there. And we still relate to them, because they*

*were actually moved off of the village when the border was created. And most of them ended up in Semiahmoo on the other side of the border. And some of them went to Lummi.*

*Interviewer: Did you say the name of that village site?*

*ID100: Let's see... SENȚE, EŁEŁ and there was two, well there was a couple of names there that, SWÍNEM, SENȚE, EŁEŁ, and ĆIWOK. All three were kind of parts of the same village. So those were the ones that our people stayed in. And most of those people that were living there were involved in the reef net site. But everyone knew, clearly, that that was a WSÁNEĆ village. They spoke our language and still do, yeah. But they were removed from their land, and most of them went over to Semiahmoo First Nation on the Canadian side, and some of them went to Lummi.*

*Interviewer: So, this happened when the border was—*

*ID100: Created [nods]. Yeah. And the Americans don't recognize the Nation there.*

Moreover, the ability to travel the Lower Mainland in the absence of colonial restrictions and/or barriers created through development has disappeared. This includes seemingly quotidian boating regulations to large-scale engineered changes to watercourses and waterbodies.

In terms of landscape-level changes impacting access, a SṪÁUTW First Nation member identified a canoe route along the SNEWIL/Fraser River as far as what was formerly Sumas Lake before it was drained in the 1920s to create farmland. They recalled hearing stories about WSÁNEĆ ancestors camping on an island in the middle of the lake and bringing items to trade with other Nations:

*Through some of the stories, they've been as far as Sumas, the Kilgard reserve. There used to be a lake that they drained. They have a pump station on the State side, and they have a pump station on the Fraser Valley side. They used that to drain the lake, but the Saanich people used to go and spend time with the people there in the summertime. They had an island in the middle of the lake that they used to spend time on. These are stories that I've just heard from over the last five to ten years. It was a big, big lake, and the flooding that happened in Abbotsford was a result of the pump station being overwhelmed, and then the dikes breaking. So, they talked about refilling the lake. It could be an option yet. But that's how far the Saanich people used to travel. Historically, I've talked to some of the Elders there, and they would always talk about our people coming up there, camping, spending time with them. [...] I think it might have been the barter system at that time. They'd bring things from the [Vancouver] island over to that part [of the mainland]. (SṪÁUTW Respondent ID101)*

Among the greatest source of impacts to SṪÁUTW First Nation members' right to travel in the Lower Mainland by water comes from the presence and activities of commercial and recreational users/vessels (see Section 2.5). One SṪÁUTW member remarked, for example, on the impact of colonial commercial crabbing on navigation in SṪÁUTW First Nation territory, saying, "I can't steer my boat in a straight line for 100 feet without having to swerve to avoid tangling my prop in a commercial crab fisherman's buoy."

Large vessels are also an omnipresent safety risk in and near the shipping lanes that transit SṪÁUTW First Nation territory, affecting the exercise of fishing rights and experiences on the water. These risks have affected the ability of SṪÁUTW to travel and harvest on the waters of SṪÁUTW First Nation territory directly and indirectly, not only to fish but also hunt waterfowl.

*Our fishermen showed how the shipping through our territory has created damaged areas as a result of the passage of huge ships through our territory. I guess the poor quality of sea life through the shipping lanes compared to other areas. Also, the danger that it created to our fishermen when they're out in the water and these huge ships go by. They curtail their fishing, sometimes on short notice. (SṪÁUTW Respondent ID110)*

Importantly, even where limited physical access and resources may exist, sensory disturbances have disrupted access and use of resources and sites in preferred ways (Evans et al. 2015). This includes the cumulative effects of reduced air quality, and more noise and visual disturbances development and urbanization in the Lower Mainland. Among the consequences are the loss of privacy necessary for the exercise of spiritual and ceremonial practices, lost sense of safety, and disturbed soundscapes that interrupt or disrupt cultural teachings on the land and water, and adverse effects to sense of place and identity.

#### *Beliefs, Place Names, and Ceremony*

The exercise of SṪÁUTW First Nation rights in the Lower Mainland is governed by SṪÁUTW laws (which are discussed in greater depth in Section 2.3.2.5). Concepts and beliefs around kinship with nature (Claxton 2015:69–70; Turner 2005) and responsibilities to community and family are foundational to SṪÁUTW First Nation governance, crosscutting harvesting practices and customs; trade and inter/intracommunity relations; responsibilities and means of stewardship; and more.

*Traditionally in WSÁNEĆ it was taught that all living things were once people, and shared with us a special knowledge about how to live. (Claxton 2015:37)*

The origin story of “how the mountains were created” (SṪÁUTW First Nation 2024) is provided below to illustrate the concepts of responsibility, kinship with the natural world, and equivalence between belief and law (emphasis added in bold).

*The Creator paddled over to the east side of the [SṪÁUTW] village and found some shiny black stones on the beach. He threw one inland, and a mountain grew out of the stone. He filled his basket with more shiny black stones and went to the top of this mountain. And, then people followed him up to that mountain and there's a rock face cliff on the mountain where they went. Once there, he threw more shiny stones around him and that's how the other mountains came to be. And, then when he was finished with that work, and then he grabbed some of our people, one by one, our ancestors, and he threw them out into the straits. And, as he tossed them out into the straits he said “QENT E TFEN SCÁLEĆE, QENT E TFEN SCÁLEĆE, QENT E TFEN SCÁLEĆE, QENT E TFEN SCÁLEĆE”: “Look after your relatives, look after your relatives, look after your relatives.” And, as he threw them out into the straits, and as they landed into the straits, and then they became those islands that are still there today. What they call the Gulf and San Juan Islands. Those were our original ancestors that got changed by the Creator. **These directions to look after our relatives are our laws. These are the kinds of things we speak about with respect to the Natural Laws. For us, a belief and a law are the same.** The names we have for different parts of the natural world are in relative terms. For instance, the SENĆOFEN word for Salmon is older cousin, while the SENĆOFEN word for deer is grandson. The word for Island means “Relative of The Deep.” Our word for Rock, Boulder and Mountain means “My gift”. Our word for Earth means “Wish for the People.*

Care for human kin and community similarly permeates SṪÁUTW culture and ways of being, including in spiritual and ceremonial practices. One example is the act of providing for the longhouse and the specialized and specific roles that are passed from generation to generation (see also Section 2.3.2.3 and Section 2.3.2.7).

*Certain things are things that are passed down in the longhouse where there's only certain people that make the fire, certain people that gather the wood. We all know which families belong to the ones that look after the fire, and those are the people that we look to when something like that happens... But it's something that's been passed down to them. There's a lot of things that are involved in the longhouse that are only allowed to be done by certain families. You have to have that right to carry out that work in the longhouse. There's a lot of different ceremonies that belong*

*to a lot of different families, and amongst their line are the only ones that are allowed to do that. It's something that's just passed down from generation to generation, and carries on the tradition. The basis of the longhouse really reflects the culture of helping one another. And then teaching a person how to help themselves. (Eric Pelkey Interview 2014).*

Like stories, place names embody cultural knowledge, history, beliefs and customs, and practices associated with place. For example, as explained by a SṪÁUTW First Nation member, ŚÁWOM is a place name attached to a sacred and ceremonial place on SMOKEĆ/Point Roberts and linked with the start of the reef net fishing season:

*I think that one of the [sacred ceremony] sites that they always went to when they went over there to the reef net sites was right on the point of Point Roberts. A little area that they went in, they said they did their ceremony there before the reef net season began. [...] ŚÁWOM, it was called. [...] ŚÁWOM was a sacred place where they used to conduct their ceremonies, in relation to the reef net site. So, whenever the people went over there, they always went in there. And did their ceremonies first, before the reef net setting began. So that there was considered a sacred area right there. (SṪÁUTW Respondent ID100)*

SEŃCOFEN place names frequently identify key resources and contain descriptive features for orienting the land that have assisted SṪÁUTW First Nation's stewardship and use of ancestral homelands for millennia. As described by SṪÁUTW scholar Nicholas XEMFOLTW Claxton:

*There are many, many names and stories connected to the WSÁNEĆ territory in the SEŃCOFEN language. My uncle would tell me that our place names defined our territory. The extent of our place names was the extent of our territory. I think that you could also say that this was the extent of our relationship to the territory. There is a vast knowledge contained and encoded in the SEŃCOFEN language and in our place names (2015:78).*

SEŃCOFEN place names in the Lower Mainland no longer reflect the conditions of their genesis. This is illustrated by the SṪÁUTW member quoted above, who goes on to say of the sacred reef net site:

*[Personal Name] was the last one I knew that conducted the ceremony. And before him, it was his [personal relation], Chief [Personal Name]. And they were the last ones that I knew that carried out the ceremony there. [...] That would've been around 1910, 1915 when he was saying that he went over and did the ceremony. (SṪÁUTW Respondent ID100)*

Additionally, ceremonies like the potlatch (which was banned in 1884 through the *Indian Act*) and Salmon Ceremony that are dependent on successful harvesting and trade systems (e.g., to obtain mountain goat wool and craft blankets) have been impacted directly and indirectly by the cumulative effects of colonization, industrialization, and urbanization. Ceremonies and spiritual practices in general should be understood to be dependent and connected to healthy natural resources, including water, plants, and animals.<sup>15</sup>

*The material is all a part that makes us who we are, the fishing the medicines, the water. [...] when we lost my dad, she told us to be ready at day break and then she took us into the salt water and bathed us, to wash away the death spirit from our bodies. See, that's a component that makes us [SṪÁUTW]. (SṪÁUTW Respondent ID111)*

*There's definitely a disconnect. I mean – no salmon, and certain species, it's... You don't have your traditional foods [...]and we've brought back the Salmon Ceremony, right? [...] Everything is tied*

<sup>15</sup> It should be noted that many ceremonial rites and practices are considered sacred and confidential and therefore inappropriate for public venues such as this report.

*together, right? It's all connected. So, when you affect one, it's going to have an effect on the other. (SṪÁUTW Respondent ID103)*

*We are the ones that is suffering because there is no more ducks for us. The longhouse people, when they have an initiation, they gotta go into Victoria and buy feathers. (SṪÁUTW Respondent ID111)*

*Like I said, I spoke to [name redacted] about black ducks and all those edible things that we used to use for our ceremonies, our food, everything. He said it is the same thing over there. No more ducks, no more of anything. Now we all know that, anyways, [names redacted], the delicacy of the soup that we used to eat, duck soup. I couldn't wait to eat duck soup. Now, we can't enjoy that. It doesn't matter what we are going to get, whether we get one dollar, two dollars or a hundred dollars, or a thousand dollars, for these impacts. This is the impact, that's what happens since the occupation of the WENITUM. The very thing that we depended on for our food, our ceremonies, now endangered to below average. It gives us a pretty bleak look of what has happened in our territory. (SṪÁUTW Respondent ID111)*

Today, as explored in Section 3.3.2.3, SṪÁUTW First Nation members cannot exercise rights to hunt and trap in the Lower Mainland due to land use changes and changes in land cover, access and hunting restrictions, and loss of animal populations. In turn, social and trade relationships have been impacted, such as those established through potlatching, which is a complexly integrated part of traditional exchange, politics, and governance.

## Conclusion

SṪÁUTW First Nation has inherent and constitutionally protected Aboriginal and Treaty rights to occupy and travel SṪÁUTW First Nation territory in the Lower Mainland, and to engage in ceremonial and spiritual practices and live by the Nation's laws. The cumulative effects of 150+ years of colonization, settlement, and development have effectively alienated SṪÁUTW First Nation members from the Lower Mainland and made it impossible to meaningfully exercise these rights. Areas of SṪÁUTW First Nation territory have been made inaccessible and there are numerous barriers to free travel as formerly. Beliefs and ceremonies rooted in the principles of kinship and respect are more difficult than ever to apply especially due to—but not limited to—the absence of sufficient resources (e.g., that are essential or the basis of many ceremonies) and existing levels of sensory disturbance. SṪÁUTW First Nation aspires to the recovery and revitalization of these rights across the territory.

### 3.3.2.5 SṪÁUTW First Nation Governance Systems

#### Definition

FortisBC's Application does not define the Indigenous interest of "Indigenous Governance Systems"; however, the potential effect pathways and associated indicators (Table 11.1-4 of the Application) are indicative that the focus is on:

- Changes and effects to Indigenous Nation laws, customs, and protocols and their implementation;
- The ability to use, develop, and control traditional land, territories, and resources; and
- Ability to steward lands and resources.

#### Current Condition

FortisBC did not assess for potential Project impacts to SṪÁUTW First Nation governance. SṪÁUTW First Nation clarifies for certainty that the Nation has governance rights in the Lower Mainland that are relevant

to the Project, including implementation of laws, customs, and protocols related to stewardship and the well-being of future generations.

*The WŚÁNEĆ people's relationship to the land is governed by laws, teachings, and beliefs that come from XÁLS, the Creator. These laws were put in place so that we could live with one another and with the land in a good way. This is what is known as SKÁLS (our laws and beliefs). [...] For the WŚÁNEĆ, the laws, beliefs, the SÉNCOFEN language, and the land were all part of our ČELÁNEN, our birthright. WŚÁNEĆ Elders maintain that our ČELÁNEN, as a concept, cannot be ceded, sold, given away, or, most of all, forgotten (Claxton and Price 2020:119)*

SṪÁUTW First Nation territory spans the San Juan and southern Gulf Islands, from Southern Vancouver Island across the Salish Sea to the Lower Mainland, as well as other areas further north on Vancouver Island. Since time immemorial, SṪÁUTW and SṪÁUTW ancestors stewarded and benefited from the resources in the territory.

As one of the five Nations who constitute the WŚÁNEĆ peoples, SṪÁUTW First Nation and other WŚÁNEĆ Nations have a shared identity as Saltwater People who relied more on saltwater resources than their Salish neighbours (Elliott and Poth 1990; Suttles 1974:61). To control access to important fisheries the WŚÁNEĆ would occasionally go to war, including on the mainland:

*Well, right there on Point Roberts, you can see there's- off to the right at the point there, there's a reef net site there that our people felt was really historically important to us, and part of the rights that we held in that area. And it was called ČEL,ŁTENEM. And that was right off the point there... It was probably 300 yards off to the south of Lily Point Beach. So that area there was one of our people's most productive reef net sites. A lot of our families used to go there. And we actually went to war over that reef net site because the northern tribes knew about that reef net site, and they wanted to come and take it over. So, our people had a bit of a war out there with them. We were told that some of them were K'ómoks people, and some of them were Haida. Yeah, they came there, and they tried to raid the site and take it over. But our people fought them off. And many of our people died there at that site but kept it for the WŚÁNEĆ people. That would've been probably early 1850s. Somewhere around there. (SṪÁUTW Respondent ID100)*

Access and control of fisheries also involved negotiation and fostering of agreements rather than force, including in areas of the ŚNEWIL/Fraser River.

*There was also a fishing village up there. [...] It was just south of Chilliwack along the Fraser River [...] [W]here the Chilliwack people had an agreement with the WŚÁNEĆ people that they were allowed to have a fishing station there. In that area. And that's kind of easy for us to find now, cause it's an industrial area. So, my [personal relation] in Chilliwack took us down there, and he said this is the area that we had an agreement with the WŚÁNEĆ people that when you came here to fish, you wouldn't be bothered by the Chilliwack people. [...] (SṪÁUTW Respondent ID100)*

Given the sacred relationship between SṪÁUTW and salmon— SṪÁUTW relatives who sustain both body and spirit—many SṪÁUTW laws are rooted in the principles of respect, reciprocity, and balance embodied in fishing and the cycles of the 13 moons (of the WŚÁNEĆ calendar). These principles extend beyond the waters, guiding conduct in all domains of life. For example, the "Origin of the SXOLE" (reef net fishery) story, as told by Earl Claxton Sr. and John Elliott Sr (1994:6–8) features the law to uphold reciprocal and respectful relationships with all living things.

*It is the belief of the Saanich people that all living things are our relatives and that long ago, the birds, animals, trees, and fish too were people just like ourselves and must be respected.*

*The Saanich people have fished this ancient fishery for a long time and have been taught as young people to respect all life as if they were our very own relatives.*

Consideration of how decisions today will affect current and future generations is a related and central tenet of SṪÁUTW law. Stewardship of the territory ensures the continued abundance of resources like salmon, clams, and eelgrass for the community, and for generations to come (Claxton and Sam 2010). An example of how these laws—care for both human and non-human kin—manifests in the day-to-day and ceremonial activities and decisions of the SṪÁUTW is expressed below:

*Our sacred knowledge, we would only take what they needed. Even when I fished with dad, out here, there was one day that we caught 70 sockeye in 2 hours, and I was trawling, but he would separate them, he would sell some of that to buy things that he needed like sugar and flour and then he would keep enough to feed the family for the season. So, they already did that, they traded. They would also help out ones in the community that weren't able to do that. (SṪÁUTW Respondent ID102)*

*All WSÁNEĆ honoured the king of salmon by pulling up their reef nets and ceasing to fish for a period of up to ten days after the first FEK̓I was caught. (Evans et al. 2019)*

SṪÁUTW also take care to steward land animals, and for this reason, “Elk were only hunted after the first snowfall as it was easier to track an elk if it was wounded. This way no meat would be wasted” (Claxton and Elliot 1993:23).

These foundational beliefs and principles of kincentric relations, stewardship, and responsibility to community and future generations permeate many aspects of SṪÁUTW lifeways, from the design of fishing equipment,<sup>16</sup> to resource sharing protocols (see Section 3.3.2.6), to the Nation’s future governance objectives and goals.

Despite the level of cumulative effects and impacts to SṪÁUTW First Nation rights already experienced in the Lower Mainland, SṪÁUTW First Nation governance includes a desire to steward and revitalize the land, waters, and resources of the region to allow for the meaningful exercise of land and harvesting rights as protected by the constitution and described in Treaty, now and into the future.

In the context of intensive development that is easily observed in the Lower Mainland, SṪÁUTW First Nation cannot meaningfully govern and steward the territory and its resources in ways that uphold SṪÁUTW First Nation rights. This has the additional consequence of preventing the Nation from carrying out its laws, customs, and protocols that are embedded in the exercise of land and harvesting rights and other rights (e.g., sharing of surplus resources or trading from a successful hunt or harvest).

A SṪÁUTW member notes how these disruptions to SṪÁUTW governance are obvious and in breach of the Douglas Treaties:

*The Douglas treaties explicitly state that those indigenous groups signatory to the treaties have the “liberty to carry on their fisheries as formerly.” If taken literally, those indigenous peoples had a system in place, a system of governance over their fisheries, which indeed formed the core of their traditional societies. These traditional fisheries and their subsequent structures of governance and management should conceivably be still intact today, which is overwhelmingly not the case. To the*

---

<sup>16</sup> As explained by Nicholas XEMFOLTW Claxton (2015:74), the escapement hole in the reef net—called “SHELIS,” which means “life”—not only ensured that salmon populations remained stable and healthy but also embodied SṪÁUTW teachings and principles of governance: “inherent in the technology was a system of governance over the salmon fishery and salmon resources. Because of the WSÁNEĆ Reef Net fishery, the WSÁNEĆ had the ability to live according to the teachings of our creator, XÁLS. The Reef Net fishery was a way of life, providing the Saanich the ability to live in such a way to be strongly connected in a healthy manner to the local marine and terrestrial environments. This was the way we lived for thousands of years, if not more”.

*contrary, indigenous fisheries were not protected as promised. (Nick Claxton as quoted in Evans et al. 2019:8-9)*

Evans et al. (2015:70–71) further describe how fishing, fish resources, and sharing are intertwined and embody roles, customs, protocols, traditions, values, and a way of life passed down through generations.

*It is a part of SḴÁUTW's self-actualization, enactment of identity and kinship, and celebration of the good life. It enables access to cherished food from familiar places, given and received by equally cherished family members, who in turn enact traditional roles and values by sharing. In this way SḴÁUTW's fishery is both the expression and the backbone of members' ȚEX TÁLEN, or the sum of the traditions inherited from their ancestors. [...] [As a SḴÁUTW member explains], traditional foods deserve special treatment, and do not fall into the same category of meaning as food from the grocery store, which are not subject to the same system of sharing and reciprocity.*

The current level and trend of cumulative effects and impacts in the Lower Mainland on SḴÁUTW First Nation rights is inconsistent with the Nation's governance principles and ideals, including care for future generations and stewardship of all living relatives in nature.

*Just looking at the map, and remembering how fishing was...You know, the Fraser River was so abundant, and it was so healthy, you know? [...] But there was an abundance of salmon back then. And it's slowly gotten worse over the years. (SḴÁUTW Respondent ID103)*

The depleted state of salmon in the ŚNEWIL/Fraser River is emblematic of resource losses experienced by the SḴÁUTW First Nation across marine and terrestrial environments. And, as articulated by the SḴÁUTW First Nation member quoted above, "the sad thing is, they're not being enhanced, or they're not being helped"—highlighting how current and reasonably foreseeable future cumulative effects contravene the Nation's governance objectives and laws.

Much of SḴÁUTW First Nation territory has been taken up by private property and other land uses that are incompatible with the SḴÁUTW way of life and the exercise of rights. The degree of settlement and taking up of lands in SḴÁUTW First Nation territory has far exceeded what the Douglas Treaties contemplated and left few viable sites for hunting, fishing, and cultural practices. Pollution and other impacts of development have also reduced the capacity of SḴÁUTW First Nation territory to support adequate populations of fish and wildlife that are suitable for harvest and consumption (SḴÁUTW First Nation 2024:11).

In sum, cumulative effects and colonial governance have disrupted community and intercommunity social conditions (see Section 2.3.2.6 and 2.3.2.8 for additional details). As well as the impacts of the Canada-USA border, SḴÁUTW First Nation members have expressed that modern-day governance (treaty) processes have adversely impacted traditional protocols and relationships between the WSÁNEĆ and other First Nations:

*The treaty process, the BC treaty process, [has] really divided our families and our Nations. Because it's undermined the traditional protocols that we had between each other. And undermined our relations that we had with each other. Because prior to the BC treaty process, we had good relationship and understanding between each other. [...] And as a result of the BC treaty process that's undermined all of those historical protocols that we had, resulted in a kind of lack of respect for each other. Respect for what our Elders had attained. (SḴÁUTW Respondent ID100)*

## Conclusion

SḴÁUTW First Nation has inherent and constitutionally protected Aboriginal and Treaty rights to self-determination and self-government. SḴÁUTW First Nation governance is founded in principles of kinship,

respect, and stewardship, as well as responsibility to future generations. These governance principles are part and parcel of land and harvesting rights and rights practice. Colonization and colonial institutions, and settlement and development across SṪÁUTW First Nation territory, including the Lower Mainland, have directly obstructed SṪÁUTW First Nation from implementing and applying its laws. Large-scale losses of natural resources have also impacted the ability of SṪÁUTW First Nation to implement these governance principles and cultural beliefs manifest in customs and protocols of resource harvesting and use. SṪÁUTW First Nation continues to have strong interest and rights to revitalize SṪÁUTW governance. The actions of developers and the Crown today have the potential to support SṪÁUTW First Nation governance or alternatively further contribute to their disruption.

### 3.3.2.6 Social and Economic Conditions

#### Definition

FortisBC's Application does not define the Indigenous interest of "Social and Economic Conditions"; however, the potential effect pathways and associated indicators (Table 11.1-4 of the Application), and topics to consider (Table 11.18-6 of the Application) are indicative that the focus is on:

- Employment and job opportunities;
- Intercommunity and trade relationships; and
- Includes the ability of Nations to improve social and economic conditions and future aspirations for the area surrounding the Project.

Topics related to harvesting rights and intracommunity relations are also listed but for the purposes of this assessment are detailed in Sections 2.3.2.3 and 2.3.2.8 respectively.

#### Current Condition

This Section (3.3.2.6) adds new information and context to FortisBC's summary of SṪÁUTW First Nation demographics, health and wellness, emergency services, housing, education, infrastructure, economic and employment data, and plans, agreements, and land use plans (currently found in Sections 11.18.2.5 to 11.18.2.16 of the Application).<sup>17</sup>

SṪÁUTW First Nation has protected rights to self-determination and self-government from which stem rights and interests to maintain, improve, and develop the Nation's social and economic institutions and conditions. As elaborated in preceding sections of this assessment, harvesting and subsistence rights and governance rights are intertwined, including with the Nation's social and economic outcomes.

The traditional economy of SṪÁUTW First Nation—and many important relationships with other Nations—centred on the harvest and subsequent disbursement and trade of marine and terrestrial resources. This predominantly involved salmon, but also clams, herring, deer, elk, beaver, wool, and more.

*The WSÁNEĆ people would trade with the inland tribes. Because we caught salmon in the Straits we were the first people each year (about a month ahead of other tribes) to have salmon; others had to wait for the river runs. (SṪÁUTW Respondent ID111)*

*[M]y grandfather and his brothers and sisters were saying that they used to travel ... all the way to Yakama and they'd trade people, cause the Yakama people used to love the smoked herrings. They used to make necklaces out of them, and also necklaces out of dried clams. Smoked clams. Make*

<sup>17</sup> Due to constraints of time and budget, SṪÁUTW First Nation has not verified the accuracy and veracity of Sections 11.18.2.5 to 11.18.2.16 of the Application.

*them, and they'd dry them up, and when they'd go to places like Yakama, the people would just swarm over them, and buy them up, or trade with them. (SṪÁUTW Respondent ID100)*

The WŚÁNEĆ economy was also elaborated on in the WŚÁNEĆ Traditional Use Study for RBT2 (Evans et al. 2019), which described how different WŚÁNEĆ families support one another through complementary harvest and exchange. Indeed, SṪÁUTW social and exchange networks continue to increase food security—especially for those who do not have the means to harvest—and support social bonds and well-being (Evans et al. 2019:37,74).

*WŚÁNEĆ families — sharing language, cultural order, kinship ties, and participating in close networks of reciprocity — exploited different ecological niches within the WŚÁNEĆ world, tailoring their seasonal movements according to the timing of local events. This pattern meant that one family knot could acquire through trade with another family knot what could not be procured locally, an arrangement that [...] continues to this day. (Evans et al. 2019:6)*

The once abundant salmon runs at SMOKEĆ/Point Roberts and along the ŚNEWIL/Fraser River and its tributaries provided the WŚÁNEĆ/SṪÁUTW peoples with a surplus that could be traded for mountain goat wool and other prized items. Game, S,ELLTENEN/,berries, and medicinal plants harvested along the waterways also supported the SṪÁUTW economy, prosperity, community well-being, and food security. However, the cumulative influences of settlement, development, and colonization have disrupted the SṪÁUTW First Nation's traditional economy and trade relationships.

*In the old days we had our traditional blankets. In the old days we had SWOKOL [traditional weaved blankets out of mountain goats and dog wool]. That was our money for trade and barter...We use those blankets to honour the individual. That was trade for us...That kind of trade is gone. (SṪÁUTW Respondent ID120)*

Resource abundances and access to the Lower Mainland are now inadequate to generate reliable surpluses that would support trade and often even household and internal community needs (see Section 3.3.2.8).

*It [referring to fishing regulations] really undermined the way of life for our people, and the economy of our people, the trade that we used to have. That we used to enjoy. That gave us a moderate living. Kind of drove a lot of our families into poverty, and some of them even into starvation. Because they couldn't get what they needed anymore. Everything was being deemed illegal. And they were allowed sustenance fishing, but even that was limited. (SṪÁUTW Respondent ID100)*

*And as I get older now, it's just – like, this summer is gonna be pretty much non-existent, and a lot of the nations that rely on sockeye for smoking or for canning, or whatever, now we're starting to rely on [Port] Alberni sockeye, because it's still healthy. And, you know, thankful for Nuu-chah-nulth family out there, we can still get that, right? (SṪÁUTW Respondent ID103)*

Among the myriad colonial regulations and restrictions against Indigenous peoples that severely impacted social and cultural well-being—including enfranchisement, the pass system, and the creation of reservations—some also directly targeted “economic” activities including the Indigenous pre-emption of land from 1866-1953; the potlatch ban of 1884 under the *Indian Act*; and regulations and legislation (including the *Fisheries Act* in 1888) preventing “Indians” from selling fish and fishing commercially. Harvesting and economic rights have moreover been dislocated by the imposition of the Canada-USA border, which “alienated Coast Salish communities in both countries from their extensive kin networks and large portions of their territories” (Fritz 2016).

The wage economy is today a dominant force in the lives of SṪÁUTW First Nation members, a consequence of colonization and assimilative Crown policies. To advance the modern economic well-

being of members and the community, SṪÁUTW First Nation is engaged in diverse economic ventures including through Ȳetcéle ICC Construction Corporation, Sidney Whale Watching, Cascadia Seaweed, Sidney Spit Ferry, Salish Straits Seafoods (a commercial fishery part owned by SṪÁUTW), K'ENES Transportation, and CWT City West Cable Corporation.

Although there are benefits to participation in the modern economy, such as access to modern conveniences and a wider range of goods and services, it is not a substitute or replacement for the traditional economy and relationships. Benefits of the wage economy moreover are not guaranteed or equitably distributed, as observed by one SṪÁUTW First Nation member, below:

*Yeah, that's the WENITEMS culture that's invading our own people. And it's literally taking over and I thought about it, I talked about it yesterday with some of our members walking down from the convenience store up there, packing alcohol and I kind of thought about it and I think, well, what else can they do? They have applied for jobs, they have done everything that they could possibly do and they can't find a job. So they do what they are doing now, and that's what's happening, that's us being impacted by the WENITEMS way. (SṪÁUTW Respondent ID111)*

Given the interconnected nature of SṪÁUTW First Nation rights with environmental conditions, an objective of SṪÁUTW First Nation governance is to seek the improvement and revitalization of the Lower Mainland's ecosystems that support the SṪÁUTW First Nation's exercise of harvesting and access rights, with associated improvement in cultural, social, economic, and health conditions (see also Section 2.3.2.8). Improvement in ecosystem health and resource abundances would have the added benefit of mitigating against the rising cost of access to resources (including time, licensing, fuel, price of and dependence on storebought food). This objective applies to conditions at and near the Project Footprint, where industrial and urban development have a noted multi-decadal history that has led to the alienation of SṪÁUTW First Nation from the use of these lands; see Section 1.3.3 of the Application, from which a passage is excerpted below.

*The entire proposed Project Footprint is located within the existing Tilbury LNG facility, which was previously used for agricultural purposes in the early part of the 20th century. In the 1970s, the agricultural fields were converted to a sawmill on the western half of the Tilbury LNG facility, and the eastern half was converted for use as natural gas processing and storage. Currently, the existing Tilbury LNG facility and proposed Project Footprint are covered by concrete surfaces, gravelled and paved areas, existing infrastructure, and equipment laydown areas, with very little to no habitat value for wildlife.*

Rather than revitalizing Tilbury Island and regenerate native ecosystems,<sup>18</sup> FortisBC's recent and ongoing development at the site, including through Phase 1A and 1B expansions, are in direct conflict with SṪÁUTW First Nation's governance aspirations and linked improvements in economic and social conditions. It is in this impacted context that the Project is being proposed.

## Conclusion

SṪÁUTW First Nation economic and social conditions and rights are closely related to SṪÁUTW self-determination, as well as the ability to exercise harvest and land rights that in turn depend on healthy ecosystems. The traditional economy of SṪÁUTW First Nation that centres on the harvest, sharing, and trade of marine and terrestrial resources can no longer be exercised in a meaningful way in the Lower Mainland, disrupting food security and intercommunity relationships. The actions of developers and the

---

<sup>18</sup> As noted by FortisBC in Section 11.18.5.3 of the Application, "vegetation within the existing facility site will be removed by construction activities associated with the existing Tilbury facility and the T1B project".

Crown today have the potential to support SṪÁUTW First Nation social and economic aspirations and outcomes, or alternatively continue their disruption.

### 3.3.2.7 Cultural Continuation

#### Definition

FortisBC's Application does not define the Indigenous interest of "Cultural Continuation"; however, the potential effect pathways and associated indicators (Table 11.1-4 of the Application) are indicative that the focus is on:

- Opportunities for intergenerational knowledge transmission as linked to experiences on the land and availability of country foods, including the revitalization and development of these opportunities; and
- Integrity of sense of place and identity.

#### Current Condition

SṪÁUTW cultural persistence is underpinned by the ability to transmit learned and accumulated knowledge across generations. Transmission can take many forms. For SṪÁUTW First Nation, oral (histories, language, place names) and experiential transmission are important to cultural continuance. Therefore, impacts to conditions that support the activity and direct experience of gathering and using medicines, for example, such as abundant and accessible medicinal plants, are also impacts to knowledge transmission. And because knowledge transmission is applicable to the whole body of cultural knowledge, it cuts across all SṪÁUTW First Nation rights and interests.

SṪÁUTW and WSÁNEĆ members have previously conveyed—in the context of other developments—experiences learning from knowledge holders or teaching while on the land and water and through stories. These accounts, some of which are shared below, pertain to hunting, fishing, navigation, and knowledge about ways of being; they also communicate the desire to perpetuate, preserve, and use cultural knowledge into the future.

*To successfully catch salmon using the reef net, the Saanich fishermen had to be keenly aware of tidal flow and the location and habits of the salmon...Reef net fishing locations, called SWALET in the Saanich language, were the birthright of the Saanich people and fishermen ...The elders of the family was usually the captain of the fishing crew, and held the knowledge and history that connected the family to that fishing location, and it was their responsibility to transfer that knowledge on (Claxton 2003:25–26).*

*I'm also trying to influence the younger community to become hunters. I'm always trying to teach them [...] I'm always bringing people over, even if it's just to pluck ducks or something like that, I'm always trying to show them something. (Tsawout MUS 2015:112)*

*Back and forth, back and forth, from Sturgeon Bank down to Roberts Bank. (TUS2, as quoted in Evans et al. 2019:27)*

*I still go to all these places; my grandpa taught me how to utilize [them]. (TUS331, as quoted in Evans et al. 2019:27)*

For SṪÁUTW First Nation members, opportunities to transmit cultural knowledge are highly correlated with opportunities to exercise rights. In the context of the Lower Mainland, this has meant a 150+ year decline in such opportunities. This trend in WSÁNEĆ territory and its implications for cultural practice and transmission was already documented by the BC provincial government 30 years ago in a study of the Saanich Inlet—a far less densely developed and populated area than the Lower Mainland.

*The traditional structure of Saanich culture is threatened due to the loss of cultural traditions associated with natural resource use, spiritual activities and lost opportunities for aboriginal youths to experience traditional practices (Simonsen et al. 1995:49).*

SṪÁUTW First Nation members recall participating in cultural teaching and learning, both in the Lower Mainland or from resources procured from the area—often recalling simultaneously how these opportunities have been taken away.

*My [personal relation] used to get these great big chubbies, from the Fraser River, it was so fat, you know it had a lot of fat in it, and he salted it up with brine, a lot of brine and he said we would just take it out when we need it, he says. And he dug a big hole in the yard, dug it way down then he put this brine fish, spring salmon down into the hole and covered it, just like you could walk over it and everything and you wouldn't know it was there. But that was his style. That part of our culture. He taught people to do that, and they taught other people. (SṪÁUTW Respondent ID326)*

*Like I said, I primarily fished the south arm [of the Fraser River]. That's kind of where I was taught to fish. Yeah. Unfortunately [we're] not able to fish in the US side, when you know, that's a big portion, and that's our Traditional Territory, right? (SṪÁUTW Respondent ID103)*

*As a result of all the occupation of the European people, all these birds that's there is endangered. We enjoyed all those things. We enjoyed telling the young ones about the birds telling the berries to ripen, the red ones, the yellow ones and the black ones [referencing the coinciding of birds arriving in summer with the ripening of berries]. Not long ago we could go and enjoy all these birds, as soon as you see those little sea gull or coho gulls you knew there was probably fish there. That's what they did, they showed us where the fish was. (SṪÁUTW Respondent ID111)*

The SENĆOŦEN language is also an important part of SṪÁUTW knowledge transmission. As explained by one SṪÁUTW First Nation member, cultural knowledge and the SENĆOŦEN language are inseparable, with the latter being essential for understanding the beliefs behind cultural practice; the protection and perpetuation of language is intimately tied with the continuation of knowledge and culture.

*The other thing is, here is, the language and the knowledge of everything in our Territory without the language they don't understand everything. We can't get the knowledge, we can't get everything that we can't understand the things that need to be understood. All the things that we have been talking about, all these different things like the fish and the animals, the birds, ducks, all those things are tied together with the land, in order for everybody to really understand everything in our Territory of how our beliefs come. A lot of our young people don't understand where our beliefs come from, because they don't understand the language. So even though they are practicing their culture, they don't know why they are practicing their culture, what the reasons are. Same thing with what they were taught, they never knew all those things. You know, my [personal relation], [name redacted] was talking about it yesterday. He was talking about this and he said I don't understand a few things and where it comes from. And he is already a man, thirty years old, so you know, those are all things that have to be built in, we lose the language then we are going to lose a lot of this stuff. A lot of things are really important as how the people, [name redacted] was just asking I think last week, are we going to get into language. But our language in an on going program, we need money. Just about everybody in the band wants to learn. But we need the funding. (SṪÁUTW Respondent ID112)*

A SṪÁUTW Elder and scholar, Mavis Underwood, explains how knowledge and identity are conveyed not only by harvesting, but also by the tools used and how they are deployed in situ:

*The reef-net used by Saltwater People to capture salmon is also a suitable metaphor for the learning process. The reef-net was a distinctive tool of the WSÁNEĆ Peoples and is distinct as it enhanced the*

*mastery of the salmon fishery which was part of the identity of the Saltwater Peoples. The reef-net technology was condemned by settlers and was viewed as a fish trap however this technology allows the People to sustainably capture fish and to pick and choose those fish they wanted to harvest. The technology illustrates the process of circling resources so that there can be observation and selection of what is needed. (Underwood 2018:3).*

Another SṪÁUTW member articulated a similar sentiment, writing of the reef net fishery that it encapsulated “what it meant in large part to be a Saanich person” (Claxton 2003:9).

Of the reef net fishery that was banned in Canada and the United States in the early and mid-20th century respectively, Evans et al. (2019:21) write, citing Fritz 2016, “reef net fishing was criminalized and curtailed, and fewer and fewer members of the WSÁNEĆ Nation were able to share its practice and associated knowledge with their descendants”. And with it went opportunities to learn navigation on the water, to form intergenerational bonds, for exchange and trade, and more.

The preceding narratives capture critical but subtle aspects of SṪÁUTW First Nation knowledge transmission:

- How it extends beyond the harvest of resources to include the use and processing of primary resources, away from where initially procured;
- How teaching begets further teaching and learning—a feedback loop of transmission;
- How knowledge transmission is experiential (consider a case of teaching river navigation without access to a river, or fishing without fish) and often social and place-based;
- The importance of SENĆOŦEN in knowledge transmission; and
- How knowledge can be impacted indirectly, e.g., through changes in access or in language.

Ceremonies, celebrations, and social gatherings are also important opportunities for knowledge transmission and indeed are core to SṪÁUTW First Nation oral traditions. Below, one member describes how the seasonal round, community celebration, and the sharing of knowledge come together in the bighouse (or longhouse).

*Well, that’s a part of the culture that they had the bighouse, and when they had their hunting and gathering season, then they would share their stories with their family members in that bighouse and that would be passing on the knowledge, you know, how to celebrate in certain ways, big celebrations. (SṪÁUTW Respondent ID102)*

The bighouse is a specific and sacred place for the community to gather, learn, heal, and strengthen cultural connection and identity, but it is only one node in a network of experiential teaching/learning opportunities needed to support SṪÁUTW First Nation cultural continuity and wellness. Everyday learning opportunities provided by a combination of healthy and accessible resources and intergenerational interaction in SṪÁUTW First Nation lands and waters are also vital.

SṪÁUTW First Nation has the right to revitalize, develop, and participate in intergenerational cultural transmission, including in SṪÁUTW First Nation territory in the Lower Mainland. However, as documented in preceding sections of this assessment, SṪÁUTW First Nation has been alienated from the Lower Mainland, while the region’s resource base has effectively disappeared due to residential and industrial development and land privatization. SṪÁUTW First Nation remains resilient in the face of these impacts combined with the generational impacts of Canadian colonial and assimilative policies, but are no longer able to meaningfully engage in cultural teaching and learning in the Lower Mainland.

Loss of opportunities to transmit cultural knowledge in the Lower Mainland has contributed to generational disconnection with SṪÁUTW First Nation identity and cultural heritage, both broadly and in specific places. A SṪÁUTW First Nation member explains the cumulative impact of development on knowledge transmission and cultural disconnection in the Lower Mainland as follows:

*People don't even know how to clean fish anymore. So, when you have more projects and more things like the coal port and other things that are a detriment to our resources and to the environment, that just puts us further away, and further disconnected from those things. I remember years ago, I brought some halibut and red snapper and other – ling cod, and stuff – to some of the Elders in the community. And some of the kids coming out – and they weren't young kids, they were your age – they were looking at it, going: "Ew! What is that?!" Right? They were that disconnected, where they didn't even know what that stuff was anymore. A lot of these youth don't even know how to cut fish or process it anymore. (SṪÁUTW Respondent ID103)*

## Conclusion

SṪÁUTW First Nation retains a strong desire to revitalize, develop, and participate in knowledge transmission, which is vital to the Nation's cultural persistence. Opportunities to engage in the transfer of cultural knowledge have been rapidly lost since the signing of the Douglas Treaties, including through impacts to the resource base and access to resources in SṪÁUTW First Nation territory and the Lower Mainland, severely limiting opportunities for experiential learning. Because these changes have persisted and spanned multiple generations, young members of SṪÁUTW First Nation are especially susceptible to cultural disconnection and have simultaneously increasing generational gaps in knowledge. The actions of developers and the Crown today have the potential to support SṪÁUTW First Nation efforts to revitalize cultural knowledge transmission and cultural resilience or alternatively continue their disruption.

### 3.3.2.8 SṪÁUTW First Nation Health and Well-being

#### Definition

FortisBC's Application does not define the Indigenous interest of "Indigenous Health and Well-being"; however, the potential effect pathways and associated indicators (Table 11.1-4), and topics to consider (Table 11.18-6), are indicative that the focus is on:

- Country foods;
- Ambient and sensory environments;
- Traditional ways of life; and
- Social determinants of health.

SṪÁUTW First Nation has rights to the "highest attainable standard of physical and mental health" (UNDRIP Article 24(2)). SṪÁUTW First Nation health and well-being is connected to all other SṪÁUTW First Nation rights.

#### Current Condition

Prior to colonization, SṪÁUTW could procure from the land and water what was needed to thrive.

*Our people were the richest people on earth. That's quite a statement to make. There's a lot of people in this world. I say: here lived the richest people on earth. (WŚÁNEĆ Elder Dave Elliot Sr.)*

SṪÁUTW also travelled extensively throughout the territory and on the ŚNEWIL/Fraser River and its tributaries, as well as the Salmon, Nicomekl, and Serpentine Rivers and other rivers or streams. Harvesting

and trading as they travelled, SṪÁUTW picked KEXMIN (wild celery, a sacred medicinal plant), SṪA,ḲEN/cattails, SZELEL/tule rushes, SKÁUISELL/wapato tubers, and S,ELLTENEN/,berries; hunted for deer, elk and mountain goats; and exchanged their ocean-caught fish for goat's wool and other highly valued trade items. These activities and the prosperous economy they supported were anchored by villages and fishing stations at SMOKEĆ/Point Roberts, SĆEU,OFEN/Tsawwassen, and along the ŚNEWIL/Fraser River, as well as by the SENCOFEN place names, travel routes, and ceremonial places that tied—and continue to tie—SṪÁUTW First Nation members to their lands and waters.

Today, the ability of SṪÁUTW First Nation members to harvest, travel, and benefit from the Lower Mainland's natural resources is highly limited due to cumulative effects and impacts. Although colonization and the impacts of settlement and development on SṪÁUTW lands and waters have changed SṪÁUTW First Nation diets and livelihoods, country foods continue to be preferred and are seen as healthier than "colonial" foods. Previous research conducted by SṪÁUTW reveals the community's continued reliance on, and preference for, wild foods (Evans et al. 2015:65–71), which are perceived "as much medicine as they are food" (Evans et al. 2015:71), despite uncertainty about the safety of wild foods.

*There's no telling nowadays what is edible and what isn't, what's affected by the population growth and the sea traffic. (SṪÁUTW Respondent ID101)*

These preferences are reflected in the words of a SṪÁUTW First Nation member as follows:

*We used to eat pretty healthy before, where- mostly seafoods and when we did have meat, it was deer. It wasn't fat meat like we get today. So, it's pretty healthy besides all of the berries and traditional vegetables we used to eat. So, you know, the introduction of colonial food has had a real detrimental effect on our people's health. [...] So those are things our people live with, as a result of not having the food that we're historically used to having. And for our health. So, it's really a detrimental effect there. Happening mostly to our women. (SṪÁUTW Respondent ID100)*

*So, it's really missing now, and our people and our traditional diets. I remember growing up and in March and the herring start coming. And we'd get herring... and we'd eat fried herring, or smoked herring. That was a real delicacy to our people. But that doesn't happen anymore. That's not there. So, it was all those things that are missing from our diets, that's what really helped our people to live a better life. And now that's gone, we're reliant on colonial foods to survive. And food that's affordable. And everything is so expensive these days that, to me, it looks like vegetables are getting more expensive than meat these days. [...] Yeah, I grew up with that smell, smoked fish in our house and that. I went away to residential school, and I came back and there were no more sacks up there. Fish started dying out. (SṪÁUTW Respondent ID100)*

Several SṪÁUTW First Nation members observed that diabetes, anemia, cancer, and other health issues within the Nation are related to the absence of traditional foods, including wild meat like deer, traditional vegetables like camas, and S,ELLTENEN/,wild berries, as well as medicines, including knowledge of how they should be used and administered. Similarly, WŚÁNEĆ members have previously indicated being unsatisfied with the amount of wild marine foods available, with adverse consequences for health (Evans et al. 2019:26).

*I became Type 2 diabetic, you know? Not having proper access to eating our traditional foods and stuff I think is a big one that's contributed to the health and well-being of our people. (SṪÁUTW Respondent ID103)*

*It's terrible, honestly. So, so many people are afflicted with diabetes. I got mine because both my parents had it, so it was inevitable. [...] But diabetes is the most, and now cancer is starting to take over as well, too. A lot of people there are cancer-stricken. It's challenging. There used to be people that know how to prepare medicines to be able to take care of that kind of stuff as well, too. Late*

*[Personal Name] was good at it. There are a few other people that still know how to do it, just kind of hard to find. (SṪÁUTW Respondent ID101)*

*It's through the occupation of the WENITEM that we are having that problem with industrial waste, human waste, today [referencing the contamination clams and crabs]. So we are being affected causing different kinds of illnesses amongst our people. Lots of our people at the early ages and things like that, so we are being impacted by that kind of thing. Because now the doctors are saying that the reason why so many of us are sick today because we are not eating our original food that we used to enjoy. So we are getting hit both ways, we are getting hit because we don't eat it, then we get the food that we buy in town, which doesn't agree with our system. (SṪÁUTW Respondent ID111)*

While the links between physical health and diets are relatively easy to discern, Indigenous health also includes the balancing of physical with “mental, spiritual, and emotional factors” (Salerno et al. 2021:8). It is also important to recognize that health and well-being are influenced by a wide range of determinants (First Nations Health Council 2015) that includes—among other things—physical environments, access to doctors and medicines, genetics, socio-economic conditions, and even individuals’ “relationships with the land, culture, and community” (Salerno et al. 2021:15). The preceding quotes highlight some of these nuanced linkages, including with economic conditions (e.g., cost of food), and access to knowledge holders with an understanding of traditional medicines, emphasizing the importance of cultural continuity, education, and social networks to health and wellness.

The loss of suitable access to the SṪÁUTW/ Fraser River and Lower Mainland—and its former richness—has also been detrimental to the mental health of the SṪÁUTW First Nation community and its members. Federal guidance (Salerno et al. 2021) on the assessment of impacts on mental wellness notes that:

*Alienation of land and resources constitutes a fundamental impact pathway for Indigenous mental well-being. Access to the land is essential to support the myriad activities and experiences that sustain physical health, social interaction, spirituality and ceremonial practices, etc., all of which connect to mental wellness. (2021:24)*

As articulated by one SṪÁUTW First Nation member, the loss of access to sockeye resulted in changes to community and household dynamics and cohesion, with effects to mental and physical health—a pattern repeated with the loss of hunted and harvestable resources.

*When you lose access, when you lose connectivity towards certain things – let's say sockeye, for instance. Like, when I was a kid growing up – and I'm pretty sure it was like that with all the families growing up on the village. I remember, like I said, it was a big family thing. We'd get sockeye, and my late mom would have the whole family, so all of her sons, and all of her daughters, all the kids and the grandkids – we all pulled together, and it pulled our families together. And we all contributed and helped in processing and getting those foods and those certain resources ready for the winter, right? And we were healthier for it. Not only physically, but mentally – as a family, and as a community, as a whole. Like, all the families did that. It wasn't just us. I remember the family next to us, you know? It was throughout the whole village. So, that made – it made people tighter as families, and as a whole community, right? We don't have that anymore. (SṪÁUTW Respondent ID103)*

Where there used to be sufficient resources to share and trade, which facilitated the building of social bonds, surplus harvests from the Lower Mainland are now inconceivable. This has had an effect beyond household and family dynamics to affect intercommunity relationships. For instance, this assessment has elaborated on resource-dependent trade relationships, and additionally, divisions created by the reserve system, BC Treaty process, and the creation of the Canada-USA border (see Sections 2.3.2.5 and 2.3.2.6).

The cumulative impacts of development in the Lower Mainland have furthermore impacted STÁUTW First Nation collective and place-based identities. STÁUTW First Nation has deep cultural ties to the Lower Mainland, which can be considered a “cultural landscape” (one manifestation of which are place names; see Section 2.3.2.4). Cultural landscapes carry individual and collective memories and experiences that have symbolic, emotional, and psychological potency. And, as described in Sections 2.3.2.5 and 2.3.2.7, STÁUTW First Nation has an obligation to steward the environment, based in foundational beliefs of reciprocal and respectful relationships with all living things. The loss of cultural landscapes and impacts to STÁUTW First Nation’s deeply felt responsibilities of stewardship can affect “how Indigenous peoples understand themselves and create intense psychological distress” and create feelings of powerlessness (Salerno et al. 2021:26).

Similarly, there has been a loss of opportunities to transmit knowledge. As previously discussed, STÁUTW cultural knowledge transmission is often in situ and experiential, and therefore highly dependent on the integrity of the land. Culturally valued species are also important components to STÁUTW celebrations and ceremonies that double as occasions for teaching and learning, and occasions for healing and strengthening social and cultural bonds. Whether in the home, community, bighouse, or out on the land and water, cumulative impacts in the Lower Mainland have contributed to the alienation of younger generations of STÁUTW from cultural teachings and therefore cultural identity, which research has shown to be a health-protective factor (Chandler and Lalonde 2008).

The persistent advance of development in the Lower Mainland and in STÁUTW lands and waters has consistently and inadequately considered STÁUTW First Nation rights and interests. As recognized in federal guidance on the assessment of impacts to Indigenous mental wellness (Salerno et al. 2021), experience with and being subject to colonial regulatory institutions and processes can have negative impacts on Indigenous well-being, including engendering uncertainty, anxiety, stress, a lack of agency and control, fatigue, and frustration.

STÁUTW First Nation has the basic human right to a high standard of physical and mental health and intends to pursue all avenues to improve conditions in STÁUTW First Nation territory to achieve this end.

## Conclusion

STÁUTW First Nation reiterates its right to the “highest attainable standard of physical and mental health” (UNDRIP Article 24(2)). The health and well-being of STÁUTW First Nation members must be viewed holistically, encompassing physical, mental, and spiritual dimensions, and consider the full range of determinants of health, including relationships with land, culture, and community. The STÁUTW First Nation perspective is that community health and well-being is tied to the exercise of rights, including those described in this assessment. Cumulative effects and impacts in STÁUTW First Nation territory and the Lower Mainland have been compromised and continue to affect STÁUTW health and well-being by adversely affecting:

- Resource base and diets;
- Economic conditions;
- Social cohesion and bonds;
- Governance responsibilities;
- Sense of place;
- Knowledge transmission and ceremonies; and
- Self-determination and governance, including in environmental assessment.

The actions of developers and the Crown today have the potential to positively support SṪÁUTW First Nation health and well-being or alternatively continue their disruption.

### **3.3.3      *Potential Effects on SṪÁUTW First Nation Interests***

This and subsequent sections provide SṪÁUTW First Nation's assessment of the Project's likely interactions with SṪÁUTW First Nation rights in the Lower Mainland; the potential effects on rights; and evaluation of FortisBC's proposed mitigations; and the identification of residual effects and cumulative effects on SṪÁUTW First Nation rights.

FortisBC's Application notes no interaction or negligible interactions with SṪÁUTW First Nation interests through the normal course of Project construction and operations. As described in Section 2.1.1 and throughout preceding sections of this report, FortisBC frequently appeals to the highly-developed nature of the Project Footprint and lack of access as rationales for an absence of interaction. SṪÁUTW First Nation's ILA reiterates that existing levels of cumulative effects in the highly-developed context of the Lower Mainland do not abrogate the Nation's protected rights and interests, and indeed, that the Project will have an effect in many instances by continuing and contributing, directly and indirectly, to impacts to SṪÁUTW First Nation rights. This SṪÁUTW assessment emphasizes to a greater degree the Nation's future experiences and aspirations—as guaranteed by Treaty and the constitution, and holistic linkages between SṪÁUTW interests as well as between SṪÁUTW interests and linked VCs.

**Table 9:** Summary of Project phases, Sᑭᐱᐅᐅᐅ First Nation and proponent’s ratings of likely interactions, and description of the nature of interaction, effect pathways, and rating rationales.

| Proposed Project Phase and Activities                                                                                                                                                                           | Sᑭᐱᐅᐅᐅ Interaction Rating<br>(Proponent Rating)      | Nature of Interaction, Relevant Project Effect Pathways, and Rationale for Interaction Rating                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### 3.3.3.1 Harvesting and Subsistence Activities

#### Summary of Current Conditions

As detailed in Section 3.3.2.3, SṪÁUTW First Nation continues to hold inherent and constitutionally protected Aboriginal and Treaty rights to fish and gather marine resources, gather plants, and hunt in the Lower Mainland. Members continue to exercise these rights as conditions allow. However, the meaningful exercise of these rights in the Lower Mainland—“as formerly”—is no longer possible due to the combined effects of colonization, settlement, and development. This includes:

- Fishing for salmon, sturgeon, and crabs, and harvesting clams and urchin, as well as other interwoven and related marine, terrestrial and intangible rights (i.e., access and occupancy, ceremonial, social and economic, knowledge transmission, governance, and health);
- Gathering plants such as S,ELLTENEN/berries, nettles, cedar, willow, horsetail, SṪA,KEN/cattails, SṪELEL/tule rushes, and seaweeds and kelp for food, medicine, and materials, as well as other interwoven and related marine, terrestrial, and intangible rights; and
- Hunting and/or trapping, particularly for deer, elk, mountain goats, beaver, muskrat, marten, waterfowl, and upland game birds, as well as other interwoven and related marine, terrestrial, and intangible rights.

#### Project Effects and Conclusion

Despite the existing level of cumulative effects that have prevented SṪÁUTW First Nation from harvesting as formerly in the Harvesting and Subsistence Activities LAA, including on and adjacent to Tilbury Island, SṪÁUTW First Nation strongly prefers the return of conditions that would enable the meaningful exercise of harvesting and subsistence rights as protected by the constitution and the Douglas Treaties. Contrary to FortisBC’s prediction that changes in the quality, quantity, and availability of resources due to the Project are “not expected to change the experience and preferences for WṢÁNEĆ Nations members around the practice of harvesting rights” (Section 11.18.5.3 of the Application, *Changes to the Experience*

and Preferences around the Practice of Harvesting Rights and Effects on the Quality, Quantity, and Availability of Resources), SṪÁUTW First Nation concludes that the Project will further breach SṪÁUTW First Nation's Douglas Treaty and Aboriginal harvesting and subsistence rights.

SṪÁUTW First Nation prefers—and has the right to expect—the revitalization and recovery of constitutionally protected harvesting and subsistence rights, and the conditions that would permit the exercise of these rights as formerly. FortisBC concludes that the Project will have numerous deleterious effects (see Table 10) but incorrectly finds no impact on WSÁNEĆ Nations Indigenous Interests; these effects will delay and prevent revitalization and recovery. With respect to SṪÁUTW First Nation harvesting and subsistence rights, this includes:

- Introducing additional air contaminants (including odours and dust) and noise disturbances where SṪÁUTW First Nation seeks a reduction in air contaminants and noise disturbances;
- Changing the visual quality of the landscape with new industrial facilities where SṪÁUTW First Nation prefers the return of landscapes without industrial human disturbance;
- Introducing and/or spreading invasive plant species where SṪÁUTW First Nation prefers and seeks the recovery of native and culturally valued species;
- Further reducing and/or altering wildlife habitats and increasing wildlife mortality risk where SṪÁUTW First Nation prefers and seeks the recovery of native and culturally valued species; and
- Continuing to limit the accessibility and availability of lands and resources for the exercise of harvesting and subsistence rights,<sup>19</sup> delaying the return and recovery of lands and resources to a condition that would enable harvesting as formerly as preferred by SṪÁUTW First Nation and as protected by the constitution and Treaty.

FortisBC's Application fails to consider that a continuation (and worsening) of current baseline conditions is nonetheless a *temporal* change—one of delay—conflicting with the harvesting and subsistence rights of SṪÁUTW First Nation and a barrier to recovery.

---

<sup>19</sup> E.g., "The proposed Project Footprint is not currently accessible for harvesting and will remain restricted for the life of the proposed Project" (Section 11.18.5.3 of the Application, *Plant Gathering*) and "The proposed Project Footprint is predominately located on the Property within an existing Tilbury LNG facility on Tilbury Island, in the Tilbury Industrial Park adjacent to the Fraser River in Delta, B.C. The proposed Project Footprint is not accessible on foot." (Section 11.18.5.3 of the Application, *Effects on Accessibility and Availability of Traditional Lands and Resources*).

### 3.3.3.2 Cultural Use Sites and Areas

#### Summary of Current Conditions

As detailed in Section 3.3.2.4, STÁUTW First Nation identifies cultural use and rights throughout its territory, including the Lower Mainland, the lower arm of the ŚNEWIL/Fraser River, and the Project Footprint. This includes:

- Permanent villages at SMOKEĆ/Point Roberts and Boundary Bay, and along established access routes following the ŚNEWIL/Fraser River and its tributaries;
- Travel and access along coastal routes and the ŚNEWIL/Fraser River and its tributaries, and on land;
- Place names in the LAA and RAA, including those associated with geographic features, fishing and fish processing locations, and ceremonial and sacred sites; and
- Cultural and spiritual practices and customs and beliefs embedded in and related to harvesting practices and yields, trade, governance, knowledge transfer, etc. exercised in the Lower Mainland.

Because of the combined effects of colonialism, urbanization, industrialization, and linked institutional and landscape changes, it is no longer possible for STÁUTW First Nation to meaningfully exercise rights related to village sites in the Lower Mainland; travel in the absence of barriers; or engage in cultural and spiritual practices, customs, and beliefs as formerly. Place names in the Lower Mainland no longer reflect the conditions of their genesis. Nonetheless, WSÁNEĆ villages and place names continue to be of great value to STÁUTW First Nation; members also continue to travel the Lower Mainland and its waters, engaging in cultural and spiritual practices, adhering to cultural customs and beliefs as able.

#### Project Effects and Conclusion

FortisBC determines that the Project will not interact with WSÁNEĆ cultural use sites and areas, including loss of access to and disenfranchisement from cultural sites. FortisBC's rationale for this conclusion is largely based on the inaccurate understanding that (see Section 11.18.5.3 of the Application, *Effects on the Quality, Quantity, and Availability of Harvested Country Foods*):

- There are no WSÁNEĆ or SṪÁUTW First Nation cultural sites and areas in the Project Footprint or LAA,
- WSÁNEĆ or SṪÁUTW First Nation members do not use the lower ŚNEWIL/Fraser River near the Project Footprint or within the LAA to fish, gather plants, or hunt, and
- The Project's effects will not be material because of the existing level of disturbance.

Conversely, SṪÁUTW First Nation has demonstrated in Section 3.3.2 the existence of traditional, historical, and contemporary cultural use sites and areas and rights to these sites and areas within the Cultural Sites and Areas LAA.<sup>20</sup> SṪÁUTW First Nation has further demonstrated that members have fished, gathered plants, and hunted in and around the ŚNEWIL/Fraser River and the Cultural Sites and Areas LAA, and aspire to the continued exercise and recovery of these protected rights. And finally, SṪÁUTW First Nation has clarified above (in Section 3.3.3.1) that massive cumulative effects and contributions to these effects—no matter their magnitude—does not abrogate the existence of these protected rights and furthermore are material temporal impacts preventing the revitalization of these cultural sites and areas and their potential use.

Because cultural sites and areas encompass harvesting and subsistence locations, the same Project effects noted in Section 3.3.3.1 apply here, including:

- Introducing additional air contaminants (including odours and dust) and noise disturbances where SṪÁUTW First Nation seeks a reduction in air contaminants and noise disturbances;
- Changing the visual quality of the landscape with new industrial facilities where SṪÁUTW First Nation prefers the return of landscapes without industrial human disturbance;
- Introducing and/or spreading invasive plant species where SṪÁUTW First Nation prefers and seeks the recovery of native and culturally valued species;
- Further reducing and/or altering wildlife habitats and increasing wildlife mortality risk where SṪÁUTW First Nation prefers and seeks the recovery of native and culturally valued species; and
- Continuing to limit the accessibility and availability of lands and resources for the exercise of harvesting and subsistence rights, delaying the return and recovery of lands and resources to a condition that would enable harvesting as formerly as preferred by SṪÁUTW First Nation.

Through these effects, the Project will impact SṪÁUTW First Nation's ability to revitalize SṪÁUTW First Nation cultural sites and associated cultural and spiritual practices, including customs and beliefs embedded in and related to harvesting practices, governance, knowledge transfer, etc.

SṪÁUTW First Nation therefore concludes that the Project will materially extend the duration of alienation from the Project Footprint, precluding its potential use for cultural purposes and the exercise of rights. The Project will additionally intensify sensory disturbances in and around the Footprint. Together these effects will delay the revitalization of SṪÁUTW First Nation access to and revitalization of SṪÁUTW First Nation cultural sites and associated cultural and spiritual practices (both in an outside of the Lower Mainland, e.g., in the bighouse).

---

<sup>20</sup> As noted in Section 3.3.2.4, SṪÁUTW First Nation considers areas in which it has rights to harvest, transmit knowledge, and govern to be cultural use sites and areas—this is in addition to physical sites and locations of cultural, historical, archaeological, paleontological or architectural value. This broader definition of cultural use sites and areas is implicitly adopted by FortisBC through the applied rationale that interactions are not expected due to the absence of fishing, gathering, or hunting. Table 11.18-12 of FortisBC's Application further includes as indicators "Cultural practices, customs, beliefs, and values associated with cultural sites" and "Participation in harvesting and subsistence activities practices and cultural and spiritual practices".

### 3.3.3.3 STÁUTW First Nation Governance Systems

#### Summary of Current Conditions

The Project is in STÁUTW First Nation territory where the Nation has governance rights, including those related to stewardship and the well-being of future generations. FortisBC did not assess for potential Project impacts to STÁUTW First Nation governance.<sup>21</sup>

In Section 3.3.2.5, STÁUTW First Nation summarizes a history of STÁUTW/WSÁNEĆ access to fisheries and villages in the Lower Mainland, in some cases forged through conflicts, negotiations, agreements, and kinship ties. The section also elaborates on the STÁUTW First Nation law to uphold reciprocal and respectful relationships with all living things, e.g., through stewardship and care for current and future generations. The existing level of cumulative effects and alienation of STÁUTW First Nation from the Lower Mainland has effectively prevented the meaningful exercise of these governance rights, including related customs and protocols embedded in the practice of harvesting, and social and economic rights.

The current trajectory of cumulative effects in the Lower Mainland conflicts with STÁUTW First Nation governance objectives and laws. The Project will contribute to and continue these effects and impacts.

#### Project Effects and Conclusion

Specifically, the Project will negatively impact STÁUTW First Nation governance by (see Table 9):

- Creating ongoing barriers to STÁUTW First Nation use of the Project Footprint through the development and occupancy of the site, and associated impacts to accessibility and loss of plant and animal populations and habitats;

<sup>21</sup> STÁUTW First Nation notes that while governance was assessed as part of the Culture VC, this was not specific to STÁUTW First Nation and was limited to governance regarding greenhouse gases.

- Creating ongoing barriers to the exercise of Sᑭᐱᐱᐱ First Nation laws, customs, and protocols, including through resource sharing, and as expressed in harvesting methods and techniques, ceremony, knowledge transmission, stewardship, etc.; and
- Creating effects inconsistent with and counterproductive to Sᑭᐱᐱᐱ First Nation stewardship goals, including by introducing disturbances to air quality, noise, riverine views, plant and animal populations and habitats, and human health.

Sᑭᐱᐱᐱ First Nation is committed to the implementation of its laws and exercise of its governance rights in Sᑭᐱᐱᐱ First Nation territory that includes the Lower Mainland and seeks the revitalization of environmental conditions that would allow for the meaningful exercise of the Nation's inherent and constitutionally protected Aboriginal and Treaty rights. Sᑭᐱᐱᐱ First Nation concludes that the Project will materially and negatively impact Sᑭᐱᐱᐱ First Nation governance rights by contributing to the further deterioration of environmental conditions counter to the Nation's laws and extending through time the Nation's alienation from the Lower Mainland, preventing implementation and exercise of laws, customs, and protocols.

### 3.3.3.4 Social and Economic Conditions

#### Summary of Current Conditions

Sᑭᐱᐱᐱ First Nation has protected rights to self-determination and self-government from which stem rights and interests to maintain, improve, and develop the Nation's social and economic institutions and conditions.

Sᑭᐱᐱᐱ First Nation harvesting and subsistence and governance rights are intertwined with the Nation's social and economic outcomes. For example, the trade and sharing of harvested resources was and remains an important part of the Sᑭᐱᐱᐱ First Nation economy and is a foundation of relationships inside and outside the community. However, the combined effects of colonization, urbanization, and industrialization have disrupted resource-based economies and social bonds and limited the scope of the Nation's potential economic activities, and therefore have constrained and impacted the Nation's

economic, social, and health outcomes. SᑭÁUTW First Nation seeks to improve economic and social conditions for its members through participation in the contemporary wage economy and revitalization of ecosystems that sustain cultural relationships and trade.

### Project Effects and Conclusion

FortisBC's assessment concludes only a positive residual effect of increased employment and economic opportunity for the W̱SÁNEĆ Nations, especially for trades-certificate holders who may support Project construction. SᑭÁUTW First Nation similarly concludes that the Project has the potential to create positive economic and social effects for its members but will depend on whether direct/indirect employment is secured.

FortisBC does not identify interactions with:

- Future aspirations for sites or areas surround the proposed Project;
- Commercial and non-commercial fishing, hunting, trapping, and gathering and cultural or ceremonial activities and practices;
- Intercommunity relations and trade; and
- Infrastructure and services.

SᑭÁUTW First Nation reiterates—as established in Section 3.3.2—that the health of the environment and SᑭÁUTW First Nation access to sufficient resources is of fundamental importance culturally, economically, socially, and in terms of human health. As discussed, SᑭÁUTW First Nation aspires for the Project Footprint and all areas of SᑭÁUTW First Nation territory to be revitalized to a condition that would enable the meaningful exercise of its protected rights, including but not limited to harvesting and improvements in the Nation's social and economic outcomes. As already established, the Project would continue the trajectory of deleterious cumulative effects and impacts on SᑭÁUTW First Nation's exercise of rights by adding new disturbance (see Table 10), and critically, contribute to the continuation of this highly disturbed state in the Lower Mainland. This is counter to SᑭÁUTW First Nation's aspiration for the Project Footprint and surrounding areas and therefore finds the potential for a negative effect.

SᑭÁUTW First Nation further finds the potential for a negative effect from the Project on the Nation's harvesting, cultural, and ceremonial rights and activities (see Sections 3.3.3.1, 3.3.3.2, 3.3.3.3, 3.3.3.5, and 3.3.3.6 for rationale). SᑭÁUTW First Nation reiterates strong disagreement that there are no W̱SÁNEĆ "cultural sites and areas within the proposed Project Footprint or Cultural Use Sites and Areas LAA".

The effects of colonization, industrialization, urbanization, and settlement, have already severely disrupted SᑭÁUTW First Nation resource-based trade and social relationships, as established in Section 3.3.2. Reenabling and revitalizing the potential for traditional trade activities and resource sharing is part of SᑭÁUTW First Nation's goal to improve the Nation's social and economic conditions. The Project will contribute to the continuation of disturbance in opposition of SᑭÁUTW First Nation's aspirations, which would instead require the improvement of environmental conditions and access.

SᑭÁUTW First Nation agrees with FortisBC that the Project is unlikely to affect the Nation's infrastructure and services.

### 3.3.3.5 Cultural Continuation

#### Summary of Current Conditions

Section 3.3.2.7 stresses knowledge transmission as the basis of cultural persistence, and that SṪÁUTW First Nation knowledge transfer is rooted in places, direct experiences, and oral traditions, and applies to the whole of SṪÁUTW First Nation cultural knowledge. Today there are few opportunities to transmit knowledge directly and in situ in the Lower Mainland due to colonization and the cumulative effects of development and settlement. The loss of access to and abundance of resources in the Lower Mainland have furthermore contributed to the decline in sense of place and identity, and learning/teaching opportunities in other parts of SṪÁUTW First Nation territory (e.g., the bighouse). Notwithstanding, SṪÁUTW First Nation has a right to revitalize, develop, and participate in intergenerational cultural transmission, and similarly the revitalization of cultural connections to place, heritage, and identity.

#### Project Effects and Conclusion

FortisBC does not assess for effects to Cultural Continuation in Section 11.18 of the Application but does assess for changes to intergenerational knowledge transfer in Section 7.14 of the Application, in which FortisBC finds (in Section 7.14.4, *Changes to Intergenerational Knowledge Transfer*):

*The proposed Project may affect changes to intergenerational knowledge transfer for Indigenous Peoples through changes in the ability to engage in cultural practices and to access areas and resources that are important for intergenerational knowledge transfer. Indigenous nations use lands, waters, and resources to pass on language, cultural laws, stories, environmental knowledge, and spiritual beliefs. The ability of Indigenous nations to engage in cultural practices that may be critical for intergenerational knowledge transfer may be affected by sensory disturbances from the proposed Project activities in all phases of the proposed Project. [...] Sensory disturbances (such as increased noise, air emissions, nighttime light pollution, and alterations to the landscape) may lead to avoidance of lands, waters, and resources in the LAA required for intergenerational cultural transmission [...]. The ability to or experience of [sic] conduct cultural practices is an important part*

*of maintaining and passing on intangible values and activities (for example, oral traditions related to use of lands and waters are important in maintaining a sense of cultural continuity [...]).*

Sᑭᐱᐱᐱ First Nation similarly concludes that the Project has the potential to negatively affect intergenerational knowledge transfer through ongoing contributions to environmental disturbance that preclude the ability of its members to engage in the exercise of harvesting and other rights. As noted by FortisBC above and by Sᑭᐱᐱᐱ First Nation in Section 3.3.2.7, the land, waters, and resources of the Lower Mainland are important venues/means for passing on cultural knowledge, including laws, language, customs, and beliefs, and that these can furthermore be disrupted by sensory disturbances, leading to, among other things, avoidance. Because the Project will add to disturbances and the continuation of cumulative effects in the Project Footprint and surrounding area, Sᑭᐱᐱᐱ First Nation efforts to revitalize, develop, and participate in intergenerational cultural transmission will be impacted.

These Project effects and ongoing absence of accessibility will concurrently lead to the continuation of lost opportunities for Sᑭᐱᐱᐱ First Nation to connect with the land and waters of the Lower Mainland. Without the ability and opportunities to use and access the land and resources in place, Sᑭᐱᐱᐱ First Nation is less able to connect to, understand, experience, and internalize connections to place names, and cultural histories and practice, which are foundational to Sᑭᐱᐱᐱ sense of place and identity. The Project will therefore affect the Nation's ability to revitalize sense of place and identity.

### 3.3.3.6 Sᑭᐱᐱᐱ First Nation Health and Well-being

### Summary of Current Conditions

Sᑭᐱᐱᐱ First Nation has a right to the “highest attainable standard of physical and mental health” (UNDRIP Article 24(2)). The health and well-being of Sᑭᐱᐱᐱ First Nation members is tied to and encompasses physical, mental, and spiritual dimensions, including relationships with land, culture, and community. The Sᑭᐱᐱᐱ First Nation perspective is that community health and well-being is tied to the exercise of rights, including those described in this assessment. Cumulative effects and impacts in

SṪÁUTW First Nation territory and the Lower Mainland have compromised and continue to affect SṪÁUTW health and well-being by adversely affecting:

- Resource base and diets;
- Economic conditions;
- Social cohesion and bonds;
- Governance responsibilities;
- Sense of place;
- Knowledge transmission and ceremonies; and
- Self-determination and governance, including in environmental assessment.

### Project Effects and Conclusion

FortisBC finds a lack of interaction between the Project and the health and well-being of the WŚÁNEĆ Nations. This is based on the rationales that:

- Despite statements in the Application to the contrary and input from SṪÁUTW First Nation, "FortisBC does not have information to indicate that WŚÁNEĆ Nations fish, hunt, or gather plants the south arm of the lower Fraser River near the proposed Project Footprint or within the Harvesting and Subsistence Activities LAA" (Section 11.18.5.3 of the Application, *Effects to Aboriginal Rights of WŚÁNEĆ Nations to Fish, Harvest, and Hunt for Food, Social, and Ceremonial Purposes*) and therefore would not interact with "Harvesting and Subsistence Activities and Cultural Use Areas and Sites, including traditional ways of life" (Section 11.18.5.3 of the Application, *Effects on Health and Well-being from Traditional Ways of Life and Cultural Sites*);
- Residual effects predicted for wildlife, vegetation, and their habitats is of "negligible to low magnitude" (Section 11.18.5.3 of the Application, *Effects on the Quality, Quantity, and Availability of Harvested Country Foods*);
- As a corollary to the above and in consideration that perceptions of adverse effects can impact the value of country foods, there are no expected adverse effects to the quality of country foods because of the level of existing industrialization and (perceived) effects to the quality of country foods (Section 11.18.5.3 of the Application, *Effects on the Value and Perceived Quality of Country Foods*); and
- Despite expected residual effects (Table 10), Project contributions to noise and air quality will be similar to existing levels or below thresholds, and exposures would be short-term and localized (Section 11.18.5.3 of the Application, *Effects on the Air Quality, Noise, and Water Quality*).

As in preceding sections of SṪÁUTW First Nation's assessment where FortisBC has relied on similar rationales, SṪÁUTW First Nation stresses that existing levels of disturbance is not a justification for finding a lack of interaction to SṪÁUTW First Nation's Treaty and Aboriginal rights. Indeed, in the context of existing cumulative effects and impacts to SṪÁUTW inherent and constitutionally protected Aboriginal and Treaty rights, adding to and contributing to the trajectory of extensive effects with impacts to rights would at minimum be an interaction with potential significance. SṪÁUTW First Nation has furthermore demonstrated (see Section 3.3.2) and disputes the lack of SṪÁUTW use or value in the lower ŚNEWIL/ Fraser River and Lower Mainland generally.

SṪÁUTW First Nation's assessment is that the health and well-being of its members and community are directly tied to the exercise of rights summarized Sections 3.3.3.1 to 3.3.3.5. In these preceding sections, SṪÁUTW First Nation has identified how the Project will add to and continue the current trajectory of

cumulative effects that has alienated the Nation and its members from the Lower Mainland, including through effects on the availability and quality and quantity of harvestable resources; effects to air quality, soundscapes, and views; and impacts to cultural sites and access, and SᑭÁUTW First Nation lifeways. The Project's continuation of these effects is a clear interaction with SᑭÁUTW First Nation health and well-being that have the potential to exacerbate adverse effects on SᑭÁUTW First Nation (see Section 3.3.2.8):

- Diets and food security;
- Prevalence of disease and chronic conditions;
- Access and use of traditional medicines and knowledge;
- Social cohesion and bonds;
- Cultural and spiritual connections to land and identity, and practice of culture and language (that can be health-protective); and
- Enactment of stewardship responsibilities.

The proposal of the Project and the environmental assessment process also need to be recognized as pathways of effect. As noted in Section 3.3.2.8, experience with and being subject to colonial regulatory institutions and processes can have negative impacts on Indigenous well-being.

SᑭÁUTW First Nation recognizes the potential for the Project to contribute positively to health and well-being via economic and employment opportunities but also notes that economic and employment changes can result in negative interactions in terms of family dynamics and individual and household stress, and limiting time to participate in culture.

### **3.3.4 Effects Management**

#### **3.3.4.1 Evaluation of FortisBC Mitigation Measures**

##### **Positive Effects**

Section 11.18.5.3 of FortisBC's Application finds that the only potential interactions between the Project and WSÁNEĆ Nations Indigenous Interests are positive interactions with Social and Economic Conditions along the following effect pathways:

- Changes to employment opportunities, Indigenous businesses, procurement opportunities, and Indigenous nation revenue; and
- Effects on Indigenous nations' ability to improve social and economic conditions.

As these are the only potential effects pathways identified, Table 11.18-14 of FortisBC's effects assessment does not propose any specific additional mitigations for potential effects to SᑭÁUTW First Nation rights and interests beyond the generic enhancement measures for effects to the Employment and Economy, Land and Resource Use, and Culture VCs found in sections 7.10, 7.11, and 7.14 of the Application, respectively. All but two of these enhancement measures are found in section 7.10 (Employment and Economy).

Section 3.4 of EAO's Effects Assessment Policy (EAO 2020) states:

*Mitigation measures should be specific, achievable, measurable and verifiable and described in a manner that avoids ambiguity in intent, interpretation and implementation. Mitigation must be described in enough detail to support the*

*assessment, including conclusions regarding the likely effectiveness of mitigation to reduce or manage effects.*

Further, section 6.5 of the AIR (EAO 2022), echoing the EAO's policy guidance, requires that "Proposed mitigation measures are to be specific, achievable, measurable and verifiable, and described in a manner that avoids ambiguity in intent, interpretation and implementation."

In contrast, many of FortisBC's descriptions of the enhancement measures for positive effects to Employment and Economy found in section 7.10 of the Application are ambiguous in their language. For example:

- *Develop fair, accessible employment practices that ensure Indigenous Peoples are considered fairly for employment opportunities during construction and operation;*
- *Encourage the use of local and regional human resources in design, planning, construction, restoration, and operation, to the extent practical;*
- *Promote awareness of local and regional business opportunities through the timely dissemination of information regarding project service and supply requirements;*
- *Continue communications with community stakeholders; and*
- *Communicate project activities, safety measures, and emergency response measures to Indigenous nations, the public, and stakeholders through different media and forums.*

FortisBC assesses the effectiveness of all these mitigations, including the examples listed above, as Moderate (for the Employment and Economy VC). STÁUTW First Nation appreciates that full details of mitigation measures are not developed at this stage of Project planning; however, this level of information is not sufficient for STÁUTW First Nation to concur with FortisBC's findings, and does not align with the EAO's guidance or with the AIR in terms of the level of detail required to support assessment of mitigation measure effectiveness.

### **Negative Effects**

As noted by IAAC, Environment and Climate Change Canada, and others as part of the Application Review process (EAO 2025), many of the mitigation measures proposed by FortisBC to mitigate negative effects to VCs (with links to STÁUTW First Nation interests) have some of the same issues of ambiguity as discussed in the preceding section of this report. Again, echoing the EAO's guidance and the AIR (2025), IAAC states that the Application's proposed mitigation should be "described in specific, achievable, measurable and verifiable terms and written as a specific commitment that clearly describes how the Proponents [sic] intends to implement it." Many mitigations are not described at all in the Application other than to generally state their end goal and/or that they will be part of the Project's Construction Environmental Management Plan (CEMP). Examples include:

- *Air Quality:*
  - *Develop dust-control measures to be described in the CEMP to limit particulate matter emission during the construction phase;*
  - *Implement the construction-related air emission mitigations listed in the CEMP;*
- *Acoustic:*
  - *During construction and operation of the project, develop mitigation and contingency measures through engagement with a QP to manage acoustic disturbance to human and wildlife receptors and incorporate these measures into the CEMP and EMS;*

- *Surface Water:*
  - *Develop erosion and sediment control measures to manage surface water in consultation with Indigenous nations and a QP and incorporate them into the CEMP to reduce sediment deposition into watercourses or storm sewers;*
- *Groundwater:*
  - *Incorporate best management practices into the CEMP to manage groundwater;*
- *Vegetation:*
  - *Develop and implement soil-management and soil-handling practices that are effective at managing the introduction and spread of invasive noxious plant species as required under Provincial regulations and Municipal bylaws. These measures will be incorporated into the CEMP;*
- *Wildlife and Wildlife Habitat:*
  - *Develop mitigation and contingency measures in consultation with Indigenous nations and a QP to reduce the potential for adverse interactions with wildlife and wildlife habitat (such as human-wildlife conflict, vehicle collisions, and sensory disturbance), and incorporate these measures into the CEMP;*
- *Fish and Fish Habitat:*
  - *Develop erosion and sediment control measures to manage surface water in consultation with Indigenous nations and a QP and incorporate them into the CEMP to reduce sediment deposition into watercourses or storm sewers;*
  - *Establish a refuelling and spill response plan. The measures will be incorporated into the CEMP;*
- *Land and Resource Use:*
  - *Traffic management mitigation measures will be developed and incorporated into the CEMP.*

It should be noted that the foregoing is not an exhaustive list, and that many of these statements are repeated as the mitigations proposed for multiple VCs, including for Culture and Human Health. In the above examples and in other similarly constructed statements, there is no actual mitigation measure being proposed: the only information provided is that FortisBC will develop and implement such a measure at a future date. As with the enhancement measures discussed in the previous section, while it is acknowledged that full information on mitigation planning may not be available at this time, it seems challenging to meaningfully assess mitigation effectiveness with the level of detail presented; however, FortisBC again assesses the effectiveness of these mitigations as Moderate or High. STĀUTW First Nation agrees with the provincial and federal reviewers that more information is needed to draw this conclusion, and that the mechanism by which these mitigations should be expected to interact with potential effect pathways should be more clearly expressed.

Temporarily setting questions of mitigation effectiveness aside, as summarized in Table 10, FortisBC's Application states that, assuming proposed mitigations function as expected, the Project is anticipated to have eleven residual effects (and thus contribute to cumulative residual effects) to six VCs. The spatial extent of all residual and cumulative effects listed in Table 10 overlap with the LAA and/or CEA boundary (see Section 3.3.6). Most of these residual effects are characterized as having a non-negligible magnitude (highlighted in yellow in Table 10) and are anticipated to be, at minimum, detectable; several will contribute to high magnitude cumulative effects (i.e., defined as effects that exceed environmental and/or regulatory standards).

**Table 10:** Residual and Cumulative Residual Effects on Valued Components Linked with One or More of WSÁNEĆ Nations Indigenous Interests (as assessed by FortisBC)

| Valued Component <sup>1</sup> | Effect <sup>1</sup>                                                                     | Residual Effect Magnitude <sup>1,2</sup> | Cumulative Effect Magnitude <sup>1,2</sup> | Spatial Overlap with LAA or CEA boundary? |
|-------------------------------|-----------------------------------------------------------------------------------------|------------------------------------------|--------------------------------------------|-------------------------------------------|
| Air Quality                   | Elevated ambient CAC concentrations during construction                                 | Negligible to Low                        | Low to Medium                              | Yes                                       |
|                               | Increase in ambient concentrations of NO <sub>2</sub> during operation                  | Negligible                               | High                                       | Yes                                       |
|                               | Increase in ambient concentrations of SO <sub>2</sub> during operation                  | Low                                      | Medium                                     | Yes                                       |
|                               | Increase in ambient concentrations of CO, PM, and VOCs during operation                 | Negligible                               | Low                                        | Yes                                       |
| Acoustic                      | Increase in noise levels during construction                                            | Negligible                               | Negligible                                 | Yes                                       |
|                               | Increase in vibration levels during construction                                        | Negligible to Low                        | n/a                                        | Yes                                       |
|                               | Increase in noise levels during operation                                               | Negligible to Low                        | Negligible to Low                          | Yes                                       |
| Vegetation                    | Introduction or spread of invasive plant species                                        | Negligible to Low                        | High                                       | Yes                                       |
| Wildlife                      | Loss or alteration of wildlife habitat                                                  | Negligible to Low                        | High                                       | Yes                                       |
|                               | Increased wildlife health and mortality risk                                            | Negligible to Low                        | High                                       | Yes                                       |

| Human Health                  | Health and well-being effects from elevated ambient CAC concentrations during operation | Low                                      | Medium                                     | Yes                                       |
|                               | Health and well-being effects from shift work                                           | Negligible to Low                        | Low                                        | Yes                                       |

<sup>1</sup> Contents of these columns are taken from sections 7.2 to 7.15 of FortisBC's Application.

<sup>2</sup> Non-negligible magnitude residual effects are highlighted in yellow.

However, while identifying the linkages between these VCs and Indigenous Interests, FortisBC does not find that these residual effects are sufficient to consider the potential for interactions with linked Indigenous Interests further. Table 11.18-12 of FortisBC's Application identifies no potential negative interactions between the Project and the remaining three assessed WSÁNEĆ Nations Indigenous Interests (Harvesting and Subsistence Activities, Cultural Use Sites and Areas, and Indigenous Health and Well-

being), and subsequent sections of the effects assessment do not assess any related potential effects or propose any specific management measures. The general rationale provided by FortisBC for identifying no potential for interactions is that:

1. FortisBC does not have information to indicate that the ᑭᐱᐱᐱ Nations currently fish, hunt, gather plants, or carry out cultural/ceremonial practices in or near the proposed Project Footprint, which is largely on private property, and where the Project's residual effects are expected to be concentrated; and
2. Project-related residual effects to VCs linked with ᑭᐱᐱᐱ Nations' Indigenous Interests are expected to be negligible or low in magnitude.

Sᑭᐱᐱᐱ First Nation is providing additional information on Sᑭᐱᐱᐱ uses of this area as part of this report, and notes that current use is not a barometer for past use or aspirational future use. In Sᑭᐱᐱᐱ First Nation's view, the presence of non-negligible residual effects and contribution of low to high magnitude cumulative effects to VCs linked with Sᑭᐱᐱᐱ First Nation rights and interests within Sᑭᐱᐱᐱ First Nation territory are sufficient grounds to, at minimum, identify the potential for an interaction. Furthermore, as noted previously, FortisBC has not assessed the Project's potential to interact with Cultural Continuation and Indigenous Governance Systems as Indigenous Interests of the ᑭᐱᐱᐱ Nations in general, or of Sᑭᐱᐱᐱ First Nation in particular, which Sᑭᐱᐱᐱ considers important to the assessment.

### 3.3.4.2 Determination of Residual Effects

Sᑭᐱᐱᐱ First Nation's assessment of potential interactions and effects is largely based on the residual effects anticipated for linked VCs determined by FortisBC, which accounts for and considers proposed effects management. Notwithstanding Sᑭᐱᐱᐱ First Nation's lack of ability to judge the effectiveness of FortisBC's proposed mitigations due to an absence of detail, as noted above in Section 3.3.4.1, Sᑭᐱᐱᐱ First Nation identifies Project residual effects to the Nation's rights and interests listed in Table 11. Similarly, Sᑭᐱᐱᐱ First Nation notes that there is insufficient detail to assess the potential effects of decommissioning activities as they are dependent on "regulations applicable at that time" and "the preferred land uses at that time", and that the anticipated condition of the Project Footprint after decommissioning is that the land "will continue to be used for industrial purposes in the future" (Section 1.5.4 of FortisBC's Application). The determination and characterization of residual effects found in Section 3.3.5 can therefore be considered conservative (i.e., with actual effects likely greater in magnitude).

**Table 11:** Residual effects to Sᑭᐱᐱᐱ First Nation rights and interests.

| Category of Indigenous Interest   | Project Phase <sup>1</sup> | Mitigation Effectiveness <sup>2</sup> | Residual Effect                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|----------------------------|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Social and Economic Conditions            | Operation – Land-based     | Unknown                               | <ul style="list-style-type: none"> <li>Positive residual effect - increased employment opportunities</li> <li>Negative residual effect - to future aspirations for the Project site and surrounding areas, including revitalization of harvesting and related resource sharing and trade</li> <li>Negative residual effect - to fishing, hunting, trapping, and gathering and cultural or ceremonial activities and practices</li> <li>Negative residual effect - to trade and social relationships</li> </ul> |
| Cultural Continuation                     | Operation – Land-based     | Unknown                               | <ul style="list-style-type: none"> <li>Negative residual effect - to knowledge transmission from ongoing environmental disturbance</li> <li>Negative residual effect - to SṪÁUTW First Nation efforts to revitalize, develop, and participate in knowledge transmission</li> <li>Negative residual effect - to opportunities to connect with and revitalize sense of place and identity</li> </ul>                                                                                                             |
| SṪÁUTW First Nation Health and Well-being | Operation – Land-based     | Unknown                               | <ul style="list-style-type: none"> <li>Negative residual effect - on mental and emotional health, and negative indirect impacts on physical health</li> </ul>                                                                                                                                                                                                                                                                                                                                                  |

<sup>1</sup> As noted above, there is insufficient information contained in FortisBC's Application to assess the potential for residual effects during the Decommissioning phase of the Project.

<sup>2</sup> As noted in Section 3.3.4.1, there is insufficient information about FortisBC's proposed mitigation measures to afford a meaningful evaluation of their potential effectiveness to reduce or eliminate Project effects; therefore, potential effects identified in Sections 3.3.3 are also considered to be residual effects.

### 3.3.5 Characterization of Residual Effects

SṪÁUTW First Nation uses the same residual effects characterization criteria as set out in Section 11.1.11 of FortisBC's Application; however, SṪÁUTW First Nation presents its own descriptions and definitions of ratings for those criteria in Table 12.

**Table 12:** Criteria for the characterization of residual effects on SṪÁUTW First Nation rights and interests.

| Characterization Criteria and Description |                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Ratings and Definitions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Context</b>                            | The extent to which SṪÁUTW First Nation can exercise this right or interest in the LAA based on the effects of historical and existing projects and activities, anticipated future use of the LAA, the level of sensitivity and/or resilience of linked SṪÁUTW values, the uniqueness of the location or value, the level of conservation concern for the location or value, and the availability (or lack of availability) of similar values in other areas. | <ul style="list-style-type: none"> <li>• <b>Low:</b> The ability of the Nation to exercise this right or interest has been greatly impaired and is discontinued or continued with substantial alteration of behaviour.</li> <li>• <b>Moderate:</b> The ability of the Nation to exercise this right has been impaired but is still practiced with some restrictions, limitations, or alteration of behaviour.</li> <li>• <b>High:</b> The ability of the Nation to exercise this right or interest is unimpaired.</li> </ul>                                                                                                                                                                                                                                                                                                              |
| <b>Magnitude</b>                          | The intensity or severity of the residual effect to the SṪÁUTW ability to exercise this right or interest when compared to existing conditions.                                                                                                                                                                                                                                                                                                               | <ul style="list-style-type: none"> <li>• <b>Negligible:</b> No change or a change that is not detectable or measurable and would not noticeably affect the ability to exercise this right or interest.</li> <li>• <b>Low:</b> A small but detectable change that would not noticeably affect the ability to exercise this right or interest.</li> <li>• <b>Moderate:</b> A demonstrable change that would noticeably affect the ability to exercise this right or interest, allowing continuation with some restrictions, limitations, or alteration of behaviour.</li> <li>• <b>High:</b> A demonstrable change that would noticeably affect the ability to exercise this right or interest; the exercise of this right or interest will either not continue or will require substantial alteration of behaviour to continue.</li> </ul> |
| <b>Extent</b>                             | The spatial area over which the residual effect is expected to occur.                                                                                                                                                                                                                                                                                                                                                                                         | <ul style="list-style-type: none"> <li>• <b>Site:</b> the effect will be limited to the Project Footprint</li> <li>• <b>Local:</b> the effect will be limited to the Local Assessment Area</li> <li>• <b>Regional:</b> the effect will be limited to the Regional Assessment Area</li> <li>• <b>Beyond Regional:</b> the effect will be beyond the Regional Assessment Area</li> <li>• <b>n/a:</b> the effect is intangible and thus does not have a spatial extent</li> </ul>                                                                                                                                                                                                                                                                                                                                                            |
| <b>Duration</b>                           | The period during which the residual effect will persist and act upon this SṪÁUTW right or interest (may be longer than the duration of the physical work or activity that produced the effect).                                                                                                                                                                                                                                                              | <ul style="list-style-type: none"> <li>• <b>Short term:</b> Effect will extend up to one year.</li> <li>• <b>Medium term:</b> Effect will occur only during the construction or decommissioning phases.</li> <li>• <b>Long term:</b> Effect will persist for less than 25 years, or one generation.</li> <li>• <b>Permanent:</b> Effect will not dissipate with time or will extend beyond 25 years, or one generation. | Risk<br>(likelihood and consequence)      | Likelihood is whether a residual effect to the Sᑭᐱᐱ right or interest is likely to occur. Consequence is derived based on consideration of the residual effect’s magnitude and extent. Risk is then defined by considering both likelihood and consequence. | <ul style="list-style-type: none"><li>• <b>Likelihood:</b><ul style="list-style-type: none"><li>○ <b>Low:</b> Effects are unlikely to occur.</li><li>○ <b>Medium:</b> Effects may occur.</li><li>○ <b>High:</b> Effects are likely to occur.</li></ul></li><li>• <b>Consequence (derived from matrix below):</b><table><tr><th colspan="5">Magnitude</th></tr><tr><th>Extent¹</th><th>Negligible</th><th>Low</th><th>Moderate</th><th>High</th></tr><tr><td>Site</td><td>Low</td><td>Low</td><td>Medium</td><td>Medium</td></tr><tr><td>Local</td><td>Low</td><td>Medium</td><td>Medium</td><td>High</td></tr><tr><td>Regional</td><td>Medium</td><td>Medium</td><td>High</td><td>Very High</td></tr><tr><td>Beyond Regional</td><td>Medium</td><td>High</td><td>Very High</td><td>Very High</td></tr></table></li><li>• <b>Risk (derived from matrix below):</b><table><tr><th colspan="4">Likelihood</th></tr><tr><th>Consequence</th><th>Low</th><th>Medium</th><th>High</th></tr><tr><td>Low</td><td>Low</td><td>Low</td><td>Medium</td></tr><tr><td>Medium</td><td>Low</td><td>Medium</td><td>Medium</td></tr><tr><td>High</td><td>Medium</td><td>Medium</td><td>High</td></tr><tr><td>Very High</td><td>Medium</td><td>High</td><td>High</td></tr></table></li></ul> | Magnitude |           |  |  |  | Extent¹ | Negligible | Low | Moderate | High | Site | Low | Low | Medium | Medium | Local | Low | Medium | Medium | High | Regional | Medium | Medium | High | Very High | Beyond Regional | Medium | High | Very High | Very High | Likelihood |  |  |  | Consequence | Low | Medium | High | Low | Low | Low | Medium | Medium | Low | Medium | Medium | High | Medium | Medium | High | Very High | Medium | High | High |

<sup>1</sup> Where extent has been characterized as "n/a", consequence is mapped directly to the 4-point magnitude rating (i.e. negligible, low, moderate, and high magnitudes define low, medium, high, and very high consequences, respectively).

Note that no characterization of confidence is offered by Sᑭᐱᐱ First Nation as part of this assessment. In general, as described in Section 3.3.4, the effectiveness of mitigations proposed by FortisBC is yet to be established, and would therefore be generally ranked as Low.

The above criteria and ratings are applied in Table 13, which presents a characterization of the potential residual effects identified in Section 3.3.4.2. Consistent with the approach taken in FortisBC's Application, only adverse residual effects are characterized in this table.

**Table 13:** Characterization of residual effects to Sᑭᐱᐱᐱ First Nation rights and interests.

| <b>Sᑭᐱᐱᐱ Interest / Residual Effect</b>                                                                                                                                                                                                                                                                             | <b>Criteria Rating</b>                                   | <b>Rationale</b>                                                                                                                                                                                                                                                                                                                                                                                             |

|                                                                                                                                                                                                   | <b>Magnitude:</b> Low                                         | The Project represents a relatively minor incremental contribution to disturbances within an existing disturbed area. However, as noted in Section 3.3.3.6, some effects to Sᑭᐱᐱᐱ well-being are anticipated due to the environmental assessment process itself. |

|                                   | <b>Risk:</b> Medium<br>(Likelihood: Medium;<br>Consequence: Medium) | STÁUTW First Nation considers that there is potential for these effects to occur; based on the preceding ratings for magnitude and extent, the consequence of this effect is rated as medium. Therefore, the risk assessed as Medium. |

### 3.3.6 Cumulative Effects Assessment

Cumulative effects may be understood as “changes to environmental, social and economic values caused by the combined effect of past, present and potential future human activities and natural processes” (Province of British Columbia 2024). Other definitions include the “accumulation of changes to the environment caused by human activities (e.g. past, existing, and proposed activities, including activities associated with the project under assessment). These changes occur over space and time and can be brought about by environmental effects that are additive or interactive” (Nunavut Impact Review Board 2007:3) and “changes to the environment or human well-being from past, present, and future development projects and human activities” (Metlakatla First Nation 2019:12).

As noted in Sections 1 and 3.1.1.8, FortisBC’s Application has taken a conventional approach to CEA that first considers the Project’s incremental contribution to existing conditions (which include past and present disturbances), and then—if that contribution is considered to constitute residual effects—to further consider how the residual effects of reasonably foreseeable future projects may combine with those of the Project. It is STÁUTW First Nation’s view that, considering the level of existing disturbance, a precautionary approach would be to conduct a CEA wherever Project-specific potential effects have been identified.

#### 3.3.6.1 Identification of Cumulative Interactions and Potential Adverse Cumulative Effects

As noted earlier, the Project represents a further disturbance within the already highly disturbed Lower Mainland, including where the STÁUTW Consultation Area (defined under STÁUTW First Nation’s Consultation Protocol and Policy (STÁUTW First Nation 2024)) overlaps the LAA and RAA. Previous development and activities in this area have affected STÁUTW interests. Table 14 presents the list of future projects and activities defined in FortisBC’s Application as “certain and reasonably foreseeable” and therefore appropriate for consideration in the cumulative effects assessments. Most of these developments are proposed for construction within the next 5 to 10 years. For the purposes of this assessment, the CEA boundary is defined as the area of overlap between the Indigenous Interests RAA set out in Figure 11.18-1D of FortisBC’s Application and the STÁUTW Consultation Area.

**Table 14:** Reasonably foreseeable projects and activities considered in the cumulative effects assessment.

| Reasonably Foreseeable Future Projects and Activities | Spatial Overlap with CEA Boundary? | Project Construction Timeline <sup>1</sup> |
|-------------------------------------------------------|------------------------------------|--------------------------------------------|
| <i>Oil and Gas Developments</i>                       |                                    |                                            |
| Tilbury Phase 1 LNG Expansion Project                 | Yes                                | Completion in 2028                         |
| Parkland Burnaby Refinery                             | Yes                                | n/a                                        |

| Reasonably Foreseeable Future Projects and Activities         | Spatial Overlap with CEA Boundary? | Project Construction Timeline <sup>1</sup> |
|---------------------------------------------------------------|------------------------------------|--------------------------------------------|
| <i>Utilities and Energy Transmission</i>                      |                                    |                                            |

| Patullo Bridge Replacement                                    | Yes                                | 2019-2025                                  |

<sup>1</sup> Information taken from Section 6.6.1 of FortisBC's Application.

n/a: Information not provided in Section 6.6.1 of FortisBC's Application.

Like the Project, these projects and activities represent expansions, redevelopments, upgrades, and additions to existing developments. In a sense, this is a byproduct of the sheer density of development in the Lower Mainland; with no room for greenfield development, additions to existing sites are all that is possible.

If any or all of these projects proceed, they will be continuing the historical and present trend of disturbance within the CEA boundary. While the individual contribution of each of these projects on sites already disturbed by development may be relatively small, each project will serve to incrementally entrench development, increasing the alienation of Sᑭᐱᐱᐱ First Nation from its territory within the Lower Mainland. Thus, the potential cumulative effects to Sᑭᐱᐱᐱ First Nations rights and interests are similar to those of the Project itself, but spread out over a broader spatial area and longer timeframe, as follows:

- Harvesting and Subsistence Rights:
  - Introducing additional sensory disturbances and further impacting plant, fish, and wildlife populations and associated habitats;
  - Delaying revitalization and recovery of harvesting and access conditions supporting rights;
- Cultural Use Sites and Areas:
  - Delaying access to and revitalization of Sᑭᐱᐱᐱ First Nation cultural sites and associated cultural and spiritual practices;
- Sᑭᐱᐱᐱ First Nation Governance:
  - Creating ongoing barriers to Sᑭᐱᐱᐱ First Nation use of the area within the CEA boundary;
  - Creating ongoing barriers to the exercise of Sᑭᐱᐱᐱ First Nation laws, customs, and protocols;
  - Creating effects inconsistent with and counterproductive to Sᑭᐱᐱᐱ First Nation stewardship goals;
- Social and Economic Conditions:
  - Increased employment opportunities;
  - Negative effect to future aspirations for the area within the CEA boundary, including revitalization of harvesting and related resource sharing and trade;
  - Negative effect to fishing, hunting, trapping, and gathering and cultural or ceremonial activities and practices;
  - Negative effect to trade and social relationships;
- Cultural Continuation:
  - Negative effect to knowledge transmission from ongoing environmental disturbance;
  - Negative effect to Sᑭᐱᐱᐱ First Nation efforts to revitalize, develop, and participate in knowledge transmission;
  - Negative effect to opportunities to connect with and revitalize sense of place and identity;
- Sᑭᐱᐱᐱ First Nation Health and Well-being:
  - Negative effect on mental and emotional health, and negative impacts on physical health.

### 3.3.6.2 *Mitigation of Cumulative Effects*

As noted in Section 3.1.1.8, FortisBC does not identify any adverse effects of the Project in its Application and does not propose any mitigations for cumulative effects. Therefore, potential cumulative effects are considered to be residual cumulative effects and are characterized in Section 3.3.6.3.

### 3.3.6.3 Characterization of Residual Cumulative Effects

Table 15 provides a characterization for each of the residual cumulative effects identified, broadly using the same criteria defined in Section 3.3.5.

**Table 15:** Characterization of residual cumulative effects to Sᑭᐱᐅᐅᐅ First Nation rights and interests.

| Sᑭᐱᐅᐅᐅ Interest / Residual Cumulative Effect                                                                                                                                                                                                                                                                                         | Criteria Rating                    | Rationale                                                                                                                                                                                                                         |

### 3.4 Summary of Effects Assessment

Since time immemorial, Sᑭᐱᐱᐱ have stewarded and benefited from the resources in Sᑭᐱᐱᐱ First Nation territory. Use of the Lower Mainland was part of the Sᑭᐱᐱᐱ seasonal round and included the land and linked waterways of the ŚNEWIL/Fraser River, and was extensive. Sᑭᐱᐱᐱ First Nation objects to the Project as proposed without adequate mitigation and action on existing cumulative effects. The Project, if approved, would contribute to the ongoing breach of Sᑭᐱᐱᐱ First Nation's inherent and constitutionally protected Aboriginal and Treaty rights.

Sᑭᐱᐱᐱ First Nation has undertaken a systematic assessment of the Project's potential impacts on its rights and interests, using methods that differ in some ways from the conventional VC-based framework adopted by FortisBC in its Application. With respect to the Project and its potential effects, these rights relate to harvesting and subsistence activities, cultural use sites and areas, governance systems, social and economic conditions, cultural continuation, and health and well-being. These rights have not been extinguished and continue to be protected despite the considerable level of cumulative effects and access barriers that effectively prevent the meaningful exercise of these rights "as formerly", including:

- Cumulative effects and access barriers that effectively prevent fishing, plant gathering, and hunting activities.
- Beliefs and ceremonies rooted in the principles of kinship and respect being more difficult than ever to apply especially due to—but not limited to—the absence of sufficient resources (e.g., that are essential or the basis of many ceremonies).
- Colonization and colonial institutions, and settlement and development across Sᑭᐱᐱᐱ First Nation territory, including the Lower Mainland, that have directly obstructed Sᑭᐱᐱᐱ First Nation

from implementing and applying its laws. Large-scale losses of natural resources have also impacted the ability of Sᑭᐱᐱᐱ First Nation to implement governance principles and cultural beliefs manifest in customs and protocols of resource harvesting and use.

- The traditional economy of Sᑭᐱᐱᐱ First Nation—which centres on the harvest, sharing, and trade of marine and terrestrial resources—no longer being able to be exercised in a meaningful way in the Lower Mainland, disrupting food security and intercommunity relationships.
- Opportunities to engage in the transfer of cultural knowledge being rapidly lost since the signing of the Douglas Treaty, including through impacts to the resource base and access to resources in Sᑭᐱᐱᐱ First Nation territory and the Lower Mainland, severely limiting opportunities for experiential learning. Because these changes have persisted and spanned multiple generations, young members of Sᑭᐱᐱᐱ First Nation are especially susceptible to cultural disconnection and have simultaneously increasing generational gaps in knowledge.
- Cumulative effects and impacts in Sᑭᐱᐱᐱ First Nation territory and the Lower Mainland being compromised and continuing to affect Sᑭᐱᐱᐱ health and well-being by adversely affecting the resource base and diets, economic conditions, social cohesion and bonds, governance responsibilities, sense of place, knowledge transmission and ceremonies, and self-determination and governance (including in environmental assessment).

FortisBC's Application assesses the Project's potential effects on W̱SÁNEĆ Nations Indigenous Interests (including the rights and interests of Sᑭᐱᐱᐱ First Nation). FortisBC concludes that the Project will have numerous deleterious effects, but concludes there will be no impact on W̱SÁNEĆ Nations Indigenous Interests. Sᑭᐱᐱᐱ First Nation prefers—and has the right to expect—the revitalization and recovery of protected harvesting and subsistence rights, and the conditions that would permit the exercise of these rights as formerly. It is Sᑭᐱᐱᐱ First Nation's view that the Project's effects present a continuation (and in some cases, worsening) of current baseline conditions, which will delay and prevent such revitalization and recovery.

In addition, Sᑭᐱᐱᐱ First Nation finds that many of FortisBC's proposed mitigation measures are expressed in such general terms that it is often difficult to understand what measures are being proposed or to evaluate.

Table 16 summarizes Sᑭᐱᐱᐱ First Nation's predicted adverse residual effects and cumulative effects on Nation rights and interests from the proposed Project, as well as characterization criteria for these effects.

**Table 16:** Summary of predicted adverse residual effects and cumulative residual effects on Sᑭᐱᐱᐱ First Nation rights and interests.

| Predicted Residual and Cumulative Residual Effect                                                                                                                                                                                                                                                                                                | Residual Effects Characterization                                                                                                                                                                                                                                                                                           | Cumulative Effects Characterization                                                                                                                                                                                                                                                                                              |

| <b>SṪÁUTW First Nation Health and Well-being</b> <ul style="list-style-type: none"> <li>Negative effect on mental and emotional health, and negative impacts on physical health</li> </ul> | <b>Context:</b> Moderate<br><b>Magnitude:</b> Low<br><b>Extent:</b> n/a<br><b>Duration:</b> Permanent<br><b>Frequency:</b> Continuous<br><b>Reversibility:</b> Irreversible<br><b>Affected Populations:</b> Disproportionate<br><b>Importance:</b> High<br><b>Risk:</b> Medium<br><b>Likelihood:</b> Medium<br><b>Consequence:</b> Medium | <b>Context:</b> Moderate<br><b>Magnitude:</b> Low<br><b>Extent:</b> n/a<br><b>Duration:</b> Permanent<br><b>Frequency:</b> Continuous<br><b>Reversibility:</b> Irreversible<br><b>Affected Populations:</b> Disproportionate<br><b>Importance:</b> High<br><b>Risk:</b> Medium<br><b>Likelihood:</b> Medium<br><b>Consequence:</b> Medium |

For thousands of years, SṪÁUTW practiced a way of life connected to and dependent on the waters and lands in SṪÁUTW First Nation territory, harvesting and trading fish, wildlife, and other natural resources; travelling via trails and waterways; and holding ceremonies and gatherings. The great abundance of the water and land made SṪÁUTW, in the words of an elder, “the richest people on earth” (WŚÁNEĆ Elder Dave Elliot Sr.).

In 1852, SṪÁUTW entered into agreements of peaceful coexistence with early settlers as signatories to the South and North Saanich Douglas Treaties. As the other party to this agreement, the Crown promised SṪÁUTW the protection of several inherent rights, including harvesting rights that would allow SṪÁUTW to carry on fisheries, hunting, and other activities with the same freedoms as before.

For the past 173 years, connection to the waters and lands of SṪÁUTW First Nation territory has continued to be central to the Nation’s identity and way of life. Land- and water-based harvesting are still tightly intertwined with SṪÁUTW customs, protocols, traditions, and values. However, over that same period, the waters and lands that were once a source of great prosperity for SṪÁUTW have undergone a massive transformation. Significant changes include dense settlement (industrial and urban) of land within the territory, overfishing and competition from colonial commercial fisheries, contamination and habitat fragmentation, and barriers to access imposed by the international border.

The cumulative effects of these actions have fundamentally impaired the freedom of SṪÁUTW to meaningfully exercise its rights. While in isolation, the Project does not represent a substantive new escalation of this overall pattern of development, it is SṪÁUTW’s view that it both incrementally worsens existing conditions and delays potential for recovery and restoration of terrestrial and aquatic ecosystems.

In a similar vein to Justice Burke’s findings in *Yahey v. British Columbia*, 2021 BCSC 1287, allowing industrial development in SṪÁUTW First Nation territory at an extensive scale without assessing the cumulative impacts of this development—or ensuring that SṪÁUTW will be able to continue meaningfully exercising its Treaty rights in its territory—is in conflict with the rights of SṪÁUTW First Nation under the Douglas Treaty. As an outcome of the *Yahey* decision, the Province and several BC First Nations entered into new agreements relating to environmental restoration and protection and resource management. Similar concrete and concerted action is required to address cumulative effects in the Lower Mainland and the attendant breach of SṪÁUTW First Nation rights.

### 16.17.2 The EAO's Views

#### **SᑭÁUTW's Assessment**

Participating Indigenous nations have the opportunity under Section 19(4) of the EAA to carry out an assessment with respect to the potential effects of the project on the nation and on its rights. SᑭÁUTW completed an effects assessment under Section 19(4), as agreed upon in the Assessment Plan of the Process Order.

The EAO acknowledges and respects that SᑭÁUTW's Section 19(4) assessment has been undertaken using its own laws, knowledge systems, and decision-making frameworks, and that the assessment reflects SᑭÁUTW's perspectives on the nature and severity of potential effects on its Aboriginal and Treaty rights. The EAO also acknowledges that SᑭÁUTW's assessment methods may differ in some respects from EAO's assessment methods, and that any characterization of residual effects and determination of significance for this assessment is based on the methods that SᑭÁUTW used.

#### **SᑭÁUTW's Involvement in the Consultation Process**

SᑭÁUTW identified as a participating Indigenous nation for the Project on October 31, 2024, which provided opportunities to participate in the environmental assessment process. Prior to this, SᑭÁUTW was engaged in the environmental assessment as part of the W̱SÁNEĆ Nations, not as a participating Indigenous nation, but receiving notifications and information on the process. The EAO updated the Process Order, and Assessment Plan on May 5, 2025, to reflect this, and SᑭÁUTW began participating in the Technical Advisory Committee starting at the Application review phase. SᑭÁUTW participated in the review of Fortis's Application, EAO's draft Assessment Report and EAC, and ongoing engagement with the EAO and Fortis.

The EAO worked collaboratively with SᑭÁUTW throughout the environmental assessment process. SᑭÁUTW participated in technical discussions and iterative engagement opportunities to review project information, identify potential effects on its rights, and provide input on mitigation and accommodation measures to address potential impacts to SᑭÁUTW's rights and title. The EAO and SᑭÁUTW maintained ongoing dialogue throughout the process, including regular meetings and discussions to understand, assess, and respond to issues as they arose.

#### **Provincial Conditions and Federal Key Mitigation Measures**

The EAO notes that SᑭÁUTW recommended additional specific mitigations, and those recommendations were considered and responded to in the development of provincial and federal conditions.

Provincial conditions and federal Key Mitigation Measures were developed to address potential effects on SᑭÁUTW's Aboriginal and Treaty rights, including effects related to harvest and subsistence rights, cultural use sites and areas, governance, social and economic conditions, cultural continuity, and health and well-being. The following provincial conditions and federal Key Mitigation Measures also address the matters assessed by SᑭÁUTW in their Section 19(4) assessment.

#### **Harvesting and Subsistence Rights**

The EAO identified the following proposed provincial conditions that would mitigate potential effects to harvesting, with any management plans from these conditions to be developed in consultation with SᑭÁUTW:

- **Condition 10 (Community Feedback Process)** creates a clear way for SᑭÁUTW to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of harvesting and cultural practices;

- **Condition 12 (Construction Environmental Management Plan)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. By reducing disturbance and protecting the environmental conditions that support fish, wildlife, and plants, this condition helps maintain the ability to access, harvest, and experience culturally important areas;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to SṠÁUTW harvesting and cultural practices;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emissions-control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support harvesting and cultural practices; and,
- **Condition 17 (Dry Street Sweeping Report)** assesses whether dry street sweeping can reduce 6PPD-quinone on project-related roads, which may lower impacts on salmon and other fish important to SṠÁUTW.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to harvesting:

- **Migratory Bird Protections** would require protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting SṠÁUTW's harvesting practices and broader ecosystem conditions important to their way of life.

#### Cultural Use Sites and Areas and Cultural Continuation

The EAO identified the following proposed provincial conditions that would mitigate potential effects to cultural use sites and areas, and cultural continuation, with any management plans from these conditions be developed in consultation with SṠÁUTW:

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance;
- **Condition 10 (Community Feedback Process)** establishes a clear and structured mechanism for SṠÁUTW to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (Construction Environmental Management Plan)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. By reducing disturbance and protecting the environmental conditions that support fish, wildlife, and plants, this condition helps maintain the ability to access and experience culturally important areas in ways that are consistent with SṠÁUTW values, supporting continuity of cultural practices and connection to place;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation. Maintaining stable and predictable environmental conditions over time helps preserve the integrity of the area, helping maintain environmental conditions that support cultural use of the area and connection to culturally important sites;

- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emissions-control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites; and,
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities, to prevent additional cultural disturbance.

### STÁUTW Governance

The EAO identified the following proposed provincial conditions that would help address potential effects related to STÁUTW governance interests, with any management plans from these conditions be developed in consultation with STÁUTW:

- **Condition 4 (Consultation)** requires the Proponent be available to meet with STÁUTW throughout all project phases and discuss issues or concerns related to the Project;
- **Condition 3 (Document Development)** requires that plans and programs include clear objectives, monitoring protocols, and reporting requirements, as well as provisions for evaluating mitigation effectiveness using baseline information (including Indigenous knowledge, where available). It also requires adaptive management where monitoring indicates that predicted outcomes are not achieved. These requirements are intended to support transparency, accountability, and ongoing refinement of mitigation measures over the Project lifecycle;
- **Condition 10 (Community Feedback Process)** ensures a clear and responsive pathway for STÁUTW to raise and resolve concerns about project effects. By enabling early identification and timely resolution of issues such as noise, dust, light, or access disruptions, this allows STÁUTW more agency over these sensory concerns;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities, to prevent additional cultural disturbance; and,
- **Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan supporting economic participation of First Nations, and local communities, that would describe employment and contracting strategies and training practices. This plan supports STÁUTW economic governance, ownership and self-determination.

### STÁUTW Health and Well-being and Social and Economic Conditions

The EAO identified the following proposed provincial conditions that would mitigate potential social and economic effects, and effects to health and well-being, with any management plans from these conditions be developed in consultation with STÁUTW:

- **Condition 10 (Community Feedback Process)** provides STÁUTW with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)** require ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with STÁUTW to be developed by the Holder in consultation with the Nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;

- **Condition 16 (Indigenous and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of SᑭÁUTW. By outlining employment, contracting, and training strategies, this condition helps support socio-economic well-being;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting physical health and overall well-being; and
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. This condition helps prevent disturbance to cultural materials and avoids associated cultural or emotional harm, supporting Indigenous health and well-being.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Well-being and Social and Economic Conditions:

- **Accidents and Malfunctions Reporting** would support mitigation of potential impacts on SᑭÁUTW's interests by ensuring timely response, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

### EAO Conclusion

Provincial conditions and federal Key Mitigation Measures were developed to address potential effects to First Nations' s.35 rights, including SᑭÁUTW's Aboriginal and Treaty rights, and the EAO is of the view that the seriousness of potential effects on SᑭÁUTW's rights would be reduced through implementation of the proposed provincial conditions and federal Key Mitigation Measures.

In consideration of the above analyses and the proposed provincial conditions, federal Key Mitigation Measures and follow-up programs, the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on the interests of SᑭÁUTW has been adequately avoided, minimized or otherwise accommodated. Based on the engagement undertaken with SᑭÁUTW on Tilbury Phase 2, as outlined above, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult and accommodate SᑭÁUTW.

# Indigenous-Led Assessment of the Effects of the Tilbury Phase 2 Expansion Project on the Rights of Tsawwassen First Nation

June 18, 2026

Prepared by:

With support from:

Submitted to:

BC Environmental Assessment Office

## Disclaimer

The information contained in this report is based on research and analysis conducted by the Tsawwassen First Nation and Firelight. The report may be updated, refined, or changed as new information becomes available. The information contained herein should not be construed as to define, limit, or otherwise constrain the Indigenous rights of Tsawwassen First Nation or any other First Nations or Indigenous peoples.

## Executive Summary

This report evaluates the effects of the Tilbury Phase 2 Expansion Project (the “Project”) on the exercise of Tsawwassen First Nation (“Tsawwassen”) Aboriginal and Treaty rights. The assessment was undertaken pursuant to section 19(4) of the British Columbia Environmental Assessment Act, which enables Indigenous nations to assess project impacts on rights recognized and affirmed under section 35 of the Constitution Act, 1982.

The Assessment focuses on the psychosocial conditions that support meaningful rights-based practice for Tsawwassen. The rights impacts identified extend beyond the initial pathways of effect identified in the Proponent’s Environmental Assessment Certificate Application to include the often-intangible dimensions that shape the conditions necessary for the meaningful exercise of Tsawwassen’s rights and Treaty Objectives. These conditions include mental and emotional well-being, sense of place and identity, and experiences of marginalization within a cumulatively industrialized landscape. Tsawwassen’s rights are defined in the Tsawwassen First Nation Final Agreement, which established a new relationship between Tsawwassen and the Crown, and acknowledges Tsawwassen’s connection to its territory, as well as its stewardship, cultural, governance, and economic objectives, which together underpin the rights and relationships set out in the Treaty.

The Project is located within the lower Fraser River, in the heart of Tsawwassen First Nation’s Territory. This is an area that has undergone sustained industrial transformation over several decades. Shoreline modification, port expansion, transportation corridors, and existing LNG infrastructure have materially altered the ecological, visual, and experiential character of the territory. Community members described cumulative discouragement, diminished confidence in territorial recovery, and concerns that thresholds of change have already been surpassed.

In light of the Proponent’s commitment to avoid use of the Fraser River, the Project is not anticipated to introduce new direct barriers to harvesting rights, nor is it predicted to materially contribute (absent an exceedance or malfunction) to direct reduction in resource abundance within the immediate project footprint. However, the Project reinforces and extends the industrial permanence of Tilbury Island, intensifies perceptions of catastrophic risk, and contributes to ongoing psychosocial strain on Tsawwassen’s exercise of its rights and ability to advance Treaty objectives within an already vulnerable context.

Residual effects on psychosocial well-being – which translate into effects on Tsawwassen’s rights and Treaty Objectives – are characterized by: **high vulnerability, moderate magnitude, long-term duration, and low reversibility**. When assessed against Tsawwassen’s articulated desired future conditions, including strengthened cultural continuity, stewardship, and confident intergenerational rights-based practice, the Project contributes incrementally to a negative direction.

The overall severity of effects on Tsawwassen's rights and Treaty Objectives through psychosocial pathways is determined to be **moderate**. While the Project does not eliminate by itself the ability of Tsawwassen members to exercise their rights, it reinforces cumulative pressures in a landscape where psychosocial thresholds have already been crossed, further constraining the relational and experiential conditions necessary for revitalized and future-oriented rights practice.

The report identifies recommended measures to reduce residual impacts on Tsawwassen's rights and Treaty Objectives. These include enhanced risk transparency mechanisms, experiential and sensory mitigation measures, support for cultural continuity and intergenerational harvesting initiatives, and structured participation and adaptive oversight mechanisms. These measures are intended to strengthen community confidence, improve experiential conditions, and support the exercise of Tsawwassen's rights within an industrialized context.

# 1. Introduction

This Indigenous-led Assessment evaluates the potential effects of the Tilbury Phase 2 Expansion Project (“the Project”) on Tsawwassen First Nation’s (“Tsawwassen”) Aboriginal and Treaty rights. The Assessment is undertaken pursuant to section 19(4) of the British Columbia Environmental Assessment Act (BCEAA), which enables Indigenous nations to assess project impacts on rights recognized and affirmed under Section 35 of the Constitution Act. Tsawwassen’s rights are defined in the Tsawwassen First Nation Final Agreement, which established a new relationship between Tsawwassen and the Crown. It acknowledges Tsawwassen’s connection to its territory, as well as its stewardship, cultural, governance, and economic objectives, which together underpin the rights and relationships set out in the Treaty.

The Project is located within the heart of Tsawwassen First Nation’s Territory, in a highly industrialized and previously disturbed area where the cumulative impacts of numerous development projects are already severely limiting Tsawwassen members’ ability to practice their rights and achieve Treaty Objectives related to a healthy river. The rights impacts identified in this Indigenous-led Assessment extend beyond the initial pathways of effect identified in the Proponent’s Environmental Assessment Certificate Application to include the often-intangible dimensions that shape the conditions necessary for the meaningful exercise of Tsawwassen’s rights and Treaty Objectives. These conditions include mental and emotional well-being, sense of place and identity, and experiences of marginalization within a cumulatively industrialized landscape.

In light of the Proponent’s commitment to avoid use of the Fraser River, the Project is not anticipated to introduce new direct barriers to harvesting rights, nor is it predicted to materially contribute (absent an exceedance or malfunction) to direct reduction in resource abundance within the immediate project footprint. However, the Project reinforces and extends the industrial permanence of Tilbury Island, intensifies perceptions of catastrophic risk, and contributes to ongoing psychosocial strain on Tsawwassen’s exercise of its rights, its stewardship responsibilities, and its ability to advance Treaty Objectives related to psychosocial health and well-being within an already vulnerable context. In doing so, it has the potential to further reinforce the industrial character of Tsawwassen’s traditional territory, weakening attachment to place, normalizing industrialization, and, over time, undermining confidence in the feasibility of rights revitalization and the realization of Treaty Objectives for current and future generations.

The meaningful exercise of Aboriginal and Treaty rights and Treaty Objectives depends on more than biophysical conditions and the technical ability to undertake specific activities. For Tsawwassen, it also depends on members’ psychological, emotional, and spiritual relationship with their lands and waters. These experiential and relational dimensions, often described in the literature as psychosocial conditions (Ninomiya et al., 2023; Gregory et al., 2020), directly influence how Indigenous peoples participate in rights-based practices, transmit knowledge to younger generations, and uphold stewardship and governance responsibilities (Acharibasam et al., 2024). When

psychosocial conditions are compromised, the effects extend across multiple rights categories, including harvesting, stewardship and governance, and cultural continuity.

Tsawwassen's articulation of its Treaty Objectives reflects this relational understanding of rights, expressed through a framework of health. Tsawwassen's Treaty Objectives are as follows:

- **Healthy Rights – Healthy River:** Recognizes the inseparable relationships between the well-being of Tsawwassen members and the health of the Fraser River and surrounding waters.
- **Healthy Relationships:** Emphasizes mutual respect and accountability in Tsawwassen's relationships with other governments, proponents, and regulatory bodies.
- **Healthy Future for Future Generations:** Reflects Tsawwassen's responsibility to ensure that decisions made today do not compromise the ability of future generations to exercise their rights and live well within the traditional territory.
- **Healthy Culture – Strong Stewardship:** Affirms the central role of culture, law, and stewardship responsibilities (šxʷkʷecxənəm) in maintaining Tsawwassen well-being (TFN, 2024).

These Objectives articulate a holistic and intergenerational vision of Treaty rights rooted in well-being and that links individuals and collective health to the condition of surrounding lands and waters, the integrity of social and environmental relationships, and the exercise of Tsawwassen governance and stewardship responsibilities. Project-related effects that weaken Tsawwassen members' relational, emotional, and psychological connection to their lands, waters, culture, and future generations therefore adversely impact the meaningful exercise of Tsawwassen's Aboriginal and Treaty rights and Treaty Objectives.

Accordingly, this Indigenous-led Assessment focuses on how the Project may influence Tsawwassen members' relational, emotional, and psychological connection to their lands, waters, culture, and future generations, and how these effects may shape the meaningful present and future exercise of Tsawwassen's Aboriginal and Treaty rights and Treaty Objectives within a cumulatively industrialized landscape.

## 2. Tsawwassen's Connection to the Fraser River and Surrounding Area

Tsawwassen First Nation (Tsawwassen) is a vibrant and complex modern Nation with deep and enduring connections to its Traditional Territory in the lower Fraser River, Boundary Bay, and the southern Strait of Georgia. Tsawwassen people are forward-looking while still maintaining a strong sense of connection with their history, culture, and governance systems. As described in the Declaration of Tsawwassen Identity and Nationhood:

We honour the ni sqwel kw̓θe syəw̓enelct (words of our ancestors) who preserved our history, our hən̓qəmin̓əm̓ (language) and protected our inheritance. We lift our hands to our ancestors and Elders who imparted syawən (teachings), s̓x̓wəx̓wəyem (stories), stiləm (songs) and q̓wəyeləx (dances) that allowed us to maintain our unique identity and way of life. We honour our children and future generations who will ensure these teachings carry on. We honour the Creator from whom all life flows as the source of our spirituality. We will uphold our fundamental belief system to maintain harmony with all of creation. (TFN 2009)

For thousands of years, Tsawwassen people have lived in relationships with the lands and waters of coastal BC. As stated by Chief Harry Joe in 1914,

...we have been in this place from time immemorial and... our ancestors were created in this place right over at the high land here known as [stl'alep] or English Bluff. That is the place where the first man of this race was created. (Bouchard and Kennedy 1991, 111)

Scəw̓aθən məsteyəx̓w̓, translated from the Salishan hən̓qəmin̓əm̓ language into the English name 'Tsawwassen First Nation', means "people of the land facing the sea". This name reflects a deeply rooted psychosocial and cultural identity that is inseparable from Tsawwassen lands and waters. Since time immemorial, Tsawwassen people have thrived as accomplished fishers and hunters on their traditional territories, from the waterways of the southern Strait of Georgia to the lower Fraser River and beyond. These places, and the beings that inhabit them – including fish, migratory birds, terrestrial animals, plants, and medicines – continue to hold profound cultural, subsistence, ceremonial, and spiritual importance for the people of Tsawwassen. The ongoing ability to access and steward these places is central to Tsawwassen well-being (TFN 2024).

Archaeological evidence, including carbon dating, demonstrates long-term habitation, while Indigenous Knowledge – including ancestral stories, legends, and hən̓qəmin̓əm̓ place names – confirms continuous use and stewardship of the territory (TFN 2015b; EAO 2019, 377; Williams per correspondence 16 May 2023). These includes two place names within proximity to Tilbury Island, the high land from Sunbury down to Mud Bay known as x̓w̓mēcənətp̓ and pəł̓x̓əneməx̓ ('meadowland'), referring to the area west of Deas Island (Williams pers. correspondence 16 May 2023). The Fraser River has long played a key role in Tsawwassen's cultural identity as a host Nation in the lower mainland. Historically, Tsawwassen held potlatches, participated in mask dancing, and welcomed canoes that came in along the Fraser River (TFN 2022).

The Coast Salish territory, known for its abundant food systems, sustained Tsawwassen peoples for millennia. Historical accounts describe a landscape where "salmon could be caught by the thousands, sturgeons reached a weight of one ton and whales a weight of thirty tons, and waterfowl numbered in the tens of thousands" (Suttles 1987, 47 as cited in TFN 1998, 21). However, by the 19th century, colonial settlement and industrial

development significantly altered both the physical environment and Tsawwassen's relationships with it. Colonial policies such as the imposition of the Indian Act and the reserve system have severely constrained Tsawwassen access to and governance over their territory. In 1871, the BC Surveyor General unilaterally defined the boundaries of the Tsawwassen reserve (Bouchard and Kennedy 1991). By 1914, the Tsawwassen reserve was confirmed at 604 acres (Bouchard and Kennedy 1991).

Large-scale infrastructure developments such as the construction of the BC Ferry Terminal and the Roberts Bank port facilities have had pronounced effects on local waters and foreshore areas, "creating a stagnant bay choked with invasive, non-Indigenous, plants and seaweed" (TFN n.d.a, 17). In the south arm of the Fraser, the establishment of canneries and increasing population of Vancouver spurred industrialization and boat traffic in this unique estuary ecosystem (Donald Luxton and Associates 2017, 4). Together with pollution, climate change, and ongoing industrial developments, these cumulative stressors have resulted in the decline or loss of many resources and foods that were once readily available to *scəwəθən məsteyəxʷ* within traditional harvesting sites (TFN 1998; Marushka et al. 2019; Weatherdon et al. 2016).

Today, Tsawwassen has 505 members, approximately half of whom reside on Tsawwassen Lands. Other members live in nearby communities such as Delta, Ladner, Surrey, and Langley, as well as in the Okanagan (British Columbia) and Bellingham (Washington) areas (TFN 2021a, 14; TFN n.d.b). Regardless of residence, Tsawwassen members maintain enduring social, cultural, and emotional connections to their traditional territory, which extends from Pitt Lake to New Westminster, south to Boundary Bay and the Point Roberts peninsula, and west into the Salish Sea and Southern Gulf Islands, including Galiano, Salt Spring, Pender, and Saturna islands (TFN 2019a). This diverse landscape includes marine waters, rivers, streams, lakes, sloughs, marshes, valleys, and bogs; all of which are surrounded by mountains (TFN 1998), and which continue to shape Tsawwassen identity, stewardship responsibilities, and well-being (TFN 1998).

Language is a core component of Tsawwassen identity. Linguistically, Tsawwassen is classified as a dialect of the mainland division of the Halkomelem Coast Salish Language, specifically of the downriver group sub-dialect (Bouchard and Kennedy 1991, 101). The *hən̓q̓əmin̓əm̓* language is a personal and cultural expression of identity. *hən̓q̓əmin̓əm̓* is also the conduit through which Tsawwassen's history and way of life was taught in the past, as it connects the community to past generations and ancestors. Despite the loss of language caused by colonization and the residential school system, the revival of *hən̓q̓əmin̓əm̓* is a vital part of Tsawwassen's culture today (TFN 2009).

Culture is integral to Tsawwassen's harvesting practices and community life. For example, the annual First Salmon Ceremony honors returning salmon, regarded as spiritual beings who provide sustenance, and includes the preparation of fish in sacred rituals that return bones to the water (TFN n.d.a.). Potlaches link food production, wealth distribution, and social relations, while providing a venue for songs, dances, oral histories, and intergenerational knowledge transfer (TFN 1998, 27). Both ceremonies

demonstrate how Tsawwassen's culture holistically supports social cohesion and community well-being.

Traditionally, Tsawwassen and surrounding Coast Salish peoples thrived in part due to their social organization by residential groups, such as the family, household, local group, and winter village. Each family prepared their food and kept their own provisions and supplies while living within a household that cooperated both economically and socially. Households lived in longhouses and together formed the core of a 'local group', also referred to as 'clans' or 'extended families' (Bouchard and Kennedy 1991). Local groups, who were linked by ties of marriage and the exchange of resources, clustered together in central villages, particularly during winter months (Bouchard and Kennedy 1991). This exchange of foods and other resources was key to the survival of First Nations families and households and took place informally among households and local groups or more formally through potlatches (TFN 1998).

Governance and leadership continue to be expressed through legal frameworks, hereditary institutions, and longhouse practices and ceremonies (TFN n.d.a.). The modern Tsawwassen governance system builds on these traditions, reflecting a continuity of responsibility, stewardship, and social cohesion. Today, Tsawwassen's contemporary relationships with the Crown is formalized through the Tsawwassen First Nation Final Agreement, a modern treaty and self-government agreement between Tsawwassen First Nation, Canada, and British Columbia which came into effect in 2009.

The Treaty recognizes Tsawwassen as a self-governing Indigenous nation, affirms ownership of Tsawwassen Lands, and establishes jurisdictional authority and Treaty rights, including hunting, fishing, and governance within its broader Traditional Territory, and specifically within the Project area. At the same time, the Treaty represents a broader project of nation-building, supporting Tsawwassen's self-determination goals while reshaping and redefining relationships with Canada and British Columbia on a government-to-government basis. In this way the Treaty marks a significant shift in these relationships, creating new pathways for decision-making in collaboration, and for the exercise of Tsawwassen law and authority. Furthermore, the Treaty provides a foundation for Tsawwassen's stewardship responsibilities and informs Indigenous-led Assessments for proposed developments to protect the cultural and psychosocial well-being of the Nation and its members.

### **3. Assessment Scope and Approach**

#### **3.1. Assessment Principles**

Several guiding principles articulated by Tsawwassen are followed in this psychosocial assessment, including:

1. The assessment must consider the nature and scope of rights as those rights are asserted, and how the rights might be impacted.

2. Assessing impacts on Aboriginal and Treaty rights and Treaty Objectives requires more than assessing environmental effects on the current use of lands and resources for traditional purposes or on physical and cultural heritage.
3. Assessing impacts on the exercise of Aboriginal and Treaty rights and Treaty Objectives requires understanding the context of historical and contemporary cumulative effects in which rights are exercised. This context needs to be evaluated before looking at Project effects on those rights.
4. The assessment should not be limited to site-specific effects but must consider all impacts on the exercise of rights within defined temporal and geographic boundaries
5. Utilizing an Indigenous perspective and Indigenous Knowledge is an imperative.
6. The assessment must consider Indigenous values, norms, and laws, where provided by a community.
7. Where a community has elected to participate, the selection of methods and indicators for assessing impacts to Aboriginal and Treaty rights and Treaty Objectives must be community driven.
8. Thresholds and measures to understand the potential effects of a project on the exercise of Aboriginal and Treaty rights and Treaty Objectives are to be utilized where they have been defined by the community.
9. Assessments of impact to the exercise of Aboriginal and Treaty rights and Treaty Objectives should consider a project's contribution to reconciliation.

### 3.2. Purpose of the Assessment

The purpose of this Indigenous-led Assessment is to evaluate the potential effects of the Project on the meaningful present and future exercise of Tsawwassen's Aboriginal and Treaty rights. This includes rights recognized and affirmed under Section 35 of the Constitution Act, 1982 and defined in the Tsawwassen First Nation Final Agreement.

Consistent with Tsawwassen's articulated principles and Treaty Objectives, this Assessment proceeds from the understanding that the exercise of rights depends not only on biophysical conditions or technical access to land and resources, but also on the relational, emotional, psychological, cultural, and governance conditions that sustain those practices over time. Rights are lived and practiced within social, environmental, and intergenerational contexts. Project-related changes that alter these conditions may therefore affect the feasibility, confidence, continuity, and vitality of rights practice, even where direct physical interference is limited.

This Assessment focuses primarily on the impacts to Tsawwassen rights and Treaty Objectives through psychosocial pathways, within a cumulatively industrialized

landscape. It examines how the Project may influence Tsawwassen members' attachment to place, confidence in harvesting and stewardship, perceptions of safety and risk, governance capacity, intergenerational knowledge transmission, and broader relational health, all of which are conditions required for the exercise of Tsawwassen's rights and the ability of Tsawwassen and the Crown to achieve Treaty Objectives. It further considers how incremental additions to industrial development may compound existing constraints on rights revitalization and resumption.

The Assessment is undertaken pursuant to section 19(4) of the British Columbia Environmental Assessment Act and reflects Tsawwassen's jurisdictional authority to assess impacts on its Aboriginal and Treaty rights and Treaty Objectives. It is intended to inform regulatory decision-making, support mitigation and accommodation discussions, and provide a clear articulation of how the Project may affect Tsawwassen's rights within their broader relational and cumulative context.

### 3.3. Assessment Boundaries

Tsawwassen has identified that the meaningful exercise of Aboriginal and Treaty rights, as well as Treaty Objectives, is not limited to biophysical conditions, but also includes the social, cultural, and psychological conditions that shape whether, how, and with what confidence rights can be practiced. This section outlines the framework used to define the spatial and temporal boundaries for assessing these types of impacts on Tsawwassen through a psychosocial Indigenous-led Assessment.

#### 3.3.1. Spatial Boundaries

The primary area of direct physical change associated with the Project is the Tilbury Island LNG facility. This constitutes the Project footprint considered in this Assessment. The Proponent has revised the Project to no longer include direct use of the Fraser River. This Assessment takes that commitment as confirmed for the purpose of defining spatial boundaries. As a result, direct physical changes to the river are not anticipated, and the spatial extent of directly biophysical effects is correspondingly more limited.

However, Tsawwassen's Aboriginal and Treaty rights depend not only on biophysical conditions, but also on the cultural and psychosocial conditions that support access, safety, cultural continuity, and connection to place. Rights-based practices and the conditions that sustain them, such as psychosocial well-being, are not confined to the Project site. Accordingly, this Assessment considers the broader landscape within which Tsawwassen members maintain cultural, governance, and stewardship connections, including how cumulative industrial development shapes the psychosocial conditions necessary to uphold Treaty Objectives.

The Assessment does not re-evaluate components assessed under the separate Tilbury Marine Jetty Project. Existing and previously approved infrastructure forms part of the cumulative context within which the Project is considered.

### 3.3.2. Temporal Boundaries

The Assessment considers both construction and operational phases of the Project. Construction-related activities are assessed in relation to short-term changes in industrial activity and perceived risk. Operational activities are assessed in relation to the long-term presence of expanded LNG infrastructure.

Given the intergenerational nature of the practice of Tsawwassen's rights, the Assessment also considers longer-term implications for cultural continuity, stewardship responsibilities, and confidence in rights revitalization. The temporal boundary includes cumulative past and reasonably foreseeable future development within the surrounding industrial landscape.

## 3.4. Guiding Frameworks and Concepts

Tsawwassen has identified that the meaningful exercise of Aboriginal and Treaty rights is not limited to biophysical conditions but also includes the cultural and psychosocial conditions that support well-being, connection to place, and the continuity of rights-based practices. Tsawwassen has further identified that its understanding of rights is inseparable from its Treaty Objectives, which reflect these interrelated conditions. Impacts to these conditions are often characterized in the literature as psychosocial impacts. These impacts are increasingly recognized in impact assessment processes, with heightened awareness that many projects can lead to adverse mental health and well-being outcomes for affected communities (Ninomiya et al., 2023; IAIA, 2021). This section outlines the framework that guides this psychosocial Indigenous-led Assessment, including psychosocial health, solastalgia, and cumulative effects.

### 3.4.1. Psychosocial Health and Risk Perception

Psychosocial health frameworks recognize the interconnection between mental, emotional, cultural, and social well-being. For many First Nations, psychosocial well-being is inseparable from relationships to land, culture, governance, and intergenerational continuity. Impacts to psychosocial health can arise from resource development projects, environmental disasters, and unwanted changes to one's environment (Edelstein & Vanclay 2024). Such changes may alter how individuals and communities experience their environment and their place in it. Psychosocial impacts may manifest as stress, anxiety, chronic uncertainty, altered behaviour, and diminished confidence in everyday activities, including cultural and land-based practices (Edelstein & Vanclay 2024).

This assessment adopts a holistic understanding of psychosocial wellness, recognizing that impacts may arise both from direct environmental change and from changes in perception. Risk perception is the "subjective judgement that individuals make about the characteristics and severity of a risk" (Spicer et al. 2020: 6851). Even where scientific

assessments indicate low or managed risk, perceived risk and changes in perception may lead to changes in behaviour, participation in land-based practices, intergenerational teaching and overall wellness (Edelstein & Vanclay 2024). In this context, perception is treated as a meaningful factor shaping the lived experience and exercise of rights.

### 3.4.2. Solastalgia and Place-Based Distress

The term solastalgia is used as a guiding concept in this Indigenous-led Assessment. Solastalgia refers to the distress experienced when one's home environment undergoes unwanted transformation while one remains physically in place (Albrecht 2005). It describes the emotional and psychological suffering that can arise from environmental change, particularly when individual perceive that valued landscapes, cultural settings, or ecological relationships are being altered or degraded.

Solastalgia describes this specific form of melancholy as someone witnesses intense and unwanted transformation of the place they call home. It is often associated with feelings of powerlessness, environmental injustice, and diminished control over decision-making affecting one's territory. This can lead to a range of unwanted psychosocial health outcomes, including chronic stress, grief, anxiety, and a weakened sense of belonging (Albrecht 2005).

In the context of Tsawwassen, solastalgia provides a lens for understanding how incremental industrial transformation within an already heavily developed landscape may affect members' attachment to territory, confidence in environmental integrity, and sense of cultural continuity. The concept is applied as an interpretive framework for examining how environmental change may influence the lived experience and meaningful exercise of Aboriginal and Treaty rights and Treaty Objectives.

### 3.4.3. Cumulative Industrialization

Cumulative effects in EA refers to a holistic perspective that considers the successive, incremental, and compounding impacts of past, present, and reasonably foreseeable future activities on the environment, society, culture, and the economy (Gill & Ritchie 2020). In the context of psychosocial health, cumulative effects may arise when repeated or sustained industrial development alters landscapes, reinforces perceptions of environmental degradation, and compounds stress, uncertainty, and loss of place attachment across generations. Unlike project-specific effects, cumulative effects arise from multiple activities interacting over time and space.

For Tsawwassen, the Project is situated within an already heavily industrialized area of the Fraser River estuary. Over time, successive industrial developments may contribute to a normalization of industrial land use, diminished expectations for ecological restoration, and erosion of confidence in the feasibility of rights revitalization and

resumption. Even where individual projects introduce limited new biophysical disturbance, incremental expansion can reinforce a broader industrial character that shapes how members experience, relate to, and envision the future of their territory and impact the exercise of rights.

This Indigenous-led Assessment therefore evaluates the Project within its cumulative industrial context, recognizing that psychosocial effects may result from incremental additions to an already transformed landscape rather than from isolated changes attributable to a single development.

#### 3.4.4. Application to Tsawwassen's Rights Context

The frameworks described above are applied in this Indigenous-led Assessment to examine how incremental industrial expansion may influence the meaningful exercise of Tsawwassen's rights. This approach is grounded in Tsawwassen's direction that rights must be understood holistically, as practices shaped by interconnected cultural and psychosocial conditions, and guided by Tsawwassen's Treaty Objectives.

From Tsawwassen's perspective, psychosocial dimensions of wellbeing are key aspects of how changes to the environment are experienced and understood, particularly within a cumulatively industrialized landscape, and how impacts to rights are experienced. These concept of psychosocial wellbeing provides a lens for understanding how industrial activities may affect the underlying conditions that support the exercise of rights. Even in the absence of substantial new biophysical disturbance, incremental expansion can alter how members experience their territory, shape expectations for its future, and influence participation in rights-based practices. Perceptions of risk, normalization of industrial land use, and feelings of marginalization or diminished influence in decision-making processes may compound over time.

In this context, psychosocial impacts are not treated as secondary or indirect effects. Rather, they are understood as pathways through which Project-related change may influence the lived experience and long-term viability of Tsawwassen's harvesting, stewardship, governance, and cultural responsibilities.

### 3.5. Assessment Dimensions

Drawing from the conceptual foundations outlined above and TFN's articulation of its Treaty Objectives, this Indigenous-led Assessment evaluates Project-related effects across three interconnected psychosocial dimensions: (1) mental and emotional wellbeing; (2) sense of place and identity; and (3) stigma and marginalization. These dimensions reflect various aspects of the scope set out in Tsawwassen's Assessment Plan, including sense of place and identity, social relationships, and spiritual, psychological, and emotional components of identity. These dimensions represent structured pathways through which incremental industrial expansion may influence the

lived experience and meaningful exercise of Tsawwassen's Aboriginal and Treaty rights and Treaty Objectives.

The dimensions are interrelated but analytically distinct. Mental and emotional well-being captures stress, anxiety, uncertainty, and confidence in environmental integrity (Albrecht 2005). Sense of place and identity reflects attachment to territory, cultural continuity, and intergenerational belonging (Cáceres et al. 2022). Stigma and marginalization address perceptions of environmental injustice, diminished influence in decision-making, and normalization of industrial land use within Tsawwassen territory (Baker et al. 2025).

Together, these dimensions provide a structured framework for assessing how changes in the physical and industrial landscape may alter the relational, psychological, and governance conditions that sustain Tsawwassen's rights practice over time.

### 3.5.1. Mental and Emotional Well-being

Mental and emotional refers to the emotional and psychological conditions that enable individuals and communities to live well within their territory and to practice their rights with confidence and continuity. For many Indigenous peoples, wellbeing is closely connected to the health and integrity of lands and waters. This encompasses rights and responsibilities to uphold sacred stewardship of the lands and waters, and all associated resources and non-human beings (Baker 2025). In this context, mental and emotional well-being is directly linked to Tsawwassen's ability to exercise and uphold its Treaty Objectives, including maintaining a healthy river, strong culture, and effective stewardship.

When these relationships with the land are degraded or placed at risk by industrial development, members may experience chronic stress, anxiety, or diminished confidence in environmental integrity. These responses may influence participation in harvesting, cultural practices, governance processes, and intergenerational teaching, and may constrain the meaningful exercise of rights and continuity of knowledge transmission across generations.

Key indicators related to mental health and well-being include:

- Increased stress, anxiety, and emotional exhaustion.
- Fear of industrial pollution affecting health and safety.
- Reduced confidence in long-term environmental integrity.
- Emotional fatigue associated with cumulative industrialization.

### 3.5.2. Sense of Place and Identity

For Tsawwassen, sense of place is foundational to the exercise of Aboriginal and Treaty Rights, as well as Treaty Objectives, as these rights are practiced through ongoing

relationships with specific lands and waters over time. Sense of place refers to the deep emotional, cultural, and historical connections individuals and communities have to the land and waters. It implies a strong emotional connection between a person or group of people with a particular location – places are centres of human meaning, attachment, experiences, and values (Windsor & McVey 2005). Sense of place is vital to group identity, and involuntary loss of sense of place can lead to serious physical and mental health consequences. This is because place provides individuals and groups with a sense of security and comfort (Windsor & McVey 2005).

From the lens of First Nations in British Columbia, sense of place may also be described in terms of connection to land, encompassing lands and waters, which provide foods for hunting, fishing, and farming; building and tool materials; medicines; and are spaces of spiritual and ceremonial connection (Windsor & McVey 2005; Baker et al. 2025). Industrial expansion alters the physical environment and sensory landscape, affecting how Tsawwassen members relate to their surroundings. Disruptions to the sensory environment can lead to disconnection from place, cultural loss, and changes in community identity, which may affect the ability and willingness of Tsawwassen members to engage in rights-based practices. Key indicators related to sense of place and identity include:

- Reduced enjoyment of harvesting activities.
- Feelings of loss and disconnection from place.
- Reduced connection to cultural identity.

### 3.5.3. Stigma and Marginalization

Industrial expansion within Indigenous territories may contribute to perceptions of inequitable burden-sharing, reduced influence in decision-making, and normalization of intensive land use. Where communities experience repeated industrial approvals within their territory, concerns may arise that Indigenous lands are treated “sacrifice zones” for industry (De Souza 2021). Within these spaces, the physical and mental health and well-being of some people is compromised in the pursuit of ‘economic development’ or ‘progress’ for the sake of capitalist gains (De Souza 2021). For Tsawwassen, such dynamics may undermine its ability to exercise governance authority and advance Treaty Objectives related to healthy relationships and self-determination.

Tsawwassen members may feel politically and socially marginalized in decisions about their territory, or that development proceeds despite articulated concerns. Such experiences may generate feelings of marginalization, diminished agency, or skepticism regarding the responsiveness of decision-making processes.

Stigma may also arise externally, where Tsawwassen Territory becomes publicly associated with industrial activity rather than with its cultural, ecological, and governance significance. Internally, ongoing development pressures may contribute to

tension between economic opportunity and cultural protection, affecting social cohesion. Together, these dynamics may influence the social and political conditions necessary to sustain collective rights and responsibilities over time.

Key indicators related to stigma and marginalization are identified, including:

- Perception of traditional territory and Treaty lands as an industrial “sacrifice zone”.
- Perceived exclusion and political disempowerment in decision-making processes.
- Community tensions over economic benefits and cultural losses, affecting social cohesion.

### 3.6. Reconciliation-Based Approach to Evaluating Project Impacts

This Indigenous-led Assessment is grounded in a reconciliation-based approach to impact assessment, which moves beyond procedural consultation to transform how impacts are identified and addressed. This approach centres Indigenous rights, values, and worldviews, ensuring that Tsawwassen voices lead the assessment process. It is founded upon core values of respect, reciprocity, relationship-building, and self-determination, which are woven into every part of this Assessment. It prioritizes recognition of cumulative and intergenerational trauma and amplifies culturally grounded measures that support community well-being. A reconciliation-based approach to Indigenous-led Assessment requires proponents and colonial governments to recognize Tsawwassen as an autonomous and self-governing Nation with decision-making power over their Traditional Territory (Craik 2016).

### 3.7. Information Sources and Engagement

This assessment draws on information from both secondary sources and primary, community-based research conducted by Tsawwassen.

In November 2025, Tsawwassen undertook a review of existing documents relevant to the Project, the Study Area, and Tsawwassen’s rights and interests. This review included key Tsawwassen governance and planning documents, relevant academic and grey literature, and project related technical and regulatory reports (a complete list of documents reviewed is provided in the References section). Documents were systematically reviewed and coded to identify key information and themes.

Between June 23, 2025, and July 3, 2025, Tsawwassen conducted two focus groups with seven community members including resource users, knowledge holders, Elders, youth, and Tsawwassen staff. This community-based research generated qualitative information on the importance of the Study Area to Tsawwassen members; Tsawwassen stewardship, governance, and decision-making responsibilities; past,

current, and desired future uses of the Study Area; cumulative stressors; and concerns regarding the Project's potential impacts on Tsawwassen's rights, psychosocial identity, and well-being.

Focus groups were guided by open-ended questions designed to elicit participant perspectives and experiences. Audio recordings were transcribed, and transcripts and facilitator notes were reviewed and analyzed using thematic coding. Coding and analysis were undertaken by Tsawwassen and the research team to identify key issues, concerns, and impact pathways relevant to psychosocial well-being.

This report also draws from archived interviews that were previously conducted for this Project between June 29<sup>th</sup>, 2023, and August 28<sup>th</sup>, 2023. In total, Tsawwassen conducted 11 separate interviews and four focus groups with 31 community members including resource users, knowledge holders, Elders, youth, and Tsawwassen staff. This archival, community-based research yielded additional insights about the importance of the Study Area to Tsawwassen. While psychosocial impacts were not the focus of this part of the research, several themes that emerged are relevant to this report and are highlighted in the results section.

### 3.7.1. Limitations

There are several limitations to this assessment. These include:

- Not all Tsawwassen members and knowledge holders were able to participate in this Study. Efforts were made to include key Tsawwassen members, however, not everyone contacted was able or willing to participate.
- Data collected for each participant is limited by what the participant is able and willing to report.
- This Report does not reflect all Tsawwassen rights-practice in or around the Study Area. **An absence of data does not signify an absence of use, value, or potential impact.**
- Mapped representations of Tsawwassen values should be understood to be a small portion of the actual area needed. For example, a single ceremony site may be mapped with a precise point, but that point does not capture the full complexity of Tsawwassen's ceremonial practices, or the environmental and social conditions which make ceremony possible and meaningful to Tsawwassen's culture and rights.
- All data included in this Report is the property of the Tsawwassen and may not be used or reproduced outside the Project regulatory process without the express written consent of the Tsawwassen.
- Nothing in this Report should be construed as to waive, reduce, or otherwise constrain Tsawwassen rights within, or outside of, regulatory processes. Nor

should this Report be construed as to define, limit, or otherwise constrain the Aboriginal or Treaty rights of other First Nations or Aboriginal peoples. It should not be relied upon to inform other projects or initiatives without the written consent of Tsawwassen.

### 3.8. Analytical Approach

This Indigenous-led Assessment applies the three psychosocial dimensions described above to evaluate how the Project may influence the meaningful exercise of Tsawwassen's Aboriginal and Treaty rights, as well as Treaty Objectives, within a cumulatively industrialized landscape. The analytical approach is structured to assess baseline conditions, identify potential pathways of effect, characterize anticipated changes, and evaluate their severity in light of Tsawwassen's relational and intergenerational understanding of rights.

#### 3.8.1. Baseline Conditions

The Assessment first identifies existing psychosocial conditions within Tsawwassen's Territory, including current levels of industrialization, community experiences of environmental change, and pre-existing stressors or vulnerabilities. Baseline conditions include both experiential factors (e.g., confidence in environmental integrity, attachment to place, governance fatigue) and structural factors (e.g., cumulative industrial presence, regulatory context). Establishing baseline conditions provides the reference point against which Project-related changes are evaluated.

#### 3.8.2. Pathways of Effect

Project-related effects are assessed through structured pathways of effect. The Assessment examines:

Project activity

- Environmental or perceptual change
- Influence on one or more psychosocial dimensions
- Implications for rights practice

This approach recognizes that psychosocial impacts may arise not only from direct physical disturbance, but also from perceived risk, incremental industrial expansion, or changes in the character of the landscape. Effects are assessed within both project-specific and cumulative contexts.

#### 3.8.3. Consideration of Mitigation and Accommodation

The Assessment evaluates whether proposed mitigation measures meaningfully address identified psychosocial pathways and whether additional measures may be required to support the continued vitality of Tsawwassen's rights practice. Mitigation

effectiveness is considered in light of cumulative context and intergenerational implications.

### 3.8.4. Characterization of Residual Effects

Residual effects on psychosocial well-being are characterized using four criteria: vulnerability, magnitude, duration, and reversibility. These criteria are consistent with environmental assessment practice and are defined below to reflect the experiential and relational nature of psychosocial conditions.

- **Vulnerability** refers to the existing condition of psychosocial well-being within Tsawwassen, including cumulative historical and ongoing stressors that shape sensitivity to additional Project-related change.
- **Magnitude** refers to the degree to which the Project incrementally reinforces, intensifies, or introduces psychosocial stressors, including reinforcement of industrial permanence, perceived risk, discouragement, or marginalization.
- **Duration** refers to the length of time over which the residual psychosocial effect is expected to persist, including whether effects are limited to construction or extend through long-term operations.
- **Reversibility** refers to the degree to which the psychosocial effect can reasonably be undone or reduced through mitigation, natural recovery, or structural change.

Table 3-1 provides rating definitions for each criterion.

*Table 3-1 Residual Effects Criteria Rating Definitions*

| Criterion            | Rating Definitions                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Vulnerability</b> | <p><b>Low:</b> Baseline psychosocial conditions are relatively stable, with limited cumulative stressors influencing sensitivity to additional change.</p> <p><b>Moderate:</b> Existing cumulative stressors are present and influence sensitivity to Project-related change.</p> <p><b>High:</b> Psychosocial conditions are already strained due to cumulative historical, environmental, or industrial stressors, such that additional change is likely to amplify effects.</p> |
| <b>Magnitude</b>     | <p><b>Low:</b> The Project results in minimal incremental reinforcement of psychosocial stressors or experiential change.</p> <p><b>Moderate:</b> The Project results in noticeable reinforcement of existing psychosocial stressors or industrial character, affecting experiential conditions.</p> <p><b>High:</b> The Project results in strong reinforcement or intensification of psychosocial stressors, with substantial experiential or symbolic effects.</p>              |
| <b>Duration</b>      | <p><b>Short-term:</b> Effects are limited to construction or temporary activities.</p> <p><b>Medium-term:</b> Effects extend beyond construction into the early</p>                                                                                                                                                                                                                                                                                                                |

|                      |                                                                                                                                                                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      | operational period.<br><b>Long-term:</b> Effects persist for the operational life of the Project or longer.                                                                                                                                                                                                           |
| <b>Reversibility</b> | <b>High:</b> Effects can be readily reduced or reversed through mitigation or over time.<br><b>Moderate:</b> Partial recovery is possible, though some effects are likely to persist.<br><b>Low:</b> Effects are unlikely to be meaningfully reversed without substantial structural, land-use, or governance change. |

### 3.8.5. Severity Determination Method

Severity is determined through an integrated evaluation of the four residual effects criteria: vulnerability, magnitude, duration, and reversibility. Severity reflects how the combined characteristics of the residual effect influence the conditions necessary for Tsawwassen's current and future rights-based practices.

Professional judgment is applied to assess how these criteria interact in context. Particular consideration is given to the cumulative nature of psychosocial conditions and the extent to which effects reinforce existing stressors within an already industrialized landscape.

In general:

- Severity increases where vulnerability is elevated, magnitude reflects meaningful reinforcement of psychosocial stressors, duration is long-term, and reversibility is limited.
- Severity decreases where vulnerability is lower, magnitude is limited, duration is short-term, and effects are more readily reversible.

Severity categories are defined as follows:

- **Low Severity** – Residual effects are limited in magnitude and/or duration and occur within a context of lower vulnerability. Effects do not materially influence the conditions supporting rights-based practices.
- **Moderate Severity** – Residual effects meaningfully reinforce existing stressors or experiential change within a context of cumulative vulnerability. Effects influence the quality, confidence, or continuity of rights-based practices but do not fundamentally alter overall ability to exercise rights.
- **High Severity** – Residual effects strongly reinforce or intensify psychosocial stressors within an already vulnerable context, persist over the long term, and materially undermine the conditions necessary for the meaningful present or future exercise of rights-based practices.

## 4. Conditions Supporting Tsawwassen Psychosocial Health

### 4.1. Foundations of Tsawwassen's Psychosocial Health

#### *Tsawwassen's Three Pillars of Life*

*Pillar 1 – Social and Human Health: Social and human health includes viewscape, landscape, and access to Tsawwassen First Nation Territory. Moreover, it includes the ability of Tsawwassen First Nation community members to enjoy their lands and territory. Social and human health includes physical and mental health of its community members.*

*Pillar 2 – Harvesting Rights: Harvesting rights includes the right of Tsawwassen First Nation community members to exercise their Treaty Rights to harvest. Harvesting rights are to fish, hunt, and harvest plants for food, social, and ceremonial purposes.*

*Pillar 3 – Culture and Heritage: Culture and heritage include Tsawwassen First Nation's way of life, including its intangible cultural heritage, such as its spiritual relationship with the Southern Resident Killer Whales and the significance of the spiritual relationships and the unique cultural values with which the relationships strengthen and enhance Tsawwassen First Nation's way of life. Access to the land, sea, and resource provides Tsawwassen First Nation with the ability to teach the language, laws, and culture to the next generations and to continue Tsawwassen First Nations traditional way of life (TFN 2024, 3).*

For Tsawwassen members, psychosocial health is grounded in place-based conditions that emerge from the ability of the Nation and its members to live in accordance with their laws, responsibilities, and relationships. As articulated by Tsawwassen's three pillars of life (TFN 2019b), psychosocial health is grounded in sustained relationships with lands, waters, and non-human species, as well as the meaningful exercise of Aboriginal and Treaty rights, strong cultural continuity, and the ability to govern and steward the Territory in ways that reflect Tsawwassen values and priorities. As one member stated,

My mom always used to say, be proud of who you are and where you come from. My connection is this land, so that's where I come from. People of Tsawwassen, we're not from Tsawwassen, our connection is of the land. (TFN Elders Focus Group, 2025)

Psychosocial health for Tsawwassen is inseparable from governance, stewardship, and rights. When Tsawwassen people can uphold their sacred responsibilities to lands and waters, transmit knowledge across generations, practice culture, and participate in

decision-making about their territory, psychosocial well-being is strengthened (TFN 2024). Conversely, when these foundations are eroded – through environmental degradation, cumulative impacts, and/or exclusion from decision-making – psychosocial harms can occur even in the absence of direct or immediate biophysical impacts.

### **Social and Human Health**

Social and human health – identified by Tsawwassen in Pillar 1 of its three pillars of life – forms a core foundation of psychosocial well-being (TFN 2024). Strong relationships with families, across generations, and throughout the broader community support identity, belonging, and resilience. Social and human health depends on the ability to access Tsawwassen lands and waters, where social cohesion can be reinforced through shared experiences on the traditional territory and participation in intergenerational cultural activities (TFN 2024).

### **Relationships to Lands and Waters**

Tsawwassen psychosocial health is rooted in enduring relationships with the Fraser River, Boundary Bay, the Salish Sea, and the broader traditional territory. These lands and waters are living relatives that shape Tsawwassen identity, values, and ways of being. The ability to access, care for, and feel safe within these places supports feelings of belonging, security, continuity, and well-being. As one participant stated,

When I got out and get on the water, my heart is full, my spirit is happy, everything makes sense. It's almost indescribable how good I feel when I'm out on the water. (TFN Focus Group 2025)

Industrial development that alters the physical, sensory, or symbolic character of these places can disrupt these relationships, impacting how Tsawwassen members feel about their home territory. Even when direct access remains possible, the perceived degradation or industrialization of culturally significant landscapes can weaken attachment to place, diminish enjoyment of being on the land and waters, and undermine the psychosocial benefits that flow from these relationships (Masterson et al. 2017).

### **Cultural Continuity and Intergenerational Responsibilities**

Psychosocial health for Tsawwassen is sustained through cultural continuity, including the ongoing transmission of language, teachings, stories, and practices that connect past, present, and future generations. Intergenerational responsibility is central to this foundation (TFN 2024). Tsawwassen decision-making is guided by the responsibility to ensure that future generations can live well within the territory and exercise their rights in meaningful ways. When current conditions or future projected impacts suggest that rights resumption might be increasingly difficult or unattainable, this can create psychosocial distress rooted in concern for future generations, as well as feelings of grief, frustration, or loss (Comtesse et al., 2021).

### **Governance, Stewardship, and Self-Determination**

Tsawwassen psychosocial health is closely linked to the Nation's ability to govern its traditional territories and be recognized as a legitimate decision-maker within regulatory processes (TFN 2024). Leadership in Indigenous-led decision-making processes, including Indigenous-led Assessments, supports psychosocial well-being by establishing a sense of control over the process, as well as agency and accountability. When Tsawwassen experiences exclusion from decision-making by colonial governments or agencies, psychosocial impacts may arise. These can include feelings of powerlessness, mistrust in regulatory systems, and perceptions that Tsawwassen lands are treated as expendable or sacrificed for broader economic priorities (De Souza, 2021). Such experiences can compound existing cumulative stressors and undermine confidence in colonial governance systems over time.

## **4.2. Vulnerability of Tsawwassen's Psychosocial Health**

The lower Fraser River and Tilbury Island are situated within one of the most intensively developed industrial corridors in British Columbia. Over several decades, the area has undergone sustained transformation associated with port expansion, transportation infrastructure, shoreline modification, and energy-related development. These changes form part of the contemporary landscape within which Tsawwassen members live, work, and exercise their Aboriginal and Treaty rights, as well as Treaty Objectives.

### **4.2.1. Colonial and Structural Context**

The industrial transformation of the lower Fraser River has occurred within a broader colonial history marked by dispossession, land alienation, and the restructuring of Indigenous governance systems. Like many First Nations in British Columbia, Tsawwassen has experienced significant reduction and fragmentation of its accessible land base through settler development, infrastructure expansion, and state regulation. Traditional territories that once supported interconnected harvesting, travel, governance, and cultural practices have been reconfigured through industrial zoning, transportation corridors, shoreline armouring, and regulatory control.

These historical processes continue to shape contemporary relationships between Tsawwassen, its territory, and external decision-making institutions. Experiences of constrained influence over land and resource governance, combined with successive waves of territorial transformation, form part of the structural context within which additional development proposals are evaluated and experienced.

#### 4.2.2. Industrial and Infrastructure Development in the Lower Fraser River

Tilbury Island and the surrounding estuarine area host a range of industrial activities and infrastructure, including:

- Port-related facilities and marine shipping traffic associated with the Port of Vancouver;
- Rail corridors and associated freight movement connecting port terminals and industrial lands;
- Major highway infrastructure, including Highway 17 and Highway 99;
- Pipeline corridors and energy infrastructure;
- Existing liquefied natural gas processing and storage infrastructure at the Tilbury facility;
- Long-standing industrial land use designations and logistics operations within the surrounding area.

Over time, these developments have incrementally reshaped land use patterns, access routes, and the visual and sensory character of the estuarine landscape. As one participant stated, “It never ends... given them an inch and they take a mile...” (TFN Elder Focus Group 2025). One participant reflected that

[when] they stated talking about Robert’s Bank, I remember my grandfather walking in that house over here, back and forth... and he looked out there shaking his head – that will never work for us. Look at it, it’s a city out there now, destroying wildlife, birds... (TFN Elder Focus Group 2025)

One participant stated that “we’re living in industrialization,” referring to cumulative project impacts on Tsawwassen’s territory like BC Rail, CN Rail, and the Delta Port (TFN Elder Focus Group 2025). Participants expressed frustration with project proponents, explaining that

I’m not happy with [BC Ferries], I’m not happy with this project, I’m not happy with the Port, I’m not happy with the South Fraser River Road. (TFN Elder Focus Group 2025)

#### 4.2.3. Modification of Shoreline and Estuarine Environment

The Fraser River estuary has experienced extensive shoreline armouring, dredging, infilling, and habitat alteration to accommodate navigation, industrial facilities, and flood protection works. Intertidal and riparian areas have been reduced or reconfigured in

places, and industrial lighting, noise, and vessel movement contribute to an altered sensory environment relative to historic conditions.

Participants expressed frustration about the seemingly endless nature of ongoing and proposed developments within their traditional territory. As one participant stated, “it’s just never ending” (TFN Elder Focus Group 2025). The participant continued by asking – “I’m curious as to when does the expansion stop? That’s the big question.” Another participant echoed that “everything is getting chipped away” (TFN Elder Focus Group 2025). Participants spoke to the cumulative impacts of these projects, explaining that,

any amount of disturbance, it doesn’t matter what time of the season, what time of the day, what time of the month... It’s going to impact because it’s a foreign object that’s being introduced to waters that’s been there for many years, many hundreds if not thousands, or however long our Fraser River has been alive. So, it will definitely have an impact... (TFN Focus Group 2025)

#### 4.2.4. Layered Regulatory Processes and Ongoing Development Pressure

The lower Fraser River has been subject to repeated project proposals and regulatory reviews over time. Successive environmental assessments, permit applications, and infrastructure expansions contribute to an ongoing cycle of development consideration and regulatory engagement.

In contexts where industrial activity is persistent and layered, cumulative development pressure may influence expectations regarding future land use and environmental change. This broader trajectory forms part of the existing conditions against which incremental expansion is assessed.

#### 4.2.5. Implications for Psychosocial Conditions

The sustained industrial and structural transformation of the lower Fraser River has produced a landscape in which ecological, cultural, transportation, and industrial functions coexist in close proximity. Additional development may contribute incrementally to psychosocial impacts by reinforcing existing patterns of industrialization, uncertainty, and perceived loss of control – all of which are impact Tsawwassen’s rights to their territory.

Understanding Tsawwassen’s psychosocial health requires keen attention to how new projects interact with existing conditions and influence both present well-being and future possibilities for practicing rights and ensuring cultural continuity. The Assessment

therefore treats current psychosocial vulnerability not as a static or individualized condition, but as one shaped by historical dispossession, territorial reconfiguration, sustained industrial presence, and ongoing regulatory layering within Tsawwassen territory.

### 4.3. Community Vision for the Future

Tsawwassen's vision for the future is rooted in the continued practice and resumption of Aboriginal and Treaty rights. Tsawwassen seeks not only to maintain these rights where they are currently exercised, but also to restore and resume rights that have been constrained or eroded through ongoing and cumulative impacts. For Tsawwassen, this is what the Final Agreement is intended to achieve and is central to Tsawwassen's understanding of Treaty rights, as evidenced by Tsawwassen's Treaty Objectives. The hope for a future where rights can be meaningfully practiced is foundational to Tsawwassen's psychosocial well-being, identity, and resilience.

Tsawwassen is presently in a period of cultural, social, and political revival and renewal, guided by a long-term commitment to the strength and sustainability of present and future generations (TFN, n.d.b). As a self-governing Nation, Tsawwassen's vision is for *scəwaθən məsteyəxw* to be "united, proud, and confident in our culture; are connected to and taking care of our lands and resources; and are healthy, self-reliant, and prospering" (TFN 2021: 5).

Central to Tsawwassen's future aspirations is the active stewardship of lands, waters, and non-human species. Tsawwassen continues to exercise its responsibilities to care for its territory in ways that support ecological integrity, cultural practice, and the ability of future generations to experience the full benefits of Treaty rights (TFN 2018: 8). Protecting these relationships is a critical component of psychosocial health, cultural continuity, and intergenerational responsibilities.

## 5. Anticipated Project Impacts

In light of the Proponent's commitment to avoid use of the Fraser River, the Project is not anticipated to introduce new direct barriers to harvesting rights, nor is it predicted to materially contribute (absent an exceedance or malfunction) to direct reduction in resource abundance within the immediate project footprint. However, the Project reinforces and extends the industrial permanence of Tilbury Island, intensifies perceptions of catastrophic risk, and contributes to ongoing psychosocial strain on Tsawwassen's exercise of its rights and ability to advance Treaty Objectives within an already vulnerable context. This demonstrates that despite the Proponent's avoidance of direct use of the Fraser River, project impacts remain, particularly for more intangible impacts experienced by members across psychosocial dimensions. These impacts

extend beyond the pathways of effect identified in the Proponents Environmental Assessment Certificate Application, which narrowly focus on tangible Project impacts such as changes to the physical environment and harvesting access.

Despite the Proponent's shift away from direct use of the Fraser River, the Project is still predicted to impact Tsawwassen members' psychosocial health across dimensions related to mental and emotional well-being, sense of place and identity, and stigma and marginalization. This section identifies predicted changes in the conditions supporting Tsawwassen members' psychosocial health based on information about likely project impact pathways and Tsawwassen predictions collected through community-based research.

## 5.1. Mental and Emotional Well-Being

### 5.1.1. Current Conditions

As described in Section 4, Tsawwassen members live within a cumulatively industrialized landscape shaped by long-standing port operations, transportation infrastructure, shoreline modification, and existing LNG infrastructure at Tilbury. Participants described ongoing sadness, frustration, and discouragement associated with environmental change in the Fraser River and declining harvesting experiences. Members also emphasized the restorative and protective effects of being on the lands and waters.

This existing context provides the baseline against which Project-specific effects are assessed. The following analysis focuses on incremental pathways through which the Project may influence mental and emotional well-being beyond existing cumulative conditions.

### 5.1.2. Project-Specific Pathways

Participants identified several pathways through which the proposed Project may influence mental and emotional well-being. These pathways relate not only to the probability of harm, but also to the perceived scale, permanence, and consequence of expanded LNG infrastructure within Tsawwassen Territory.

#### **(a) Perceived Escalation of Catastrophic Risk**

The Project would increase LNG processing and storage capacity at the Tilbury facility. Participants consistently focused not on routine operations, but on the potential consequences of a major accident.

One Elder stated:

[If] disaster happens, at that plant there, is it going to happen at the same time as our fishery? Just a thought that comes into your head. But hopefully not... (TFN Elder Focus Group 2025)

Although the same participant expressed confidence in the environmental assessment process, they acknowledged that “there’s always a chance that something happens.” Another member emphasized that while incidents may be rare, “when it does it’s pretty bad” (TFN Focus Group 2025).

These statements reflect persistent background anxiety associated with the scale of potential consequences. Expansion increases the quantity of LNG processed and stored on site. Even where regulatory systems are trusted, enlargement of the facility intensifies concern about catastrophic outcomes affecting fisheries, air quality, community safety, and surrounding waters. The psychological burden arises from living alongside infrastructure perceived as carrying low-probability but high-consequence risk.

### **(b) Discouragement and Emotional Fatigue**

Participants also described the expansion as emotionally discouraging within an already cumulative context. One Elder stated:

I think it’s going to have a major mental setback... people are just going to be discouraged...” (TFN Elder Focus Group 2025)

These expressions reflect emotional fatigue associated with repeated industrial proposals. The Project was not discussed as a discrete project, but as another increment in an ongoing trajectory. For some members, the expansion reinforced a sense that development pressure is continuous and difficult to influence.

This discouragement operates at the level of internal resilience. Participants described feelings of hopelessness, including statements such as “we’ll never get back to point A.” The expansion contributes to these emotional responses by signaling continuation of a pattern members perceive as eroding environmental and cultural stability.

### **(c) Moral Distress and Association with Upstream Extraction**

Some participants linked the Project to broader concerns about fracking, greenhouse gas emissions, and environmental degradation beyond Tsawwassen Territory. While

these activities occur elsewhere, expansion of LNG processing was understood as connected to upstream extraction:

I think some people don't know enough about the dangers of fracking. (TS14, 2025)

For some members, this association contributed to frustration and moral discomfort. The Project was viewed not only as local infrastructure, but as participation in a broader industrial system perceived as environmentally harmful. This moral dimension adds another layer of emotional strain beyond immediate physical risk.

### 5.1.3. Summary of Mental and Emotional Well-Being Effects

Participants described the Project as contributing to psychological strain rooted in perceived catastrophic risk, cumulative fatigue, and moral concern. While some members expressed confidence in regulatory oversight, expansion of LNG processing and storage capacity intensified awareness of low-probability but high-consequence accident scenarios. Harvesting and using the River alongside enlarged infrastructure was associated with persistent background anxiety, particularly in relation to fisheries, air quality, and community safety.

The Project was also framed as reinforcing a broader trajectory of industrial expansion. Participants described feelings of discouragement and emotional exhaustion linked to repeated development proposals and a perception that industrialisation continues with limited community influence. The Project was interpreted by some as another increment in this pattern, contributing to a sense of resignation and diminished optimism regarding future conditions.

In addition, proximity to LNG infrastructure was associated with unease related to truck traffic and potential accidents. Expansion reinforces the scale and permanence of these conditions, contributing to heightened vigilance and anticipatory stress when travelling or fishing near the facility.

Finally, some participants connected the Project to upstream gas extraction and broader environmental harm. This association contributed to moral discomfort and frustration for members who perceive alignment between local expansion and environmentally harmful industrial systems.

Taken together, the Project contributes to increased anxiety, discouragement, and emotional fatigue within a cumulatively industrialized context. These effects arise through perceived risk, reinforcement of ongoing industrial pressure, and moral

concern, rather than through direct biophysical interference. The severity of these residual effects is evaluated in Section 8.

## 5.2. Sense of Place and Identity

### 5.2.1. Current Conditions

As described in Section 4, the lower Fraser River and Tilbury Island are situated within a landscape that has undergone sustained industrial transformation. Shoreline modification, port expansion, transportation corridors, and existing LNG infrastructure have altered the ecological, visual, and sensory character of the estuary. Participants described long-term changes in harvesting conditions and environmental quality and emphasized the importance of the river and surrounding lands as sources of identity, continuity, and grounding.

Being on the water and within the territory was repeatedly described as restorative and identity-affirming. Members spoke of fishing, travelling the river, and spending time on the land as central to cultural continuity and personal well-being.

This existing relational context forms the baseline against which Project-specific effects are assessed.

### 5.2.2. Project-Specific Pathways

Participants identified several ways in which the Project may affect sense of place and identity. These pathways relate primarily to how expansion may alter the meaning, character, and experiential quality of the landscape, rather than introducing direct physical barriers to access.

#### **(a) Reinforcement of Industrial Character of Place**

Participants repeatedly framed Tilbury Island and the surrounding river corridor as a landscape transformed by successive waves of infrastructure and industrial development. When discussing the Project, members did not treat it as a standalone project; rather, it was understood as another increment within a broader pattern.

One participant stated directly:

We're living in industrialization. (TS14, 2025)

Industrialisation was identified as the primary cause of territorial change. Members referenced the construction of BC Ferries, highways, rail infrastructure, and port expansion as examples of developments that proceeded without meaningful Tsawwassen control. The Project was situated within that same trajectory.

Participants expressed concern that the expansion represents further consolidation of industrial land use in an area historically associated with fishing, gathering, and community life:

Where does it stop? We're just at survival level now. (TS15, 2025)

This framing reflects more than cumulative frustration. It situates the Project as reinforcing a perception that the industrial identity of Tilbury Island is becoming permanent. Members described earlier conditions in which they “used to roam up and down the Fraser River,” contrasting that experience with the present:

Now it's null and void right now, it's nothing. (TS14, 2025)

The increase in LNG processing and storage capacity contributes to this sense of entrenchment. The Project does not introduce a new land use type; rather, it intensifies an existing one. In doing so, it consolidates the industrial character of the area and reshapes how members understand what the place is and what it is becoming. Attachment to place is affected not by direct exclusion, but by reinforcement of an industrial identity within a culturally significant landscape.

### **(b) Alteration of Sensory and Experiential Environment**

Participants described their relationship to the river as emotionally grounding and central to identity. Being on the water was associated with relief from stress and mental strain:

When I'm on the water, I don't feel any of that. (TS11, 2023)

At the same time, members described concrete sensory intrusions associated with existing LNG operations, including odours and discomfort when travelling past the facility:

It smelled like really heavy methane gas. It's disgusting. (TFN Elder Focus Group 2025)

Passing the facility was described as something one “just [has] to put up with.”

The Project increases the scale and permanence of LNG infrastructure within this experiential setting. The expansion does not merely maintain the status quo; it enlarges processing and storage capacity at a prominent industrial site within a culturally meaningful space. Participants anticipated that this would “greatly affect” their experience of moving through the area (TFN Focus Group 2025).

The river functions as a site of cultural continuity, healing, and identity affirmation. Expansion intensifies the presence of industrial cues, such as visual scale, infrastructure density, truck traffic, and association with LNG risk. As industrial presence expands, the experiential quality of being on the water shifts. Reduced comfort and

diminished enjoyment while fishing or travelling are direct consequences of this altered sensory environment.

### **(c) Avoidance and Cultural Continuity**

Participants described long-term reductions in shoreline harvesting and changes in everyday river use:

We cannot go out on our own shoreline and harvest... that can no longer be done. (TFN Focus Group 2025)

While the Project does not introduce new formal access restrictions, members raised concerns about increased truck traffic and accident risk associated with expanded LNG operations:

Do you know how many trucks will be coming in and out of there? (TS14, 2025)  
If they're carrying LNG it could be a manmade disaster. (TS14, 2025)

Concerns about intensified industrial activity contribute to unease when fishing or travelling near the facility. Participants described the possibility of disasters occurring while on the river and the broader discomfort associated with proximity to LNG infrastructure.

Avoidance can occur in such contexts without formal exclusion. Where areas are perceived as industrial, risky, or undesirable, members may limit time spent near them or shift activities elsewhere. Over time, reduced presence in culturally significant locations weakens continuity of river-based practices.

Participants explicitly linked industrialisation to generational shifts in practice and identity, describing younger generations as increasingly disconnected from fishing and land-based activities. The Project reinforces the industrial trajectory within which these changes are occurring, contributing to conditions that make sustained cultural presence more difficult.

### 5.2.3. Summary of Sense of Place and Identity Effects

The Project reinforces an already articulated trajectory of industrialisation within Tsawwassen Territory. Participants framed the Project not as an isolated proposal, but as part of a cumulative pattern of development that has progressively reshaped the ecological, social, and experiential character of the lower Fraser River.

Expansion of LNG processing and storage capacity consolidates the industrial identity of Tilbury Island. The Project increases the scale and permanence of infrastructure within a culturally significant landscape historically associated with fishing, gathering, and community life. This reinforcement of industrial character affects how members understand the meaning of place and the future direction of the territory.

The Project also intensifies the sensory and experiential presence of industrial infrastructure within spaces relied upon for cultural connection and emotional grounding. Participants described discomfort associated with existing LNG operations and anticipated that expansion would further affect their experience of travelling and fishing in the area. Reduced comfort and diminished enjoyment in these spaces represent direct effects on sense of place.

Finally, the expansion contributes to conditions under which avoidance behaviours may occur. While the Project does not introduce new legal restrictions on access, concerns regarding increased industrial activity, traffic, and accident risk influence willingness to use areas near the facility. Reduced presence in culturally significant locations weakens continuity of river-based practices and reinforces generational shifts in identity described by participants.

Taken together, these effects operate through reinforcement of industrial character, alteration of experiential quality, and gradual displacement of cultural presence. They are relational rather than biophysical in nature but directly influence TFN members' connection to place and confidence in the long-term continuity of land-based identity. The severity of these residual effects is evaluated in Section 8.

## 5.3. Stigma and Marginalization

### 5.3.1. Current Conditions

As described in Section 4, Tsawwassen Territory has experienced successive waves of industrial and infrastructure development over several decades. Participants described these developments as occurring within a broader pattern in which major projects proceed with limited TFN control and limited tangible benefit to the community.

Members referenced past infrastructure decisions that were perceived as predetermined, describing consultation processes as largely procedural rather than outcome-determinative. Participants expressed frustration that “nothing we can say or do will stop these projects” and that Tsawwassen is often treated as “the afterthought of their projects” (TFN Elder Focus Group 2025).

Industrial expansion was also associated with economic imbalance and external profit generation, with members noting that large projects generate substantial revenue while delivering comparatively limited community benefit. In addition, participants described demographic and social changes associated with ongoing development, including the influx of people unfamiliar with Tsawwassen culture and history.

This existing context reflects perceptions of limited influence in decision-making, cumulative governance fatigue, and structural inequity associated with industrial expansion. These conditions form the baseline against which the Project-specific pathways for stigma and marginalization are assessed.

### 5.3.2. Project-Specific Pathways

Participants framed the Project within a broader pattern of industrial decision-making in which Tsawwassen influence is perceived as limited. The Project was not discussed as a neutral technical proposal, but as part of a cumulative trajectory that reinforces feelings of political marginalization and inequitable treatment.

#### **(a) Reinforcement of Perceived Limited Influence**

Several participants expressed skepticism regarding the ability of Tsawwassen members to meaningfully influence project outcomes. One member stated:

Nothing we can say or do will stop these projects... we're just the afterthought of their projects. (TFN Elder Focus Group 2025)

When discussing engagement processes, participants suggested that consultation often occurs after key decisions have already been made. The proposed expansion was therefore interpreted by some as another example of development proceeding regardless of community concern.

This pathway relates to reinforcement of perceived limited agency. Expansion of LNG capacity signals continuation of industrial land use within Tsawwassen Territory, contributing to a perception that development pressure is structurally entrenched and difficult to redirect.

#### **(b) Economic Inequity and Distributive Imbalance**

Participants also framed the Project in terms of economic imbalance. Members noted that large-scale industrial developments generate substantial external profit while delivering comparatively modest direct benefits to Tsawwassen:

Look at the billions they make, but it's peanuts [distributed] to us. (TFN Elder Focus Group 2025)

While some discussion referenced potential employment, participants questioned whether limited job creation offsets broader territorial impacts. This framing situates the Project within concerns about distributive injustice, where risks and environmental burdens are borne locally while financial gains accrue elsewhere.

Expansion of LNG capacity reinforces perceptions of structural inequity where Tsawwassen Territory functions as a site of industrial production without proportionate decision-making authority or economic return.

### **(c) Cumulative Threshold and Normalization of Industrial Disregard**

Participants repeatedly described cumulative industrialization as having pushed Tsawwassen “to a survival level.” When discussing the Project, members questioned:

Where does it stop? (TS15, 2025)

Such statements reflect concern that incremental expansion contributes to normalization of industrial prioritization over Indigenous territorial interests. The Project was interpreted by some as reinforcing a pattern in which development continues despite longstanding community concerns.

This cumulative framing contributes to perceptions that Tsawwassen Territory is treated as an acceptable site for repeated industrial expansion. Over time, this can reinforce stigma associated with Indigenous lands functioning as industrial zones while community voices are perceived as secondary.

### **(d) Moral Framing of Corporate Decision-Making**

Participants also expressed concern that corporate decision-making prioritizes financial gain over environmental and cultural considerations. One member stated:

All they see at the end of the day is a cheque. (TFN Elder Focus Group 2025)

Expansion of LNG infrastructure was therefore interpreted by some as evidence of value systems misaligned with Tsawwassen priorities and Treaty Objectives. This moral framing contributes to perceptions of marginalization where Indigenous concerns are viewed as subordinate to profit-driven objectives.

### **5.3.3. Summary of Stigma and Marginalization Effects**

Participants framed the Project within a broader history of industrial decision-making in Tsawwassen Territory. The Project was interpreted not as an isolated proposal, but as part of an ongoing pattern of development perceived to proceed with limited community influence and disproportionate external benefit.

Expansion of LNG capacity reinforces perceptions of constrained agency in land and resource governance. Participants described engagement processes as frequently procedural and expressed skepticism regarding the ability of Tsawwassen members to alter development trajectories. In this context, the Project was understood by some as signaling continuation of industrial expansion irrespective of longstanding concerns.

The Project was also situated within concerns regarding distributive imbalance. Members questioned whether economic returns to Tsawwassen are proportionate to the scale of industrial activity occurring within the territory. Expansion of LNG infrastructure therefore contributes to perceptions of inequitable allocation of risk, burden, and benefit.

Finally, the cumulative framing of industrial growth led some participants to question “where does it stop,” reflecting concern that incremental expansion normalizes prioritization of industrial development over Indigenous territorial interests. In this way, the Project contributes to reinforcement of structural marginalization rather than creating entirely new forms of exclusion.

Taken together, the residual effects in this dimension relate to reinforcement of perceived political marginalization, economic inequity, and cumulative disregard within decision-making processes. These effects operate through institutional and distributive pathways and shape how Tsawwassen members understand their position within ongoing industrial development.

The severity of these residual effects is evaluated in Section 8.

#### 5.4. Connection to Treaty Objectives

All of these dimensions – including mental and emotional wellbeing, sense of place and identity, and stigma and marginalization – are not standalone impacts but are deeply connected and ultimately tied to the fulfillment of Tsawwassen’s Treaty Objectives. The ability of Tsawwassen members to experience a sense of safety and confidence in their Territory directly shapes the meaningful exercise of their rights and responsibilities, both now and for future generations. For instance, impacts to mental and emotional wellbeing are closely linked to the Objective of Healthy Rights – Healthy River, which recognizes the interconnectedness of the wellbeing of Tsawwassen members and the health of the Fraser River and surrounding waters. Changes to sense of place and identity are directly connected to Healthy Culture – Strong Stewardship, which affirms the central role of culture and stewardship responsibilities in maintaining Tsawwassen wellbeing. The dimensions identified in this Indigenous-led Assessment map directly onto Tsawwassen’s stated Treaty Objectives, demonstrating pathways by which psychosocial wellbeing and the conditions that support it are necessary for the fulfillment of Tsawwassen goals and priorities as a self-governing Nation.

## 6. Evaluation of Proponent-Identified Mitigation

FortisBC has identified mitigation measures primarily directed at avoiding or reducing biophysical effects associated with construction and operation of the Project. These measures include removal of the previously proposed marine offloading facility, implementation of construction best management practices, spill prevention and response planning, stormwater management, air quality controls, and monitoring through a Construction Environmental Management Plan. The proponent concludes that, with implementation of these measures, no adverse residual effects to Tsawwassen rights or interests are anticipated.

FortisBC has also identified potential positive effects related to employment and procurement opportunities and has committed to implementing hiring policies that promote diversity consistent with its Statement of Indigenous Principles. The proponent has further committed to continued engagement with Tsawwassen regarding mitigation and offsetting strategies.

However, the mitigation measures identified in the Application are directed primarily at physical environmental pathways and general economic enhancement. The Application does not identify specific mitigation measures addressing psychosocial pathways, including perceived catastrophic risk, reinforcement of industrial character, experiential changes to the landscape, or structural marginalization within decision-making processes.

Accordingly, while biophysical risk pathways are addressed through standard avoidance and reduction measures, the psychosocial, relational, and structural pathways identified in this Indigenous-led Assessment remain largely unmitigated. The characterization of residual effects below reflects this absence of targeted mitigation.

## 7. Characterization of Residual Effects

While the preceding sections distinguish three analytical dimensions for clarity, psychosocial well-being is experienced holistically. The residual severity determination below therefore evaluates the combined effect of the Project across mental and emotional well-being, sense of place and identity, and stigma and marginalization.

**Vulnerability** is assessed as **high**. Tsawwassen's psychosocial baseline exists within a landscape that has undergone sustained industrial transformation, including port expansion, transportation infrastructure, shoreline modification, and existing LNG development. Participants described cumulative discouragement, diminished confidence in restoration, and fatigue associated with ongoing industrialization. Expressions of being "at survival level" and not being able to "get back to point A" reflect

perceived threshold conditions. In this context, sensitivity to additional industrial expansion is elevated.

**Magnitude** is assessed as **moderate**. The Project does not introduce new physical barriers to access or predicted reductions in resource abundance. However, it increases LNG processing and storage capacity within an already industrialized setting and reinforces perceptions of industrial permanence, catastrophic risk, and entrenchment of industrial land use. Participants linked expansion to discouragement, unease, and reduced confidence in long-term territorial recovery. While incremental in physical footprint, the Project meaningfully reinforces existing psychosocial stressors.

**Duration** is assessed as **long-term**. The Project involves permanent infrastructure with a multi-decade operational lifespan. Psychosocial effects associated with perceived permanence, industrial entrenchment, and experiential change would persist throughout the operational life of the facility.

**Reversibility** is assessed as **low**. The psychosocial pathways identified are linked to structural land-use patterns and cumulative industrialization. No targeted mitigation measures address reinforcement of industrial character, perceived marginalization, or symbolic permanence. Reversal of these effects would require broader structural, or land-use change beyond the scope of Project-level mitigation.

Table 7-1 summarizes the residual effects ratings.

*Table 7-1 Residual Effects Ratings*

| Criterion     | Rating    | Rationale                                                                                                                                              |
|---------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Vulnerability | High      | Occurs within a cumulatively industrialized landscape where participants expressed fatigue, discouragement, and threshold conditions.                  |
| Magnitude     | Moderate  | Reinforces industrial permanence, perceived catastrophic risk, and experiential unease, but does not introduce new direct biophysical interference.    |
| Duration      | Long-Term | Linked to permanent LNG infrastructure with multi-decade operational lifespan.                                                                         |
| Reversibility | Low       | No targeted mitigation addressing reinforcement of industrial character or structural marginalization; reversal would require broader land-use change. |

## 8. Severity Determination

Severity reflects the combined implications of high vulnerability, moderate magnitude, long-term duration, and low reversibility for Tsawwassen's current and future rights-based practices.

Tsawwassen has articulated desired future conditions grounded in healthy relationships, cultural continuity, stewardship responsibilities, and a revitalized connection to lands and waters. Within this context, severity is evaluated based on whether the Project supports, maintains, or moves conditions further away from those articulated objectives.

The psychosocial baseline is characterized by cumulative industrialization and expressed fatigue regarding continued expansion. Within this elevated vulnerability context, the Project reinforces perceptions of industrial permanence, catastrophic risk, and diminishing prospects for territorial recovery. Although the Project does not introduce new physical barriers to access or measurable reductions in resource abundance, it consolidates an industrial land-use trajectory that participants associate with discouragement and erosion of confidence in long-term cultural continuity.

The long-term operational lifespan of the expanded facility means that these reinforcing effects would persist for decades. Given the absence of mitigation measures addressing psychosocial pathways, the effects are unlikely to be meaningfully reversed within the foreseeable future.

Taken together, residual effects on psychosocial well-being are determined to be of **Moderate Severity**. While cumulative thresholds have already been surpassed, the Project does not independently create a new structural constraint on rights practice. Rather, it incrementally reinforces existing constraints on the conditions necessary for their confident, future-oriented revitalization.

## 9. Recommended Measures to Address Psychosocial Effects

As identified in Section 7, residual effects on psychosocial well-being are characterized by high vulnerability, moderate magnitude, long-term duration, and low reversibility. While the Project does not introduce new physical barriers to rights-based practices, it reinforces industrial permanence, perceived catastrophic risk, experiential unease, and cumulative discouragement within an already industrialized landscape.

The following measures are recommended to reduce residual psychosocial effects and support the conditions necessary for confident and intergenerational rights-based practice.

## 9.1. Risk Transparency and Confidence-Building Measures

To address perceived catastrophic risk and background unease associated with expanded LNG capacity:

### 1. Independent Safety and Risk Review Mechanism

Establish a Tsawwassen-supported independent technical advisory mechanism to review safety performance, incident reporting, and emergency preparedness for the facility. Annual plain-language summaries should be provided to Tsawwassen members.

### 2. Enhanced Environmental Transparency

Provide Tsawwassen with real-time access to relevant environmental monitoring data, including air quality and odour reporting, and establish clear communication protocols in the event of operational incidents.

### 3. Co-Developed Emergency Response Planning

Update and co-develop emergency response procedures with Tsawwassen, including joint training exercises and culturally appropriate communication protocols.

These measures increase transparency, reduce uncertainty, and strengthen community confidence in risk management.

## 9.2. Experiential and Spatial Quality Measures

To address reinforcement of industrial character and experiential alteration of the river environment:

### 4. Sensory Impact Management Enhancements

Implement enhanced measures to minimize odour, noise, lighting spill, and visual intrusion associated with expanded operations, beyond regulatory minimum requirements where feasible.

### 5. River Access and Experiential Quality Improvements

In collaboration with Tsawwassen, support improvements to river access infrastructure and shoreline areas or other measures that facilitate safe and culturally meaningful use of the territory, including boat access enhancements and site improvements identified by Tsawwassen.

These measures help maintain the experiential and relational quality of the river environment that supports psychosocial well-being.

### 9.3. Cultural Continuity and Intergenerational Support

To address discouragement and erosion of confidence in future rights-based practice:

#### **6. Community Harvest and Cultural Revitalization**

Establish long-term, Tsawwassen-directed support harvesting activities, youth mentorship, and Elder-led cultural transmission initiatives that strengthen intergenerational continuity and river-based identity.

Eligible initiatives may include:

- Equipment and safety supports for community harvesting
- Youth-on-the-river programming
- Community food sharing events
- Elder-led skills transmission activities

This measure reinforces confidence in the continuity of rights-based practices within an industrialized context.

#### **7. Action Stewardship Measures**

Engage in measures to action stewardship through restoration and rejuvenation of Tilbury Island and track progress over time. The core measure for this initiative is the restoration of the Tilbury Slough.

#### **8. Cumulative Effects Initiative**

Establish and fund a long-term cumulative effects initiative for the Lower Fraser to support the ongoing assessment, monitoring, and management of conditions affecting Tsawwassen's rights. The initiative should include community-based monitoring and long-term research on cumulative and psychosocial impacts.

### 9.4. Structured Participation and Adaptive Oversight

To address structural marginalization and cumulative discouragement:

#### **9. Ongoing Operational Liaison and Reporting Mechanism**

Establish a formalized Tsawwassen-Proponent operational liaison committee to review monitoring results, planned operational changes, and emerging community concerns on a regular basis.

## 10. Periodic Psychosocial Follow-Up Assessment

Provide funding for periodic Tsawwassen-led community check-ins or focused assessments to evaluate whether psychosocial conditions are improving, stable, or declining over time, with commitments to consider additional measures if warranted.

These measures strengthen agency, oversight, and adaptive management in relation to psychosocial pathways.

## 10. Conclusion

This Indigenous-led Assessment evaluated the potential effects of the Project on the psychosocial conditions that support Tsawwassen's Aboriginal and Treaty rights, as well as Treaty Objectives. The assessment focused on mental and emotional well-being, sense of place and identity, and experiences of marginalization within a landscape shaped by sustained industrial transformation.

The Project does not introduce new physical barriers to harvesting or access, nor is it predicted to directly reduce resource abundance within the immediate project footprint (absent an exceedance or malfunction). However, it reinforces the industrial permanence of Tilbury Island, intensifies perceptions of catastrophic risk, and contributes to cumulative discouragement expressed by community members regarding the trajectory of territorial change.

Participants described the lower Fraser River as a landscape where thresholds have already been surpassed. Expressions of being "at survival level" and not being able to "get back to point A" reflect perceptions that cumulative industrialization has materially altered the relational conditions necessary for confident, intergenerational rights-based practice. Within this elevated vulnerability context, additional industrial expansion carries heightened psychosocial consequence.

Residual effects on psychosocial well-being are characterized by high vulnerability, moderate magnitude, long-term duration, and low reversibility. When assessed against Tsawwassen's articulated desired future conditions, including strengthened cultural continuity, stewardship, and intergenerational renewal, the Project contributes incrementally but materially to ongoing strain.

The overall severity of residual psychosocial effects is determined to be **Moderate**. The Project does not eliminate the ability of Tsawwassen members to exercise their rights. However, it reinforces cumulative pressures in a landscape where psychosocial thresholds have already been crossed, further constraining the conditions that support confident, future-oriented revitalization of rights-based practices.

The recommended measures outlined in Section 9 are intended to reduce these residual effects and support restoration of relational, experiential, and governance

conditions necessary for the meaningful exercise of Tsawwassen's Treaty Objectives and Aboriginal and Treaty rights.

The findings of this Indigenous-led Assessment should be considered alongside biophysical and technical findings, recognizing that psychosocial conditions are foundational to the meaningful exercise of constitutionally protected rights.

### 16.18.2 The EAO's Views

#### Tsawwassen First Nation's Assessment

Through engagement during the Process Planning phase, it was identified that Tsawwassen First Nation (Tsawwassen) would undertake an Indigenous led assessment of project effects on its Treaty Rights and Objectives, under section 19(4) of the Act. The EAO acknowledges and respects Tsawwassen's leadership in undertaking its 19(4) assessment using its own laws, knowledge systems, and decision-making frameworks and in accordance with the Assessment Plan. EAO recognizes and appreciates the significant effort invested by Tsawwassen in assessing the potential effects of the Project on its Treaty rights, interests, and Treaty Objectives.

#### Tsawwassen's Involvement and Engagement

Throughout the environmental assessment, the EAO and Tsawwassen sought to work together in a manner that reflected the spirit and requirements of the Tsawwassen First Nation Final Agreement and the government-to-government relationship between Tsawwassen and the Province. This included, among other things, identifying as a participating Indigenous nation for the Project, taking part in technical discussions (including through development of the Process Order, Application Information Requirements, Assessment Plan, FortisBC Application, EAO's Assessment Report) and iterative engagement opportunities respecting project information, potential effects on its Treaty rights, and measures to address the recommendations identified in the ILA. These discussions and engagement opportunities were grounded in Tsawwassen's Treaty Objectives and a shared recognition of Tsawwassen's stewardship responsibilities and the cumulative effects context Tsawwassen is experiencing.

#### Tsawwassen First Nation's Recommendations

The EAO notes that Tsawwassen's 19(4) assessment included recommendations intended to address identified effects from the Project on Tsawwassen and its Treaty rights. These recommendations aligned with proposals identified by Tsawwassen earlier in the assessment process.

Through holistic discussions grounded in Treaty, a range of measures have been identified that, taken together, respond to and address Tsawwassen's recommendations.

Provincial conditions and federal Key Mitigation Measures that respond to recommendations by Tsawwassen in its Section 19(4) assessment, including impacts to mental and emotional well-being, sense of place and identity, stigma and marginalization, include:

- Condition 3 (Document Development) requires plans and programs to include clear objectives, monitoring and reporting requirements, and adaptive management to improve mitigation measures where needed throughout the Project lifecycle.
- Condition 4 (Consultation) requires the Proponent to be available to meet with Tsawwassen throughout all project phases, and discuss issues or concerns that are related to the Project.
- Condition 10 (Community Feedback Process) is intended to establish a pathway for Tsawwassen to raise concerns about project effects and provide opportunities to address issues relating to mental and emotional well-being.
- Condition 12 (Construction Environmental Management Plan) requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction by reducing disturbance and protecting the environmental conditions that support fish, wildlife, and plants, this condition helps maintain the ability to access, harvest, and experience culturally important areas;
- Condition 13 (OEMP) requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation. Maintaining stable and predictable environmental conditions over time helps preserve the integrity and character of the area, supporting ongoing relationships with the land and reinforcing identity tied to harvesting and stewardship practices;

- Condition 14 (Air Quality Management Plan) ensures the Project selects and applies effective emissions control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support harvesting and cultural practices; and,
- Condition 15 (Chance Find Protocol) requires procedures to identify and protect archaeological or cultural materials discovered during project activities, to prevent additional cultural disturbance; and
- Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan) requires the development and implementation of a plan supporting economic participation of First Nations, and local communities, that would describe employment and contracting strategies and training practices. This plan supports economic governance, ownership and self-determination.
- Condition 17 (Dry Street Sweeping Report) assesses whether dry street sweeping can reduce 6-PPDQ on project related roads, which may lower impacts on salmon and other fish important to Tsawwassen.

This is complemented by the potential federal condition relating to accidents and malfunctions reporting to IAAC that is intended to ensure timely responses to accidents and malfunctions, incorporation of Indigenous perspectives and relevant authorities', and continuous improvement to avoid or reduce the risk and severity of future incidents. In addition, the potential federal conditions would strengthen protections for migratory birds, their nests, eggs and habitats, helping to reduce disturbance from project activities.

Tsawwassen also notes that the Proponent has made several commitments directly to the Nation that Tsawwassen considers responsive to recommendations in the Tsawwassen Indigenous led assessment, including measures to support cultural mitigation activities, an innovative habitat restoration project for the Tilbury Slough, a commitment not to use the Fraser River to transport construction materials and collaboration on information sharing and emergency response procedures and exercises.

Where Tsawwassen's recommendations could not be fully addressed through project conditions, Tsawwassen and the Province worked collaboratively to find a path forward grounded in the Treaty relationship.

### **EAO Conclusion**

In consideration of mitigations committed to by the proponent and the holistic approach to conditions/accommodations that has been developed to respond to the ILA recommendations, Tsawwassen has indicated that the Province has satisfied its consultation and accommodation obligations for the Project under Treaty. This has informed the EAO's conclusion that it has upheld its consultation obligations to Tsawwassen on Tilbury Phase 2.

# 1. Introduction

Tsleil-Waututh Nation (TWN) has participated throughout the environmental assessment (EA) process for the Tilbury Phase 2 LNG Expansion Project (Project) to identify concerns and assess the Project's potential effects on TWN's constitutionally protected rights, title, and interests under Section 35 of the *Constitution Act, 1982* (Section 35 rights), including rights to harvest, fish, hunt, gather, and practice culture throughout our territory. TWN's participation in this process has been guided by our stewardship responsibilities, obligations to future generations, and commitment to protecting the environmental, cultural, spiritual, and economic foundations necessary for our Nation to thrive.

Under the *Declaration on the Rights of Indigenous Peoples Act* (DRIPA), the Province of British Columbia has committed to implement the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP) in consultation and cooperation with Indigenous peoples. This includes, among other obligations, consulting and cooperating in good faith to obtain the free, prior and informed consent (FPIC) of Tsleil-Waututh Nation before adopting or implementing measures that may affect them (Article 19); recognizing and protecting rights to lands, territories, and resources (Article 26); establishing fair and transparent processes that respect Indigenous laws and governance (Article 27); protecting cultural heritage and knowledge (Article 31); and ensuring that projects affecting Indigenous lands and resources proceed only with FPIC and appropriate measures to mitigate impacts (Article 32).

səlilwətaʔ (Tsleil-Waututh Nation or Tsleil-Waututh people), the People of the Inlet, are a distinct Coast Salish Nation whose traditional territory includes Burrard Inlet (səlilwət) and the waters draining into it. səlilwətaʔ have lived in, occupied, governed, and acted as stewards of our territory since time immemorial and continue to do so today. We hold a sacred and legal obligation to our Ancestors, current citizens, and future generations to maintain, protect, and restore the lands, waters, and resources of our territory so that the environmental, cultural, spiritual, and economic foundations necessary for our Nation to thrive are sustained. These responsibilities are embedded within TWN's laws and governance systems and is articulated through the Tsleil-Waututh Nation's Stewardship Policy (2009), which guides TWN's approach to stewardship, impact assessment, and decision making.

TWN's Section 19(4) assessment of the Project (TWN's Assessment) is grounded in TWN's Section 35 rights, stewardship obligations, legal orders, knowledge systems, and assessment methodologies. From our perspective, TWN's own assessment is the most appropriate means of determining how the Project may affect TWN's rights, responsibilities, governance, and relationship with our territory.

Throughout the EA process, TWN engaged with the B.C.'s Environmental Assessment Office (EAO), the Impact Assessment Agency of Canada (IAAC) and other regulators through consultation, information sharing, technical discussions, and consensus-seeking processes regarding the Project's potential effects on TWN's rights and interests. These engagements were intended to support a better understanding of TWN's concerns, identify potential pathways to avoid or minimize adverse effects, and advance more informed decision making. Although areas of alignment were achieved on some issues, TWN recognizes that significant differences in perspectives and conclusions remain regarding certain Project effects and the adequacy of proposed mitigation measures, including the characterization of residual and cumulative effects.

Due to TWN's inherent authority, laws, stewardship obligations, and distinct methodologies, TWN requested to conduct and present TWN's own assessment of the Project's potential effects on our rights and interests under section 19(4) of the *Environmental Assessment Act, 2018* (the EA Act).

The 19(4) TWN Assessment is presented in TWN's own words and reflects our own assessment framework, methodologies, legal orders, and knowledge systems. The views, conclusions, and characterization of effects presented in TWN's 19(4) Assessment reflect Tsleil-Waututh Nation's perspectives and do not necessarily reflect the views or conclusions of the EAO. Where the EAO's conclusions differ from those presented under this section, we consider TWN's own assessment and conclusions to best reflect the Project's potential impacts on our constitutionally protected rights, title, interests, governance responsibilities, and relationship with our territory. From TWN's perspective, cumulative and ongoing industrial development within our territory has already created significant constraints on the meaningful exercise of Section 35 rights and responsibilities, including impacts to fishing practices, culturally important species, cultural continuity, stewardship obligations, and intergenerational wellbeing.

TWN expects both Provincial and Federal decision makers to carefully consider the findings and conclusions presented in this assessment, including the cumulative nature of impacts on TWN's rights and interests, and to ensure that decisions are consistent with applicable legal obligations, including Section 35 of the *Constitution Act, 1982*, DRIPA, UNDRIP, and relevant jurisprudence related to cumulative effects, meaningful consultation and accommodation, and the continued ability of Indigenous peoples to meaningfully exercise their rights, responsibilities, and governance obligations within their territories.

## **1.1 Purpose of Tsleil-Waututh Nation Assessment**

This assessment was undertaken by Tsleil-Waututh Nation pursuant to our role as a Participating Indigenous Nation under Section 19(4) of the EA Act in response to the Project. Our analysis is guided by TWN's Stewardship Policy and applies the methodology set out in TWN's Cumulative Effects Framework and Environmental Assessment Framework. Through this process, we evaluate how the Project may affect TWN's Section 35 rights and interests, our territory, and our relationships with the lands, waters, and resources, using our own legal and governance frameworks.

The Project is located within, and would directly affect, our Consultation Area (see Figure 1), asserted territory, and areas of cultural, spiritual, and governance importance. The geographic overlap between the Project and Tsleil-Waututh Nation's Consultation Area, combined with the nature of the Project and its interaction with social, cultural and environmental systems, triggered the need for us to undertake a TWN Assessment of the impacts to our rights and interests. These interests must be understood in the context of the cumulative effects that have already constrained our ability to exercise our rights, transmit cultural knowledge, and uphold our stewardship responsibilities.

For the purposes of this assessment, we focus on scé·tən (salmon) from the Lower Fraser River as one of our key interests likely to be affected by the Project, particularly in relation to our constitutionally protected rights. This focus reflects the Project's proximity to the Fraser River and the ways in which construction activities, associated vessel traffic, contaminants, and emissions may affect scé·tən habitat, health, and the safe access and sustainability of our harvesting practices. While we use scé·tən as a primary indicator, this does not mean that our interests are limited to scé·tən. scé·tən provide a way to

trace pathways of effects from the Project, through the environment, to our rights, culture, and governance, allowing us to assess the significance of residual and cumulative effects in a holistic way.

This assessment extends beyond biophysical effects to consider how the Project may affect our ability to exercise our rights, maintain access to culturally important resources and places, and carry out cultural, spiritual, and governance responsibilities. In accordance with səliłwətał law, impacts to our rights, include not only changes to species and habitat, but also effects on access, use, cultural practices, self-governance, health, and our relationships with our territory.

## 2. Tsleil-Waututh Nation Community Profile

We are səliłwətał, the People of Burrard Inlet, where our First People were created and where our Ancestors have lived since time out of mind. Our Consultation Area includes, but is not limited to, Burrard Inlet, the Fraser River, and the greater Vancouver region, and overlaps TWN's traditional territory as well as shared territories with neighbouring First Nations.

We are a distinct Coast Salish Nation, governed by a Chief and six Councillors, each elected for four-year terms. Our Nation has entered into several agreements with the Crown, including a Reconciliation Agreement (2025) with the federal government,<sup>1</sup> Collaborative Decision-Making Regarding Disposal at Sea (2018), and a Letter of Understanding with the Province (2022). These agreements recognize TWN's inherent rights and stewardship role within our territory,<sup>2</sup> which reflects traditional responsibilities in a contemporary governance framework. TWN is also a member of the Naut'sa mawt Tribal Council.<sup>3</sup>

Historically, səliłwətał spoke the downriver dialect of hə́ŋqəmínəm (Halkomelem)<sup>4</sup> and through intermarriage also spoke Skwxwú7mesh (Squamish). Due to the impacts of colonization, fluency in these languages was severely disrupted, and today there are very few fluent hə́ŋqəmínəm speakers within our community. Language revitalization is a priority for səliłwətał, and the Tsleil-Waututh Language Program is actively working to restore language knowledge, learning, and use.<sup>5,6,7</sup>

Currently, many səliłwətał Members reside at Burrard Inlet IR No. 3 (Sleil-Waututh or Burrardview) in North Vancouver, with two smaller reserves located at Inlailawatash on the Indian River (Inlailawatash IR No. 4 and IR No. 4a). As of 2025, TWN had over 600 registered members and our community continues to grow through natural population growth and the reinstatement of previously disenfranchised Members.

TWN operates through several departments and programs that support governance, stewardship, community wellbeing, and economic development. This includes Treaty, Lands and Resources; Health and Wellness; Public Works and Climate Action; Economic Development; and Community Development. These departments and programs work together to support TWN's responsibilities to the lands, waters, culture, language, health, and future generations. TWN has also developed and implemented initiatives, including a Health and Wellness Strategic Plan, a Food Sovereignty Policy, a Climate Change Resiliency Action Plan, and a Cumulative Effects Monitoring Initiative, in response to the cumulative impacts of industrialization, environmental degradation, and climate change within our territory.

Continued access to fisheries of the Lower Fraser River is highly significant for TWN, including in relation to the Project. Today, səliłwətał asserts Section 35 rights in fisheries on the Fraser River, and our chiefs were signatories on petitions asserting TWN's interests on the Lower Fraser as early as the AD 1860s. The very large historic Coast Salish village (DgRs-17), located on the north bank of the South Arm approximately opposite to the Project speaks to the richness of the salmon fishery here. Of the fisheries of the Fraser River, sockeye fisheries are the most important, as sockeye is the preferred food species, and by far the single largest source of traditional seafood that is available for harvest by səliłwətał within our territory. Chinook scé-łən is also a preferred species, which is only available within the Lower Fraser River area.<sup>8</sup>

Tsleil-Waututh Nation currently has allocations for sockeye and chinook on the Lower Fraser River through our food, social, and ceremonial (FSC) licenses issued by the Department of Fisheries and Oceans (DFO). However, in recent years, we were unable obtain our full allocation of sockeye due to increasingly poor returns. As a result of poor-return years, TWN's food fish distribution to the community has been curtailed, and individual community members received only a few fish each, if any. Our diets should contain local foods to maintain personal health and a healthy relationship with the lands and waters of our territory.<sup>9</sup>

Furthermore, sharing traditional foods at large community gatherings, particularly those involving guests from other Indigenous communities, is an important cultural practice and responsibility for səliłwətał<sup>10</sup>. Sockeye scé-łən continues to be a central food served at many TWN gatherings and ceremonies, and without reliable access to scé-łən harvests, it becomes increasingly difficult to uphold cultural protocols, reciprocal relationships, and community responsibilities in a culturally appropriate way. səliłwətał also access fish beyond DFO jurisdiction through cultural protocols and kinship ties with neighboring First Nations, which are integral to our cultural, nutritional, and community wellbeing.<sup>11</sup>

<sup>10</sup> Tsleil-Waututh Nation (2015) Assessment of the Trans Mountain Pipeline and Tanker Expansion Proposal. Tsleil-Waututh Nation, Treaty, Lands and Resources Department. pp. 80-81.

<sup>11</sup> Tsleil-Waututh Nation, Treaty, Lands and Resources Department. (2023). *Ethnohistoric review and summary of Tsleil-Waututh Nation's rights and interests in relation to the FortisBC Tilbury LNG Phase 2 Expansion Project*.

səliwətaʔ also use sockeye for ceremonial purposes, including seasonal burnings to take care of our ancestors and supernatural beings.<sup>12,13,14</sup> As described in Morin (2015, pg.390), Tsleil-Waututh Nation ritualists say that our ancestors and supernatural spirits want local traditional foods because these are the foods our ancestors know and remember. Part of TWN's stewardship obligation to our ancestors and local supernatural spirits is to take care of those beings/spirits by ritually sending them local traditional food. Sockeye or chinook scé-ʔən have been the focal food at every recent səliwətaʔ burning ceremony. Without access to sockeye and chinook scé-ʔən from the Lower Fraser River, our ritualists cannot fulfill our obligation to take care of our ancestors.

Industrialization throughout our territory, including along the Lower Fraser River and Burrard Inlet, has degraded ecosystems and restricted access to marine foods, such as scé-ʔən. In response, TWN actively undertakes stewardship and restoration initiatives. For example, TWN has been working in partnership with the District of North Vancouver on a shoreline restoration project at Whey-ah-Wichen (Cates Park) in North Vancouver, and TWN co-developed the Water Quality Objectives for Burrard Inlet with the Province. TWN also issues Cultural Heritage Investigation Permits and deploys environmental and archaeological monitors to project sites, fulfilling stewardship responsibilities while building expertise in natural and cultural resource management.

Tsleil-Waututh Nation assesses projects holistically, recognizing that effects on our Nation are cumulative and interconnected. Long-standing industrial development, settlement, and climate change have contributed to declining ecosystem health, with corresponding impacts on the cultural, physical, mental, social, and economic well-being of our community. In response, TWN has initiated a Health and Wellness Strategic Plan, a Food Sovereignty Plan, Cumulative Effects Monitoring Initiative and a Climate Change Resiliency Action Plan.

Tsleil-Waututh Nation also participates in economic development through a range of Nation-owned and affiliated businesses operated through our Economic Development Department, including Inlailawatash LP (resource management), Takaya Developments (real estate), Salish Seas Limited Partnership (fisheries), and Takaya Tours (tourism).

In summary, TWN seeks meaningful participation in all planning and development processes within our Consultation Area to fulfill our stewardship responsibilities, protect our rights and interests, restore ecological and cultural health, and advance economic and social outcomes that can be equitably shared by present and future generations.

### 3. Regional Context

The Project is located within Tsleil-Waututh Nation's traditional territory, including our Consultation Area (see Figure 1). TWN's Consultation Area encompasses much of the Lower Mainland, extending

<sup>14</sup> Morin, Jesse (2015) Tsleil-Waututh Nation's History, Culture and Aboriginal Interests in Eastern Burrard Inlet. Prepared for Gowlings, Lafleur, Henderson LLP. Submitted to the National Energy Board. pp. 364, 389-391.

from Mount Garibaldi and the Squamish Valley in the north, to Gibsons in the west, the 49th parallel in the south, and eastward along the Lower Fraser River to approximately the Alouette River. Our Consultation Area is a living document that may be refined over time and is informed by traditional use studies (TUS) documenting TWN Members' land and resource use.

TWN's Consultation Area overlaps portions of our traditional territory and shared territories, including those of neighbouring First Nations, which are accessed in accordance with long-standing Coast Salish laws and protocols. It is important to note that our traditional territory is not necessarily confined to the boundaries of our Consultation Area and may extend beyond them, as TUS represent snapshots in time rather than exhaustive accounts of territorial use.

In pre-contact times and continuing thereafter, our Ancestors accessed and stewarded the resources of our territory, including those within and nearby the Project footprint, through seasonal rounds and kinship ties with neighbouring First Nations. The Fraser River was accessed by canoe, including routes from the Point Grey area, and by overland travel along established trails, including routes connecting present-day New Westminster and Port Moody.

While the primary focus of TWN settlement is eastern Burrard Inlet, səliłwətał families traditionally participated in seasonal rounds that included regular use of the Lower Fraser River. These seasonal movements occurred in both spring and late summer and enabled the harvesting of scé-łən, as well as eulachon in the spring. Although sockeye and eulachon harvesting was of particular importance, TWN also harvested sturgeon, chum, pink, and Chinook scé-łən, as well as steelhead, throughout the Lower Fraser River.

While eulachon is rarely harvested today due to the collapse of Fraser River eulachon populations more than a century ago, scé-łən from the Lower Fraser River remain a crucial source of food and cultural continuity for səliłwətał.<sup>15,16,17</sup> The Project TUS confirms that the Lower Fraser River has been actively fished by səliłwətał in recent decades, including within and nearby the Project footprint.<sup>18</sup> The Lower Fraser River, including the Project footprint, lies within TWN's FSC salmon fishing area.<sup>19</sup>

The Project TUS also identified a broad range of cultural use sites, Indigenous place names, archaeological sites, spiritual areas, and marine use areas throughout the study area, reinforcing the longstanding and ongoing importance of this region to səliłwətał. Archaeological and cultural sites within the study area continue to experience pressures from industrial development, vessel traffic, pollution, wake erosion, and acoustic disturbance. TWN also maintains significant cultural and spiritual relationships with species such as ǵəłəłəməcən (killer whales, including Southern Resident Killer

Whales), which may be adversely affected by increased vessel traffic and underwater noise associated with the Project and related marine shipping activities.

TWN holds a sacred and legal responsibility to past, present, and future generations to protect, defend, and steward the water, land, air, and resources of our territory. However, much of this territory, including the Lower Fraser River, has been profoundly altered by industrial, urban, and infrastructure development. TWN considers the cumulative effects of past, present, and ongoing projects to have exceeded what is allowable under səlilwətał law, resulting in sustained pressures on ecological integrity, cultural continuity, and the meaningful exercise of Section 35 rights and stewardship responsibilities.

### **3.1 Links to Cumulative Effects and Related Projects**

Although this subsection of TWN's 19(4) Assessment is not intended to function as a standalone cumulative effects assessment, TWN considers cumulative effects and existing pressures on the territory to be central to understanding the Project's potential impacts on TWN's rights, interests, stewardship responsibilities, and cultural continuity. From TWN's perspective, the Project effects cannot be meaningfully assessed in isolation from the broader context of ongoing industrialization, marine shipping, habitat degradation, pollution, and increasing development pressures throughout səlilwətał territory.

Accordingly, TWN's Assessment considers the broader cumulative context surrounding the Project, including interactions with existing and reasonably foreseeable projects and activities within TWN's territory. This includes adjacent and connected projects such as Tilbury Phase 1A (T1A), Tilbury Phase 1B (T1B), associated gas line and utility expansions, as well as the Tilbury Marine Jetty (TMJ), which received an Environmental Assessment Certificate (EAC) in March 2024. Although TMJ and the Project are regulated as separate projects, they share the same proponent and are operationally connected, as TMJ would facilitate shipping and bunkering of the Project's LNG product. From TWN's perspective, the effects of all Tilbury projects should be considered together within the broader cumulative effects context.

TWN has consistently raised concerns regarding the cumulative impacts associated with increasing vessel traffic and industrial development within our territory, including impacts to fisheries, harvesting practices, culturally important species, cultural and spiritual practices, marine access, archaeological sites, intergenerational knowledge transmission, and the meaningful exercise of Section 35 rights and stewardship obligations. In a separate submission to Ministers regarding the TMJ project in October 2022, TWN raised concerns that the Province's piecemeal approach to consultation and assessment did not adequately assess cumulative effects as a whole and, from TWN's perspective, did not justify further infringements on TWN rights and interests.

From TWN's perspective, the combined effects of the Project and TMJ project, together with other existing and foreseeable developments within the territory, increase pressure on already stressed ecosystems and further constrain TWN's ability to meaningfully exercise rights, responsibilities, and relationship with our territory. Accordingly, this assessment considers cumulative context as an important component in understanding the seriousness, extent, and implications of Project effects on TWN's rights, interests, and stewardship responsibilities.

Figure 1. Tsleil-Waututh Nation Consultation Area

## 4. Consultation Process

This section broadly describes the consultation process for the Project between TWN and the EAO, the IAAC, other regulators, and—where relevant—the proponent (FortisBC).

As the foundation for meaningful consultation, TWN's Stewardship Policy articulates who we are, sets out our legal principles and community objectives, and establishes our standards for effective engagement, including consultation and accommodation. TWN has applied our Stewardship Policy, including its provisions, as the overarching framework for assessing whether consultation in this EA process has met the standard of what TWN defines as "meaningful consultation"<sup>20</sup>.

TWN also applies the principle of FPIC, as affirmed in the UNDRIP and implemented through the DRIPA, in evaluating consultation conducted through the EA process. These principles, together with TWN's Stewardship Policy, inform our expectations for meaningful consultation and guide this Assessment prepared pursuant to section 19(4) of the EA Act.

From TWN's perspective, meaningful consultation is not merely procedural. It is a collaborative process that recognizes TWN's governance, laws, legal orders, and decision-making authority, and must provide TWN with a meaningful opportunity to assess potential impacts to Section 35 rights, cultural heritage, stewardship responsibilities, and cumulative effects within TWN's Consultation Area prior to decision-making.

The following are TWN's requirements for meaningful consultation, as per the provisions in our Stewardship Policy, and for the principle of FPIC:

### **Timely Notice and Resourcing**

The Crown and proponent must provide advance notice of proposed activities or decisions related to the Project that may impact TWN's rights and interests. Adequate resourcing must be provided to support TWN's full and effective participation, including funding for internal coordination, technical review, TWN's own Assessment under Section 19(4) (of the EA Act), cultural analysis, and community engagement.

### **Full and Transparent Information Sharing**

TWN must be provided with complete, timely, and accessible information in formats that enable informed analysis and decision-making. This includes technical studies, impact assessments, project design used for modeling, and regulatory frameworks associated with the Project. Information must be sufficient for TWN to assess potential impacts on Section 35 rights, cultural health, stewardship responsibilities, and cumulative effects.

### **Adequate Time for Review and Dialogue**

Meaningful consultation requires that TWN be provided with reasonable and mutually agreed upon timelines to review information, conduct TWN's own Assessment under Section 19(4), and engage internally with leadership, advisors, and community Members. We must have the opportunity to

---

<sup>20</sup> Tsleil-Waututh Nation Stewardship Policy (2009) outlines the necessary steps for meaningful consultation, which has been shared with the regulators and proponent.

present TWN's views, receive responses, and engage in dialogue to address concerns and identify areas of disagreement prior to decision-making.

### **Collaboration in Good Faith and Issue Resolution**

TWN's input, including TWN's Section 19(4) assessment, must be fully and fairly considered in decision-making. This includes a clear process for identifying and addressing outstanding issues, with efforts made to reach mutual understanding and resolve differences prior to the potential approval of a project. Final decisions should reflect a genuine effort to accommodate TWN's rights and interests, consistent with FPIC and DRIPA, and not merely to notify or document them.

## **4.1 Regulatory and Consultation Issues**

The issues below demonstrate that the EA process did not meet the principles set out in TWN's Stewardship Policy for meaningful consultation and the principle of FPIC were not fully upheld, despite TWN's clear and consistently communicated concerns throughout the EA process.

### **Duty to Consult and FPIC**

TWN continues to have significant concerns regarding the adequacy of the regulatory and consultation process for the Project and whether the IAAC and the EAO, on behalf of the Crown, have met their duty to meaningfully consult and accommodate TWN in relation to the potential impacts of the Project on TWN's rights and interests. TWN has raised consultation issues throughout the EA process to the EAO and IAAC, as described in issues tracking tables, consensus-seeking tables and consultation letters.<sup>21</sup> TWN identified fundamental flaws in the EA and consultation process that undermine the principles of scientific integrity, objectivity, thoroughness, and accuracy, as required under Section 6(3)(b) of the *Impact Assessment Act, 2019* (IA Act).<sup>22</sup>

Since the EAO is the regulator responsible for leading, administering and coordinating the substituted EA process for the Project, TWN expects the EAO to ensure assessments are carried out in a thorough, transparent, and impartial way, using the best available science and Indigenous Knowledge in decision making, as required under Section 2(2)(b) of the EA Act.<sup>23</sup> Section 2(2)(b) also requires that the EAO collaborate with Indigenous Nations on EA projects, consistent with the UNDRIP, while recognizing their right to participate in decision-making on matters that would affect their rights. This means that FPIC should be upheld throughout the EA process, while allowing Indigenous Nations to fully understand and assess the potential impacts of projects before decisions are made. This includes critically assessing whether information relied upon during the assessment, including information used to support conclusions on the significance of residual effects, the Project's contribution to sustainability, the effectiveness of mitigation measures, and the overall characterization of impacts on Indigenous rights and interests is adequate, complete and evidence based.

---

<sup>21</sup> TWN's consultation issues are outlined in letters sent to the EAO and IAAC on July 6, 2022, February 6, 2024, and August 5, 2025.

### **Information Gaps, EA Process Limitations, and Post-Certificate Deferral**

Since the Early Engagement phase, TWN has repeatedly raised concerns regarding gaps, uncertainties, and the lack of sufficient detail in key aspects of the Detailed Project Description, marine transportation activities, air emissions, proposed mitigation measures, follow-up programs, cumulative effects, and Post-Certificate processes. These concerns are described in issues tracking tables, consensus-seeking tables, and TWN's consultation letters sent to the EAO and IAAC throughout the EA process (see footnote 21). TWN remains particularly concerned that many important details and decisions have not been fully resolved or assessed during the EA process and instead have been deferred to the post-certificate phase. This includes deferring decisions on several key mitigation measures and emissions-control technologies to the post-certificate phase, rather than clearly defining and assessing them during the EA process. As a result, important aspects of the Project may later be addressed through permitting processes, management plans, adaptive management frameworks, future amendments, or left to the proponent's discretion following the potential issuance of an EAC for the Project. From TWN's perspective, this limits our ability to fully understand the potential effects of the Project and assess the implications for our territory, rights, cultural continuity, and future generations.

TWN recognizes the limitations of the current EA processes and acknowledges that the proponent is generally responding to the requirements established under the EA Act, the IA Act, and associated process documents. Simultaneously, TWN remains concerned that our outstanding information requests have not yet been adequately addressed through the EA process. These concerns include, but are not limited to, the need for independent and neutral technical experts at Technical Advisory Committee or bilateral meetings to address technical issues related to greenhouse gas (GHG) emissions, mitigation measures, certain aspects of the proponent's Application, and proposed conditions. TWN notes that the treatment of technical issues throughout the EA process did not fully reflect the intent of relevant EAO guidance and policy documents, including the *Environmental Assessment Certificate Policy* (EAO, 2021) and the *Effects Assessment Policy* (EAO, 2020). TWN also maintains that the level of detail required under the *Application Information Requirements Guidelines* (EAO, 2020) to support informed decision-making was not always met, or that certain Project components were exempted from the Application Information Requirements without clear justification.

### **Project Splitting, Cumulative Effects, Insufficient Conditions, and Characterization of Effects**

TWN remains particularly concerned with the continued splitting and separate review of Tilbury projects, including the TMJ Project and associated marine shipping activities, despite these projects being operationally connected and contributing collectively to increased industrialization, vessel traffic, and emissions within our territory. From TWN's perspective, this project-by-project approach does not reflect how impacts are experienced within our territory and limits a full understanding of cumulative effects on fisheries, marine access, cultural and spiritual practices, culturally important species and places, archaeological sites, and the meaningful exercise of TWN's rights and stewardship responsibilities.

TWN is also concerned with the increasing reliance on broad or flexible language in the Revised Application, Certified Project Description (CPD), and proposed conditions, leaving room for discretionary loopholes, future amendments, or additional activities without requiring a fulsome reassessment of impacts or renewed consultation. This includes potential future in-water works, dredging, marine vessel

activities, demolition, hydrostatic test water discharge, and transportation-related impacts that may later proceed through amendments, permitting, or Post-Certificate approvals without adequate review or consultation. In TWN's view, many proposed measures lack the certainty, detail, enforceability, and accountability necessary for the protection of TWN's rights and interests.

TWN further remains concerned with the heavy reliance on post-certificate planning, future permitting, non-binding measures, and provincial mechanisms to address potentially significant effects, as only two federal conditions have been proposed for the Project. Significant effects include impacts related to fish and fish habitat, marine shipping, Indigenous health, cumulative effects, air quality, GHG emissions, and Indigenous rights. From TWN's perspective, this approach does not provide the level of certainty, oversight, accountability, monitoring, or compliance required to address matters involving federal jurisdiction and potential impacts on Indigenous rights. TWN is particularly concerned that these issues are increasingly being deferred to provincial processes or future planning stages that may not involve comprehensive consultation with affected Indigenous Nations.

TWN also remains concerned that several conclusions regarding negligible or non-significant residual effects rely heavily on future management plans and mitigation measures that have not yet been developed or validated. This includes conclusions related to fish habitat quality, groundwater contamination, hydrostatic test water discharge, air quality, GHG emissions, and cumulative effects. From TWN's perspective, the assessment process relies too heavily on adaptive management and Post-Certificate discretion rather than requiring a fulsome assessment and enforceable mitigation measures prior to the potential approval of the Project.

### **Good Faith Participation and Misleading Information**

TWN has engaged in good faith throughout the EA process and has consistently provided detailed comments and feedback within the timelines established by the Crown and regulators. Despite these efforts, TWN remains concerned that engagement and consultation activities to date have been inadequate and, from TWN's perspective, have contributed to an incomplete and at times inaccurate understanding of the Project's potential effects. TWN has repeatedly raised concerns regarding the use of promotional or unverifiable claims related to the Project's GHG emissions and climate benefits. From TWN's perspective, some of this information has been relied upon or reflected throughout the assessment despite ongoing uncertainties, carrying forward of unresolved issues, and requests for further evidence and clarification.

Many of these issues are not new and have been consistently raised throughout the EA process with both the EAO and the IAAC, including through consensus-seeking tables, issues tracking tables, technical review comments, and formal consultation correspondence. This includes concerns related to project splitting, changing or selective scoping, exclusion of marine shipping and downstream adverse effects, unsupported environmental claims, outdated GHG lifecycle analysis, omission of methane slip, and the lack of sufficiently transparent, accurate, and evidence-based information needed to enable informed decision making. As outlined in TWN's consultation letter to IAAC and the EAO (August 5, 2025) regarding outstanding information requests and unresolved issues, TWN remains concerned that these issues have not been sufficiently addressed despite repeated requests for clarification, additional evidence, and a more fulsome assessment.

## Priority Project Designation and Impartiality

Tsleil-Waututh Nation's unresolved issues are further compounded by the Province's designation of the Project as a "priority project" under the Province's "Look West" strategy.<sup>24</sup> From TWN's perspective, this raises additional concerns regarding the neutrality and impartiality of the assessment process, particularly where significant uncertainties and outstanding concerns remain unresolved. Where Project approval may already appear aligned with broader provincial priorities, TWN is concerned about whether regulators can fully exercise independent due diligence throughout the EA process, including the Post-Certificate phase.

## Lack of Meaningful Consultation and FPIC

Meaningful consultation and the implementation of FPIC require that Indigenous Nations have access to complete, accurate, and sufficiently detailed information to understand the potential impacts of projects and to make informed decisions regarding projects that may affect their territories and rights. TWN does not consider that this standard has been met in the context of this Project.

The regulatory and consultation issues collectively limit TWN's ability to fully assess the potential impacts of the Project on TWN's rights and interests, constrain TWN's meaningful participation throughout the EA process, and prevent TWN from making an informed decision regarding the Project.

## 5. Assessment Boundaries

Tsleil-Waututh Nation's Assessment boundaries establish the temporal and spatial scopes for evaluating the Project through a holistic lens. This approach goes beyond biophysical factors to include cultural health, while also examining cumulative impacts on TWN's rights and interests.

### 5.1 Temporal

The temporal scope of TWN's Assessment examines conditions across multiple timeframes, from pre-contact times, through the colonial era to the present, and into a 'foreseeable' future layered with industrial projects.

These timeframes include:

- Where we came from: the pre-contact era until the late 18th century.
- Where we are now: reflects the cumulative effects of past impacts from the late 18<sup>th</sup> century to the present.
- Where we are going (a future with the Project): a future that imagines the Project in a vacuum in order to isolate incremental project effects.
- Where we are going (a future with the Project and other reasonably foreseeable projects, activities, and climate change): a future that builds on existing conditions and includes the Project along with other reasonably foreseeable projects, activities, and forecasted climate change.

---

<sup>24</sup> Province of British Columbia. (2026). Look West Update. Building on early momentum, B.C. accelerates growth by nearly doubling priority major projects. Retrieved from: <https://news.gov.bc.ca/releases/2026PREM0020-000479>

By examining past, current, and reasonably foreseeable future conditions, TWN's Assessment seeks to identify how our rights and interests have been affected and if/how the Project may continue to affect them.

## 5.2 Spatial

Tsleil-Waututh Nation's geographic scope generally corresponds to our territory, which can include cultural practices that are undertaken within TWN's Consultation Area and beyond. Consistent with the temporal scope, the spatial scope of TWN's Assessment is holistic. For the purposes of assessing the Project's effects, nested spatial scopes are applied.

This approach ensures that multiple spatial scales are considered, beginning with a smaller assessment area nested within progressively larger ones. In doing so, both direct and indirect effects are meaningfully assessed to reflect the full range of potential effects pathways and their significance to our rights and interests.

The smallest "Local" scope is the study area developed for TWN's Traditional Use Study for the Project (TUS Study Area). The TUS Study Area falls within TWN's Consultation Area. It was defined using natural ecological boundaries and traditional modes of travel, based on a two-hour travel radius by foot and canoe from the Project.

The TUS Study Area is nested within the "Regional" scope, which includes scé-łən habitat and the Metro Vancouver airshed. The "Beyond Regional" scope includes migratory species routes and global climate systems. These broader spatial scales help demonstrate the full extent of potential effects pathways and their relevance to our rights, interests, and way of life.

Figure 2. TWN Nested Scope

## 6. TWN's Assessment Methods and Rights-Based Approach

This Assessment applies a rights-based methodology developed by TWN to evaluate how the Project may affect our sacred obligations, Section 35 rights, and internationally affirmed rights (under the UNDRIP). Consistent with TWN's Stewardship Policy, TWN's Assessment considers the following guiding questions:

1. What impact does the Project have on the natural and cultural resources?
2. What impact does the Project have on the socio-economic conditions of TWN Members?
3. Does the Project jeopardize, prejudice, or otherwise compromise TWN rights or interests?
4. What does the Project contribute to the cumulative effects of past land-use decisions?
5. Does the Project have the potential to deprive future generations of TWN of the control and benefit of our lands and waters?
6. Does the Project represent the best use of lands and resources for the present and future?

TWN's approach to assessing impacts on TWN's rights, recognizes that the exercise of rights is realized through relationships with specific places, species and cultural practices, referred to as "**interests**." As such, this assessment begins by identifying key TWN interests likely to be affected by the Project and uses those interests as entry points to assess broader rights impacts.

Each interest is assessed using a structured, **8-step process** that integrates TWN's knowledge systems, legal orders, planning, and community-defined values. This process allows us to articulate how environmental changes translate into impacts on rights, sacred obligations, health and well-being.

### Step 1: Selection and Justification of an Interest

The assessment begins with the identification of a TWN interest likely to be affected by the Project's activities. The selected interest is directly connected to TWN's constitutionally and internationally recognized rights, and this connection is detailed in TWN's Assessment. The relevance of the interest is justified in the context of the Project and the broader exercise of TWN's stewardship obligations.

### Step 2: Discussion of Pre-Contact Baseline Conditions

This step describes the pre-contact conditions under which the selected interest became integral to TWN's way of life. These conditions reflect the environmental, economic, cultural, social, and health conditions that sustained our interest prior to European contact.

Information is derived from both Indigenous Knowledge sources and supporting technical and scientific materials, including:

- Indigenous Knowledge shared by TWN Cultural Advisors, Knowledge Holders, Harvesters, and TWN Members;
- TWN's Traditional Use Study (TUS) database and community-based information;
- TWN stewardship policies and previous TWN submissions and assessments;
- Scientific studies and technical reports, including reports co-authored by TWN;

- Baseline field studies, archaeological studies, and environmental monitoring data;
- Academic research, government reports, and other supporting literature relevant to pre-contact conditions;
- Cumulative effects and health-related studies where relevant to the assessment of TWN rights and interests.

### **Step 3: Discussion of Future Aspirations**

TWN's future aspirations for the selected interest are described in alignment with the pre-contact conditions. This step reflects TWN's legal and moral imperative to restore and revitalize our way of life.

Sources of information include:

- Regular engagement with Cultural Advisors,
- TWN Cumulative Effects Monitoring Initiative,
- Official TWN reports and planning documents,
- TWN Community Harvesting Survey.

### **Step 4: Description of Cumulative Effects to Date (Existing Conditions/Context)**

The existing conditions for the selected interest are evaluated through the lens of cumulative effects since European contact. This assessment describes how colonization, industrial development, and shifting regulatory regimes have altered the conditions necessary for TWN's interest and associated rights to thrive.

By analyzing these historical stressors, we assess whether existing conditions (i.e., the context) enable TWN's interest and associated rights. As illustrated in Figure 3, context is characterized along a spectrum, ranging from conditions that enable TWN's interest and the full exercise of associated rights in accordance with səlilwətał law, to conditions that limit or prevent the exercise of TWN's rights.

The way TWN uses the spectrum in Figure 3 to characterize context is by asking the following question:

**Do existing conditions enable TWN to meaningfully exercise the Section 35 rights associated with the selected interest, in accordance with səlilwətał law and TWN's way of life?**

We then determine where the answer falls on the following scale:

Allows the exercise of rights in alignment with TWN law: Conditions enable the interest and the full exercise of the associated rights in accordance with səlilwətał law and way of life. The interest is healthy, accessible, and abundant/available enough to sustain desired uses into the future.

Does not limit the exercise of rights: Conditions do not constrain the interest or the meaningful exercise of the associated rights. There is an unfettered ability to access and use the interest safely and appropriately, and practice associated rights.

Limits the exercise of rights: Conditions constrain the interest and the meaningful exercise of the associated rights, but some practice remains possible. Exercise may be reduced, require workarounds, or be inconsistent over time.

Prevents the exercise of rights: Conditions prevent the ability to access or use the interest and meaningfully practice the associated rights. The interest may be unavailable, unsafe, inaccessible, or otherwise incompatible with the exercise of associated rights. Cumulative effects to date have exceeded what is allowable under səlilwətał law.

**Figure 3. TWN Existing Conditions Spectrum for Characterizing Context**

### Step 5: Identification of Residual Effects on TWN's Interest and Pathways to TWN's Rights

This step identifies specific project activities and the resulting effects that could affect TWN's selected interest. For each relevant effect, we assess its direction (positive, perpetuating, or negative). We use the term "**project effects**" here to include both positive and adverse effects. We do not refer to "residual effects" at this stage because project effects are considered residual only after mitigation measures have been considered. Residual effects are the adverse effects that remain after mitigation measures are applied, including where mitigation may be ineffective or insufficient.

The direction of the project effect is illustrated in Figure 4 and described as follows:

- A project effect moves in a positive direction if it improves existing conditions in a way that enables the interest and the exercise of associated rights.
- A project effect moves in a perpetuating direction if it does not materially change existing conditions; existing constraints remain in place or may be reinforced.
- A project effect moves in a negative direction if it introduces new or additional limitations on the interest and the meaningful exercise of associated rights.

**Figure 4. Direction of Project Effects**

A project effect is labeled as an ‘**adverse effect**’ if it moves in a negative direction or perpetuates existing conditions where these conditions already limit or prevent TWN’s interest and rights.

For ‘adverse effects,’ we further assess:

- The effectiveness of mitigation measures proposed by the proponent to avoid or minimize the adverse effect;
- Circumstances where no mitigation measures were proposed, as the adverse effect was predicted by the proponent to be indiscernible from existing conditions;
- The adverse ‘**residual effect**’ likely to remain after mitigation or without the application of mitigation measures.

We also clearly describe the pathway linking adverse ‘residual effects’ to potential impacts on TWN’s interest and associated rights.

#### **Step 6: Characterization of Residual Effects on TWN’s Interest and Associated Rights**

Each adverse residual effect on TWN’s interest and associated rights is characterized using criteria drawn from both conventional impact assessment methods and TWN’s knowledge and experience. Table 1 outlines the criteria used and how these are defined.

TWN applies Nation-specific definitions to ensure effects are assessed in a manner that reflects TWN law, values, and the conditions required to meaningfully exercise constitutionally protected rights. TWN’s approach is grounded in pre-contact conditions, future aspirations and səlilwətał law. It accounts for cumulative effects that already limit or infringe TWN’s rights and ensures that project effects are not understated where conditions are already degraded and constraining.

TWN’s characterization of residual effects is key in informing the overall significance of the impacts on TWN’s rights (see Step 8).

**Table 1. TWN Criteria and Definitions for Characterizing Residual Effects on TWN's Interest and Associated Rights**

| Criteria and General Description                                                                                                                                                                                                                                                                                                                                                                                                                                              | Assessment Definitions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Context:</b> Represents existing conditions, which refer to the current health of the different systems upon which TWN's way of life depends, including ecological, socio-economic, cultural and spiritual systems, and legal and governance systems.</p> <p>Existing conditions reflect projects and activities since European contact, as well as natural and human-caused trends that influence present-day conditions for TWN's interest and associated rights.</p> | <p><b>Allows:</b> Conditions enable the interest and the full exercise of the associated rights in accordance with səlilwətał law and way of life. The interest is healthy, accessible, and abundant/available enough to sustain desired uses into the future.</p> <p><b>Does Not Limit:</b> Conditions do not constrain the interest or the meaningful exercise of the associated rights. There is an unfettered ability to access and use the interest safely and appropriately and practice associated rights.</p> <p><b>Limits:</b> Conditions constrain the interest and the meaningful exercise of the associated rights, but some practice remains possible. Exercise may be reduced, require workarounds, or be inconsistent over time.</p> <p><b>Prevents:</b> Conditions prevent the ability to access or use the interest and meaningfully practice associated rights. The interest may be unavailable, unsafe, inaccessible, or otherwise incompatible with the exercise of associated rights. Cumulative effects to date exceed what is allowable under səlilwətał law.</p> |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Magnitude:</b> The severity or degree to which a residual effect perpetuates or changes existing conditions in ways that affect TWN's interest and the ability to exercise associated rights.</p> <p><u>Magnitude assesses both:</u></p> <ol style="list-style-type: none"> <li>1. The extent to which existing conditions "Allow", "Do not limit", "Limit", or "Prevent" TWN's interest and the exercise of associated rights.</li> <li>2. The direction of the adverse residual effect, including whether it perpetuates existing conditions, or places further limitation on, or prevention of, the exercise of associated rights associated with TWN's interest.</li> </ol> |  <p><u>Negligible:</u> Residual effect perpetuates conditions that enable TWN's interest and "Allow" the exercise of associated rights in alignment with səlilwətał law. Systems remain capable of sustaining interest for future generations.</p> <p><u>Low:</u> Residual effect perpetuates conditions that "Do not limit" TWN's interest and the exercise of associated rights or shifts conditions from "Allow" to "Do not limit" rights. Introduces early warning signs without constraining TWN's interest and associated rights.</p> <p><u>Moderate:</u> Residual effect perpetuates conditions that "Limit" TWN's interest and the exercise of associated rights or the residual effect creates a material constraint on the meaningful practice of rights, shifting conditions into a "Limit" state.</p> <p><u>High:</u> Residual effect perpetuates conditions that "Prevent" TWN's interest and the exercise of associated rights or the residual effect shifts conditions to a "Prevent" state, where rights cannot be meaningfully practiced.</p> |
| <p><b>Extent:</b> Geographic scope of a residual effect in relation to TWN's interest and associated rights.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p><u>No Spatial Overlap:</u> Residual effect has no direct or indirect pathway affecting TWN's interest.</p> <p><u>Local:</u> Residual effect is within current and/or past use areas, including harvesting and cultural use areas, or travel routes. Effect may interfere with area-specific exercise of rights.</p> <p><u>Regional:</u> Residual effect is across aquatic ecosystems, species ranges, or cultural land and seascapes. May affect ecological or cultural systems that support the exercise of associated rights across generations.</p> <p><u>Beyond Regional:</u> Residual effect extends beyond the Regional Assessment Area (e.g., transboundary or global scale). May affect migratory species, climate systems, or broader stewardship obligations.</p>                                                                                                                                                                                                                                                                                                                                                                   |
| <p><b>Duration:</b> Length of time a residual effect persists in relation to TWN's interest and associated rights.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p><u>Short-term:</u> Residual effect is felt temporarily during the construction or decommissioning phases only. Or the effect occurs for less than two years in operations.</p> <p><u>Medium-term:</u> Residual effect is felt during construction, operations and decommissioning phases.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                                                                                                                                                                                                                                                                                                                                                                                                                            | assumptions. Mitigation measures are unproven, contradict Indigenous knowledge, or are deferred beyond the EA process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b>Risk:</b> Reflects the potential for a residual effect to result in serious or irreversible harm to TWN's interest and associated rights, particularly under conditions of uncertainty or where outcomes are difficult to predict or mitigate. Risk is informed by the severity of potential consequences, the endurance of the effect, and the degree of uncertainty, rather than probability-based likelihood.</p> | <p><u>Low Risk:</u> Residual effect is limited in severity, duration, and extent, and well understood. Effect is unlikely to result in lasting impacts to TWN's interest or associated rights and can be effectively avoided, mitigated, or reversed.</p> <p><u>Moderate Risk:</u> Residual effect may result in meaningful but recoverable impacts to TWN's interest or associated rights. There may be some uncertainty regarding outcomes or mitigation effectiveness, and effects could contribute to cumulative impacts if realized.</p> <p><u>High Risk:</u> Residual effect could result in serious, long-term, or irreversible impacts to TWN's interest or associated rights. This includes effects that:</p> <ul style="list-style-type: none"> <li>- Impact areas of high cultural importance,</li> <li>- Have high endurance (limited recovery or irreversible),</li> <li>- Are concentrated on key sub-populations,</li> <li>- Involve significant uncertainty or unproven mitigation.</li> </ul> <p>A high risk rating may be assigned even where the probability of occurrence is uncertain or low, where the consequences would be severe.</p> |

## Step 7: Cumulative Effects Assessment

Step 7 addresses cumulative effects into the future and evaluates:

- Existing conditions and residual Project effects;
- Other reasonably foreseeable projects and activities;
- Anticipated climate change impacts (using TWN's *Climate Vulnerabilities Report* and regional climate projections).

The analysis considers whether future cumulative conditions will likely allow the exercise of rights in alignment with səlilwətaʔ law, not limit, limit, or prevent TWN's interest and associated rights.

## Step 8: Final Significance Determination of Impacts on TWN's Rights

The final step in TWN's assessment methodology is to determine the significance of residual and cumulative effects on TWN's Nation-specific interest and associated Section 35 rights.

**Significance** is the overall determination of whether effects are acceptable under səlilwətaʔ law and whether they result in an infringement of TWN's rights. This determination integrates information from all previous assessment steps.

Significance reflects the extent to which adverse effects limit or prevent the meaningful exercise of TWN's rights. It is assessed relative to TWN-defined rights-enabling conditions informed by səlilwətał law, pre-contact conditions, and future aspirations.

TWN applies the following significance thresholds:

- Not Significant: Effects do not perpetuate, or result in, a meaningful limitation on, or infringement of, TWN's interest and associated rights.
- Significant: Effects perpetuate, or result in, a meaningful limitation on TWN's interest and associated rights. Effects may reduce access, quality, continuity, or cultural integrity, but do not fully prevent the exercise of rights.
- Highly Significant: Effects perpetuate, or result in, a substantial limitation on TWN's interest and effective prevention of TWN's ability to exercise rights. This includes situations where rights are no longer meaningfully exercisable, where effects entrench existing infringement conditions, or where restoration and future exercise are foreclosed. These effects are inconsistent with səlilwətał law and require avoidance or structural redress.

## 7. Effects Assessment

### 7.1 Step 1: Selection and Justification of an Interest

#### Disclaimer on Assessment Focus

While this assessment focuses on Lower Fraser River scé·łən (salmon) as a representative interest, TWN affirms that scé·łən are not the only species, or interest, that could be adversely impacted. The Project has the potential to adversely affect a much broader range of rights and interests within səlilwətał territory. This includes harvesting, hunting, gathering, and cultural use associated with waterfowl, berries, plants, eulachon, crab, herring, prawns, shellfish, and other culturally important species and resources identified through the Project TUS and community knowledge. TWN holds inherent obligations to protect and steward our territory, including lands, waters, air, resources, species, and ecosystems, under səlilwətał law.

All potentially affected species are important to TWN, and the health of our territory as a whole is central to our identity, culture, wellbeing, and responsibilities. However, for the purposes of this effects assessment, Lower Fraser River scé·łən have been selected as one focus area due to their strong and multi-dimensional connection to TWN's constitutionally protected and internationally recognized rights, including:

- Cultural Rights (UNDRIP Articles 11 and 31): scé·łən are central to TWN cultural expressions, ceremonies, seasonal practices, oral histories, and identity.
- Spiritual and Religious Rights (UNDRIP Article 12 and 25): TWN spiritual beliefs and ceremonial life are directly connected to the scé·łən cycle and seasonal returns. Sacred relationships with scé·łən and the Lower Fraser River are tied to TWN's distinctive spiritual relationship with our lands, waters, and resources, and to our responsibilities to future generations.
- Language and Cultural Transmission (UNDRIP Article 13): Knowledge of scé·łən, harvesting techniques, protocols, stories, and place names are transmitted intergenerationally through language and water-based practices.

- Right to Self-Determination and Self-Government (UNDRIP Articles 3, 4, and 5): TWN's ability to manage and make decisions regarding scé·łən stewardship reflects self-determination in environmental, cultural, and food governance.
- Rights to Lands, Territories, and Resources (UNDRIP Article 26): scé·łən depend on healthy aquatic ecosystems. Projects that degrade the Lower Fraser River ecosystem may infringe on TWN's rights to our traditional territory and the resources within it.
- Environmental Protection and Stewardship Rights (UNDRIP Article 29): TWN has a sacred responsibility to steward and restore TWN's territory, including protecting scé·łən habitat, supporting food sovereignty, and exercising environmental governance.
- Right to Food Security and Traditional Livelihoods (UNDRIP Articles 20 and 21): scé·łən are foundational to TWN food systems, harvesting practices, and traditional livelihoods, and support community wellbeing, cultural continuity, and intergenerational resilience.

These rights are recognized and upheld under Section 35 of the *Constitution Act, 1982* and in the UNDRIP. Damage to scé·łən habitat, species abundance, or harvesting access, may therefore infringe upon multiple interrelated rights and obligations, including TWN's responsibility to care for future generations and fulfill our sacred trust to the land and waters.

In this sense, scé·łən functions as a key indicator of broader ecological and cultural impacts. Effects on this interest are likely to signal more systemic harms to our territory, rights, well-being, and way of life.

### **Selected Interest: scé·łən from the Lower Fraser River**

For this assessment, scé·łən from the Lower Fraser River have been identified as a central interest likely to be adversely affected by the Project. This reflects the Project's proximity to one of TWN's key FSC fishery areas, and the Project's potential to affect scé·łən habitat and health, as well as the health and well-being of TWN Members.

In addition to FSC harvesting, TWN holds communal commercial fishing licences through the Allocation Transfer Program in areas adjacent to the Project. These include licences for crab, herring, prawn, sockeye, and other scé·łən species. TWN also participates in commercial fisheries through Salish Seas Limited Partnership, a joint enterprise with Musqueam Indian Band and Tla'amin Nation, harvesting species such as halibut, sablefish, prawn, crab, herring, and scé·łən.

Within səliwətał territory, there are no alternative sources of sockeye and Chinook outside the Lower Fraser River and its approaches. Access to these areas is already highly constrained by intensive shipping activity and competition with other fisheries, further limiting TWN's ability to meaningfully exercise our harvesting rights.

scé·łən are not only ecologically significant within TWN's territory, they are foundational to our economy, culture, food sovereignty, self-determination, and sacred obligations. Among all scé·łən species, sockeye from the Lower Fraser River remain one of the most important traditional foods TWN can still access. scé·łən are integral to səliwətał seasonal rounds, əmeħ t ǎ snəw əyət (braiding generational knowledge), and communal harvesting practices.

Currently, the Project's TUS Study Area is one of two highly significant TWN fishing areas on the Lower Fraser River,<sup>25</sup> and oral histories and archaeological findings document the importance of Fraser River scé·łən through time:

"About 90% of our diet was once derived from Burrard Inlet and the Fraser River..." (p. 2)  
"Salmon have been some of the most important populations of interest to Tsleil-Waututh communities for millennia, for food, social, and ceremonial purposes..." (p. 6)<sup>26</sup>

Archaeological research at the səlilwətał village site at temtemix̓'ten (Belcarra Park) further confirms long-term sustainable scé·łən stewardship. Chinook and sockeye remains were found in the midden, despite these species not being abundant in Burrard Inlet, suggesting they originated from the Fraser River.<sup>27</sup>

These longstanding relationships, encoded in səlilwətał law, confer sacred obligations to protect and care for scé·łən and the ecosystems they depend on. The Project's TUS also notes that the health of the Lower Fraser has significantly declined from pre-contact conditions, and that ongoing industrial development further threatens already vulnerable scé·łən populations. TWN Members continue to follow scé·łən along the Lower Fraser River, making scé·łən movement and habitat conditions within the entire TUS Study Area directly relevant to our ability to practice harvesting rights.

Lower Fraser River scé·łən, therefore, represent a primary interest in this assessment. Impacts to this interest will be examined in relation to our inherent, constitutional, and international rights. Where Project effects interfere with these rights and responsibilities, such effects may constitute infringements—even if indirect, cumulative, or residual.

## 7.2 Step 2: Discussion of Pre-Contact Baseline Conditions

To understand the impacts of a project on TWN, it is essential to begin with the conditions that shaped our way of life prior to European contact. These baseline conditions—ecological, cultural, legal, economic, and social—allowed the full and uninterrupted exercise of our inherent rights in accordance with səlilwətał law.

### Relationships to Territory and Resources

Prior to contact, səlilwətał lived in dynamic relationship with the lands and waters of our territory, traveling seasonally throughout the region in accordance with the availability of key resources. səlilwətał law and cultural systems evolved in deep alignment with these patterns. As stated in the TWN Annual Report (2024-2025):

---

<sup>25</sup> Tsleil-Waututh Nation, Treaty, Lands and Resources Department. (2023). *Ethnohistoric review and summary of Tsleil-Waututh Nation's rights and interests in relation to the FortisBC Tilbury LNG Phase 2 Expansion Project*.

<sup>26</sup> Efford, M., Taft, S., Morin, J., George, M., George, M., Cavers, H., Hilsden, J., Paskulin, L., Loewen, D., & Zhu, J. (2023). *Archaeology demonstrates sustainable ancestral Coast Salish salmon stewardship over thousands of years*. *PLOS ONE*, 18(8), e0289797. <https://doi.org/10.1371/journal.pone.0289797>

<sup>27</sup> Ibid., pp. 12-13.

“Our Ancestors traveled throughout our territory, keeping villages in many locations, living wherever seasonal resources were plentiful. Our lands and waters have shaped our culture and will continue to be central to our way of life.” (p. 1)<sup>28</sup>

Eastern Burrard Inlet was the primary focus of səliwətaʔ settlement, but seasonal rounds extended far beyond, including the Lower Fraser River. In the late summer, səliwətaʔ would move to the Lower Fraser River to mass-harvest and dry sockeye, and in the spring, they would also move to the Lower Fraser River to mass-harvest and dry eulachon.<sup>29</sup> The preserved fish were brought back to the primary səliwətaʔ settlements in Burrard Inlet, where they were consumed during winter months. While the sockeye and eulachon fisheries were the most important to səliwətaʔ, sturgeon, chum, pink and chinook scé-ʔən, as well as steelhead were also fished on the Lower Fraser River.

TWN’s presence in the Lower Fraser was not sporadic or opportunistic; it was based on long-standing kinship ties and carefully observed Coast Salish protocols that allowed for access to key harvesting areas, including the Lower Fraser River. These kinship ties allowed səliwətaʔ families to lawfully access and harvest scé-ʔən, eulachon, crab, sturgeon and other species in the Fraser River, reflecting a shared and relational understanding of resource governance and collective responsibility.<sup>30</sup>

### Traditional Fishing Practices

Scé-ʔən were not only critical dietary staples, but also foundational to our spiritual, economic, and social systems. Archaeological studies at təmtəxʷtən (Belcarra Park) show that scé-ʔən vertebrae dominate the faunal remains, underscoring both the abundance of scé-ʔən and their foundational role in Ancestral diets.<sup>31</sup>

Historical records further demonstrate the intensity and sustainability of our scé-ʔən harvesting practices. The Fort Langley Journals (1827–1830) document hundreds of canoes traveling along the Fraser River for the sockeye fishery. TWN was one of many Coast Salish Nations who partook in one of the richest fisheries in the world. səliwətaʔ families regularly returned to Burrard Inlet with hundreds of kilograms of smoked scé-ʔən, affirming both the abundance of scé-ʔən and the cultural infrastructure required to process, preserve, and distribute it across the territory.<sup>32</sup>

Recent archaeological analysis affirms our deep relationship with scé-ʔən over millennia. Efford et al. (2023) found that səliwətaʔ harvested chum salmon for at least 3,000 years, representing about 100 generations of sustainable harvest and ecological stewardship. DNA analysis of chum salmon remains at təmtəxʷtən reveals that this harvesting was sex-selective, with a focus on harvesting males during the late fall spawning season. Male chum, whose appearance changes dramatically during spawning, were easier to identify and catch, allowing more females to continue upstream to spawn. This practice reflects a sophisticated and intentional resource management system, one that enabled sustained

salmon abundance and aligned with səliwətaʔ legal principles rooted in respect, reciprocity, and responsibility toward the land and waters.<sup>33</sup>

TWN emphasizes that, to effectively evaluate the conditions required for the səliwətaʔ way of life, it is necessary to understand the conditions under which it developed. These baseline conditions, healthy, functioning habitats; abundant and accessible scé-ʔən; and strong inter-Nation relationships, sustained our people physically, culturally, and spiritually.

This understanding is not limited to the past; it is foundational to our future aspirations. The conditions that once enabled a thriving way of life continue to guide our aspirations for revitalization, restoration, and the exercise of rights in accordance with səliwətaʔ law and sacred responsibilities.

### 7.3 Step 3: Discussion of Future Aspirations

For Tsleil-Waututh Nation, future aspirations are guided by Ancestral law and the restoration of pre-contact conditions; when scé-ʔən were abundant, safe to consume, and accessible for sustainable harvest throughout our territory. These aspirations include the full and unhindered realization of our rights to self-determination, stewardship, culture, and harvesting.

Scé-ʔən are not merely a food source. They are central to our identity, spiritual life, legal obligations, governance, and intergenerational knowledge transmission. TWN's 2024–2025 Annual Report affirms:

“We maintain a sacred trust, a responsibility to care for and restore our traditional territory to its former state. Our stewardship of the land, air, and water is deeply ingrained in our culture because we understand that the health of our people is interconnected with our environment.” (pg.1).

Through our stewardship protocols and cumulative effects work, we seek to protect and restore the ecological systems that sustain scé-ʔən and other culturally significant species. This vision aligns with rights affirmed in the UNDRIP (see Effects Assessment, Step 1).

TWN's aspirations reflect the restoration of constitutionally protected and internationally affirmed rights. These aspirations are essential to our cultural continuity, health, governance, and survival as a distinct people. TWN's ability to fulfill these responsibilities, by restoring the ecological conditions that enable scé-ʔən, will directly shape the well-being of present and future generations.

Community perspectives reinforce the centrality of these aspirations. From February 18 to March 31, 2025, TWN conducted a community-wide survey to better understand current and desired harvesting, processing, and consumption of traditional wild foods. All TWN Members over the age of 13 were invited to participate, with additional questions tailored for Elders and a separate art-based activity for younger students at the səliwətaʔ school. The project was led by TWN's Cumulative Effects

---

<sup>33</sup> Efford, M., Taft, S., Morin, J., George, M., George, M., Cavers, H., Hilsden, J., Paskulin, L., Loewen, D., & Zhu, J. (2023). *Archaeology demonstrates sustainable ancestral Coast Salish salmon stewardship over thousands of years*. PLOS ONE, 18(8), e0289797. <https://doi.org/10.1371/journal.pone.0289797>

Management team, with support from Treaty Lands and Resources programs. More than 200 Members participated.

The results demonstrate a strong and widespread desire to restore harvesting practices. Eighty-seven percent (87%) of respondents indicated they want to harvest more wild foods. Seventy-six percent (76%) expressed a desire to harvest more sockeye scé·łən specifically. When all scé·łən species were considered together, scé·łən was the top wild food that community Members wish to harvest in greater quantities.

Thus, the restoration of scé·łən abundance in the Lower Fraser River is not simply an environmental objective. It is a present-day community priority and an intergenerational aspiration grounded in law, culture, and lived experience.

#### **7.4 Step 4: Cumulative Effects to Date (Existing Conditions/Context)**

The current condition of Lower Fraser River scé·łən populations reflects more than a century of layered and interacting impacts, including industrial development, habitat alteration, colonial regulations, contamination, and climate change. These cumulative effects have substantially limited TWN's ability to harvest, trade, and rely upon scé·łən as a cornerstone of food security, culture, and identity.

Historically, scé·łən and forage fish were central to səliłwətał diets, governance systems, seasonal rounds, and trade networks. Archaeological evidence and oral histories confirm their foundational role in spiritual and economic life. Today, that relationship is under immense pressure.

##### **Long-Term Population Decline and Restricted Access**

TWN holds FSC allocations of sockeye and Chinook from the DFO's established Fishery Areas, within the Study Area of the Project's TUS. However, we are rarely able to access the full allocation due to poor returns. The 2020 Fraser sockeye return was the lowest on record, continuing a long-term trend of decline. In most years, meaningful harvest opportunities occur only during strong cyclical returns, typically once every four years. Even then, the harvest must be shared among a growing səliłwətał population, resulting in fewer fish per person.

While TWN continues to rely on Nation-to-Nation trade, kinship ties, and ceremonial sharing protocols to meet community needs, these adaptive practices do not replace direct, sustained access to healthy and abundant scé·łən populations.<sup>34</sup> More than half of Fraser River salmon populations are now listed as threatened or endangered.<sup>35</sup>

---

<sup>34</sup> Tsleil-Waututh Nation, Treaty, Lands and Resources Department. (2023). *Ethnohistoric Review and Summary of Tsleil-Waututh Nation's Rights and Interests in Relation to the FortisBC Tilbury LNG Phase 2 Expansion Project*.

## Habitat Loss and Contamination

The Lower Fraser River system is already critically degraded. Approximately 85% of the historical floodplain, and roughly 1,700 km of stream length have been lost.<sup>36</sup> This has removed or fragmented key feeding, rearing, and migration habitat for and access routes for First Nations.

Widespread contamination in the remaining Lower Fraser River fish habitat presents a significant obstacle to səlilwətał harvesters. In the 2025 TWN Community Harvesting Survey, the most frequently cited industrial impacts that limit TWN harvesting were:

- Pollutants and contaminants, and
- Oil refineries and terminals.

Recent sampling has identified hundreds of pollutants in Lower Fraser surface and groundwater, including excess nutrients, metals, fecal coliform, hydrocarbons, pesticides, pharmaceuticals, perfluorinated compounds, and tire-related chemicals.<sup>37</sup> Of particular concern is 6PPD-quinone (6PPD-q), a toxic byproduct associated with tire wear particles in urban stormwater runoff. 6-PPDQ is highly toxic to scé·lən at extremely low concentrations and has been linked to acute mortality events in urban streams. While coho scé·lən was the first to be identified as highly vulnerable, further studies have now found other species to be acutely sensitive including Chinook salmon, rainbow trout/steelhead, brook trout, and coastal cutthroat trout.<sup>38, 39</sup>

The proponent's Revised Application confirms that the waters in fish habitats adjacent to the Project already exceed multiple safety thresholds for fish and fish habitat:

- The Fraser River exhibits exceedances of B.C. and CCME water quality guidelines for several metals, particularly during high turbidity and sediment load conditions during freshet.
- Tilbury Slough is characterized by low dissolved oxygen, elevated summer temperatures, low pH, and exceedances of B.C. and CCME freshwater guidelines for metals, including aluminum, copper, cadmium, iron, manganese, and zinc, as well as total phosphorus.
- The slough receives roadway and industrial runoff, and limited flushing due to tidal gate operations that may allow contaminants to persist long-term.
- Metals and PAHs associated with transportation and diesel combustion are already present in the receiving environment and are known to impair fish health, particularly under low dissolved oxygen and high temperature conditions.
- Light extractable petroleum hydrocarbon (LEPH) exceedances have been identified in groundwater.

- Arsenic-contaminated soils are present within the Project footprint.

These documented exceedances confirm that environmental thresholds intended to protect fish and fish habitat are already being surpassed.

### Climate Change as a Compounding Stressor

Between 1950 and 2015, average temperatures in the Fraser River Basin increased by approximately 1 °C. This warming has doubled the number of summer days when river temperatures exceed 20 °C. Water temperatures above 18 °C are highly stressful for migrating scé·tən and can result in increased mortality, particularly among females, with direct consequences for reproductive success and overall population abundance.<sup>40</sup> According to the Province of British Columbia (BC), 886,300 hectares burned during the 2025 wildfire season, well above the provincial 10-year average.<sup>41</sup> Wildfires introduce additional contaminants and eroded materials into scé·tən streams, further degrading water quality and habitat.<sup>42</sup>

Increasingly frequent extreme rainfall events during winter, including recurrent atmospheric rivers, generate large volumes of runoff and sudden high flows in scé·tən streams. These conditions can significantly reduce survival of fall-run scé·tən incubating in the Fraser River.

At the same time, trends indicate that snowpack melt and freshet are occurring earlier in the spring. As a result, early high-flow conditions may negatively affect early spring scé·tən runs, while drought-like conditions may occur during late spring and summer runs. As noted by the Q'ul-Ihanumutsun Aquatic Resources Society:

“In extreme drought, waterways can become disconnected and fragmented, or even completely dewatered.”<sup>43</sup>

Once scé·tən enter the Salish Sea and Pacific Ocean, rising sea surface temperatures reduce ocean mixing and alter the timing of seasonal productivity. This can create mismatches between the timing of scé·tən outmigration and the availability of plankton in nearshore marine environments. Ocean acidification further affects plankton communities, potentially reducing food availability for scé·tən. Acidification has also been shown to impair scé·tən olfaction, a critical sense for effective migration and homing.<sup>44</sup>

TWN has directly experienced the impacts of climate change on scé·tən in both the Lower Fraser River and the Indian River Watershed. We have seen the Indian River dry up more frequently and earlier in

the year. In September 2023, our Treaty, Lands and Resources fisheries crew had to respond quickly when low-flow drought conditions caused the Indian River to dry up, preventing spawning pink scé·łən from moving upstream to access spawning habitat. As the fish began to congregate in large numbers in the remaining water, dissolved oxygen levels dropped rapidly to dangerously low levels. The crew acted swiftly, working with DFO and the Pacific Salmon Foundation to restore freshwater flow. Through this emergency response, the crew saved tens of thousands of scé·łən.<sup>45</sup>

### **Colonial Regulatory and Access Barriers**

Beyond ecological degradation, TWN's ability to harvest scé·łən has been constrained by colonial regulatory systems that criminalized Indigenous harvesting, appropriated lands and waters, and imposed externally controlled fisheries management regimes. These regulatory barriers form part of the cumulative effects context and continue to shape access to fisheries today.

### **Implications for Effects Assessment**

The Lower Fraser River and Tilbury Slough are overburdened systems in which scé·łən populations have declined immensely since European contact and TWN's harvesting and cultural rights are significantly constrained. These declines also have cascading cultural impacts, as reduced scé·łən availability diminishes a key food source for SRKW, a species that is foundational to səliłwətał culture.

Within this context, Project effects that perpetuate or exacerbate degraded conditions, via contaminant loading, habitat disturbance, emissions, or sediment mobilization, cannot be dismissed as negligible simply because they may be difficult to discern from existing conditions. From TWN's perspective, where cumulative effects already significantly constrain the exercise of rights, the addition of further adverse effects is not diminished in importance; rather, the existing strain heightens their significance.

## **7.5 Step 5: Identification of Residual Effects on TWN's Interest and Pathways to TWN's Rights**

TWN has identified several Project activities that could result in adverse effects. After reviewing the proponent's proposed mitigation measures, we identified the adverse 'residual effects' likely to remain after mitigation is applied (or where mitigation is unclear or not fully described) and the pathways through which those residual effects could impact TWN's interest and associated rights.

Residual effects pathways that could lead to impacts on TWN's rights include, but are not limited to:

- Pathways to scé·łən and scé·łən habitat,
- Pathways to access to scé·łən,
- Pathways to tangible cultural heritage,
- Pathways to intangible cultural heritage,
- Pathways to TWN health and wellbeing.

Here, the plural dimensions of scé·łən as a Nation-specific interest become clear: for TWN, Lower Fraser River scé·łən are not merely a biophysical resource, but a foundational Nation-Specific Interest tied directly to the current conditions for Indigenous rights (habitat quantity and quality; and access to, health, and abundance of scé·łən), the Ancestral exercise of those rights (tangible cultural heritage from

---

<sup>45</sup> Nicholas, G., Tsleil-Waututh Nation (2023). Urgent Drought Response Work by TLR to Save Salmon in Indian River Watershed. <https://twnation.ca/tlr-drought-response-work-at-indian-river-watershed-on-september-15-16-2023/>

seasonal rounds and harvesting conducted through kinship ties), and the future exercise of those rights (the ability to engage in and maintain desired cultural practices and identity). How the Project, and even the consultation process, may affect past, present or future rights will ultimately impact the health and wellbeing of our Members.

The tables below summarize the direction of potential Project effects, the pathways through which post-mitigation residual effects could impact TWN's interests, and the rights that could be affected through those pathways. The text following the tables provides more detailed descriptions of the proponent's mitigation measures, the residual effects that may remain, and how those residual effects could affect TWN's interest and associated rights.

## Residual Effects Pathways to scé-łən and scé-łən Habitat

**Table 2. TWN Summary of Residual Effects Pathways to scé-łən and scé-łən Habitat**

| Relevant Project Phase(s)                | Project Effect Direction | Residual Effect Pathway                                                                                                                                                                                                                                                     | Impact on TWN Interest                                                                                                              | Impacted TWN Rights                       |
|------------------------------------------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| Construction, Operation, Decommissioning | Negative                 | <b>(a) Contamination</b> of scé-łən and scé-łən habitat via use of trucks and equipment; hydrostatic test water discharge; deposition of SO <sub>2</sub> , Nox, dust and particulate matter emissions; and Project construction mobilizing groundwater or soil contaminants | Reduction in scé-łən habitat quality, increased risk to scé-łən health and mortality, changes in scé-łən distribution and abundance | Cultural                                  |
|                                          | Negative                 | <b>(b) Underwater noise</b> in scé-łən habitat via upland construction, operation and Decommissioning activities                                                                                                                                                            |                                                                                                                                     | Spiritual and religious                   |
|                                          | Negative                 | <b>(c) Greenhouse gasses</b> emitted by the Project may reduce scé-łən habitat quality and quantity by contributing to climate change                                                                                                                                       |                                                                                                                                     | Language and cultural transmission        |

|                                          |                          |                                                                                                                                                                                                                                                                             |                                                                                                                                     | Food security and traditional livelihoods |

### (a) Contamination

The Project may result in contamination of scé-łən and scé-łən habitat via use of trucks and equipment, hydrostatic test water discharge, and deposition of acid, nitrogen, dust and/or particulate matter. Project construction could also mobilize existing ground water or soil contamination.

### Truck and Equipment Use

The Revised Application estimates that construction truck traffic will consist of 26,369 truckloads total. With “a nominal of 1,800 truckloads per month from July 2025 to July 2026, the Tilbury project site could expect to receive about 90 truckload deliveries everyday during the overall T2 Expansion Project construction period” (Appendix R, pg. 23). These on-road trucks are expected to travel over a million kilometers (1,080,000 km) (Appendix N, pg. 23), and construction equipment use will consist of around 178,132 hours of operation (Appendix N, pg. 20–22). The Revised Application does not provide information on truck and equipment use during the operations or decommissioning phases.

Heavy duty trucks and equipment are known to release 6PPD-quinone from tire wear, particulate matter (PM), polycyclic aromatic hydrocarbons (PAH), and trace Metals. Contaminants from the Project’s significant scale of construction activity could be picked up from the Project site by stormwater that could enter the City of Delta’s storm sewer system, which drains to the Tilbury Slough. The Tilbury Slough is tidally influenced and connected to the Fraser River, so this creates a plausible pathway for contaminants to reach fish-bearing waters.

However, the Revised Application does not assess potential effects to fish and fish habitat from truck and equipment use on the basis that Project-related traffic would represent approximately 0.6% of total traffic volume and approximately 5% of commercial vehicles. From TWN’s perspective, the relative percentage of overall traffic volume is not an ecologically relevant criterion for screening out the assessment of aquatic effects. In the context of existing cumulative water quality stressors for a culturally significant species, like scé·lən, this pathway warrants an assessment.

The Revised Application also omits evidence to support the assumption that capturing stormwater in sumps will reduce contact-water and sedimentation effects to “negligible,” and therefore, no residual effects assessment was needed. The Revised Application also does not clearly show how climate change is considered in runoff and erosion analysis. In a system where water and sediment quality guidelines are already exceeded, even small additional inputs may add to cumulative stress on juvenile and migrating scé·lən.

TWN repeatedly requested an assessment of the effects of truck and equipment use on fish and fish habitat to uphold the principle of FPIC and ensure a sufficient impact analysis on TWN’s rights. Despite repeating these requests in consensus-seeking meetings with the IAAC and the EAO, the EAO accepted the Revised Application without this information.

### Hydrostatic Test Water Discharge

The Revised Application concludes that hydrostatic test water discharge is not expected to change Tilbury Slough water quality or cause erosion at stormwater outlets. This conclusion is based on commitments to treat the water to meet B.C. Water Quality Guidelines (WQGs) before discharge and to limit discharge to a maximum of 11 cubic metres per minute. However, much of this conclusion depends on future permitting, an agreement with the Corporation of Delta, and monitoring and erosion-control measures that have not yet been described in detail and are intended to be finalized during permitting. Appendix Q of the Revised Application acknowledges this gap, stating that “the runoff volume capacity and hydraulics of the Tilbury Slough are not part of this technical memorandum and as such they must be confirmed prior to finalizing the actual hydro-test discharge flowrate” (pg. 11). In TWN’s view, this

means important information needed to understand how the Tilbury Slough will respond to the discharge has not yet been assessed.

TWN also emphasizes that hydrostatic test water could contain many contaminants; that the discharge could total approximately 100 million litres of water; and that additional hydrostatic testing may be required for liquefaction trains and piping systems.

scé-tən are particularly sensitive to changes in turbidity, dissolved oxygen, temperature, hydrocarbons, and metals.<sup>46, 47, 48</sup> Juvenile rearing habitat inside channels and sloughs may be especially vulnerable to localized or short-term concentration spikes associated with storm events or discharge pulses.

TWN repeatedly requested a fulsome assessment regarding the discharge of approximately 100 million litres of hydrostatic test water to fish and fish habitat. TWN maintains that it is essential to uphold the principle of FPIC and ensure a sufficient impact analysis on TWN's rights. Despite repeating these requests in consensus-seeking meetings with IAAC and the EAO, the EAO accepted the Revised Application without this information.

#### Acid and Nitrogen Deposition

For combustion activities during all phases of the Project, sulphur dioxide (SO<sub>2</sub>) and nitrogen oxides (NO<sub>x</sub>) are likely to be emitted. These emissions can settle and deposit in scé-tən habitat. Nitrogen and acid deposition to fish habitat has the potential to damage aquatic life, alter habitat chemistry, and disrupt food webs.

According to Appendix K of the Revised Application, nitrogen and acid deposition could exceed provincial screening thresholds over the Fraser River adjacent to the Project.

TWN is also concerned that Appendix K assessed effects only during the Project's operations phase, and that no nitrogen or acid deposition study was completed for the construction or decommissioning phases, despite the significant use of trucks and equipment likely to occur during those phases.

Appendix K was also written in 2024, and yet it used baseline data from 2013–2015 thereby omitting nearly a decade of cumulative effects in a heavily industrialized area.

In addition, the assessment relied on ammonia concentration assumptions drawn from Alberta-based guidance. This introduces significant **uncertainty** into the results, particularly since the assessment indicates that most nitrogen deposition in the affected area occurs in a form that is strongly influenced by ammonia availability.

TWN is also concerned about the timing and disclosure of Appendix K. This appendix was not included in the original Application's Air Quality Technical Data Report. TWN received Appendix K for the first time

<sup>48</sup> Williams C. (2013). *Effects of cadmium on olfactory mediated behaviors and molecular biomarkers in coho salmon (Oncorhynchus kisutch) [Master's thesis, University of Washington School of Public Health]*. <https://deohs.washington.edu/edge/blog/cadmiu-mexposure-affects-coho-salmon-ability-smell-and-why-it-matters>

on October 31, 2025, after key consultation stages had already occurred. Therefore, TWN was unable to include comments on these issues in the Issues Tracking Table.

Overall, these gaps mean that the Application's assessment of nitrogen and acid deposition to fish and fish habitat does not reliably describe potential effects on scé-łən or on TWN's associated rights.

#### Dust and Particulate Matter

Construction and operation of the Project may generate emissions of dust and PM (PM<sub>2.5</sub> and PM<sub>10</sub>) that could be transported to scé-łən habitat.

Several air contaminants of concern are already present at elevated concentrations within the Local and Regional Assessment Areas. Deposition of fine particulates and associated contaminants into the Tilbury Slough and the Fraser River may contribute to bioaccumulation and stress in scé-łən.

The Revised Application defers the selection of dust-specific control measures to the post-certification Construction Environmental Management Plan (CEMP). Without identifying the specific measures, performance standards, and measurable targets, it is not possible to validate the proponent's conclusion that residual effects related to dust will be low.

TWN is also deeply concerned about the total absence of assessment for **demolition of the 1971 Base Plant**. As documented in the 2022 Detailed Project Description (DPD): "

"The demolition of the Base Plant is a key component of the Tilbury LNG Storage Expansion project, which is the subject of a Certificate of Public Convenience and Necessity (CPCN) Application that was filed with the British Columbia Utilities Commission (BCUC) in December 2020" (pg. 1-1).<sup>49</sup>

While the BCUC focused its review on economic, financial, and public convenience aspects of that application, environmental and human health impacts (e.g., dust, particulate matter and deposition) fall squarely under the jurisdiction of this EA process managed by the BC EAO.

FortisBC itself has acknowledged this regulatory sequencing, noting that the BCUC's issuance of the CPCN merely paved the way for next steps:

"Right now, our focus is on the Environmental Assessment process with the B.C. Environmental Assessment Office for the Tilbury Phase 2 LNG Expansion project. Approval at this critical stage is required before construction can begin on the **Tilbury LNG Storage Expansion project, which is part of Phase 2**. Phase 2 also includes additional liquefaction equipment to produce LNG for marine fueling."<sup>50</sup>

Consequently, TWN expects the EAO to regulate this demolition as an interconnected component of the Project to safeguard human health and Indigenous rights. The Crown's current emphasis on expediting

project timelines and avoiding "regulatory duplication" has instead created a regulatory gap: at present, no regulatory body is assessing the environmental impacts of this demolition or mandating necessary protective mitigation measures.

Demolishing legacy industrial infrastructure from the 1970s presents severe, localized risks regarding the release of hazardous dust and particulate matter, including asbestos, lead, and other legacy contaminants. Airborne and waterborne releases of these toxins could have profound, detrimental impacts not only on *scé·łən*, but also on Indigenous health and the meaningful exercise of rights within the Project's vicinity.

#### Groundwater–Surface Water Interaction

The Revised Application acknowledges that the unconfined aquifer beneath the Project site is hydraulically connected to both the Tilbury Slough and the Fraser River. However, contaminant transport between groundwater and surface water has not been fully assessed in the Revised Application.

Potential risks related to groundwater contamination include:

- Mobilization of potential petroleum hydrocarbons in groundwater during excavation or dewatering;
- Contaminated groundwater transport to surface water or infiltration of contaminated surface runoff to groundwater;
- Movement of contaminated waters to the Tilbury Slough/Fraser River.

In a tidally influenced system, groundwater and surface water can exchange contaminants, increasing complexity and **uncertainty**. Without quantitative modelling or conditions for monitoring, potential pathways of contaminated groundwater to *scé·łən* and *scé·łən* habitat cannot be omitted.

#### Contaminated Soils

The Revised Application notes that soil and water on the site are already contaminated and that construction could expose additional hazardous materials.

Activities that could increase the risk of contamination include:

- Excavating and handling contaminated soil and sediment;
- Managing "contact water" (water that has touched contaminated surfaces); and
- Storing and transporting hazardous soils.

If these materials are not tightly controlled, contaminants could spread into the surrounding environment, including *scé·łən* habitat.

At this phase of the EA process, detailed plans to manage these risks are being deferred until after Project approval. Deferring these details makes it harder to confirm that contamination controls will be effective in practice.

## **(b) Underwater Noise**

Construction activities, heavy truck traffic, and ongoing industrial operations associated with the Project could increase ambient noise in nearby waterways and along the shoreline. Increased nearshore noise can:

- Change scé·łən migration behaviour;
- Trigger scé·łən stress responses; and
- Disrupt scé·łən feeding or rearing in nearshore habitats.

Even if noise does not cause mortality, it can lead to behavioural disturbance. For example, it can increase energy use, reduce predator avoidance, and change habitat use. These effects are especially important for scé·łən populations that are already under stress.

TWN has a high **uncertainty** about the underwater noise that may be generated during upland construction due to the unavailability of information on the demolition of the 1971 Base Plant.

## **(c) Greenhouse Gases**

The Project would emit greenhouse gas (GHG) emissions during construction and operation, and likely in decommissioning. These emissions would come from burning fuel, flaring, releasing CO<sub>2</sub> from the natural gas feedstock, acquiring energy, and from unplanned gas releases (i.e., ‘fugitive’ emissions). These emissions will likely occur across multiple Project components that connect to other Tilbury projects.

After reviewing the Revised Application, submitting comments, and participating in meetings with the IAAC, the EAO and other regulators, TWN still has major questions regarding the Project’s GHG emissions. These unanswered questions will be discussed at length under the subsection “(d) Misrepresentation of Climate Risks”. Regardless of these uncertainties, the Application acknowledges that the Project will add net GHG emissions to Metro Vancouver, British Columbia, and Canada’s overall GHG inventories.

Climate change caused by GHGs is already affecting the Fraser River watershed and scé·łən populations, and key risks include:

- Warmer river and estuary water temperatures;
- Changes to water flow patterns;
- More frequent and more severe extreme weather events; and
- Marine heatwaves and other ocean changes that affect scé·łən survival in the ocean.

As noted in the “Cumulative Effects to Date” section, scé·łən are sensitive to water temperature and flow at multiple life stages. Warmer river temperatures are linked to higher pre-spawn mortality, lower migration success, greater susceptibility to disease, and reduced reproductive success. Changes in the timing and volume of river flows can reduce spawning habitat, affect juvenile rearing conditions, and lower survival during smolt outmigration. Ocean warming and acidification can also change food webs and reduce survival at sea.<sup>51</sup>

---

<sup>51</sup> Q’ul-Ihnumutsun Aquatic Resources Society. (n.d.). *How human activities impact salmon*. QARS. <https://www.qars.ngo/post/how-human-activities-impact-salmon>

The Project would add GHG emissions to an already warming climate. Many ecological limits are already being reached or exceeded.

TWN emphasizes that natural gas (NG) and liquefied natural gas (LNG) are predominantly fracked fossil methane. Methane is a potent GHG that drives strong near-term warming, which is particularly relevant for scé·lən because water temperatures in freshwater and estuarine areas are already close to, or above, harmful thresholds during key migration and spawning periods. Even small increases in warming could worsen conditions for scé·lən survival, threatening the meaningful exercise of TWN harvesting rights and near-term aspirations.

TWN further emphasizes that these climate effects extend well beyond the life of the Project. Fugitive methane leaks drive intense near-term warming, and after atmospheric oxidation, methane is converted to carbon dioxide, a portion of which remains in the atmosphere for centuries to millennia. Accordingly, methane and carbon dioxide emissions from the Project result in an effectively **permanent** residual effect when viewed through the lens of human decision-making timelines.

#### (d) Marine Shipping

The Process Order for the Project includes cargo vessels carrying large liquefaction modules from Sand Heads Lighthouse to the Project Site. Even if the modules are transferred to an off-site location (such as Lynnterm Terminal in Burrard Inlet) for subsequent ground transport to the Project site, that marine transport remains a Project activity. TWN understands these modules may be shipped from China or the United States before potentially arriving in Burrard Inlet.

Although the exact route is unclear, these cargo vessels could add to existing marine pressures, including contamination of fish and fish habitat, underwater noise, physical disturbance, habitat disruption, and the spread of pathogens. This shipping would also result in GHG emissions; however, TWN has included that effect under subsection “(c) Greenhouse Gases”.

Due to these well-documented effects of marine shipping and TWN's interest in scé-ŧan, as well as ǵŧŧalámæcæn (killer whales, including SRKW), TWN repeatedly asked for information about the route that would likely be used to transport the liquefaction modules through TWN territory.

TWN also notes that the EAO's *Environmental Assessment Certificate Policy* states that CPDs should describe all project components and activities authorized for the Project (pg. 17). However, the EAO has not clearly included these construction activities in the CPD. TWN also raised concerns with IAAC and the EAO at a meeting on May 7, 2026, because the draft CPD stated that "construction activities will include but are not limited to..." (pg. B-4) which leaves the Project scope open for future changes.

TWN requested that the CPD be revised to reduce uncertainty and clearly identify all relevant project components and activities, including the cargo vessels delivering the large modules. This information is needed to support informed decision-making and to assess potential effects on the marine environment and on TWN's interest and rights.

## Residual Effects Pathways to TWN Access to scé·łən

**Table 3. TWN Summary of Residual Effects Pathways to TWN Access to scé·łən**

| Relevant Project Phase(s)                | Project Effect Direction | Residual Effect Pathway                                                                                                                                                                                            | Impact on TWN Interest                                                                                       | Impacted TWN Rights                                                                                                                                                                                                                         |

### (a) Industrialization, Discharges and Emissions

In addition to effects on scé·łən and other harvested species, the Project could make it harder for TWN Members to safely access the Fraser River near Tilbury Island and to meaningfully exercise our Indigenous Rights there.

During construction, operation, and decommissioning, the Project would release air pollutants, including nitrogen oxides (NO<sub>x</sub>), sulphur dioxide (SO<sub>2</sub>), and particulate matter (PM<sub>2.5</sub> and PM<sub>10</sub>), as well as other regulated air contaminants.

Air quality modelling in the Revised Application indicates the following:

- Ambient pollutant levels including nitrogen dioxide (NO<sub>2</sub>), may already be above health-based standards in the area surrounding the Project.
- Project emissions would add to these levels, which could increase health risks for Members who are fishing or taking part in cultural activities nearby.
- There is no air quality monitoring station on Tilbury Island, so TWN Members cannot confirm whether air quality conditions near the Project site are safe or access real-time information.

The Project would also likely emit irritants like noise, dust, pollution and vibration, and lead to increased commercial truck traffic and visual impacts. These disturbances can create practical barriers that discourage Members from using traditional places to access scé·łən. Even when scé·łən are present, Members may avoid the area because of:

- Worries about breathing polluted air and being close to heavy industrial traffic.
- A shoreline and river corridor that feels less safe, welcoming, or suitable for traditional use.
- The cumulative burden of adding another major industrial project to an area that is already heavily impacted.

For harvesting rights to be meaningful, Members must be able to exercise them safely and without unreasonable barriers. When environmental conditions are degraded—or when there is a reasonable fear of contamination—people may choose not to fish or practice culture in that area. In practice, this can limit the exercise of rights even if legal access remains.

Inaccessibility of scé·łən may also **disproportionately** affect TWN Members and exacerbate existing inequities. Individuals who do not currently have the resources, skills, and/or connections required to access a boat for fishing, would be further marginalized when fishing areas begin to feel less safe.

## Residual Effects Pathways to Tangible Cultural Heritage

**Table 4. TWN Summary of Residual Effects Pathways to Tangible Cultural Heritage**

| Relevant Project Phase(s)                | Project Effect Direction | Residual Effect Pathway                                                                                                                                                                                                                                 | Impact on TWN Interest                                          | Impacted TWN Rights                                                       |
|------------------------------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|---------------------------------------------------------------------------|
| Construction                             | Negative                 | <b>(a) Destruction or damage</b> of tangible cultural heritage may result from site preparation, ground disturbance, and infrastructure development                                                                                                     | Direct loss of cultural heritage                                | Cultural<br>Spiritual and religious<br>Language and cultural transmission |
| Construction, Operation, Decommissioning | Negative                 | <b>(b) Industrialization, discharges and emissions</b> (e.g., air contaminants, dust, noise, light, and vibration) may result in increased sensory disturbance resulting in a reduced quality of experience and avoidance of areas of cultural heritage | Functional loss of desired access to tangible cultural heritage | Self-determination and self-governance<br>Lands, territory, resources     |

### (a) Destruction or Damage

As noted in the Archaeological Heritage chapter of the BC EAO's Assessment Report:

“DgRs-17 is known as a cultural site of high significance to several Indigenous nations. The Revised Application noted sources referencing the site and information about the site was received from Musqueam Indian Band, Quw'utsun Nation, Ts'uubaa-asatx, Tsawwassen First Nation, Tsleil-Waututh Nation, Kwantlen First Nation, Semiahmoo First Nation, and Stó:lō communities. First Nations also shared that when there is a village site on one side of a river, there is often a related site on the other side, which could include the location of Tilbury Phase 2” (pg. 2).

Thus, while TWN acknowledges site conditions and the Archaeological Impact Assessments that were conducted, based on Indigenous Knowledge, TWN has concerns that the Project's construction activities, such as site preparation, ground disturbance, and infrastructure development, could result in the direct and even **permanent** loss of tangible cultural heritage.

## (b) Industrialization, Discharges and Emissions

The Project's industrial footprint and environmental effects could also restrict the meaningful exercise of TWN cultural rights, as Project emissions and industrial disturbance would deter TWN Members from accessing cultural heritage areas.

Without site-specific air quality monitoring, TWN Members lack the information needed to ensure it is safe to conduct cultural activities on or adjacent to Tilbury Island.

Industrial intensification—including noise, dust, truck traffic, and visual impacts— would exacerbate “practical barriers” to accessing areas of tangible cultural heritage. TWN Members may thereby be deterred from practicing rights due to:

- Increased traffic and industrial operations that limit safe entry to shoreline areas.
- Concerns over contamination that discourage the use of the river corridor for cultural purposes.
- The further industrializing of the area already heavily impacted, diminishing its value for spiritual and traditional use.

For cultural rights to be meaningful, Members must be able to access heritage areas safely and without undue burden. When industrial conditions degrade the environment, it creates a functional barrier to the exercise of those rights.

Inaccessibility of tangible cultural heritage areas may also impact TWN Members **disproportionately** and exacerbate existing inequities. While some individuals possess the mobility, health and resources to visit areas of cultural significance, those with limited access—such as Elders or individuals with compromised health—are further marginalized when areas of cultural significance feel even less safe to visit due to increased industrialization.

## Residual Effects Pathways to Intangible Cultural Heritage

**Table 5. TWN Summary of Residual Effects Pathways to Intangible Cultural Heritage**

| Relevant Project Phase(s)                | Project Effect Direction | Residual Effect Pathway                                                                                                   | Impact on TWN Interest                                                                                                                     | Impacted TWN Rights                                                                                                 |
|------------------------------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Construction, Operation, Decommissioning | Negative                 | <b>(a) Stewardship and/or restoration impediments</b> due to further degradation and industrialization of scé-tən habitat | Reduced ability to make decisions concerning territory and resources and to engage in and maintain desired cultural practices and identity | Cultural<br>Spiritual and religious<br>Language and cultural transmission<br>Self-determination and self-governance |
| Operation                                | Negative                 | <b>(b) Self-governance impediments</b> due to Project's extreme demands on BC hydroelectricity and the committing region  | Reduced ability to make decisions concerning land use and self-governance over matters such as climate change                              | Lands, territory, resources<br>Environmental protection and stewardship                                             |

|--|--|-------------------------------|--|-------------------------------------------|

### (a) Stewardship and/or Restoration Impediments

Tilbury Slough and the Lower Fraser River are already heavily burdened by industrialization, water quality exceedances, habitat fragmentation, and climate-related stressors. At the same time, Tilbury Slough has been identified as a high-priority site for habitat reconnection and restoration under initiatives funded by Fisheries and Oceans Canada.<sup>52</sup>

Any incremental degradation or additional contaminant loading associated with the Project may not only affect present-day scé·lən populations but also constrain future habitat recovery and restoration potential.

For TWN, restoring scé·lən harvest in accordance with səliwətaʔ law is not an abstract environmental objective, it is a clearly articulated community priority grounded in culture, stewardship, and intergenerational responsibility. Community-wide engagement conducted in 2025 demonstrated overwhelming support for increasing the harvesting of traditional foods, particularly scé·lən. These aspirations reflect TWN's intention to rebuild abundance, restore harvesting practices, and strengthen cultural continuity.

Strengthening harvesting practices directly supports TWN Members' ability to maintain cultural identity and community wellbeing. In the 2025 Community Harvesting Survey, the top reasons participants gave for wanting to harvest more were:

- Community and family connection,
- Spending time together,
- Sharing stories and lessons while the work is done,
- Processing food together,
- Togetherness.

Where residual Project effects incrementally contribute to cumulative stressors in the Lower Fraser River and perpetuate degraded conditions, they constrain TWN's ability to harvest and engage in these cultural practices. These effects may also:

- Limit or prevent the ecological conditions necessary for scé·lən population recovery.
- Increase the scale of restoration required to achieve community-identified goals.
- Foreclose or delay habitat reconnection opportunities.
- Undermine TWN's ability to determine and implement our stewardship objectives.

These effects extend beyond immediate biophysical impacts and directly engage TWN's inherent right of self-determination, including the authority to restore, manage, and sustain scé·lən for future generations.

<sup>52</sup> Resilient Waters, "Site Assessment Data: Fish, Water Quality, and Genetic Analysis at Priority Sites Affected by Flood Infrastructure," <https://www.resilientwaters.ca/research/siteassessments>

Residual effects may also **disproportionately** impact certain TWN subpopulations by increasing barriers to stewardship knowledge and harvesting participation. According to TWN's 2025 survey results:

- No youth (under 18) or Elders (71+) selected "Yes, I know about [harvesting practices] in detail."
- The highest proportion of respondents reporting detailed knowledge were between ages 19–35.
- Detailed knowledge increased with higher levels of formal education.
- A higher proportion of TWN employees reported knowledge of section 35 rights.

This demonstrates that barriers to harvesting and stewardship are not experienced equally across the community. Adverse residual Project effects therefore risk not only perpetuating limitations on TWN's rights but also exacerbating inequities within the Nation itself.

In this way, Project effects contribute to and reinforce an already stressed system, interfering not only with present harvesting rights, but with TWN's long-term capacity to govern, restore, and revitalize those rights in accordance with our laws, aspirations, and way of life.

### **(b) Self-Governance Impediments**

Bold action is required to mitigate climate change and reduce GHG emissions to help protect Valued Components (VC) and Nation-specific interests, like scé-łən. That is why TWN has our own 2023 *Community Energy Plan*, which contains 'net-zero ready' targets. Nevertheless, TWN's GHG reduction objectives depend on the Province and federal government meeting or exceeding their own net-zero commitments. However, at both the provincial and federal levels, the Crown is failing to make meaningful progress toward these targets.

As stated in the federal government's own report on Canada's 2030 *Emissions Reduction Plan*:

"The government has not treated emissions reduction with the seriousness it demands. In recent months, it has weakened or reversed several of its own climate policies. While it continues to describe climate change as a threat, its actions do not reflect the urgency such language implies. The evidence before the committee points to a stark and troubling conclusion, which is the government's decisions are not aligned with its stated commitments" (p. 49).<sup>53</sup>

As stated in the provincial 2025 *Climate Change Accountability Report*:

"Total [oil and gas] sector emissions are projected to rise as natural gas production growth continues to increase and new sources of emissions from Liquefied Natural Gas are included in the results (p.19)."<sup>54</sup>

TWN is concerned about the Project's demand on the Province's limited hydroelectric supply. Using renewable energy to process fossil fuels, rather than prioritizing local decarbonization is a significant concern during the climate crisis. TWN's concerns can be summarized as follows:

---

<sup>53</sup> House of Commons Standing Committee on Environment and Sustainable Development, Canada's 2030 Emissions Reduction Plan: Federal Climate Policy at a Crossroads (Ottawa: House of Commons, 2024), available at: [ourcommons.ca/Content/Committee/451/ENVI/Reports/RP14043687/envirp03/envirp03-e.pdf](https://ourcommons.ca/Content/Committee/451/ENVI/Reports/RP14043687/envirp03/envirp03-e.pdf)

<sup>54</sup> British Columbia, 2025 Climate Change Accountability Report (Victoria: Government of British Columbia, 2025), available at: [www2.gov.bc.ca/assets/gov/environment/climate-change/action/cleanbc/2025\\_climate\\_change\\_accountability\\_report.pdf](https://www2.gov.bc.ca/assets/gov/environment/climate-change/action/cleanbc/2025_climate_change_accountability_report.pdf)

- The Project could require a quarter of Site C Dam’s annual capacity.<sup>55</sup>
- This diversion is expected to reduce the availability of renewable power and increase electricity costs for TWN Members.
- If more renewable energy projects must be built at a rapid pace to accommodate fossil fuel production, those “clean” energy projects may result in their own set of adverse effects on Indigenous rights.
- Diverting renewable energy to fossil fuel processing undermines the Crown’s climate targets and threatens TWN’s ability to meet our own GHG reduction objectives.

The Project would also commit the region to long-term natural gas (i.e., fracked fossil methane) combustion and introduce a major shift toward using LNG as a marine fuel. This shift should require a neutral and verifiable assessment of downstream GHG emissions. Specifically, the assessment must address methane slip, which has a significantly higher warming potential than CO<sub>2</sub> over a 20-year period. While TWN repeatedly requested such an assessment since the Early Engagement phase of the EA process, that request remains outstanding. Please see subsection “(d) Misrepresentation of Climate Risks” for further discussion.

## Residual Effects Pathways to TWN Health and Well-being

Table 6. TWN Summary of Residual Effects Pathways to TWN Health and Well-being

| Relevant Project Phase(s)                | Project Effect Direction | Residual Effect Pathway                                                                                                                                                                                                                                   | Impact on TWN Interest                                                                                                            | Impacted TWN Rights                                                              |

### (a) Barriers to Accessing Cultural Heritage

TWN maintains that our diets should include local, traditional foods to enable both personal health and a sustained relationship with the lands and waters of our territory. As TWN's Food Sovereignty Policy states:

“Health for Tsleil-Waututh People is inseparable from health of the water and land. We have a sacred trust to ensure the health of the lands and waters within the unceded, traditional territory now and for generations to come <sup>56</sup>.”

Sockeye scé-łən is essential to community life and a staple food at large gatherings.<sup>57</sup> It is particularly important when hosting other First Nations, where serving traditional foods is a cultural requirement. Where TWN's access to scé-łən is limited, TWN's ability to host such events in a culturally appropriate manner is significantly constrained.

In addition, sockeye holds important ceremonial and spiritual roles. səliwətał ritualists conduct seasonal burning ceremonies to care for Ancestors and supernatural beings, in which local traditional foods are offered.<sup>58, 59, 60</sup> These foods are understood to be necessary because they are what Ancestors and spirits know and recognize. Sockeye and Chinook have been central to these ceremonies in recent years. Without access to Lower Fraser River scé-łən, TWN cannot fully fulfill these cultural and spiritual obligations.

Furthermore, if the construction of the Project damages or destroys tangible cultural heritage, and/or Project emissions discourage TWN Members from visiting culturally significant areas, this would harm the health and well-being of səliwətał and the community.

Cultural places and materials support identity and the transfer of teachings between generations. When those places are damaged or avoided because they feel unsafe, TWN Members may lose opportunities to practice culture, spend time on the land and water, and maintain community connections. Over time,

<sup>57</sup> Morin, Jesse (2015) Tsleil-Waututh Nation's History, Culture and Aboriginal Interests in Eastern Burrard Inlet. Prepared for Gowlings, Lafleur, Henderson LLP. Submitted to the National Energy Board. pp. 364, 389-391.

<sup>58</sup> Kew, Michael (1970) Coast Salish Ceremonial Life: Status and Identity in a Modern Village. Unpublished PhD dissertation, Department of Anthropology, University of Washington, Seattle. Pp. 210-230.

<sup>59</sup> McHalsie, Albert (Sonny) (2007) *We Have to Take Care of Everything That Belongs to Us. In Be of Good Mind: Essays on the Coast Salish*, edited by B. Miller, pp. 82-130. UBC Press, Vancouver. pp. 119-120.

<sup>60</sup> Morin, Jesse (2015) Tsleil-Waututh Nation's History, Culture and Aboriginal Interests in Eastern Burrard Inlet. Prepared for Gowlings, Lafleur, Henderson LLP. Submitted to the National Energy Board. pp. 364, 389-391.

this can contribute to stress and grief, as well as negatively impact knowledge transmission, cultural identity, cultural continuity, and sense of place.

### **(b) Industrialization, Discharges and Emissions**

The Project would release a range of air emissions during all phases of its life cycle. These emissions could reduce air quality on and near the Project site, including in areas where TWN Members may travel, fish, or practice cultural rights.

Key air pollutants of concern for human health include:

- Dust (from ground disturbance, demolition, and material handling)
- Diesel particulate matter (DPM) from trucks and heavy equipment
- Particulate matter (PM<sub>10</sub> and PM<sub>2.5</sub>)
- Nitrogen dioxide (NO<sub>2</sub>)
- Sulphur dioxide (SO<sub>2</sub>)
- Volatile organic compounds (VOCs)

Many of these pollutants can irritate lungs and airways, trigger asthma symptoms, and worsen existing heart and respiratory conditions. Fine particles (especially PM<sub>2.5</sub> and DPM) are of particular concern because they can penetrate deep into the lungs and may contribute to longer-term health effects with repeated exposure<sup>61</sup>.

TWN noted the following concerns with the Revised Application through the Issues Tracking Table, and consensus seeking meetings held with IAAC and the EAO on March 17 and 24, 2026:

- Table 7.2-9 of the Revised Application lists dust mitigation as a future commitment to “develop dust-control measures” in a CEMP. This is too general to support the conclusion that construction dust effects will be negligible to low, especially given concerns about dust from transportation and the demolition of the 1971 Base Plant.
- The Revised Application does not describe what dust controls will be used or how they will be checked (what will be monitored, where, how often, and what levels would trigger changes). Without this information, TWN cannot adequately assess whether the measures will protect air quality or support conclusions about effects on Indigenous health and the meaningful exercise of TWN’s rights in an already overburdened area.
- Section 7.2, p. 43 of the Revised Applications Air Quality Assessment, characterizes NO<sub>2</sub> residual effects as “negligible,” but the modelling results do not clearly support this. Using the applicable regulatory statistic (the 98th percentile for 1-hour NO<sub>2</sub>), predicted concentrations exceed air quality objectives in both the Base Case and the Application Case, including within 50 m of the Project site. The proponent defines “negligible” as no exceedance of applicable objectives, so it is unclear how a negligible rating is appropriate when exceedances occur in both cases. The rating appears to rely in part on assumptions that future ambient NO<sub>2</sub> levels will decline, which adds uncertainty. Where current NO<sub>2</sub> levels already exceed standards, any additional Project contribution would result in a more-than-negligible adverse effect on air quality and human health.

---

<sup>61</sup> Xing, YF, Xu, YH, Shi, MH, Lian, YX. (2016) *The impact of PM2.5 on the human respiratory system. J Thorac Dis.* 2016 Jan;8(1):E69-74. doi: 10.3978/j.issn.2072-1439.2016.01.19

Nitrogen dioxide (NO<sub>2</sub>) is a “non-threshold” contaminant, meaning there is no safe level of exposure. As NO<sub>2</sub> concentrations increase, the risk of health effects, especially for people with asthma or other respiratory conditions, also increases<sup>62</sup>, creating **disproportionate** effects.

TWN also notes that the Revised Application does not clearly identify what emissions-control technology was assumed in modelling the Project’s criteria air contaminant (CAC) emissions. Furthermore, except for requiring a fully enclosed ground flare, the EAO’s conditions do not appear to require specific technology choices. This creates significant **uncertainty** about whether the Project design will effectively minimize harmful CAC emissions.

### (c) Greenhouse Gases

The GHGs emitted by the Project would contribute to climate change and in turn may impact the health of TWN Members. Earlier in this Assessment, we described how climate is and may continue to impact scé:łən, but it is essential to elaborate on how climate change exacerbated by this Project could impact səlilwətał more broadly.

As stated in TWN’s 2023 *Climate Change & Community Health Action Plan*:

“TWN community Members are already experiencing impacts of extreme summer heat, intense rainfall and more extreme winter storms, reduced air quality from wildfire smoke, coastal and overland flooding, shoreline erosion, and changing oceanic conditions. Many of these changes to our climate and natural environment are happening faster than were thought to be possible” (pg. 9).<sup>63</sup>

By contributing to climate change, the Project also has the capacity to adversely impact TWN’s cultural health. As emphasized in TWN’s 2019 *Climate Change Vulnerability Assessment Summary Report*:

“Climate change has the potential to profoundly impact the Tsleil-Waututh Nation and many key aspects of community life. It influences the ability of our community to harvest some wild foods and medicinal plants, how we access the shoreline and marine waters, and how we connect with Nature. It poses community health risks, influences our ability to practice spiritual and cultural ceremonies, and share cultural teachings” (pg. 6).<sup>64</sup>

In 2019, the TWN *Climate Change Vulnerability Assessment Summary Report* further outlined the key risks for TWN in the face of climate change as shown in Figure 5.

---

<sup>64</sup> Tsleil-Waututh Nation, *Climate Change Vulnerability Assessment: Summary Report*, (North Vancouver: Tsleil-Waututh Nation, 2020), [https://twnation.ca/wp-content/uploads/2025/08/TWN\\_CCVA-SUMMARY-FINAL-VERSION-Jan-2020-PP.pdf](https://twnation.ca/wp-content/uploads/2025/08/TWN_CCVA-SUMMARY-FINAL-VERSION-Jan-2020-PP.pdf).

**Figure 5. TWN Climate Change Vulnerabilities**

Any Project that adds GHGs to regional, provincial, and national GHG inventories after the application of mitigation measures contributes to climate change. Accordingly, those emissions should be treated as an adverse residual project effect, rather than merely as background context.

#### **(d) Misrepresentation of Climate Risks**

If an EAC is issued for the Project, the Project would join several LNG projects expected to proceed in BC in the near term. Like the proponent's Application, the Crown has promoted not only the Project, but also LNG Canada, Cedar LNG, Woodfibre LNG, Ksi Lisims LNG as providing the "lowest carbon-emitting LNG"<sup>65</sup> without clearly defining what that means or allowing that claim to be independently tested.

At present, LNG Canada is the only major LNG export terminal in BC providing a real-world point of comparison between these claims and actual GHG performance. In 2025, LNG Canada reportedly flared approximately 350 million cubic metres of gas, more than the estimated highest LNG flaring source in the world in 2024.<sup>66, 67</sup> While the Project differs from LNG Canada, this reality calls into question both Crown and proponent claims regarding "low carbon LNG."

Recent studies reinforce TWN's concerns regarding the adequacy of existing LNG project assessments and monitoring frameworks. EAs and regulatory reviews have consistently underestimated or excluded emissions associated with LNG startup and commissioning flaring, despite evidence that these phases

<sup>66</sup> Matt Simmons, "LNG Canada burned more gas in 2025 than the world's biggest LNG flarer did in 2024," The Narwhal (2026), available at: [thenarwhal.ca/lng-canada-burned-gas/](https://thenarwhal.ca/lng-canada-burned-gas/)

<sup>67</sup> Lauren Krugel, "LNG Canada Equipment Problems, Flaring Violations Detailed in Report," CBC News, May 12, 2026, <https://www.cbc.ca/news/canada/british-columbia/lng-canada-flaring-problems-9.7196886>.

can result in prolonged and significant emissions events.<sup>68</sup> Existing assumptions and modelling approaches used in LNG assessments may not fully reflect real-world operational conditions, potentially underestimating impacts to air quality, climate, and human health. TWN emphasizes that we raised questions about emissions associated with commissioning of the Project in the Issues Tracking Table (codes: TWN-APP-200, TWN-APP-288) and that these questions remain unaddressed.

TWN also questions why the Government of Canada's 2020 Strategic Assessment of Climate Change (SACC) explicitly excludes downstream emissions from its GHG assessment guidance. This omission diverges from international GHG accounting standards, which require calculations of upstream, midstream, and downstream emissions to support informed decision-making. As a result, the Project's climate assessment remains incomplete and presents a potentially misleading representation of its true emissions profile.

Although the proponent commissioned a 2022 lifecycle GHG assessment for the TMJ project,<sup>69</sup> TWN has raised significant concerns regarding continued reliance on that study in the Revised Application. Key concerns include:

- The study relies on outdated FuelEU Maritime methane slip values, which are now widely recognized as underestimating actual methane emissions from LNG engines.
- The 2022 study lacks the neutrality expected in the EA process, as it was funded by the proponent and was not independently peer reviewed.
- The Application uses the study's conclusions to characterize LNG as a beneficial marine fuel while failing to assess the adverse effects of LNG shipping and bunkering.

Additional unresolved concerns regarding the Revised Application's GHG assessment include:

- Appendix N provides a facility-wide estimate of fugitive emissions using scaled-up data from Tilbury Phase 1A (TP1A) but does not explain how the substantial increase in scale for the Project was accounted for, or which Project-specific activities were included. TWN requested clarification, but the response was inadequate and the issue remained unresolved through consensus-seeking with the IAAC and the EAO.
- TWN raised concerns regarding the proponent's statement that emissions are not expected during maintenance and cleaning. This is unusual in the LNG sector and requires supporting evidence.
- The assessment did not include fugitive methane emissions from leaks during regasification of the Project's LNG for local use or from leaks during marine vessel loading.
- TWN requested information regarding refrigerant leaks associated with commissioning, pressure testing, and system adjustments. Given that the Project's storage tank is a cryogenic tank with a capacity exceeding 142,000 cubic metres, refrigerant leakage should reasonably be anticipated and assessed. No clear response was provided.

<sup>69</sup> Affinity (Shipping) LLP, Study on the Air Quality Benefits to the Port of Vancouver by Adopting LNG as a Marine Fuel, prepared for Tilbury Jetty Limited Partnership and FortisBC, April 2022, <https://tilburypacific.ca/wp-content/uploads/2022/10/Affinity-Study-Vancouver-Air-Quality-Report-02.09.2022.pdf>.

These unresolved issues, combined with the continued use of contestable claims regarding the Project's LNG as a "lower carbon" energy source, create distress and imposes mental and physical burdens on TWN. As acknowledged in the Revised Application itself, "fears and anxieties can affect health status, whether they are perceived or real (pg. 7-809)," and concerns related to climate change, air quality, traffic, and environmental degradation can adversely affect health and quality of life. The Revised Application further recognizes that "the proposed Project may incrementally and cumulatively elevate the risk of fear and anxiety within the public about public safety and adequate climate action" (pg. 7-826).

TWN emphasizes that these effects extend beyond public concern and directly affect Indigenous wellbeing, particularly in relation to climate anxiety. Indigenous communities have faced ongoing existential threats resulting from colonization, displacement, and systemic injustice. As a result, climate anxiety may be experienced more acutely and **disproportionately** within Indigenous communities.

While the Revised Application states that risk perception will be mitigated through "ongoing, transparent communications" (pg. 7-810), the proponent's approach to assessing GHG emissions has not met TWN's transparency standard. As detailed in the Issues Tracking Table, TWN's repeated requests for clarification remain unresolved. Rather than addressing TWN's substantive concerns regarding the proponent's portrayal of the Project's GHG profile, the proponent repeatedly relied on the non-technical, non-regulated marketing term "lower-carbon" fuel, which has no legally defined meaning under Canadian law.<sup>70</sup> This approach exacerbates climate anxiety, undermines informed decision-making, and trivializes legitimate concerns regarding cumulative climate risk.

Overall, TWN is concerned that the Revised Application does not include a sufficiently comprehensive or independent health assessment capable of evaluating the full range of potential health impacts associated with LNG projects like this, including barriers to cultural heritage, air quality impacts, prolonged flaring events, and climate-related mental health impacts. Existing monitoring and mitigation commitments cannot be considered adequate where the underlying assessment fails to fully characterize potential health risks or relies heavily on proponent claims that have not been independently validated.

## **7.6 Step 6: Characterization of the Residual Effects on TWN's Interest and Associated Rights**

Based on the detailed information provided in Step 5, TWN has characterized residual effects impacting the following:

- scé·tən and scé·tən habitat,
- Access to scé·tən,
- Tangible cultural heritage,
- Intangible cultural heritage,
- TWN health and wellbeing.

| Risk                              | Moderate to High Risk                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Moderate Risk        | High Risk                            | Moderate to High Risk   |

**Table 8. TWN Characterization of Residual Effects on Access to scé-lən**

| Residual Effects Characterization | Industrialization, Discharges, and Emissions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Context                           | <b>Limits:</b> In addition to existing conditions that limit scé-lən distribution and abundance through environmental stressors, TWN's access to scé-lən is further constrained by the enduring impacts of colonization and ongoing regulatory barriers. These conditions differ immensely from pre-contact conditions, where access to scé-lən was governed by Indigenous laws, protocols, and kinship ties. TWN Members identified barriers such as limited access to boats, transportation, and knowledge, as well as contamination and cost, as current barriers to fishing. |
| Magnitude                         | Moderate                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Extent                            | Local                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Duration                          | Medium-term                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Reversibility                     | Partially Reversible                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Risk                              | High Risk                                                                                                                                                                                                                                            | Moderate to High Risk                        |

**Table 10. TWN Characterization of Residual Effects on Intangible Cultural Heritage**

| Residual Effects Characterization | Stewardship and/or Restoration Impediments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Self-Governance Impediments          |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------|
| Context                           | <b>Limits to Prevents:</b> Existing conditions already limit TWN's ability to exercise self-determination and self-governance in relation to our stewardship obligations, greenhouse gas reduction targets, and climate action. At present, the federal and provincial governments are not on track to meet their climate commitments, undermining TWN's climate objectives. Certain existing Crown policies and policy reversals are also entrenching climate change in ways that may ultimately prevent TWN from meaningfully exercising a range of rights. |                                      |
| Magnitude                         | High                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | High                                 |
| Extent                            | Regional                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Beyond Regional                      |

| Residual Effects Characterization | Barriers to Accessing Cultural Heritage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Industrialization, Discharges and Emissions | Greenhouse Gases                     | Misrepresentation of Climate Risks |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|--------------------------------------|------------------------------------|
| Context                           | <b>Limits to Prevents:</b> Existing conditions arising from industrialization, contamination, and climate change already limit TWN Members' access to cultural heritage and undermine health and wellbeing. At present, the proponent and Crown's representation of the Project LNG as "lower carbon LNG," despite several unaddressed information requests, contributes to mental distress. Certain existing Crown policies and policy reversals are entrenching climate change in ways that may ultimately prevent TWN from meaningfully exercising a range of rights, causing harm to TWN health and wellbeing. |                                             |                                      |                                    |
| Magnitude                         | High                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | High                                        | High                                 | High                               |
| Extent                            | Regional                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Regional                                    | Beyond Regional                      | Beyond Regional                    |
| Duration                          | Long-term to Permanent                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Long-term                                   | Permanent                            | Medium-term                        |
| Reversibility                     | Partially Reversible to Irreversible                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Partially Reversible to Irreversible        | Partially Reversible to Irreversible | Partially Reversible               |
| Frequency                         | Constant                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Constant                                    | Constant                             | Regular                            |
| Affected Populations              | Disproportionate                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Disproportionate                            | Disproportionate                     | Disproportionate                   |
| Uncertainty                       | High Uncertainty                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | High Uncertainty                            | High Uncertainty                     | High Uncertainty                   |
| Risk                              | High Risk                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | High Risk                                   | High Risk                            | High Risk                          |

## 7.7 Step 7: Assessment of Cumulative Effects

In Step 7 of TWN's Assessment, cumulative effects are projected into the future evaluated based on:

- Existing conditions and residual Project effects;
- Other reasonably foreseeable projects and activities; and
- Anticipated climate change impacts, informed by TWN's *Climate Vulnerabilities Report* and regional climate projections.

This analysis considers whether future conditions will allow the exercise of rights in alignment with səlilwətał law, or whether they will limit or even prevent TWN's Nation-specific interest and the exercise of associated rights.

### Cumulative Effects on scé·lən and scé·lən habitat

#### (a) Cumulative Contamination

The Lower Fraser River and the Tilbury Slough are already subject to significant cumulative contamination from industrial development, urban runoff, wastewater discharge, transportation corridors, agricultural inputs, dredging, and historical contamination. Existing conditions include exceedances of B.C. and CCME water and sediment quality guidelines for multiple metals, phosphorus,

and PAHs, as well as low dissolved oxygen, elevated temperatures, and poor flushing conditions in the Tilbury Slough.

Future cumulative contamination is expected to increase as additional industrial projects proceed along the Lower Fraser River corridor, including the Project and connected infrastructure such as the TMJ.

Project-related sources of additional contaminant loading include:

- Stormwater runoff from expanded industrial surfaces, roads, and paved areas;
- Atmospheric deposition of NO<sub>x</sub>, SO<sub>2</sub>, PM, trace metals, and PAHs from increased truck traffic, construction equipment, marine vessels, and facility operations;
- Hydrostatic test water discharge to the Delta storm sewer system and ultimately the Tilbury Slough;
- Disturbance and potential mobilization of historically contaminated soils and groundwater during excavation, dewatering, demolition, and ground improvement activities; and
- Accidental spills, leaks, or releases of fuels, chemicals, or contaminated contact water.

These contaminant pathways do not occur in isolation. In a tidally influenced and already degraded system such as the Tilbury Slough, contaminants may persist due to limited flushing, interact through mixture toxicity, and compound existing habitat stressors such as low dissolved oxygen and elevated temperatures. There is also uncertainty regarding the cumulative effects of combined contaminant exposures, including air deposition associated with industrial operations, marine traffic, and LNG-related activities, on aquatic ecosystems, shoreline environments, and culturally important species, such as scé-łən.

In addition to the Project, other foreseeable future projects and activities may contribute metals, hydrocarbons, suspended solids, nutrient loading, degraded water quality, and increased contaminant deposition to scé-łən habitat.

### **(b) Cumulative Underwater Noise**

The Lower Fraser River is already subject to substantial underwater noise from existing commercial shipping and marine traffic, dredging, terminal activities, and industrial river use. These existing conditions create a chronic acoustic disturbance environment within scé-łən habitat.

Reasonably foreseeable future projects—including the TMJ, LNG-related vessel movements, barge transport for T1B, dredging activities, and increased industrial marine traffic and construction throughout the Fraser River corridor—will contribute additional underwater noise and vibration to an already stressed aquatic environment.

### **(c) Cumulative Greenhouse Gases**

GHG emissions associated with the Project extend well beyond the scope selected by the EAO for the Application Information Requirements (AIR). The AIR did not require assessment of several significant sources of GHG emissions likely to result from the Project, including:

- Methane slip while fueling trucks with the Project's LNG;
- Methane slip while loading marine vessels with the Project's LNG;
- Methane slip while bunkering and shipping the Project's LNG;

- Fugitive leaks during distribution of the Project's LNG;
- Fugitive leaks and combustion emissions for the regasification of the Project's LNG;
- Combustion (end use) of the Project's LNG.

In addition to emissions directly associated with the Project, multiple existing and planned projects on Tilbury Island will also contribute cumulatively to climate change. These include:

- T1A, including liquefaction and storage capacity and two truck loading bays;
- T1B, including liquefaction, connection to TMJ and a 6 km power line;
- Three km gas line expansion;
- Demolition of the 1971 Base Plant; and
- TMJ.

Beyond Tilbury Island, significant industrial development is planned throughout the Lower Fraser River corridor. TWN has been, and continues to be, actively engaged in assessing several major projects in this region, each of which will contribute additional GHG emissions to the atmosphere.

Cumulative emissions add carbon dioxide and methane to the atmosphere, both of which are significant drivers of climate change. Climate change, in turn, adversely affects scé·tən and scé·tən habitat through warming waters, reduced dissolved oxygen, altered freshet timing, sea level rise, and increased ecosystem instability.

In this way, climate-related cumulative effects are directly connected to TWN's rights to harvest, steward, and restore scé·tən populations.

#### **(d) Cumulative Marine Shipping**

Cumulative effects must also consider the multiple adverse residual effects associated with the TMJ project, which would be functionally connected to the Project to facilitate the shipping and bunkering of LNG produced by the Project.

Shipping and bunkering associated with the Project are expected to result in:

- Underwater noise;
- GHG emissions;
- Air contaminants that may deposit into fish habitat;
- Habitat disturbance and shoreline effects;
- Increased vessel wake and navigation pressures; and
- The potential spread of pathogens and invasive species.

Since the Early Engagement phase of the EA process, TWN consistently requested information regarding vessel transport associated with the Project, including marine shipping of liquefaction modules for construction, LNG bunkering, and downstream LNG transport.

During Process Planning, TWN requested clear information regarding both construction-related marine deliveries and LNG shipping. The EAO acknowledged that Project scope and consideration of the TMJ project's bunkering information would be addressed during scoping. However, despite repeated requests in consultation letters dated July 6, 2022; February 6, 2024; and August 5, 2025, the Revised Application still does not provide sufficient or transparent information regarding vessel movements within the Fraser River, Burrard Inlet, or Salish Sea.

TWN specifically requested that if downstream benefits associated with LNG use as a marine fuel were included in the Application, downstream adverse effects, particularly those associated with shipping, bunkering, and vessel traffic, must be assessed.

Ultimately, cumulative effects from shipping associated with the Project, TMJ, and all other shipping currently active on, or planned for, the Lower Fraser River, are expected to cause immense pressure on scé-łən and scé-łən habitat.

In conclusion, where contaminants persist over the long term in aquatic environments, or where underwater noise, climate change, and shipping (individually or cumulatively) push ecological systems beyond recovery thresholds, cumulative effects may degrade scé-łən and scé-łən habitat to the point of triggering temporary or prolonged fishery closures. Such closures could **prevent** TWN from meaningfully exercising the section 35 rights listed in Table 2.

## **Cumulative Effects on Access to scé-łən**

### **(a) Cumulative Industrialization, Discharges and Emissions**

The Project would add air emissions and industrial stressors, including noise, vibration, and visual disturbance, to the already heavily industrialized Lower Fraser River area, where existing LNG facilities, marine traffic, shoreline industry, and other reasonably foreseeable projects are expected to further degrade air quality and intensify industrial pressures.

The Revised Application identifies overlapping cumulative effects from projects including the TMJ, T1B, and other major industrial developments, with cumulative modelling showing exceedances of NO<sub>2</sub> air quality objectives near the TMJ, particularly from bunkering activities (Air Quality VC Chapter, pg. 7.2-50).

In conclusion, cumulative air pollution could make Lower Fraser River scé-łən inaccessible, by not only reducing the quality of the harvesting experience, but by making conditions unsafe for harvesting. Air pollution affects TWN Members' meaningful access to harvesting areas by making culturally significant places along the river feel increasingly industrialized, unhealthy, and inconsistent with TWN's stewardship responsibilities. In this way, cumulative air quality effects may **prevent** TWN's ability to access to scé-łən, thereby impacting TWN's rights listed in Table 3.

## **Cumulative Effects on Tangible Cultural Heritage**

### **(a) Cumulative Destruction or Damage**

Reasonably foreseeable projects near the Project include TMJ and T1B. Given Tilbury Island's proximity to known archeological sites, construction of these projects could risk destruction of tangible cultural heritage.

Furthermore, cumulative marine traffic and vessel wake along the Lower Fraser River may also contribute to erosion of known archaeological sites and culturally significant shorelines, resulting in permanent and irreversible loss of tangible cultural heritage. These effects are cumulative, where shoreline instability is already being driven by industrialization, dredging, vessel traffic, and climate-related changes, such as sea level rise and altered river hydrology.

## **(b) Cumulative Industrialization, Discharges and Emissions**

In addition, pollution and industrialization diminish the experience of accessing tangible cultural heritage areas and may even prevent access to culturally significant places due to safety concerns.

In conclusion, cumulative effects in the Lower Fraser River corridor arising from planned industrialization, increased pollution, marine traffic, and shoreline disturbance could not only **prevent** access to places of cultural significance but could also destroy tangible cultural heritage. In this way, cumulative effects on tangible cultural heritage could adversely affect TWN's rights listed in Table 4.

## **Cumulative Effects on Intangible Cultural Heritage**

### **(a) Cumulative Stewardship and/or Restoration Impediments**

The Tilbury Slough has been identified as a high-priority site for habitat reconnection and restoration under federal initiatives led by DFO.<sup>71</sup> Its restoration potential is particularly significant for juvenile salmon habitat, including Chinook and chum salmon, which are culturally important to TWN and ecologically critical as prey for qəłələməcən (SRKW).

Incremental degradation from the Project, when added to existing pressures and future cumulative effects, may foreclose future habitat recovery opportunities in the Tilbury Slough and adjacent fish-bearing environments and undermine TWN's long-term aspirations for scé-tən abundance and harvesting.

### **(b) Cumulative Self-Governance Impediments**

As of mid-2026, the Crown is accelerating the expansion of LNG projects. Federally, LNG Canada Phase 2 and Ksi Lisims LNG are being advanced through the *Building Canada Act* (Bill C-5), which prioritizes expedited approvals for 'Projects of National Interest'.<sup>72, 73</sup> Provincially, BC's *Look West: Jobs and Prosperity for a Stronger BC and Canada* similarly designates priority projects to expand LNG extraction, processing, and export.<sup>74</sup>

The Province has justified this expansion by claiming that BC is providing the "lowest carbon-emitting LNG," relying heavily on LNG facilities using hydroelectric power rather than fossil fuel combustion to make these claims.<sup>75</sup>

If major LNG projects, including LNG Canada, Cedar LNG, Woodfibre LNG, Ksi Lisims LNG, and the Project, were all to rely on hydroelectricity for major operations, the cumulative demand on BC's finite electricity supply would be enormous. Meeting that demand would require major expansion and fast-

tracking of hydroelectric generation and transmission infrastructure, creating further impacts to Indigenous heritage, lands, waters, and rights.

Furthermore, the “lowest carbon-emitting” LNG claims are not based on real-world data, since most of these LNG projects have not been built yet. Instead, these claims are based on proponent-led GHG forecasts following the requirements of Canada’s *Strategic Assessment of Climate Change* (SACC). Unlike well-established GHG accounting methodology typically used for major decision-making, Canada’s strategic assessment requirements exclude all downstream emissions (typically the largest source of emissions across a project’s lifecycle) and all upstream emissions below a certain threshold.

As previously described, TWN’s GHG reduction objectives depend on the Province and federal government meeting, or exceeding, their own net-zero commitments, and it appears increasingly unlikely that the Crown will meet those targets. TWN is also concerned that the cumulative electricity demand created by multiple LNG projects could place significant pressure on BC’s hydroelectric supply, potentially increasing the cost and reducing the accessibility of renewable energy for TWN Members. Using renewable electricity to process fossil fuels, rather than prioritizing local decarbonization and resilience, is a significant concern during the climate crisis.

Regardless of whether LNG facilities rely primarily on fossil fuels or large-scale electrification, the Province is deepening long-term dependence on methane extraction through fracking, LNG infrastructure, and fossil fuel combustion, while shifting significant cumulative burdens onto Indigenous Nations. This includes committing the Province to continued use of fossil methane and the ongoing risk of fugitive methane leaks throughout extraction, liquefaction, transport, regasification, and end use. Methane has a significantly higher warming potential than carbon dioxide over a 20-year period, making this long-term reliance particularly concerning in the context of accelerating climate change.

In conclusion, the cumulative impacts of industrialization on the Lower Fraser River may prevent TWN’s ability to make decisions concerning our territory and resources and to engage in and maintain desired cultural practices and identity. Similarly, the Crown’s policy decisions and fast-tracking of LNG projects may prevent TWN’s ability to make decisions concerning land use and self-governance over matters such as climate change. The intensity of industry and Crown policy decisions could thereby **prevent** TWN from meaningfully exercising our rights listed in Table 5.

## **Cumulative Effects on TWN Health and Well-being**

### **(a) Cumulative Barriers to Accessing Cultural Heritage**

As previously described, cumulative effects from pollution, industrialization, construction, vessel wake, and increased marine and road traffic may not only prevent TWN Members’ access to scé-lən and places of cultural significance but may also result in the destruction and permanent loss of tangible cultural heritage.

These effects can adversely impact TWN Members’ health and well-being by disrupting the ability to practice culture, ensure cultural continuity, and fulfill responsibilities to Ancestors, family, and future generations. Access to harvesting sites (both past and present), travel corridors, and places of spiritual and historical importance is directly connected to identity, belonging, and community wellness. When these places become unsafe, inaccessible, or physically damaged, the impacts are not only environmental, they are social, cultural, emotional, and spiritual.

Loss of access to scé·lən and harvesting places also weakens food security, traditional teaching opportunities, and the daily exercise of stewardship responsibilities that support both individual and collective well-being. For TWN, the inability to safely access and care for these places undermines relationships with the land and water and contributes to cumulative stress, grief, and cultural displacement.

In this way, cumulative effects on tangible and intangible cultural heritage are also cumulative effects on health and well-being, with impacts extending across generations.

### **(b) Cumulative Industrialization, Discharges and Emissions**

The Project is being added to an already heavily industrialized airshed. The Revised Application Air Quality VC Chapter acknowledges that the Lower Fraser River and Tilbury Island area are already subject to CAC emissions from existing operations, including the existing T1A facility and the cumulative effects analysis confirms that the Project would operate within a landscape where multiple overlapping LNG, marine, transportation, and industrial projects are contributing to chronic air pollution.

The Revised Application identifies five reasonably foreseeable projects with overlapping air quality effects, including the TMJ, T1B, the Delta Grinding Facility, the Roberts Bank Terminal 2 project, and the Vancouver Airport Fuel Delivery project. However, only TMJ and T1B were explicitly modelled. The three other projects were excluded from quantitative modelling because of insufficient information, despite being acknowledged as relevant contributors to cumulative effects. This creates uncertainty and likely understates total cumulative impacts.

Most significantly, the cumulative modelling predicts that hourly NO<sub>2</sub> concentrations exceed both Metro Vancouver and federal air quality objectives, with exceedance zones centred around the TMJ project and strongly influenced by LNG bunkering activities. Even annual NO<sub>2</sub> concentrations slightly exceed current objectives near the TMJ.

From TWN's perspective, air quality effects are directly connected to Section 35 rights and responsibilities, and poor air quality affects TWN Members' health when trying to practice their rights on the Lower Fraser River.

### **(c) Cumulative Greenhouse Gases**

GHG emissions from the Project, together with existing and reasonably foreseeable LNG, marine, transportation, and industrial projects throughout the Lower Fraser River corridor, and the province, will likely further exacerbate climate change and intensify TWN's existing climate vulnerabilities.

These GHG emissions extend beyond the scope assessed in the Revised Application and include marine loading, bunkering, shipping, regasification, fugitive methane leaks, and end-use combustion of the Project's LNG, in addition to emissions from related projects such as T1A, T1B, TMJ, gas and power line expansions, and other major provincial developments.

For TWN, climate change is not an abstract future risk, it is already creating direct impacts on Nation-specific interests and rights. As climate change is perpetuated, sea level rise and storm intensity worsen coastal flooding, shoreline erosion, creek flooding, and urban flooding, threatening waterfront infrastructure, archaeological sites, burial grounds, canoe storage, and culturally significant places. Coastal squeeze and intertidal habitat loss reduce access to shellfish, fish habitat, and important food

harvesting areas. The warmer waters, reduced dissolved oxygen, ocean acidification, harmful algal blooms, and invasive species further degrade scé-łan habitat and marine ecosystems that support TWN harvesting and stewardship responsibilities.

Extreme heat, wildfire smoke, and vector-borne disease also create direct risks to TWN community health, cultural practice, and food security, while increased pressure on BC's finite hydroelectric supply may reduce access to affordable renewable energy for TWN Members.

Regardless of whether LNG facilities rely on fossil fuels or large-scale electrification, the Province is deepening long-term dependence on methane extraction and LNG infrastructure while shifting significant cumulative burdens onto Indigenous Nations. These cumulative climate effects could prevent TWN's ability to harvest, steward, restore, and maintain relationships with lands, waters, and species in accordance with səliłwətał law. In turn, this multitude of effects will likely impact TWN health and well-being.

#### **(d) Cumulative Misrepresentation of Climate Risks**

TWN remains concerned that the climate risks associated with LNG development in BC are consistently understated while speculative "lower-carbon" or "best-in-class" claims are emphasized to justify continued expansion of fossil methane infrastructure.

Recent studies and regulatory reviews have shown that LNG assessments frequently underestimate emissions by excluding or minimizing major sources such as startup and commissioning flaring, fugitive methane releases, and downstream combustion. Researchers have specifically warned that assumptions used in LNG assessments often fail to reflect real-world operating conditions and may significantly underestimate impacts to air quality, climate, and human health.<sup>76</sup>

In the federal review of the Project (Appendix 15 of the EAO's Assessment Report), the Project is described as "best in class" for carbon intensity because of electrically driven compression. However, when TWN requested that the EAO identify the specific, enforceable conditions and project-level monitoring, reporting, and verification framework that would substantiate the Proponent's emissions claims, the EAO directed TWN to the Greenhouse Gas Industrial Reporting and Control Act (GGIRCA). Relying on GGIRCA as a primary oversight mechanism introduces severe regulatory blind spots. GGIRCA enforces a highly restrictive boundary that excludes lifecycle impacts, capturing only direct (Scope 1) facility emissions. Furthermore, the framework relies on accounting using generalized, mathematical emission factors rather than continuous, real-world GHG measurement. This reliance systematically underreports fugitive methane leaks and irregular operational venting.

TWN requested a clear and enforceable Project-wide GHG Monitoring and Reporting System that would apply to commissioning through decommissioning, quantify direct and indirect emissions, incorporate real-world methane detection technologies, and provide annual reporting that TWN could review. Without such requirements, there is no meaningful mechanism to verify emissions intensity claims or distinguish actual operational performance from accounting assumptions or offsets.

---

<sup>76</sup> Minet, L. et al. (2025). Analysis of Flaring Activity at Liquefied Natural Gas (LNG) Export Facilities Worldwide. Environmental Science & Technology. American Chemical Society. <https://doi.org/10.1021/acs.est.5c03755>

The absence of these enforceable requirements contributes to cumulative mental distress for TWN. The Crown continues to promote BC LNG as “lowest carbon-emitting” while expanding long-term dependence on fossil methane extraction. When climate risks are trivialized and accountability mechanisms are minimized, TWN is left to carry uncertainty about future harm to lands, waters, scé-łən, cultural continuity, and community wellbeing. This creates ongoing stress and intergenerational anxiety regarding whether the Crown is meaningfully protecting the future of our people and territory or merely using climate language to justify further industrialization.

In conclusion, the cumulative impacts of prevented access to culture, air pollution, intensification of TWN’s climate vulnerabilities, and mental distress caused by misrepresentation of LNG facility climate risks all culminate to impact TWN health and wellbeing. This harm to health and wellbeing could thereby **prevent** TWN from meaningfully exercising our rights listed in Table 6.

## 7.8 Step 8: Final Significance Determination

The final step in TWN’s assessment is to determine the significance of residual and cumulative effects on TWN’s Nation-specific interest and associated Section 35 rights.

**Significance** is the overall determination of whether effects are acceptable under səlilwətał law and whether they result in an infringement on TWN’s rights. This determination integrates information from all previous steps.

Significance reflects the extent to which adverse effects limit or prevent the meaningful exercise of TWN’s rights. It is assessed relative to TWN-defined rights-enabling conditions informed by səlilwətał law, pre-contact conditions, and future aspirations. TWN applies the following significance thresholds:

- Not Significant: Effects do not perpetuate, or result in, a meaningful limitation on, or infringement of, TWN’s interest and associated rights.
- Significant: Effects perpetuate, or result in, a meaningful limitation on TWN’s interest and associated rights. Effects may reduce access, quality, continuity, or cultural integrity, but do not fully prevent the exercise of rights.
- Highly Significant: Effects perpetuate, or result in, a substantial limitation on TWN’s interest and effective prevention of TWN’s ability to exercise rights. This includes situations where rights are no longer meaningfully exercisable, where effects entrench existing infringement conditions, or where restoration and future exercise are foreclosed. These effects are inconsistent with səlilwətał law and require avoidance or structural redress.

### Overall Summary of Impacts to TWN’s Rights and Interests

Based on TWN’s characterization of residual effects, the Project would contribute to existing cumulative effects that already constrain the meaningful exercise of TWN’s rights and stewardship responsibilities throughout our territory. The Lower Fraser River and surrounding area is already under significant ecological, cultural, and governance stress due to ongoing industrialization, marine shipping, habitat degradation, contamination, and climate change.

Within this context, even incremental residual effects may result in meaningful additional impacts where existing conditions already limit or prevent the exercise of rights. TWN therefore concludes that several residual Project effects, particularly those related to scé-łən, cultural continuity, stewardship

obligations, and cumulative marine and climate-related pressures, are significant and, in many cases, highly significant or unacceptable under səlilwətaʔ law.

**Table 12. TWN Final Significance Determination and Summary of Residual and Cumulative Effects on TWN Rights and Interests**

| Key Residual Effects                                                 | Residual Effects Characterization                                                                                                                                                                                                                                                                                                   | Cumulative Effects Context                                                                                                                                            | Significance Determination for Residual Effects | Significance Determination for Cumulative Effects |

## 8. TWN's Recommended Conditions

Throughout the EA, TWN provided targeted condition recommendations via the Issues Tracking Table, consensus-seeking meetings, and formal comment periods. TWN has consistently emphasized that conditions should be issued, overseen, and enforced by the respective jurisdiction, rather than deferred to other jurisdictions, future permitting processes, or non-binding mechanisms. This is particularly important for areas such as air quality management, where responsibilities are often fragmented across jurisdictions or deferred to future permitting stages, creating uncertainty around accountability, enforceability, and cumulative effects management. The following summary focuses, non-exhaustively, on critical conditions and concerns that remain unresolved in the proposed provincial and federal draft conditions:

### 8.1 TWN-Led Cultural Continuity and Stewardship Program

To address the Project's residual and cumulative effects on TWN's cultural heritage, stewardship responsibilities, cultural continuity, and the meaningful exercise of Section 35 rights, TWN recommends:

- A binding condition requiring the development and implementation of a TWN-led Cultural Continuity and Stewardship Program.
- In collaboration with TWN, the proponent must develop, implement, and maintain a TWN-led Cultural Continuity and Stewardship Program for the life of the Project.
- The Program must:
  - a) Be co-developed with TWN and informed by səlilwətał law, TWN knowledge systems, cultural practices, and TWN-defined cultural continuity indicators, where identified by TWN;
  - b) Include secure, long-term, and sustained funding from the proponent sufficient to enable TWN's participation, at TWN's discretion, in activities related to the Program throughout all phases of the Project lifecycle;
  - c) Establish mechanisms for monitoring and reporting on Project-related impacts to cultural continuity, stewardship practices, cultural use, access, and intergenerational knowledge transmission, with funding available to support TWN participation at TWN's discretion;
  - d) Be reviewed and updated periodically throughout the life of the Project.

### 8.2 Greenhouse Gas Inventories and Lifecycle Assessments

While TWN acknowledges the utility of macro-level provincial frameworks like the GGIRCA and the BC Output-Based Pricing System, the EAO's deference to these mechanisms introduces significant regulatory gaps. By design, these high-level administrative regimes utilize narrow accounting boundaries that de-scope the vast majority of a project's lifecycle emissions, artificially minimizing its true carbon footprint. Deferring exclusively to these systems fails to address the specific cumulative climate impacts that directly infringe upon TWN's rights and territory. The EAO has a distinct mandate under the EA Act to assess cumulative effects and establish Project-specific mitigations; substituting this duty with general carbon pricing frameworks constitutes an improper deferral of regulatory oversight. To ensure transparency and robust Project-specific carbon accounting TWN recommends:

- The Proponent must conduct annual, Project-level GHG inventories quantifying actual emissions compiled during the preceding calendar year across all active Project phases. These inventories

must encompass Scope 1 (direct), Scope 2 (acquired energy), and Scope 3 (upstream supply chain and downstream marine transport/combustion) emissions.

- To ensure data integrity and prevent the distortion of baseline data, annual inventories must strictly adhere to Canada's GHG Quantification Requirements, the 2006 IPCC Guidelines, and ISO 14064-1 standards, including the mandatory, full disclosure of data gaps and methodological uncertainties.
- The Proponent must provide a third-party verified, cradle-to-grave Lifecycle Assessment (LCA) every three years, or upon material changes to the upstream supply chain, to accurately calculate the Project's evolving Carbon Intensity. This LCA should utilize the lifecycle accounting methodologies established under the federal Clean Fuel Regulations and the B.C. Low Carbon Fuel Standard but extend the physical boundary to include international marine transit and foreign end-use combustion.
- Carbon offsets must only be applied to mitigate verified, technically unavoidable residual emissions identified in the annual inventory. Offsets must not be applied to alter or artificially lower the baseline calculations within the Lifecycle Assessments.
- Annual GHG Inventories and periodic Lifecycle Assessments must use both the standard 100-year Global Warming Potential and the 20-year timescale to show the near-term climate impacts of fugitive methane.
- Annual GHG Inventories, periodic Lifecycle Assessments, and all underlying raw data must be submitted to TWN upon request.
- The Proponent must analyze, update, and implement feasible pathways for transitioning the facility to cleaner alternative fuels (such as hydrogen or ammonia) over the Project lifecycle to prevent asset stranding and lock-in of high-carbon infrastructure.

### **8.3 Greenhouse Gas Mitigation via Best Available Technology (BAT) and Independent Auditing**

To address a lack of project-specific design mandates, continuous fugitive methane tracking, and rigorous enforcement triggers in the draft EA conditions, TWN recommends:

- Mandatory low-leakage valves, closed-loop systems, and optimized compressor seals across all facility infrastructure.
- Prohibition of venting depressurized maintenance gas to the atmosphere. All such gases must be routed to a high-efficiency flare system or a vapor recovery unit for re-injection into the process line.
- Mandatory, multi-tiered continuous and aerial monitoring that entails:
  - Installation and operation of an automated network of real-time methane detectors across the facility, which trigger an alert if concentrations exceed background levels.
  - A minimum of four independent aerial or satellite-based emissions surveys per calendar year using high-resolution infrared spectroscopy or Light Detection and Ranging (LiDAR) technology.
  - Comprehensive ground-level Leak Detection and Repair (LDAR) surveys conducted a minimum of four times per calendar year, utilizing Optical Gas Imaging (OGI) cameras paired with quantification tools to measure leak mass flow rates.

- All Aerial/satellite and ground surveys, data analysis, and compliance reporting must be conducted and signed off by an independent, qualified third-party environmental professional. All audit results, continuous data streams, and imagery logs must be made public within 30 days of data collection.
- Any leak detected via monitoring must be logged instantly and repaired within seven calendar days.

#### 8.4 Transition Fuel Mandate and Feedstock Lifecycle Standards

To ensure that "net-zero" claims reflect absolute, source-level emissions avoidance rather than a reliance on creative carbon accounting or offsets, TWN recommends:

- RNG, or an approved transition fuel, is used for all facility combustion operations. Fracked fossil gas must not be used unless the Proponent demonstrates, through verifiable evidence, that compliant transition fuels are physically unavailable despite exhaustive efforts.
- Financial constraints, market price fluctuations, supply-chain premiums, or project profitability metrics must not constitute grounds for an exemption from the transition fuel mandate.
- Any "transition fuel" utilized by the Project must be defined strictly as a fuel possessing a low, zero, or net-negative lifecycle carbon **intensity**. Quantification of this intensity must encompass the full supply-chain footprint (e.g., hydrogen must not be classified as a transition fuel if it is produced using fossil-methane).

#### 8.5 Legacy Materials and Contaminant Controls

To protect human health and the local environment from the release of legacy industrial contaminants through demolition and other Project activities, TWN recommends:

- Prior to any dismantling activities, hazardous materials surveys must be conducted. A *Legacy Contaminant Management Plan* must be developed and implemented along with localized, continuous demolition air quality monitoring to identify, contain, manage and track historical industrial pollutants.
- Prior to demolition, excavation, or redevelopment activities, the Proponent must characterize the nature and extent of legacy contamination within areas that may be disturbed by the Project, including soil, groundwater, sediment, and existing infrastructure, and implement appropriate remediation or risk management measures where contamination exceeding applicable regulatory standards or posing risks to human health or ecological receptors.
- Any remediation, risk management, or demolition activities must be designed and implemented to prevent the mobilization of contaminants to Tilbury Slough, the Fraser River, adjacent habitats, and surrounding lands.
- Monitoring frameworks must enable independent, third-party validation of residual air quality, ensuring oversight of potential acute or chronic human health impacts.

#### 8.6 Facility-Wide Hydrostatic Testing Plan

To ensure comprehensive oversight and eliminate risks to local hydrology through the discharge of hydrostatic test water, TWN recommends:

- Regulating all piping, lines, and components undergoing hydrostatic testing (not just the storage tank).

- Mandatory opportunities for affected Indigenous Nations to review and approve the *LNG Hydrostatic Testing Plan*.
- Explicit restrictions on water sourcing to guarantee that volume withdrawals do not negatively impact fish habitat.
- Prohibiting the discharge of test water if established thresholds are exceeded, alongside mandatory biological toxicity testing to account for construction chemicals, biocides, and heavy metals.
- Strict, measurable stop-work orders for turbidity and erosion to actively prevent sediment re-suspension and bank scouring during discharge.

## **8.7 Aquatic Habitat Protection from Transportation and Equipment Contaminants**

To avoid the deposition of heavy metals, PAHs, and other transportation-related pollutants into fish habitats from heavy-duty Project traffic, TWN recommends:

- Identification and quantification of all transportation and equipment-related contaminant pathways to surface waters during Construction and Decommissioning.
- Enforceable integration of these pathways into management plans, defining explicit mitigation measures to prevent toxic roadway runoff from entering local waterways.
- Implementation of source-control, stormwater treatment, and runoff management measures designed to prevent Project-related heavy metals, PAHs, tire-wear contaminants (including 6PPD-quinone), and other transportation-related pollutants from entering fish-bearing waters and aquatic habitats.
- Establishment of water-quality monitoring and adaptive-management triggers to prevent Project-contributed pollution in low-oxygen, limited-flushing environments.
- Mandating that on-road and off-road vehicles and equipment used during Decommissioning be electric or otherwise zero-emission, wherever technically feasible at the time Decommissioning occurs.

## **8.8 Third-Party Air Quality Monitoring, Contaminant Attribution and Public Reporting**

To prevent regional data from masking the Project's specific contributions to cumulative airshed degradation, TWN recommends:

- Mandatory continuous air quality monitoring covering all Project emission sources.
- Explicitly mandating real-time monitoring on Tilbury Island, since short-range effects on air quality in the Project area are not readily measured by the current Metro Vancouver monitoring network.
- Requiring Project-specific thresholds for not only CACs but also GHGs (including methane).
- Where monitoring identifies exceedances of Project-specific thresholds or unanticipated Project-related air quality impacts, the Proponent must implement additional mitigation measures, operational modifications, or emissions reduction measures sufficient to return emissions and air quality conditions to acceptable levels.
- Requiring on-site air quality monitoring to begin before any Project activities occur and continue through decommissioning to ensure accurate attribution of Project emissions.

- Enforcement of a rigorous site-specific data framework designed to accurately isolate and attribute localized air quality impacts.
- Opportunities for affected Indigenous Nations to be notified when ambient air quality thresholds are exceeded on or near Tilbury Island.

## 8.9 Marine Traffic and In-water Works Condition

To address TWN's concern that future modifications (i.e., in-water works, dredging, or expanded water-based transportation) could be brought forward as "non-material amendments" or through secondary permits without adequate Indigenous consultation or a new assessment, TWN recommends:

- Enforceable regulations for any Project-related ocean-going cargo vessel transit routes and vessel timing in the Salish Sea, Fraser River, or Burrard Inlet, including potential cargo vessels delivering materials to marine based locations in TWN's territory (e.g., Lynnterm Terminal). This condition must be designed to mitigate impacts on TWN's rights and interests.
- Prohibiting future amendments that would enable vessel deliveries to the Project site, formalizing the proponent's non-binding commitment to eliminate barge deliveries and construction of the Material Offloading Facility (MOF).
- Prohibiting future amendments for in-water works, dredging, MOF construction, or upgrades to the existing MOF, reflecting that these activities have been removed from the Project scope.

## 8.10 Tilbury Slough Restoration Program

The long-term health of the Tilbury Slough is essential to scé·łən populations, aquatic ecosystem function, and the future exercise of TWN's rights. To help address the Project's potential exacerbation of chronic exceedances of BC and CCME guidelines for multiple heavy metals in the Slough, as well as potential adverse effects from the Project's emissions and discharges, TWN recommends:

- Requiring the Proponent to support fish habitat protection and restoration in Tilbury Slough, including funding a legally binding Tilbury Slough Restoration and Management Program in direct partnership with affected Indigenous Nations.

The summarized conditions above represent critical regulatory frameworks required to mitigate the Project's multi-scoped climate, environmental, health, and cultural impacts. TWN emphasizes that this is not an exhaustive list of our outstanding concerns. Rather, these recommendations highlight fundamental gaps where the Crown's proposed conditions and regulations currently fail to enforce absolute emissions reductions, protect and restore fish habitat, or protect Indigenous health and rights.

## 9. TWN's View on the Project's Contribution to Sustainability

TWN does not consider the Project to make a positive contribution to sustainability as required under the BC *Environmental Assessment Act* or the federal *Impact Assessment Act*.

While the sustainability assessment in Appendix 15 of the Assessment Report emphasizes economic benefits, energy supply, and industrial development, it does not meaningfully account for the long-term protection of TWN's Nation-specific interests, stewardship obligations, and Section 35 rights. In TWN's view, sustainability must include the protection and restoration of scé·łən, food sovereignty, cultural

resurgence, intergenerational wellbeing, climate resilience, and the ability of future generations to exercise their rights in accordance with səlilwətał law. Sustainability cannot be assessed solely through economic objectives, but must also consider cumulative ecological effects, cultural health, Indigenous rights, long-term stewardship responsibilities, and the risks associated with continued reliance on fossil fuel infrastructure.

The Project does not yet adequately demonstrate how these objectives will be achieved or maintained over the long term. Instead, it risks further pollution, habitat degradation, barriers to cultural heritage, and long-term dependence on fossil methane infrastructure during a climate crisis. TWN also remains concerned that broader provincial and federal policy objectives tied to LNG expansion may be narrowing the scope of what is considered “sustainable” or in the “public interest,” despite unresolved concerns regarding cumulative effects, climate risks, and impacts to Section 35 rights and cultural health.

### **Energy Resiliency and Long-Term Sustainability**

TWN notes a fundamental contradiction in the Project’s justification as an energy resilience measure for peak shaving. The Project is presented as necessary to ensure reliable natural gas supply during periods of high demand, yet the facility itself depends on substantial amounts of hydroelectricity to liquefy and store fossil gas.

This raises a critical question of sustainability and energy security: If significant renewable electricity is required to process, store, and ship LNG, why is that same hydroelectricity not prioritized for local decarbonization and community resilience rather than reinforcing long-term dependence on fossil gas infrastructure and potential LNG export?

TWN acknowledges that FortisBC Energy Inc. and the BCUC have identified domestic energy resiliency and system reliability as key justifications for the Project. However, from TWN’s perspective, a broader sustainability and public interest analysis must also consider whether alternative approaches to energy security could achieve similar objectives with fewer cumulative impacts on Indigenous rights, climate commitments, cultural health, and ecological systems. TWN remains concerned that the Revised Application and the Crown’s assessments have not sufficiently evaluated lower-impact alternatives or fully considered the long-term implications of deepening fossil gas dependence. Using finite renewable electricity to prolong reliance on fossil methane is not, in TWN’s view, a resilient or sustainable energy strategy.

### **Omission of Downstream Emissions and Methane Slip**

Despite TWN’s repeated requests since Early Engagement, the Revised Application does not adequately quantify downstream emissions associated with marine loading, bunkering, shipping, regasification, combustion, and methane slip.

For a project intended for marine fuel use and LNG export, these emissions represent the majority of the Project’s GHG profile. Their omission excludes the Project’s primary contribution to climate change and presents an incomplete and misleading emissions profile.

Furthermore, LNG is mostly composed of methane, and methane is a highly potent GHG. Reliance on a 100-year Global Warming Potential significantly understates near-term climate effects; over a 20-year timeframe, methane has more than 80 times the warming potential of carbon dioxide. This methodological choice minimizes impacts during the critical period for emissions reduction.

### **Lack of Enforceable Net-Zero Mechanisms**

Reliance on the proponent's stated "net zero by 2030" commitment is not sufficient without clear, enforceable legal mechanisms to ensure compliance.

TWN remains uncertain how emissions performance will be monitored, verified, or enforced over the life of the Project. Without binding conditions and transparent reporting, commitments to "best-in-class" emissions intensity or net-zero readiness, remain aspirational rather than reliable.

TWN agrees with the EAO's own conclusion that the Project is unlikely to contribute meaningfully to Canada's ability to meet its climate commitments.

### **Reliance on Offsets Rather Than Real Reductions**

The proponent has not demonstrated that its Net Zero Plan will achieve actual emissions reductions. Although the Application references the use of 100% renewable natural gas (RNG), it does not provide:

- Verified sources, volumes, or carbon intensities of RNG; or
- A credible, time-bound contingency plan if RNG is unavailable.

Without this information, the Net Zero Plan appears likely to rely heavily on carbon offsets rather than avoided emissions. Offsets do not eliminate emissions at source and do not provide the certainty required for a conservative and reasonably foreseeable assessment.

An unverifiable and unenforceable emissions strategy undermines TWN's own climate governance objectives and our ability to plan for long-term resilience.

### **Economic Sustainability Risk**

Claims that the Project supports long-term economic sustainability for the public and TWN are unpersuasive. During the Project's six-year construction period, the delivery portion of customer natural gas rates is projected to increase. More broadly, the long-term economic benefits of LNG expansion remain increasingly speculative in light of global market instability, armed conflict, climate risk, and growing liabilities associated with fossil gas infrastructure.

TWN is also concerned that the Project is being advanced within a broader policy context that increasingly prioritizes LNG expansion and industrial growth as matters of "provincial" or "national" interest, despite significant uncertainty regarding long-term LNG demand, climate transition pathways, and the long-term viability of methane-based infrastructure. From TWN's perspective, LNG expansion may not represent a durable or sustainable long-term energy solution, particularly given climate commitments and ongoing global decarbonization efforts.

True sustainability does not deepen dependence on fossil gas or transfer climate and infrastructure costs to the public, Indigenous Nations, and future generations. Expanding methane-based energy systems during a climate crisis risks imposing long-term financial burdens on TWN Members while undermining self-determination.

TWN concludes that the Project does not make a positive contribution to sustainability. Instead, it risks materially undermining TWN's climate goals, cultural resurgence, stewardship responsibilities, and long-term self-determination, while threatening the protection and restoration of culturally significant

species, access to harvesting practices, and obligations to future generations. From TWN's perspective, a sustainability assessment that excludes cumulative effects, cultural health, climate justice, and long-term stewardship is incomplete. Likewise, a public interest determination that prioritizes LNG development to benefit private sector capital growth over Indigenous rights, shared ecological systems, and intergenerational wellbeing cannot reflect a meaningful or holistic understanding of **sustainability** under səlilwətaʔ law.

## 10. Conclusion

Tsleil-Waututh Nation undertook this assessment pursuant to section 19(4) of the EA Act to evaluate the Project through TWN's own laws, governance responsibilities, knowledge systems, and assessment methodologies. This assessment reflects TWN's understanding of how the Project may affect TWN's constitutionally protected rights, interests, stewardship obligations, cultural continuity, and relationship with our territory.

**Through this assessment, TWN has identified significant concerns regarding both the regulatory process and the EA of the Project.** TWN remains concerned about significant uncertainty surrounding mitigation measures, Project components, GHG emissions, increased vessel traffic associated with the Tilbury projects, and broader cumulative pressures affecting TWN's rights and interests within the Lower Fraser River and surrounding territory.

TWN has already experienced significant impacts from decades of urbanization and industrialization, which have constrained our ability to meaningfully exercise rights, stewardship responsibilities, and cultural practices throughout our territory. From TWN's perspective, the Revised Application and the Crown's assessment of the Project do not sufficiently consider the combined effects of past, present, and reasonably foreseeable future projects and activities, including emissions, marine impacts, and ongoing industrialization throughout the region. While individual projects may appear incremental in isolation, together they continue to place increasing pressure on already stressed ecological, cultural, and governance systems.

TWN remains concerned that ill-defined mitigation measures will not meaningfully address the Project's adverse effects, and **if an EAC is issued for the Project as it stands, the Project would further contribute to the degraded conditions of the Lower Fraser River and Tilbury Slough, as well as ongoing cumulative pressures on cultural health, food systems, stewardship responsibilities, and the meaningful exercise of Section 35 rights.**

Based on the overall findings of TWN's 19(4) Assessment, including the summary of effects presented in

Table 12 above, TWN concludes that additional legally binding mitigation, monitoring, reporting, and accommodation measures are required to address impacts on TWN's rights and interests. TWN's Assessment identifies multiple interconnected pathways through which the Project may adversely affect the exercise of Section 35 rights, including air quality and health impacts, GHG emissions and climate-related risks, effects on fish and fish habitat, and barriers to tangible and intangible cultural heritage. These pathways must be understood within the broader cumulative context of ongoing industrial development on Tilbury Island and the Lower Fraser River.

TWN also remains concerned regarding unresolved information gaps, project splitting, and increasing reliance on Post-Certificate planning. These gaps have resulted in a lack of enforceable mitigation measures or means to confirm emissions performance once the Project is in operation. The Project is also being advanced within a broader policy context that increasingly prioritizes expedited approvals and “provincial” or “national interest” objectives, despite ongoing uncertainty regarding long-term LNG demand and whether LNG expansion represents a sustainable solution aligned with the Crown’s climate commitments.

**In TWN’s view, meaningful consultation and the implementation of FPIC require complete, accurate, transparent, and sufficiently detailed information before decisions are made. TWN does not consider that this standard has been met for this Project.**

TWN worked collaboratively and in good faith with the EAO, the proponent, and regulators throughout the assessment process. Although some areas of alignment were achieved, consensus was not reached on several key issues, including the assessment of GHG emissions, project splitting, marine shipping, insufficiency of the Application, and deferral of mitigation measures until after an EAC is issued. Therefore, where the EAO’s conclusions differ from those presented in TWN’s Assessment, Tsleil-Waututh Nation considers the conclusions in TWN’s 19(4) Assessment to best reflect the Project’s impacts on TWN’s rights, interests, and relationship with the territory.

From TWN’s perspective, moving forward to decision-making while significant concerns and unresolved issues remain outstanding does not reflect meaningful consultation or align with reconciliation commitments, DRIPA, UNDRIP, and the principles outlined in TWN’s Stewardship Policy. TWN expects provincial and federal decision-makers to carefully consider the findings, concerns, conclusions, and recommended conditions we have put forward throughout the EA process before making any decision, and to ensure that any decision is consistent with section 35 of the Constitution Act, 1982, and the Crown’s duty to meaningfully consult and accommodate Tsleil-Waututh Nation.

### 16.19.2 The EAO's Views

#### səlilwətał (Tsleil-Waututh) Nation's Assessment

Participating Indigenous nations have the opportunity under section 19(4) of the *Environmental Assessment Act* (2018) to carry out an assessment with respect to the potential effects of the Project on the Nation and its rights. Tsleil-Waututh Nation completed an effects assessment under section 19(4), as agreed upon in the Assessment Plan of the Process Order.

The EAO acknowledges and respects that Tsleil-Waututh Nation's section 19(4) assessment has been undertaken using its own laws, knowledge systems, and decision-making frameworks, and that the assessment reflects Tsleil-Waututh Nation's perspectives on the nature and severity of potential effects on its right and interests under Section 35 on the *Constitution Act, 1982* (Section 35 rights). The EAO also acknowledges that Tsleil-Waututh Nation's assessment methods may differ in some respects from EAO's assessment methods, and that any characterization of residual effects and determination of significance for Tsleil-Waututh Nation's 19(4) assessment is based on the methods that Tsleil-Waututh used.

#### Tsleil-Waututh Nation's Involvement in the Consultation Process

Tsleil-Waututh Nation identified as a participating Indigenous nation for the Project, was provided with opportunities to participate in the environmental assessment process, including through the development of the Process Order, Application Information Requirements, Assessment Plan, FortisBC's Application, EAO's Assessment Report and ongoing engagement with the EAO and FortisBC.

The EAO worked collaboratively with Tsleil-Waututh Nation throughout the environmental assessment process. Tsleil-Waututh Nation participated in technical discussions and iterative engagement opportunities to review project information, identify potential effects on its rights, and provide input on mitigation and accommodation measures to mitigate impacts on Tsleil-Waututh Nation's rights and title. The EAO and Tsleil-Waututh maintained ongoing dialogue throughout the process, including regular meetings and discussions to understand, assess, and respond to issues as they arose.

Through engagement during the Process Planning phase, it was identified that Tsleil-Waututh Nation would undertake its own assessment of the Project's effects on its rights and interests under section 19(4) of the Act.

#### Provincial Conditions and Federal Key Mitigation Measures

The EAO notes that Tsleil-Waututh Nation recommended additional specific mitigations, and those recommendations were considered and responded to in the development of provincial and federal conditions.

Provincial conditions and federal Key Mitigation Measures were developed to address potential impacts on Tsleil-Waututh Nation's Section 35 rights, including harvesting fish and fish habitat, and access to Fraser River sćé:lan (salmon), effects on tangible and intangible cultural heritage, health and well-being effects, and Tsleil-Waututh Nation's governance and stewardship. The following provincial conditions and federal Key Mitigation Measures also address the matters assessed by Tsleil-Waututh Nation in their section 19(4) assessment.

#### Impacts to Harvesting, Access, and Habitat (particularly sćé:lan/salmon)

The EAO identified the following proposed provincial conditions that would mitigate potential effects to harvesting, access and habitat, with any management plans from these conditions to be developed in consultation with Tsleil-Waututh Nation.

- Condition 10 (Community Feedback Process) creates a clear way for Tsleil-Waututh Nation to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of harvesting and cultural practices;

- Condition 12 (Construction Environmental Management Plan) requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. By reducing disturbance and protecting the environmental conditions that support fish, wildlife, and plants, this condition helps maintain the ability to access, harvest, and experience culturally important areas;
- Condition 13 (Operations Environmental Management Plan) requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to Tsleil-Waututh harvesting and cultural practices;
- Condition 14 (Air Quality Management Plan) ensures the Project selects and applies effective emissions-control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support harvesting and cultural practices; and,
- Condition 17 (Dry Street Sweeping Report) helps assess whether dry street sweeping can reduce 6PPD-quinone on project-related roads, which may lower impacts on salmon and other fish important to Tsleil-Waututh Nation.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to harvesting:

- Migratory Bird Protections would require protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Tsleil-Waututh's harvesting practices and broader ecosystem conditions important to their way of life.

### **Cultural Sites and Use, Tangible and Intangible Cultural Heritage**

The EAO identified the following proposed provincial conditions that would mitigate potential effects to cultural sites, use, and tangible cultural heritage, with any management plans from these conditions to be developed in consultation with Tsleil-Waututh Nation.

- Condition 9 (Public Information and Flaring Notices) requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance;
- Condition 10 (Community Feedback Process) establishes a clear and structured mechanism for Tsleil-Waututh Nation to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- Condition 12 (Construction Environmental Management Plan) requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. By reducing disturbance and protecting the environmental conditions that support fish, wildlife, and plants, this condition helps maintain the ability to access and experience culturally important areas in ways that are consistent with Tsleil-Waututh values, supporting continuity of cultural practices and connection to place;
- Condition 13 (Operations Environmental Management Plan) requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation. Maintaining stable and predictable environmental conditions over time helps preserve the integrity of the area, supporting continued cultural use of the area, connection with sites, and knowledge transfer;

- Condition 14 (Air Quality Management Plan) ensures the selection and implementation of effective emissions-control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites; and
- Condition 15 (Chance Find Protocol) requires procedures to identify and protect archaeological or cultural materials discovered during project activities, to prevent additional cultural disturbance.

### **Tsleil-Waututh Governance and Stewardship**

The EAO identified the following proposed provincial conditions that would mitigate potential effects to Tsleil-Waututh governance and stewardship, with any management plans from these conditions to be developed in consultation with Tsleil-Waututh Nation.

- Condition 4 (Consultation) requires the Proponent to be available to meet with Tsleil-Waututh throughout all project phases and discuss issues or concerns related to the Project;
- Condition 3 (Document Development) requires that plans and programs include clear objectives, monitoring protocols, and reporting requirements, as well as provisions for evaluating mitigation effectiveness using baseline information (including Indigenous knowledge, where available). It also requires adaptive management where monitoring indicates that predicted outcomes are not achieved. These requirements are intended to support transparency, accountability, and ongoing refinement of mitigation measures over the Project lifecycle;
- Condition 10 (Community Feedback Process) ensures a clear and responsive pathway for Tsleil-Waututh Nation to raise and resolve concerns about project effects. By enabling early identification and timely resolution of issues such as noise, dust, light, or access disruptions, this allows Tsleil-Waututh more agency over these sensory concerns and,
- Condition 15 (Chance Find Protocol) requires procedures to identify and protect archaeological or cultural materials discovered during project activities, to prevent additional cultural disturbance.
- Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan) requires the development and implementation of a plan supporting economic participation of First Nations, and local communities, that would describe employment and contracting strategies and training practices. This plan supports Tsleil-Waututh Nation economic governance, ownership and self-determination.

### **Health and Well-being**

The EAO identified the following proposed provincial conditions that would mitigate potential effects to health and well-being, with any management plans from these conditions to be developed in consultation with Tsleil-Waututh Nation.

- Condition 10 (Community Feedback Process) provides Tsleil-Waututh with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance;
- Condition 12 (Construction Environmental Management Plan) requires mitigation measures to manage dust, noise, traffic, spills, surface water, erosion, and wildlife interactions during Construction. These measures help minimize construction-related disturbances that could affect Tsleil-Waututh community members' comfort, safety, health, and well-being;
- Condition 13 (Operations Environmental Management Plan) requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation, limiting long-term environmental disturbances;

- Condition 16 (Indigenous and Local Economic Inclusion and Monitoring Plan) requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support socio-economic well-being;
- Condition 14 (Air Quality Management Plan) requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting physical health and overall well-being; and
- Condition 15 (Chance Find Protocol) requires procedures to identify and protect archaeological or cultural materials discovered during project activities. This condition helps prevent disturbance to cultural materials and avoids associated cultural or emotional harm, supporting Indigenous health and well-being.

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Wellbeing:

- Accidents and Malfunctions Reporting would support mitigation of potential impacts on Tsleil-Waututh's interests by ensuring timely responses, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

From TWN's perspective, several draft federal and EAC conditions were overly discretionary or reactive, failing to proactively prevent impacts on TWN's rights. TWN also noted that the Crown's focus on avoiding regulatory duplication inadvertently created regulatory gaps.

To address these shortcomings, TWN requested ten clear, enforceable conditions designed to mitigate the Project's residual and cumulative effects on their cultural heritage, stewardship responsibilities, cultural continuity, and the meaningful exercise of Section 35 rights, as captured in TWN's assessment under section 19(4) of the EA Act. In developing the draft table of conditions, EAO considered TWN's proposed conditions and the concerns and effects identified in TWN's assessment, and incorporated measures intended to address those issues where appropriate and within EAO's regulatory mandate. Notwithstanding this, TWN remains concerned that its recommendations are not fully reflected in the current condition framework.

Regarding greenhouse gas (GHG) emissions, TWN acknowledged the utility of macro-level provincial frameworks like the GGIRCA and the BC Output-Based Pricing System. However, TWN emphasized that the EAO's post-certificate reliance on these mechanisms is based on narrow accounting boundaries that de-scope the vast majority of the Project's lifecycle GHG emissions, minimizing the Project's apparent emissions profile and significantly understating its overall carbon footprint.

### EAO Conclusion

Provincial conditions and federal Key Mitigation Measures were developed to address potential effects to First Nations' section 35 rights, and the EAO is of the view that the seriousness of potential effects on those rights would be reduced through implementation of the proposed provincial conditions and federal Key Mitigation Measures.

In consideration of the above analyses and the proposed provincial conditions, federal Key Mitigation Measures and follow-up programs, the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on the interests of Tsleil-Waututh has been adequately avoided, minimized or otherwise accommodated. Based on the engagement undertaken with Tsleil-Waututh Nation on Tilbury Phase 2, as outlined above, the EAO has concluded that it has fulfilled the provincial Crown's duty to consult and accommodate Tsleil-Waututh Nation.

## 16.20 Ts'uubaa-asatx

### 16.20.1 Community Profile

Ts'uubaa-asatx (formerly Lake Cowichan First Nation) is a Hul'q'umi'num-speaking people who descended from Ditidaht and Hul'q'umi'num' ancestors, particularly the Somenos. They have a strong cultural, ethnic, and kinship ties across the Pacific coast of B.C., Lower Mainland, Vancouver Island, Washington, and northern Oregon.

The Ts'uubaa-asatx belong to the Hul'q'umi'num Treaty Group, which also includes Cowichan Tribes, Halalt First Nation, Lyackson First Nation, and Penelakut Tribe. Their traditional territory encompasses parts of south-eastern Vancouver Island, the southern Gulf Islands, a portion of the Lower Mainland, and waters of the Salish Sea to the Sunshine Coast including the lower portion of Howe Sound, Haro Strait, the Strait of Juan de Fuca and the south arm of the Fraser River up to Yale. Hul'q'umi'num Treaty Group has identified that within the area, there is a Core Traditional Territory within which Aboriginal title and related governance over Hul'q'umi'num lands is asserted, and a broader Marine Traditional Territory within which an Aboriginal right to fish and jurisdiction in fisheries management based in traditional law are asserted.

The Ts'uubaa-asatx community is located on a single reserve on the northeastern shore of Cowichan Lake, about 30 km west of Duncan, B.C., and 20 km east of Nitinat Lake on Vancouver Island. Historically, the community faced significant challenges, including a devastating smallpox epidemic in 1860 and the harmful impacts of government and church policies. Despite these difficulties, Ts'uubaa-asatx is working to build a strong and healthy community.

As of December 2022, Ts'uubaa-asatx had 30 registered members, with 18 residing on reserve lands. Additional membership requests suggest the population may be underreported. Traditionally, Ts'uubaa-asatx utilized lands and waters across the Salish Seas, engaging in resource gathering and trade. Key activities included trading for goat wool to create innovative winter clothing and conducting cultural and ceremonial events at significant sites, such as the Fraser River approaches.

Ts'uubaa-asatx assert Aboriginal rights to camp, fish, hunt, and gather food within their traditional territory but note limited current use due to concerns about the current environmental health and availability of traditional foods in the region, pollution, access, and conservation issues. Historical practices, such as following fish runs and hunting seals, continue to influence their cultural and environmental practices in hwi'alasmut tu mukw lhwet (taking care of everything).

The community is actively involved in initiatives to protect their resources, preserve cultural heritage, and reawaken their language, song, and dance traditions. Efforts include documenting traditional sites and signing a Memorandum of Understanding with the province for heritage site conservation. Ts'uubaa-asatx emphasizes its role as sh-hwi'alasmut (caregivers) of its traditional territory while fostering cultural revitalization.

### 16.20.2 Ts'uubaa-asatx Involvement in the Environmental Assessment

During the Early Engagement Phase, Ts'uubaa-asatx identified as a participating Indigenous nation, which afforded Ts'uubaa-asatx certain procedural rights under the Act, as outlined in [Section 5](#): Participating Indigenous Nations.

The EAO worked collaboratively with Ts'uubaa-asatx throughout the assessment process. As part of the TAC, Ts'uubaa-asatx participated in technical meetings throughout the EA for Tilbury Phase 2. Ts'uubaa-asatx and the EAO worked together through joint work planning, consensus-seeking and collaborative drafting of this section of the Report. Ts'uubaa-asatx and the EAO held semi-regular calls throughout the EA to discuss concerns related to Tilbury Phase 2 and to understand, address and resolve issues as they came up. The EAO and IAAC provided funding to support Ts'uubaa-asatx's engagement in the EA process. Through discussions with Ts'uubaa-asatx during the Process Planning phase, it was agreed upon that the EAO would assess project effects on Ts'uubaa-asatx's interests with input and iterative review from Ts'uubaa-asatx, as identified in the Assessment Plan.

The EAO used the following sources in drafting the assessment of Tilbury Phase 2 effects on Ts'uubaa-asatx's interests:

- FortisBC's (Proponent) Revised Application;
- Information submitted during the EA by the Proponent and Ts'uubaa-asatx;
- Conclusions from the EAO's assessment of VCs; and
- Section 11.08 of the Revised Application, along with the Proponent's Indigenous Engagement Report, provides a summary of the Proponent's engagement with Ts'uubaa-asatx.

Section 11.08 of the Revised Application includes a summary of FortisBC's engagement with Ts'uubaa-asatx, who have been involved in the process since July 2019. The section was co-developed with Ts'uubaa-asatx through regular meetings and joint drafting. The Revised Application also includes tables summarizing engagement activities with Ts'uubaa-asatx members, which are further detailed in the Indigenous Engagement Report.

### 16.20.3 Assessment Boundaries

#### Spatial Boundaries

The spatial assessment boundary for each Indigenous interest is the overlap of the First Nation's traditional territory with the combined LAAs and the RAAs defined for the VCs that are linked to the Indigenous interests.

Table 47: Indigenous Interests Assessment Area Boundaries

| Assessment Area            | Definition                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proposed Project Footprint | The Tilbury Phase 2 Footprint is the area directly disturbed by Construction activities, including associated physical works and activities                                                                                                                                                                                                    |
| Local Assessment Area      | The LAA is the combined LAAs defined for the VCs that are linked to the Indigenous interests. This is the area that potential direct and indirect effects from Tilbury Phase 2 on Indigenous interests are assessed.                                                                                                                           |
| Regional Assessment Area   | The RAA is the area of overlap between the Indigenous nation's traditional territory and the combined RAAs defined for the VCs that are linked to the Indigenous interests. This is the area that provides regional context and is the area from which potential cumulative effects from Tilbury Phase 2 on Indigenous interests are assessed. |

Some First Nations have reserves or community locations that are not located within the Indigenous interests' LAAs or RAAs. The LAAs and RAAs are based on the potential of Tilbury Phase 2 to interact with Indigenous interests.

### 16.20.4 Regional Context

Tilbury Phase 2 is located in the Tilbury Industrial Park on Tilbury Island, Delta, B.C. Tilbury Island is located within the south arm of the Fraser River in the regional district of Metro Vancouver, which lies within Hul'q'umi'num Treaty Group's traditional territory. The Hul'q'umi'num Treaty Group describes its Traditional Fishing Territory as including the Fraser River, from Strait of Georgia up Sawmill Creek, north of Yale. Also, the Hul'q'umi'num Treaty Group describes its Traditional Territory as including the South Arm of the Fraser River, including Canoe Pass, up to and including Douglas Island, with lands on the north shore of the South Arm up to Sapperton Channel (New Westminster), the islands in the South Arm of the Fraser River and the south bank of the Fraser River along Canoe Pass up to Deas Island. Ts'uubaa-asatx indicated that, in addition to the Hul'q'umi'num Treaty Group's definition, the territory also includes areas on the south bank of the Fraser River from Deas Island to Douglas Island, including surrounding islands.

### 16.20.5 Ts'uubaa-asatx Interests

The Proponent identified Ts'uubaa-asatx interests to be assessed in the Revised Application through:

- Reviewing guidance from the EAO, including Schedule C – AIR Table 6;
- Documenting Ts'uubaa-asatx interests based on provincial and federal frameworks; and
- Conducting engagement efforts with Ts'uubaa-asatx to gather information on their interests.

The Revised Application assessed the following potential effects to Ts'uubaa-asatx interests:

- **Fish and fish habitat:** Ts'uubaa-asatx is concerned about the potential negative effects of the Tilbury Phase 2 on fish and fish habitat, including the ability to access fishing sites, fish harvesting, and the protection of habitat. They are particularly concerned about the construction phase due to potential impacts from 6PPD-Quinone (6-PPDQ) releases from increased truck trips and noise. Ts'uubaa-asatx is a one-fifth owner in the Hul'q'umi'num' Fisheries Limited Partnership and has seen commercial fishing closures due to cumulative effects in the Fraser River. They are looking for net-positive effects on fish and fish habitat, not just no net loss;
- **Surface water quality:** Ts'uubaa-asatx is interested in preventing potential contamination and changes to surface water quality due to the Tilbury Phase 2, which could affect aquatic and terrestrial organisms, as well as human populations. They advocate for protection, restoration, enhancement, and innovative measures to increase fish habitat in the Fraser River region and are concerned about stormwater management;
- **Groundwater:** Ts'uubaa-asatx is concerned about Tilbury Phase 2's potential impact on aquifers and their connection to the Fraser River, as well as the potential release of contaminants and the need for effective spill response and recovery processes. They believe that cumulative effects from diking and paving in the Lower Mainland affect groundwater;
- **Vegetation:** Ts'uubaa-asatx has an interest in the health and availability of instream and riparian vegetation, as well as their right to gather plants for cultural and traditional uses. They are concerned about the introduction of invasive species from increased truck traffic and stormwater runoff affecting vegetation. They advocate for habitat protection, enhancement, and revegetation with traditional plants;
- **Air quality:** Ts'uubaa-asatx is interested in how Tilbury Phase 2 might affect air quality and subsequently impact their Aboriginal rights to harvest and practice traditional/cultural practices, their health and well-being, and contribute to sensory disturbances;
- **Acoustics:** Ts'uubaa-asatx is concerned about the noise levels from Tilbury Phase 2 and their potential effects on their Aboriginal right to harvesting, their health and well-being, and the habitat of harvested species. They advocate for noise and vibration reduction measures;
- **Soil:** Ts'uubaa-asatx is interested in the potential for soil contamination, erosion, and the impact on archaeological values. They note the cumulative effect of topsoil loss in the Lower Mainland; and
- **Wildlife and wildlife habitat:** Ts'uubaa-asatx is concerned about the health and availability of birds and mammals due to Tilbury Phase 2's construction and its potential impact on their right to harvest these species and their habitat. They advocate for habitat protection and involvement in monitoring programs.

#### Cultural and Heritage interests:

- **Archaeological and heritage resources:** Per Ts'uubaa-asatx knowledge the Tilbury Phase 2 site is located within the Tl'uqtiinus area, a major precontact trade center and community gathering place<sup>45</sup>. They are

<sup>45</sup> See Section 3.1 for naming and jurisdictional context regarding the Historic Indigenous Village Site

concerned about cumulative effects on archaeological and heritage resources in the Lower Mainland and advocate for no further loss of the archaeological record and avoidance of impacts to ancestral remains and sites. They also emphasize the need for culturally trained personnel during inground works, onsite investigations and the following of their archaeology protocol; and

- Culture: Ts'uubaa-asatx is concerned about the potential effects of the Tilbury Phase 2 on their governance and stewardship systems, customs, beliefs, values, language, intergenerational knowledge transfer, and community and cultural cohesion. They emphasize their connection to Tl'uqtinus as an important cultural space. They advocate for cultural recognition and appreciation through design and education, including art installations reflecting cultural importance.

#### Socio-Economic Resources:

- Employment: Ts'uubaa-asatx seeks meaningful training, contracting, and employment opportunities for their members throughout all phases of Tilbury Phase 2, from Construction to Decommissioning. They are concerned about ongoing barriers to pursuing their economic interests and want to see increased First Nation representation in the workforce. They emphasize the need to develop long-term relationships with FortisBC and want to diversify their economic base beyond just hiring;
- Economy: Ts'uubaa-asatx is interested in Tilbury Phase 2's potential to improve their economic conditions and social and community well-being. They want to be an economic partner with FortisBC and seek opportunities to increase their wealth to be a meaningful partner in today's economy. They are interested in bringing forward their traditional practices of commerce into a contemporary setting;
- Land and resource use: Ts'uubaa-asatx has interests in the use and enjoyment of land and resources, including intercommunity relations and trade, commercial and non-commercial fishing, gathering, cultural and ceremonial activities, and their ability to use, develop, and control traditional lands and resources. They emphasize the historical importance of Tl'uqtinus as a trade center. They are also interested in potential impacts on their ability to improve social and economic conditions related to economic activity and government revenue;
- Infrastructure and services: Ts'uubaa-asatx is interested in how Tilbury Phase 2 might affect infrastructure and services, and they advocate for historical issues related to aging infrastructure to be rectified; and
- Human health: Ts'uubaa-asatx is concerned about potential impacts on their health from changes in air quality, drinking water quality, noise, soil quality, and the quality and quantity of country foods. They advocate for responsible practices to improve human health and well-being and are concerned about potential increased use of the area impacting First Nation use areas.

Based on the Revised Application and through discussions with Ts'uubaa-asatx the following valued interests have been identified as having the potential to be affected by Tilbury Phase 2:

- Harvesting and subsistence activities;
- Cultural use sites and areas;
- Social and economic conditions; and
- Indigenous health and well-being.

The assessment of Ts'uubaa-asatx's interests in this section uses these categories. The EAO's assessment of Ts'uubaa-asatx's interests includes describing the Ts'uubaa-asatx interest, current context, potential effects, mitigation, effects analysis. If there is an adverse residual effect a characterization of effects and cumulative effects assessment is also completed. In addition to the EAO's assessment of effects to Ts'uubaa-asatx interests, Ts'uubaa-asatx provided their position on how Tilbury Phase 2 will affect Ts'uubaa-asatx's interests.

## 16.20.6 Harvesting and Subsistence Activities

### Background

Ts'uubaa-asatx has a deep and ongoing relationship with harvesting and subsistence activities, rooted in their cultural identity and traditional practices. They are part of the Coast Salish Peoples and have ancestry connecting them to the Ditidaht and Hul'q'umi'num nations. The Hul'q'umi'num traditional territory encompasses areas around southern Vancouver Island, the Gulf Islands, and a portion of the Lower Mainland, including the Fraser River.

Historically and currently, Ts'uubaa-asatx's traditional fishing practices involve following fish runs from the north end of Vancouver Island through Johnston Strait, the Salish Sea, and into the Fraser River; this includes their use of Tl'uqtinus and Tilbury Island which extends beyond the tenured areas defined in the Tantalus database, meaning their traditional use covers the Project site<sup>46</sup>. They have also identified the approaches to the Fraser River (meaning the lands and waters adjacent to and providing access to the South Arm of the Fraser River, including foreshore areas and nearby routes) as important areas for hunting seals and sea lions and harvesting crabs and other fish. Their traditional activities were intrinsically linked to generating goods for trade, which allowed them to access specific resources from Lower Mainland and up-river groups, such as trading for goat wool. They historically had campsites near the Fraser River that were important for trade, harvesting, and First Nations' intergovernmental and inter-community relations.

### Current Context

The current use of their traditional territory for these activities is limited due to Ts'uubaa-asatx's concerns about; pollution, reduced access, and declines in fish stocks and ongoing infringement of Ts'uubaa-asatx rights due to development and use of Tilbury Island. While Ts'uubaa-asatx does not currently fish in the area, they have historically and have intention to fish within three generations. Ts'uubaa-asatx has found it increasingly difficult to access food, social, and ceremonial fish from the Fraser River due to development and a perceived lack of action by Crown agencies. This difficulty in accessing resources impacts their ability to practice their culture and traditions, including sacred bathing rituals associated with harvesting. The interruption to their tradition of harvesting and processing resources for trade at Tl'uqtinus has also put people out of work and denied them opportunities to garner traditional wealth.

Ts'uubaa-asatx is actively involved in various working groups and initiatives aimed at protecting their resources and advocate for a reawakening of their culture and heritage. Their knowledge forms the basis of their 16-point Lower Mainland Policy<sup>47</sup>, aimed at restoring access and health of resources for safe harvesting free from pollution within three generations. Their advocacy policies related to fish and fish habitat emphasize protection, restoration, enhancement, and innovative measures to increase fish habitat in the Fraser River region. They advocate for best management practices, natural vegetation along the river, and robust spill response.

Ts'uubaa-asatx is concerned about the potential negative effects of development projects, such as Tilbury Phase 2, on their ability to access fishing sites, fish harvesting, and harvesting-based livelihoods. They are also worried about habitat loss and sensory disturbances affecting harvested fish. While they acknowledge avoidance measures by FortisBC might mitigate operational impacts, they remain concerned about Construction phase impacts, such as potential 6-PPDQ release affecting fish habitat.

Ts'uubaa-asatx is a part-owner in the Hul'q'umi'num' Fisheries Limited Partnership, which holds Area E<sup>48</sup> salmon licenses on the Fraser River that have faced closures due to cumulative development effects, highlighting the

<sup>46</sup> Crown Land Registry (Tantalus) <https://www2.gov.bc.ca/gov/content/data/geographic-data-services/land-use/crown-land-registry>

<sup>47</sup> Ts'uubaa-asatx's 16 Point Mainland Policy is a framework based on traditional knowledge, designed to guide environmental assessments, project planning, and engagement, particularly in relation to the South Arm of the Fraser River.

Area E- [https://www.agr.dfo-mnp.gc.ca/fm-gp/maps-cartes/salmon-saumon/images/AreaE\\_biq.gif](https://www.agr.dfo-mnp.gc.ca/fm-gp/maps-cartes/salmon-saumon/images/AreaE_biq.gif)

economic importance of these resources. They are seeking a net-positive effect on fish and fish habitat rather than just no net loss from development projects.

#### Potential Project Effects

The EAO and Ts'uubaa-asatx identified the following pathways of effects, prior to the application of mitigation measures, along with the associated VCs outlined in [Appendix 6](#), that may affect Ts'uubaa-asatx harvesting rights and interests during Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources** from loss or alteration of habitat supporting harvested wildlife, fish, bird, or plant species of cultural or medicinal importance (wildlife and wildlife habitat, fish and fish habitat, and vegetation VCs). Changes to salmon and salmon habitat (fish and fish habitat VC) correlated with impacts to Ts'uubaa-asatx way of life, and surface water quality and quantity and effects from increased sensory disturbances such as dust, noise, odour, visual landscape (air quality, acoustics, land and resource use VCs);
- **Effects to Ts'uubaa-asatx First Nation rights to fish for food, social and ceremonial (FSC) purposes** from habitat loss (wildlife and wildlife habitat, fish and fish habitat, vegetation VCs), increased mortality risks to fish, birds, and marine mammals (fish and fish habitat, wildlife and wildlife habitat VCs), and changes in their behavior, including migration patterns, due to sensory disturbances (acoustics, air quality VCs). Additionally, contamination risks to fish habitat in Tilbury Slough (surface water VC) may further impact traditional harvesting and cultural practices; and
- **Effects on the accessibility and availability of traditional lands and resources** may occur as a result of altered land or water based travel routes, access restrictions, or safety considerations, including changes to navigability and the usability of established travel corridors (land and resource use and surface water VCs), as well as indirect effects from sensory disturbances such as noise, dust, lighting, or visual changes that may discourage travel through otherwise accessible areas (air quality, acoustics, and land and resource use VCs).

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures that FortisBC has proposed in response to potential Tilbury Phase 2-related effects on harvesting and subsistence rights, as mentioned in the section above. A full table of Proponent mitigations can be found in [Appendix A of the Revised Application](#). Below is a summary of Key Mitigation Measures, how they address effects on relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Ts'uubaa-asatx's harvesting and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during Construction and Operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Ts'uubaa-asatx's harvesting and cultural practices;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm-sewer system. These protections support water quality and fish habitat relied on to support Ts'uubaa-asatx's harvesting and cultural practices;

- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by Ts'uubaa-asatx for harvesting and cultural practices;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by Ts'uubaa-asatx for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to Ts'uubaa-asatx's harvesting and cultural practices;
- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat and water quality used by salmon migrating through the Lower Fraser River. These actions support the health and availability of salmon and other fish species central to Ts'uubaa-asatx's FSC harvesting and cultural practices;
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used for harvesting or cultural practices;
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Ts'uubaa-asatx's harvesting and cultural practices; and
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat and vegetation important to Ts'uubaa-asatx's harvesting and cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions to help reduce potential impacts on Ts'uubaa-asatx's harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting (see [Section 8](#) of this Report):

- **Condition 10 (Community Feedback Process)** creates a clear way for Ts'uubaa-asatx to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of Ts'uubaa-asatx's harvesting and cultural practices;
- **Condition 12 (CEMP)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to Ts'uubaa-asatx's harvesting and cultural practices;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to Ts'uubaa-asatx's harvesting and cultural practices;

**Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emissions-control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support Ts'uubaa-asatx's harvesting and cultural practices; and,

**Condition 17 (Dry Street Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project-related roads, which may lower potential impacts on salmon and other fish important to Ts'uubaa-asatx's harvesting and cultural practices.

In addition to the Proponent's mitigation and the provincial conditions, the EAO and Ts'uubaa-asatx identified the following federal Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to Ts'uubaa-asatx's harvesting and subsistence activities:

- **Federal Consideration for Migratory Bird Protections:** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting Ts'uubaa-asatx's harvesting practices and broader ecosystem conditions important to their way of life.

#### The EAO and Ts'uubaa-asatx's Analysis and Conclusions

After considering the proposed mitigation measures, the EAO and Ts'uubaa-asatx concludes that Tilbury Phase 2 could result in the following residual effects to Ts'uubaa-asatx's harvesting and subsistence activities:

- Changes to the experience and preference around the practice of harvesting rights and effects to the quality, quantity, and availability of resources;
- Effects to Ts'uubaa-asatx Aboriginal rights to fish for FSC purposes; and
- Effects on the accessibility and availability of traditional lands and resources.

Ts'uubaa-asatx and the EAO's characterization of the residual effects of Tilbury Phase 2 on Ts'uubaa-asatx harvesting and subsistence activities are summarized in the table below.

Ts'uubaa-asatx wished to provide the following statement regarding reversibility: the Nation does not agree with the characterization of residual effects as fully reversible, noting that their small population means the loss of Elders results in irreversible loss of cultural knowledge. Given the Project's long-term duration, disruptions to intergenerational knowledge transfer over multiple generations could result in effects that are effectively permanent rather than reversible.

Table 48: Summary of residual effect and rationale on Ts'uubaa-asatx and its harvesting and subsistence activities.

| Ts'uubaa-asatx Interest                                                                                                                                                                                                                                                                                                                                           | Assessment Rating*                                                                                                                                                                                                                                                           | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Harvesting and subsistence activities<br>- Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources<br>- Effects to Ts'uubaa-asatx Aboriginal rights to fish for FSC purposes<br>- Effects on the accessibility and availability of traditional lands and resources | Context (resilience): Medium<br>Magnitude: Low<br>Extent: Local<br>Duration: Medium-term<br>Reversibility: Fully reversible<br>Frequency: Continuous<br>Affected Populations: Disproportionate - Elders, knowledge holders, and harvesters.<br>Risk: Low<br>Uncertainty: Low | <p><b>Context:</b> The interest is rated as having a medium resiliency. Ts'uubaa-asatx harvesters historically frequented Tilbury Phase 2 site and surrounding areas for traditional harvesting before extensive industrial development. While current activity is reduced due to existing and ongoing industrial development pressures, the community remains reasonably resilient to additional environmental stresses. If barriers were reduced, harvesting activity would likely increase. The ability for community knowledge holders to transfer the culture to future generations would be negatively affected.</p> <p><b>Magnitude:</b> The magnitude of impact to fishing rights is rated as low because Tilbury Phase 2 is a land-based project, and the only known harvesting activity is limited to minimal plant gathering along the site's edge. Residual effects on vegetation and wildlife VCs are rated negligible to low, so there could feasibly be some detectable impact to Ts'uubaa-asatx harvesters either presently or in the future. Additionally, sensory disturbances, such as acoustic, air quality, land and resource (light and visual disturbance) from the Project are expected to be negligible to low magnitude; these potential impacts could also affect Ts'uubaa-asatx harvesters' use, enjoyment and perceived safety of areas used for</p> |

| Ts'uubaa-asatx Interest                                                                                                           | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p>harvesting. Effects to fish, fish habitat surface water are also rated as negligible.</p> <p><b>Extent:</b> Rated as local, since the spatial scale of residual effects to applicable VCs is limited, the impact on harvesting is expected to remain local, primarily within the immediate Project area.</p> <p><b>Duration:</b> The effects on harvesting will persist for as long as the Tilbury Phase 2 facility remains operational, making them medium-term (40 plus years Operation).</p> <p><b>Reversibility:</b> Most effects, particularly those related to sensory disturbances such as noise and light, would cease if Tilbury Phase 2 were halted or upon decommissioning, making them potentially reversible.</p> <p><b>Frequency:</b> Rated as continuous as while certain effects would be most prominent during Construction, some sensory effects (noise, light disturbance) would occur continuously.</p> <p><b>Affected Populations:</b> Tilbury Phase 2's impacts will primarily affect Ts'uubaa-asatx members who benefit from harvesting practices, though indirect effects may also be felt by those who refrain from harvesting due to perceived environmental degradation in the highly developed area. These effects are considered disproportionate.</p> <p><b>Risk:</b> The likelihood of these effects occurring are low given the effectiveness of proposed mitigation measures, including removal of in-water works, environmental management plans, and air and acoustic controls. With low magnitude and effects confined to a local extent, the overall consequences are expected to be minor. While cumulative pressures in the Fraser River corridor heighten sensitivity, the incremental contribution of Tilbury Phase 2 is small. Therefore, the risk is rated as low.</p> <p><b>Uncertainty:</b> The pathways of effects, such as increased noise, light, vibration, and impacts on harvesters, are well understood. While mitigation measures are expected to be moderately to highly effective, some uncertainty remains regarding their effectiveness in fully addressing harvesters' experiences and perceptions. As a result, the level of uncertainty is rated as low.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### Cumulative Effects

As described in the Background and Current Context section, the lower Fraser River and Tilbury Island area have undergone longstanding industrial development, as well as impacts due to climate change, resulting in existing pressures on environmental conditions and on Ts'uubaa-asatx's harvesting and subsistence activities.

The Revised Application identifies several reasonably foreseeable projects that may adversely affect Ts'uubaa-asatx's harvesting and subsistence interests. These include T1B, which would increase LNG production, and TMJ, which would introduce additional vessel traffic on the Fraser River and further modify the foreshore next to the Project site. After mitigation and conditions have been implemented, the residual effects would be minimally disrupted from current conditions. Both T1B and TMJ could contribute additional sensory disturbances (noise, light, vibration), and impact air quality in areas used by Ts'uubaa-asatx for harvesting. TMJ could further alter fish and fish habitat, vegetation, and vegetation habitat as well as water quality in areas used by Ts'uubaa-asatx for harvesting. Climate change is also expected to continue influencing vegetation, wildlife, and fish resources relied upon by Ts'uubaa-asatx.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project-specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

Ts'uubaa-asatx has stated that there are cumulative effects to their rights associated with the ongoing development in and around Tilbury Island, the Project site, and the foreshore of the Fraser River, which will continue to degrade their ability to transfer knowledge to future generations.

#### Conclusion

Considering the above analyses, FortisBC's proposed mitigation measures, EAO's Table of Conditions and the federal Key Mitigation Measures, the EAO concludes that TP2 would have a minor effect on Ts'uubaa-asatx's harvesting and subsistence activities.

### 16.20.7 Cultural Use Sites and Areas

#### Background

Ts'uubaa-asatx has significant cultural use sites and areas, particularly in the lower mainland, with a rich historical background. The area of Tl'uqtnus, situated on the South Arm of the Fraser River and including Tilbury Island, holds immense cultural importance as a major pre-contact trade center and community gathering place for Ts'uubaa-asatx. Ts'uubaa-asatx emphasizes that their use of Tl'uqtnus and Tilbury Island extends beyond the area defined in the provincial TANTALIS database as an area with cultural significance, which is limited to a site across the Fraser River from the Tilbury Phase 2. Ts'uubaa-asatx asserts that the tenured area in the database does not represent the full extent of their uses and verbal histories associated with the Tl'uqtnus core area.

Historically, Ts'uubaa-asatx traditionally utilized the lands and waters on both sides of the Salish Sea through annual movements for resource access and trading opportunities. Their traditional activities were deeply connected to generating goods for trade, which was essential for accessing resources exclusively available from Lower Mainland and up-river groups. The approaches to the Fraser River were specifically important for hunting seals and sea lions, as well as harvesting crab and other fish. Traditional fishing practices involved following the salmon runs from Johnston Strait down through the Salish Sea and into the Fraser River. Ts'uubaa-asatx has used the South Arm of the Fraser River for trade, harvesting, and First Nation intergovernmental or intercommunity relations, such as naming ceremonies and marriages.

#### Current Context

Tilbury Phase 2 site itself has a history of cultural use by Ts'uubaa-asatx. Sacred bathing rituals related to harvesting and other traditional practices were interrupted by industrial development and the establishment of the existing LNG facility and associated infrastructure. The site was also used for encampment during trade, First Nation Government-to-First Nation Government relations, inter-community relations, and harvesting activities. Furthermore, Ts'uubaa-asatx had a tradition of harvesting and processing resources throughout the year to bring to Tl'uqtnus for trade, a practice that has been interrupted, impacting their livelihoods and ability to garner traditional wealth. While Ts'uubaa-asatx does not currently fish in the area, they have historically and have intention to fish within three generations.

Ts'uubaa-asatx currently asserts Aboriginal rights to camp, fish, hunt, and gather food within their mainland traditional territory based on historic use. However, current use of these areas is limited by members due to concerns about pollution, reduced access, and the conservation status and declines in fish stocks. Ts'uubaa-asatx views Tilbury Phase 2 site as an ongoing and permanent infringement on their use and culture.

They emphasize the need for cultural activities to occur prior to any undertaking.

Ts'uubaa-asatx advocates for the celebration and acknowledgement of local Aboriginal culture through design and education, including the integration of interpretive opportunities within infrastructure. They also highlight the importance of protecting cultural sites, activities, and practices. Overall, the cultural use sites and areas of Ts'uubaa-asatx use “under the wings of our neighbouring nations” (Hereditary Chief G. Livingstone), particularly Tl'uqtinus and the South Arm of the Fraser River, have a deep and continuous history of economic, social, and spiritual significance that extends to the present day.

#### Potential Project Effects

The EAO identified the following pathways of effects, prior to the application of mitigation measures, along with associated VCs outlined in [Appendix 6](#), that may affect Ts'uubaa-asatx's cultural use sites and areas during Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Effects on cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural value:** Potential effects include disturbance or alteration of cultural heritage features and archaeological resources during construction activities such as excavation, grading, and ground disturbance (archaeological and heritage Resources VC). These effects may extend to storied places, habitation sites, and archaeological sites along the south arm of the Fraser River, and Tilbury Island. Additional effects could arise from sensory disturbances such as noise and vibration (acoustic VC), odour and air emissions (air quality VC), dust, and visual changes (Land and Resource Use VC), which may affect the integrity or condition of cultural heritage resources;
- **Loss of access to and disenfranchisement from cultural sites;** While the Project Footprint is not currently accessible for activities like plant harvesting and will remain restricted, the Ts'uubaa-asatx currently uses areas adjacent to the Project Footprint and would likely use the project site if they had the opportunity to and they did use the area historically. The ability for community knowledge keepers to transfer the culture (culture VC) to future generations could be impacted from loss of access to the site from Project related impacts. While sensory disturbances (acoustic, air quality, culture, and land and resource use VCs) are predicted to have low impacts, compared to existing industrial conditions, they do have the potential to alter the experience of Ts'uubaa-asatx members using cultural sites in the vicinity; and
- **Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas;** The predicted levels of sensory disturbance could impact and deter Ts'uubaa-asatx members from engaging in their cultural and spiritual practices (culture VC) at their preferred locations close to the Project site (land and resource use VC).

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed to potential Tilbury Phase 2 related effects on cultural use sites and areas. These include the following:

- **Acoustics (Section 7.3)** Noise reduction measures during Construction and Operation, such as idle reduction policies, equipment muffling, enclosures, and engineered noise controls, help limit disturbance to culturally important areas and activities. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and transmission of knowledge by Ts'uubaa-asatx's;
- **Soil (Section 7.6)** Soil management measures, including erosion control, spill prevention protocols, and careful handling and disposal of contaminated soils, help prevent the migration of pollutants into nearby cultural areas and waterways. Maintaining soil stability and quality supports the protection of culturally important places and landscapes used by Ts'uubaa-asatx;

- **Air Quality (Section 7.2)** The air quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Ts'uubaa-asatx's cultural practices;
- **Land and Resource Use (Section 7.11)** Traffic management planning, noise and lighting controls, and communication regarding project activities help reduce disruptions to access and use of culturally important areas. These measures support Ts'uubaa-asatx's ability to safely access and continue cultural practices within their traditional territory;
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance-find procedures, site protection, and early notification to Indigenous nations, help protect culturally important sites, features, and landscapes. These measures support Ts'uubaa-asatx's ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connection to territory; and
- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support Ts'uubaa-asatx's ability to access, use, and maintain culturally important areas, including places of teaching, ceremony, and connection to land and water.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects to Indigenous cultural use sites and areas (see [Section 8](#) of this Report):

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance;
- **Condition 10 (Community Feedback Process)** to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, light, or disturbances near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of the culturally important landscapes and areas, supporting Ts'uubaa-asatx's continued access to and use of cultural sites during project Construction;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by Ts'uubaa-asatx;
- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emissions-control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan maintains conditions suitable for access to, and use of culturally important areas and sites used by Ts'uubaa-asatx; and,
- **Condition 15 (Chance Find Protocol)** requiring the development and implementation of a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If Ts'uubaa-asatx historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

In addition to the Proponent's mitigations and the provincial conditions, the EAO identified the following Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to cultural use sites and areas:

- **Federal Consideration for Migratory Bird Protections:** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from lighting and project activity, supporting Ts'uubaa-asatx's harvesting practices and broader ecosystem conditions important to their way of life.

#### *The EAO's and Ts'uubaa-asatx's Analysis and Conclusions*

After considering the proposed mitigation measures, the EAO and Ts'uubaa-asatx conclude that Tilbury Phase 2 could result in the following residual adverse effects to Ts'uubaa-asatx's cultural use sites and areas:

- Effects to cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural value;
- Loss of access to and disenfranchisement from cultural sites; and
- Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas.

Ts'uubaa-asatx and the EAO's characterization of the residual effects of Tilbury Phase 2 on cultural use sites and areas are summarized in the table below.

Ts'uubaa-asatx wished to provide the following statement regarding reversibility: the Nation does not agree that residual effects on cultural use sites and areas can be characterized as fully or partially reversible, as their small population means the loss of Elders results in irreversible loss of cultural knowledge, teachings, and connections to culturally important places. Given the Project's long-term duration, disruption to access and use of cultural sites across multiple generations could result in permanent effects on cultural practice and intergenerational knowledge transfer, even if physical conditions are eventually restored.

Table 49: Summary of residual effects and rationale on Ts'uubaa-asatx and its cultural use sites and areas.

| Ts'uubaa-asatx Interest                                                                                                                                                                                                                                                                                                                                                  | Assessment Rating*                                                                                                                                                                                                                                  | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cultural Use Sites and Areas<br><br>- Effects to cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural value<br><br>- Loss of access to and disenfranchisement from cultural sites<br><br>- Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas | Context (resilience): Low<br>Magnitude: Low<br>Extent: Local<br>Duration: Medium-term (40 plus years operation)<br>Reversibility: Partially reversible<br>Frequency: Continuous<br>Affected Populations: Even<br>Risk: Low<br>Uncertainty: Moderate | <p><b>Context:</b> The interest is rated as having low resiliency, recognizing that while Ts'uubaa-asatx culture has demonstrated resilience despite historical impacts, it is difficult to quantify how adaptable members are to additional adverse effects. Cultural strength may have been greater in the absence of cumulative disturbances, and potential linkages between cultural impacts and community health add to the complexity of assessment. Given the historical and ongoing challenges, this rating represents a conservative estimate.</p> <p>An important cultural concept that further illustrates this complexity is 'uy' <i>shqwaluwun</i>, often translated, imperfectly, as "good thoughts, good manners, good behaviour." While there is no direct English equivalent, the term reflects a holistic state of balance and alignment of body, mind, and spirit, similar in some ways to Eastern understandings of <i>chi</i>. This principle is central to cultural and community well-being. When external pressures disrupt the conditions that support 'uy' <i>shqwaluwun</i>, the effects are not only material but also spiritual and emotional, making resiliency more challenging to assess through conventional metrics.</p> <p><b>Magnitude:</b> The magnitude is rated as low because Tilbury Phase 2 site is located on fee simple land within a heavily impacted regional area where cumulative effects have already altered baseline conditions. While the project may result in negligible to low magnitude residual effects related to air quality, human health, fish, vegetation and wildlife and their habitats as</p> |

| Ts'uubaa-asatx Interest                                                                                                           | Assessment Rating* | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                   |                    | <p>well as acoustic and visual disturbance, these effects are expected to result in minor to undetectable modifications to existing conditions. They are not anticipated to introduce significant new disturbances that would meaningfully affect Ts'uubaa-asatx members if cultural activities were to occur in the vicinity of the Project site, either under current conditions or in the foreseeable future.</p> <p><b>Extent:</b> Rated as local, as the anticipated residual effects are geographically confined to Tilbury Phase 2 vicinity and immediate surrounding areas. While Ts'uubaa-asatx members continue to maintain connections across the Lower Fraser, the predicted effects are unlikely to extend beyond the LAA for cultural use.</p> <p><b>Duration:</b> The effects on cultural use sites and areas may persist beyond two years, aligning with the Operation and Decommissioning phases, making them medium-term (40 plus years operation).</p> <p><b>Frequency:</b> Rated as continuous, particularly for loss of site use for cultural purposes, which is an ongoing effect. Sensory disturbances (e.g., noise, light) may be either continuous or irregular, depending on project activities.</p> <p><b>Reversibility:</b> Most sensory-related disturbances (e.g., noise, light) would be partially reversible following project Decommissioning. However, cultural impacts linked to the loss of access or disruption to traditional practices may be irreversible.</p> <p><b>Affected Populations:</b> The effect is expected to be evenly distributed among Ts'uubaa-asatx members. While direct impacts would disproportionately affect those actively practicing or seeking to practice their culture, indirect effects could extend to all members due to the interconnected nature of Ts'uubaa-asatx's cultural identity.</p> <p><b>Risk:</b> The likelihood of direct Tilbury Phase 2-related impacts on cultural use sites is low due to the application of proposed mitigation measures, and the overall consequence is minor given the negligible to low magnitude of predicted VC residual effects. Therefore, the risk is rated as low.</p> <p><b>Uncertainty:</b> The pathways of effects, such as the loss of intergenerational knowledge transfer, sensory-related disturbances on cultural effects are inherently challenging to quantify and may be subject to individual and community-specific experiences that are difficult to predict with certainty. While mitigation measures are expected to be moderately to highly effective, some uncertainty remains regarding the cultural transmission of knowledge to future generations, therefore the uncertainty rating is moderate.</p> |
| * Note: Criteria and assessment ratings are defined in <a href="#">Appendix 3 - Residual Effects Characterization Definitions</a> |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### Cumulative Effects

The historical context of environmental degradation and land-use changes has already affected Ts'uubaa-asatx's cultural use sites and areas, as detailed in the Background and Current Context section above. Ts'uubaa-asatx experiences limited access and altered ecological conditions along the Fraser River, and the degraded state of sites like Tilbury Island due to industrial development. These past and present impacts have reduced the ability of Ts'uubaa-asatx members to fully utilize culturally important locations and have hindered the transmission of Indigenous Knowledge.

As stated above, FortisBC notes that two foreseeable projects, T1B and TMJ, are expected to modify the Tilbury Island foreshore prior to construction of Tilbury Phase 2. These developments are expected to introduce additional

sensory disturbance (noise, light, vibration) affecting nearby cultural site access and use. T1B could remove vegetation, impacting culturally important plants and wildlife habitat, while TMJ shipping activities may increase aquatic disturbances, with potential effects on fish populations and cultural connections to the Fraser River. The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

### Conclusion

Considering the above analyses, FortisBC's proposed Proponent mitigation measures, EAO's Table of Conditions, and KMMs, therefore, the EAO predicts that the Project will have a minor residual effect on the cultural use sites and areas of Ts'uubaa-asatx.

## 16.20.8 Social and Economic Conditions

### Background

Ts'uubaa-asatx's social and economic conditions have a rich historical background that continues to influence their present circumstances and future aspirations.

Ts'uubaa-asatx's traditional activities were intrinsically linked to generating goods for trade, which was essential for accessing specific resources only available from Lower Mainland and up-river groups. They had traditional trading ties with up-river groups, exchanging goods for items like goat wool. Approaches to the Fraser River were important for hunting seals and sea lions, and harvesting crab and other fish, following the salmon runs. They also had historical camp sites near the Pattullo Bridge Replacement project, serving as important locations for trade, harvesting, and intergovernmental or intercommunity relations. The tradition of harvesting and processing resources throughout the year to bring to Tl'uqtinus for trade has been interrupted, impacting their livelihoods and ability to garner traditional wealth.

However, significant events have shaped their current social and economic conditions. In 1860, the community was significantly affected by a smallpox epidemic, and its population has remained small for the past 80 years. As of December 2022, Ts'uubaa-asatx had 30 registered members, with 18 living on their reserve on the northeastern shore of Cowichan Lake. Despite their small size, they are actively working to build a strong and healthy community and are seeing potential membership requests.

### Current Context

Currently, Ts'uubaa-asatx asserts Aboriginal rights to camp, fish, hunt, and gather food within their mainland traditional territory based on historic use. However, current use of these areas is limited by members due to concerns about pollution, reduced access, and the conservation status and declines in fish stocks. They report increasing difficulties in accessing food, social, and ceremonial fish from the Fraser River, partly due to development. Ts'uubaa-asatx also notes that the Southern Vancouver Island, the Gulf Islands, and the Lower Mainland are increasingly out of reach for First Nations to live, work, further their education, recreate, or visit, and that many Indigenous peoples are experiencing homelessness.

Despite these challenges, Ts'uubaa-asatx has a clear vision for economic development, aiming to enhance the quality of life for their community while considering cultural and traditional ways. Their strategies include diversifying their economic base, maximizing benefits from existing businesses, developing new businesses that create employment, and pursuing strategic alliances, adhering to green development principles. They are investing in diversification through joint ventures.

Their economic development focuses on residential development and tourism-related activities on their reserve lands and the Lake Cowichan Area, including trail building, marina development, and retail. They are also seeking economic development opportunities through negotiations with the government. Ts'uubaa-asatx advocates for opportunities to increase their wealth and be a meaningful partner in today's economy.

Ts'uubaa-asatx has also identified the need to acquire land in the lower mainland to re-establish a residential area for members pursuing educational and economic opportunities in the area. Their educational objectives include promoting education within the forestry and natural resources sectors. They have identified key target groups for training, including Indigenous youth, youth-in-care, and women.

In their interactions with FortisBC regarding Tilbury Phase 2, Ts'uubaa-asatx emphasizes the need to bring their traditional practices of commerce, specific to the project site, into a contemporary setting. They are actively seeking meaningful training, contracting, and employment opportunities from the project, from Construction to Decommissioning, and expect regular reporting on these achievements. They are also advocating for the re-establishment of a place of residence for their members in the Lower Mainland and engagement as economic partners. Ts'uubaa-asatx views Tilbury Phase 2's site as an ongoing and permanent infringement on their use and culture. They advocate for acknowledging their culture through design and education, including interpretive opportunities.

Overall, Ts'uubaa-asatx's social and economic conditions are shaped by a history of trade and resource use in the Lower Mainland, significant historical disruptions, a current small population based primarily on their reserve, and ongoing limitations to accessing their traditional territories and resources. They are actively pursuing economic development opportunities and advocating for their rights and interests in the context of development projects, with a strong focus on revitalizing their culture and improving the well-being of their members.

#### Potential Project Effects

The EAO identified the following effect pathways, prior to the application of mitigation measures, along with associated VCs in [Appendix 6](#) that may affect Ts'uubaa-asatx's social and economic conditions during Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Effects to Ts'uubaa-asatx's employment opportunities, Indigenous businesses, procurement opportunities, and Ts'uubaa-asatx revenue:** Tilbury Phase 2 could positively affect Ts'uubaa-asatx's employment and business opportunities, depending on member participation and access to contracts (employment and economy VC). Indigenous workers are also more likely to be in construction-related jobs. However, smaller Indigenous businesses, including those linked to Ts'uubaa-asatx, may face challenges competing for workers or meeting Tilbury Phase 2 demands;
- **Effects to Ts'uubaa-asatx's future aspirations for sites or areas surrounding Tilbury Phase 2:** Potential residual effects, both real and perceived, from Tilbury Phase 2 could affect Ts'uubaa-asatx's aspirations for land and water restoration in the Lower Fraser region (land and resource VC);
- **Effects to Ts'uubaa-asatx's ability to improve social and economic conditions:** Tilbury Phase 2 may support Ts'uubaa-asatx's efforts to improve social and economic conditions by creating employment, training, and business opportunities. Increased demand for skilled workers could also boost interest in trades training. (employment and economy VC);

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that FortisBC has proposed in response to potential Tilbury Phase 2 related effects on social and economic conditions. These include the following:

- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports Ts'uubaa-asatx's food security, cultural identity, and health by safeguarding salmon and other species essential to FSC harvesting;

- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting Ts'uubaa-asatx's cultural continuity and nutritional well-being;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to Ts'uubaa-asatx's physical health and cultural practices;
- **Human Health VC (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect Ts'uubaa-asatx members' physical, cultural, and mental health;
- **Land and Resources VC (Section 7.11)** Mitigation measures that manage traffic, noise, lighting, and spill risks help maintain safe access and stable land use conditions, supporting Ts'uubaa-asatx's long-term aspirations for land and water restoration and reducing stressors that can affect well-being;
- **Employment and Economy VC (Section 7.10)** Employment, training, and procurement measures create pathways for Ts'uubaa-asatx members and businesses to participate economically in the project, supporting improved social conditions and community well-being;
- **Infrastructure and Services (Section 7.12)** Measures that manage worker demand on housing, services, and emergency response help avoid added pressure on local systems, reducing potential socio-economic impacts on Ts'uubaa-asatx and supporting health and community stability; and
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Ts'uubaa-asatx's well-being.

In addition to the Proponent's mitigation measures, the EAO developed further conditions that would mitigate potential effects on social and economic conditions:

- **Condition 10 (Community Feedback Process)** provides Ts'uubaa-asatx with a clear mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely responses and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting ongoing social and economic interests;
- **Condition 12 (CEMP)** requires mitigation measures to manage dust, noise, traffic, spills, surface water, erosion, and wildlife interactions during Construction. These measures help minimize construction-related disturbances that could affect community and social well-being of members;
- **Condition 13 (OEMP)** requires ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation. By limiting long-term environmental disturbances, this condition supports stable environmental conditions that protect Ts'uubaa-asatx's social and economic interests;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality mitigates sensory disturbances, such as dust and odors, and prevents particulate deposition that may impact traditional resources. This supports the social and economic conditions of the Ts'uubaa-asatx by preserving the cultural acceptability and integrity of harvested species, ensuring harvesting does not become more difficult or costly to access;
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If The Ts'uubaa-asatx historically used the area, this condition helps prevent disturbance to cultural materials and avoids associated social harm;

- **Condition 16 (First Nation and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support Ts'uubaa-asatx's socio-economic well-being through increased access to jobs, skills development, and business opportunities associated with Tilbury Phase 2; and,
- **Condition 17 (Dry Street Sweeping Report)** requires FortisBC to submit a report on the effectiveness Dry Street Sweeping to mitigate the effects of 6-PPDQ on fish within eighteen months of a Certificate being issued. By informing measures to protect downstream aquatic environments, this condition supports Ts'uubaa-asatx's social and economic interests by helping maintain confidence in environmental quality and minimizing potential concerns related to damage to culturally important harvested species and waterways.

#### The EAO's and Ts'uubaa-asatx's Analysis and Conclusions

After considering the mitigation measures and potential effects described above, the EAO and Ts'uubaa-asatx concluded that while Tilbury Phase 2 may result in negligible effects on Ts'uubaa-asatx's social and economic conditions, there is also potential for positive effects. These positive effects are expected in addition to the proposed mitigation measures are sufficient to offset any negative impacts with a reasonable degree of certainty. As a result, it was determined that there would be no residual impacts on the contemporary social and economic conditions, and therefore, a characterisation of effects or cumulative effects assessment was not conducted. Ts'uubaa-asatx stated that there could be a positive effect in terms of long-term relationship between Ts'uubaa-asatx and FortisBC, not specific to this Project.

#### 16.20.9 Ts'uubaa-asatx Health and Well-Being

##### Background

Ts'uubaa-asatx has a strong interest in the health and well-being of its members, and Tilbury Phase 2 has prompted discussions and identification of potential effects on this interest. Ts'uubaa-asatx collaborated with FortisBC to incorporate their views and concerns into the Revised Application. This collaboration involved regular meetings to co-draft input and address Ts'uubaa-asatx's biggest areas of concern. The unique layout of Section 11.11 reflects decisions agreed upon by both parties.

Ts'uubaa-asatx's views on health and well-being are linked to several factors:

- **Environmental Quality and Traditional Practices:** Ts'uubaa-asatx's health and well-being are closely tied to the health of the environment and their ability to practice their traditional ways of life, including harvesting. They express concerns that Tilbury Phase 2 could negatively impact air quality, noise levels, water and soil quality, and the availability and quality of country foods. These environmental changes could affect their Aboriginal Rights to harvest wildlife and plants;
- **Historical Context of Health Impacts:** Ts'uubaa-asatx stated historic removal from traditional foods is linked to certain health conditions, including higher rates of diabetes and other conditions among Indigenous populations. In 1860, the community was significantly affected by a smallpox epidemic, and their population remained small. These historical factors contribute to their current vulnerability and concerns about further health impacts;
- **Sensory Disturbances:** Sensory disturbances such as noise, odour, dust, and visual landscape are identified as potential stressors that can affect their health and well-being and the exercise of their rights. Light pollution and trespass are also mentioned as potential stressors with various health-related issues;
- **Infrastructure-related Concerns:** Ts'uubaa-asatx expresses concern that new development does not reflect their community's values, which may weaken social cohesion and cultural practices. They also note that large projects can be linked to increased risks such as homelessness, drug activity, and human trafficking, which could affect the health and well-being of their members;

- **Cumulative Effects:** Ts'uubaa-asatx believes that Tilbury Phase 2 will contribute to ongoing and cumulative effects across all VCs, which should be considered to a greater extent in the residual and cumulative effects characterization, including impacts on health. They view First Nations as a more vulnerable population that may disproportionately experience these cumulative effects;
- **Access to Traditional Foods and Harvesting Areas:** They express concerns about reduced access to food, social, and ceremonial fish from the Fraser River due to development, which impacts their health. Changes to vegetation could also affect the health and availability of plant species, impacting their well-being and traditional ways of life; and
- **Importance of Consultation and Mitigation:** Ts'uubaa-asatx emphasizes the need for their agreement on the effectiveness of proposed mitigations and advocates for a net-positive effect, not just no net loss. They are actively involved in proposing mitigation measures to protect the environment, which they see as essential for safeguarding their health and well-being.

Ts'uubaa-asatx is actively working to build a strong and healthy community despite a history of challenges. Their engagement in the EA process highlights their commitment to protecting the health and well-being of their members in the face of proposed developments.

#### Potential Project Effects

The EAO identified the following effects pathways, prior to application of mitigation measures, along with the associated VCs in [Appendix 6](#) that may affect Ts'uubaa-asatx's health and well-being during Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Effects on the quality, quantity, and availability of harvested country foods:** This potential effect relates directly to the VCs of vegetation, wildlife and wildlife habitat, and fish and fish habitat. Ts'uubaa-asatx has stated they have historically harvested (including fishing, hunting, and gathering plants) on the South Arm of the Fraser River, including the project site. As per EAO's assessment, there is expected to be a negligible interaction between the Tilbury Phase 2 activities and Ts'uubaa-asatx health and well-being related to the quality, quantity, and availability of resources;
- **Effects on the value and quality (including perceived quality) of country foods, including sacred plants:** The use of country foods, including sacred plants, is central to Ts'uubaa-asatx well-being. This potential effect relates to human health and to valued components associated with contamination pathways, including air quality, acoustic environment, surface water, groundwater, and soil, as well as vegetation, wildlife, and fish and their habitats. It encompasses potential changes to the quality, quantity, and availability of plants, wildlife, and fish, as well as how these are perceived during harvesting practices. The EAO predicts negligible impacts on the biophysical quality, quantity, and availability of country foods, while acknowledging that residual effects are not entirely avoided. Although perceptions can influence harvesting behaviour, the EAO anticipates minimal interaction between Tilbury Phase 2 and perceived impacts on country food quality, citing limited biophysical effects, the area's existing industrial character, and the elimination of waterborne deliveries;
- **Effects on air quality, noise and water quality:** These effects are directly linked to the VCs of air quality, acoustic, surface water, and groundwater. EAO predicts that some Ts'uubaa-asatx members could be minimally affected by changes to water quality or noise during all phases of the Project. Air quality effects are expected to be negligible-to-minor, with low-magnitude SO<sub>2</sub> emissions not anticipated to noticeably impact Ts'uubaa-asatx interests. Noise effects are also predicted to be low in magnitude and not detectable to all Indigenous people that find themselves near the site; and

- **Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites:** This overarching effect relates to human health, culture, harvesting and subsistence activities, and cultural use sites and areas. EAO acknowledges Ts'uubaa-asatx's view that practicing traditions supports health and well-being and concludes that the Project will have negligible (but not non-existent) interaction with traditional activities or access to cultural sites. As such, minimal effects on health and well-being tied to traditional practices are anticipated. EAO also notes potential positive effects on socio-economic health determinants through increased employment and economic opportunities for Ts'uubaa-asatx members.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on Ts'uubaa-asatx health and well-being. These include the following:

- **Air Quality (Section 7.2)** The air quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support Ts'uubaa-asatx's health and well-being;
- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures and early notification to Indigenous nations, help protect culturally important sites and landscapes that support Ts'uubaa-asatx's broader connection to territory and the continuity of practices tied to health and well-being;
- **Acoustic (Section 7.3)** Noise reduction measures during Construction and Operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support Ts'uubaa-asatx's connection to their cultural practices that impact health and well-being;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm sewer system. These protections support water quality and fish habitat relied on to support Ts'uubaa-asatx's connection to cultural practices, health and well-being;
- **Soil (Section 7.6)** Soil management measures, such as erosion control, spill prevention, and careful handling of contaminated soils, help prevent sediment or pollutants from entering nearby watercourses. Protecting soil and runoff quality supports the health of fish habitat and vegetation relied on by Ts'uubaa-asatx for strong connections to cultural practices and knowledge transfer to future generations, Ts'uubaa-asatx's health and well-being;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by Ts'uubaa-asatx for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to Ts'uubaa-asatx's harvesting, cultural practices, and their health and well-being;

- **Fish and Fish Habitat (Section 7.9)** Avoiding in-water works and implementing erosion, sediment, and spill-prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the health and availability of salmon and other fish species central to Ts'uubaa-asatx's FSC harvesting, cultural practices, and health and well-being;
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used for harvesting or cultural practices, which Ts'uubaa-asatx rely on for transfer of knowledge impacting their health and well-being;
- **Culture (Section 7.14)** Mitigation that limits sensory disturbance, protects cultural sites, and maintains landscape integrity helps support cultural practices and intergenerational knowledge transfer linked to Ts'uubaa-asatx's harvesting, cultural practices, health, and well-being;
- **Human Health (Section 7.15)** Mitigation that reduces exposure to contaminants, noise, and other stressors, while supporting access to traditional practices, helps protect Ts'uubaa-asatx members' physical, cultural, and mental health; and,
- **Groundwater (Section 7.5)** Protecting groundwater from contamination helps maintain the quality of ecosystems that support fish, plants, and wildlife relied on for Ts'uubaa-asatx's subsistence and health.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on Indigenous health and well-being:

- **Condition 10 (Community Feedback Process)** provides Ts'uubaa-asatx a clear and transparent mechanism to raise concerns related to community well-being, safety, access, or environmental disturbance. Timely response and reporting help address issues such as noise, dust, traffic, or perceived environmental effects early, reducing stress and supporting Indigenous health and well-being;
- **Conditions 12 and 13 (Construction and Operations Environmental Management Plans)** require ongoing management of noise, air quality, lighting, water quality, spills, and traffic during Operation and Construction phases. It will also require an emergency communication protocol with Ts'uubaa-asatx to be developed by the Holder in consultation with the Nation. By ensuring timely, transparent communication and coordinated response in the event of incidents, these conditions help reduce uncertainty and anxiety related to catastrophic risks, supporting a sense of safety, control, and trust that underpins mental and emotional well-being;
- **Condition 14 (Air Quality Management Plan)** requires emissions controls and monitoring to manage air contaminants during Operation. Maintaining air quality helps protect respiratory health and reduce concerns related to environmental safety, supporting Ts'uubaa-asatx's health and overall well-being; and,
- **Condition 15 (Chance Find Protocol)** requires procedures to identify and protect archaeological or cultural materials discovered during project activities. If Ts'uubaa-asatx historically used the area, this condition helps prevent disturbances to cultural materials and avoids associated cultural or emotional harm, supporting Ts'uubaa-asatx's health and well-being.
- **Condition 16 (Indigenous and Local Economic Inclusion and Monitoring Plan)** requires the development and implementation of a plan to support economic participation of First Nations and local communities. By outlining employment, contracting, and training strategies, this condition helps support socio-economic well-being;

The EAO identified the following federal Key Mitigation Measures that would mitigate potential effects to Health and Well-being:

- **Accidents and Malfunctions Reporting** would support mitigation of potential impacts on the Nation's interests by ensuring timely responses, incorporation of Indigenous perspectives, and continuous improvement to reduce the risk and severity of future incidents.

#### Ts'uubaa-asatx and the EAO's Analysis and Conclusions

After consideration of the mitigation measures and potential effects, described above, the EAO and Ts'uubaa-asatx identified the following residual effects:

- Effects on the quality, quantity, and availability of harvested country foods;
- Effects on the value and perceived quality of country foods;
- Effects on air quality, noise and water quality; and
- Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites

Ts'uubaa-asatx and the EAO's characterization of the residual effects of Tilbury Phase 2 on Ts'uubaa-asatx health and well-being are summarized in the table below.

Ts'uubaa-asatx wished to provide the following statement regarding reversibility: the Nation does not agree that residual effects on health and well-being can be characterized as fully or partially reversible, as their small population means the loss of Elders results in irreversible loss of cultural knowledge, practices, and connections that are foundational to community well-being. Given the Project's long-term duration, disruptions to intergenerational knowledge transfer and traditional ways of life across multiple generations could result in lasting or permanent effects on the health and well-being of Ts'uubaa-asatx members, even if environmental conditions improve over time.

Table 50: Summary of residual effects and rationale on Ts'uubaa-asatx and its health and well-being.

| Ts'uubaa-asatx Interest                                                                                                                                                                                                                                                                                                                                                                                                   | Assessment Rating*                                                                                                                                                                                                                                                                  | Rationale                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Health and well-being</p> <ul style="list-style-type: none"> <li>- Effects on the quality, quantity, and availability of harvested country foods</li> <li>- Effects on the value and perceived quality of country foods</li> <li>- Effects on air quality, noise and water quality</li> <li>- Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites</li> </ul> | <p>Context (resilience): medium</p> <p>Magnitude: Low</p> <p>Extent: Local</p> <p>Duration: medium-term</p> <p>Reversibility: Partially</p> <p>Frequency: Continuous/Intermittent</p> <p>Affected Populations: disproportionately</p> <p>Risk: Low</p> <p>Uncertainty: moderate</p> | <p><b>Context:</b> The Ts'uubaa-asatx has experienced significant environmental and social challenges, reducing their resilience to further adverse effects. However, their efforts to maintain cultural connections and recent improvements, such as gaining access to clean drinking water, indicate a medium capacity for resiliency.</p> <p><b>Magnitude:</b> Rated as low because the Project is expected to have negligible to low magnitude impact on air quality and human health VC's and Ts'uubaa-asatx do not regularly use the area close to the Project site. Additionally, the project is anticipated to positively impact socio-economic determinants of health by increasing employment and economic opportunities.</p> <p><b>Extent:</b> The potential effects are rated as local since effects would be limited to areas directly surrounding Tilbury Island and its immediate zone of influence on the Fraser River. They are not expected to spread across the wider territory or affect regional cultural or health systems.</p> <p><b>Duration:</b> Potential effects, including environmental changes and perceptual impacts, are expected to persist throughout the project's 40 plus years of Operation, making them medium-term. While sensory disturbances may end after Decommissioning, impacts on cultural well-being could have lasting effects.</p> <p><b>Frequency:</b> The frequency of effects is both continuous and intermittent. Some stressors, such as noise and visual changes, may be continuous throughout the operational phase, while others, particularly those during Construction, may be intermittent. Additionally, the perception of environmental degradation could result in continuous effects on well-being.</p> <p><b>Reversibility:</b> The effects are considered partially reversible. Sensory disturbances, such as noise and light, are expected to be fully reversible after decommissioning. However, impacts on cultural well-being, including loss of connection to traditional practices and perceived environmental degradation, may be irreversible or require a long time to recover.</p> <p><b>Affected Populations:</b> While positive economic effects may benefit a broad range of Ts'uubaa-asatx members, those engaged in traditional harvesting and cultural practices or with pre-existing health vulnerabilities could be disproportionately impacted by negative environmental changes or perceived risks.</p> <p><b>Risk:</b> The likelihood of a negative effect occurring is low given Ts'uubaa-asatx members do not frequent the area close to the site where air quality and human health will be most impacted; as well as effective mitigations, conditions and permitting requirements. The consequences are likely to be minor due to negligible to low magnitude effects to relevant VC's and potential for some positive effects, such as increased economic activity, therefore the risk is low.</p> <p><b>Uncertainty:</b> The assessment of potential effects on Ts'uubaa-asatx's health and well-being carries a moderate degree of uncertainty primarily due to the inherent challenges in quantifying cultural effects, their subsequent impacts on well-being, and the impacts associated with knowledge transfer to future generations from community knowledge holders. These impacts can vary significantly based on individual and community-specific experiences, making precise predictions.</p> |

| Ts'uubaa-asatx Interest                                                                                                           | Assessment Rating* | Rationale |

### Cumulative Effects

As noted in the Background and Current Context sections above, historic and ongoing industrial development in the Lower Fraser region has contributed to long-standing cumulative impacts on Ts'uubaa-asatx's Indigenous health and well-being. Pollution, habitat degradation, declining access to traditional foods, and increasing pressures on land and water have already created a context in which Ts'uubaa-asatx's health and well-being outcomes are challenged.

FortisBC notes that two foreseeable projects, T1B and TMJ, are expected to result in cumulative impacts to air quality and associated human-health pathways, and these additional sensory and environmental stressors could further affect Ts'uubaa-asatx members' overall health and well-being, especially given existing regional pressures on traditional foods, respiratory health, and culturally grounded wellness practices. These projects may increase noise, light, and vegetation loss and further affect wildlife and aquatic resources, all of which play a role in supporting Ts'uubaa-asatx's cultural health practices and social well-being.

The EAO also notes that the Province committed to meaningfully addressing and managing cumulative effects as a result of TMJ in partnership with federal and regional/local governments, as well as Indigenous Groups in the lower Fraser River.

The EAO recognizes the project-specific effects alongside existing and anticipated pressures in the area. Based on the above considerations and given the localized extent of effects, limited VC residual effects, and mitigation measures and conditions, Tilbury Phase 2 is not expected to materially alter cumulative conditions.

Ts'uubaa-asatx has stated concerns that contamination and pollution of their traditional harvesting areas, which has reduced the quality and availability of country foods and directly affects their diet, cultural practices, and overall well-being. At the same time, settlement, urban development, and industrial activities have resulted in the loss of and restrictions on access to traditional lands and resources, disrupting cultural practices and the intergenerational transmission of Ts'uubaa-asatx Knowledge that is integral to health and well-being. These impacts are compounded by a decline in economic resources associated with the loss of the once-abundant fishery, further affecting social and economic conditions that are key determinants of health.

### Conclusion

Considering the above analyses, including proposed Proponent mitigations, and EAO's conditions, the EAO concludes that the Project will have a minor residual effect on Ts'uubaa-asatx's health and well-being.

### 16.20.10 Conclusions

Considering the above analyses and the good faith execution of the EAO's Table of proposed provincial conditions, identified KMMs to inform federal conditions under the IAA 2019, the EAO and Ts'uubaa-asatx concluded that the potential for adverse effects of Tilbury Phase 2 on the Ts'uubaa-asatx interests is anticipated to have the following impacts:

- Minor residual effects to Ts'uubaa-asatx harvesting and subsistence activities;
- Minor residual effects to Ts'uubaa-asatx cultural use sites and areas; and
- Minor residual effects to Ts'uubaa-asatx Indigenous health and well-being.

Considering the above analyses the EAO concluded that the potential for adverse effects of Tilbury Phase 2 on Ts'uubaa-asatx interests have been adequately avoided, minimized or otherwise accommodated. Based on the engagement undertaken with Ts'uubaa-asatx on Tilbury Phase 2, as outlined above in Section 16.20.2 the EAO has concluded that it has fulfilled the provincial Crown's duty to consult with Ts'uubaa-asatx.

## 16.21 WSÁNEĆ Nations

### 16.21.1 Community Profiles

The WSÁNEĆ Nations are comprised of Malahat Nation, Pauquachin First Nation, Tsartlip First Nation, STÁUTW First Nation (STÁUTW) and Tseycum First Nation (Tseycum). The WSÁNEĆ People, also known as Saltwater People<sup>49</sup> are descendant signatories of the Douglas Treaties, signed between 1850 and 1854<sup>50</sup>. They are based on the southwest coast of Vancouver Island, and the traditional territory extends across the Salish Sea to the lower arm of the Fraser River. WSÁNEĆ Nations have strong kinship, cultural and ethnic ties with other Indigenous nations on the Pacific coast of B.C., Lower Mainland, Vancouver Island, Washington State, and northern Oregon State<sup>51</sup>.

Culture and traditions are the roots of the WSÁNEĆ Nations, with community members practising their culture in many ways like involvement in cultural activities, abilities in traditional skills like stories of lessons, histories, and teachings orally passed on from Elders to youth. The longhouse is an important place for WSÁNEĆ Nations' people to gather and participate in cultural events and ceremonies.

### 16.21.2 WSÁNEĆ Nations Involvement in the Environmental Assessment

During the Early Engagement Phase, the WSÁNEĆ Nations did not identify as participating Indigenous nations.

The EAO and the IAAC provided funding to support the WSÁNEĆ Nations' engagement in the environmental assessment process. They provided documents, project updates, the draft Initial Project Description and DPD, and Process Planning documents for review. During the Process Planning phase, it was agreed that the EAO would assess the Project effects on WSÁNEĆ Nations' Indigenous interests, as identified in Section 4 of the Assessment Plan.

On October 31, 2024, STÁUTW requested to be identified as a participating Indigenous nation and to assess the effects of Tilbury Phase 2 on its interests under Section 19(4) of the Act. The EAO updated the Process Order and Assessment Plan on May 5, 2025, in response to these requests. STÁUTW was also invited to TAC meetings starting at the beginning of the Application Review Phase.

### 16.21.3 Malahat First Nation - Community Profile

Malahat Nation is a Coast Salish Indigenous community and one of the five WSÁNEĆ (Saanich) Nations, located between Victoria and Mill Bay, B.C. The nation's two reserves are nestled along the western shore of the Saanich Inlet beneath the sacred Malahat mountain range, a site of deep cultural and spiritual importance. Malahat, with 367 family ties with the WSÁNEĆ Peoples of the Saanich Peninsula and secondary familial and cultural connections to the Quw'utsun people<sup>52</sup>. Malahat members speak SENĆOŦEN, Hul'q'umi'num' and Samish languages.<sup>53</sup> Malahat is a Te'mexw Treaty Association which is in stage 5 of the B.C. treaty negotiation process. Malahat is working to prioritize cultural preservation and revitalization as well as economic development.

Malahat Nation identifies as a marine-based Nation with longstanding cultural, familial, and harvesting connections throughout the Salish Sea. Malahat Nation indicated that its members historically travelled extensively by canoe to support harvesting, trade, cultural exchange, and the maintenance of family relationships with neighbouring Coast Salish Nations, including communities located throughout the Gulf Islands, San Juan Islands, Boundary Bay, Roberts

Bank, and the Fraser River estuary. Malahat Nation continues to support cultural revitalization initiatives, including canoe-building programs and participation in Tribal Canoe Journeys, which facilitate the transmission of cultural knowledge and strengthen connections between generations.

As stewards of the Salish Sea, the Malahat places strong emphasis on sustainable fisheries and marine harvesting, which serve not only as sources of sustenance and income, but also as vital tools for transmitting cultural teachings to future generations. Through these integrated efforts in governance, economic growth, cultural revitalization, and environmental stewardship, Malahat continues to build a strong, self-determined, and thriving community.

#### 16.21.4 Pauquachin First Nation - Community Profile

Pauquachin, a name generally meaning “the land of cliffs and bluffs”, is a First Nation that is located on Southern Vancouver Island.<sup>54</sup>

Economic development for Pauquachin is supported by the South Island Prosperity Partnership (SIPP). The nation is governed by a Chief and four Councillors, elected biannually under the *Indian Act*. Although Pauquachin is not part of the *First Nations Land Management Act*, it manages land through certificates of possession and traditional holdings, with land development and jurisdiction still under the *Indian Act* framework.

#### 16.21.5 Tsartlip First Nation - Community Profile

Tsartlip First Nation’s primarily reserve is located in Brentwood Bay on the Saanich Peninsula north of Victoria, B.C., Tsartlip First Nation holds four reserves. Essential services like water, wastewater, and fire protection are provided through agreements with the District of Central Saanich, while the nation's administrative offices are located in Brentwood Bay.

Governed under the *First Nations Elections Act* by a Chief and nine Councillors, with elections every four years, Tsartlip's leadership values respect, integrity, and collaboration. The nation has also participated in environmental assessments, notably opposing impacts from the Trans Mountain Pipeline project, citing damage to the Salish Sea’s ecosystem and its effect on constitutionally protected rights. The W̱SÁNEĆ marine territory is defined as encompassing the Southern Gulf Islands, the Saanich Peninsula, and extending across the Strait of Georgia. This territory is central to Tsartlip identity, includes sacred sites for cultural and spiritual practices, and sustains vital connections with the Southern Resident killer whale, KELLÖLEMEĆEN, a key figure in W̱SÁNEĆ cosmology and oral tradition.

#### 16.21.6 S̱ÁUTW̱ - Community Profile

S̱ÁUTW̱ is one of five communities that constitute the W̱SÁNEĆ Nation.

East Saanich Indian Reserve No. 2, the S̱ÁUTW̱ main village, is about 15 minutes north of the City of Victoria and lies on the east side of the Saanich Peninsula. East Saanich Indian Reserve No. 2 is approximately 241 hectares in size. 1600 people live in S̱ÁUTW̱ (year 2006 est.) with approximately one-third of the population being registered band members, and others being residents who are leasing lands.

While Saanichton Bay is of importance to S̱ÁUTW̱, and their “headquarters”, the S̱ÁUTW̱ were not stationary. According to S̱ÁUTW̱ their territory includes “the Saanich Peninsula, south to Mount Douglas, across to Mount Finlayson and Goldstream. In addition, the Southern Gulf Islands, reaching to Point Roberts, and San Juan Islands constituted what is the Saanich Peoples traditional territory. The S̱ÁUTW̱ and Saanich peoples’ traditional territory is the lands and seas that we traditionally used throughout every season.”<sup>55</sup>

<sup>54</sup> Pauquachin History: <https://www.pauquachin.ca/>. Accessed on April 24, 2025.

<sup>55</sup> About S̱ÁUTW̱ – Tsartlip First Nation. Accessed on May 26, 2025.

Effects of Tilbury Phase 2 to STÁUTW are assessed in [Appendix 6, Section 16.17](#) of this Report.

#### 16.21.7 Tseycum First Nation - Community Profile

The Tseycum is a First Nation's government located on southern Vancouver Island near Victoria. Tseycum (Union Bay Indian Reserve No.4) is one of the four Saanich villages of Southern Vancouver Island, located at the centre of Patricia Bay on the Saanich Peninsula. The community also entered into a 2012 agreement with the Government of B.C. aimed at expanding their land base and economic opportunities, with additional support from the South Island Prosperity Partnership (SIPP).

Tseycum is governed under the *Indian Act* by a Chief and two Councillors and provides a range of supports for members, including services related to health, youth, elders, finances, and employment. Through a combination of traditional knowledge, economic partnerships, and community-driven governance, Tseycum is working to strengthen its self-sufficiency and support for its members.

#### 16.21.8 EAO's Assessment of Tilbury Phase 2 on the WSÁNEĆ Nations

This assessment is intended to provide an assessment of the effects of Tilbury Phase 2 to the WSÁNEĆ Nation overall, while recognizing that each of the WSÁNEĆ Nations have both shared and distinct rights, histories, traditions, and interests. The EAO acknowledges that STÁUTW is conducting an assessment of Tilbury Phase 2 on its interests under Section 19(4) of the Act located in [Appendix 6, Section 16.17](#) of this Report, which assesses interests and values specific to STÁUTW.

The EAO used the following sources in drafting its assessment of Tilbury Phase 2 effects on the WSÁNEĆ Nations's Indigenous interests:

- FortisBC's Revised Application;
- Information submitted during the environmental assessment by the Proponent and WSÁNEĆ Nations;
- Conclusions from the EAO's assessment of VCs; and
- The Proponent's [Indigenous Consultation Report](#) which is a summary of the Proponent's engagement with WSÁNEĆ Nations.

#### 16.21.9 Assessment Boundaries

The spatial assessment boundaries for each Indigenous interest were based on the overlap between WSÁNEĆ Nations' traditional territories with the combined Local and RAAs identified for linked VCs. Although Tilbury Phase 2 is located outside WSÁNEĆ Nations' traditional territories, there is overlap with the LAA and RAA for the Indigenous interests discussed in this section of the EAO's Assessment Report. See Figure 11.18-1A-E of the Revised Application, WSÁNEĆ Nations Indigenous Interests Territorial Map.

The assessment of potential effects related to Tilbury Phase 2 considered three distinct phases:

- Construction phase, with an estimated duration of three to six years;
- Operation phase, expected to last more than forty years; and
- Decommissioning phase, anticipated to take approximately two years.

#### 16.21.10 Regional Context

The WSÁNEĆ Nations have traditionally occupied a vast territory including southern Vancouver Island, nearby islands, the Salish Sea (including what is now known as Puget Sound, the Strait of Georgia, and Juan de Fuca Strait), and extending across Georgia Strait to Boundary Bay and the lower Fraser Valley.

This traditional territory encompasses spiritual places, medicine and fruit gathering places, fishing stations, hunting and trapping areas, winter and summer homesites, and burial sites. Historically, WSÁNEĆ families travelled and lived throughout this territory, including maintaining reef-net sites and other fishing/harvesting areas along the salmon's

migration route to the Fraser River. Historical records also describe Saanich People travelling to the salmon fisheries on the Fraser River.

The STÁUTW's traditional territory specifically includes Roberts Bank (see [Section 16.17](#) of the Assessment Report for STÁUTW's assessment of Tilbury Phase 2).

#### 16.21.11 Indigenous Interests

The EAO engaged W̱SÁNEĆ Nations during the Early Engagement phase in the development of the [Joint Summary of Issue and Engagement for Tilbury Phase 2 LNG Expansion Project](#); however, the EAO did not receive any input during that phase. During the Application Development and Review phase, the EAO received a technical memo from Malahat Nation which summarized an initial understanding of their interests, which have been included in the overall W̱SÁNEĆ Nation's interests, these are; respect for Aboriginal rights, title and knowledge. As well as interests related to economic development and capacity building, and a meaningful assessment of cumulative effects on environmental and cultural resources.

During the Readiness Decision phase in the development of the [Readiness Decision Report](#), EAO engaged with W̱SÁNEĆ Nations who indicated that their primary concerns regarding Tilbury Phase 2 include: cumulative effects, and marine use of the Fraser River for navigation and fisheries activities. This information was used in drafting the [Tilbury Phase 2- Schedule C – Application Information Requirements](#) Table 6; see Proposed Preliminary List of Indigenous Interests.

The Proponent identified W̱SÁNEĆ Nation's Indigenous interests to be assessed in the Revised Application through:

- Reviewing requirements and guidance from the EAO and the AIR;
- Conducting engagement efforts with W̱SÁNEĆ Nations to gather information on their Indigenous interests, as outlined in [Section 11.18.3](#) Summary of Engagement of the W̱SÁNEĆ Nation's section of the Nations section in the Revised Application;
- Engaging collaboratively with STÁUTW beginning in the Application Development and Review Phase; and
- Reliance by FortisBC on secondary data and sources external to W̱SÁNEĆ Nations.

The EAO attempted to engage with W̱SÁNEĆ Nations, and with the exception of STÁUTW, during the development of this Report. As no comments were received on their section, the EAO relied on the preliminary list of Indigenous interests identified in the AIR, which include:

- Harvesting and subsistence activities;
- Cultural use sites and areas;
- Social and economic conditions; and
- Indigenous health and well-being.

The assessment of W̱SÁNEĆ Nations' Indigenous interests in this section uses these categories. The EAO's assessment includes describing the Indigenous interest, the current context, potential effects, applicable mitigation, and the resulting effects analysis. If there is an adverse residual effect a characterization of effects and cumulative effects assessment is also completed. In addition to the EAO's assessment of effects to W̱SÁNEĆ Nations' Indigenous interests, STÁUTW provided their position on how Tilbury Phase 2 will affect STÁUTW's Indigenous interests.

#### 16.21.12 Harvesting and Subsistence Activities

##### Background

The W̱SÁNEĆ Nations have resided on southern Vancouver Island, the western side of the Saanich Peninsula, and nearby islands for millennia. Their extensive traditional territory spans across the Salish sea to the lower arm of the Fraser River, including Saanich Inlet and adjacent forest lands.

In their 1987 Territorial Declaration, the WSÁNEĆ describe their homeland as encompassing all spiritual places, medicine and fruit gathering places, fishing stations, hunting and trapping areas, winter and summer homesites, burial sites, meditation places, and all territory in between. As “Saltwater People”, the sea is profoundly important to their way of life, and they believe themselves to be an inherent part of the natural world, including birds, animals, fish, and mountains. Their traditional beliefs hold that all non-human creatures and many inanimate environmental components were once people, transformed and given as gifts, emphasizing an egalitarian relationship with nature.

#### Existing Conditions

Within the WSÁNEĆ governance system, harvesting fish for food, culturally important plant gathering, hunting, and ceremony aligns with sustainability management.

WSÁNEĆ people actively engage in marine resource harvesting, which is vital for sustenance, culture, and income. They practice Douglas Treaty Rights, including salmon fishing and the harvesting of marine resources within their traditional territories. They continue to gather culturally important plants for medicinal and ceremonial purposes.

The present industrial developments, including land conversion, railway expansions, industrial accidents, the growth of the Port of Vancouver, and pollution, have had profound and far-reaching effects on Indigenous communities. These changes have reduced lands available for harvesting and gathering, adversely affected fish and fish habitat, wildlife, water quality, and access to cultural areas. The loss of land is considered an important factor contributing to cultural stress and decline in Indigenous well-being for WSÁNEĆ members.

Malahat Nation indicated that harvesting and marine use activities are affected by declining resource abundance, pollution, industrial development, environmental degradation, and marine traffic. As a “Fraser approach Nation” with historical reliance on reef-net fisheries associated with Fraser River sockeye migration routes, Malahat Nation expressed concern that developments within the Fraser River estuary and surrounding marine environments may affect areas historically used for harvesting, travel, trade, and cultural activities. Malahat Nation also highlighted ongoing efforts to revitalize harvesting practices and support intergenerational exercise of Indigenous rights.

Regarding the specific area of Tilbury Phase 2 on the south arm of the lower Fraser River, the Proponent states that the available information shows that WSÁNEĆ Nations do not currently use this specific area to fish, gather plants, hunt, or access cultural sites or areas. The Department of Fisheries and Oceans Food, Social, and Ceremonial (FSC) catch data does not indicate current fishing by WSÁNEĆ Nations near Tilbury Phase 2.

Malahat Nation noted that the absence of documented current use in a specific location should not be interpreted as an absence of Indigenous rights or interests. Malahat Nation stated that its members continue to maintain cultural, historical, and spiritual connections to marine environments throughout the Salish Sea and Fraser River estuary and are actively supporting opportunities for future generations to exercise those rights.

#### Potential Project Effects

The EAO identified the following pathway of effects, prior to the application of mitigation measures, along with the associated VCs outlined in [Appendix 6](#), that may affect WSÁNEĆ Nations’ harvesting rights and subsistence activities during Construction, Operation, and Decommissioning phases of Tilbury Phase 2:

- **Changes to the experience and preferences around the practice of harvesting rights and effects on the quality, quantity, and availability of resources** from increased noise, light, and air pollution (acoustics, air quality, soil, groundwater, and land and resource use VCs) may deter WSÁNEĆ Nations’ members from accessing preferred harvesting areas near Tilbury Phase 2 site. Changes in fish distribution and abundance (fish and fish habitat VC) and the introduction of invasive plant species (vegetation VC) may further reduce the experience and preference of the practicing of harvesting rights. While WSÁNEĆ Nations’ do not currently fish or harvest close to Tilbury Phase 2, they have historically and could in the future if the site was decommissioned to a more natural state;

- **Effects to W̱SÁNEĆ Nation's Rights to fish for FSC purposes** from habitat loss, (fish and fish habitat, vegetation VCs), increased mortality risks to fish, birds, and wildlife (wildlife and wildlife habitat VCs), and changes in their behavior due to sensory disturbances (acoustics, air quality VCs). Additionally, contamination risks to fish habitat in Tilbury Slough (surface water, groundwater VCs) and Fraser River downstream, as well as contaminated soil (soil VC) could impact important plant species, may further impact traditional harvesting and cultural practices; and
- **Effects on the accessibility and availability of traditional lands and resources** may occur as a result of altered land or water based travel routes, access restrictions, or safety considerations, including changes to navigability and the usability of established travel corridors (land and resource use and surface water VCs), as well as indirect effects from sensory disturbances such as noise, dust, lighting, or visual changes that may discourage travel through otherwise accessible areas (air quality, acoustics, and land and resource use VCs).

### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on harvesting and subsistence activities. A full table of Proponent mitigations can be found in [Appendix A of the Revised Application](#). Below is a summary of Key Mitigation Measures, how they address effects on the relevant VC interests, and where they are located in the Revised Application:

- **Air Quality (Section 7.2)** The air quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support W̱SÁNEĆ Nations' harvesting and cultural practices;
- **Acoustic (Section 7.3)** Noise reduction measures during Construction and Operation, such as idle reduction policies, equipment enclosures, and engineered noise controls, help limit disturbance to fish, wildlife, and nearby harvesting areas. Managing noise and vibration also helps maintain the conditions that support W̱SÁNEĆ Nations' harvesting and cultural practices;
- **Surface Water (Section 7.4)** Erosion and sediment control measures, along with containment and treatment of contact water, help prevent sediment or contaminants from entering Tilbury Slough and the Delta storm sewer system. These protections support water quality and fish habitat relied on to support W̱SÁNEĆ Nations' harvesting and cultural practices;
- **Groundwater (Section 7.5)** Groundwater protections, such as containing and treating contact water, managing stormwater, and preventing contaminated runoff, help maintain water quality that supports downstream fish habitat and vegetation important to W̱SÁNEĆ Nations' harvesting and cultural practices;
- **Vegetation (Section 7.7)** Avoiding the MOF footprint prevents disturbance to riparian areas and culturally important plant species relied on by W̱SÁNEĆ Nations for harvesting practices. Measures to prevent the spread of invasive plants also help maintain healthy native plant communities that support traditional gathering and ecosystem integrity;
- **Wildlife and Wildlife Habitat (Section 7.8)** Wildlife protection measures, such as timing construction to avoid sensitive periods, managing lighting, reducing sensory disturbance, and preventing invasive species, help maintain habitat conditions that support the animals and ecosystems important to W̱SÁNEĆ Nations' harvesting and cultural practices;

- **Fish and Fish Habitat (Section 7.9)** Avoiding in water works and implementing erosion, sediment, and spill prevention measures help protect fish habitat and water quality used by salmon migrating through the lower Fraser. These actions support the health and availability of salmon and other fish species central to W̱SÁNEĆ Nations' FSC harvesting and cultural practices; and,
- **Land and Resource Use (Section 7.11)** Traffic management, noise and lighting controls, and clear communication of project activities help reduce disturbances that could affect access to areas used for harvesting or cultural practices.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions to help reduce potential impacts on W̱SÁNEĆ Nations' harvesting and subsistence interests. The following provincial conditions would support mitigation of effects on harvesting rights (see [Section 8](#) of this Report):

- **Condition 10 (Community Feedback Process)** creates a clear way for W̱SÁNEĆ Nations to raise concerns about project effects on harvesting, habitat, or access. By requiring timely responses and ongoing reporting, it helps ensure issues like dust, noise, or disturbance are addressed early, supporting the protection of W̱SÁNEĆ Nations' harvesting and cultural practices;
- **Condition 12 (CEMP)** requires comprehensive plans for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction, which helps protect the environmental conditions that support fish, wildlife, and plants important to W̱SÁNEĆ Nations' harvesting and cultural practices;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, wildlife interactions, spills, and lighting during Operation, helping maintain stable environmental conditions that support salmon, wildlife, and plants important to W̱SÁNEĆ Nations' harvesting and cultural practices;
- **Condition 14 (Air Quality Management Plan)** ensures the Project selects and applies effective emissions-control technologies and monitors air contaminants during Operation. By managing pollutants that can affect people harvesting in the area, salmon, vegetation, and health, this plan helps protect the environmental conditions that support W̱SÁNEĆ Nations' harvesting and cultural practices; and,
- **Condition 17 (Dry Street Sweeping Report)** helps assess whether dry street sweeping can reduce 6-PPDQ on project-related roads, which may lower potential impacts on salmon and other fish important to W̱SÁNEĆ Nations' harvesting and cultural practices.

In addition to the Proponent's mitigations and the provincial conditions the EAO identified the following Key Mitigation Measures and Follow-up Programs under the IAA that would mitigate potential effects to harvesting and subsistence activities:

- **Federal Consideration for Migratory Bird Protections:** The EAO recommends that IAAC consider additional federal conditions to strengthen protections for migratory birds under federal legislation. These measures would help maintain culturally important bird species and their habitats while reducing disturbance from project activity, supporting W̱SÁNEĆ Nations' harvesting practices and broader ecosystem conditions important to their way of life.

#### The EAO's Analysis and Conclusions

After consideration of the potential effects, mitigation measures and conditions, described above, the EAO has identified that there will not be any residual effects to W̱SÁNEĆ Nations harvesting and subsistence interests, primarily based on the above proposed mitigation measures, the EAO's analysis, and the lack of current use of the Project area.

### 16.21.13 Cultural Use Sites and Areas

#### Background and Current Context

W̱SÁNEĆ Nations have not identified cultural sites or areas that their members have used or are currently using in or adjacent to Tilbury Phase 2.

The W̱SÁNEĆ Nations' traditional territory, known as Á,LEŊENEŁ ŁTE or "our homeland," historically included diverse sites for villages, resource gathering, and ritual activities, with culture and traditions being fundamental to the W̱SÁNEĆ Nations' pride, balance, healing, and happiness.

Malahat Nation identified canoe travel as an important cultural practice that supports harvesting, trade, family connections, and the transfer of cultural knowledge between generations. Malahat Nation indicated that contemporary canoe journeys and related cultural revitalization activities continue to play an important role in maintaining cultural identity and connections throughout Coast Salish territories.

#### Potential Project Effects

The EAO identified the following pathway of effects, prior to the application of mitigation measures, along with the associated VCs outlined in [Appendix 6](#), that may affect W̱SÁNEĆ Nations' cultural use sites and areas during Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- **Effects to cultural heritage and structures, sites, or things of historical, archaeological, paleontological, or architectural significance:** Tilbury Phase 2 could affect cultural use sites and areas through Construction activities that disturb culturally important places, such as archeological sites, due to ground disturbance, accidental spills of deleterious substances, or other construction-related interactions (culture, soil, archaeological and heritage resources VC);
- **Loss of access to and disenfranchisement from cultural sites:** W̱SÁNEĆ Nations' harvesters could experience direct adverse effects to cultural and spiritual practices if access to cultural sites is altered or lost due to closure or construction of trails, parking areas, or access points between Tilbury Phase 2 and the Fraser River for safety or construction purposes (land and resource use VC). Changes in sensory effects (acoustic, air quality, culture, land and resource use VC) could change the experience of W̱SÁNEĆ Nation members using cultural sites; and
- **Effects to cultural and spiritual practices caused by changes to or loss of access to cultural sites and areas:** Access to cultural sites could be affected (land and resource use VC) by Tilbury Phase 2. Adverse effects to culture (culture VC) which are connected to potential effects on wildlife, habitat, and vegetation (See Harvesting and Subsistence Activities section above) could influence the ability or desire to access these sites.

#### Mitigation Measures

The Revised Application summarizes relevant mitigation measures proposed by FortisBC to address potential Tilbury Phase 2 related effects on cultural use sites and areas, including:

- **Land and Resource Use (Section 7.11)** Traffic-management planning, noise and lighting controls, and communication regarding project activities help reduce disruptions to access and use of culturally important areas. These measures support W̱SÁNEĆ Nations' ability to safely access and continue cultural practices within their traditional territory;
- **Culture (Section 7.14)** Measures that reduce noise, light, habitat disturbance, and impacts to heritage sites help maintain the cultural landscapes and environmental conditions that support W̱SÁNEĆ Nations' ability to access, use, and maintain culturally important areas, including places of teaching, ceremony, and connection to land and water;

- **Archaeology and Heritage Resources (Section 7.13)** Measures to prevent disturbance to archaeological and heritage materials, including chance find procedures, site protection, and early notification to Indigenous nations, help protect culturally important sites, features, and landscapes. These measures support W̱SÁNEĆ Nations' ongoing use of cultural areas and help maintain cultural continuity, knowledge transmission, and connections to territory;
- **Air Quality (Section 7.2)** The air quality measures, such as idle-reduction, dust control, electrification, equipment maintenance, and emissions controls, limit contaminants that can cause sensory disturbance or degrade habitat. They help protect salmon, wildlife, vegetation, and surface water that support W̱SÁNEĆ Nations' harvesting and cultural practices;
- **Acoustics (Section 7.3)** Noise reduction measures during construction and operation, including idle-reduction policies, equipment muffling, enclosures, and engineered noise controls, help limit disturbance to culturally important areas and activities. Managing noise and vibration supports the continued use of cultural sites and helps maintain settings conducive to cultural practices, ceremonies, and the transmission of cultural knowledge by W̱SÁNEĆ Nations; and
- **Soil (Section 7.6)** Soil management measures, including erosion control, spill-prevention protocols, and careful handling and disposal of contaminated soils, help prevent the migration of pollutants into nearby cultural areas and waterways. Maintaining soil stability and quality supports the protection of culturally important places and landscapes used by W̱SÁNEĆ Nations.

In addition to the Proponent's mitigation measures, the EAO has developed further conditions that would mitigate potential effects on cultural use sites and areas (see [Section 8](#) of this Report):

- **Condition 9 (Public Information)** requires advance notice of planned flaring and timely notification of unplanned high-volume flaring events, along with publicly accessible project information. By improving predictability and awareness of activities that may affect air quality, visibility, and safety, this condition helps reduce uncertainty and supports confidence in accessing and using the area, particularly during periods of elevated disturbance.
- **Condition 10 (Community Feedback Process)** establishes a clear and structured mechanism for W̱SÁNEĆ Nations to raise concerns related to project effects on culturally important areas, access, or sensory conditions. Requiring timely responses, follow-up actions, and reporting helps ensure that issues such as dust, noise, lighting, or disturbance near cultural sites or travel routes are identified early and addressed, supporting the continued use and protection of cultural areas;
- **Condition 12 (CEMP)** requires comprehensive planning and mitigation for managing dust, noise, surface water, spills, erosion, and wildlife interactions during Construction. These measures help protect the environmental and sensory conditions of culturally important landscapes and areas, supporting W̱SÁNEĆ Nations's continued access to and use of cultural sites during project Construction;
- **Condition 13 (OEMP)** requires ongoing management of noise, water quality, lighting, wildlife interactions, and spills during project Operation. By maintaining stable environmental and sensory conditions over the long term, this condition supports the integrity and continued use of cultural areas relied on by W̱SÁNEĆ Nations;
- **Condition 14 (Air Quality Management Plan)** ensures the selection and implementation of effective emissions-control technologies and ongoing monitoring of air contaminants during Operation. By managing pollutants that may affect air quality, visibility, and outdoor use of the area, this plan helps maintain conditions suitable for access to and use of culturally important areas and sites by W̱SÁNEĆ Nations; and,

- **Condition 15 (Chance Find Protocol)** requires the development and implementation a Chance Find Protocol for archaeological finds throughout the life of Tilbury Phase 2. This measure ensures any artifacts discovered are properly protected. If W̱SÁNEĆ Nations historically used the area, it would also help mitigate effects on any of their cultural materials that may be present.

#### The EAO's Analysis and Conclusions

After consideration of the potential effects, mitigation measures and conditions, described above, the EAO has identified that there will not be any residual effects to W̱SÁNEĆ Nations' cultural use sites and areas interest, primarily based on the above proposed mitigation measures, the EAO's analysis, and the lack of current use of the Project area.

### 16.21.14 Social and Economic Conditions and Indigenous Health and Well-being

#### Background

W̱SÁNEĆ Nations' social and economic conditions and health and well-being have been expressed as an issue of concern by W̱SÁNEĆ Nations. Colonialism has extensively impacted their social and economic well-being and health. There are disparities which are systemic and stem from factors like intergenerational trauma, racism, poverty, and barriers to educational and employment opportunities.

#### Existing Conditions

The existing conditions noted in the Revised Application related to social and economic factors include information on population, age characteristics, marital statuses, emergency services, housing, education, and community infrastructure.

In terms of Indigenous health and well-being, W̱SÁNEĆ Nations are deeply influenced by the legacy and ongoing impacts of colonialism, resulting in extensive socio-economic disparities that function as social determinants of health and manifest in poorer health outcomes compared to the non-Indigenous population.

See sections on [Cultural Use Sites and Areas](#) and [Harvesting and Subsistence Activities](#) for additional context.

#### Potential Project Effects

The EAO identified the following pathways of effects, along with associated VCs outlined in [Appendix 6](#), that may affect W̱SÁNEĆ Nations' social and economic conditions and Indigenous health and well-being during Construction, Operation, and Decommissioning phases of the Tilbury Phase 2:

- **Social and Economic Conditions:**
  - **Effects on infrastructure and services;** Tilbury Phase 2 may add pressure on services if out-of-region workers are used, but according to the Revised Application effects are expected to be limited and not distinguishable from existing conditions (land and resource use, employment and economy, infrastructure services VC);
  - **Effects to with W̱SÁNEĆ Nations' employment opportunities, Indigenous businesses, procurement opportunities, and W̱SÁNEĆ Nation revenue:** Tilbury Phase 2 could positively affect W̱SÁNEĆ Nations' employment and business opportunities, depending on member participation and access to contracts (employment and economy VC). Indigenous workers are also more likely to be in construction-related jobs. However, smaller Indigenous businesses, including those linked to W̱SÁNEĆ Nation, may face challenges competing for workers or meeting Tilbury Phase 2 demands (culture VC); and

- **Effects to WSÁNEĆ Nations' ability to improve social and economic conditions;** Tilbury Phase 2 may support WSÁNEĆ Nations' efforts to improve social and economic conditions by creating employment, training, and business opportunities. Increased demand for skilled workers could also boost interest in trades training (infrastructure and services, and employment and economy VC).
- **Indigenous Health and Well-being:**
  - **Effects on the quality, quantity, and availability of harvested country foods:** Land, water or air-based contamination from Tilbury Phase 2 could adversely affect country foods such as fish and traditional plants. (See [Harvesting and Subsistence Activities](#) section above);
  - **Effects on the value and perceived quality of country foods:** Quality, quantity or availability of plants or wildlife could be impacted from Tilbury Phase 2. Country foods could become contaminated. (See list of potential project effects above). Community perceptions with respect to the quality of country foods have the potential to interact with WSÁNEĆ Nation members' participation in harvesting and subsistence activities and cultural and spiritual practices even in the absence of adverse effects (land and resources and culture VCs);
  - **Effects on air quality, noise and water quality:** Tilbury phase 2 activities have the potential to contribute contaminants of concern to air and water, and increased noise levels in proximity to the facility property line (air quality, acoustics, surface water, land and resource use, and human health VCs); and,
  - **Effects on health and well-being from the potential effects to traditional ways of life and to cultural sites;** Tilbury Phase 2 may interact with WSÁNEĆ Nation's health and well-being through changes to traditional practices, access to cultural sites, and socio-economic factors. Effects on traditional ways of life due may still influence health outcomes indirectly. Positive effects may include increased income and employment opportunities for members, while potential adverse effects relate to shift work and family stress.

#### Mitigation Measures

The Revised Application includes a summary of relevant mitigation measures identified that the Proponent has proposed in response to potential Tilbury Phase 2 related effects on social and economic conditions and Indigenous health and well-being. These include the following:

- **Air Quality (Section 7.2)** Air emission controls help protect respiratory health and prevent contamination of country foods, supporting WSÁNEĆ Nations' physical well-being and confidence in harvesting;
- **Surface Water (Section 7.4)** Managing runoff, erosion, and sediment helps maintain water quality in the lower Fraser, supporting WSÁNEĆ Nations' cultural and nutritional reliance on healthy salmon and aquatic ecosystems;
- **Fish and Fish Habitat (Section 7.9)** Protecting fish habitat, water quality, and migration conditions supports WSÁNEĆ Nations' food security, cultural identity, and health by safeguarding salmon and other species essential to FSC harvesting;
- **Vegetation (Section 7.7)** Measures to prevent invasive species and avoid loss of culturally important plants help protect traditional foods and medicines that contribute to WSÁNEĆ Nations' physical health and cultural practices;
- **Wildlife and Wildlife Habitat (Section 7.8)** Mitigation that reduces wildlife disturbance and mortality helps sustain species important for cultural practices and country food harvesting, supporting WSÁNEĆ Nations' cultural continuity and nutritional well-being;
